Unstructured Decisions. At the other end of the continuum are unstructured decisions. While these have the same components as structured ones   data, process, and evaluation   the two processes have little else in common. With unstructured decisions, for example, each decision maker may use different data and processes to reach a conclusion. In addition, because of the nature of the decision there may be only a limited number of people within the organization qualified to evaluate the decision.

Generally, unstructured decisions are made in instances in which all elements of the business environment   customer expectations, competitor response, cost of securing raw materials   are not completely understood (new product and marketing strategy decisions commonly fit into this category). According to Burstein and Holsapple, unstructured decisions that are particularly complicated and muddled are sometimes referred to as *wicked* decisions. Unstructured decision systems typically focus on the individual or the team that will make the decision. These decision makers are usually entrusted with decisions that are unstructured because of their experience or expertise; it is their individual ability that is of value. One approach to support systems in this area is to construct a program that simulates the process used by a particular individual. In essence, these systems   commonly referred to as "expert systems"   prompt the user with a series of questions regarding a situation that requires a decision. "Once the expert system has sufficient information about the decision scenario, it uses an inference engine which draws upon a data base of expertise in this decision area to provide the manager with the best possible alternative for the problem," explained Jatinder N. D. Gupta and Thomas M. Harris in the *Journal of Systems Management.* "The purported advantage of this decision aid is that it allows the manager the use of the collective knowledge of experts in this decision realm. Some of the current DSS applications have included long-range and strategic planning policy setting, new product planning, market planning, cash flow management, operational planning and budgeting, and portfolio management."

Another approach is to monitor and document the process used so that the decision maker(s) can readily review what has already been examined and concluded. An even more novel approach is to provide environments

specially designed to give these decision makers an atmosphere conducive to their particular tastes. The key to support of unstructured decisions is to understand the role that individuals experience or expertise plays in the decision and to allow for individual approaches.

Semi-Structured Decisions. In the middle of the continuum are semi-structured decisions where most actual decision support systems take place. Decisions of this type are characterized as having some agreement on the data, process, and evaluation to be used, but are also typified by efforts to retain some level of human judgment in the decision-making process. An initial step in analyzing which support system is required is to understand where the limitations of the decision maker may be manifested (i.e., the data acquisition portion, the process component, or the evaluation of outcomes).

Grappling with the latter two types of decisions unstructured and semi-structured can be particularly problematic for small businesses, which often have limited technological or work force resources. As Gupta and Harris indicated, "many decision situations faced by executives in small business are one-of-a-kind, one-shot occurrences requiring specifically tailored solution approaches without the benefit of any previously available rules or procedures. This unstructured or semi-structured nature of these decisions situations aggravates the problem of limited resources and staff expertise available to a small business executive to analyze important decisions appropriately. Faced with this difficulty, an executive in a small business must seek tools and techniques that do not demand too much of his time and resources and are useful to make his life easier." Subsequently, small businesses have increasingly turned to DSS to provide them with assistance in business guidance and management.

KEY DSS FUNCTIONS

Gupta and Harris observed that DSS is predicated on the effective performance of three functions: information management, data quantification, and model manipulation. "Information management refers to the storage, retrieval, and reporting of information in a structured format convenient to the user. Data quantification is the process by which large amounts of information are condensed and analytically manipulated into a few core indicators that extract the essence of data. Model manipulation refers to the construction and resolution of various scenarios to answer 'what if' questions. It includes the processes of model formulation, alternatives generation and solution of the proposed models, often through the use of several operations research/management science approaches."

Entrepreneurs and owners of established enterprises are urged to make certain that their business needs a DSS before buying the various computer systems and software necessary to create one. Some small businesses, of course, have no need of a DSS. The owner of a car-washing establishment, for instance, would be highly unlikely to make such an investment. But for those business owners who are guiding a complex operation, a decision support system can be a valuable tool. Another key consideration is whether the business's key personnel will ensure that the necessary time and effort is spent to incorporate DSS into the establishment's operations. After all, even the best decision support system is of little use if the business does not possess the training and knowledge necessary to use it effectively. If, after careful study of questions of DSS utility, the small-business owner decides that DSS can help his or her company, the necessary investment can be made, and the key managers of the business can begin the process of developing their own DSS applications using available spreadsheet software.

DSS UNCERTAINTIES AND LIMITATIONS

While decision support systems have been embraced by small-business operators in a wide range of industries, entrepreneurs, programmers, and business consultants all agree that such systems are not perfect. Some observers contend that although decision support systems have become much more user-friendly, the issue remains problematic, especially for small business operations that do not have significant resources in terms of technological knowledge.

Hard-to-Quantify Factors. Another limitation that decision makers confront has to do with combining or processing the information that they obtain. In many cases these limitations are due to the number of mathematical calculations required. For instance, a manufacturer pondering the introduction of a new product cannot do so without first deciding on a price for the product. In order to make this decision, the effect of different variables (including price) on demand for the product and the subsequent profit must be evaluated. The manufacturer's perceptions of the demand for the product can be captured in a mathematical formula that portrays the relationship between profit, price, and other variables considered important. Once the relationships have been expressed, the decision maker may now want to change the values for different variables and see what the effect on profits would be. The ability to save mathematical relationships and then obtain results for different values is a feature of many decision support systems. This is called "what-if" analysis, and spreadsheet software packages are fully equipped to support this decision-making activity. Of course, additional factors must also be taken into consideration when making business decisions. Hard-to-quantify factors such as future interest rates, new legislation, and hunches about product shelf life may all be considered. So even though the calculations may indicate that a certain demand for the product will be achieved at a

certain price, the decision maker must use his or her judgment in making the final decision.

If the decision maker simply follows the output of a process model, then the decision is being moved toward the structured end of the continuum. In certain corporate environments, it may be easier for the decision maker to follow the prescriptions of the DSS; users of support systems are usually aware of the risks associated with certain choices.

Processing Model Limitations. Another problem with the use of support systems that perform calculations is that the user/decision maker may not be fully aware of the limitations or assumptions of the particular processing model. There may be instances in which the decision maker has an idea of the knowledge that is desired, but not necessarily the best way to get that knowledge. This problem may be seen in the use of statistical analysis to support a decision. Most statistical packages provide a variety of tests and will perform them on whatever data is presented, regardless of whether or not it is appropriate. This problem has been recognized by designers of support systems and has resulted in the development of DSS that support the choice of the type of analysis. Elliot Bendoly warns in his 2008 guide to designing DDS that decision support systems are intended to support the decision-making process, not to replace it.

DELEGATION

Delegation is the practice of turning over work-related tasks and authority to employees or subordinates. Small-business owners often have difficulty with delegation for a variety of reasons, from concerns about the abilities of subordinates to long-standing "hands-on" management habits (a common characteristic of successful entrepreneurs). Indeed, "businesses founded on the creative talents of the owner often struggle with]delegation[because the success of the enterprise depends on the owner's style," wrote Linda Formichelli in *Nation's Business.* The authors of the 2009 book *Small Business Management* note that an entrepreneur's inability to delegate is often a result of his or her background or personality type. In effect, what drove such individuals to start a business in the first place may also lead them to take on too much responsibility once the business is up and running. Inefficient delegation can also be a consequence of habit. Entrepreneurs usually work long hours during start-up and may find it difficult to switch gears once employees are hired and the business is fully functional. But small-business consultants warn that owners who do not learn to delegate responsibilities and tasks often end up stunting their company's growth.

THE NEED FOR EFFECTIVE DELEGATION PRACTICES

"Many managers think of delegation as a task an activity to be carried out and forgotten. In reality, delegation is a process that makes up a critical component of successful management," wrote Janet Houser Carter in *Supervisory Management.* "To get work done with and through others, a manager must regularly give authority to his or her staffers. This shows staffers that the manager has faith in their abilities which is what makes delegation such a powerful motivational tool."

A propensity for micromanagement or nanomanagement, as it is sometimes called when applied to a small business firm can have a deleterious impact on a company in a variety of ways. Moreover, many analysts contend that a lack of delegation can be particularly detrimental to the fortunes of smaller businesses. "In small, entrepreneurial companies, micromanagement by one person typically

the owner can be especially growth-inhibiting because it can have a proportionately larger sweep through the firm than micro-management by one executive in a large company," wrote Formichelli. Business consultants thus counsel their clients to practice sensible delegation of tasks to their employees even in instances where they might not do as good a job initially. "Employees can't learn unfamiliar tasks if they never get the chance to learn and practice them," noted Carter. "In the short term, it may make sense to do it yourself; over the long term, however, you save more time by showing others how to do the job."

Of course, not all tasks or responsibilities should be delegated to employees. Small-business owners need to take care of basic strategic and planning issues themselves, and other management duties, such as conflict resolution and performance evaluations, should be delegated judiciously.

Business experts cite a number of specific problems that are often associated with companies that do not effectively delegate. These include:

- Poor employee morale. An inability or refusal to delegate can have a corrosive impact on the morale of good employees that want to contribute their talents to the business in a meaningful way. "Delegating work to subordinates helps to develop them for their own career advancement as well as improve their management skills," wrote W.H. Weiss in *Supervision.*
- Burnout. Even the most talented, ambitious, and energetic entrepreneurs are apt to run out of gas if they insist on tackling all major aspects of a company's operation. Some small-business owners can manage all or most important tasks for the early life of a company. Indeed, some small businesses especially single-person enterprises like freelance graphics design or editorial services may be able to handle all significant aspects of a company's operation for years on end. But for the vast majority of small and mid-sized businesses enjoying a measure of growth, owners sooner or later must face the reality that they cannot undertake all duties and responsibilities.
- Misallocation of Personal Resources. Small-business owners and entrepreneurs who do not delegate often run the risk of using too much of their time on routine tasks and not enough time on vital aspects of the company's future, such as strategic planning, long-range budgeting, and marketing campaigns.
- Damage to Company Image. Business owners who do not empower their employees, insisting instead on attending to all relevant aspects of his or her business themselves, run the risk of inadvertently suggesting to customers and vendors that the company's workforce is not competent or trustworthy.
- Damage to Company Health. This should be the bottom-line consideration of all entrepreneurs running their own business. If micromanagement is slowing processing of work orders, hindering development of new marketing efforts, or otherwise causing bottlenecks in any areas of a company's operation, then it may be eating away at the company's fundamental financial well-being.

Small business owners are encouraged to evaluate whether they are perhaps falling into the trap of micromanagement. Consultants and entrepreneurs cite the following as major warning signs:

- Taking work home in the evening or working long hours of overtime
- Failure to give important tasks the amount of attention that they warrant
- Basic company documents (like business plans) are not updated for long periods
- Excessive amounts of time spent going over work already completed by employees
- Completing important tasks with little time to spare (or a day or two late)
- Spending inordinate amounts of time on relatively unimportant or routine jobs
- Vacations assume mythic status
- Unhappy employees
- Unhappy family members

KEYS TO EFFECTIVE DELEGATION

Effective delegation is ultimately predicated on ensuring that the company's workforce is sufficiently talented and motivated to take on the responsibilities that are delegated to them. "New entrepreneurs often have difficulty figuring out what kind of workers to hire," remarked Formichelli. "If the wrong people are hired, they require more training and supervision, which invites nanomanagement." Sound hiring practices and adequate training are thus universally regarded as major factors in establishing a healthy system of delegation. Once those aspects have been addressed, there are other considerations that can be studied as well. These include:

- Work Environment. Establish a positive work environment where employees are not paralyzed by fear of failure or dismissive of tasks that they think are beneath them. Owners and managers need to emphasize tools of motivation and communication to nourish employee enthusiasm. In December 2009, Christopher Palmeri of *Business Week* wrote about the

work environment, or culture, at Zappos.com. In contrast to many companies' call centers, Zappos employees were given free rein to do whatever it took to solve the customer's problem. The company did not enforce time limits on calls or ask employees to read scripts. The proof may be in the numbers; Zappos sales were up by double digits in 2009, a year that was especially rough for retailers due to the recession. The company began to offer $4,000 seminars to other businesses on how they could adapt their work environment to have happier, more productive employees.

- Plan for Delegation. A company that is armed with a strong, clear vision of its future and the role that its employees will play in that future is far more likely to be successful than the business that does not plan ahead.
- Review Responsibilities. Business owners and managers need to examine objectively which tasks that they have previously taken care of can be delegated to others. "Reserve for yourself those tasks which require the experience, skill, and training which only you possess," wrote W. H. Weiss in the *Supervisor's Standard Reference Handbook.*
- Selection of Appropriate Employees for New Responsibilities. As every personnel manager knows, some members of the work force are better suited to take on new responsibilities than others. When reviewing potential candidates to take on additional responsibilities, business owners should consider level of employee motivation and ambition, skill sets, level of allegiance to the company, and emotional maturity.
- Established Policies. Detailed manuals of policies and procedures can go far toward eliminating the uncertainties that hamstring some delegation efforts.
- Prepare for Bumps in the Road. Even the best-planned delegation efforts can go awry, leading to short-term productivity and profitability losses. Indeed, risk is an inherent element of the delegation process, and some errors or misjudgments may occur as workers adjust to their new responsibilities."Employees need to be reassured that the manager will be there to offer assistance or clarification, and that mistakes during the learning period are to be expected," said Carter. "Mistakes should be viewed as opportunities to teach, not punish."
- Training. Delegation of tasks and responsibilities is far more likely to be successful if the employees have the knowledge necessary to fulfill their new duties. "The fact that no one has the skills to complete a task you are handling doesn't mean you should avoid delegation it means you should train," wrote Alice Bredin in *Los Angeles Business Journal.* "While building the skills of an employee requires an investment of time, that investment will pay off."
- Communication. "Be clear and concise when delegating," said Weiss. "Right from the beginning you must clarify what decisions you are delegating and what you are reserving for yourself. Delegating fails when the person to whom you have delegated a task fails to perform it or makes a decision beyond the scope of authority granted." Conversely, delegation can also fail if the business owner hands off a responsibility, but does not give his or her employee the necessary level of authority to execute that responsibility. "If you overlook this, you may cause the person delegated to suffer frustration and stress because he or she was given an assignment yet not given the authority and power needed to accomplish it properly," wrote Weiss in *Supervision.*
- Provide advisory role. Small-business owners should make sure that they keep lines of communication open at all times after delegating responsibilities. Employee questions and uncertainties about their new responsibilities are perfectly natural, so owners should make themselves available for questions and maintain a nonjudgmental, helpful stance.

Ultimately, small-business owners need to recognize that delegation can help a business grow and prosper, and that good employees, when used intelligently, can be a significant advantage in the marketplace. "The manager who wants to learn to delegate more should remember this distinction," wrote Thomas S. Bateman and Carl P. Zeithaml in *Management: Function and Strategy.* "If you are not delegating, you are merely doing things; the more you delegate, the more you are truly *building* and *managing* an organization."

DELIVERY SERVICES

The U.S. Postal Service (USPS) was established by the Continental Congress in America on July 26, 1775 before the United States was officially founded. The first Postmaster General was Benjamin Franklin. The USPS has had a colorful history since, delivering mail and packages by steamboat, railroad, pony express, and air. In 2008 the service carried 203 billion parcels. Throughout its history, the USPS has been and remains the world's largest delivery service, currently delivering half the world's mail.

COMPETITION AND CHALLENGES

Although federal law has given the USPS an official monopoly since the Postal Reorganization Act was passed in 1970, this act also reorganized the Postal Service from an executive branch department into an independent government corporation. Since the reorganization, the Postal Service has become more self-sufficient; by the early 1980s, the USPS was no longer receiving taxpayer dollars. Private delivery services of limited geographical coverage and specialized service have always existed side by side with postal service, increasing rather than decreasing since the government granted the USPS its official monopoly. Today's largest private carrier, United Parcel Service (UPS) began in Seattle in 1907 as American Messenger Service, founded by nineteen-year-old James E. Casey on a borrowed $100. Casey had worked for other delivery services before. The company underwent several name changes before it became UPS. In 2008 UPS delivered 3.9 billion packages, making it the world's largest package delivery company.

Other major companies in the delivery business are FedEx and DHL. DHL was founded in 1969 by Adrian *D*alsey, Larry *H*illblom, and Robert *L*ynn. DHL began in international carriage of bills of lading. The concept of FedEx, originally Federal Express, began with a term paper written by Frederick W. Smith in 1965. Smith became the founder of Federal Express, incorporating the company in 1971 and launching operations in 1973. Smith's critique of airfreight shippers was that they were piggybacking on passenger routes; he saw a better solution: company-operated major air hubs based on traffic volume. Both DHL and FedEx the name was changed from Federal Express in 2000 expanded both by providing competitive services and by acquiring smaller organizations.

The entrance of competitors into the package delivery industry has had a predictable effect on prices and the range of services offered by the USPS. Even though the Postal Service remains the largest parcel carrier by far, its high-revenue package delivery operations have been impacted by UPS, FedEx, and DHL. Increased usage of e-mail during the twenty-first century and increasing competition combined at first to slow growth and later to bring about a decline of mail volume. Delivery volume peaked in 2006, and mail volume dropped by nearly 5 percent in both 2007 and 2008, resulting in a decline in overall mail volume of approximately 20 billion parcels from 2006 to 2008.

Independence, competition, and technology have combined to force the Postal Service to make more and more rapid changes in recent decades. The Postal Service has had to innovate to keep up with change in the delivery industry, introducing new services such as online tracking, overnight delivery, and flat-rate packages. Significant postal reform has been underway since the Postal Service's 2005 release of its "Strategic Transformation Plan, 2006 2010," which resulted in the Postal Accountability and Enhancement Act of 2006, the first major legislative change to the Postal Service since 1971. This act was designed to give the USPS greater flexibility in responding to changing market conditions by making it easier for the Postal Service to conduct competitive pricing and respond to changes in customer needs. Price increases for stamps which for many decades took place only every 3 or 4 years are now a familiar annual occurance. In 2007 the Postal Service introduced the Forever Stamp, a first-class stamp that can be used anytime regardless of when it was purchased or for how much. A Forever Stamp purchased in 2007 for the first-class mail stamp price of 41 cents could still be used when the price of a first-class stamp increased to 44 cents in 2009, and, as the name implies, it can be used indefinitely, no matter how much the price of a first-class stamp increases.

The economic downturn in 2008 further hurt an already struggling Postal Service. In early 2009 the Postmaster announced that because of plummeting volume and revenues brought on by the recession, the USPS might be forced to eliminate a day of mail service. As of early 2010, six-day mail service continues, but the immediate and long-term future of the Postal Service remains uncertain, and further reform remains on the minds of postal administrators and federal lawmakers. There are even calls for privatization, such as those by Michael A. Crew, a professor of regulatory

economics at Rutgers University and coeditor of the 2009 book *Handbook of Worldwide Postal Reform.* According to Crew, "The Postal Accountability and Enhancement Act of 2006 was supposed to make the agency competitive and bring regulations into the 21st century. But it just painted over the cracks, and they're still struggling."

WEIGHING DELIVERY OPTIONS

Because of all of the changes in the delivery industry over the past five decades, the small-business owner of the twenty-first century has many choices of delivery service and must consider a wide range of factors to reach a cost-effective solution. Small businesses that do a lot of shipping but have not analyzed all of their options may be able to cut costs by a little attention to the multiplicity of services and incentives available. Some issues to consider are described below.

Speed and Reliability vs. Cost. Private delivery services have created their place in the market by providing rapid, reliable services, but they do so at a premium cost. As noted above, the Postal Service has responded to this competitive pressure by establishing express mail and package services as well. However, the USPS is not always as convenient or reliable as private carriers even though the price is generally though not always lower.

Incentives. Parcel carriers have optimized their operations around parcel sizes that represent the bulk of their carriage. Two weight ranges that are incentivized are small packages at or below 5 pounds and packages of 20 to 30 pounds. Carriers will provide the best service and lowest prices in these ranges. If a business can redesign its shipping system to move more packages into these ranges, cost savings may be realized. With the rapid increase in online shopping and the consequent rise in package delivery services needed by businesses, major private carriers have rushed to provide lower-cost bulk services. For businesses that ship many items overnight, a long-term contract with a private carrier can produce savings while maintaining certainty.

Destination. Some carriers specialize in cross-country or overseas delivery and offer "single-zone" pricing structures. Others offer attractive rates for shipments within smaller regions. The small business might gain advantages by analyzing the destination of its shipments and selecting carriers based on the most attractive destination zone pricing.

Drop-Off or Pickup. Many small businesses have trucks or vans on the road which, with a little administrative effort, may be used to drop off packages to private delivery services rather than using pickup at the business site. Investigation of savings possible by doing its own drop-off may provide slightly lower costs to the business and optimize the use of its own fleet of vehicles.

Tracking. In the past, tracking was a specialized service of private carriers. Companies that delivered materials to rural or remote locales or that shipped time- or content-sensitive materials would only enlist the services of companies that could provide clients with detailed information on shipment data. Tracking services were pioneered by FedEx and UPS, but this is one area where the Postal Service has changed in response to market conditions, updating its online tracking system and introducing the Intelligent Mail barcode in 2006. Tracking is now a familiar and free service offered by all major carriers.

DEMOGRAPHICS

Demography is the statistical study of populations; the roots of the word come from the Greek words for "people" (*demos*) and "picture" (*graphy*). Demographics, thus, are pictures of the people derived from statistics. The largest single, consistent collection of data on the population is the U.S. census conducted every 10 years under the auspices of the U.S. Census Bureau. The Bureau also collects partial data every year, published as "population estimates." The census itself is at least theoretically a 100 percent count, although controversies about "undercounted" elements of the population break out every decade. This national count

covers numbers, gender, age, family relationships, ethnicity and race, location, income, occupation, and data on housing patterns. The geographical coverage is down to the census tract level (just a few blocks in extent), so that, for census years, anyway, data can be obtained down to the zip-code level.

All demographics are ultimately based on the census, although the data are extended by many other surveys, many conducted by government agencies. The U.S. Department of Health and Human Services (HHS), for instance, tracks health issues; U.S. Department of Labor follows employment trends; U.S. Department of Education captures data on educational levels; U.S. Department of Agriculture collects and publishes data on farmers; and state vehicle registration offices collect data on driving. And so on.

Added to this are many private surveys that attempt to track consumer preferences, buying habits, attitudes, opinions, and so on *ad infinitum.* The best-known private survey is probably the TV-rating service provided by the Nielsen Company. People who use discount cards at major grocery or other retail stores are supplying demographic data every time they purchase something. Every subscriber to any kind of print publication is generating demographic information for the publisher which the publisher uses to set advertising rates. The Nielsen Company now collects data from Internet users as well. According to *Adweek*, Nielsen increased its reach to 30,000 Web sites in 2009. The Internet has become a major source for demographic information. Once a user's address or zip code is entered onto a Web site looking to collect this data, the information can be blended with demographic data from the census to reveal more detailed demographic information such as his or her likely ethnicity, age, income, and more. The values obtained are approximate because the census does not reveal individual household data, but people with similar profiles tend to live together.

In modern American society, data collection in some form or another accompanies most commercial transactions done using credit cards. Vast amounts of information come to be stored in countless computers. Techniques of "data mining" from such stores have developed over the years providing companies information better to target their customers.

The public sector is also a major generator and user of demographic information. Health surveys, for instance, are based on doctors' patients' records. Voter registration records trigger selection of juries. HHS tracks birth and death records to generate projections of life expectancy which in turn serve commercial purposes, such as life insurance. Companies and agencies can, if they make the effort, construct quite accurate "pictures" of many different aggregations of people Superbowl attendees, large-boat buyers, first-time voters, and adherents to religions or parties. Demographics is simply an aspect of modern life.

TECHNIQUES AND TRENDS

Extensive collection of demographic data by virtually all larger institutions is both necessitated and motivated by a mass culture. In colonial times, when sellers knew their customers and principals knew their students, information could be left to ordinary human memory. But the gradual evolution of very large institutions far removed from the actual interchange between people has produced disconnects between decision makers and their constituencies.

The costs of collecting precise demographic data are high, even when in part subsidized by public services like the census. For over a decade, the major trend in this field has been to automate data collection using computers and incentives. Two example of incentives are free information that is made available on the Internet (although users must *register* to access it), or small discounts given when customers use a discount card (but they have to *tell* something about themselves to get it). The data collected are then consulted using specialized analytical software, the reports from which are integrated into the decision stream.

Indirect marketing by mail or advertising is notoriously hit and miss. Producing ever better profiles of people who watch a particular show or people who share the same zip code helps advertisers and marketers to pinpoint the right "venue" on which to spend money to reach their most desired audience, be that that the "young" or the "young-at-heart."

The high costs of mass marketing can be made more effective by ever more precisely targeted marketing aimed at prequalified buyers. But for this method to work, it must remain automated. The highest costs are associated with actual contact between a researcher and a would-be customer; and for this contact to yield any meaningful results, it will require 20 minutes of interaction. Such contacts are only made with tiny samples.

THE PRIVACY DEBATE

The vast stocks of demographic data held by many thousands of institutions in easily searchable and correlatable forms has spawned a debate about privacy. The issue has heated up since Internet browsing became widespread and techniques were developed, through search engines or Internet portals, to track and to record the interests of a user. As people increase their use of the Internet, businesses and advertisers dream up new ways to get the right ad or product in front of the right demographic. The Federal Trade Commission (FTC) has begun to examine these advertising techniques more closely. In 2009 the FTC threatened to regulate the industry more tightly if the industry did not start regulating itself. The FTC's declaration led Jules Polonetsky, the cochairman and director of the Future of Privacy Forum, to develop the little "i" symbol as a way to inform consumers when demographic

and behavioral data has been used to select an ad that pops up on the Web page they are browsing. The little "i" consumer-awareness campaign began in early 2010. The simple fact is that privacy is attainable (if at all) only by opting out of any and all transactions that require electronic mechanisms or filling in forms. The real protection consumers have is that the exploitation of the data by marketer or others is costly and difficult. As anyone leafing through the day's mail can attest, despite a vast amount of information available, many people sending sales letters are aiming at an altogether wrong profile.

SMALL BUSINESS AND DEMOGRAPHICS

It is a truism that the business close to its clientele can do without sophisticated demographics to reach its market. Some small businesses, of course, are *in business* precisely to provide such data to their customers. They will, therefore, be very knowledgeable about demographics; they are still not likely to use such data to reach *their* markets. Other small businesses may be servicing a national market through a Web site, for instance, and, through that Web site, may have access to data on their customers that might be exploitable. For most small businesses thinking of turning demographic data to good use for expansion, through a direct mailing for instance, might explore the field by using the services of an advertising agency. The agency will have knowledge of and access to much of the tooling required, including existing and well-honed mailing lists.

DEPRECIATION

Depreciation is the reduced value of something; specifically of fixed or capital assets. In accounting terminology the word depreciation refers to an entry on the balance sheet which records the amount of money deducted from total assets because the assets have aged. All capital assets are subject to depreciation except land. The current year's depreciation of capital assets may be deducted from income for tax purposes.

The traditional treatment of capital assets their depreciation over a number of years is based on the simple fact that buildings, machinery, vehicles, roads, computers, and other similar assets have life spans of multiple years. In theory, they are paid for from savings accumulated over several years and are depreciated (written off) over their useful life span. Land is not considered to be a depreciable asset. Bookkeeping is aimed at accurately reflecting ongoing operations of assets each year. For this reason, capital inflows are not reflected in income, and depreciation is spread out over the life of the asset.

THE BALANCE SHEET PERSPECTIVE

Company balance sheets are divided into Assets and Liabilities. On the Asset side, the ledger shows current and fixed assets. *Fixed Assets* are subdivided into such categories as Vehicles, Furniture and Fixtures, Equipment, and Buildings. As fixed assets are acquired, the actual costs of their acquisition are entered under these categories. Each of these categories, however, is followed by a line that says: "Less: Accumulated Depreciation." Each year a portion of the asset is added to the depreciation line. The net of these two values (acquisition costs less accumulated depreciation) is what is counted as "fixed assets." The role of depreciation in the accounting sense, therefore, is to keep the value accurate and the books honest: only the actual *remaining* value of fixed assets is counted on the balance sheet.

Accountants calculate how much of each category of assets to depreciate every year by using Generally Accepted Accounting Principles (GAAP) established by Financial Accounting Standards Board. Within a single category,

such as buildings, for instance, the life of a structure may vary from 10 years for a toolshed to 80 years for fire-resistant bearing walls, beams, decks, and floors. The acquisition cost is divided by the appropriate number of years. *Residual/scrap value* is the monetary value an item holds after its life is over, so something rarely depreciates to zero. For example, cars have an inherent scrap value. Very complex schedules are used to determine "life."

THE TAX PERSPECTIVE

Depreciation is treated as a cost category in tax calculations. It is not a "cash cost" because no actual disbursement of cash takes place; depreciation is simply an entry in the books. The Modified Accelerated Cost Recovery System (MACRS) determines the value of business property after 1986. The MACRS uses the General Depreciation System (GDS) and the Alternative Depreciation System (ADS). For tax purposes, depreciation does have a "cash consequence": it reduces the actual tax liability of a company. From a tax perspective, therefore, any law that permits higher deductions of depreciation than accounting principles specify are favorable for the corporation: no cash payment is involved in so-called accelerated depreciation but real cash benefits result: lower taxes.

Letting companies speed up depreciation has, for this reason, become a popular technique for stimulating the economy. Regulating depreciation in the tax code is also a relatively precise instrument. Congress can aim its policy at certain categories of expenditures. It can, for instance, stimulate purchases of vehicles by letting businesses write them off more quickly; or it can favor a broad category such as computers. Congress has done both. It can also, at its discretion, stimulate industrial construction, for instance, by letting companies write off buildings or land improvements quickly.

The 2008 Economic Stimulus Act instilled a bonus depreciation which allowed an additional first-year depreciation of 50 percent of an asset's purchase price. The American Recovery and Reinvestment Act of 2009 extended the bonus depreciation another year. The latter Act also granted an extension on the $8,000 increase of first-year depreciation for luxury passenger vehicle purchases, granted the year before. For instance, consider the purchase of a a $36,000 van. Under the rules in force during the 2009 tax year, a small business could write off an extra $8,000 of that van in the year of acquisition. (The maximum depreciation allowed in 2009 was $11,060.)

CASH FLOW CALCULATION

Companies usually calculate the cash flow of their business in the context of justifying loans. Cash flow is simply the netting out, for a given period of time (a quarter, a year, multiple years), of all the cash coming in from sales and cash flowing out for purchases and payments on debt and interest. In this context, however, depreciation is often mentioned as part of the cash flow calculation: depreciation is said to be "added back." This phrasing often produces confusion. Cash flow calculations are often automated so that all current income and current costs are cumulated; costs are then deducted from net income to derive the cash flow. In this process, however, some costs are not cash costs. Depreciation is a cost that lowers net income but does not involve cash. Therefore, to get an accurate cash flow, depreciation must be added back in because it was not a cash cost in the first place.

ALTERNATIVE METHODS USED

Depreciation may be calculated in a variety of ways all of which are specified by law and elaborated in the Generally Accepted Accounting Principles. Major categories are: 1) the straight-line method; 2) units-of-production method; 3) declining-balance method; and 4) sum-of-the-years-digits method.

Straight-Line. The residual (scrap) value of the asset is first estimated. Thereafter, the asset, minus residual value, is divided by the useful life of the asset. The resulting value is deducted for each year of the asset's life.

Units-of-Production. This method is used when the usage of the asset varies from year to year, and its use can be determined by a specific measure such as miles driven, tonnage hauled, cuts made, and other factors. Again, salvage value is deducted. Next, the remaining value is divided by the total units the asset is estimated to be able to produce. Units produced are recorded for every year. Depreciation for each year is calculated based on the units. Thus, depreciation may be very high one year, low in another year until the total count of units has been used up.

Declining-Balance. This method, also known as double-declining-balance, is an accelerated method of depreciation because depreciation is highest in the first year and then declines with each year. The formula requires dividing 2 by the years of life to get a percentage and then applying that percentage to the balance of the asset. Assuming a 3-year life for a $5,000 asset, the first year of depreciation will be $5{,}000 \times (2/3) = \$3{,}333$. The asset is then reduced by that amount and becomes $1,667. The second year, the depreciation is $1{,}667 \times (2/3)$ or $.66667 = \$1{,}111$. Again, the asset is reduced by that amount, leaving $556. The procedure is repeated again. Under this method, however, the asset may not be depreciated below its salvage value; for this reason, the third year operation may not be possible.

Sum-of-the-Years-Digits. Suppose that the life of an asset is 5 years. In that case the sum of the year's digits will be

1+2+3+4+5 = 15. The asset value less its salvage value is calculated. Let us assume that the result is $8,750. In the first year the net asset value will be multiplied by the fraction 5/15 (0.333), in the second by 4/15 (0.2667), in the third by 3/15 (0.2), and so on, yielding depreciations streams of $2,914, $2,333, $1,750, and so on. After 5 years, the total depreciation streams will sum to $8,750.

It is worthwhile to know about such fascinating things as sum-of-the-years-digits, but most small-business owners do not have the time to become experts in depreciation. Those with substantial fixed assets typically seek the advise of certified public accountants (CPAs) and profit by their professional experience. During the middle of the first decade of the twenty-first century, with the administrations of President George W. Bush pursuing a policy of tax cuts, the economic environment was favorable to small business, seen as a generator of new jobs substantial tax savings and incentives to invest were available in an ever-changing tax code to which the CPA became an invaluable guide.

DESKTOP PUBLISHING

Desktop publishing, sometimes abbreviated as DTP, is a technique for preparation of professional-quality visual products. Small businesses use them for items such as flyers, newsletters, postcards, business cards, posters, and PDF files using computers, software, and printers, when necessary. Whenever text is laid out with pictures or graphics, some form of DTP is used. Given the rise of more affordable computer software, e-books, and digital readers, it is not always the case that the finished product actually gets printed.

Unless the product is something very simple, DTP does require training and experience. Small-business owners who have limited time or little experience using software such as InDesign, Adobe, or PageMaker often hire graphic designers or desktop publishers to do the work for them. Desktop publishing represents the latest level of automation in an industry that, with the invention of typesetting, marked the dawn of modernity.

MODERN DTP

Centuries after Johannes Gutenberg invented the printing press, DTP has reached a certain maturity. Many different software packages for home or office use are on the market: QuarkXpress, Dreamweaver, and Adobe's InDesign, to name a few. A competitive see-saw in the software market has been the rule. David Blatner, a leading expert on both QuarkXpress and InDesign believes, according to a 2003 article in *eWeek*, that InDesign has the competitive edge, although he does acknowledge that QuarkXpress works well for certain projects. Such judgments, of course, are always merely snapshots at a given point in time. For example, in 2009, an article in the*IT Enquirer* compared the flash capabilities of the QuarkXpress 8 and InDesign CS4 and found the InDesign software lacking.

INTERNAL SKILL SETS

Practiced at the professional level, DTP requires substantial skills acquired over a long period of time. Skill sets rapidly age unless the art is continuously practiced. A business that only rarely uses DTP faces relearning cycles each time for a loss of efficiency. Sending the job out may be more cost-effective.

Professional-level DTP requires the same know-how that traditional typesetters and page-designers also possess. The difference is that operations that once required cutting, measuring, and pasting are done today by computer. The software packages dutifully import traditional measurement systems and terminology which must be learned. The great complexity involved in handling a document that may be on several overlaid "layers" (for colors, for pictures, for text of various kinds) requires mastery of sometimes baffling, uninformative, and unintuitive menu systems. Their meanings have to be worked out gradually by trial and error. Manuals provided by the software producer rarely cover matters well, are rarely up-to-date, and may not be available in printed form. Operators are often required to buy and to use simultaneously several third-party references to solve a single problem.

These cautionary points should not be taken to imply that DTP does not have superb value for the enterprise that makes an effort to master and use it. DTP is truly excellent tooling especially for those who come to DTP already skilled in the underlying arts of photocomposition, layout, and typesetting. In fact, there were 26,400 desktop publishing jobs in the United States in 2008. Most worked for newspapers, periodicals, and book publishers.

Desktop publishing can impose training burdens on the small business that lacks expertise in this area. Therefore, a commitment to this type of production must be a deliberate and commercial decision reached, ideally, after thoughtful testing of alternatives. If DTP is needed for specific projects, experienced freelance employees are a cost-effective option.

DIFFICULT CUSTOMERS

Successful small-business owners recognize that customer satisfaction is one of the essential elements of organizational prosperity. After all, providing quality service that clients appreciate not only ensures repeat business but also encourages future word-of-mouth sales. But virtually every small business will, sooner or later, encounter customers who prove troublesome. Customer service experts counsel small-business owners who encounter such customers to: 1) determine whether the difficult customer has a legitimate complaint; 2) determine whether the business can take steps to mollify the client's concerns (regardless of their legitimacy) and improve the relationship; and 3) in cases where the customer is being unreasonable, decide whether the customer's value is sufficient to warrant continuance of service.

In most industry sectors, the vast majority of customers are fairly easy to satisfy. They understand the basic rules of commerce, in which they pay a business an agreed-upon amount to render a service or provide a product to them under certain terms that are also mutually agreed upon. But a minority of customers experts place the number at anywhere from 5 to 10 percent qualify as difficult. Sometimes these customers seem more prevalent, however, simply because they can take up so much of a business's time and energy.

Nonetheless, small businesses need to learn to differentiate between truly difficult customers who are ultimately of questionable value to their operations and those who may be annoying for one reason or another but who are ultimately solid, valuable clients worth keeping. Often, the difficult customer is someone who has simply taken an annoying habit to an extreme. For example, Richard F. Gerson, author of *Great Customer Service for Your Small Business,* listed ten types of customer behaviors, only one of which the perfect customer was wholly desirable to the small-business owner. Customers who are "know-it-alls," unduly dependent, argumentative, indecisive, chronic complainers, or monopolizers of time present a challenge to any business. Many of these may be individuals the establishment depends on for long-term success, and as long as their quirks do not become formidable obstacles to business transactions, a business should continue to do its best to satisfy them. It is when these and other characteristics become excessive that the small-business owner needs to intercede and decide how his or her business will interact with that customer if at all in the future.

DETERMINING IF THE DIFFICULT CUSTOMER HAS A LEGITIMATE GRIPE

Customer service experts contend that many difficult customers behave belligerently because they have a legitimate gripe with the product or service they have received. Indeed, the chances are very good that a poorly run business operation is apt to encounter a far greater number of "difficult" customers than will an establishment that is efficient, competent, and dedicated to the ideals of customer service. "Many 'bad' customers are the result of a bad situation," stated Jenny McCune in *Nation's Business.* "A salesclerk is surly; your company doesn't respond quickly enough to a request; a product defect ruins the customer's

day; or an order promised for Wednesday doesn't arrive until Friday."

Small-business owners and managers, then, need to determine whether the customer has a legitimate complaint before taking any other action. Customers often feel ignored by business owners. A 2009 survey in *Forbes* revealed that 47 percent of customers believed executives did not understand their experiences. While small-business owners might feel that the survey does not apply to them, since they are not executives, it is a warning, however, not to ignore customer feedback. Many customers who made their complaints known (41%, according to the survey) felt their feedback was disregarded.

The client is obviously the individual who is best equipped to explain the reasons for his or her dissatisfaction, so he or she should be given a full opportunity to express the grievance. From there provided that it is determined that the customer was poorly served in one respect or another the small-business manager should gather all the pertinent facts from his or her staff to determine where the error occurred and to figure out how best to mollify the client and prevent the problem from occurring again. If the customer who, after all, may have provided a service to the company by alerting it to an operational weakness or personnel problem is convinced that the business operator is genuinely sorry for the slip-up and genuinely interested in solving the problem, preservation of the business relationship is usually possible.

In addition to making apologies and moving to address problems in performance, small-business owners can take several other steps to improve their relationships with difficult customers. Many customers do not formally complain, but they remain dissatisfied. These customers are not only likely to take their business elsewhere; nine out of ten will also spread negative word-of-mouth experiences. Proactively communicating with customers will enhance relationships and prevent future problems. For example, firms that take preventive measures such as regular inquiries into customer satisfaction are often able to address minor grievances before they erupt into major spots of contention. Instituting such proactive arrangements gives businesses the opportunity to prevent attitudes that eventually grow into problem attitudes from ever taking root.

LETTING DIFFICULT CUSTOMERS GO

There are occasions, however, when even a company's best efforts to address or anticipate customer complaints are fruitless. In other words, a small but significant percentage of customers that a business deals with may prove to be consistently unpleasant, no matter what measures are taken to satisfy them. Few businesses are exempt from this reality. After all, the convenience store owner confronted with a disruptive customer is essentially grappling with the same problem as the owner of a small manufacturing company who is treated shabbily by a corporate buyer. In both cases, the business owner is dealing with a customer or client who makes conducting business a distinctly unpleasant experience.

When confronted with difficult customers who appear unlikely to change their stripes, then, small-business owners have to decide whether their business is worth the aggravation. Several factors should be considered:

Impact on Business. This is generally the single most important consideration when considering whether to continue doing business with a difficult customer. Is the customer a major client? How difficult would it likely be to replace the revenue from that customer? Is the client a possible conduit to other potentially valuable customers? Is the client a major opinion-shaper in the community or industry? What is the nature of the difficulty? This latter consideration is an important one, say customer service experts. For example, a customer that is an indecisive or impossible-to-please sort, and whose demands result in extensive drains on a business's resources, may be far more problematic than a client who is difficult simply because he is woefully lacking in interpersonal skills. If a business can handle the loss, it is perfectly acceptable to sever ties with a difficult customer. But small-business owners should do their best to end the relationship decisively and as civilly as possible. "It is impossible to please unreasonable or marginal customers on all occasions, and it's best to consider leaving them to other vendors," summarized Jack Falvey in *Sales and Marketing Management.* "It's far better to expend your efforts in further satisfying already satisfied accounts. The return on investment is almost always far greater."

Impact on Staff. This consideration is sometimes overlooked by small-business owners, to their detriment. Unhappy employees are far more likely to secure employment elsewhere than those who are content, and few things can make an employee unhappy faster than the specter of regularly dealing with unpleasant customers. Abusive treatment of staff at the hands of clients must be dealt with firmly and speedily. Otherwise, internal morale and performance can deteriorate quickly and dramatically.

Impact on Business Owner. Small-business owners are more likely to be personally affected by difficult customers than are corporate executives, who may be insulated from such unpleasantness. And since small businesses tend to rely on their founders for a sizable share of their direction and management, the feelings of those founders need to be considered. A small-business owner who approaches encounters with a given customer with dread needs to consider carefully whether such meetings are having an adverse impact on his or her ability to attend to other needs of the business without feeling stressed or distracted.

Mitigating Circumstances. Finally, in some instances there may be reasons for difficult behavior that are not

immediately apparent. "Most difficult customer situations are complicated by all kinds of subjective judgments and seemingly mitigating circumstances," wrote Falvey. For example, changes in personnel at a client company can have a dramatic impact on intercompany relations. If the new representative is insecure about his or her capabilities and knowledge, that may manifest itself in a variety of undesirable ways. If the small-business owner takes the time to figure out why the customer has suddenly become a problematic one, he or she may be able to devise a strategy to repair the relationship rather than end it.

DIFFICULT EMPLOYEES

The term "difficult employee" is typically used to refer to a worker who fails to conduct him- or herself in a responsible and professional manner in the workplace. Effectively dealing with such employees is one of the greatest challenges that small-business owners and managers face. Few relish the prospect of disciplining or criticizing others in or outside the work environment. When difficult employees become an issue, however, their failings must be addressed quickly and decisively lest they erode morale and efficiency. Managers may be tempted to delay action, indulge problematic employees, and hope the behavior will change. Unfortunately, when unacceptable traits are indulged, they just make things worse.

THE WELL BEHAVING WORKPLACE

Problematic employee behavior is particularly difficult because it may have several causes that are difficult to discern. The causes may be related to work, home, behavior, or health. Changes may be triggered by other employees or outsiders, by changes of work, others' promotions, rising stress levels, and other factors. The small-business owner or leading manager will try to ensure that internal causes are minimized. There are fewer difficult employees in well-run work environments than otherwise. Companies with high ethics experience much less unethical behavior. In well-run operations, broad policy and structural approaches serve as preventive measures; careful and, above all, attentive management practices serve diagnostic purposes; and a clear, sequenced, escalating, well-documented "coping" process can rapidly bring closure.

Policy and Work Environment. A reasonably formal, orderly, well-organized, straightforward, business-like but friendly work environment helps instill the correct expectation in the workforce. Such an environment is almost always deliberately created and maintained by management by such means as setting working hours, initiating employees by having them read and sign brief but complete employment policies, and passing on the general "rules of the road." The more explicit, clear, and rational these policies are and the more they are observed to be enforced the more they contribute to a functional work ambiance.

Maintaining an efficient and ordered work environment is only indirectly related to handling difficult employees, but once problems appear, this background is vital to the resolution of the problem. It is essential that the workplace *have* rules, that these be *public*, *uniformly enforced*, and equally applicable to all ranks. A chaotic workplace has poorly established routines, tolerates temperamental bosses, overlooks inappropriate behavior, and loosely schedules events.

Management Style. Assuming that the policies are appropriate and the work environment is reasonably disciplined, managers should be consistent but also flexible and sensitive. In effect, this means that managers in charge of individuals will pay attention to those they supervise, maintain a proper but not a frosty distance, apply company policies rather than personal whims, constantly avoid inappropriate relations (like flirtations or special friendships), and promptly and willingly provide both positive and negative feedback in an objective manner. Effective management style will always involve clear and prompt communication when changes threaten to disrupt business-as-usual even when the

changes are positive. Good managers will represent the company and their superiors in a straightforward way, neither deifying nor disparaging those they represent. Such managers will be loyal to their employees and promptly go to bat for them. They will avoid turf-oriented behavior and support collective goals and will promote such attitudes in word and deed.

Methods of Discipline. The first signs of a difficult employee will usually appear quite early in a well-management operation. However, most of the time the full-fledged "difficulty" will not surface because it will have been dealt with effectively in its nascent stages. If problems persist, the company will have in place a well-planned process of dealing with them. The process will be orderly but escalating, beginning with information exchange and goal setting, followed by reviews; this will escalate to increasing sanctions such as warnings, opportunities for appeal, notices, and finally discharge. In this entire process, management will behave rationally rather than emotionally. It will briefly but fully document the facts in writing because, in today's environment, that is the wisest policy. Such methods should be followed even in operations that have at-will hiring policies because the difficult employee may sue anyway. Small-business owners should take an appropriate role in supervising such processes to ensure that policies are followed. A problem employee, managed in a rational, methodical, and orderly manner, will rarely succeed in prevailing against the employer.

Generally, the pain of facing up to problems early is almost always negligible compared to the distress and disruption that may result from neglect and avoidance. Here the famous "Pay me now or pay me later" warning applies in full. The general rule assuming, again, that good policies are in place and properly implemented is to insist on rational and sensible behavior, full disclosure of problems on both sides, and clearly spelled out consequences that are actually applied.

SPECIFIC METHODS

Management experts cite several steps that entrepreneurs and managers should take when dealing with a difficult employee.

- *Importance of the Written Word.* Companies should prepare and maitain written policies and guidelines. These should include definitions of poor performance and gross misconduct and describe performance and termination review procedures. They should also include the latest information from the U.S. Department of Labor and the Equal Employment Opportunity Commission.
- *Taking Stock and Cutting Slack.* In most business settings, workers spend long hours in close proximity. Inevitably, each employee will exhibit personality traits, some of which may annoy co-workers, managers, or the owner of the business. But a mildly overbearing, cocky, or whiny demeanor on the part of an employee is not in itself cause for intervention. An owner who attempts to stamp out every personality manifestation that he or she finds mildly unpleasant will quickly alienate the workforce and hamper the company's ability to focus its energy on business issues. But when employee behavior begins to have a negative impact on co-workers or the health of the business itself, the business owner must intercede quickly. Morale will decrease and turnover will increase if high-performing employees have to take on extra work from low performers. The expense of high turnover is always costly.
- *Taking Control.* If a problem employee emerges, the business owner or supervisor should schedule a meeting to discuss the person' behavior. This meeting time should be scheduled so that both the supervisor and the employee can focus on the issues at hand and speak without being disturbed. It is unwise to hold such a meeting when emotions are running high; but issues must be addressed in a timely manner. Performance problems, whether they take the form of insubordination, tardiness, poor work performance, or problematic behavior with other employees, will intensify or multiply if not addressed. Employees who do not meet standards whether knowingly or unknowingly will continue to do so if their unacceptable behavior is not challenged.
- *Hearing the Other Side.* Small-business owners often assume that workers possess the same skills and knowledge that they do. But some meetings with "difficult" employees reveal that their inadequate work performance is rooted in a lack of skills. In such cases, instruction and education, rather than disciplinary measures, are the keys to making the employee a valuable part of the workforce. In other instances, the employee may be grappling with personal issues that have had a deleterious impact on his or her performance. Owners can, at their discretion, implement measures that may enable to the employee to weather his or her difficulties and became a valuable member of the workforce. For example, it may be necessary to adjust a schedule for an employee with medical problems.
- *Uniform Rules.* Business owners should use the same criteria of performance and behavior evaluation with all employees.
- *The Facts.* When confronting a difficult employee, business owners and supervisors are encouraged to

focus on two or three specific instances when the worker exhibited problematic behavior. Whenever possible, measurable and observable facts should be used to explain the problem from management's perspective. The link between the employee's unacceptable behavior and performance, and the overall health and direction of the company, must be established.

- *Avoiding Adversarial Confrontations.* Because of his or her own position, the owner is the employee's ally and should try to convince the employee that the meeting is, in essence, an effort to solve a problem both parties share. Any ill will involved can be dealt with later.
- *Consequences and Review.* Small-business owners and managers need to make it clear to problem employees that continued inappropriate or substandard behavior will have consequences. These consequences should be chosen with care, however. "Tell an employee who doesn't give a hoot about climbing the corporate ladder that he or she may lose out on a possible promotion, and you'll get no results," noted *Entrepreneur*'s Robert McGarvey. "For a consequence to matter and actually make a difference, it needs to matter to that employee." One way owners and supervisors can serve notice to a difficult employee that they are serious about imposing discipline and correcting behavior is to schedule a follow-up meeting *during* the initial meeting. Scheduling a second meeting puts the employee on notice that behavior and performance is regarded as a serious matter that will be monitored on a regular basis.
- *Acknowledging Improvements.* Finally, business owners and managers need to recognize instances in which a problem employee makes a genuine effort to correct his or her workplace shortcomings. A little praise and positive reinforcement can go a long way. Without such acknowledgements, an employee is more likely to slide back into negative patterns of performance or interaction with co-workers.
- *Terminating Problem Employees.* Some difficult employees will resist all management efforts to convince them to change their behavior or attitudes. In these cases, termination of employment may be necessary. This is not a step to be taken lightly, especially if the problem employee provides important services to the company (as in the case of the verbally abusive employee who nonetheless is a good computer programmer). But in some cases, it is necessary in order to maintain or restore company morale and efficiency in other areas. If behavior-related termination is warranted, small businesses should make sure that they document the employee's shortcomings in specific, quantifiable terms. Personnel files should include accounts of specific incidents of poor performance; summaries of meetings held with the employee and other company-initiated efforts to correct behavior; and any formal warnings of probation or dismissal.

DIRECT MARKETING

Direct marketing evolved as a technique to directly reach prequalified customers at a reasonable cost as opposed to mass marketing in which, for every eligible customer, several hundred totally uninterested people are contacted. Direct marketing grew out of using qualified mailing lists to reach customers. The interactions, therefore, were typically a customer receiving a letter or e-mail, and the sender receiving a

phone call. Companies dealing with the same customers on a narrow subject, like bicycles, soon learned that they could earn extra money by selling their mailing lists to others. The next phase in direct marketing was capturing such lists in computer databases and adding more information about the customer. This was then hyped as "database marketing." Direct marketing has since added a proactive function of *building* mailing lists and databases using federal statistical sources, surveys, and telephone queries.

DIRECT MARKETING MEDIA

While many people associate direct marketing with direct mail, direct mail is only one of several advertising media utilized by direct marketers. Other major direct marketing media include e-mail, magazines, newspapers, television, and radio. Alternative media include card decks, package and bill inserts, and matchbooks. Within the major media, new technological developments are giving direct marketers an expanded range of choices from DVDs (possibly advertised on television, requested by telephone or the Internet, and delivered via mail or alternate delivery services) to home-shopping networks, interactive television, and the Internet. The use and effectiveness of digital media is expanding. According to the Direct Marketing Association (DMA), 79.1 percent of marketers used e-mail in 2008 while 75.4 percent used direct mail.

Direct Mail. Direct mail is the most heavily used direct marketing medium and the one most direct marketers learn first. Direct mail has been used to sell a wide variety of goods and services to consumers as well as businesses. Direct mail offers several advantages over other media, including selectivity, personalization, flexibility, and testability. It allows businesses to target individuals with known purchase histories or particular psychographic or demographic characteristics that match the marketer's customer profile. Direct mail can be targeted to a specific geographic area based on zip codes or other geographic factors. Personalization in direct mail means not only addressing the envelope to a person or family by name, but also perhaps including the recipient's name on the letter itself.

Direct mail packages come in all shapes and sizes, from postcards to brochures, making it one of the most flexible of the direct marketing media. A standard direct mail package includes an envelope, a letter, a brochure, and a response device. The envelope's job is to motivate the recipient to open the package. Regardless of the volume of mail a person receives, the envelope must distinguish itself from other mail by its size, appearance, and any copy that might be written on it. Experts advise using color, graphics, and persuasive text to accomplish this. The letter is a sales letter and provides the opportunity directly to address the interests and concerns of the recipient. The letter typically spells out the benefits of the offer in detail. These letters represent the company ; typically, the offers are for free services, gifts, or promotions. While the letters tell the recipients about the benefits of the offer, the brochure illustrates them. Illustrated brochures are used to sell services as well as products and may require the services of a graphic designer. Finally, the package must include a response device, such as a business reply card that the recipient can send back, a phone number to call, or a Web site to view. Response rates are generally higher when the response device is separate from, rather than part of, the brochure or letter. Toll-free numbers are often prominently displayed to allow the recipient to respond via telephone.

Direct mail is the most easily tested advertising medium. Every factor in successful direct marketing the right offer, the right person, the right format, and the right timing can be tested in direct mail. Computer technologies have made it easier to select a randomized name sample from any list, so that mailers can run a test mailing to determine the response from a list before "rolling out," or mailing, the entire list.

Digital Media Direct Marketing. Digital media-based marketing is growing. The time consumers spend online makes digital media a natural marketing tool. E-mail is one method of digital marketing; similarly to direct mail marketing, clients can opt to provide their e-mail addresses or their addresses can be found on databases. E-mails do not require postage, which is one advantage, but not every e-mail will make it past the junk mail filter, even if the addresses are provided.

Magazines. Direct response print ads in magazines must make a definite offer or request that asks the reader to do something. Typically, such ads require a reader to send in a coupon or reply card, call a toll-free number, or visit a particular Web site. With consumer magazines being published on a variety of topics, magazine ads allow direct marketers to reach audiences with identifiable interests. In addition to advertising heavily in special interest magazines, direct marketers utilize mass consumer magazines and take advantage of regional advertising space to target specific audiences.

Unlike general advertisers, who measure the effectiveness of their print ads in terms of reach and frequency, direct marketers measure the effectiveness of their print ads in terms of cost effectiveness either cost-per-inquiry or cost-per-order. Magazine ads offer the advantages of good color reproduction, a relatively long ad life (especially compared to daily newspapers), and a lower cost. Creative costs for magazine ads are also usually lower than for direct mail. But direct marketers find magazines' long lead times, slower responses, and scarcer space than direct mail to be disadvantages.

Newspapers. While direct marketers advertise in magazines more than newspapers, newspapers have some distinct advantages. These include the variety of sections offered within a newspaper, shorter closing dates, an immediate response, and broad coverage of a large and diverse audience. Disadvantages include poor ad reproduction and the limited availability of color. Editorial content can also have more of an adverse effect on ad response than in magazines. In addition to advertising in the regular pages of a newspaper, direct marketers also advertise in free-standing inserts (FSIs) that are usually distributed with the Sunday editions of newspapers.

Television. Direct marketing on television is increasing. Early examples of direct response advertisements on television include those for knives, garden tools, exercise equipment, records, and books, which ask viewers to call in and order a specific product. Another development in direct response television advertising is a lengthier format, commonly known as the infomercial, where a product or other offer is explained in some detail over a time period extending to 30 minutes or more. Advocates of this format point out that the greater length gives the advertiser the opportunity to build a relationship with the viewer and overcome initial viewer skepticism, and at the same time present a convincing story spelling out product features and benefits in detail.

Not all direct response television involves asking for an order. Many advertisers have included toll-free, 800 telephone numbers and Web addresses with their television ads to get viewers to request more information about their product or service.

DIRECT MARKETING LISTS AND DATABASES

Lists are commonly used in direct mail and telemarketing. The two basic types of lists are response lists and compiled lists. Response lists contain the names of all the prospects who have responded to the same offer. These individuals typically share a common interest. Names on a response list may include buyers, inquirers, subscribers, continuity club members, or sweepstakes entrants. They may have responded to an offer from one of several media, including direct mail, television, or a print ad. Response lists are not usually rented; rather, they are an in-house list compiled by a particular business. Compiled lists are often rented by direct marketers. Compiled mass consumer, specialized consumer, and business lists are available for a wide range of interests.

Direct marketing databases are similar to mailing lists in that they contain names and addresses, but they go much further. They are the repository of a wide range of customer information and may also contain psychographic, demographic, and census data compiled from external sources. They form the basis of direct marketing programs whereby companies establish closer ties with their customers.

Database marketing became one of the buzzwords of the direct marketing industry in the 1980s, and it has continued to evolve in the twenty-first century. Whether it is called relationship marketing, relevance marketing, or bonding, the common theme of database marketing is strengthening relationships with existing customers and building relationships with new ones. Databases allow direct marketers to uncover a wealth of relevant information about individual consumers and apply that knowledge to increase the probability of a desired response or purchase.

As with mailing lists, there are two basic types of marketing databases, customer databases and external databases. Customer databases are compiled internally and contain information about a company's customers taken from the relationship-building process. External databases are collections of specific individuals and their characteristics. These external databases may be mass-compiled from public data sources; they may contain financial data based on confidential credit files; they may be compiled from questionnaires; or they may be a combination of all three sources.

Database marketing, and especially the prospect of using confidential information for marketing purposes, has made privacy an important issue in the direct marketing industry. Some states have passed legislation limiting access to previously public data or limiting the use of such data as automobile registrations, credit histories, and medical information. In order to avoid excessive government regulation, the direct marketing industry has attempted to be self-policing with regard to the use of sensitive data. However, the struggle between industry self-regulation and government regulation will probably continue for some time.

SUCCESSFUL DIRECT MARKETING FOR SMALL BUSINESSES

Thanks to its relatively low cost, its ability to reach specialized target markets, and its ability to provide immediate and measurable results, direct marketing can be an important tool for start-up businesses. It can also be used effectively as a supplement to a small business's traditional sales efforts. Entrepreneurs interested in starting a direct marketing program can consult with advertising and direct marketing agencies for help in evaluating their sales potential and preparing materials for a campaign. They can also benefit from the networking with other small-business owners and learn from their techniques.

In the *Macmillan Small Business Handbook*, Mark Stevens identified three steps for a small-business owner to take in initiating a direct marketing effort: 1) create promotional tools (such as catalogs, advertisements, or direct mail pieces)

that emphasize the benefits of the product or service; 2) identify the target market and select mailing lists and advertising media to reach it; and 3) monitor the results of each campaign and revise the tactics as needed to find the optimum mix of price, copy, and audience. Stevens noted that entrepreneurs might also find it helpful to give consumers an incentive to act, such as a free gift or special price; promote to existing customers who usually provide the highest response rate as well as new prospects; and build on successful promotions by broadening the product line.

There are certain situations where direct marketing is more likely to work than others. First, the direct marketer must be able to identify the target audience in terms of shared characteristics. Are they likely to read a particular magazine? Live in a certain geographic area? Have a certain minimum income? Be a certain age or gender? The more characteristics of the target audience that can be identified, the more likely it is that a direct marketing campaign targeted to those individuals will work.

Since direct marketing relies on one-to-one communications and motivating the recipient to act, it is essential to be able to reach the target audience. It is no use identifying a target market if there is no mailing list or print or broadcast medium available to reach them. Some other situations in which direct marketing works well are when there is great feedback concerning a product or service; when the product or service has the potential for repeat sales; and when there is a need to have greater control over the sales message.

The success of a direct marketing program depends on delivering the right offer at the right time to the right person in the right way. Direct marketing is a complex discipline that requires expertise in several areas to achieve success. It involves identifying the target market correctly and selecting the appropriate media and lists to reach it. The offer must be presented in the most effective way, and direct marketers must use creative execution to successfully motivate customers and prospects. At its most successful, direct marketing is an ongoing process of communication to maintain relationships with existing customers and build relationships with new ones.

DIRECT PUBLIC OFFERINGS

A direct public offering (DPO) is a financial tool that enables a company to sell stock directly to investors without using an underwriter as an intermediary. The company can thus avoid many of the costs associated with "going public" through an initial public offering or IPO. DPOs are sort of an IPO "lite." The business choosing this route is exempted from many of the registration and reporting requirements of the Securities and Exchange Commission (SEC).

DPOs first became available to small businesses in 1976 but only gained some popularity in 1989 when the rules were further simplified. In 1992 SEC established its Small Business Initiatives program; the program eliminated even more of the barriers that had limited the ability of small companies to raise capital by selling stock. The development of the Internet stimulated this route because it promised the possibility that companies could sell their stocks more directly to investors. While the demanding structure and the reporting requirements of IPOs arose in an environment of reform and discipline in the wake of the Great Depression, DPOs developed during a period of exuberant market expansion.

The principal differences between a full-fledged IPO and a DPO is that: 1) DPO stock is not registered and trading in such stock is difficult; 2) the amounts of capital

that may be raised are delimited in various ways; 3) the costs of a DPO are lower; and 4) the very strict adherence to the requirements of SEC-imposed disclosures, accounting methods, and conformity to requirements of the Sarbanes-Oxley Act of 2002 (a consequence of the Enron scandal in 2001) do not apply.

The principal similarity is that in both cases stock is sold to the general public; the business, therefore, is able to reach beyond its intimate circle of friends to raise capital.

Although many small businesses need the capital that an IPO can provide, they often lack the financial strength and reputation to appeal to a broad range of investors necessary ingredients for a successful IPO. For other small businesses, the loss of control, the strict reporting requirements, or the expense of staging an IPO are prohibitive factors.

ADVANTAGES AND DISADVANTAGES

The primary advantage of DPOs over IPOs is a dramatic reduction in cost. IPO underwriters typically charge a commission of 13 percent of the proceeds of the sale of securities, whereas the costs associated with a DPO are closer to 3 percent. DPOs also can be completed within a shorter time and without extensive disclosure of confidential information. Finally, since the stock sold through a DPO goes to a limited number of investors who tend to have a long-term orientation, there is often less pressure on the company's management to deliver short-term results.

However, DPOs' are limited by the amount that a company can raise within any 12-month period. The stock is usually sold at a lower price than it might command through an IPO. Stock sold through exempt offerings is not usually freely traded: no market price is established for the shares or for the overall company. This lack of a market price may make it difficult for the company to use equity as loan collateral. Finally, DPO investors are likely to demand a larger share of ownership in the company to offset the lack of liquidity in their position. Investors eventually may pressure the company to go public through an IPO so that they can realize their profits.

TYPES OF DPOS

The most common DPO is known as a Small Corporate Offering Registration, or SCOR. The SEC provided this option to small businesses in 1982 through an amendment to federal securities law known as Regulation D, Rule 504. SCOR gives an exemption to private companies that raise no more than $1 million in any 12-month period through the sale of stock. There are no restrictions on the number or types of investors; the securities can be freely traded. The SCOR process is easy enough for a small-business owner to complete with the assistance of a knowledgeable accountant and attorney. It is available in most states.

A related type of DPO is outlined in SEC Regulation D, Rule 505. This option enables a small business to sell up to $5 million in stock during a 12-month period to an unlimited number of *accredited investors*. Accredited investors must be people or institutions of substantial means ($1 million in assets for individuals, $5 million for institutions). The business may sell stock to no more than thirty-five people or institutions who do not meet this test. The SEC's purpose in requiring such qualifications arises from the fact that "accredited" investors are presumed to be knowledgeable and sophisticated enough not to be taken in by a scam.

Another type of DPO is outlined in SEC Regulation A. This option is frequently referred to as a "mini public offering": it follows many of the same procedures as an IPO; the securities may also be freely traded. However, companies choosing this option may only offer up to $5 million in securities in any 12-month period. Regulation A offerings are allowed to bypass federal SEC registration and instead are filed with the Small Business Office of the SEC.

Two further types of DPOs are available to businesses with less than $25 million in annual revenues. A Small Business Type 1 (SB-1) offering enables a company to sell up to $10 million in securities in a 12-month period and has simpler paperwork. A Small Business Type 2 (SB-2) filing enables a company to sell an unlimited amount of securities and has more difficult paperwork.

A final type of DPO is available through the SEC's intrastate filing exemption, Rule 147. This option allows companies to raise unlimited funds through the sale of securities as long as the stock is sold only in the primary state in which they do business. Both the company and all the investors must be residents of the same state. This exemption is intended to provide local businesses with a means of raising capital within their locale.

ONLINE DPOS

In the late 1990s, the Internet was touted as a way taking dot-coms public and selling their DPO stock on the Web. According to Jack A. Rosenbloom, writing in *Journal of Internet Law*, "During the boom, funding from venture capital was occurring at an astonishing rate, peaking at almost $100 billion in 2000.... Businesses with nothing more than an idea and a half finished business plan were going public at astonishing rates, peaking at 1,017 IPOs filed in 2000.... Businesses simply did not see the need to conduct their own Internet DPOs when more established alternatives were so readily available." By 2003 the venture capital had dried up. In that year only 118 IPOs were filed. When IPOs are hard to get, so are DPOs.

In any case, the hangover after the dot-com collapse shows that the Internet is not an amplifier of information but rather a multiplier of it. To make a DPO stock

offering visible on the Internet, the seller of stock must be assured of a high rate of traffic. If such traffic does not exist, the stock will still have low visibility.

BASIC OFFERING METHODS

When a small business is ready to consider a DPO and has enough time to devote to the process, it should begin by tallying the securities it can offer (investors may be interested in places at the board or other benefits to sweeten the deal) and preparing all financial statements for examination. A business beginning a DPO can expect to be audited, which means the books need to be extremely accurate and give a positive view of the company. The business's estimated dollar value should also be known, since this will determine the total number and price of the shares that will be offered. This and related information can be summarized in the private placement memorandum.

A private placement memorandum (PPM), also known as an offering memorandum and a private offering memorandum, is a document used when a company is trying to attract investors to a DPO. There are varying types of private placement memorandums depending on the type of DPO and the requirements for revealing financial aspects of the business. Basically, a PPM shows investors what they stand to gain or lose from investing in the business, and usually includes sections on risk factors, the use of the received funds, biographies of all the management, and the overall capitalization plan.

Small businesses interested in starting a DPO should also carefully inspect state laws for the states in which they intend to make the DPO available. For instance, Massachusetts has what is known as a "test the waters" exemption that allows a business first to solicit investors for indications of interest to see if going through the entire DPO process will be worthwhile. California and Texas also have certain exemptions for small businesses trying to raise a limited amount of capital, usually around $1 million. There are also statewide "blue sky" laws that govern the process a business must legally go through in order to create DPOs. These laws differ from state to state, but can involve releasing certain financial records or inspections designed to find the merit in the business's offering (to avoid fraud). Blue sky laws may be repealed for certain small businesses by other federal laws, so carefully examining both state laws and exemptions is worthwhile.

CAUTIONS

Although DPOs can simplify the process of raising capital, there is no guarantee that an offering will be successful. Robert Lowes noted, writing in *Medical Electronics*, "In all types of DPOs, the companies usually declare a minimum amount needed to carry out the business plan. Seven of every ten SCORs fail to reach that target to 'break escrow,' in the parlance." Small-business owners considering a DPO need to realize that there is hard work involved. In fact, the business may suffer during the offering period: management often lacks time both to promote the offering and run the company. For this reason, DPOs are most likely to be successful in companies that are not overly dependent on their top management and that have a sound business plan in place.

DPOs are also more likely to be successful for companies that have an established and loyal customer base. Customers are often the best potential investors. Companies initiating DPOs can advertise their stock to customers on product packaging, through mailing lists, with posted messages in offices or other facilities, or by making the prospectus available on an Internet site. "Experts suggest that any company gauge investor enthusiasm before launching a DPO because costs for attorneys, accountants, and marketing materials can add up," warned Carol Steinberg in *Success*.

Finally, companies can improve their chances for a successful DPO by availing themselves of expert securities advice. "Whether an offering is properly exempt from registration with the SEC is a matter for competent legal counsel and careful structuring of the offering," according to Gary D. Zeune and Timothy R. Baer. The fact that a DPO does not have to be registered with the SEC does not release a company from compliance with the antifraud provisions of U.S. securities laws. Potential investors must have ample, accurate information to make an informed decision about whether or not to buy stock in the company. Finally, securities laws vary by state, so it is important that small-business owners interested in pursuing a DPO consider the laws applicable to their companies.

DISABILITY INSURANCE

Disability insurance or disability income insurance (abbreviated DI in the industry), is designed to compensate the policy holder for income lost if the holder becomes disabled. DI usually also covers additional services such as rehabilitation. DI is available to individuals or groups, although group DI policies may have upper limits on their income protection provisions; sometimes it turns out to be difficult to realize a benefit under such policies because of elaborate and government-imposed review processes. Private DI policies were once available providing very high compensation replacement; insurance companies have changed their products since the 1990s in order to protect themselves against claims losses, but private policies can still be purchased with higher benefits than group policies.

Disability insurance is generally grouped into several categories. First there is a national insurance program offered by the U.S. government, which is mostly under the umbrella of Social Security and applies to all citizens who meet the basic criteria. Then there is employer disability insurance that covers disabilities related to events at the workplace and is offered by private companies. There is also worker's compensation, a more specific form of employer disability insurance that targets workers disabled by on-the-job injuries; it pays for medical expenses among other related costs. Lastly there is individual disability insurance, designed to protect self-employed and temporary workers.

Despite the various kinds of disability insurance offered, in 2009 the Social Security Administration estimated that approximately a third of employees will be in some way disabled before they retire, while a similar number, 36 percent of employees, have long-term disability insurance, which usually lasts 2 years at most. The low number of employees insured and the brief length of the policy term are a result of the costs involved in insuring employees and the nebulous definitions of some disabilities.

Protection against disability in the workplace takes several forms, some at the option of the employer, some provided under state or federal law: 1) most employees have legally mandated sick leave privileges; 2) many employers offer short-term disability (STD) insurance in addition; private STD insurance is available but can be difficult to obtain; 3) worker's compensation programs are provided by state governments paid for through levies on employers; in most states the compensation is two-thirds of wages earned; other benefits (like retraining) may be provided; 4) Social Security disability insurance becomes available after an individual has been unable to work for a year; only those totally disabled are eligible; and payments begin six months after eligibility has been established; the amount paid, like Social Security itself, is based on past earnings but does not necessarily match them; 5) long-term disability (LTD) group plans are offered in about 40 percent of medium to large-sized companies, according to *Kiplinger's Personal Finance*, but this is not common among small businesses.

INDIVIDUAL DI

Individual disability insurance, according to Peter C. Katt, an industry advisor, writing in *Journal of Financial Planning*, ran into turbulent times in the late 1990s because of mistakes made in the 1980s. These problems are still affecting DI companies and those wishing to buy policies.

The DI industry developed insurance products for individuals with high income some of which was badly underpriced in the 1980s. These came to be known as "own occupation" policies in which a person was deemed to be totally disabled if he or she could not perform the duties of his or her "own occupation." Thus, using one of Katt's examples, an orthopedic surgeon unable to stand during long operations because of persistent back pain would be deemed "totally disabled" and entitled to collect up to 60 percent of his or her weekly compensation until retirement age even though this same person could easily, by switching to general practice, earn a very decent income if not at the peak level as a surgeon. Such policies became very popular with physicians, specialists, and lawyers. "DI companies fell all over themselves providing narrower definitions of such occupations." Claims experience later showed that the incidence of such narrowly defined disability was much higher than anticipated, the premiums charged too low to sustain the business, and therefore new DI policies were tailored with insurance company limits and profits in mind.

"Own occupation" coverage may be limited to some period of time after the disability. Thereafter an "any occupation" clause comes into effect. Thus, for instance, the surgeon in the above example who has difficulty standing for long periods is obliged to practice some other branch of medicine rather that sit back and collect high DI payments until age sixty-five.

Group Long-Term-Disability Packages. Group coverage generally replaces 40 to 60 percent of the insured person's

income, but usually only up to about $5,000 a month. This compensation is fully taxable if the premium is paid by the employer, but the company is permitted to deduct the premium as a business expense. Group plans are relatively inexpensive but are designed to limit what is covered and to make benefits payable as predictable as possible for the insurance carrier. Definitions of disability are limited, any external income or benefits the claimant receives may be deducted from benefits, and certain conditions are excluded. The claimant's ability to sue the company must take place under the provisions of the Employee Retirement Income Security Act of 1974 (ERISA). As Mark F. Seltzer reported in *Physician's News Digest*, the law surrounding ERISA-managed appeals processes has come to favor the insurance carrier.

CONFLICTS

Insurance works most rationally in a real-life situation in which a *particular* claims event (e.g., a death) is very difficult to predict but the *aggregate* of such events can be projected statistically with fair precision. In such circumstances the insurance carrier can rationally calculate a reasonable premium which will ultimately pay the claimant what is contractually defined while permitting the carrier to have a profit. This can lead to some conflicts between the insurance company, with an eye on its own profits, and the businesses applying for group or individual coverage for a wide variety of situations.

There are also definitional problems. Inability to perform one's "own occupation" is contrasted to performing "any occupation." Some disabilities, such as chronic fatigue syndrome, may also be subjective and difficult to determine in a legal sense. On the private side, insurance carriers attempt to limit exposure by a combination of high premiums in private policies and delimited benefits in mass policies. On the public side, minimal protection is provided but only in cases of total disability, which is the Social Security disability outcome.

When considering DI policies, small businesses should note the time and legal costs involved in choosing a plan. Alternatives include aggressive savings plan employee benefits and internal contracts that provide limited income to an employee.

SMALL BUSINESS OWNERS AND BOES

While small businesses may be required to offer disability insurance in some areas and are free to pursue alternatives in others, DI typically pertains to employees, not employers themselves. However, small-business owners cover many areas of management and often have the most to lose by becoming disabled themselves. To avoid the issues this would create for the business, owners may choose to buy Business Overhead Expense (BOE) insurance for themselves, a specific type of disability policy made for workers with their own business. BOE insurance is most popular among physicians who manage their own practices or business owners who wear many hats at their job.

BOE insurance can cover many different types of overhead expenses, including rent payments, employee salaries and benefits, utility bills, property taxes, and other costs incurred naturally in the process of running a business. The insurance can also cover other insurance premiums for malpractice, depreciation, interest payments, and various other fixed costs, depending on what the business owner feels is necessary.

DISASTER ASSISTANCE LOANS

Disaster assistance loans are utilized by businesses to recover from disasters such as floods, fires, earthquakes, and tornadoes, that damage one or more aspects of their operations, from physical structure to inventory to lost business. Of course, adequate insurance policies offer the best protection for small-business owners, but many businesses do not maintain adequate coverage. Small businesses are particularly reliant on disaster loans since they cannot draw on the corporate coffers to which larger firms often turn. Some small-business owners solicit loans from banks and other lending institutions in the wake of a natural disaster, but many others turn to loan programs offered by the Small Business Administration (SBA) and other federal agencies. Indeed, the SBA is a primary source of funding for businesses seeking to rebuild after a disaster strikes.

Any business that qualifies under SBA definitions as a small business, is located in a major disaster area, and has suffered damage as a consequence of that disaster may apply for assistance. The assistance is earmarked in two ways. First, as help to repair or replace damaged property. Second, as help to meet those financial obligations that it would have been able to honor had a disaster not taken place. The SBA maintains separate programs for each of these eventualities. The agency notes, however, that qualification for an SBA disaster relief loan is not a given. "The SBA disaster relief program is not an immediate emergency relief program such as Red Cross assistance, temporary housing assistance, etc.," according to the agency. "It is a loan program to help you in your long-term rebuilding and repairing. To make a loan, we have to know the cost of repairing the damage, be satisfied that you can repay the loan, and take reasonable safeguards to help make sure the loan is paid."

PHYSICAL DISASTER BUSINESS LOANS

The SBA makes physical disaster loans of up to $1.5 million to qualified businesses, provided that the businesses use this money for the repair or replacement of real property, equipment, machinery, fixtures, inventory, and leasehold improvements. This property may have been insured or uninsured prior to the disaster. "In addition," noted the SBA, "disaster loans to repair or replace real property or leasehold improvements may be increased by as much as 20 percent to protect the damaged real property against possible future disasters of the same type." This latter allowance can be particularly attractive to victims of natural disasters that tend to occur on a cyclical basis. Finally, some businesses can use this money to relocate, although the SBA cautions business owners not to commit formally to such plans before gaining loan approval. The SBA points out that the disaster loan is "made for specific and designated purposes. Remember that the penalty for misusing disaster funds is immediate repayment of one and a half times the original amount of the loan. The SBA requires that you obtain receipts and maintain good records of all loan expenditures as your restore your damaged property, and that you keep these receipts and records for three years."

There are also several other types of disaster-related loans that certain small businesses can apply for in the case of emergencies or damages. Economic injury disaster loans, for instance, give capital so that certain companies can continue their business in the wake of a disaster at the same level they operated at before the disaster. There are also farm emergency loans for food producers to recover from particular kinds of disasters that may affect farmland more than other areas, and tax relief assistance that gives businesses extra time to file their taxes during disaster recovery.

There are also a number of more specific loans that govern specific disasters or the reparation of certain types of property. Home and property loans govern assistance for permanent rebuilding or replacement of business property. Military reservist economic injury disaster loans fund certain businesses that lose employees because of military call-ups for those on active duty.

Applications for these loans require the business to file a variety of financial and other records, including an itemized list of losses (with estimated replacement/repair cost), federal income tax information, history of the business, personal financial statements, and business financial statements. Whereas loans of less than $10,000 require no collateral, loans of amounts greater than that require the pledging of collateral to the extent that it is available. The SBA notes that while it will not decline a loan solely for lack of collateral, it does require businesses to pledge collateral when it is available.

Interest rates on physical disaster loans vary, depending on whether the applicant is able to obtain credit with other financial institutions. In instances where the business is not able to obtain credit elsewhere, U.S. law sets a maximum interest rate of 4 percent per year on these loans, with a maximum maturity of 30 years. Businesses that would be able to secure credit elsewhere, however, do not get quite so advantageous terms. For these latter enterprises, the interest rate is either 8 percent or whatever is being charged in the private sector at the time, whichever is less. The maturity of these loans cannot exceed 3 years. Nonprofit organizations can secure better interest rates and maturity terms through the SBA than can for-profit businesses.

ECONOMIC INJURY DISASTER LOANS

The EIDL loan program is available to small business and small agricultural cooperatives that have suffered substantial economic injury resulting from a physical disaster or an agricultural production disaster. The SBA defines "substantial economic injury" as "the inability of a business to meet

its obligations as they mature and to pay its ordinary and necessary operating expenses." In essence, it gives companies an opportunity to catch their breath in the wake of a disaster.

EIDL assistance is available only to those entities that are unable to secure credit from other private sources (banks, etc.). It is used less often than the physical disaster loan option for several other reasons as well:

1. The SBA limits its total assistance to any one company to $1.5 million, no matter how many programs are utilized. This means that a business that secures a $1.5 million loan for facility repair through the SBA's physical disaster business loan is not eligible for any funds through EIDL.
2. The SBA puts limitations on how EIDL funds can be used. For instance, these funds cannot be used to pay cash bonuses or dividends, or for disbursements to owners, partners, officers, or stockholders who are not directly related to the performance of services for the business.
3. Finally, EIDL loans do not give the borrower any leeway in the realms of relocation or physical improvements, both of which are sometimes possible through the SBA's physical disaster loan program.

In many other respects, however determination of interest rates, penalties for misuse of funds, use of collateral, procedures for securing a loan the procedures for EIDLs are largely the same as those for physical disaster business loans.

SBA LOANS AND FLOOD INSURANCE

According to the SBA, if damage is caused by flooding, or the business is in a special flood hazard area, the business seeking the SBA loan must have flood insurance before the agency will disburse the loan. If the business was legally required to maintain flood insurance but did not, then the SBA will not grant a disaster loan.

SMALL BUSINESS DISASTER READINESS AND REFORM ACT OF 2009

The Small Business Disaster Readiness and Reform Act of 2009 is a piece of legislation being reviewed in 2010 by the U.S. Senate after being passed by the House of Representatives in 2009. This act makes several changes to the way the SBA governs and offers disaster assistance-based loans.

Among other amendments, the Act prohibits the SBA from requiring small-business owners to use their homes as collateral for certain loans, and increases the disaster loan limit up to $3 million, from $2 million. It also separates loans below or equal to $150,000, those between $150,000 and $500,000, and those more than $500,000 into separate categories with their own requirements. The Act allows the SBA to make grants up to $100,000 to businesses that do not meet the requirements for loans. The Act would also require the SBA to develop more complete disaster preparedness and restoration plans for different sectors of the United States based on need and natural climate cycles.

DISASTER PLANNING

Small-business owners are strongly encouraged to make contingency plans for responding to and recovering from disasters that may befall them. Analysts note that disasters whether they take the form of floods, corporate espionage, fires, or power outages can have a devastating impact on a business's viability. Business experts also insist that the importance of a good disaster and recovery plan has never been as acute as it is today. In large part this is because so many businesses rely on vulnerable technology (communication networks, management information systems, process

control systems, etc.) to execute fundamental business operations.

Yet as Alan M. Levitt reported in *Disaster Planning and Recovery*, "various studies and surveys instruct us that most organizations have not established a comprehensive strategy for disaster planning and recovery. The percentage of organizations that lack any semblance of a plan is, simply put, frighteningly large." Levitt also noted that many disaster contingency plans that do exist are "applicable only to certain specific business processes (put another way, it is designed only to rescue specific bits and pieces of the business, not to save the entire organization!)." Many other companies' disaster planning policies, meanwhile, seem to consist only of disaster insurance. Such coverage is valuable, but it is only of limited usefulness. Indeed, Kenneth N. Myers, author of *Total Contingency Planning for Disasters*, described disaster insurance as only one element of a comprehensive disaster contingency plan. "The role of insurance in protecting against loss of physical assets, such as buildings and equipment, is clear," wrote Myers. "However, using insurance policies to protect against the loss of cash flow, the ability to service customers, or the ability to maintain market share is often not practical.... The primary function of business insurance is to provide a hedge against loss or damage. A disaster recovery and business continuation plan, however, has three objectives: 1) Prevent disasters from happening; 2) Provide an organized response to a disaster situation; 3) Ensure business continuity until normal business operations can be resumed."

It is essential, then, that small businesses take the time and effort to construct comprehensive disaster and recovery plans if they hope to weather unwelcome interruptions in business operations in good financial and market condition.

CREATING A DISASTER AND RECOVERY PLAN

"It is not easy to recognize the hundreds of hazards or perils that can lead to an unexpected loss," wrote Susan Anastasio in the SBA's *Small Business Insurance and Risk Management Guide*. "For example, unless you have experienced a fire, you may not realize how extensive fire losses can be. Damage to the building and its contents are obvious, but you should also consider: smoke and water damage; damage to employees' personal property and to others' property (for example, data-processing equipment you lease or customers' property left with you for inspection or repair) left on the premises; the amount of business you will lose during the time it takes to return your business to normal; and the potential permanent loss of customers to competitors."

Of course, many other types of disasters can strike a business as well, ranging from those triggered by natural events such as floods, tornadoes, earthquakes, or hurricanes, to those that come about as a result of localized environmental problems, like water main breaks, workforce strikes, power outages, hazardous materials spills, explosions, and major transportation mishaps (aircraft crash, train derailment, etc.). In addition, damage that is the direct result of premeditated human actions such as vandalism, sabotage, and arson can also be classified as a disaster.

The first step in creating a strategy (or reviewing existing contingency plans) to protect a company from these and other events is to move forward in creating a plan. Small-business owners need to make sure that they devote adequate resources to disaster preparedness and recovery planning before beginning the process. Once a business's leadership has decided to invest the necessary time and effort into the creation of a good disaster preparedness and recovery plan, it can proceed with the following steps:

Determining Vulnerabilities. "Begin the process of identifying exposures by taking a close look at each of your business operations and asking yourself what could cause a loss," counseled Anastasio. "If there are dozens of exposures you may find dozens of answers.... Many business owners use a risk analysis questionnaire or survey, available from insurance agents, as a checklist." These questionnaires will typically address the business's vulnerability to losses in the areas of property, business interruption, liability, and key personnel, among others.

Obviously, this component of disaster preparedness planning often referred to as risk management needs to be comprehensive, covering all aspects of business operations, including telecommunications, computer systems, infrastructure, equipment, and the facility itself.

Gathering Information. Businesses should make an extra effort to solicit the opinions of all functional areas when putting together a disaster and recovery plan. Facility management may be most knowledgeable when it comes to the vulnerabilities of computer systems and offices, but other areas can often provide helpful information about the aspects of the business that most need protection or fallback plans so that the business can continue to operate in the case of a disaster.

Reconciling Findings with Principle Objectives. All businesses should be concerned with meeting certain fundamental goals of disaster prevention, safety, and fiscal well-being when working on contingency plans. Analysts offer largely similar assessments of priorities in this regard, although minor differences in nuance and emphasis are inevitable, depending on the industry, the size of the business, and the viewpoint of the analyst. Most experts agree, however, that the primary objectives of a good disaster response plan should include:

- Preventing disasters from occurring whenever possible (through use of annual reviews, disaster prevention devices such as fire detectors and alarm systems, and physical access control procedures).
- Containing disasters when they do occur.
- Protecting the lives, safety, and health of employers and customers.
- Protecting property and assets.
- Establishing priorities for utilization of internal resources (such as manpower, talent, and materials).
- Providing an organized response to a disaster.
- Minimizing risk exposure and financial loss (disruptions to cash flow as a result of canceled orders, etc.) through alternate procedures and practices.
- Prevent a significant long-term loss of market share.

Disaster response strategies will vary from business to business, but they should all be structured in ways that will best ensure that essential business functions can be maintained until operations can return to normal.

Businesses will also need to create separate plans for evacuating and for staying in the same place. Evacuations will need to remove employees to a safe location, while shelter-in-place plans will need to encompass protection for all on-site employees waiting for help to arrive.

Communication of Plan. Disaster contingency plans should be widely disseminated throughout the company. All employees should be cognizant of the business's basic disaster plan, but this is particularly important for managers, who are often called upon to make important operational decisions in the aftermath of crisis events.

Recovery. This final stage of contingency planning is concerned with returning the business to its predisaster competitive position (or at least returning it as close to the position as is possible) and normal business operations in the event that a crisis event does take place.

SPECIFIC DISASTER ADVICE

Fires are the most common disaster to strike businesses in America. To ensure that businesses are prepared for fires, business owners should have their properties regularly inspected for fire safety, and smoke detectors and fire extinguishers should be placed in appropriate areas. Owners should also put into place a plan for warning all employees about a fire and alerting the fire department.

If the business is in an area where tornados are a seasonal concern, the business should assign one employee to keep track of weather forecasts so that any tornado alerts will be quickly noted. A plan should be made for employees to gather in a specific safe location, such as a bathroom, basement, or short hallway. Blankets should be kept in a shelter area in case employees need to stay there for an extended period of time.

When it comes to hurricanes, warnings are often widely broadcast ahead of time. Owners and managers should let employees know whether they need to come to work, and where they should look for more information after the storm is over. Vehicles and movable property should be relocated to a safer position, and vulnerable parts of business property should be properly protected. Utilities should be turned off for the duration of the storm.

If the business may be in danger of flood damage, the owner should decide whether to include flood insurance in the total insurance cost of the business. Valuable electronics should be kept off the floor by several feet to help protect them in case of a flood, and a plan should be in place to remove important documents during a flood watch. Owners may also want to install damage prevention measures such as a backflow valve to prevent sewage backup.

Employees should be prepared for earthquakes with knowledge of the best places to seek shelter. Natural gas and water lines should be equipped with flexible connections and emergency valves so that they cannot cause extensive damage if they are broken during in an earthquake. Doors and file cabinets should have latches with manual releases.

DATA PLANS

One of the most frequent disasters to befall small businesses is data loss. While data loss does not threaten employees and is not considered a natural disaster, it can be devastating to a small business, especially one that relies heavily on electronic information.

To prepare for data disasters, small businesses should formulate specific backup plans to protect their data regularly, whether online or by other means. An employee should be designated for managing these backups, or a third-party provider should be hired. The business should also be familiar with the recovery process so that data recovery can progress smoothly if information is lost.

DISCOUNT SALES

Discounts are reductions of the regular price of a product or service in order to obtain or increase sales. These discounts also commonly referred to as "sales" or markdowns are utilized in a wide range of industries by both retailers and manufacturers. The merits of discount pricing, however, have been a subject of considerable debate as analysts argue about their effects on short-term sales, longer term profits, brand loyalty, and total supply chain costs for retailers and manufacturers.

RETAILER AND MANUFACTURER VIEWS OF DISCOUNTING

Discounts are a staple of business strategy for many retail firms. As Tom Hartley noted in *Business First of Buffalo*, sales remain "the fuel that drives the retail engine." He cited the views of several retail experts who flatly insist that sales promotions are integral to most retailers' success. "The name of the game is promotion," one expert told Hartley. "Sales are the only way to drive the business and retailers have to have them, even if they seem to be going on all the time. Discounting in America has been built into the retail cycle. It is no longer a big deal."

Business consultants cite several considerations that small retailers should weigh when putting together their overall marketing strategy. For example, retailers should beware of overuse. According to many economists and business owners, discount periods increase sales volume but also deepen sales troughs between sales. Other analysts contend that frequent sales tend to numb customer response over time; Hartley pointed out that "many retail experts think consumer have become less trustful of retailers who[m] they see running weekly sales, or marking up items so high that they make a profit even after slashing prices 20, 30, or 50 percent."

In addition, retailers should study historic customer response, inventory levels, competitor pricing, seasonal cycles, and other factors in determining the level of discount. Some businesses are able dramatically to increase sales volume through discounts of 20 percent or less, which in many instances enables them to maintain a decent profit margin on sales. Other businesses may have to offer discounts of 40-50 percent (because of seasonal considerations, industry trends, etc.) in order to see meaningful increases in traffic. Of course, some retailers employ a price philosophy that emphasizes everyday low prices in the hopes that the increased volume will make up for the small profit margin achieved on individual sales.

Manufacturers, meanwhile, should be very careful in establishing discounts for their goods. Studies have indicated that price promotions offered by manufacturers often set a dangerous precedent; they condition customers to make purchases based on price rather than brand loyalty. "Over the long term," claimed *Management Today* contributor Alan Mitchell, " [discount pricing initiatives] do precious little to improve base-line sales, increase the incidence of repeat buying or attract new customers. They do, however, undermine other marketing initiatives by sensitizing consumers to price." A top manufacturing executive agreed with this analysis, noting that manufacturers "are actually training consumers to hunt around, to look for high-value offers. We're either encouraging them to shop up heavily when the offer appears and distort the supply chain, or we're really annoying them if they miss the offer because it's just stopped. Net, we're undermining their loyalty." Finally, ill-considered discount sales can lead to price wars with other competitors and can tarnish the image of the brand in question.

There are other drawbacks often associated with discount sales as well, and these can quickly get an unsuspecting small-business owner in serious trouble. *Sales & Marketing Management* contributor Minda Zetlin noted, for example, that "discounts have a way of taking on a life of their own." Indeed, the customer that receives a 15 percent discount for one purchase may well feel entitled to an

identical or even greater discount the following year. Moreover, news of a discount extended to one client is often difficult to keep under wraps, and when one client finds out that his deal is not as good as the one that another client is getting, he is apt to react in ways that are not good for business. "What happens is customers talk," one executive told Zetlin. "You get a call from Fred, who thought he was getting your best deal, and found out last night at the bar that he isn't and is now unhappy with you." One way for small businesses to minimize the likelihood of running into such complications, say experts, is to make sure that they adhere to a uniform set of discount rules. Of course, some small-business owners have to give customers different deals as part of their efforts to establish and grow their enterprises. Nonetheless, as one businessman recounted to *Sales & Marketing Management,* "[with] indiscriminant discounting . . . you wind up giving different deals to different customers based on their negotiating ability rather than some more rational technique."

DISCOUNT SALES AND THE COMPANY SALES FORCE

Many businesses utilize sales representatives to deal with customers and close deals. But whereas sales personnel employed by retail outlets typically do not have the power to offer discounts, many representatives in the manufacturing and service sectors are provided with some leeway in this area. Both existing and prospective customers are well aware of this state of affairs. Small-business owners, then, need to pay extra attention to this reality as they build their sales force. For as business experts in all industry areas will attest, many sales representatives are so eager to secure a sale and thus a commission that they will offer a discount on a sale at the first hint of a price objection. "Salespeople offer discounts too quickly because they get flustered and fear losing a deal, or because it's easier than making the customer understand why this product is worth more," wrote Zetlin.

To head off scenarios in which salespeople might unnecessarily fritter away profits on a sale with an unnecessary discount offer, business consultants and successful salespeople recommend that entrepreneurs consider the following:

1. Informed salespeople are formidable salespeople. Many requests for discounts are based on ignorance (feigned or not) of the difference between a company's goods and services and those of the competition, which may be dangling a lower price. The challenge for the small-business owner is to make sure that sales representatives can talk about nonprice benefits authoritatively.
2. Knowledge of client issues. Knowledge includes not only representative awareness of his or her employer's circumstances (inventory, profit margin, etc.), but also an understanding of the challenges facing current and potential customers. By taking a proactive approach that seeks out answers to customer hopes, strategies, and concerns, many representatives can head off attempts to secure a discount by highlighting customer service advantages that they can secure through the company. In addition, small-business owners who are knowledgeable about key customers are better able to offer discounts that ultimately benefit their companies. For example, offering a small discount can be a good way to curry favor with a client that is on the verge of significant growth.
3. Provide guidelines and training to sales staff. Sales personnel should be provided with firm guidelines regarding their authority to negotiate discount prices to customers. Moreover, many business experts counsel entrepreneurs who often serve as their own sales representatives, especially during a business's formative years and their sales staff to receive training in negotiation tactics so that they can better differentiate between customers who truly are unhappy with the price and those who are merely angling for a discount.
4. Recognize industry dynamics. Some industries allow participants to adhere to set price guidelines fairly closely, while others whether because of intense competition, economic problems experienced by target markets, or some other factor may have to be considerably more flexible in providing discount sales to clients.
5. Talk to the right personnel. Negotiations over price can vary considerably, depending on the personnel that are involved on the customer's side of the table.
6. Set a firm plan for the discount. The ideal small-business discount should be short and to the point. If discounts last too long, the business will drive its own value proposition down. The ideal discount is well advertised and lasts anywhere from a day to a week at the longest. Discounts should always be used to further a specific company goal or objective, such as increasing market share among a certain demographic or improving the brand image in a specific way. Discounting only for a nebulous increase in sales is often ineffective.
7. Know when to look elsewhere for business. Some customers simply will not agree to terms without unreasonable discounts that cut too great a swath into the business's profit margin (or obliterate it altogether). In such instances, it is usually better to move on in search of other customers rather than continually butt heads with a single client.

8. Try to balance out the discounts with cutbacks in other areas so there is not a net loss. Many small businesses cut back marketing efforts in order to afford discounts. Online marketing and event planning can often lower marketing budgets and create room for more robust discounting practices in the short term.
9. Businesses should also be aware of any state or federal laws applying to discounts. Usually there are compliance guidelines for fulfilling specific details of the discount, especially in online or broadcast mediums.

ALTERNATIVES TO TRADITIONAL DISCOUNT STRUCTURES

In addition to traditional discounts, wherein individual goods or services are offered at a given percentage below the original asking price, small-business owners also have the option of instituting several different discounting variations, such as ''earned'' discounts, early-payment discounts, and multibuy promotions.

''Earned'' Discounts. Some companies offer their customers discounts if they meet certain requirements. Under this scenario, customers that agree to make large purchases, provide repeat business, or sign multiyear contracts are in essence rewarded for their business by receiving a discount on the price of the goods or services they have purchased.

Early-Payment Discounts. Some small- business owners offer discounts to customers who pay promptly (within 10 days is a common stipulation). Small businesses that do this are often relatively new firms that are operating under tight financial constraints. Unlike established business owners, who may have a financial cushion from which to draw to meet various business and personal obligations, entrepreneurs are often in greater need of securing prompt payment from customers. An early-payment discount provides customers with an incentive to make payment quickly. Businesses that utilize this discount option range from manufacturers to freelance writers.

Business consultants warn, however, that some customers may abuse this option by taking the early-payment discount, only to pay off the bill after the discount period has ended. Christopher Caggiano noted in *Inc.* that small-business owners can institute a couple of different policies that can curb such abuses. One device that entrepreneurs can use is to make it clear that the early-payment discount will be offered only if collection can be made in person by the entrepreneur himself or a member of his staff. Another option is to charge customers for the difference on the next invoice that they submit. In most cases, the customer will pay the amount without complaint since it did not meet the previously agreed-upon terms.

Multibuy Promotions. Multibuy promotions are an increasingly popular alternative to the standard discount pricing strategies, especially for retailers. Rather than knock 25 percent off the price of a product, some companies are choosing to offer ''buy one, get one free'' or ''buy three for the price of two'' promotions to consumers. This strategy is driven by statistics that indicate that such promotions are often so succesful that the volume of sales outweighs the cost of the discount given. Business observers point out that many multibuy promotions are made economical by the hidden savings that can be realized through them. ''Supermarkets now have computer systems which recognize a second or third pack and automatically adjust the bill at the till, thereby eliminating most of the administrative hassle,'' wrote Alan Mitchell in *Management Today*.. ''Since the goods being promoted come in standard packs, many of the design, manufacturing, and transportation costs associated with other types of promotional offers are lowered.''

Additional Discounts. There are many ways a small business can offer subtle discounts to customers without dropping the price outright or jeopardizing its value proposition. The more creative a business is in planning discount opportunities, the better chance it has of reaching consumers outside its traditional marketing range. Small businesses are usually able to appeal to their customers more easily through direct or loyalty discounts, a branch of customer service that smaller companies can manage more easily because of personal contact with regular customers.

Other businesses also have the option of offering special deals like free shipping instead of specific price discounts. Free shipping or free set up services allow businesses to offer incentives without affecting their bottom line so dramatically, and many consumers are more attracted by the idea of free services than by a slight decrease in price, even if the loss to the company is the same.

Small businesses can also choose to be even more careful in their discount practices and lower prices without ever announcing a discount. For instance, a clothing store can subtly move to an inventory of items that cost, on average, $20 or $50 less, lowering the prices of the goods in the store without enforcing any kind of discount. Other companies have the ability to shift focus from new items to used items for a time, which can give the appearance of offering better deals without resorting to marking down items. Sometimes, discounts are as simple as adjusting services or supplies so that the overall price can be dropped without jeopardizing company profits.

DISCOUNTED CASH FLOW

Discounted Cash Flow (DCF) analysis is a technique for determining what a business is worth *today* in light of its cash yields in the *future*. It is routinely used by people buying a business. It is based on *cash flow* because future flow of cash from the business will be added up. It is called *discounted* cash flow because in commercial thinking $100 in pocket now is worth more than $100 in a person' pocket a year from now. Why? A person can, at minimum, put $100 in the bank and it will earn some interest, say 4 percent. A year from now it will be worth $104. Therefore, looked at the other way, $100 received a year from now is worth only $96.15 today if the discount rate is 4 percent ($96.15 \times 1.04 = 100$). If current cash could earn 10 percent interest, the future $100 would be worth only $90.9 in today's valuation.

CALCULATING DCF

The elements of DCF therefore are: 1) the period of time to be used for evaluation, say a business life of 10 years; 2) the flows of cash that will occur every year in that business; and 3) an internal discount rate or, put another way, what the money could earn if invested in something else of equivalent risk. What is really important in DCF is assessing the business and accurately predicting what flows of cash it will yield.

Investors may also use the DCF method to value stock options for large companies. While small businesses may struggle to produce a strong DCF value, large companies can be overinflated because of market conditions and trade stock on a level that their DCF analysis does not support. Investors compare DCF value and current market capitalization to see how well large companies are performing. If their market capitalization numbers are higher than their DCF value, their stock price is inflated, which could be a danger sign farther down the road.

Obtaining the annual cash flow to be discounted is done as follows:

- Start with Net Income After Tax.
- Add Depreciation for the year (because depreciation is not a cash cost).
- Deduct Change in working capital from the previous year. This change may actually be negative, in which case this operation will add to cash. In a growing operation it will be positive and so will require cash.
- Deduct Capital expenditures.

Working capital is current assets less current liabilities. Unless the DCF is very detailed, the usual items included are the "biggies," receivables and inventories on the asset side and payables on the liabilities side, only changes being counted. If receivables were $100,000 at the beginning of the year and $130,000 at the end, $30,000 is the change. If inventories decreased from $40,000 to $35,000, the change is −$5,000 for a net change in assets of $25,000. Assume payables went from $80,000 to $110,000. The change in liabilities then is $30,000. Change in assets less liabilities is therefore −$5,000. This amount is deducted, from net income after tax, but deducting a negative causes it to be added. In effect the situation in this case means that the *cash* position of the business has improved. Finally capital expenditures, a flat drain on cash, are deducted.

These estimates of the cash flow are repeated for every year of the forecast period, in this case a 10-year cycle. To derive the crucial starting number, net income after tax, the analyst must, of course, project sales and costs assuming some reasonable growth rate for the operation usually based on the target company's history. He or she must derive necessary inventory levels to support projected

sales and also calculate additions to capital based on capacity at the beginning of the period.

Most DCFs end by assuming that at the end of the cycle the company will be sold again at some conservative multiple of its after-tax earnings. This number is then plugged in as a "residual value" for the eleventh year.

Next, and crucially, the analyst must determine what discount rate to use. Suppose the prospective buyer of the company enjoys a net return on its own, current investments in its own business of 16.7 percent. It may use that rate as a minimum or as an acceptable average return.

Many investor groups use calculations that factor in additional discounts based on the business itself. These include discounts for the risk of taking on a small business, discounts for lack of liquidity, and other types of discounts that pertain to the risks of buying another company. These discounts change based on general business solvency and the state of the business in question.

Now, with the annual cash flows neatly keyed into a spreadsheet down a column, each row representing a year and the eleventh year carrying the "resale residual," application of a discount formula can be applied. The formula for each row is quite simple:

$$PV = FV \times (1 + dr) \wedge \text{-n}.$$

In this formula, PV stands for present value, namely right now, in the year of analysis. FV is the cash projected for one of the years in the future. dr is the discount rate. The 16.7 percent would be entered as .167. The caret symbol stands for exponentiation; n is the number of years; the negative n is the negative value of the year. Thus year 1 is −1, year 2 is −2 and so on.

Let us assume that the years begin with 2007 and that these years are in column A, beginning on row 5 of the spreadsheet. The cash flows are in column B, also beginning on row 5. Then, the formula in column C, row 5, will read:

```
=B5*(1+0.167)^(-(A5-2006))
```

Replicating this formula down to the last row, row 15 (which will start with 2017 and will hold the residual), will automatically transform the projected cash flows into their discounted equivalents. Simply adding them up will result in the discounted cash flow value of the business. Assume that the cash flows in column B are (with 1,000s suppressed) 135, 137, 138, 142, 145, 150, 150, 170, 169, 175 and the last, the residual, is 675, the discounting formula will produce the values 116, 101, 87, 77, 67, 59, 51, 41, 42, 37, and, finally, 123. These values will add to 809. In actual cash, as projected, the business will generate $2,186,000, the sum of the first set of numbers. But by discounting using the 16.7 rate, that value,*today*, is worth $809,000. Thus if the asking price is at or below that value, the deal is good. If it is higher, the prospective buyer should probably pass.

OTHER ISSUES

Discounted cash flow analysis is almost always applied when a company is thinking of purchasing another. As shown above, the technique is ultimately simple enough if applied with care. An ordinary spreadsheet is enough to do the job. But the primary application goes beyond the use of a math formula.

As David Harrison pointed out in *Strategic Finance*, "The simplicity of a DCF valuation is probably what contributes most to underestimating the time required for valuation jobs in the first place. Think about it it isn't the DCF calculations that require any time; they run in an instant. But the DCF is only as good as its inputs, so that old adage, 'you are what you eat;' couldn't be truer with respect to DCF. Good estimates yield good valuations; bad estimateswell, you know the rest. How do we get a reasonable range of estimates for our discounted cash flow? Therein lies the problem the gremlin that eats away our time, drives us crazy, and makes us feel like plodding amateurs."

DCF, in other words, greatly depends on many much fuzzier issues, the most uncertain of which is how the future will treat the business we are thinking of buying. Here, as always, a thorough knowledge of the industry, conservative assumptions, due diligence in looking at the business in detail, especially visits with its clients and suppliers, and also a certain humility on the buyer's part are of crucial importance. Many owners have great confidence in their own abilities and a low estimate of the seller's. That should be a much bigger red flag than a lackluster DCF number.

In order accurately to gauge a business's value, other methods may be used. The Earnings Capitalization (EC) method is very common, since it allows the investor to account for past earnings when projecting future values, providing a standard by which to predict business success. Ideally, both EC and DCF values should be very close, but this depends on the type of growth the business has experienced and the assumptions about its future profits.

APPLICATIONS FOR SMALL BUSINESS

Small businesses are not likely to use DCF evaluations in order to examine other companies to see if they are worth investing in or buying. It is much more likely like a small business will be subject to a DCF evaluation by a much larger organization. However, there are two ways in which the DCF method can be useful to small businesses.

First, small businesses are able to evaluate themselves with discounted cash flow techniques. This is very useful if the small business is planning on selling the business at some time in the future, or even if the owner wants an additional method to gauge the business's success that does not depend solely on net income. By focusing on factors that will improve DCF results, an owner can create a

company that will be much more attractive to possible buyers.

The second use lies within the company itself. On a smaller scale, the DCF technique is an excellent method of evaluating the viability of any long-term business project, from launching a new product to tackling a new marketing method. All the same factors apply, with cash flow itself sometimes carrying over to other types of long-term benefits. By comparing the DCF value with the cost it would take to carry out the project, a business owner can decide if the project will be worthwhile.

DISCRETIONARY INCOME

Discretionary income is a widely used but imprecise definition of that portion of personal income not spent on actual or perceived necessities. Thus discretionary income also includes savings. Perhaps because the definition of "necessities" varies from person to person, the U.S. Census Bureau (which collects such data) and the U.S. Bureau of Labor Statistics (BLS which publishes the Consumer Expenditure Survey) no longer use the term, but the components from which it can be constructed are available.

Personal income is one of the elements of the Gross Domestic Product and is reported by the Census Bureau at quarterly intervals. Personal income less taxes owed is then defined as *disposable income*. From this the Bureau deducts personal consumption expenditures, personal (nonmortgage) interest payments, and contributions to derive *personal savings*. Some portion of consumption expenditures is discretionary; most of it is not. Similarly, some contributions such as union fees are not discretionary. Categories commonly excluded from necessities include alcoholic beverages, entertainment, reading, education, tobacco, miscellaneous, and cash contributions.

Discretionary income rises and falls depending on economic conditions. In 2007 approximately 64 percent of Americans had discretionary income, although one year with a higher discretionary income was 2006, when the average per household reached $24,335. In 2008 numbers dropped sharply, corresponding to a 3.6 percent overall drop in household income.

Knowing the pertinent facts about discretionary income is of vital importance to both business and government. Companies are interested in discretionary income levels of consumers in various geographic areas, age brackets, and socioeconomic backgrounds: consumers with larger amounts are more likely to spend their money on the goods and services that businesses provide. The statistics also provide information about consumer spending habits that can be useful in targeting marketing campaigns. Although the data alone cannot predict how a certain consumer will choose to spend his or her discretionary income, it can provide information to help marketers make sound planning decisions.

Discretionary incomes of people in certain age groups are of particular value to business and marketing specialists. For example, those over the age of fifty have half of the total amount of discretionary income in their control, making the fifty-plus age category the wealthiest group in the nation. This group also corners three-quarters of the bank deposits in the nation, and accounts for 80 percent of all savings accounts. In short, the "over fifties" have enormous financial clout. Similarly, teenage and young adult consumers have considerable sums of discretionary income and are thus highly valued by companies because they are more likely to have their living costs absorbed by other individuals (typically parents) and they are less likely to be in a position where they have to devote resources to support a family.

Businesses also have discretionary income that can be used for various purposes. Small-business owners typically use their discretionary income for business growth and marketing, but it is unusual for smaller companies to have much discretionary income left over after expenses, especially during the first several years of operation. As businesses develop, the uses for discretionary income expand to include employee bonuses, remodeling, and project savings. Many businesses

incorporate a percentage-based plan for using any discretionary income that is produced.

Discretionary income is also calculated when a business is being sold. This requires a formula that adds in depreciation, owner's salary, interest expense, and similar items while subtracting interest income and gain on sale of assets from the net income of the business. The result is the amount of cash buyers will immediately have on hand to spend however they choose, an important consideration for many buyers.

DISTRIBUTION CHANNELS

Goods produced in factories and commodities produced in agriculture must reach consumers. The systems by which goods reach the consumer are known as distribution channels. These are organizations that facilitate the sale and movement of products. The totality of all distribution channels forms a distribution network.

PARTICIPANTS IN DISTRIBUTION

The distribution process is complex but can be conceptually divided into four major categories: 1) market makers; 2) sellers; 3) transporters; and 4) hybrids.

Market Makers. Market makers are organizations that provide either a real or virtual place where goods may be bought and sold. Classical example are the farmer's market, considered as the entity that rents space to farmers for their stalls; a stock market that controls who may or may not trade by selling seats on its exchange; a shopping mall that makes its money by leasing space to stores at the mall; convention centers like McCormick Place in Chicago which host trade fairs; and a franchiser who, in effect, sells a method, a name, and an image. Markets need not be "places." Therefore catalog publishers and Web-based sellers are also "market makers." A pure form of a Web-based market maker is the auction house eBay: eBay itself does not sell anything; it hosts a selling/buying community. The distribution *function* fulfilled by market makers is the aggregation in a real or virtual place of diverse and competing sellers. Thus market makers provide a convenience to the customer who likes to compare many competing products with the least amount of trouble.

Sellers and Resellers. Selling organizations either purchase and own the goods they sell or fulfill a selling function without ownership. If they are in the first category, they will be called distributors, wholesalers, jobbers, retailers, or dealers. If sellers are in the second category, they will be called brokers, traders, rep organizations, and agents. The distinction between these categories is all-important from the producer's point of view. "Purchasing and owning" sellers are the most desirable because they take possession and cannot return the merchandise. Sales agents just represent; they take no ownership risk.

Transporters. Central to every distribution system, but usually least talked about, is the community of organizations that physically store and move the goods. These elements may be owned by sellers or producers; most often they are independently owned. The post office and commercial freight carriers, or instance, are important players. Transporters operate warehouses and provide ground, water, and air transport services.

Hybrids. Some functions are mutually exclusive. A seller either owns merchandise or does not. Other roles, however, are more easily combined and traditionally have been. A grocery store is thus the merging of a farmers market and a dry goods market into a single enterprise that "makes its own market" and also owns all the merchandise it sells. Major grocery chains also tend to own all or part of the transportation system they use. In the modern environment a large shopping mall is a market of markets, each store within it being itself an assembly of many types of merchandise that, once, were sold in separate markets. A restaurant is the best example of a small "hybrid." It creates its own market by offering a diversity of foods; it combines the production function by cooking the food and the selling function by offering it for sale on site. Most diverse stores

such as grocery chains, drug stores, department stores, and major discounters are hybrids in that they make a market but also own and sell the merchandise. The ice cream vendor selling in the city from a little truck combines seller and transporter roles in a hybrid distribution mode.

STRUCTURAL FEATURES OF CHANNELS

Distribution is a logistical function at the physical level modulated by communications activities. Channels have evolved over time and continue to change as participants attempt to take advantage of change as it occurs. A good example of a recent impact on distribution is the communications revolution introduced by the Internet. Thus many books once purchased in stores are bought online and delivered by UPS, FedEx, and DHL. Many airline tickets once sold by travel agents and picked up by customers are purchased online and printed out at home.

Tiers. Distribution systems are said to have tiers or levels, the number of tiers being defined by the middleman between the original seller and the ultimate buyer. A single-tier system involves a single intermediary seller, the retailer. A two-tier system will have a distributor/wholesaler plus a retailer. More tiers may be present. Imported goods, for instance, may be channeled first through an importer. In some industries smaller wholesalers (jobbers) may be involved as secondary distributors between a major wholesaler and a large number of retailers. Some manufacturers sell directly to customers. This may be viewed as a "tier-less" distribution channel; more correctly the manufacturer simply acts as its own retailer: the retail function is simply kept in-house. Competitive pressures limit the number of tiers possible because every level must be compensated and has its own margin (in effect its own "tax") on the transaction. Hierarchical distribution may be necessitated by capital intensity (manufacturers needing to share the burden of capitalizing the distribution system), by remoteness and distance (producers cannot reach every corner of their market), by technical service requirements (manufacturers need dealers to service technical goods and do not wish to establish hundreds of wholly-owned operations), and other factors.

Differentiation by Customer. Distribution channels typically service either the consumer or an industrial/institutional client. Industrial/institutional distribution is frequently highly adapted to specific branches. On the whole industrial distribution activity is less marked by hype and much more technical and price-oriented; the impulse buying element is eliminated by professional purchasing functions; at the same time, occasionally industrial sales produce corruption and kickback scandals because very large transactions are frequently the rule.

Differentiation by Technology. The vast spread of computer use in every institution produced a brand new category of intermediaries, the so-called VARs or value-added resellers, sometimes called integrators. These organizations came into existence as independent entities because the complexity of adapting computer systems and networks into the operations of a buying establishment require many complex skills, in the absence of which no product could actually be sold. Very few producers of computers or peripherals are able (never mind willing) to master the intricacies of competing products in order to sell their own. The VARs took on this challenge. The emergence of VARs is an excellent example of the manner in which products and services shape and transform distribution channels.

Recurring Trends. In the cyclical relationship between the original producer and the "channel," the existence of a distribution "margin" produces recurring attempts by both sides to capture more of that margin by down- or upward integration or by cutting out the middleman. Producers frequently attempt to eliminate distributors by establishing a wholly-owned "branch" structure making themselves distributors. Distributors, in turn, attempt to buy manufacturing operations so that they come to own the products that they sell.

A similarly recurring trend is to eliminate the retailer by "selling at wholesale" in large, bare discount operations usually somewhat below the retail level but not quite at the wholesale price. Yet another perennial is represented by the well-established machinery seller who distributes through "servicing dealers" and who, thinking of having it both ways, suddenly shifts a large part of his or her sales to a big discount house that does not offer services. The dealer channel will find itself undersold and burdened by new service business which is *not*subsidized by original equipment sales. The reaction is usually violent, eventually forcing the producer to abandon discount sales. An intermediate position is presented by powerful retailers who offer their customers "home brands" more cheaply; these, typically, are of a lower quality than branded merchandise.

DISTRIBUTION AND SMALL BUSINESSES

When a business begins, the founder will need to choose how to distribute goods or services. For many starting small businesses, direct distribution is often the easiest choice. This occurs when the business itself acts as the dealer and distributor, utilizing in-house selling teams to sell directly to interested parties locally and online. This can be very cost effective: if the business has a low inventory or a specialized service, setting up complex distribution channels is usually too expensive or impossible. Direct distribution is a common stepping stone that gives small businesses experience in distribution

practices and allows them to grow until they are ready to consider more complex distribution methods.

If a small business decides to use direct distribution practices, it will need to decide what channels to incorporate. Online distribution is usually very easy for a small business to keep in-house, since it requires only maintenance of a Web site and transportation with the help of a shipping company. Other businesses may prefer to sell using a printed catalog that outlines their various products. Direct distribution also involves the collective marketing techniques that the business uses to draw in new clients, such as direct mailers.

When a business does begin to use multiple distribution channels with intermediaries, it is typically a slow process. They may start by bringing in a consultant for advice, and that consultant may recommend another company or supplier, which involves the business in a preexisting distribution channel. But the goal of a distribution channel is always to expand the business's market to consumers it could not reach otherwise, and many small businesses have trouble developing such channels on their own. Some small businesses band together with competitors to form a partnership that shares distribution channels to alleviate the costs involved. These partnerships require careful legal agreements but can be beneficial to all involved if carried out correctly.

Other small businesses may choose to develop direct distribution methods in the United States but use agents to market specialty goods overseas. There are some overseas areas, such as the Caribbean, where an agent will have superior knowledge of businesses contacts and potential customers. Hiring an agent in these other countries will also mean that the business is subject to laws in those countries concerning employees and imports.

Small businesses may also inherit a distribution channel. The founding owner may be quite expert in distribution by having worked in the industry before. In the absence of personal knowledge, the best approach to learning about the channel rapidly is by immersion in the trade literature. Trade magazines will rapidly teach the business owner such fundamentals as major shows where the industry regularly meets. Visiting such a show and talking to competitors, buyers, and sellers will soon reveal the opportunities open to the business. The owner will probably encounter sales rep organizations, see retail and wholesale distributors at work, and will learn the one or two major preferred means of reaching the market used by the industry.

Special difficulties face the new business that enters an activity for which distribution channels are poorly developed. This often happens when the business is a new kind of service not yet "commodified." An extreme example might be decorating ceilings with original art. The business owner may have to discard his or her original intent to sell the service through art stores but discover that very high-end furniture dealers are the right distribution venue and the mode of contact will be to decorate the ceilings of such dealers free of charge to attract the eyes of wealthy shoppers. Another venue may emerge by working closely with stores that sell special lighting equipment which would, of course, be an element in ceiling art. Consulting businesses with abstract products, such as futures studies in support of marketing strategy, may similarly have to create their own distribution channel by the sheer rock-breaking methods of trial and error.

DISTRIBUTORSHIPS AND DEALERSHIPS

Distributors and dealers are participants in a supply channel. The distributor is usually a wholesaler who sells to dealers. Dealers are usually retailers who sell directly to the public. The dealer-distributor terminology is most common in the distribution of machinery and mechanical goods thus in automobiles, trucks, farm and construction equipment, yard and garden goods (green goods), appliances (white goods),

electronics, and also in the sale of industrial equipment. This basic structure has many variants.

Both distributors and dealers actually purchase the goods they sell the distributor from the manufacturer, the dealer from the distributor. Distributors maintain parts inventories and the dealers provide service functions to the ultimate consumers ("servicing dealers"). Relationships among manufacturers, distributors, and dealers are typically contractual in nature. Distributors and in turn dealers participate in incentive programs offered by the manufacturers such as subsidized advertising programs, bonuses, and special discounts. Distributors and dealers have rights to use the manufacturer's trademarks and logos but not as their own.

Distributor and dealer relationships to manufacturers have many features in common with franchises. Indeed, state laws governing franchises may have clauses that directly relate to distributors and dealers. But the franchise concept is fundamentally different from the distributor-dealer model. Traditional distributors and dealers never pay an up-front fee to the manufacturer for the privilege of selling the producer's goods but may be contractually required to buy some minimum amount of goods. Distributors and dealers may be relatively strong or relatively weak over against the producer, but in all cases they bring something to the table, namely an established market already developed. It is not unusual for strong distributors and dealers to carry the goods of competing manufacturers, although, in most cases, one of the brands will be dominant, the other serving a smaller customer base.

PARTICIPANTS

The participants in the supply channel are the manufacturer, the distributor, and the dealer.

The Manufacturer. A two-tier distribution system (distributor, dealer) may be the preferred channel used by the manufacturer of one or a whole line of its goods. Using distributorships gives the producer the advantage of dealing with just a few major buyers, the distributors, who then, in turn, take care of selling the product through to the consumer using dealers. In any kind of major equipment business, substantial capital is involved in carrying and holding merchandise, including parts inventories. Distributorships share the burden by purchasing goods on their own account and freeing up the producer's working capital for the next round in the production cycle. The producer in such a channel may be involved in marketing programs, incentive programs for distributors and dealers, discounts for the consumer, and may provide technical training programs for distributor and dealer personnel.

The Distributor. The distributor is an independent selling agent who has a contract to sell the products of a manufacturer. The distributor cannot represent him- or herself *as* the producer but may display the producer's trade name in signage and in the sales situation. Depending on the relative power of the producer, the distributor may be limited to selling only one brand of a product; in practice the strong distributors will have much more freedom. The distributor usually has an exclusive territory which may be part of a metro area or, depending on the product, may be a large territory including more than one state. Distributors pay wholesale prices for the product and then distribute to dealers who pay dealer price.

Variants to this general pattern exist. One such is the contract distributor who purchases a product from a producer, consolidates it with other products thus adding value, and resells the product. A contract distributor differs from a wholesaler in that a wholesaler merely purchases a product, along with other products from different manufacturers, and resells the product with little if any changes.

Being an independent entity, the distributor's operations are not under the direct managerial control of a producer. Producers, however, influence the distributor by providing common methods for display, for inventory management, producing national advertising and symbolism, and offering incentives. Some of these internal matters may be governed by the general contract under which distributors and producers operate.

The Dealer. A dealership is sometimes called a retail distributor. It is similar to a distributorship, except that a dealer usually sells only to the public. Unlike other types of franchisees, including some distributors, a dealer rarely carries a single product line. Even in the auto industry, a major dealer will carry competing products, often on the same site, but these will be differentiated by being each in its own building.

By operating as a dealer for a branded product, the dealership in effect participates, but at second hand, in the producer's total marketing scheme enjoying national advertising support, receiving training, and taking advantage of incentive programs. By taking part in dealer groups, dealerships also act as a feedback mechanism for the producer conveying insights gained by dealing directly with the customer.

SECURING A DEALERSHIP/ DISTRIBUTORSHIP

If a business owner is interested in starting a wholesale company and becoming a distributor, it is best to start small. Focusing on small, nearby dealers will give businesses a greater chance of creating contracts to sell their products, even if they only have a small product line. Typically, acting as a wholesaler or distributor requires a detailed contract spelling out the relationship between dealer and distributor.

The starting business will also need to set aside funds for inventory storage and transportation. Many distributors use a credit policy with their dealers, since dealers are not always able to pay their distributors in the same period that the product sells. This means that a start-up distributor will also need to have enough financial resources to offer an attractive credit program when it is needed.

Small dealerships and distributors can often develop close ties and mutual dependency. However, they are always governed by the legal contract they are under, along with any state or federal laws applicable to dealerships and franchises. These often make it difficult for one side to gain an unfair advantage over, or unduly influence, the other side. For instance, dealers and distributors can only present gifts to one another as long as they are at or under $25 per person.

BENEFITS AND COSTS OF DEALERSHIPS AND DISTRIBUTORSHIPS

There are differences in operating a distributorship and a dealership. A distributorship normally costs more than a dealership and requires leadership capability and a better knowledge of basic business skills. It will most likely have a larger territory than a dealership and may even extend to more than one location. A dealership tends to be local and requires less start-up capital. A dealer can focus his or her efforts on the management and success of one location. The dealer works closely with a distributor so it pays him or her to nurture that relationship as well. In the final analysis, the distributorship can be more lucrative, but it will require different skills and higher investments.

The chief benefit of participation in such a two-tiered channel comes from the brand equity of the products carried and the support the brands may have from the producer. The relationship, however, is mutual. Well-supported brands will tend to be higher priced. The pressure to stock at high levels will be greater and conformity with the producer's programs will be enforced. In turn a well-run distributorship will ensure selection of excellent dealers who, in turn, by commanding strong locations and providing good service to consumers, contribute substantially to the brand's image.

Producer-distributor-dealer relationships have built-in conflicts as well, the smooth resolution of which is central to profitable long-term operations. Conflicts often take opposite forms: producers may wish to "push" more product into the channel than the channel really wants; at other times, especially when a product really takes off, the channel cannot get enough product to meet demand. Effective participants in this channel pay a good deal of attention to the parties. Producers will cultivate goodwill down the channel. Distributors will both push and protect their dealers. Dealers will "stretch" to meet producer needs by stocking a little more and will benefit when product is short by being first in line for shipments.

CHALLENGES FOR DEALERSHIPS AND DISTRIBUTORSHIPS

Dealers are sometimes confronted with situations that change or threaten the way they do business. Car companies, for example, can choose to buy out a certain percentage of their dealerships and make them factory owned, as General Motors did in the 1990s. In 2009, while struggling to remain a viable company GM did not renew franchise agreements with over 1,000 dealerships, around one-fifth of all its dealers.

The advent of the Internet has also changed the way that dealerships and distributorships operate. Dealerships and distributorships emerged as businesses when manufacturing companies were new and focusing on production, as opposed to distribution. As production costs diminish with increased pressure for profits, many manufacturing companies are looking for a bigger piece of the pie. Business-to-business selling has increased dramatically. Manufacturers have begun selling their products directly to the public, and the Internet is a relatively inexpensive method of doing so. While this may take away some sales from the distributor, a manufacturer's Web site can also benefit its distributors. Many manufacturers use the site as a storehouse for information on the company and its products, providing prospective sellers with needed information that its distributors cannot deliver to unknown markets or sellers.

While they may engage in direct online sales, it is in the best interest of the manufacturer also to direct visitors to the distributors, providing another channel of opportunity for the distributor. In order to improve their chances at getting that sale, a distributor should establish its own Web presence. While online purchasing capabilities are most likely beyond the resources of a distributor, a Web site gives the manufacturer something to direct the customer to and provides another marketing opportunity to the distributor.

There are also distributor lines based solely on online programming and software creation. Using the Internet, small businesses can develop software applications and use large companies, such as Apple, as distributors for these applications. Both the small business, which fills the role of the producer, and the large company, which is both the distributor and dealer (selling straight to the consumer) profit from the arrangement, and contracts are usually much more simple than traditional dealer and distributor relationships.

Dealerships and distributorships can be great business opportunities for the prospective entrepreneur. The benefits of established brands, no manufacturing costs, and marketing

and training support from a larger company come at a price, but may mean the difference between success and failure.

DIVERSIFICATION

Diversification, in corporate jargon, means participation in multiple industrial activities that do not move in concert as the economy goes up and down. Thus a company that is engaged both in construction and in lumber is *not* said to be diversified. If construction slumps, so will lumber. But a company with activities in travel destinations and video games is thought to be much more diversified. A slump that hurts vacation travel may encourage the activity of staying home and playing the latest game.

There are three main types of diversification: related, horizontal, and conglomerate. Related diversification includes additional products and services that are closely related to the original service of the small business, such as a wine business also selling wine glasses. Horizontal diversification deals with separate products that are designed to appeal to the same market, such as when a fashionable clothing store begins to offer the latest music hits. Conglomerate diversification occurs when businesses expand into completely different areas which are unrelated to their original market group or product.

Diversification may also be referred to as product-related and product-unrelated, two broader definitions that usually show the difference between businesses that are trying to develop operational synergy (by sticking with existing markets) and businesses that are trying to develop financial synergy (by creating conglomerates).

In actuality the history of corporations shows a cycle of fashions in which diversification is viewed positively in one part of the cycle and negatively in the other. Arguments are made for either. An environment that favors diversification emphasizes that "management" is a skill independent of *what* is managed; management therefore is seen as free to select the playing pieces on its boards to reflects its vision of the future. In an environment that favors "focus" (the popular term in the twenty-first century), emphasis is placed on management knowledge of an industry; the "core" business is emphasized; and diverse holdings are viewed as "distractions." Generally the attitudes and mindsets associated with diversification or concentration are influenced by corporate and stock performance and far less, if at all, by considerations of market needs and employment. Matters of the latter sort are always much more important to the small business which lives and operates at the community level. Diversification, therefore, has a different meaning for the small business.

CONCENTRATION

Concentration may be quite narrow. An example of such a company may be one that owns a single electric furnace that it operates with purchased scrap. Thus its business is steel-making and nothing else. Its well-being will be governed by such issues as distance of other suppliers, the price of steel globally, the going rate for scrap, for electric power, and the well-being of the companies that purchase its steel. If this company also made steel from iron ore in a Bessemer furnace, it would be more diversified: it would have two sources of raw material. If next it acquired the shipping company that transports its ore on the Great Lakes and bought a trucking company and several scrap dealers in its next expansion move, it would be more diverse yet. In the event of a softening in steel demand, it might be able to redeploy its transportation lines to carry other products. It might next innovatively transform its Bessemer slag into a gravel product and begin to sell it as road construction fill supporting this business by its transportation and by adding a wholly-owned plant for making reinforcing bar from its own steel. All of these moves would be considered "diversification," but the company would remain "concentrated" in and around the steel business.

Some of these moves are in the category of *vertical integration*, which is one type of diversification practiced by concentrated companies. Vertical integration brings under the company's own control activities it once purchased. The company now earns the margin produced by the this business. Integration, however, exposes the company to greater risk if the business as a whole has a turndown. Therefore vertical integration has its reverse implementation, called *outsourcing*: outsourcing may or may not be cheaper; it certainly provides greater flexibility.

DIVERSITY

At the other end of the spectrum may be the hypothetical IJK company which sells Florida time-share condos, operates a printing company that supports investment banking operations, has a banking subsidiary, owns a AAA ball club, a lumber mill, two construction firms, a cruise line, and a textile importer. It also owns IJK Canning, the original company in the diversification of which all these properties were acquired. Over time IJK has become transformed from a manufacturer to a conglomerate. Its many businesses have so little commonality that the company has become, in effect, a holding operation. The management skills involved in running IJK are almost exclusively financial. It operates as a kind of bank and measures its operations by return on investment (ROI). If ROI is growing steadily, IJK stock will be valued. But if the company's overall performance begins to slip, stock analysts will begin to question IJK's "coherence." If problems continue, the company may well begin shedding properties based on some formula. In due time, by keeping its condos, ball club, and cruise line, and adding a cluster or well-chosen multiscreen movie centers in well-known upscale suburbs across the country, it may emerge into coherence again as an entertainment company thus completing a cycle from extreme diversification to relative diversification, its management now marked by expertise in identifying major trends in recreational activities.

COMMON THEMES

Aside from diversification moves motivated by the likes, dislikes, or predilections of a leading personality or a management team and moves that are the result of a period of exuberance diversification is motivated by four structural issues common both to large and small businesses.

1. Cyclicality. Publicly traded companies typically aim at steady and predictable earnings. If they are in a highly seasonal business or if their performance is tied to economic cycles (like housing), they will attempt to diversify to remove cyclicality from their performance. A small business in the lawn and garden business may thus diversify into offering snow-removal equipment and use some part of its retail space in winter to sell Christmas decoration as a way of steadying employment.
2. Growth or Lack of Growth. A business may be engaged in an industry the nature of which limits growth. As Elizabeth McGowan reports in *Waste Age*, hazardous waste disposal is a current example. The industry is stable but its character is controlled by federal regulation. The industry, therefore, seeks diversification in order to grow. A small business may similarly find itself in a well-served market unable to expand except by adding some related product line to its business.
3. Defense. A business may find itself pressed by the absence of competition in its area for some component that it requires and must virtually sole-source through one vendor. Cost pressures may induce it to enter that business to lower its own costs and also to expand by providing its competitors another source.
4. Unusual Opportunity. Due to unplanned circumstances, a business may find itself in possession of an asset which may require diversification for its full exploitation.

DIVERSIFICATION AS ADAPTABILITY

From the small-business perspective diversification is a form of adaptability. Significant size was implied before diversification took on its more jargonized meaning of acquisitions and divestitures aimed at major transformations of the corporate profile and its image in the market. For the small business diversification moves will emerge as a natural by-product of operations, announcing themselves as problems (the weakening of a product or service line) or as opportunities (new ways of deploying existing resources). A good general rule for the small business is to diversify in relatively small steps from the well known to the lesser known until the new itself becomes a firm base for the next steps.

In some cases, small businesses can diversify more easily than larger companies, as long as they stay within their own market. Some small businesses have found their true niche by exploring other products and services related to the market in which they originally started. Diversification can also help smaller businesses survive slumps in growth or economic recessions. By diversifying into lower-cost products and services related to their original ideas, businesses can appeal to people who would not have spent money on the primary offering but are willing to buy low-cost goods or

services related to it. Entering into the coffee business, for instance, might save a small bookstore during an off season.

There are also programs and legislation designed to help small businesses diversify. In the United States there are few federal initiatives that focus on diversification, but states create their own programs to address specific economic concerns. Connecticut, for example, began its Small Business Innovation and Diversification Program in December 2009, which centers around a dollar for dollar matching grant system. The program, which is scheduled to run through 2011, grants money up to $25,000 to small businesses for the development of innovative technology and for branching out into related areas of their business. These programs tend to come with several requirements. In Connecticut, the business must have under 500 employees, and must remain in the state for at least 10 years after the grant is received.

DIVIDENDS

Dividends and stock repurchases are the two major ways that corporations can distribute cash to shareholders. Dividends might also be distributed in the form of stock (stock dividends and stock splits), scrip (a promise to pay in stock or cash at a future date), or property (typically commodities or goods from inventory).

By law, dividends must be paid from profits; dividends may not be paid from a corporation's capital. This law, which is designed to protect the corporation's creditors, is known as the impairment of capital rule. The law stipulates that dividend payments may not exceed the corporation's retained earnings as shown on its balance sheet. "Without the rule, a company that is in trouble might distribute most of its assets to stockholders and leave its debtholders out in the cold," wrote Eugene F. Brigham and Joel F. Houston in their 2007 book, *Fundamentals of Financial Management,*

Companies usually pay dividends quarterly. When the company is about to pay a dividend, the company's board of directors makes a dividend announcement that includes the amount of the dividend, the date of record, and the date of payment. The date of the dividend announcement is known as the declaration date. All shareholders on the date of record are entitled to receive the dividend.

The ex-dividend date is the first day on which the stock is traded without the right to receive the declared dividend. All shares traded before the ex-dividend date are bought and sold with rights to receive the dividend (also known as the cum dividend). Since it usually takes a few business days to settle a stock transaction, the ex-dividend date is usually a few business days before the record date. On the ex-dividend date the trading price of the stock usually falls to account for the fact that the seller rather than the purchaser is entitled to the declared dividend.

Corporate dividend policy is a sometimes underappreciated element of overall company strategy and financial planning. "It's difficult to generalize about dividend policy because it is usually very company-specific or

industry-specific, [but] some general observations are possible," wrote Frederic Escherich in *Directors and Boards*. "Dividend policy's most important uses are to: 1) return excess cash to shareholders; 2) effectively manage the company's cash needs and capital structure; and 3) credibly signal shareholders about future earnings prospects." Indeed, when a company puts together its dividend policy, it must decide whether to distribute a certain amount of earnings to the company's shareholders or retain those earnings for reinvestment.

Factors influencing dividend policy include legal constraints on declaring dividends (bond indentures, impairment of capital rule, availability of cash, and penalty tax on accumulated earnings), the nature of the company's investment opportunities, and the effect of dividend policy on the cost of capital of common stock. Most firms follow a dividend policy of issuing a stable or continuously increasing dividend. Relatively few firms issue a low regular dividend and declare special dividends when annual earnings are sufficient.

Among the arguments against dividends are that they tend to be taxed higher than capital gains. Since dividends come at the expense of share value, such as reinvesting in new equipment, higher taxes make dividends less attractive than leaving the money with the company to grow as capital. However, as H. Kent Baker noted in his 2009 book, *Dividends and Dividends Policy: History, Trends, and Determinants*, "Despite voluminous study, researchers have been unable to identify the 'true' relationship between dividend payments and stock prices." Consequently Baker advised against considering dividends and tax policy in isolation.

DOUBLE TAXATION

Double taxation refers to a situation where the same income, asset, or transaction is taxed twice. In the United States, double taxation usually refers to the practice of taxing a corporation's profits and then taxing dividends paid to shareholders on those profits. Double taxation can also refer to instances where two countries tax the same income, such as when an individual living in one country earns income in another. Most industrialized countries, including the United States, have agreements prohibiting this type of double taxation. Another form of double taxation occurs when different levels of government (federal, state, or municipal) impose taxes on the same transaction, such as real estate.

In the United States, double taxation affects C corporations when business profits are taxed at both the corporate and personal levels. The corporation must pay income tax at the corporate rate before any profits can be paid to shareholders. Then any profits that are distributed to shareholders through dividends are subject to income tax again at the recipient's individual rate. In this way, the corporate profits are subject to income taxes twice. Double taxation does not affect S corporations, which are able to "pass through" earnings directly to shareholders without the intermediate step of paying dividends. In addition, many smaller corporations are able to avoid double taxation by distributing earnings to employee/shareholders as wages. Still, double taxation has long been subject to criticism from accountants, lawyers, and economists.

Critics of double taxation would prefer to integrate the corporate and personal tax systems, arguing that taxes should not affect business and investment decisions. They claim that double taxation places corporations at a disadvantage in comparison with unincorporated businesses, influences corporations to use debt financing rather than equity financing (because interest payments can be deducted and dividend payments cannot), and provides incentives for corporations to retain earnings rather than distributing them to shareholders. Furthermore, critics argue, integration would simplify the tax code significantly.

HISTORY OF DOUBLE TAXATION

The U.S. federal government instituted double taxation on corporation profits as a deliberate strategy to check the growth and influence of "powerful pyramidal business groups," University of Alberta professor Randall Morck wrote in a 2005 paper in *Tax Policy & the Economy.* Such groups dominate corporate organization outside the United States, including Europe and Canada. Morck attributed that domination largely to the lack of double taxation on corporate profits.

"This taxation of intercorporate dividends creates a tax penalty on pyramidal corporate groups," Morck wrote.

This results in the vast majority of publicly traded U.S. firms being widely held. For example, 3M Corporation's largest shareholder in 2005 owned only 7.7 percent, and company officers owned just 1 percent.

"The U.S. tax on intercorporate dividends was largely responsible for producing the country's highly exceptional large corporate sector composed of freestanding, widely held firms," Morck wrote. He contrasted that with Europe, where "corporate groups allow wealthy individuals or families to control corporate assets worth vastly more than their actual wealth."

In 2003 the administration of George W. Bush sought to eliminate double taxation as one of the reforms in the Jobs and Growth Tax Relief Reconciliation Act (JGTRRA). Instead, the government reduced the individual dividend income tax rate to 15 percent, a reduction that expired in 2009.

AVOIDING DOUBLE TAXATION

There are many ways for corporations to avoid double taxation. For many smaller corporations, all major shareholders are also employees of those firms. These corporations are able to avoid double taxation by distributing earnings to employees as wages and fringe benefits. Although the individual employees must pay taxes on their incomes, the corporation can deduct those wages and benefits as business expenses, and thus is not required to pay corporate taxes on those amounts. For many small businesses, distributions to employee-owners account for all of the corporate income, leaving nothing subject to corporate taxes. Where income is left in the business, it is usually retained to finance future growth. Although this amount is subject to corporate taxes, these tax rates are usually lower than those paid by individuals.

Larger corporations which are more likely to have shareholders who are not employed by the business and who thus cannot have corporate profits distributed to them in the form of salaries and fringe benefits can often avoid double taxation as well. For example, a nonactive shareholder may be called a "consultant," since payments to consultants are considered tax-deductible business expenses rather than dividends. Of course, the shareholder-consultant must pay taxes on his or her compensation. It is also possible to add shareholders to the payroll as members of the board of directors. Finally, tax-exempt investors such as pension funds and charities are often significant shareholders in large corporations. The tax-exempt status of these groups enables them to avoid paying taxes on corporate dividends received.

C VERSUS S

Tax changes introduced by Congress in the 2003 and 2004 Tax Acts have created additional avoidance strategies available to C corporations with 100 or fewer stockholders. First, the laws reduced the top individual income tax rate from 39.5 to 35 percent, making it equivalent to the top corporate rate. Whether in a C or an S corporation, the stockholder paid the same rate. "S corporations are generally not subject to corporate income tax, but their shareholders must take into account their share of the S corporation's income," according to a 2009 news release from the U.S. Department of the Treasury. The 2004 Tax Act also permitted S corporations to have 100 stockholders, up from 75. With this change, all else equal, C corporations of the right "stockholder size" could convert to S corporations, pay the maximum personal and corporate rate on earnings (they are the same) and avoid the dividend levy of the C corporation form.

DRUG TESTING

Drug testing of employees is legally mandated in certain occupations. Corporations may also require that employees undergo drug testing before employment, at periodic intervals, or after an accident or incident. The usual drug test consists of supplying a urine sample, which is then analyzed in-house or by a commercial laboratory for specified drugs (such as marijuana, amphetamines, cocaine, or some other

substance). Tests are almost never exhaustive of all substances because of cost. Testing of the breath, saliva, or hair are alternatives. An employee's blood is almost never tested unless a medical situation has arisen. While drug testing is justified for safety reasons, it is rarely popular because it is intrusive. Opponents also charge that drug testing violates fundamental individual rights and can have a corrosive effect on workplace morale.

FEDERAL DRUG TESTING

Testing of transportation workers was mandated by the Omnibus Transportation Employee Testing Act (OTET) of 1991. According to the Department of Transportation (DOT), the act "requires drug and alcohol testing of safety-sensitive transportation employees in aviation, trucking, railroads, mass transit, pipelines and other transportation industries." The DOT states that roughly 12.1 million people are included under the "safety-sensitive" employee definition, but neither the department nor the regulation (49 Code of Federal Regulations, Part 40) actually spell out what that phrase means. It is left to each DOT element regulating the transportation industry to define such individuals. The phrase refers generally to operating and direct supervisory individuals in the transportation industry. Each regulatory agency also publishes separate regulations of how and when it conducts drug and alcohol tests.

In February 2010 the DOT proposed new rules to conduct initial testing for MDMA (Methylenedioxymethamphetamine, also know as ecstasy) and 6-Acetylmorphines as well as confirmatory testing for MDMA and MDEA (Methylenedioxyethylamphetamine). The changes, to take effect in May 2010, would also lower the test cutoff requirements for amphetamines and cocaine, and call for mandatory initial testing for heroin, according to a February 2010 posting by the DOT on the *Federal Register*. The new rules would align the DOT's drug testing with the U.S. Department of Health and Human Services testing requirements as required under the OTET.

CORPORATE DRUG TESTING

According to a 2006 *Time* article, the American Management Association reported in 2004 that 62 percent of companies had conducted employee drug testing. That was down from 81 percent in 1996, but up from 21 percent in 1987. The Seattle-based Institute for Corporate Productivity conducted a survey in 2009 of 246 respondents that found 95 percent of companies that screen for drugs do the screening before hiring. "Seventy percent test when there is 'reasonable suspicion' of drug use, 62 percent test following an employee accident, and 41 percent say they do random testing," said a news release from the institute. Ninety-five percent of companies that test use urine tests, while 10 percent use breath tests.

DRUG USE PATTERNS IN THE POPULATION

The U.S. government's Substance Abuse and Mental Health Services Administration's (SAMHSA) 2008 National Survey on Drug Use and Health involved interviews with about 67,500 Americans. A report on that survey estimated that 20.1 million Americans aged twelve or older, or about 8 percent of that population, had used illicit drugs in the preceding month. "Illicit drugs include marijuana/hashish, cocaine (including crack), heroin, hallucinogens, inhalants, or prescription-type psychotherapeutics used nonmedically." Marijuana was the most popular drug, with 15.2 million users. An estimated 1.9 million Americans over age twelve used cocaine in 2008, down slightly from 2.1 million the year before. An estimated 1.1 million used hallucinogens in 2008, including 555,000 who used ecstasy. About 6.2 million people engaged in nonmedical use of prescription-type drugs in the preceding month, according to the survey. In most areas, usage varied only slightly from what SAMHSA's 2007 survey reported.

The eighteen to twenty-five age group reported the highest incidence of drug use at 19.6 percent. The rate of illicit drug use among those aged twelve to seventeen had dropped significantly between 2002 and 2008, to 9.3 percent from 11.6 percent. For adults aged twenty-six or older, 5.9 percent reported illicit drug use in the previous month.

The survey report estimated that 22.2 million Americans (8.9 percent of those twelve or older) had a substance-abuse problem. That was virtually unchanged from the 22 million with such a problem in 2002. An earlier SAMHSA study estimated that in 2004, around 110 million people aged twelve or older had used illicit drugs during their lifetimes.

These data show that: 1) a large number of people use or have used illicit drugs; 2) the overwhelmingly dominant drug of choice is marijuana; and 3) other forms of drug use are extremely varied.

DRUG TESTING ISSUES

Drug testing may be an appropriate initiative for a small business experiencing problems in its workforce or in order to avoid costly problems in the operation of expensive and sensitive equipment. The business might also, because of contracting regulations, be required to institute such a program. Drug testing can also lower insurance costs. Advice in the establishment of such a program is available to the small business through the Substance Abuse and Mental Health Administration. The main issues to consider in planning such a program are the following:

Legality. Drug testing is legal and implicitly supported at the federal level by the 1998 Drug Free Workplace Act. The Act creates a right to work in a drug-free environment.

Drug testing may also be regulated at the state level. Researching such regulations should be an early step.

Test Criteria. The most common form of drug test is a urine test, although saliva or hair samples are sometimes used. Testing hair can detect past drug use, but the method is costly. Saliva testing is not now used in federal testing protocols, possibly because it cannot detect the presence of THC after 24 hours. (THC, or delta-9-tetrahydrocannabinol, is the active intoxicant in marijuana.) Most testing programs focus on a few drugs in order to avoid the high expenses of multiple tests. The hallucinogen LSD, for instance, cannot be detected in urine and requires expensive tests. For these reasons, also, conditions of the test need to be established in such a manner that costs can be predicted. The usual times of administration are: 1) before hire; 2) randomly throughout the year; and 3) following incidents or accidents. The testing plan needs also to define in advance if all employees will be tested or only certain categories of employees, such as heavy-equipment operators.

Costs of drug tests vary widely. According to a 2010 article in the *Dayton Daily News*, probation officers in Montgomery County, Alabama, conducted "almost 20,000 drug tests in 2009, using a five-panel, instant-read, cup at a cost of $1.50 a piece." Meanwhile, AccuSearch stated on its Web site in 2010 that it charges "$35 for a five-panel lab-based drug test that is added to any pre-employment screening package, and $40 for a drug test alone." Another company, Pre-Employment Drug Screening, said tests for small businesses generally run $50 to $70 and include "lab analysis and collection of the sample, laboratory analysis, services of a Medial Review Officer, and communications of the results in the manner most convenient to the employer."

Promulgation. The drug-testing program needs to be made a formal part of the company's employment policy and announced so that workers are well aware of the testing program and, above all, how positive results will be handled, before the program is instituted.

The Testing Protocol. The drug-testing program must have a well-designed protocol that will define where and how the test samples will be collected, how privacy will be preserved, and where the actual tests will be conducted. Lists of certified laboratories are available from SAMHSA. If testing is initially conducted in-house using commercially available testing kits, it is especially important to have arrangements for passing on non-negative results with samples to certified labs which can do more equipment-intensive testing (gas chromatography, mass spectroscopy).

Physician's Review. An employee might test positive because of his or her use of prescription medications. The availability of a medical review physician to look into such cases should be planned and made part of the total program.

DUE DILIGENCE

Due diligence is a program of critical analysis that companies undertake before making business decisions such as corporate mergers and acquisitions or major product purchases or sales. Due diligence can also refer to precautions taken to ensure workplace safety and compliance with environmental standards, as well as to procedures for investigating the value of potential investments.

Whether outsourced or executed in-house, due diligence aims to provide business owners and managers with reliable and complete background information on proposed business deals so they can make informed decisions about whether to go forward with the business action. "In a due diligence study, you verify the positive features of the business that prompted the study and pursue a search for defects and unknown aspects," Gordon Bing wrote in his 2008 book *Due Diligence: Planning, Questions, Issues.* The ultimate goal of such activities is to make sure that there are no hidden drawbacks or traps associated with the business action under consideration.

Many companies undertake the due diligence process with insufficient vigor. In some cases, the prevailing culture views it as a perfunctory exercise to be checked off quickly. In other instances, the outcome of the due diligence process may be tainted (either consciously or unconsciously) by owners, managers, and researchers who stand to benefit personally or professionally from the proposed activity. Businesses should be vigilant against letting such casual or flawed attitudes impact their own processes. An efficient due diligence process can save companies from making costly mistakes that may have profound consequences for the firm's other operational areas and its corporate reputation. "Comprehensive due diligence means attending to details, not avoiding searches to save money and time," wrote Randy Shain in his 2008 book, *Hedge Fund Due Diligence: Professional Tools to Investigate Hedge Fund Managers.*

AREAS OF DUE DILIGENCE

The due diligence process is applied in two basic business situations: 1) transactions involving sale and purchase of products or services; and 2) transactions involving mergers, acquisitions, and partnerships of corporate entities. In the former instance, purchase and sales agreements include a series of exhibits that, taken in their entirety, form due diligence of the purchase. These include sales, rental, and employment contracts, and inventory, customer, and equipment lists. These "representations" and "warranties" are presented to back up the financial claims of both the buyer and seller. The importance of this kind of due diligence has been heightened with the emergence of the Internet and other transforming technologies. Indeed, due diligence is a vital tool when a company is confronted with major purchasing decisions in information technology. "The technical due diligence should also allocate some time to understanding the development methodology and technologies used by the vendor for its system or product," wrote John Baschab and Jon Piot in their 2007 book, *The Executive's Guide to Information Technology.*

In cases of potential mergers and acquisitions, due diligence is a more comprehensive undertaking. "The track record of past operations and the future prospects of the company are needed to know where the company has been and where its potential may carry it," explained William Leonard in *Ohio CPA Journal.* The dramatic increase in information technology (IT) has complicated the task of due diligence for many companies, especially those engaged in negotiations to buy or merge with another company. System incompatibilities can require huge amounts of time, money, and personnel resources to integrate.

Leonard noted that traditional due diligence practices in acquisition/merger scenarios called for detailed examination of financial statements, accounts receivable, inventories, workers compensation, employment practices and employee benefits, pending and potential litigation, tax situation, and intellectual property before signing on the dotted line. But in a dynamic business environment, other areas should be looked at as well, including (if applicable): intellectual property rights, new products in the production pipeline, status of self-funded insurance programs, compliance with pertinent ordinances and regulations, competition, environmental practices, and background of key executives and other personnel.

The due diligence process should also incorporate objective self-analysis. "Self-analysis is the fundamental first step to realistically determine whether the post-acquisition 'whole' will be greater than the sum of its part," wrote Aaron Lebedow in *Journal of Business Strategy.* A detailed assessment of the market that is the target of the proposed acquisition should also be undertaken prior to closing a deal. Both of these requirements can be completed in a reasonable period, even in a fast-changing business environment, by companies that either: 1) outsource the due diligence task to a reputable research firm or; 2) build an efficient in-house program within their legal, marketing, or corporate security sectors. "Unquestionably, opportunities for growth through acquisition exist," Lebedow stated. "Exploiting these opportunities has risks, but to those companies that acquire only after a comprehensive and systemic assessment of the marketplace and competition, the rewards justify the risks. Limiting due diligence to financial and managerial review is rarely enough. Successful acquisition strategy depends on the structure and depth of the due diligence process."

SUPPLEMENTING DUE DILIGENCE

Growing numbers of businesses are pursuing additional legal protection so as to shield themselves from harm if their due diligence efforts fail to uncover a serious problem with a merger or purchase transaction. A popular means of mitigating such risks associated is to secure "representations and warranties liability insurance." These policies call for insurance underwriters to pay insured parties for losses resulting from various "wrongful acts." This umbrella term generally covers errors, misstatements, and misleading information, but underwriters do include exclusions, some of which should be noted by potential buyers. These include acts of "fraud" (if adjudicated in the courts), pollution (which is typically covered under separate policies), or situations in which a party has received benefits financial or otherwise to which it is not entitled. One significant benefit of "representations and warranties liability" policies, however, is the coverage can be used in place of reserves, escrow, or indemnity provisions that are included in purchase agreements.

Premiums for such policies can be expensive, especially for small and mid-sized firms. Moreover, securing such insurance is a time-consuming and painstaking process, for underwriters are putting themselves at considerable financial risk. "Premiums will be determined based on the risk and the comfort level of the underwriter," summarized Leonard. "It is most important that the process start early and not be left to a time when someone gets a 'feeling' things may not be entirely up to snuff. Although this type of coverage can be purchased after the closing, understandably the most beneficial time to place the coverage is during the due diligence phase preceding the closing."

DUE DILIGENCE AND VENTURE CAPITAL

The expression 'due diligence' has its origins in federal securities laws because of the 'rigorous obligations' those laws impose on public securities offerings, wrote Justin J. Camp in his 2002 book, *Venture Capital Due Diligence: A Guide to Making Smart Investment Choices*.

In venture capital, due diligence has a slightly different meaning because the transactions are private and typically outside the purview of federal securities law. "Companies issuing securities privately are not required to provide purchasers (read: venture capitalists) the same level of information they would if they were selling the same securities in the public markets," Camp wrote. Consequently, "venture capitalist due dilgence" refers to the hard work venture capitalists undertake to inform themselves about their prospective investments. This seldom involves a lot of number crunching, Camp wrote. Rather it focuses on asking pointed questions of the entrepreneurs, employees, partners, former employees, customers, marketing experts, and the like.

FINANCIAL COLLAPSE AND DUE DILIGENCE

The importance of due diligence was heightened in the wake of the financial industry's collapse and the 2008 Bernard Madoff scandal, according to the Web site of *Due Diligence Online*, which provides "Virtual Data Room Industry Solutions." (Madoff, a prominent New York investor, bilked clients of at least $50 billion in a pyramid scheme and was sentenced in 2009 to 150 years in prison for his crimes.)

"The usage of virtual data rooms for ongoing operations, rather than just for individual transactions, is going to substantially increase," *Due Diligence Online* stated. This was expected to become even more pronounced in the United States as the administration of President Barack Obama emphasized "compliance and transparency for financial transactions especially related to private equity and hedge funds."

E

ECONOMIC INDICATORS

Economic indicators assist investors, business people, economists, entrepreneurs, policy makers, and others in making decisions about matters such as purchases, hiring, capital investment, and business strategies. Among the indicators that these and other interested parties watch most closely are gross domestic product (GDP), new housing starts, consumer and producer price changes, inventories and sales, and stock indexes. There are, however, thousands of indicators to choose from, as Richard Yamarone noted in his 2007 book, *The Trader's Guide to Key Economic Indicators*. These range from fun indicators, like sales of men's underwear, to arcane ones, such as tracking sales of the plastics and paint additive titanium oxide against the demand for building materials. About 100 indicators are of importance to economists, wrote Richard Stutely in *The Economist Guide to Economic Indicators*, whereas Yamarone referred to a core of about 50 "consistently reliable indicators." As of March 2010, the Web site of the National Bureau of Economic Research had links to 230 indicators, ranging from the daily Federal Reserve release on commercial paper rates to annual indicators like the major work stoppages report of the Bureau of Labor Statistics.

TYPES OF INDICATORS

Economists divide economic indicators into three types: leading, coincident, and lagging. Leading indicators move in advance of the overall economy, sometimes by several months. Movements of coincident indicators occur in sync with the greater economy, while lagging indicators trail trends in the overall economy by as much as several months. Examples of leading indicators include housing starts, manufacturing orders, consumer expectations, and stock prices. Coincident, or concurrent, indicators include the gross domestic product (which measures a country's overall economy), total industrial production, and manufacturing and retail trade sales. Among the lagging indicators are the length of unemployment, labor costs per unit, the average prime rate, and outstanding commercial and industrial loans.

Leading indicators attract the most attention from investors, traders, policy makers, and other economy watchers because of their capacity to foreshadow trends. Some indicators have better records of success as predictors than others, but none are infallible. "Each (indicator) has drawbacks and may shed false signals of unforeseen shocks, faulty measures, or suspect collection processes," Yamarone wrote. For example, economists once believed, because it happened in the 1960s and 1970s, that when the unemployment rate dropped below 6 percent, inflation followed. Yet that proved wrong when unemployment dipped below 4 percent in the late 1990s and inflation also declined.

Indicators are also defined by their relationship to the business cycle. Procyclical indicators move with the economy while countercyclical indicators move opposite the economy. (Acyclical indicators have no relationship with the economy at all.)

Inflation and other factors can weaken the capacity of indicators to track trends. Consequently, many indexes of indicators are pegged to a baseline year to produce results in "constant" dollars or other monetary units to enable year-over-year comparisons. However, this results in other

distortions, which require either the introduction of new baselines years or other more complicated calculations such as "chain-weighting" of the GDP. Chain-weighting also has a shortcoming in that the subcomponents no longer add up.

The majority of economic indicators in most countries are produced by government agencies, such as the U.S. Department of Commerce's Bureau of Economic Analysis (BEA), using statistics compiled by those agencies themselves or by other government agencies, business organizations, or research institutions such as universities or think tanks. In the United States, as of 2010, the National Income and Product Accounts (NIPAs) of BEA provided the raw data for many of the most closely followed indicators.

Depending on the indicator, the data can be expressed in monetary terms, such as the value of building permits in a given period, or as expressions of sentiments, as in surveys of consumer expectations. Not-for-profit business organizations, chiefly the Conference Board, also prepare popular indexes of economic indicators, as do private companies, such as Standard & Poor's, which has been a division of the media conglomerate McGraw-Hill since 1966.

Release of the most prominent reports is tightly controlled so that none of the information can be leaked out in advance. This is because the data often includes surprises, such as unexpected spikes in unemployment, that can affect share prices of stocks and other publicly traded securities. For that reason, journalists wishing to review advance copies of these reports are literally locked up in secure rooms with those embargoed reports. Former *Time* magazine reporter Bernard Baumohl wrote about his experience in being in such a lock-up in the 2008 edition of his book, *The Secrets of Economic Indicators: Hidden Clues to Future Economic Trends and Investment Opportunities.* "Individuals getting such hot figures ahead of time can make a quick bundle of money, because they know something about which no one else in the financial markets is yet aware of," Baumohl explained.

Indexes can profoundly influence business decision making. For example, Yamarone cited a 2001 *Wall Street Journal* interview with a Ford Motor Company executive who admitted that a drop in the University of Michigan's index of consumer sentiment "played an important role" in the automaker's decision to cut production in North America.

BRIEF HISTORY OF ECONOMIC INDICATORS

The development of most modern economic indicators in the United States can be traced back to the 1930s, in the aftermath of the 1929 stock market crash and subsequent Great Depression. "Up until that time, there was no government agency calculating the most critical of economic statistics," Yamarone wrote. However, Yamarone also noted two indicators popular in 2008 that had earlier roots. *The Manufacturers' Shipments, Inventories, and Orders* survey, known as M3, grew out of the Department of Commerce's *Current Industrial Report*, which dates back to 1904. The second of these indicators, *Manufacturing ISM (Institute for Supply Management) Report on Business*, had its origins in the 1920s, when a predecessor organization of the ISM began periodic polling. Also, as early as 1922, the Federal Reserve introduced a monthly *Indexes of Domestic Business* report that measured fifty-five commodities in three indexes: agricultural movements, mineral products, and production of manufactured goods.

It was the Great Depression, though, that "forced the government to develop some sort of national accounting method," Yamarone wrote. He credited economist Simon Kuznets with pioneering that "national income accounting" for the Department of Commerce. Kuznets produced his first estimate in 1934 and his first report to Congress in 1937, covering the period from 1929 to 1935. It was not until July 1947, however, that Kuznet's National Income and Product Accounts (NIPAs) were presented formally, in a supplement to *Survey of Current Business.*

Since then, the indicators have grown in numbers and complexity, to reflect advances in economic thinking and in the economy itself. Not only are the figures themselves regularly updated but the BEA undertakes "benchmark revisions" every 5 years that include building new tables for new categories. "Obviously, there were times when CDs, microwave ovens, MP3 players, and DVDs didn't exist," Yamarone wrote.

THE GREATEST OF ALL INDICATORS

The gross domestic product (GDP) is widely regarded as the most important of all economic indicators. That is because, as its name suggests, it measures a country's entire domestic economic output for a given period. The key word is "domestic." Production outside the specific country is not included in GDP even of domestically owned companies. However, production by foreign-owned companies is counted. Consequently, Honda automobiles manufactured in the United States are included in U.S. GDP, whereas Mattel toys built in Mexico are not.

"Economists, policy makers, and politicians revere the GDP above all other economic statistics because it is the broadest, most comprehensive barometer available of a country's overall economic condition," Stutely wrote. Rising GDP per capita indicates economic expansion while falling GDP points to economic contraction.

GDP includes items that are final and produced. Components that go into the production of complex

equipment like automobiles, for example, are not counted individually. An exception is for replacement parts. For example, tires manufactured for tire stores are added to GDP but tires installed on new vehicles are not included. Resale of items are also excluded because they do not relate to present production.

GDP is calculated using the following formula: GDP=C+I+G+(X-M) with "C" representing personal consumption, "I" pertaining to gross private domestic investment, "G" standing for government expenditures and investment, "X" equaling exports, and "M" signifying imports.

One shortcoming is GDP is that it usually does not take into account the underground economy, also known as the black or shadow economy. Estimates of the size of this unreported economy "various enormously," Stutely wrote. In the United States, for example, those estimates range from 4 to 33 percent of GDP. For Germany, the estimated range is 2 to 28 percent. "Clandestine activity like this can understandably alter the estimate of several economic indicators but none more than GDP," Yamarone wrote.

A drawback of GDP is its lack of timeliness. In the United States, it is updated quarterly, with the first report released by the BEA at 8:30 A.M. Eastern Time, one month after the end of the quarter of record. It is then revised twice, with the final report coming two months after the initial one. For that reason, economic observers look for more timely proxies in attempting to predict the trends before the GDP reports reveal them.

GDP is not to be confused with gross national product (GNP), which counts foreign production by domestically owned companies but not domestic production by foreign-owned firms. The difference between the two measures is typically very small, however.

Another criticism of GDP is that it is not an accurate measure of human well-being because GDP blindly adds regrettable expenditures, such as oil spill cleanups, to the bottom line. In response to that, ecological economist Mark Anielski of Edmonton, Alberta, has devised what he calls "genuine progress indicators" that quantify such things as water quality, commuting time, problem gambling, savings rates, electricity usage, commuting times, and the suicide rate to create an index of well-being that he compares with GDP. Mainstream economists, like James Pesando of the University of Toronto, agree that the GDP has shortcomings. However, Pesando expressed skepticism that anyone will ever come up with a useful single measure of well-being because weighting the components of such an index is too subjective. "The efforts have been here for 40 years, they'll be here for another 40 years," he said in a 2010 article in *U of T Magazine*.

Different agencies and observers have their own favorite indicators. As of 2010, the Conference Board, for example, was producing three indexes that tracked a combined twenty-one indicators, including ten leading indicators. Since most of the data in the Conference Board's reports have already been released weeks or months before, economic watchers do not pay a lot of attention to those reports. They do, however, analyze them for their ability to predict long-term economic trends, according to Yamarone. The leading indicators are good at foreshadowing economic downturns perhaps too good. Famed economist Paul Samuelson has been widely quoted as observing, "Economists have correctly predicted nine of the last five recessions." As R. Mark Rogers noted in the second edition of *Handbook of Key Economic Indicators* in 1998, the Conference Board's leading index did predict four recessions that did not occur until 2 years later. However, he argued that those figures did accurately predict slowdowns and that the recessions did eventually happen.

EXAMPLES OF LEADING INDICATORS

Some well-known leading indicators are the employment situation, monthly employment, jobless claims, and the purchasing manager's index reports. These and other indicators are described below.

The Employment Situation Report. Released monthly by the Bureau of Labor Statistics, this report receives as much attention as any indicator. Yamarone referred to the first Friday of the month, when the BLS releases that report, as "the most important trading session of the month." It is so important that financial professionals "plan their vacations around its release." While the correlation between joblessness and the economy is not precise, unemployment figures do influence markets.

The Monthly Employment Report. This report is based on two surveys. The first, called the Current Population Survey, asks questions of 60,000 households. The second, called the Current Employment Statistics Survey, looks at payroll data from 400,000 work places. The latter is of more interest to investors.

"Both surveys have undergone refinements in sampling and reporting techniques, incorporating advances in computer-aided data-gathering and voice-recognition technologies," Yamarone wrote. "The result is that today we have a timely, accurate, and comprehensive indicator of labor-market conditions, reported from both the employees' and the employers' perspective." Like most indicators, the monthly employment report was a child of the 1930s, although the BLS did compile monthly studies of manufacturing industry payrolls as far back as 1915.

The Jobless Claims Report. Also known as the unemployment insurance weekly claims, this report is released on Thursdays by the Department of Labor. The short reporting period makes the numbers volatile; for that reason, they are seasonally adjusted and headlined as a 4-week moving average. State-to-state differences in eligibility requirements also distort these statistics, Yamarone noted.

The Purchasing Managers' Index (PMI) Report. Former Federal Reserve chairman Alan Greenspan is said to have called it his "desert island statistic." The PMI is the headline index of a monthly report by the Institute for Supply Management (ISM) of Tempe, Arizona. The Manufacturing ISM Report on Business is released on the first business day of every month. The PMI "often provides the earliest reading on changes in the economy's strength," noted Evan F. Koenig in a 2002 article in the *Federal Reserve Bank of Dallas Economic & Financial Policy Review.* Another feature is that it does not undergo large revisions. On the downside, it captures opinions of conditions only at the beginning of the survey month, so cannot detect shocks in the second half of the month. Nor does it weigh opinions according to the size of the firms surveyed. While it surveys only about 300 purchasing managers across the United States, the PMI has proven to reflect the broader economy. That is because those surveyed are responsible for major buying decisions, which ripple through the economy. Yamarone noted, for example, that the PMI "has shown an uncanny ability to predict recessions months before the National Bureau of Economic Research (NBER) declares them."

The New Residential Construction Report. Commonly referred to as "housing starts," this report is released by the U.S. Census Bureau and the U.S. Department of Housing and Urban Development (HUD) around the 15th of each month and references the preceding month. While house construction only accounts for about 5 percent of GDP, it greatly affects the investment variable of the GDP equation. Because of the expense involved, the rate of new house construction reflects overall consumer confidence. The building of new houses also stimulates other large purchasers such as furniture and appliances as owners outfit their new homes. Like many other economic indicators, the housing starts data are "seasonally adjusted" using a mathematical formula to account for regular and recurring swings in a given market at different times of the year. Seasonal variations also mean that economic watchers prefer to compare year-to-year figures (such as one February to another) rather by consecutive months.

Standard & Poor's 500. This index tracks the movement of 500 stocks, as the name suggests. It is considered a much more reliable barometer of the stock market than the Dow Jones Industrial Average, which tracks the stocks of only thirty blue-chip companies. With the advent of the Internet, the S&P Index is updated continually online. The speculative nature of stock trading and its susceptibility to panics and "irrational exuberance," in the words of Greenspan, undermine the stock market's value as an indicator of overall economic health. However, as the recession of 2008 and 2009 revealed, irrational market behavior can profoundly affect the economy. Rising markets indicate business growth and improved consumer confidence, while declining markets point to the opposite. In a March 2009 posting on his blog, investment professional Christopher Monoki of Reconnaissance Capital wrote that the S'P 500 is not a good leading indicator if the market is irrational. "Thus, at levels below 700 on the S'P 500 . . . stocks more than discount most current anxiety and future concerns, known and perhaps even unknown," Monoki wrote.

In the 2006 edition of *Using Economic Indicators to Improve Investment Analysis*, Evelina M. Tainer cited Geoffrey Moore, a business cycle expert, who observed that production costs rise, profits fall, and interest rates typically increase as business expansion slows down. Those factors cause stock prices to drop before the expansion stops. The lag is usually around 6 months, also on the upturn. Knowing the state of the stock market and business cycles aids investment decisions, Tainer wrote. "For example, to follow the adage 'buy low and sell high,' you could buy stocks of consumer durable goods companies (such as producers of automobiles or furniture) when the stock market is turning around *but* while the economy is still in recession."

Commodities Indexes. These track the markets for raw materials such as oil, lumber, metals, corn, and thousands of other commodities. Among the popular commodities indexes is the S&P GSCI, so-named because Standards & Poor's acquired the Goldman Sachs Commodity Index in 2007. Other commodities indexes include the Reuters CRB Index, the Dow Jones-UBS Commodity Indexes, and Rogers International Commodity Index. While commodities indexes are volatile and susceptible even to the weather, they do coincide with economic trends, such as inflation. The supply and price of individual commodities also affect industrial sectors that depend on those materials, such as cement and lumber in building construction.

The Thomson Reuters/University of Michigan Index of Consumer Sentiment. This index is built from monthly surveys of consumers conducted by the university's Survey Research Center. The surveys, which George Katana started in 1946, ask about fifty questions. As of 2010, about 500 consumers across the coterminous United States (the forty-eight states south of Canada, plus the District of Columbia) were being questioned each month. The surveys "have proven to be an accurate indicator of the future course of the national economy," according to a posting on the

university's Survey of Consumers Web site. As of April 2010, the Conference Board and ABC News also released indexes based on consumer surveys.

The Beige Book. This is the name given because of its color to the *Summary of Commentary on Current Economic Conditions*, which is published eight times a year by the Federal Reserve board. "Each Federal Reserve Bank gathers anecdotal information on current economic conditions in its District through reports from Bank and Branch directors and interviews with key business contacts, economists, market experts, and other sources," according to a 2010 posting on the Federal Reserve Board Web site. While the Beige Book contains no new information, it can offer clues to economic watchers trained in interpreting the jargon used in the report, according to a posting on www.investopedia.com.

The Yield Curve. Also called the interest rate spread, the yield curve measures the difference in the yield between short- and long-term securities. In the United States, the Conference Board measures the spread on 10-year Treasury bonds and the overnight interest rates that banks charge each on their loans. "The longer the term to maturity, the greater the chance something could happen to cause the issuer to default on bonds, thus raising the risk of exposure for the investors," Joel Magnuson wrote in his 2007 book, *Mindful Economics: How the U.S. Economy Works, Why It Matters, and How It Could Be Different.*

The Money Supply. This refers to the money in the economy. The Conference Board includes what is known as the M2 money supply, which is based on 1992 U.S. dollars adjusted for inflation, in its leading index. Changes in M2 are linked to inflation.

EXAMPLES OF COINCIDENT INDICATORS

The Industrial Production and Capacity Utilization Report is released in the middle of each month by the Federal Reserve board. It is one of the oldest measures of the U.S. economy, dating back to shortly after the founding of the Federal Reserve in 1913. Industrial production is procyclical and can be a proxy for the quarterly GDP report. However, while every recession since 1950 came with a drop in industrial production, there were occasions when a healthy economy coincided with sluggish industrial production.

The indexes that form the foundation of the industrial production and capacity utilization report are based on actual output, such as barrels of oil or tons of steel, and monetary dollar values. They are compared to a base year, which in 2010 was 2002. Economists estimate that the optimum rate for capacity utilization is around 85 percent, although it varies by industry. Lower levels indicate a recession whereas higher levels portend inflation.

Number of employees on Non-agricultural Payrolls. This statistic is found on the monthly Employment Situation report (see above) of the Bureau of Labor Statistics. The number accounts for over half the weight on the Conference Board's coincident index of four indicators. "Because the changes in this series reflect the actual net hiring and firing of all but agricultural establishments and the smallest businesses in the nation, it is one of the most closely watched series for gauging the health of the economy," the Conference Board explained on its Web site.

The Manufacturing and Trade Inventories and Sales Report. The U.S. Census Bureau collects data for this report from three separate surveys: the Monthly Retail Trade Survey, the Monthly Wholesale Trade Survey, and the Manufacturers' Shipments, Inventories, and Orders Survey. "The report is monitored in conjunction with a variety of other economic indicators to help gauge the direction and strength of the economy, and what the Federal Reserve might do next with short-term interest rates," according to the *Schwab Guide to Economic Indicators* in a November 2007 posting to its Web site.

EXAMPLES OF LAGGING INDICATORS

Three of the more common lagging indicators are the average duration of employment, average primerate, and changes in manufacturing cost per unit.

Average Duration of Unemployment. This indicator appears in a table in the monthly BLS Employment Situation report. Length of unemployment tends to lag behind the overall economy because of employers' reluctance to hire after a recession ends and the delay in reducing staff once a recession begins.

Average Prime Rate. The Federal Reserve board reports each month on the average rate banks charge each other for loans. The rate tends to move up or down with the federal funds overnight rate, which the Fed will raise or lower to regulate the economy. For that reason, the average prime rate lags behind changes in the overall economy.

Change in Manufacturing Labor Cost Per Unit. The Conference Board arrives at this indicator from various data sources including the Federal Reserve and the BEA. The index is calculated over 6 months because the monthly changes are erratic. However, the changes tend to be most pronounced during recessions because output drops faster than employers lay off workers.

OTHER INDICATORS

Many other indicators provide insight into the economy. These include sales and prices of new and existing houses, rates of mortgage delinquencies and foreclosures, inventory to sales ratios, and the *Economist* 's Big Mac Index, which in 2010 was comparing the cost of the hamburger to currency values in about 120 countries. The magazine calls it "arguably the world's most accurate financial indicator to be based on a fast-food item."

ECONOMIC ORDER QUANTITY (EOQ)

The Economic Order Quantity (EOQ) model was introduced in 1913 by Ford Whitman Harris in an article published in *Factory, The Magazine of Management*. The article was disseminated widely at the time, but the EOQ concept was not broadly embraced until its rediscovery in 1988. Today it serves as a standard tool for inventory management.

The Economic Order Quantity is the number of units that a company should add to inventory with each order to minimize the total costs of inventory such as holding costs, order costs, and shortage costs. The EOQ is used as part of a continuous review inventory system in which the level of inventory is monitored at all times and a fixed quantity is ordered each time the inventory level reaches a specific reorder point. The EOQ provides a model for calculating the appropriate reorder point and the optimal reorder quantity to ensure the instantaneous replenishment of inventory with no shortages. It can be a valuable tool for small-business owners who need to make decisions about how much inventory to keep on hand, how many items to order each time, and how often to reorder so as to incur the lowest possible costs.

The EOQ model assumes that demand is constant, and that inventory is depleted at a fixed rate until it reaches zero. At that point, a specific number of items arrive to return the inventory to its beginning level. Since the model assumes instantaneous replenishment, there are no inventory shortages or associated costs. Therefore, the cost of inventory under the EOQ model involves a tradeoff between inventory holding costs (the cost of storage, as well as the cost of tying up capital in inventory rather than investing it or using it for other purposes) and order costs (any fees associated with placing orders, such as delivery charges). Ordering a large amount at one time will increase a small business's holding costs, while making more frequent orders of fewer items will reduce holding costs but increase order costs. The EOQ model determines the quantity that minimizes the sum of these costs.

The basic EOQ relationship is shown below. Assume there is a painter using 3,500 gallons of paint per year, paying $5 a gallon, a $15 fixed charge every time he or she

orders, and an inventory cost per gallon held averaging $3 per gallon per year.

The relationship is TC = P×D + H×Q÷2 + S×D÷Q

- TC is the total annual inventory cost to be calculated.
- P is the price per unit paid assume $5 per unit.
- D is the total number of units purchased in a year assume 3,500 units.
- H is the holding cost per unit per year assume $3 per unit per annum.
- Q is the quantity ordered each time an order is placed initially assume 350 gallons per order.
- S is the fixed cost of each order assume $15 per order.

Calculating TC with these values, the total inventory cost is $18,175 for the year. Notice that the main variable in this equation is the quantity ordered, Q. The painter might decide to purchase a smaller quantity. If he or she does so, more orders will mean higher fixed order expenses (represented by S) because more orders are handled but lower holding charges (represented by H) because less room will be required to hold the paint and less money will be tied up in in-stock paint inventory. Assuming the painter buys 200 gallons at a time instead of 350, the TC will drop to $18,063 a year, for a savings of dollar;112 a year. That does not mean that reduced order quantities always translate into lower total costs. For example, if the painter lowers purchases to 150 at a time the results become unfavorable, with total costs increasing to $18,075. Where is the optimal purchase quantity to be found?

The EOQ formula produces the answer. The ideal order quantity comes about when the two parts of the main EOQ relationship HQ/2 and SD/Q are equal. The order quantity can be calculated as follows: Multiply total units (D) by the fixed ordering costs (S) 3,500 × $15 and get 52,500; multiply that number by 2 and get 105,000. Divide that number by the holding cost (H), which is $3 in this example, and get 35,000. Take the square root of that and get 187. That number is then Q.

In the next step, HQ/2 translates to 281, and SD/Q also comes to 281. Using 187 for Q in the main EOQ relationship, the total annual inventory cost is $18,061, the lowest cost possible with the unit and pricing factors shown in the example above.

Thus EOQ is defined by the formula: EOQ = square root of 2DS/H. The number for Q, 187 in this case, divided into 3,500 units, suggests that the painter should purchase paint nineteen times during the year, buying 187 gallons at a time.

The EOQ will sometimes change as a result of quantity discounts offered by some suppliers as an incentive to customers who place larger orders. For example, a certain supplier may charge $20 per unit on orders of less than 100 units and only $18 per unit on orders over 100 units. To determine whether it makes sense to take advantage of a quantity discount when reordering inventory, a small-business owner must compute the EOQ using the formula (Q = the square root of 2DS/H), compute the total cost of inventory for the EOQ and for all price break points above it, and then select the order quantity that provides the minimum total cost.

For example, say that the painter can order 200 gallons or more for $4.75 per gallon, with all other factors in the computation remaining the same. He must compare the total costs of taking this approach to the total costs under the EOQ. Using the total cost formula outlined above, the painter would find TC = PD + HQ/2 + S*D/Q = (5 × 3,500) + (3 × 187)/2 + (15 × 3,500)/187 = $18,061 for the EOQ. Ordering the higher quantity and receiving the price discount would yield a total cost of (4.75 × 3,500) + (3 × 200)/2 + (15 × 3,500)/200 = $17,187. In other words, the painter can save $875 per year by taking advantage of the price break and making 17.5 orders per year of 200 units each.

EOQ calculations are rarely as simple as this example shows. In practice they present many implementation issues, especially for small businesses. Specifically, EOQ strategies require continuous monitoring of inventory balances and frequent updating of both ordering and carrying cost information to ensure accurate knowledge of ordering costs per order and carrying costs per dollar of inventory. This can be particularly cumbersome if EOQ values are being calculated separately for each item in the product line. The small business with a large and frequently turning inventory may be well served by utilizing inventory software that applies the EOQ concept more complexly to real-world situations, helping to facilitate calculations and purchasing decisions. The business should be sure to test the accuracy of the software programming prior to actual inventory implementation. This must be done by manually checking the calculations using sample items that represent the variations inherent in the inventory base.

Whichever EOQ method is used strictly manual or sophisticated software it is important to consider both the short-term and long-term effects the calculation will have on warehouse space, cash flow, and operations and to respond accordingly. For instance, if the calculation calls for a substantial increase in inventory level, but the company's infrastructure cannot accommodate it right away, the EOQ formula should be temporarily adjusted until appropriate arrangements can be made to manage the added storage requirements and compensate for cash flow effects. Conversely, if the calculation shows inventory levels

dropping and order frequency increasing, it may be time to evaluate staffing, equipment, and process changes to handle the increased activity and to revise the assumptions in the formula. In addition to such reactionary revisions to the EOQ calculation, it is also essential to review the formula regularly (at least once per year). This will ensure that the calculation values order costs, carrying costs account for changes in interest rates, storage costs, and operational expenses.

ECONOMIES OF SCALE

Economies of scale refer to economic efficiencies that result from carrying out a process on a larger scale. In other words, when increased output leads to decreased costs, the result is an economy of scale. Scale effects are possible because in most production operations both fixed and variable costs are involved; the fixed costs (such as equipment operation) are not related to production volume, but the variable costs (like how many units are generated) are tied in. Large production runs therefore absorb more of the fixed costs than do short runs. An example is a traditional printing run. Setting up the run requires burning a plate after a photographic process, mounting the plate on the printing press, adjusting ink flow, and running five or six pages to make sure everything is set up correctly. The cost of setting up will be the same, or fixed, whether the printer produces one copy or 10,000. If the set-up cost is $55 and the printer produces 500 copies, each copy will carry 11 cents' worth of set-up cost. But if 10,000 pages are printed, each page carries only 0.55 cents of set-up cost. The reduction in cost per unit is an economy due to scale. Much the same thing happens when an author writes a book and gets it published. If the publisher pays the author a $10,000 advance and then only sells 25 copies, each book costs the publisher $400 in fixed cost and the publisher will lose a lot of money. If the book sells 5,000 copies, each carries $2 dollars in fixed cost, generating a significantly more favorable cost profile and much better potential for profit.

CONTRIBUTING FACTORS

Economies of scale can result from a variety of situations, mainly internal. The list below highlights some of the common contributors.

- Specialization. With training, workers can become highly proficient at specific tasks, enabling division of labor and increased efficiency.
- Capacity. High fixed costs, such as those associated with constructing a factory, are lower if the factory runs at peak capacity and churns out maximum product.
- Bulk purchasing. Purchasing larger quantities at one time reduces transportation and packaging costs.
- Overhead. Overhead costs can be lowered by merging operations and facilities where feasible. One office is cheaper to maintain than two.

SCALE AND LIMITATIONS

While beneficial, economies of scale do not offer endless opportunities. They have their limits. Economies of scale are closely tied to systems of production where something standardized is replicated many times or to fixed facilities that operate for a set number of hours per day, ranging from a few hours only up to 24 hours a day. Limitations are thus imposed by equipment capacity, time, and the nature of the product or service. For example, equipment cannot be in use longer than 24 hours per day. Similarly, internal staffs cannot effectively handle an ever-growing volume of transactions without eventually expanding the size of the allocated employee base. Type of service also plays a role. Heart bypass operations, although many thousands are performed every day, are always unique. A heart surgeon's personal action is involved and cannot be mechanically multiplied. Economies of scale are thus not available in heart surgery. Neither are they available in barber shops. In general, businesses or activities that provide unique services delivered *in person* are less able to generate economies of

scale. People who ultimately sell their time rather than something that they have made (which can be multiplied) tend to charge more for their time. The higher the skill level, the more they charge and volume discounts seldom apply.

SMALL BUSINESS AND SCALE

It is frequently repeated that small businesses have less opportunity to apply economies of scale for the simple reason that they are small and unlikely to be engaged in mass production. The generalization is true enough if economies of scale are viewed narrowly. In effect economies of scale are also available to small businesses, and they are becoming increasingly so as a consequence of modern developments in the services sectors and in technology.

Buying Services. Many small businesses achieve economies of scale by using external services rather than doing every job in-house themselves. Many small businesses, for example, purchase their payroll services from a large payroll company; they receive sophisticated services, including annual tax notifications, at a much lower cost than they could achieve by paying an internal payroll staffer. Accounting services are purchased similarly, often in combination with using a modern software program for keying in data at the company's location and having a professional accountant check and use the software for tax preparation purposes. The small business engaging the professional payroll clerk or accountant only uses a small portion of his or her time and pays only a small percentage of the professional's fixed costs. Any organization (like a payroll or accounting firm) servicing a large number of small businesses is, from the small business perspective, an "economy of scale."

Sharing Risks. A 2009 report from the Small Business Administration found that small businesses pay up to 18 percent more than large businesses for the same health insurance policies. The discrepancy, according to the report, is because big corporations can spread risk across a large pool of employees. In many locations across the country, chambers of commerce or other organizations, such as employer exchanges, offer health insurance services to small businesses. In these instances, the organization effectively becomes the "large-scale" purchaser of insurance on behalf of its members. It thus creates a large pool of people much more attractive to the insurance carrier, which enjoys the scale effect by dealing with a single purchaser. The small business enjoys an attractively low premium otherwise unavailable except by this participation, enabling it to gain leverage and economies of scale through association.

Scaling Through Technology. Developments in computers and the spread of the Internet have created economies of scale at low cost that the small business is able to exploit. Today a small business with a handful of employees, a few computers, and an Internet connection can deliver services that, in the 1950s, would have required some 200 employees. The Internet has enabled small operations to be much more productive in purchasing, marketing, hiring, data collection, accounting, selling for credit, desktop publishing, and a host of other areas.

updated by S. Miller, Anaxos

ECONOMIES OF SCOPE

Economies of scope are cost advantages that result when firms provide a variety of products rather than specializing in the production or delivery of a single product or service. Economies of scope also exist if a firm can produce a given level of output of each product line more cheaply than a combination of separate firms, each producing a single product at the given output level. Economies of scope can arise from the sharing or joint utilization of inputs, such as marketing and distribution strategies, that can lead to reductions in unit costs. For example, a sales force promoting and selling multiple products is able to spread the costs of advertising and travel time over a larger revenue base resulting in cost efficiencies compared to dedicating those dollars solely to the marketing and sale of one product. Similarly, economies of scope can be achieved through

shipping efficiencies resulting from bundling products for distribution to a specific location versus shipping individual product types to that location separately. Scope economies are frequently documented in the business literature and have been found to exist in industries ranging from healthcare and banking to publishing and telecommunications. Even business-to-business and e-commerce providers utilize economies of scope.

SCOPE VERSUS SCALE

Economies of scope differ from economies of scale. Essentially, economies of scale involve spreading fixed costs over a larger number of production units for the same product or service while economies of scope involve spreading the cost of set resources or skills over multiple product or service units. That being said, it must be recognized that economies of scope and economies of scale are not mutually exclusive. While economies of scope allow costs to be spread over several enterprises, the size of each enterprise can be modified to also achieve economies of scale. So a company that gains cost benefits from demand-side efficiencies associated with producing a more diversified product portfolio can also reap cost advantages from supply-side efficiencies arising from increasing single-unit production to certain levels.

METHODS OF ACHIEVING ECONOMIES OF SCOPE

Companies can target economies of scope in numerous ways. Some common tactics include:

Flexible Manufacturing. The use of flexible processes and flexible manufacturing systems has resulted in economies of scope because these systems allow quick, low-cost switching from one product line to another. If a producer can manufacture multiple products with the same equipment and if the equipment allows the flexibility to change as market demands change, the manufacturer can add a variety of new products to its current line. The scope of products increases, offering a barrier to entry for new firms and a competitive synergy for the manufacturer itself. The advent of computer-integrated manufacturing (which electronically unifies all production processes) also facilitates economies of scope because it reduces the time required for setup and tuning between products, making it economically efficient to produce small batches of nonstandardized products providing additional competitive advantage.

Related Diversification. Economies of scope often result from a related diversification strategy and may even be termed "economies of diversification." This strategy is made operational when a firm builds upon or extends existing capabilities, resources, or areas of expertise for greater competitiveness. According to M. A. Hill, R. D. Ireland, and R. E. Hoskisson in their best-selling strategic management textbook, *Strategic Management: Competitiveness and Globalization*, firms select related diversification as their corporate-level strategy in an attempt to exploit economies of scope between their various business units. Cost savings result when a business transfers expertise in one business to a new business. The businesses can share operational skills and know-how in manufacturing or even share plant facilities, equipment, or other existing assets. They may also share intangible assets like expertise or a corporate core competence. Such sharing of activities is common and is a way to maximize capabilities and limit constraints.

As an example, Kleenex Corporation manufactures a number of paper products for a variety of end users, including products targeted specifically for hospitals and health care providers, infants, children, families, and women. Their brands include Kleenex, Viva, Scott, and Cottonelle napkins, paper towels, and facial tissues; Depends and Poise incontinence products; Huggies diapers and wipes; Pull-Ups, Goodnites, and Little Swimmers infant products; Kotex, New Freedom, Litedays, and Security feminine hygiene products; and a number of products for surgical use, infection control, and patient care. All of these product lines utilize similar raw material inputs and manufacturing processes as well as distribution and logistics channels. They can also share marketing expertise and expense to maximize promotional efforts and impact.

Mergers. The merger wave that swept the United States in the late 1990s and the first decade of the twenty-first century was, in part, an attempt to create scope economies. Mergers may be undertaken for any number of reasons. "As a rule of thumb," explained Rob Preston in an article about the trouble with mergers, "'scope' acquisitions moves that enhance or extend a vendor's product portfolio succeed more often than those undertaken to increase size and consolidate costs." Pharmaceutical companies, for example, frequently combine forces to share research and development expenses and bring new products to market. Research has shown that firms involved in drug discovery realize economies of scope by sustaining diverse portfolios of research projects that capture both internal and external knowledge crossover.

Linked Supply Chains. Today's linked supply chains among raw material suppliers, other vendors, manufacturers, wholesalers, distributors, retailers, and consumers often bring about economies of scope. Integrating a vertical supply chain results in productivity gains, waste reduction, and cost improvements. These improvements, which arise from the ability to eliminate costs by operating two or more businesses under the same corporate umbrella, exist whenever it is less costly for two or more

businesses to operate under centralized management than to function independently.

The opportunity to gain cost savings can arise from interrelationships anywhere along a value chain. As firms become linked in supply chains, particularly as part of the expanding information economy, there is a growing potential for economies of scope. Scope economies can increase a firm's value and lead to increases in performance and higher returns to shareholders. Building economies of scope can also help a firm to reduce the risks inherent in producing a single product or providing a service to a single industry.

8(A) PROGRAM

The 8(a) Program is a Small Business Administration (SBA) program intended to provide assistance to economically and socially disadvantaged business owners. The initiative, which originated out of Section 8(a) of the Small Business Act hence its name provides participants with access to a variety of business development services, including the opportunity to receive federal contracts on a sole-source or limited-competition basis. The program has been an important one for thousands of minority entrepreneurs since its inception in 1968.

8(A) PROGRAM ELIGIBILITY REQUIREMENTS

Entrepreneurs seeking to gain entrance into the SBA's 8(a) program must meet a number of criteria in such areas as ownership, management, and likelihood of success.

- An applicant must qualify as a small business enterprise as defined by the Small Business Administration's rules and regulations.
- An applicant firm must be majority-owned (51 percent or more) by an individual(s) who is an American citizen. If the business is a corporation, "at least 51 percent of each class of voting stock and 51 percent of the aggregate of all outstanding shares of stock must be unconditionally owned by an individual(s) determined by SBA to be socially and economically disadvantaged," stated the Small Business Administration.
- Majority owners of the applicant firm have to meet the SBA definition of a socially and economically disadvantaged group. Socially disadvantaged individuals are defined by the SBA as those who have been subjected to racial or ethnic prejudice or cultural bias because of their identification as members of groups without regard to their individual qualities. Economically disadvantaged individuals, meanwhile, are defined by the SBA as socially disadvantaged people whose ability to compete in the free enterprise system has been diminished as a result of lesser capital and credit opportunities. Individuals from a broad array of social/ethnic groups have been designated as eligible for the 8(a) Program under the above criteria, including black Americans, Hispanic Americans, Native Americans, Pacific Americans, and members of other ethnic groups. Individuals who are not members of recognized socially disadvantaged groups may also apply, but the SBA notes that such applicants "must establish social disadvantage on the basis of clear and convincing evidence."
- Stock status is also considered. For example, a business may not claim to be unconditionally owned by socially/economically disadvantaged individuals if it makes that claim on the basis of unexercised stock options. Similarly, the SBA considers options to purchase stock held by nondisadvantaged entities when determining ownership.

- One 8(a) firm may not hold more than a 10 percent equity ownership interest in any other 8(a) firm. Moreover, no individual owner of an 8(a) firm, even if he or she qualifies as disadvantaged, may hold an equity ownership interest of more than 10 percent in another firm involved in the 8(a) program.
- According to the SBA, "the management and daily business operations of a firm must be controlled by an owner(s) of the firm who has been determined to be socially and/or economically disadvantaged. For a disadvantaged individual to control the firm, that individual must have managerial or technical experience and competency directly related to the primary industry in which the firm is seeking 8(a) certification . . . . for those industries requiring professional licenses, SBA determines that the firm or individuals employed by the firm must hold the requisite license(s)."
- At least one full-time manager who qualifies under SBA definitions as a disadvantaged person must hold the position of president or CEO in the company.
- The individual(s) claiming disadvantage must demonstrate that he or she personally suffered disadvantage, not just that the social or economic group of which he or she is a member has historically been considered to be disadvantaged. Moreover, the SBA stipulates that social disadvantage must be: 1) rooted in treatment received in American society, not other countries; 2) chronic and substantial; and 3) hindered the individual's entrance or progress in the world of business. Applicants can point to several kinds of experiences to demonstrate the above, including denial of equal access to institutions of higher education; exclusion from social and professional associations; denial of educational honors; social pressures that discouraged the individual from pursuing education; and discrimination in efforts to secure employment or professional advancement.
- Individuals claiming economic disadvantage cannot have a personal net worth in excess of $250,000, no matter what their origins are.
- Applicants have to show that they have been in business in the industry area to which they are applying for at least 2 years prior to the date of their 8(a) application. They can do this by submitting income tax returns showing revenues for those years.
- Applicants must be deemed by the SBA to have a good probability of success in the industry in which they are involved. In making this determination, the Small Business Administration considers many factors, including the technical and managerial abilities and experiences of the owner(s), the financial situation of the applicant firm, and the company's record of performance on prior federal and private sector contracts.

Businesses owned by white women may also be eligible for the program. Traditionally, these entrepreneurs had to demonstrate in strong terms that they had been discriminated against in the past because of gender, and that this discrimination had been sufficiently egregious to hinder their success in the business world. In the late 1990s, however, the SBA adjusted eligibility requirements to make it easier for white women-owned businesses to gain entrance into the 8(a) Program.

If a disadvantaged individual acquires a business that is enrolled in the 8(a) Program, he or she may be able to continue to maintain the firm's participation in the program, provided that prior approval was obtained by the SBA.

Certain kinds of businesses are ineligible for inclusion in the 8(a) Program. These include franchises of any kind, nonprofit organizations, brokers and packagers, and businesses owned by other disadvantaged firms. In addition, firms may be denied entry into the program for reasons of character. As defined by the SBA, demonstrations of "lack of character" may include any or all of the following:

- Adverse information regarding possible criminal conduct undertaken by the applicant or the firm's principals.
- Violations of SBA regulations.
- Debarment or suspension of firms or individuals.
- Evidence of lack of business integrity (such as indictments, pleas of guilt in legal cases, convictions for violations of legal behavior, adverse civil judgements, or out-of-court settlements).
- Evidence that the company knowingly submitted false information during the application process.
- Owners or other principals of the firm are currently in prison, on parole, or on probation for criminal activity.

Waivers of the "2-Years-In-Business" Requirement. Under certain circumstances, the SBA permits small businesses that have not yet been in operation for 2 years to participate in the 8(a) program. These mitigating circumstances include:

- Individual(s) making the application has "substantially demonstrated business management experience."
- Applicant has sufficient technical expertise in his or her chosen area of business to make it very likely that he or she will be able to launch and maintain a successful business.

- Applicant demonstrates enough capital to carry out his or her business plan.
- Applicant shows that he or she has the ability to obtain the necessary personnel, facilities, equipment, and other requirements to perform all duties and obligations associated with contracts available through the 8(a) Program.
- Individual(s) making the application has a record of successful performance of contract work in the past, provided that those contracts (which may be from either government or private clients) are in the primary industry category in which the applicant is seeking program certification.

APPLYING TO THE 8(A) PROGRAM

Applications to the SBA's 8(a) Program can be made through local SBA district offices or online via SBA's Web site. Small business owners will be asked to provide a wide range of materials, ranging from personal and business financial statements to organization charts, licenses, and schedules of business insurance. Prior to applying for the 8(a) Program, each firm is encouraged to take an online training course that explains the 8(a) Program in detail and culminates in an eligibility self-assessment test

Rulings on completed applications are generally made within 90 days. Not all applicants are accepted into the 8(a) Program, which has been a very popular one since its inception. If an application is turned down, the owner has the right to resubmit the application to the SBA with additional or changed information, but if the resubmitted application is still rejected, the owner may not present a new application until 12 months have passed from the date of the reconsideration decision. Finally, in cases where the applicant has been denied enrollment in the program solely because of questions about the applicant's social or economic disadvantage or majority ownership, then the owner may appeal the SBA's decision to that agency's Office of Hearings and Appeals. In this case, however, the applicant may not change the application in any way.

8(A) CONTRACT ELIGIBILITY AND SUPPORT

In fiscal 2008 participating small businesses received more than $16 billion in 8(a) contracts. However, companies that are accepted into the 8(a) Program are not eligible for 8(a) contracts until they submit and receive approval from the SBA for their business plan. "After the firm has an approved plan, the length of time before the first 8(a) contract is awarded will vary based on the success of the firm's marketing efforts," said the SBA. "While SBA will make every effort to assist a firm with its marketing efforts, the 8(a) Program is a self-marketing program and SBA cannot guarantee 8(a) contract awards."

In addition to marketing assistance, participants in the 8(a) Program receive help in the following areas during both the developmental stage (first 4 years) and transitional stage (next 5 years) of their involvement. During the developmental stage, program participants can look forward to sole-source and competitive 8(a) Program support, transfer via grants of technology or surplus property owned by the United States, and training to enhance entrepreneurial skills in a variety of areas. During the transitional period, meanwhile, small-business owners can look forward to continued aid in the above areas, as well as assistance from procuring agents in forming joint ventures and technical assistance in planning for graduation from the 8(a) Program.

8(A) BUSINESS DEVELOPMENT MENTOR PROTÉGÉ PROGRAM

In 1998 the SBA introduced a Business Development Mentor-Protégé Program meant to help improve the fortunes of 8(a) participants seeking federal government contracts. Mentors which may include graduates of the 8(a) Program, firms in the transitional stage of that program, or other businesses are required to demonstrate the ability to assist the protégé company for at least 1 year. Mentor companies also are required to be in good financial health and be existing federal contractors in good standing.

Companies interested in entering the program as protégé firms, meanwhile, must be in the developmental stage of the 8(a) business development program, unless they have never received an 8(a) contract or are of a size that is less than half the standard size for a small business in their primary industry of operation. Protégé companies also must be qualified for inclusion in the 8(a) Program in all other respects and be current with all reporting requirements.

Ideally, benefits of this special 8(a) Program to the protégé firm which can have only one mentor at a time will include technical and management assistance; options to enter into joint-venture business agreements with mentor firms to compete for government contracts; financial assistance in the form of equity or loans; and qualification for other SBA assistance programs.

8(A) PROGRAM ENHANCEMENTS

In November 2009 the SBA announced proposed modifications aimed at enhancing the 8(a) Program. According to SBA Administrator Karen Mills, the changes spring from the program's "ldquo;foundation of success." Mills explained that, "The 8(a) Program has a proven record as an effective program for helping disadvantaged small businesses gain access to training and contracting opportunities to help them grow, create jobs, and ultimately succeed in the marketplace once they graduate from the program."

The proposed improvements include adjustments to how assets, gross income, and retirement savings are addressed when assessing whether a company is economically disadvantaged. For example, retirement account assets would be excluded from the net worth calculations that are used in admitting businesses to the program. The intent is to broaden the program's reach. In addition, ownership and control requirements would be modified to allow greater flexibility in admitting immediate family members of current and former 8(a) participants into the program. Another significant change would involve joint venture requirements. Firms would need to perform at least 40 percent of the work on joint ventures, rather than subcontracting it out to larger businesses.

ELASTICITY

Elasticity is a measure of the responsiveness of one economic variable to another. For example, advertising elasticity is the relationship between a change in a firm's advertising budget and the resulting change in product sales. Economists are often interested in the price elasticity of demand, which measures the response of the quantity of an item purchased to a change in the item's price. A good or service is considered to be highly elastic if a slight change in price leads to a sharp change in demand for the product or service. Products and services that are highly elastic are usually more discretionary in nature readily available in the market and something that consumers may not necessarily need in their daily lives. On the other hand, an inelastic good or service is one for which changes in price result in only modest changes to demand. These goods and services tend to be everyday necessities.

Elasticity measures are reported as a proportional or percentage change in the variable being studied. The general formula for elasticity, represented by the letter "E" in the equation below, is:

$$E = \text{percent change in x} \div \text{percent change in y.}$$

Elasticity can be zero, one, greater than one, less than one, or infinite. A situation is said to be perfectly elastic when any change in *y* results in no change in *x*; elasticity is zero. When elasticity is equal to one there is unit elasticity. This means the proportional change in one variable is equal to the proportional change in another variable; in other words, the two variables are directly related and move together. When elasticity is greater than one, the proportional change in *x* is greater than the proportional change in *y* and the situation is said to be elastic.

When elasticity is less than one or is infinite, inelastic situations result. For instance, when the proportional change in *x* is less than the proportional change in *y* elasticity is less than one and the situation is considered to be inelastic. Perfectly inelastic situations result when any change in *y* will have an infinite effect on *x*.

ELASTICITY FOR MANAGERIAL DECISION MAKING

Economists compute several different elasticity measures, including the price elasticity of demand (how price changes influence demand), the price elasticity of supply (how price changes influence supply), and the income elasticity of demand (how income changes influence demand). Elasticity is typically defined in terms of changes in total revenue since that measure is of primary importance to CEOs, managers, and marketers.

Price Elasticity of Demand. For managers, a key point in discussions of demand is what happens when they alter the prices of their products and services. It is important to know the extent to which a percentage change in unit price will affect the demand for that product. The greater the price elasticity, the more sensitive consumers are to price modifications. A very high price elasticity suggests that when the price of a good or service goes up, consumers will buy much less of it, and when the price goes down they will buy much more. A very low price elasticity suggests the opposite, with price changes having little

influence on demand. With elastic demand, total revenue will decrease if the price is raised. With inelastic demand, however, total revenue will increase if the price is raised.

The possibility of raising prices and increasing dollar sales (total revenue) at the same time is very attractive to managers. This occurs only if the demand curve is inelastic. Here total revenue will increase if the price is raised, but total costs probably will not increase and, in fact, could go down. Since profit is equal to total revenue minus total costs, profit will increase as price is increased when demand for a product is inelastic. It is important to note that an entire demand curve is neither elastic nor inelastic; it only has the particular condition for a change in total revenue between two points on the curve (and not along the whole curve).

Demand elasticity is affected by three things: 1) availability of substitutes; 2) the urgency of need, and 3) the importance of the item in the customer's budget. Substitutes are products that offer the buyer a choice. For example, many consumers see corn chips as a good or homogeneous substitute for potato chips, or see sliced ham as a substitute for sliced turkey. The more substitutes available, the greater will be the elasticity of demand. If consumers see products as extremely different or heterogeneous, however, then a particular need cannot easily be satisfied by substitutes. In contrast to a product with many substitutes, a product with few or no substitutes like gasoline will have an inelastic demand curve. Similarly, demand for products that are urgently needed or are very important to a person's budget will tend to be inelastic.

Price Elasticity of Supply. The price elasticity of supply is used to assess how sensitive the supply of a product or service is to a pricing change. The greater the price elasticity, the more sensitive producers and sellers are to price changes. A very high price elasticity implies that when the price of an item or service increases, sellers will supply significantly less of it, and when the price goes down, sellers will supply substantially more. With very low price elasticity, price alterations have little influence on supply.

The main determinants of price elasticity of supply are the ability of suppliers to modify output and the time horizon. In terms of the former, consider that the easier it is for suppliers to change their output, the more elastic supply will be for that product. For example, the supply of fine art is fixed because artists cannot produce beyond their lifespan, meaning the supply is essentially inelastic. In regard to time horizons, the price elasticity of supply for most products is more elastic over the long-term than in the short-term because an extended time horizon gives suppliers more opportunities to alter their output of an item.

Income Elasticity of Demand Income elasticity of demand helps reveal how sensitive the demand for a product or service is to changes in consumer income. The higher the income elasticity, the more sensitive demand is to income changes. Given a very high income elasticity, consumer purchases for certain products are likely to rise when income rises. A very low price elasticity suggests the opposite, that changes in a consumer income have insignificant influence on demand.

The types of goods influenced by income elasticity of demand include necessity goods, luxury goods, and inferior goods. An item is considered a necessity if its income elasticity is positive, but less than one. For example, if income increases by 10 percent, the quantity demanded rises by less than 10 percent; consumers spend a smaller percentage of their income on necessities. An item is classified as a luxury good if its income elasticity is positive, and greater than one. This means that if income rises by 10 percent, the quantity demanded grows by more than 10 percent; consumers spend a bigger percentage of their income on luxuries when they have larger incomes. An item is deemed inferior if its income elasticity is negative; when income rises, quantity demanded falls.

It is important for managers to understand the elasticity of their products and services in order to set prices and market goods appropriately to maximize profits and revenues.

ELDERCARE

Eldercare is an important issue for many members of today's work force, and is thus a relevant matter for employers to study as well. Analysts contend that many businesses lose valuable production from the estimated 30 percent of working Americans who have to contend

with the needs of elderly parents and other relatives, and they point out that America's changing demographics are likely to make this an even more important issue for employers and employees in the coming years. "Eldercare is the next big wave washing over the workplace," wrote Jill Mazullo in *Minneapolis-St. Paul CityBusiness*. "Many workers are faced with taking on caregiving duties for an aging parent, spouse, or sibling who needs assistance with grocery shopping, medical visits, bathing, and more. Some caregivers spend upwards of 20 hours a week with a family member in need. The emotional toll is difficult to quantify, particularly when care for a loved one with Alzheimer's disease or dementia is involved. Add that to a full-time job, and you've got a career crisis in the making."

Eldercare receives far less publicity than does childcare, another very important issue to workers. But as Elise Feuerstein Karras noted in *Small Business Reports*, "in many ways, eldercare is more complex than childcare because it covers such a wide range of needs. Many elderly people need assistance with routine tasks such as eating, dressing, bathing and obtaining medical care. But as adults, they also need to pay their bills, access Social Security benefits and deal with legal matters such as estate planning. Employees may have to help with these tasks or arrange for others to do it sometimes for relatives who live far away." Karras added that the level of dependency that older relatives have for caregivers also increases with time, while the opposite is true of childcare. Finally, she pointed out that caregivers for elderly parents and relatives often have to tread a fine, and sometimes exhausting, line between diplomacy and control: "The balance of authority between employees and their parents can make the [eldercare] arrangements awkward. An employee with children can simply make any necessary arrangements because he or she has the authority to do so. But the grown son or daughter of an elderly person must obtain the parent's consent before arranging for care."

IMPACT OF ELDERCARE OBLIGATIONS ON EMPLOYEE PERFORMANCE

In many instances, obligations associated with providing eldercare can become a considerable drain on an employee's productivity. According to a 2010 study by the Metlife Mature Market Institute, the average health care costs for an employee providing eldercare are 8 percent higher than those of an employee not required to provide eldercare, resulting in an estimated $13 billion in employer expenses. This is because employees providing eldercare are prone to developing chronic diseases from stress or lack of proper care for their own health. Another 9 percent leave the workforce altogether, through early retirement or resignation, in order to fulfill their eldercare duties. When these sorts of situations develop, small-business owners and other employers are faced with the loss or diminished value of a productive, trained employee and in cases where those obligations force a departure additional costs associated with finding and training a replacement.

But the obligations associated with eldercare are felt in other ways, too. Workers who provide assistance to their elderly parents or other relatives are likely to take off several days each year to attend to routine care issues. The MetLife survey confirmed this condition, noting that more than 60 percent of respondents responsible for eldercare reported having to leave work early, call in sick, or reduce their working hours in order to accommodate eldercare. Some employers might comfort themselves by observing that those vacation days are not unexcused absences, but they should recognize that losing vacation time for this reason can have a negative impact on employee morale and, ultimately, performance. Moreover, partial absenteeism late arrivals, long lunch breaks, early departures can take a heavy toll as well. But Tibbett L. Speer contended in *American Demographics* that even bigger problems for employers are "the workday interruptions faced by caregivers who talk on the phone with loved ones and service providers. This situation can arise even with employees who don't physically care for parents or whose parents live elsewhere. Estimated at one hour per week per caregiver, this factor is the biggest drain of all on employee productivity."

SMALL BUSINESS AND ELDERCARE BENEFITS

Many small-business owners operate under the assumption that they can provide little assistance to employees who are grappling with eldercare issues. In reality, however, business experts say that both small and large companies can take several relatively inexpensive measures to help their staffers out and, in the long run, help them reach or return to high levels of productivity. Indeed, "by helping employees balance work and family responsibilities, elder care benefits can have a positive effect on employee attendance and productivity," observed *HR Magazine*. "Elder care benefits also support recruitment and retention efforts."

Possible eldercare benefits feasible for small businesses include the following:

Information services. An inexpensive way in which employers can help employees with eldercare problems is to offer resource and referral hotlines for such services and subjects as adult day care, nursing home evaluation, insurance issues, and "meals on wheels." Finding such information can be a time-consuming process for employees, and the establishment of a small in-house resource center that contains contact information can save workers significant

hassles. In addition, many resource and referral services offer one-on-one counseling and seminars, many of which can be arranged to take place at the business's facilities. These seminars and counseling sessions can provide employees with important information on such diverse issues as nursing home care, Medicare and Medicaid, legal issues, and Alzheimer's disease. However, it should be noted that the popularity of eldercare referral services declined by more than 50 percent between 2006 and 2009, with only 11 percent of corporations offering such a service in 2009.

Incorporate Into Existing Assistance Programs. Many companies have chosen to integrate eldercare benefits with existing employee assistance plans.

Flexible Work Schedules and Telecommuting. Employers have a variety of options from which to choose, including job sharing, compressed work weeks, and work-at-home arrangements. Allowing for flexibility with start and end times for work shifts, when possible, can help reduce call-ins and tardiness while also providing a benefit to the caregiver. In addition, some small-business owners have loosened vacation and sick day policies, blending them together into so-called personal days, better to accommodate employees with eldercare obligations.

Financial Benefits. Employers should consider setting up dependent care assistance programs (DCAPs) for their employees. Under this plan, employees who have elderly dependents living with them can gain assistance in paying for various eldercare expenses. Funds are regularly withheld from the paychecks of participating employees, who then bill the plan and receive reimbursements for eldercare expenses. "The result," noted Karras, "is that employees don't pay income or Social Security taxes on the DCAP funds. Your company saves as well because it won't owe Social Security and unemployment taxes on the money they set aside." Business consultants note, however, that businesses that set up DCAP plans do run into administration expenses, whether they choose to administer the program themselves or hire an outside firm to do so.

Wellness Programs. Rather than concentrating on assisting with eldercare, another strategy is to provide wellness programs for the caregiving employee. This will help to improve the employee's overall health and state of mind, which can result in lower costs for treating chronic illnesses and can reduce absenteeism. Wellness programs may include stress reduction classes, exercise programs, and rewards for participating in preventative services like annual physical exams (which can also reduce insurance premiums).

INTERGENERATIONAL CARE

Another trend that is shaping the way in which employees and employers approach eldercare is the increased popularity of intergenerational care facilities. These programs allow working parents who also have obligations to care for their own parents to place both children and elderly relatives in a single facility, where they will be cared for. Given the steady growth of women in the workplace and the success that many hospitals, child care centers, and nursing homes have had with intergenerational care programs, many analysts believe that the availability of such facilities will continue to grow, especially in regions in which competition for labor talent is intense. Indeed, demographic trends would seem to guarantee the continued growth of intergenerational care facilities. A 2004 study conducted by the National Alliance for Caregiving and American Association of Retired Persons (AARP) showed that 21 percent of adults (eighteen and older) provided unpaid aid to friends and relatives; the caregiving population thus was more than 44 million people. Sixty-one percent of caregivers were women, 39 percent were men. Such statistics indicate that businesses seeking to attract and retain top talent will not only examine child care assistance options in greater depth, but will also factor the elder care issue into their analysis of options with increasing frequency.

ELDERCARE RESOURCES

Employees and employers can turn to a variety of sources for information on dealing with the many financial, medical, and personal aspects of eldercare. Local hospitals, churches, and agencies on aging are often good sources of information on eldercare issues. In addition, several national organizations maintain a variety of services and information on the subject. Notable organizations include the American Association of Retired Persons (202-434-3525), the Alzheimer's Association (800-272-3900), and the American Association of Homes and Services for the Aging (202-783-2242). Another good source of information is the Eldercare Locator (800-677-1116), a federally funded hotline operated by the National Association of State Units on Aging and the National Association of Area Agencies on Aging.

ELECTRONIC DATA INTERCHANGE

In the quest to achieve a paperless society, electronic data interchange (EDI) has long been a leading technology. Ralph W. Notto, a leading chronicler of electronic commerce, has noted that EDI is and has been an essential component in such commerce. EDI predates the emergence of the Internet, now the chief electronic network connecting just about every business to every other. The first implementations of EDI were internal to companies, used private networks, and enabled a multilocation company to use a common accounting system regardless of location. Earliest uses of EDI were also heavily deployed to track parts inventories within a business but also between a producer, its distributors, and, in turn, the dealers served by the distributors. These private networks were full-grown implementations of EDI in the sense that data were exchanged by means of wired or wireless networks and kept data in live format and therefore instantly accessible.

With the spread of small computers, EDI in the less automated form of exchanges of data on tape and on diskettes (and later on CDs) came into widespread use. This technique is still widely used in the exchange of electronic files between systems using the Internet. Many EDI systems in use in the 2010s remain private and move data through private networks; many others utilize proprietary software, but the software uses Internet connections; yet other forms are special arrangements for data sharing making use of standard methods of Internet exchange. Large systems today invariably involve data encryption to ensure data security.

The driving force behind EDI is efficiency made possible by avoiding the handling and rekeying of data on paper. Electronic scanning of bar codes at the point of sale or in inventory taking and document scanning technologies combined with improvements in optical character recognition (OCR) systems have further contributed to EDI by replacing keying of some documents. Data capture, however, is still accomplished predominantly by human keying. A human interface is also typically necessary to check OCR results.

Electronic data interchange had its beginnings in the management of financial data. The technique, however, is rapidly expanding to documentary information and, in such areas as security and law enforcement, also to biometric data.

BENEFITS OF EDI

EDI was developed to solve the problems inherent in paper-based transaction processing and in other forms of electronic communication. In solving these problems, EDI is a tool that enables organizations to reengineer information flows and business processes. It directly addresses several problems long associated with paper-based transaction systems:

- Time delays. Paper documents may take days to transport from one location to another, while manual processing methodologies necessitate steps like keying and filing that are rendered unnecessary through EDI.
- Labor costs. In non-EDI systems, manual processing is required for data keying, document storage and retrieval, sorting, matching, reconciling, envelope stuffing, stamping, and signing. While automated equipment can help with some of these processes, most managers will agree that labor costs for document processing represent a significant proportion of their overhead. In general, labor-based processes are much more expensive in the long term than are EDI alternatives.
- Accuracy. EDI systems are more accurate than their manual processing counterparts because there are fewer points at which errors can be introduced into the system.
- Information Access. EDI systems permit myriad users access to a vast amount of detailed transaction data in a timely fashion. In a non-EDI environment, in which information is held in offices and file cabinets, such dissemination of information is possible only with great effort, and it cannot hope to match an EDI system's timeliness. Because EDI data

is already in computer-retrievable form, it is subject to automated processing and analysis. It also requires far less storage space.

INFRASTRUCTURE FOR EDI

Several elements of infrastructure must exist in order to introduce an EDI system, including: 1) format standards to facilitate automated processing by all users; 2) translation software to translate from a user's proprietary format for internal data storage into the generic external format and back again; 3) value-added networks to solve the technical problems of sending information between computers; 4) inexpensive computers to bring all potential users even small ones into the market; and 5) procedures for complying with legal rules. It has only been in the past several years that all of these ingredients have fallen into place.

Format Standards. To permit the efficient use of computers, information must be highly organized into a consistent data format. A format defines how information in a message is organized: what data go where, what data are mandatory, what is optional, how many characters are permitted for each data field, how data fields are ordered, and what codes or abbreviations are permitted.

Early EDI efforts in the 1960s used proprietary formats developed by one firm for exclusive use by its trading partners. This worked well until a firm wanted to exchange EDI documents with other firms that wanted to use their own formats. Since the different formats were not compatible, data exchange was difficult if not impossible. To facilitate the widespread use of EDI, standard formats were developed so that an electronic message sent by one party could be understood by any receiver that subscribes to that format standard. In the United States the Transportation Data Coordinating Committee began in 1968 to design format standards for transportation documents. The first document was approved in 1975. This group pioneered the ideas that are used by all standards organizations today.

North American standards are currently developed and maintained by the American National Standards Institute (ANSI), a volunteer organization. The format for a document defined by ANSI is broad enough to satisfy the needs of many different industries. Electronic documents are typically of variable length and most of the information is optional. When a firm sends a standard EDI purchase order to another firm, it is possible for the receiving firm to pass the purchase order data through an EDI translation program directly to a business application without manual intervention. In the 2010s, international format standards were in force to facilitate international business activity as well.

Translation Software. Translation software makes EDI work by translating data from the sending firm's internal format into a generic EDI format. Translation software also receives a sender's EDI message and translates it from the generic standard into the receiver's internal format. There are currently translation software packages for almost all types of computers and operating systems.

Value-Added Networks (VANs). When firms first began using EDI, most communications of EDI documents were internal or directly between trading partners. Unfortunately, direct computer-to-computer communication requires that both firms: 1) use similar communication protocols; 2) have the same transmission speed; 3) have a common proprietary network; and 4) have compatible computer hardware. If these conditions are not met, communication becomes difficult if not impossible. A value-added network (VAN) can solve these problems by providing an electronic mailbox service. By using a VAN, an EDI sender need only learn to send and receive messages to or from one party: the VAN. Since a VAN provides a very flexible computer interface, it can communicate with virtually any type of computer. This means that to conduct EDI with hundreds of trading partners, an organization only has to communicate with one party. In addition, VANs provide important security elements for dissemination of information between parties.

Some information technology specialists believe that in the future, EDI will not require a VAN, but will be implemented via the Internet through cloud computing. Cloud computing involves the use of computing and network resources that are provided over the Internet in an on-demand framework. Businesses do not have to maintain their own physical network resources, and can increase or decrease the available resources based on the needs of the business. This option is also more cost-efficient, though some business owners may be wary of allowing critical pieces of their business processes to be maintained outside the physical space of the company.

Inexpensive Computers. The fourth building block of EDI is inexpensive computers that permit even small firms to implement EDI. Since such computers are now prevalent, it is possible for firms of all sizes to deal with each other using EDI. Internet protocols, including standard formats such as HTML, have created a standard understood by computers of all makes running different operating systems all of which are fully enabled to communicate across the Web.

Procedures for Complying with Legal Rules. Legal rules apply to the documents that accompany a wide variety of business transactions. For example, some contracts must include a signature or must be an original in order to be

legal. If documents are to be transmitted via EDI, companies must establish procedures to verify that messages are authentic and that they comply with the agreed-upon protocol. In addition, EDI requires companies to institute error-checking procedures as well as security measures to prevent unauthorized use of their computer systems. Still, it is important to note that some sorts of business documents such as warranties or limitations of liability are difficult to transmit legally using EDI.

An example of a legal requirement is represented by the Public Health Security and Bioterrorism Preparedness and Response Act of 2002, known as the Bioterrorism Act. Manufacturers, processors, packagers, transporters, receivers, holders, and importers of food must establish and maintain records of all such transactions. As reported in *Food Logistics*, the Grocery Manufacturers Association (GMA) examined commonly used EDI systems to ensure that their record-keeping methods comply with the Bioterrorism Act. GMA found that EDI systems meet the challenge.

SMALL BUSINESS AND EDI

In at least some form (such as securing backups to computerized accounting and inventory data), most small businesses participate in EDI actively. Many use online order taking integrated with their own systems through proprietary software. Small businesses serving as suppliers to large organizations may participate in a number of EDI systems tied into their own computer systems using the Internet.

Another area in which EDI can prove critical is in international electronic invoicing. For example, in December 2009 the European Committee for Standardization laid out directives for how businesses should handle and retain electronic invoicing; in particular, businesses were required to maintain invoice records to show that the value added tax (VAT), collected on goods sales throughout the European Union, was correctly calculated and collected. One of the systems specifically listed as acceptable for this process was EDI, though individual member nations of the European Union are free to determine their own requirements. Before engaging in international business transactions, business owners should check to ensure that their invoicing system meets all such requirements.

E-MAIL

In large part, e-mail has displaced internal memoranda in most institutions of any size and has also significantly cut down on telephoning as a way of coordinating business. E-mail requires a network of computers or a single computer linked to the Internet. Messages are generated by and read inside mail software such as Microsoft's Outlook or Mozilla's Thunderbird. Mail moves to the recipient's address directly through a corporate mail server or over the Internet using a mail-services provider. Most systems enable the user to attach documents to the e-mail message itself. These may be anything digital, such as word processing documents, spreadsheets, photographs, databases, or other electronic letters. Sending software is designed so that the same letter can be sent to multiple recipients; blind or open copies (what in the old days were labeled bcc's and cc's) can be sent as well. An e-mail is delivered almost instantly and thus is like a phone call but the e-mail recipient need not be there to receive it. These many benefits have made e-mail ubiquitous. It is doubtful that anyone actually knows how many e-mails are sent, but studied estimates have been made. A report by the Radicati Group estimates that over 200 billion e-mails were sent per day in 2008.

As a result of the ubiquity of e-mail services, business owners might discover that implementing an e-mail system is more of a requirement than a beneficial choice. For example, beginning January 1, 2010, the U.S. Department of Labor instituted a rule requiring all businesses small and large alike to use e-mail for filing certain pension

and retirement plan forms. Businesses that fail to send these forms electronically may be subjected to large fines.

E MAIL PROS AND CONS

E-mail is very rapid and yet, unlike a telephone call, it is much less intrusive. It can be used at any hour of the day. Once the basic cost of a network or an Internet connection has been justified, e-mail is very cheap. Modern electronic documentation techniques have advanced to such a level that e-mail attachments can be book-sized documents typeset like books, with illustrations embedded.

The negatives of e-mail arise from its very popularity. Many employees in larger organization, especially management employees, complain of overwhelming e-mail volume. Mark Brownstein, writing in *Network Magazine*, noted, citing various sources, that data stored on disk has more than doubled between 1999 and 2002 (according to the University of California at Berkeley), that e-mail volume grows at a rate of 20 percent a year (according to the Radicati Group), and that three out of four electronic documents are unprotected and unmanaged (according to Strategic Research). The management of e-mail alone is absorbing more and more time so that it appears to be interfering with the very productivity such innovations as e-mail are supposed to be bringing about. In fact, a 2007 study by the Radicati Group found that the average business employee spent close to two hours each day reading and responding to e-mail.

Spam. E-mail rapidly came to be abused by organizations sending out millions of unsolicited e-mail messages selling everything from drugs to insurance to pornography. Such unwanted mail became known as spam. Spam is one of the negative phenomena associated with e-mail, and it has steadily grown to the extent that the vast majority of all e-mails sent worldwide are spam. MessageLabs, a division of security software makers Symantec, released a report indicating that in May 2009, over 90 percent of all e-mail sent was spam. The MessageLabs report also indicated that nearly one-third of the spam originated from Europe, and over one-quarter originated from Asia; less than 14 percent came from North America.

Spam came under relatively mild regulation with the passage of the Controlling the Assault of Non-Solicited Pornography and Marketing Act, also officially called the CAN-SPAM Act of 2003 (Public Law 108-197). It became effective in December 2003 and took effect on January 1, 2004. The act requires that senders of unsolicited commercial e-mail label their messages, but Congress did not require a standard labeling language. Such messages are required to carry instructions on how to opt out of receiving such mail; the sender must also provide its actual physical address. Misleading headers and titles are prohibited. Congress authorized the Federal Trade Commission (FTC) to establish a "do-not-mail" registry but did not require the FTC do so. CAN-SPAM also has preemptive features: it prohibits states from outlawing commercial e-mail or to require their own labeling.

With CAN-SPAM in effect, it is at least theoretically possible to curb unsolicited mail by the tedious effort of answering every piece of spam and filling in an "opt out" form. Software for controlling unsolicited e-mail is also available; the simplest forms of such control require entering addresses from which mail may be accepted; all other mail is rejected; this technique is very effective but, obviously, turns e-mail into a private communications service. E-mail servers also offer effective filtering services. Nonetheless, a rather negative conclusion must be drawn: with the positive aspects of e-mail go many negative aspects which erode its effectiveness.

E MAIL DOCUMENTS ARE RECORDS

Jeanette Burriesci, writing in *Intelligent Enterprise*, pointed out that fines in the millions of dollars have been assessed by the Securities and Exchange Commission (SEC) on organizations for failure to keep adequate records. She explained that e-mail has become a main feature of record keeping concerns "because it proliferates so quickly." Intense preoccupation with record keeping has come in the wake of the Sarbanes-Oxley Act ("SOX") passed in 2002. The Act was triggered by corporate accounting scandals and has imposed very strict record keeping requirements on publicly traded companies and accounting firms. As a consequence of SOX, corporations have been retooling their archiving methods, including collecting and classifying e-mail by subject matter and reorganizing back-up systems so that backup tapes are not periodically reused lest old e-mails are erased. In addition, the Federal Rules of Civil Procedure were revised to require that companies must turn over pertinent e-mail records within 30 days of a discovery hearing asking for such records. If the company fails to do so, they can be subjected to severe financial penalties.

Small privately held business concerns will, of course, rarely be touched by these issues. However, awareness of what is happening in the larger context of the publicly traded companies is valuable and, in any case, effective management of records benefits businesses of any size. E-mails, by their very character (their sheer number and frequently informal tone) may suggest that they are unimportant like casual conversation. With heightened attention on records, it is becoming obvious, however, that electronic communications, no less than those on paper, have legal status.

EMERGING MARKETS

The phrase "emerging markets" has two distinct connotations. First, it means new and emerging foreign export markets for U.S. companies. The U.S. Commerce Department's International Trade Administration (ITA) uses the phrase in this sense pointing at markets where U.S. companies might find additional sales. Second, the phrase acts as an abbreviation in investment circles and refers to groups of nations, regions of the world, and investment strategies which specialize in buying and selling the stock or debt instruments of "emerging markets." The same countries are often referred to in either context, although U.S. trade promoters sometimes include countries that would not meet the definition of an emerging market as used by Wall Street investors.

Depending on the particular viewpoint of the individual or institution providing the definition, emerging markets are just a few leading countries or include more than forty countries on all continents. Frequently mentioned emerging markets are China and India in Asia; Argentina, Brazil, and Chile in the Americas; the former Communist European countries and Russia in Europe; Turkey in the Middle East; and Egypt in Africa. An important leading subgroup with the catchy acronym of "the BRICs" includes Brazil, Russia, India, and China thus the largest of the emerging markets.

The defining features of emerging markets include some, if not most, of the following factors. The markets are actively growing under governmental policies that favor a capitalist-style economy. Governments are predictably stable but not necessarily democratic. Substantial future growth is guaranteed because their internal resources and infrastructure still remain unexploited and undeveloped. They have a large, growing, and prosperous middle class; in China, for instance, the size of this class is equivalent to the total population of the United States; in India this class is only slightly smaller. The countries have either abandoned or are in the process of abandoning state control and ownership of major sectors. They have transparent and modern financial systems. They have a skilled but modestly compensated labor force.

THE GLOBAL CONTEXT

Emerging markets may be seen as a global natural phenomenon in which waves of economic development lift different countries in sequence to a higher level. The "economic miracle" of the German economy after World War II marked Germany's recovery from the destruction of Allied bombing with the help of aid and the inflow of foreign investment; Germany led the recovery of Europe. Japan's rise and the rise of the Asian "Tigers" (Hong Kong, Taiwan, Singapore, and South Korea) followed in turn. Latin America developed by exploitation of its agriculture and oil resources. The collapse of Communism led to liberalization of East European economies and the emergence of new market economies there, initially in Poland, then elsewhere. This process indirectly stimulated Chinese liberalization of its economy (if not its politics) producing the rise of China to economic eminence in the twenty-first century. The process, however, is never without its ups and downs.

THE LOCAL CONSEQUENCES

In the context of major international trade agreements, such as the North American Free Trade Agreement (NAFTA), emerging markets are presented to the U.S.

public as opportunities for export and therefore a vibrant domestic economy. However, the globalization of modern, technological economies is an adjustment process that has local costs for mature economies which may be higher than benefits achieved.

Emerging markets are "emerging" because they offer advantages, usually a lower cost for labor, no longer available in mature economies. Thus they induce a flow of capital from developed to developing theaters of economic activity.

As Jeffrey E. Garten pointed out, writing in *Newsweek International*, "emerging markets have moved from the periphery of the global economy to the center. They have become integral to international production, trade, and finance.... [O]ver the last 10 years the emerging-market share of international trade has increased from about 27 percent to more than 33 percent." This translates into a strong flow of direct investment (in plant and equipment) to these markets. Garten cites IMF figures: "Between 1994 and 1996 net private direct investment...was 1.5 times greater than investment in stocks and bonds.... Now it is eight times greater. Between 1994 and 2005, net foreign direct investment increased 92 percent, whereas net investment in stocks and bonds actually decreased slightly."

Many compnaies from mature economies also set up shop in emerging markets. Wal-Mart, one of the world's leading retail chains, opened its first retail store in China in 1996, and by 2009 had expanded to 146 locations; in Brazil, the company opened its first store in 1995, and by 2009 had increased its presence to 313 stores. In 2009, with much of the industrialized world experiencing a recession, many U.S. businesses, such as Dow Chemical, showed profitability in emerging markets even as revenues in developed countries were down.

Meanwhile, as Robert Samuelson pointed out (in *Newsweek*), the U.S. economy, seemingly unaware of the broad trends, went on a shopping spree during the first half of the twenty-first century. "From 1996 to 2005," Samuelson wrote, citing Sara Johnson of Global Insight, "the United States generated almost 45 percent of global growth in consumer spending....That dwarfs the U.S. share of the world economy, [which is] about 20 percent." This caused the U.S. trade deficit to increase from $191 billion in 1996 to $784 billion in 2005. However, the global recession beginning in 2008 resulted in a pullback of American spending; in 2009 the U.S. trade deficit decreased to $380.7 billion. This is a further indication that near-term future profits are more likely to be generated in creating goods or services for emerging markets than for U.S. consumers.

HALF FULL OR HALF EMPTY?

Emerging markets off U.S. shores represent a growing standard of living across the globe. Locally they cause the unwelcome phenomenon of factory closings and layoffs due to outsourcing. Globalists see the glass half full and foresee eventual equilibrium as emerging markets mature. Samuelson put it as follows: "As people [overseas] grow richer, their wants multiply. Industry looks more to meeting their demands than generating ever-larger trade surpluses. The expansion of consumer credit (which is still tiny compared with the United States) encourages the process." Meanwhile American consumers, hurt by high interest rates and very high debts will wean themselves off their consumption addiction. And the gap will close. Pessimists see the glass half empty and advocate, instead, curbing uncontrolled globalization in favor of managed trade that will protect the jobs of U.S. workers.

For small businesses, emerging markets represent a unique reservoir of potential consumers that may require special strategies to access. The Internet, for example, can be an excellent tool for reaching these international customers without having to maintain a physical presence in far-flung nations something that is only likely to be accomplished by larger corporations. In fact, according to the Small Business Administration, over two-thirds of all exporting businesses have a staff of fewer than twenty employees. Before exporting to emerging markets, a small-business owner should make sure that the goods do not require an export business license from the Bureau of Industry and Security.

The flipside of globalized markets is that businesses in emerging markets also have access to American customers through those same channels. This means that small businesses in the United States may have to compete with business owners in other countries with lower overhead and lower average wages. Still, for business owners that can offer unique goods and services in a way that emerging-market customers recognize their value, the potential for success is enormous.

EMPLOYEE ASSISTANCE PROGRAMS

Employee assistance programs (EAPs) are plans that help identify and resolve issues facing troubled employees through short-term counseling, referrals to specialized professionals or organizations, and follow-up services. Many EAPs also train business owners and supervisors to recognize and deal with behavioral problems in the workforce. These programs are not designed to provide long-term treatment, but as *Business Week* noted, "they do offer a safe environment where an employee can discuss problems with a counselor who then makes a confidential assessment, and if necessary, gives a referral to a mental-health professional." Indeed, business experts regard them as a potentially valuable tool in reversing declining performance among valued workers. "We're not talking here about employees who turn violent or hear voices," said *Business Week.* "The people a business owner needs to worry about are the... valued workers whose productivity suddenly and mysteriously plummets. From depression to anxiety, from drug abuse to alcohol addiction, common psychiatric disorders take a remarkable, if little-discussed, toll. In lost productivity and absenteeism alone, the cost to business approaches $312 billion annually."

Given these sobering statistics regarding the impact of emotional disorders on business productivity, employee assistance programs have become an increasingly popular element of total benefits packages for small and large employers alike. According to the Employee Assistance Professionals Association, 65 percent of American employers offered some kind of EAP in 2008; the availability of EAPs was higher for the largest organizations, with 97 percent of businesses with more than 5,000 employees offering such programs. Typical utilization rates by employees in other words, the number of employees who actually make use of EAPs range from 5 to 10 percent. While this may seem like a rather small fraction of a business's workers, the programs target those employees who are most at risk of suffering poor productivity or other problems that can have a negative impact on the workplace.

First created in response to business concerns about the impact of employee alcohol and drug abuse on bottom-line productivity, employee assistance programs (EAPs) are now designed to deal with a wider range of issues confronting workers today. Modern EAP systems are designed to help workers with problems such as family and marriage counseling, depression, stress, gambling addiction, financial difficulties, crisis planning, illness among family or co-workers, and preretirement planning. Many EAPs have also expanded the scope of their counseling to help workers grapple with eldercare issues, natural disasters, and workplace violence. In addition, many employee assistance programs have added proactive elements to their offerings. For example, a number of employee assistance programs have actively promoted AIDS/HIV workplace policies and education efforts.

This expansion in the scope of EAP counseling is commonly attributed to changes in America's larger social fabric. "The prevalence of two-wage-earner families, single parent households, mobility and career change patterns, demographic shifts, and technological change have helped to create new and different types of stress and mental health crises, which affect the health and productivity of many employees," wrote Jody Osterweil in *Pension World.* "Where individuals formerly sought advice and counsel from a respected cleric, a personal physician, a close family member or a friend, those relationships are increasingly rare and cannot fulfill individuals' needs for crisis intervention. Thus, individuals experiencing a personal or family crisis, or who are under chronic stress, may have no place to turn for advice other than to the benefits (the EAP) offered through their workplace."

In addition, companies have come to realize that a direct link can often be detected between employee well-being and employee productivity, and that the difference in value between happy and unhappy employees can often be quite profound. This is especially true if the troubled person is a manager or supervisor with important responsibilities. In addition, erratic behavior from one employee typically has a ripple effect, producing

anxiety and lost efficiency in numerous other employees who have to deal with the troubled individual on a regular basis. ''Despite continuing technological advances, today's companies rely on their employees to improve productivity and increase the bottom line,'' wrote Brian W. Gill in *American Printer*. ''Therefore, the relationship between employees' well-being and productivity cannot be ignored. Personal and work-related problems may manifest themselves in poor job performance, which adversely affects the firm's overall productivity.'' Indeed, consultants contend that few staffers are able wholly to shield their work performance from the negative residue of personal difficulties. Increased absenteeism, higher accident rates, substandard performance on previously mastered tasks, employee theft, and poor morale are just some of the symptoms that may appear if an employee is struggling to handle a problem in his or her personal or professional life.

KEY ADVANTAGES OF EAP IMPLEMENTATION

Perceived costs associated with implementation and maintenance of employee assistance programs looms as the biggest concern for most small-business owners. Many owners of small businesses recognize that EAPs can be helpful to the members of their work force, but the specter of yet another operating expenditure may dissuade them. But analysts say that small-business owners can institute an employee assistance program for their employees at relatively small expense.

Benefits experts and businesses alike cite several important benefits associated with employee assistance programs. Business owners are, of course, concerned with the utility of an EAP as a cost-management tool. To an entrepreneur with a small business, the most important advantage associated with an EAP is likely to be its positive impact on employee productivity and its use in controlling health care costs. But according to many businesses that have adopted employee assistance programs, there are other benefits that may accrue as well. For example, companies that provide for an EAP may be viewed as more employee-supportive in the community in which they operate than will competitors for workers who do not provide such a program. In addition, employee assistance programs have been cited as an effective element in employee retention efforts designed at reducing turnover.

But a less remarked on advantage associated with EAP implementation is that it frees the company to do what it does best provide its goods or services to its customers instead of devoting work time to issues that may not be directly related to meeting production deadlines. Basically, putting together an EAP allows business owners and managers to concentrate on their internal operations. ''We have to focus on the job and the ability to do the job,'' one business executive told the *Pittsburgh Business Times*. ''We don't want to play counselor and dive into areas we're not qualified for.''

In the twenty-first century, there has been a trend toward ''bundled'' EAPs that are included as part of an employer's health insurance plan, with no additional cost to the employer. These ''free'' EAPs are not generally tailored to the specific needs of a business, and therefore may not be utilized by employees as much as custom EAPs. These bundled EAPs may also offer fewer emergency or intervention services, and may lack follow-up reports to the company's human resources personnel that would help the company better understand the needs of its employees. Still, the prevalence of bundled EAPs suggests that many businesses will continue to use such programs in the future, and the affordability of bundled EAPs may appeal to small-business owners who want to offer such programs to their employees but cannot afford the expense of a custom EAP.

CHOOSING AN EMPLOYEE ASSISTANCE PROGRAM

The characteristics and quality of EAP programs can vary considerably, so small-business owners should undertake a careful study of their options before selecting a plan. Factors to consider when comparing programs include:

Appropriate qualifications. The EAP should be operated by professionally licensed staff with established relations with local health groups or national self-help organizations. The staff should also be engaged in continuing education initiatives. Business owners are advised to check the staff's affiliations and level of EAP experience when reviewing their program.

Find out about cost structure. Roberta Reynes noted in *Nation's Business* that costs can vary considerably from program to program, depending on operation structure, types and extent of services provided, and method of calculating charges. Benefits experts also recommend that small-business owners make sure that materials and administration costs incurred by EAP providers are included in their base fee. National services tend to offer more affordable programs than local providers, but this is by no means always the case.

Extent of training services. EAP training programs vary widely in scope and subject matter. The most comprehensive plans provide managers with assistance in confronting troubled employees, developing wellness policies and arranging seminars on health issues.

Convenience and responsiveness. Business owners should seek out EAP providers with facilities that are in the same geographic region as the company, so that employees can visit the facilities before, during, or after work. The EAP that is ultimately selected should also have a toll-free telephone

line that is operational around the clock, since difficulties do not always strike employees during traditional working hours. In addition, business owners should inquire about the program's response time to employee inquiries in non-emergency situations (a wait of more than 3 days is a warning sign that the program has problems with its central mandate: helping troubled employees).

Communication. "Most providers issue monthly updates," wrote Karen Carney in an article in *Inc.* "But they should also record their own effectiveness in helping you reach agreed-upon productivity goals or implement safety programs. Some providers also supply payroll handouts or 'stuffers' on subjects like practical parenting."

NOURISHING YOUR EMPLOYEE ASSISTANCE PROGRAM

Training of managers and other supervisory personnel (including the owner, if he or she is actively involved in supervision) is a vital component of instituting a successful EAP. "Managers who have the most contact with employees will be the first line of defense in recognizing potential problems and correcting them before they reach the termination stage," stated Gill. "Therefore, it is imperative that managers understand the objectives of the EAP to ensure the program's success and reduce any potential employer liability." In addition, management personnel have to be adequately instructed about what Gill termed "the do's and don'ts" of EAPs. They can refer employees to the assistance program, but no one can be forced to seek assistance. Supervisors and employees must understand that these services are strictly confidential and using them will not be cause for disciplinary action. However, being involved in an EAP service does not exempt employees from disciplinary action when company rules are violated. This is a very fine line that must be addressed in supervisory training.

Promotion of the program is another important element for small businesses seeking to maximize the effectiveness of their EAP. "All too often, plan sponsors assume that employees are fully cognizant of the EAP and the services it offers," stated Osterweil. "Employees and dependents must become more aware of the program's existence, the nature of its resources and coverages, and the means of accessing such programs. Employees must develop confidence in the abilities of those providing such services, trust that confidentiality will be assured, and obtain knowledge that their specific needs can be addressed through the resources available from the EAP. Simply publishing an '800' telephone number in a summary plan description, or posting a notice in the workplace, is not likely to effectively communicate the existence of this valuable resource."

Osterweil noted, though, that a coordinated approach that is nonthreatening in tone and that indicates that "the sponsor truly desires to meaningfully assist and retain employees and sees them as a valuable resource" can help significantly in reassuring employees about the program's character and purpose. For that reason, benefits experts counsel small businesses to establish a plan in which workers are provided with regular, timely (around the holidays, for instance) reminders of the availability and offerings of their employee assistance program, including assurances that the program is confidential and free.

EVALUATING ESTABLISHED EAPS

Once an employee assistance program has been put in place, it is up to the sponsor to make certain that it is an effective addition to the company's overall benefits package. After all, an EAP that does not address the primary needs and concerns of a company's employees is essentially a waste of money. Admittedly, determining the effectiveness of an employee assistance program can sometimes be a difficult task, since employee problems like family strife, substance abuse, and workplace stress are impossible to quantify. For example, an EAP provider will not be able to provide statistics to a client stating that over the previous 6 months, workplace stress dropped by 27 percent and family strife declined by 14 percent. In addition, the confidentiality restrictions associated with employee assistance programs place further limitations on tracking EAP use and effectiveness.

Small-business owners looking for information on the effectiveness of their EAP do have other options, however. "Attention to trends in utilization and expenditures by type of service (such as in- or out-patient detoxification, rehabilitation, and aftercare) can help plan sponsors evaluate the cost-effectiveness of their EAP and the efficacy of the vendors providing these services," said Osterweil. "For example, a successful EAP should show a positive influence on expenditures under the employer's health plan. It should also show lessening absenteeism, tardiness, and disability and improving productivity. And the evaluation process gives plan sponsors an opportunity to design a system that can capture data that will more readily assess the ongoing cost-effectiveness of the program." However, as Jodi Jacobson stated in an interview with the *Journal of Employee Assistance*, "The focus, and sometimes sole reliance, on health care costs as a measure of EAP effectiveness has further narrowly defined EAPs as being only a mental health benefit rather than an important and even critical workplace resource." This can create a problem when the EAP professionals are not embraced into the culture of the business, and therefore may not be able fully to understand the source of employee issues.

Signs of a Flawed Employee Assistance Program. Employee assistance programs are commonly touted as a valuable cost-management tool, but if the implementation or design of an EAP is flawed, then the purported cost savings of the program will not be realized. Benefits experts counsel small-business owners to look out for the following indications that an employee assistance program may need revision:

- General dissatisfaction with the program expressed by employees.
- Only a small percentage (less than 5 percent) of eligible employees use the program.
- Issues that prompted the initial use of the EAP are not resolved within a reasonable period of time.
- EAP referrals indicate an unwarranted bias toward one type of care or treatment.
- Employees view the EAP with distrust, seeing it as a possible management tool for doling out punishment or justifying termination.
- EAP staff have potential conflicts of interest (for example, a staffer who is found to have financial ties to a provider to whom referrals are made).

All of these warning signs can be addressed, but companies should make sure that they conduct adequate research into the needs and desires of their employees before attempting any sort of shake-up. And when revision of an EAP does occur, employers should take every precaution to ensure that any employees who did benefit from the program's previous incarnation are not left behind.

EMPLOYEE BENEFITS

The phrase "employee benefits" is an umbrella term that includes insurance programs, fully compensated absences (vacations, holidays, sick leave), pensions, stock ownership plans, and employer-provided services (such as child care) offered by employers to their employees. Employee benefits are also referred to as fringe benefits. Yet other benefits sometimes are treated by government as forms of income for tax purposes. These include bonuses, profit sharing, and the provision of a leased vehicle or housing. All "fringes" are by definition offered at the employer's option; thus employer contributions to Social Security, Medicaid, basic Medicare, Workers' Compensation, and other programs are not viewed as fringe benefits; they are required under law.

Certain categories of employee benefits may require that the employee pay a part of the cost of the benefit in order to receive the employer's contribution. For this reason, employees who have *access* to benefits outnumber employees who actually *participate* in the benefits offered. Young employees, for instance, may opt out of retirement programs. An employee may choose not to participate in a medical insurance program because he or she may already be covered by the spouse's participation in a family program elsewhere.

THE NATIONAL SURVEY

The U.S. Bureau of Labor Statistics (BLS) conducts an annual compensation survey as part of which it collects data on the major categories of employee benefits. Benefits tracked include paid leave, health insurance, retirement plans, life insurance, and disability benefits. The highlights of the BLS March 2009 survey follow:

- *Paid Leave* of some kind was offered to about three-fourths of all employees; this includes paid vacation (75 %) and paid holidays (76 %). About two-thirds of all employees were offered paid sick leave.
- *Health Care Benefits.* Seventy-four percent of employees had access to medical care benefits, 48 percent had access to dental care, and 29 percent to vision care. Seventy-two percent of employees had access to outpatient prescription drug coverage. Because most plans required employee contributions, participation rates in medical plans

were 56 percent. For single coverage plans (covering only the employee), employers paid an average of 82 percent of the plan premium; for family coverage, employers paid 71 percent of the plan premium.

- *Retirement Benefits.* Seventy-one percent of employees had access to such benefits; 57 percent participated in such programs. About 67 percent of workers in private industry had access to retirement benefits, compared to 90 percent of government workers.
- *Life Insurance.* Of all civilian employees, 62 percent had access to such insurance; 60 percent participated.
- *Disability Insurance.* Thirty-seven percent of employees had access to short-term and 33 percent to long-term disability benefits. Nearly all eligible employees participated in these programs.

TRENDS IN ACCESS

Trends in access to employee benefits in the 10-year period 1999 to 2009 have been generally favorable from the employee's point of view showing either no change or a positive change. Thus access to retirement plans and medical care plans increased, while vision and dental access remained stable. The number of employees enjoying paid vacation appears to have decreased, from 79 percent in 1999 to 75 percent in 2009. Access to both short-term and long-term disability insurance is also down, though access to life insurance remains relatively high. Child care access showed a positive increase, from 6 percent in 1999 to 14 percent in 2005, but that access decreased to 10 percent by 2009. In 1999 67 percent of medical plans required an employee contribution; this rose to 76 percent in 2005, a 9-point increase reflecting the continuing growth in health care and hence in health insurance costs. By 2009 medical coverage that did not require an employee contribution was available to just 12 percent of workers.

SMALL ESTABLISHMENTS

The BLS national survey provides breakdowns in its data by establishment size rather than company size, thus for establishments with 1 to 99 workers and those with 100 workers and more. Across the board, a smaller percentage of employees working for small establishments have access to benefits. Under medical programs, 60 percent of small establishment workers had access (versus 89 percent of large establishment workers); medical coverage was also the top-ranking programmatic benefit (ignoring time off) offered by small establishments. Data for other categories follow showing percentage of workers having access in small establishments and, in parentheses, the percentage in large establishments: Dental: 31 (67); Vision: 18 (43); Prescription Drugs: 58 (88); Retirement: 54 (90); Life Insurance: 44 (85); Short-Term Disability: 27 (48); and Long-Term Disability: 21 (51).

While small establishments offer fewer employees medical insurance, the costliest of the employee benefits, for single employee coverage small establishments paid nearly as high a proportion of such insurance as did large establishments. In 2009, small enterprises picked up 81 percent of the medical insurance premium for single coverage; large enterprises 85 percent. Small establishments, however, required more participation from the employee opting for family coverage: they paid 66 percent of such premiums compared to 75 percent paid by large establishments.

GOODS PRODUCERS AND SERVICES PROVIDERS

In every programmatic benefit category, goods producers offered more of their employees benefits than did establishments engaged in providing services. However, the gap between goods producers and service providers has been narrowing. Data for several benefits categories follows in abbreviated format showing percentage of workers in the goods producing sector having access and, in parentheses, the corresponding percentage for services producers: Dental: 56 (46); Vision: 33 (28); Prescription Drugs: 82 (70); Retirement: 75 (70); Life Insurance: 71 (61); and Short-Term Disability: 52 (34). Long-Term Disability coverage was equal for both types of companies at 33 percent.

Goods producers also paid more of family medical premiums than companies in the service sector: 75 percent versus 70 percent. Both sectors paid an average of 82 percent of single-care coverage, and both show a general decreasing trend in employee access to medical benefits. Not surprisingly, as the Baby Boomer generation begins to enter retirement age, the percentage of employers offering retirement benefits and prescription drug coverage has steadily increased.

THE PROS AND CONS OF BENEFITS

A comprehensive benefits package can be an important and useful asset for a company in attracting and holding employees. A company with a reputation for excellent benefits particularly a long history of offering and *protecting* such fringes has competitive advantages and, indeed, can in part compensate for the cost of such benefits by paying somewhat lower salaries and wages.

Rich benefits packages, of course, also have a downside. They are costly. Cutting back on benefits in difficult economic environments can produce adverse effects on employee morale and productivity. However, severe economic conditions such as the global recession that began in 2008 demand that businesses cast a critical eye on benefits

that cost more than they offer in employee satisfaction. Since most employment contracts do not offer specific guarantees regarding benefits, employers are free to alter existing benefit plans based on economic or employee needs, as long as employees are fully informed and do not lose previously accrued benefits. Some benefits that might be cut in order to save costs include employee discounts, subsidies for additional schooling, social events such as employee appreciation parties, and office refreshments such as coffee, bottled water, and discounted vending machine items. As with other cuts to employee benefits, open communication with employees regarding the cutbacks can help to reduce negative responses to the measures.

Tough economic times do not necessarily have to result in cutbacks to all employee benefits, however. In fact, a small-business owner may have the flexibility to offer some low-cost or even no-cost benefits that larger companies would not be able to match, thereby attracting and retaining quality employees. Examples of such benefits include offering a flexible work schedule to allow for day care and other obligations, or offering some employees the opportunity to work from home on certain days.

Small businesses tend to benefit from economically stressful times because cut-backs and layoffs increase the labor pool and small organizations with minimal benefit programs can compete more effectively for employees. In rapidly growing economies, large organizations improve their benefits programs to attract scare labor resources. These conditions suggest the optimum solution for the small business: it is to offer benefits sufficient to hold employees in good times but to keep benefits always affordable and modest enough to survive the downturns.

EMPLOYEE COMPENSATION

People work in order to earn money, but the structure of compensation is quite diversified. The two broadest categories are salaries and wages. Salaries tend to be paid every other week or monthly; wages are typically calculated by the hour but paid by the week. As a consequence of legislative language, salary-earning employees are sometimes referred to as "exempt" employees and hourly workers as "non-exempt"; in other words the first are exempt from the requirements of Fair Labor Standards Act (discussed below), while the latter group are covered. Compensation may also take the form of commissions paid to salespeople based entirely on some percentage of the goods or services they sell; this type of compensation is often combined with a minimal salary to even out the ups and downs of commission earnings but people on pure commission who fail to "earn back" their base salary rarely continue in the job long. Piece work, where pay is based on actual performance of some job measured by units produced, is a variant of this approach. People serving as wait-personnel in restaurants are typically compensated by a low wage inadequate to support them; they get the majority of their income from tips. Starting in the 1990s and continuing into the 2010s, many individuals became self-employed of necessity but, often continued working in actual "jobs," much as before. The compensation of such people is based on contract revenues, but they receive no fringe benefits and are required to pay their own payroll taxes.

Compensation has a legal status and, once engaged, people can use the courts to enforce the employment agreement. Employee benefits ("fringe benefits") have another status: they are provided at the employer's option and may be withdrawn at will. As such they are not strictly speaking compensation although, in practice, they are viewed as a part of the full compensation "package." The employer's payment of premiums for certain types of fringe benefits, such as health care coverage and insurance policies (disability, life insurance), are not viewed under tax law as part of the employee's taxable income. Others, such as the provision of an automobile or housing, are taxable and therefore fall under the definition of "compensation."

COMPENSATION AND TIME

For the nonexempt part of the workforce, hours spent on the job are the measure of compensation to be paid. Time spent at work is regulated by the government, and laws govern pay scales over and above the specified work week, typically 40 hours. The vast majority of exempt workers are also required to work a fixed number of hours a week but the hours may be flexible under "flextime" rules set by the employer. For exempt employees, pay for "overtime" is not controlled by law in most cases. In other words, the typical administrative/professional/executive employee is expected to work 40 hours and as many more as the job may require, the extra hours compensated, if at all, by bonuses or time off. In the case of people working for commissions, time spent on the job is only incidentally related to compensation. Normally, of course, such people spend a lot of time working but one can imagine the highly charismatic (and lucky) salesperson who, in a couple of hours a month, can sell a million dollars worth of real estate.

COMPENSATION LAWS

The Fair Labor Standards Act of 1938 (FLSA) is in a sense the basic law controlling employment and compensation issues and, through amendments passed later, the management of benefits packages. FLSA sets minimum wage, overtime pay, equal pay for men and women, controls child labor, and establishes record keeping requirements. On the whole FLSA is aimed at protecting the nonexempt work force which was the overwhelming majority of all workers at the time of the law's passage. Since that time the profile of the workforce has greatly changed; amendments to FLSA have in part reflected these changes. As illustrated by state overrides of FLSA's minimum wage requirements (see below), states also actively regulate compensation and other aspects of the workplace.

The chief amendment of FLSA was passage of the Equal Pay Act of 1963 (EPA). EPA prohibits unequal compensation of men and women in the same workplace doing similar jobs. EPA makes exceptions for seniority, allows the use of merit systems, and recognizes compensation systems based on performance. EPA requirements do not differentiate between exempt and nonexempt employees.

Other legislation related to employment compensation issues includes: 1) the Consumer Credit Protection Act of 1968, which deals with wage garnishments; 2) the Employee Retirement Income Security Act of 1974 (ERISA), which regulates pension programs; 3) the Old Age, Survivors, Disability and Health Insurance Program (OASDHI), which forms the basis for most benefits programs; and 4) legislation implementing unemployment insurance, equal employment, worker's compensation, Social Security, Medicare, and Medicaid programs and laws.

MAJOR COMPENSATION ISSUES

The two major issues related to compensation are the adequacy of the compensation, addressed by minimum wage laws, and pay equity between women and men and between racial and ethnic groups addressed by EPA and social antidiscrimination statutes.

Minimum Wage. Nonexempt employees, for whom the definition is intrinsically tied to time, are also guaranteed a minimum wage of $7.25 per hour under federal law. Five states Alabama, Louisiana, Mississippi, South Carolina, and Tennessee have no state-approved minimum wage; in these states, the federal minimum wage applies. In 2010, five states Arkansas, Colorado, Georgia, Minnesota, and Wyoming had minimum wages set below the federal minimum. Fourteen states have approved a higher minimum wage than the United States as a whole: Alaska, California, Connecticut, Illinois, Maine, Massachusetts, Michigan, Nevada, New Mexico, Ohio, Oregon, Rhode Island, Vermont, and Washington. Some of these states have minimum wages determined by inflation; this means that the rates may fluctuate up or down depending on economic conditions. The rest of the states have the same minimum wage as the national rate. Under the federal rules, a nonexempt worker is entitled to receive the highest minimum wage available in the place where he or she works. Changes in state law are monitored by the U.S. Department of Labor and may be consulted at www.dol.-gov/esa/minwage/america.htm.

Equal Pay for Women and Men. Detailed data comparing income of men and women in the same occupation are not routinely collected so that the pay-equity issues remain somewhat in the dark, but more general data series give an indication of overall patterns. Based on data published by the U.S. Census Bureau, the average income of a man in 1954, but measured in 2004 dollars, was $20,992 a year. The average income of a woman, using the same method of calculation, was $9,358. On average, in 1954 a woman earned 44.6 percent of what a man earned. Women's earnings were 41.1 percent of men's in 1964, thus showing a decline, 42.2 percent in 1974 (still down from 1954), were up to 49.3 percent in 1984 but dropped again to 43 percent in 1994. In 2008 average male income was $45,556, while average female income was $35,471. A gap of $10,085 separated men from women, but women were earning an all-time high of 77.9 percent of what men earned on average.

In this 50+ year period, women's income grew at a faster rate than men's (1.98 percent a year versus men's income at 1.44 percent). Women's participation rate in the workforce grew in this period as well: female participation in the workforce increased from 34 percent to 59.5 percent, 1954 to 2008. Because women have traditionally

earned less than male employees in similar positions, business owners may be more inclined to retain lower-cost female employees during tough economic times. This is substantiated by data, published in *Social Trends and Indicators USA*, showing that more men than women (on a percentage basis) are laid off during periods of recession. Some have speculated that this could lead to women outnumbering men in the American workforce in the near future. The U.S. Department of Labor estimates that women will comprise 47 percent of the labor force by 2016.

Racial and Ethnic Differences. The U.S. Bureau of the Census data cited above for all men and women also provide a look at racial and ethnic difference and difference between men and women in those groups. Data cited are for 2004 only because long-term data are not uniformly available. The highest average earnings are achieved by Asians. Asian women have the highest earnings among all women but earn only 61.1 percent of the income of Asian males. Lowest earnings were reported for Hispanics, again for both males and females. Hispanic females earned 66.5 percent of what Hispanic males earned. Whites had the second highest earnings, but white women lagged furthest behind. They had 56.9 percent of white males' earnings. Black women earned 75.5 percent of black males' earnings. For these four racial and ethnic group comparisons, black women were highest in relation to men.

COMPENSATION IN THE SMALL BUSINESS SECTOR

According to a press release announcing the latest Wells Fargo/Gallup Small Business Index, "Sixty percent of small business owners see the amount of compensation they can offer an employee as a critical disadvantage when compared to larger companies."

Data for 2008 from the Bureau of Labor Statistics confirm this perception. The data show that the smaller the firm, the lower the average payroll per employee. The average annual income for an employee at a company with more than 100 employees was $47,690; the average income for an employee at a company with fewer than 100 employees was $39,321. In addition, according to the Office of Advocacy of the U.S. Small Business Administration, small businesses experience substantially higher turnover rates for employees than larger companies; this may be related to the lower available pay, which in turn leads to a less experienced staff for small businesses.

SMALL BUSINESS COMPENSATION EXCEPTIONS

There are numerous exemptions to the FLSA that may allow a small business to provide compensation below federal minimums. First and foremost, companies that do not generate more than $500,000 in annual sales or receipts are not covered by the FLSA. In some states, such as Arkansas and Georgia, the minimum wage applies only if a company has more than a certain number of employees (though this number is likely to be quite small). Even if a company is large enough to be covered by the FLSA, there are many exemptions to the minimum wage for employees operating in various job categories. These categories range from fishing and switchboard operating to making wreaths at home. Business owners can check with the Department of Labor's Office of Compliance Assistance Policy for additional information about minimum wage and overtime exemptions to the FLSA.

A practical aid for the small-business owner offered by the Bureau of Labor Statistics is an extensive and reasonably up-to-date tabulation of wages actually paid per occupation by area. This is the BLS Wages by Area and Occupation Program, accessible on the Internet. Close study of what wages actually are paid often shows that prevailing rates are frequently much more modest than generally believed because of local or regional economic conditions.

EMPLOYEE HIRING

Hiring employees involves a certain formality, even if the business is very small and the person hired is a member of the family. At the very least, mandatory forms must be filed with the federal and state government. The bigger the business, the more complex the hiring process is likely to be. The major elements in the process are: 1) the definition of the job itself, often a formal job description rendered on paper, an important aspect of which is determination of the compensation to be paid; 2) a process of recruitment; 3) prospective employee interviews; 4) the job offer and related negotiations (if any); 5) registration of the employee and related introductions and orientations; and 6) some kind of job training which may be minimal or may involve formal training programs. The hire may be a permanent or temporary employee; this status will also influence the process.

Employment of individuals is substantially governed by federal and often also by state law touching on compensation (the minimum wage requirement), the type of job offered (hourly or salaried), and also on matters relating to discrimination and equal pay for men and women. Hourly workers are covered by the Fair Labor Standards Act (FLSA) and are therefore viewed as "nonexempt" meaning nonexempt from the FLSA rules whereas salaried workers are exempt. If the business offers fringe benefits, these in turn are regulated by law. Businesses that do government contracting may also be under regulatory requirements.

Only larger businesses typically have human resources people who keep up to date with changing requirements. In the smallest operations hiring is typically done by the owner; in large companies administrative workers handle the process. Regardless of the methodology, hiring is still governed by applicable rules

Hiring employees is an activity in which personality, fit, and many intangible qualities play crucial roles. In businesses of any size, a new employee changes the company, a process especially true of small businesses.

DEFINING THE JOB

Writing a job description brings out crucial aspects of the job not usually consciously considered, which helps later in the recruiting and in the interviewing process. More importantly, a job description helps prospective employees understand the requirements and decide whether or not they are qualified. Details are important: waiting on customers is a different process depending on whether most customers are children or seniors. Stocking the store requires different skills depending on what types of machinery are used and when stocking takes place.

Small-business owners should also use the hiring opportunity to establish what kind of workforce they will have and what overall recruiting strategy they will use. Some companies prefer to hire from those already trained, people who hold MBAs or similar types of certification. There is also pyramid-shaped recruiting, which relies on an up-or-out strategy, where a large number of employees are hired at the entry level, then either eventually promoted or dismissed from the company and replaced with other new employees.

Certain businesses may not have enough capital to attract MBAs and may be too easily damaged by the abrasive up-or-out strategy, so a conservative strategy is often desirable, where both experienced and inexperienced employees are hired and coached for the betterment of the company.

Crucial to the job's description is a compensation level. This may be easy if the job already exists. If it is new, the business owner may wish to consult data offered by the Bureau of Labor Statistics on wages actually paid for specific occupations in an area. This is the BLS Wages by Area and Occupation Program and is accessible on the Internet. More clarity can be given during the interview if required.

Some owners may have trouble generating enough start-up capital to offer a truly competitive salary, and may prefer attracting employees by other means. It is best for owners to be completely honest about compensation and focus on future benefits or wages the company is planning to offer. This will decrease the number of potential employees but focus on those more likely to be passionate about the job.

Small-business owners should also be very careful when defining what employee benefits will be available as part of the position. Some benefits are required by law, while others are offered as part of a bonus compensation plan. Social Security, unemployment insurance, worker's compensation, and disability insurance are all required by law. Most leave benefits (discounting the Family and

Medical Leave Act) are not required, and there is frequent variation in both health and retirement benefits.

TOOLS OF RECRUITMENT

Recruitment can be conducted via word of mouth, advertisement, participation in job fairs, contact with state unemployment services, or the engagement of a recruiting firm. Businesses typically aim for both hiring outside the company and promotion within the company, in order to keep a balance of new talent and to encourage high performance.

When creating recruitment ads, the job should be minimally described and the approach specified: should the candidate call, visit, or send a résumé? Sometimes it is valuable to show the compensation, sometimes it is best left unrevealed. Small businesses typically pay less than large ones. Many prospective employees are scared away by job titles but would apply if they judged the salary within their personal reach. Small businesses may want to specify the size of their company, depending on the potential employees they want to attract.

Employment Agencies and Programs. There are both private and government-sponsored employment agencies. Private employment agencies will typically require a fee for providing their services but tend to attract higher quality employees than government-sponsored agencies. Recruiters are often a good idea if the business is looking for a high-level management position, but for entry level positions flexibility is very important. Owners should consider internship programs with local high schools and colleges to pick up fresh talent.

Web sites. Web sites have become a very popular method of recruiting, and there are several types of job sites small businesses can use. Most are differentiated according to industry and job type. Some sites are only for managers, or factory workers, or accountants. Businesses should also consider looking at blogs that cover their industry for possible recruits. When it comes to large job board sites like Monster.com, creating an attractive offering is important. A link to an external Web site is a good idea, and the job posting should be created with consideration about how the potential employee will view it.

Word of Mouth. Small businesses can hire some of their best employees through local contacts and word of mouth. Internal job postings, for instance, will allow present employees to move to a position they have been looking forward to, or encourage employees to suggest qualified acquaintances. In addition to these referrals, owners who attend business gatherings, Chamber of Commerce meetings, and other local functions can often find potential candidates by spreading the word.

INTERVIEWS

In the well-managed hiring process, résumés or applications will be filtered and only a selection of promising candidates will be invited for an interview. The well-prepared employer will have read and annotated the résumé.

The interview should be a semi-formal but friendly interchange in which the interviewer makes an effort to help the candidate to relax so that a *conversation* can ensue. The clear object of the interview is to elicit information *from* the candidate but in reaction*to* the offered job situation. Objectivity and concentration on the mission are important. It is good practice in larger organizations to pass promising candidates to two or three other people, each of whom will, in turn, obtain a different view and also present the company from a different perspective.

SELECTION AND JOB OFFER

Every business has a selection process; it may be formal or simply understood. The manager directly in charge of the open position will typically be given the power of decision. Small businesses tend to be more organic when it comes to job offers, and the owner may decide after discussion with other employees. Companies of every size should take time to verify references and ensure the documentation of their candidate is in order.

A job offer, even when verbally made, can be construed as a contractual agreement. For this reason the offer should be made very clearly and precisely, indicating the type of job it is (hourly or salaried, permanent or temporary), the compensation offered and at what intervals it will be paid, the trial period during which the employer reserves the right to terminate the offer, what benefits are included or excluded (“We have a medical program but no dental or vision care; if you participate, you will have to pay part of the cost.”), and how long the employee has to respond to the offer. These matters should be covered even if already discussed during the interview. If a verbal offer is followed up in writing, the letter should repeat these and other appropriate points.

The offer itself may be followed by some negotiation with the prospective employee, in the course of which the manager may agree to certain adjustments based on the employee’s existing schedule.

REGISTRATION AND ORIENTATION

Registration of new employees involves filling out necessary government forms and submitting them to the proper organizations. Three types of documents are involved: the *Federal Tax Withholding Form (W-4)*, which has an employee and employer version; the *State and/or Local Tax Withholding forms* that correspond to the federal W-4; and the *Employment Eligibility Verification Form (I-9)* required

to be filed with the U.S. Citizenship and Immigration Services (successor to the Immigration and Naturalization Service).

The new employee's initial session, at which these forms are filled out, is also an ideal time to collect information for use by the company, such as the names and telephone numbers of next of kin for emergency purposes, information on the individual's health status for the files, and other information the company should keep.

This is also an opportune time to review company policy and handbooks with the employee. Many businesses have new employees read and sign a copy of the handbook to verify they understand the contents. An orientation is also given, including a tour of the applicable workspace and building and possibly an introduction to employee training. Most businesses use orientation as an opportunity to review specific work policies regarding behavior and safety.

In most work situations some training will be required. In well-run operations such training will be administered based on a checklist and often incorporate a mentor who can show new employees necessary processes. Training can also have online and class-based components.

HIRING FIRST EMPLOYEES

Businesses that want to start hiring employees will first need to obtain an Employee Identification Number (EIN) from the Internal Revenue Service (IRS), which is necessary for reporting any taxes that involve employees, including state taxes. The IRS also requires companies to keep records of employment taxes for at least 4 years, and good record keeping is an important part of hiring. All the employee W-4 forms must be kept in their files, along with the version sent to the IRS. These W-4 forms make it possible for businesses to fill out W-2 forms, or federal wage and tax statements, which must be turned in by the last day of February. These forms show the IRS how much the business paid in wages, and the amount of taxes withheld for each employee. Certain states may also require state taxes to be withheld from wages, so employers should carefully check their state laws.

Employers are also often required to register with the state New Hire Reporting Program. This program monitors employees that are newly hired or rehired so states can keep track of employment records, and employees must be entered into the database within 20 days after they are hired. Some states, such as Hawaii, California, New Jersey, New York, and Rhode Island also require employers to obtain disability insurance.

In the workplace, all new employers should keep work requirements and labor law information clearly posted, as required by federal law. Posters with this information are available from both state and federal labor agencies.

The hiring process is also subject to legal guidelines dealing with discriminatory hiring practices. Companies that hire people may not discriminate on the basis of sex, age, race, national origin, religion, physical disability, or veteran status. A hiring manager may not screen out any applicant because of membership in a protected class or address topics during the job interview related to the protected class.

The most important laws related to hiring are:

- The Civil Rights Act of 1964 (Title VII)
- Age Discrimination in Employment Act of 1967 (ADEA)
- Americans With Disabilities Act of 1990 (ADA)
- The Uniformed Services Employment Reemployment Rights Act of 1994 (USERRA)
- Immigration Reform and Control Act of 1986

Anti-discrimination laws do not require a company to hire an applicant because of membership in a protected class, nor is a manager required to hire applicants from any protected class in proportion to their numbers in the community. However, the business owner is required to select the best qualified applicant for the position, based on the critical skills of the job, and is required to make that selection irrespective of whether that applicant belongs to a protected class.

The complexity of these laws can be daunting. Further information can be obtained at the Web site of the U.S. Equal Employment Opportunity Commission.

EMPLOYEE INTERNET USAGE POLICY

Downloading issues are the risks and liabilities a small business faces as a result of providing Internet access and e-mail service to its employees. Most companies provide Internet access to employees for legitimate business purposes, such as conducting research, and find that such access improves productivity. But connecting employees to the Internet also brings up potential problems for small businesses. Since 2005 the popularity of social networking sites such as Facebook and Twitter have provided even more distractions for employees and posed more monitoring challenges for employers.

"The good news: The ever-expanding universe of high-tech tools facilitates users' ability to quickly and conveniently transmit business-critical data and stay connected with colleagues and customers around the globe, " Nancy Flynn wrote in 2009's *The e-Policy Handbook.* "The bad news: Emerging technologies dramatically increase the employers' exposure to potentially costly and protracted risks including workplace lawsuits, regulatory fines, security breaches, and productivity drains, among others."

Many potential problems associated with employee Internet access involve downloading of information. For example, employees might download copyrighted software, offensive material, or files that are infected with computer viruses. A small business may be legally liable for damages resulting from claims of copyright infringement, racial discrimination, or sexual harassment based on such downloads. Another potential problem in granting employees access to the Internet is personal use that detracts from productivity.

"Internet abuse in the workplace (a.k.a. cyber-slacking) has become a pervasive problem for employers. When employees abuse the Internet through activities like online gaming, online shopping, personal investment managing, personal emailing, chatting, media watching and viewing pornography, they waste work time and reduce available bandwidth," researchers from Southern Illinois University wrote in the abstract of a 2008 paper in *Journal of Internet Commerce.* While previous research did not identify the most likely cyber-slackers, their study revealed that young executives are the prime culprits. The researchers' analysis found that the Internet was an easy way for these executives to find relief from their job pressures. "In addition, young executive's high degree of autonomy also appears to perpetuate their propensity to cyber-slack."

In January 2010 Internet security firm ScanSafe reported that its data showed a "significant 55% increase in illegal MP3 and software download attempts" over corporate networks in the preceding 3 months. "Employees mistakenly assume they can use the Internet at work in exactly the same way as they use it at home and this is potentially one of the reasons for this steady increase in illegal download attempts over recent months," said Spencer Parker, director of product management at ScanSafe. "Inappropriate Internet use in the workplace can put the employer at risk for legal liabilities."

Improper workplace use of computers can prove embarrassing for both the employee and the company. In February 2010, Australian broker David Kiely was caught in the background by a TV camera as he looked at images on his computer of a scantily clad model while a colleague was being interviewed. Subsequent news reports suggested Kiely was the victim of a prankster who had e-mailed him the photos during the broadcast. (His employer, Macquarie Group, did not fire Kiely, and the model, Miranda Kerr, signed a petition calling for him to keep his job.)

Lost productivity costs U.S. businesses $4.4 billion a day, or over $1 trillion a year, according to a 2009 data analysis by Global 360, a process and document management provider. Global 360 arrived at that estimate by combining figures from the Bureau of Labor with statistics from a 2007 survey by salary.com, according to a news release.

MONITORING EMPLOYEES' INTERNET USAGE

In 2007 the American Management Association and the e-Policy Institute conducted a survey that found 30 percent of bosses had fired employees for Internet abuse and 28 percent had fired workers for misusing e-mail. Inappropriate content was cited in 84 percent of the cases of

firings for Internet abuse, while violation of company policy was noted in 48 percent of the cases, and excessive personal use in 34 percent. The major reasons cited for the firings over e-mail usage were that it violated company policy (64 %) or used offensive or inappropriate language (62 %).

The survey also found that 66 percent of employers monitored Internet connections and 65 percent used software to block offensive sites. The use of software blocking was 27 percent higher than in a similar survey in 2001. The overwhelming concern of employers blocking Web sites in the 2007 survey (96 %) was about employees visiting sites with sexual content. Game sites (61 %), social networking sites (50 %), and entertainment sites (40 %) were among other leading concerns. ''Of the 43% of companies that monitor e-mail, 73% use technology tools to automatically monitor e-mail and 40% assign an individual to manually read and review e-mail,'' a report on the 2007 survey stated.

A 2009 survey by Manpower Inc. of 34,000 employers worldwide found that 20 percent had formal policies for using social networks on the job. Sixty-three percent of those companies said the policy helped avoid productivity loss. WorkPlaceMedia reported in July 2009 on a survey that found 55 percent of workplace Internet users had at least one social networking account. Of those, 43 per cent accessed it at work, the majority of whom (78 %) spent less than half an hour a day on the site.

Software company CEO Ray Boelig told Sarah Boehle in *Training*, ''Organizations need to look at the proper use of their assets.'' At the same time, however, wholesale monitoring of employees' communications can cause a different set of problems for small businesses. For example, employers can be held liable for invasions of privacy. Furthermore, employers who develop a reputation for excessive monitoring of employee communications may have problems attracting and retaining valuable tech-savvy workers. Finally, it takes time to monitor employees communications, time that could be used in any number of more productive tasks.

RISKS ASSOCIATED WITH EMPLOYEE INTERNET USE

In his book *Clicking Through: A Survival Guide for Bringing Your Company Online*, Jonathan Ezor mentioned several risks companies might face as a result of employee Internet use. These risks include liability for copyright infringement, criminal liability for online gambling, fraudulent acts committed online, or downloads of illegal materials, exposure to sexual harassment or racial discrimination charges based on downloads of offensive materials, and breaches of company confidentiality or security.

As Ezor explained, Internet users have an implied license to copy the information for viewing on their computer screens. But this implied license applies only to a single user and a one-time use. Many people, failing to understand this condition, save copyrighted documents or software to a hard drive and reuse them without permission. In addition, pirate Web sites routinely display and distribute information for which they do not hold copyright. Small businesses can be held liable for copyright infringement if illegal software is found on company computers, or even if employees use network PCs to play pirated music or watch pirated movies, and the monetary damages can be substantial.

Small businesses may also be exposed to criminal liability resulting from employee Internet use. Ezor noted that online casinos are commonplace, which may tempt employees to place bets using company machines during work hours. Poll results released in February 2010 by the Society for Human Resource Management found that two-thirds of organizations surveyed had workplace gambling policies. However, only 4 percent of firms had disciplined employees for violating those policies and only 2 percent had fired employees for violations. ''The challenge is to identify the problem gamblers before they become desperate. To this end, it is important that all employers and employees develop a greater awareness of the signs associated with a gambling problem,'' according to a posting on the Web site of the Nevada Council on Problem Gambling.

Online activities can expose a small business to other criminal liability. A company might be implicated if an employee commits stock fraud by posting insider information or misleading data on investment Web sites. Likewise, the company may be responsible if an employee uses the Internet connection to conduct electronic commerce and makes false claims about products or services. Employees may also use workplace computers to acquire documents or images that are illegal to produce or possess. Examples include child pornography, military secrets, bomb-making instructions, or data-encryption algorithms (which cannot legally be sent overseas). Many people are unaware of the distinctions between legal and illegal materials, so downloading from the Internet may put employees at risk of arrest or imprisonment. Furthermore, as Ezor pointed out, a company might be legally obligated to report an employee's illegal online activities, even if that exposed the company to prosecution as well.

CONTROLLING THE RISKS OF DOWNLOADING

Experts recommend that small-business owners develop policies regarding employee Internet use. Ezor suggested that employers begin by outlining the various business

purposes to be achieved by granting employees Internet access. These purposes may differ depending on each employee's role in the company. For example, one employee may only need to send and receive e-mail, while another may need to visit competitors' Web sites. Next, the small-business owner should decide whether or not to monitor employee Internet use and, if so, what Web browser to provide. Finally, the small-business owner should establish consequences in the event an employee runs afoul of the company's policies. The types of punishment should vary depending on the specific offense and the extent to which it exposes the company to liability.

Before starting to monitor employee Internet usage, however, it is important for small-business owners to establish guidelines regarding inspections and inform employees about the company policies. Otherwise, employees may challenge the monitoring of e-mail or computer usage by claiming the employer has invaded their privacy. It may be helpful to inform employees in advance that the company offers Internet access for business purposes and reserves the right to monitor the use of its computer system.

EMPLOYEE MANUALS

The employee manual or handbook can be a valuable tool for any business. Ideally, it should provide detailed guidelines for the employment relationship and document company policies and procedures for both employer and employee. For example, handbooks define an employer's legal responsibilities by putting policies on record; make employees aware of rights, benefits, and policy, providing legal protections to employers; provide background information on the organization; and serve as employee reference tools. Because of its many uses, it is crucial for businesses to craft their employee manuals in a careful and thoughtful fashion.

Indeed, employee manuals have become the focus of considerable employment-related litigation in recent years, as growing numbers of workers and employers became enmeshed in legal tangles over workplace actions and expectations. "Since there is no reason to believe that this flood of litigation will slow any time soon, an employer can help protect itself by drafting a handbook that clearly sets forth its policies and covers the important topics in a way that will not come back to haunt," wrote Paul Berninger in *Business Courier*. "The specific contents will vary widely, depending on the size of the company and the nature of the business, but there are some elements that every employee handbook should contain."

TYPICAL CONTENTS

The contents of employee manuals should be limited to statements of fact, avoiding vague or blanket pronouncements on issues that are generally addressed on a case-by-case basis (such as job security). "Make only statements of fact regarding company policies and procedures, avoiding generalizations, and reiterate the employer's right to change employment practices and procedures at any time without prior notice to employees," Berninger counseled.

Most employee manuals contain these basic sections:

1. A welcome from the president, the company's mission or vision statement, and a brief history of the company.
2. The company's discrimination and harassment policies, including complaint and investigation procedures. By incorporating these policies in the manual, an

employee understands that there is no tolerance for such activity. This language helps ensure a productive, efficient workplace, and can protect the company from legal liability. "You must make sure you have a discrimination and harassment policy that's right at the cutting edge of the law," explained one attorney in *Workforce*. "There are a lot of laws that say the existence of these procedures may well provide the employer with a safe harbor, shielding it from liability."

3. Employee classifications and an explanation of them.
4. General pay and overtime provisions. Often, there are state laws that must be followed with regard to pay, so this section should be thoroughly reviewed.
5. Hiring and recruiting policy, including a statement regarding equal employment opportunity.
6. Sections on general procedures such as work hours, dress code, and other office-specific policies.
7. Sections describing benefits, including vacation, leaves of absence, insurance, pensions, and sick time. Again, because many of these are covered by state as well as federal regulations, it is important to review these carefully before publication. For example, employers covered by the Family and Medical Leave Act (FMLA) must include information about employee rights and obligations under the FMLA.
8. Statement of disciplinary procedures, including a clear list of behaviors that can result in immediate termination. Drug and alcohol policies are typically explained here.
9. Outline of grievance procedures. Company privacy policies, extending from employee lockers to their use of the Internet.
10. An employment-at-will statement, defining the rights of the employer to terminate an employee at any time. This right is also granted the employee, who may resign at any time for any reason. An acknowledgment, to be signed and returned to the employer, stating that an employee has received, read, and understood the information contained in the manual. This is a vital but often overlooked aspect of the handbook creation and distribution process, for it provides significant legal protection for employers.

Disclaimers may also be added, such as a disclaimer stating that the manual does not represent a contract made with the employee, or a disclaimer stating that the list of company rules and procedures is not exhaustive. Such disclaimers protect the company from potential legal action in these areas. Whatever liability shielding language is employed, however, businesses should make sure that all handbook contents are carefully reviewed by legal counsel before publication.

REVIEW

If at all possible, the employee manual should be reviewed by the company's legal counsel to ensure that it conforms to federal and state laws and states legal matters in an appropriate language. As reported by Todd Raphael in *Workforce*, a small private service company in San Diego won the World's Worst Manual contest in 2002 for an employee manual filled with outright errors, including a misstatement of California's overtime rules. As Raphael said in his article, "This isn't the kind of contest you want to win."

MAINTENANCE, DISTRIBUTION, AND UPDATING ISSUES

When constructing or maintaining an employee manual, it is worthwhile to consider using a team approach, bringing in people from all areas of the company who are impacted by the policies embodied in the manual. This group ensures that policies are not developed and reviewed solely by human resources representatives (although their input can certainly be valuable) or the owner, but by a representative cross-section of the entire company. If this technique is used, it is critical to assign trustworthy people to manage the project and see to its completion.

An employee manual should be distributed at the time of hire to all incoming employees. This does not mean that the manual does not ever change, however. If revisions are to be made, a manual must first state that the employer has the right to revise the policies in it at any time. It should then be redistributed (in whole or in part, depending on its format) to all employees, with a detailed description of the revisions made. Generally, the manual should be reviewed once per year to see if revisions are necessary. In addition, in instances where federal and state laws materially impact a company's operations or policies, relevant sections should be updated immediately, then disseminated to all affected employees. If any changes to the policies in the manual appear to affect the terms of a worker's employment contract, the business owner should ensure that each employee signs off in acknowledgement that they have received the updated policy information.

Small-business owners in particular may question the need for an employee manual. When dealing with a small operation, the owner can just as easily communicate policies directly to employees, or can send e-mails outlining any policy changes. The key difference here is that with a conversation or e-mail, the business owner does not receive written acknowledgement from each employee indicating that they have read and understood these new or altered policies. For this same reason, a

small-business owner should avoid creating an online manual for employees to access via the office network or the Internet. Electronic signatures are quickly becoming recognized as valid alternatives to handwritten signatures, but require several specific traits to achieve compliance; for simplicity and undisputed legal validity, a signed acknowledgement written in an employee's own hand still remains the best option. An online resource may prove beneficial as a backup to a printed manual, as long as the information is kept up-to-date.

EMPLOYEE MOTIVATION

Employee motivation is the level of energy, commitment, and creativity that a company's workers bring to their jobs. Whether the economy is growing or shrinking, finding ways to motivate employees is always a management concern. Competing theories stress either incentives or employee involvement (empowerment). Employee motivation can sometimes be particularly problematic for small businesses. The owner has often spent years building a company hands-on and therefore finds it difficult to delegate meaningful responsibilities to others. But entrepreneurs should be mindful of such pitfalls: the effects of low employee motivation on small businesses can be harmful. Such problems include complacency, lack of interest, even widespread discouragement. Such attitudes can cumulate into crises.

But the small business can also provide an ideal atmosphere for employee motivation: employees see the results of their contributions directly; feedback is swift and visible. A smoothly working and motivated workforce also frees the owner from day-to-day chores and allows him or her to think of long-term development. Furthermore, tangible and emotional reward can mean retention of desirable employees. People thrive in creative work environments and want to make a difference. Ideally the work result itself will give them a feeling of accomplishment but well-structured reward and recognition programs can underline this consequence.

WHAT MOTIVATES?

One approach to employee motivation has been to view "add-ins" to an individual's job as the primary factors in improving performance. Endless mixes of employee benefits, such as health care, life insurance, profit sharing, employee stock ownership plans, exercise facilities, subsidized meal plans, child care availability, and company cars, have been used by companies in their efforts to maintain happy employees in the belief that happy employees are motivated employees.

Many modern theorists, however, propose that the motivation an employee feels toward his or her job has less to do with material rewards than with the design of the job itself. Studies as far back as 1950 have shown that highly segmented and simplified jobs resulted in lower employee morale and output. Other consequences of low employee motivation include absenteeism and high turnover, both of which are very costly for any company. As a result, "job enlargement" initiatives began to crop up in major companies in the 1950s.

While terminology changes, the tenets of employee motivation remain relatively unchanged from findings over half a century ago. Today's buzzwords include "empowerment," "quality circles," and "teamwork." Empowerment gives autonomy and allows an employee to have ownership of ideas and accomplishments, whether acting alone or in teams. Quality circles and the increasing occurrence of teams in today's work environments give employees opportunities to reinforce the importance of the work accomplished by members as well as receive feedback on the efficacy of that work.

In small businesses, which may lack the resources to enact formal employee motivation programs, managers can nonetheless accomplish the same basic principles. In order to help employees feel that their jobs are meaningful and that their contributions are valuable to the company, the small-business owner needs to communicate the company's purpose to employees. This communication should take the form of words as well as actions. In addition, the small-business owner should set high

standards for employees, but also remain supportive of their efforts when goals cannot be reached. It may also be helpful to allow employees as much autonomy and flexibility as possible in how their jobs are performed. Creativity will be encouraged if honest mistakes are corrected but not punished. Finally, the small-business owner should take steps to incorporate the vision of employees for the company with his or her own vision. This will motivate employees to contribute to the small business's goals, as well as help prevent stagnation in its direction and purpose.

MOTIVATION METHODS

There are as many different methods of motivating employees today as there are companies operating in the global business environment. Still, some strategies are prevalent across all organizations striving to improve employee motivation. The best employee motivation efforts will focus on what the employees deem to be important. It may be that employees within the same department of the same organization will have different motivators. Many organizations today find that flexibility in job design and reward systems has resulted in employees' increased longevity with the company, improved productivity, and better morale.

Empowerment Giving employees more responsibility and decision-making authority increases their realm of control over the tasks for which they are held responsible and better equips them to carry out those tasks. As a result, feelings of frustration arising from being held accountable for something one does not have the resources to carry out are diminished. Energy is diverted from self-preservation to improved task accomplishment. According to Cindy Ventrice, a business author who surveyed hundreds of employees regarding workplace motivation, providing employees with an opportunity to succeed is one of the most fundamental elements of employee satisfaction and drive. When interviewed by *Entrepreneur*, Ventrice stated, "An award may be a tangible sign of recognition, but employees see an opportunity as a sign that their manager truly values them."

Creativity and Innovation. At many companies, employees with creative ideas do not express them to management for fear that their input will be ignored or ridiculed. Company approval and toeing the company line have become so ingrained in some working environments that both the employee and the organization suffer. When the power to create in the organization is pushed down from the top to line personnel, employees who know a job, product, or service best are given the opportunity to use their ideas to improve it. The power to create motivates employees and benefits the organization in having a more flexible work force, using more wisely the experience of its employees, and increasing the exchange of ideas and information among employees and departments. These improvements also create an openness to change that can give a company the ability to respond quickly to market changes and sustain a first mover advantage in the marketplace.

Small-business owners can spur creativity by creating open forums for ideas related to improving the business. These may be specific, such as asking for creative solutions to a particular challenge the business or workplace is facing; for example, a business owner might send an e-mail soliciting suggestions for how best to keep a common area, such as a break room or kitchen, from becoming messy. The owner could simply create signs that read, "Clean Up After Yourself," but by sharing the problem and asking for solutions, employees will be more likely to view the problem as motivation to help improve their own working conditions.

Small-business owners can spur employee creativity by soliciting ideas for new products or services. A video game developer might have an "open call" for game proposals from its employees; this also creates an opportunity for the owner to identify talented individuals for advancement within the company. By contrast, talented employees whose ideas are not solicited will not only be less motivated and less happy, but they will also be more likely to leave and take their valuable ideas with them.

Learning. If employees are given the tools and the opportunities to accomplish more, most will take on the challenge. Companies can motivate employees to achieve more by committing to perpetual enhancement of employee skills. Accreditation and licensing programs for employees are an increasingly popular and effective way to bring about growth in employee knowledge and motivation. Often, these programs improve employees' attitudes toward the client and the company, while bolstering self-confidence. Supporting this assertion, an analysis of factors which influence motivation-to-learn found that it is directly related to the extent to which training participants believe that such participation will affect their job or career utility. In other words, if the body of knowledge gained can be applied to the work to be accomplished, the acquisition of that knowledge will be a worthwhile event for the employee and employer.

Quality of Life. The number of hours worked each week by American workers is on the rise, and many families have two adults working those increased hours. Under these circumstances, many workers are left wondering how to meet the demands of their lives beyond the workplace. Often, this concern occurs while at work and may reduce an employee's productivity and morale. Companies that have instituted flexible employee arrangements have gained motivated employees whose productivity has

increased. Programs incorporating flextime, condensed workweeks, or job sharing, for example, have been successful in focusing overwhelmed employees toward the work to be done and away from the demands of their private lives.

Monetary Incentive. For all the championing of alternative motivators, money still occupies a major place in the mix of motivators. The sharing of a company's profits gives incentive to employees to produce a quality product, perform a quality service, or improve the quality of a process within the company. What benefits the company directly benefits the employee. Monetary and other rewards are being given to employees for generating cost-savings or process-improving ideas, to boost productivity and reduce absenteeism. Money is effective when it is directly tied to an employee's ideas or accomplishments. Nevertheless, if not coupled with other, nonmonetary motivators, its motivating effects are short-lived. Further, monetary incentives can prove counterproductive if not made available to all members of the organization.

Other Incentives. Study after study has found that the most effective motivators of workers are nonmonetary. According to Ventrice, a 2007 employee survey "found that 57 percent of the most meaningful recognition was free and 80 percent cost under $20." Monetary systems are insufficient motivators, in part because expectations often exceed results and because disparity between salaried individuals may divide rather than unite employees. Proven nonmonetary positive motivators foster team spirit and include recognition, responsibility, and advancement. Managers who recognize the "small wins" of employees, promote participatory environments, and treat employees with fairness and respect will find their employees to be more highly motivated. One company's managers brainstormed to come up with thirty powerful rewards that cost little or nothing to implement. The most effective rewards, such as letters of commendation and time off from work, enhanced personal fulfillment and self-respect. Other inexpensive but effective incentives include internal publications that recognize employees in print, such as newsletters or blogs. Over the longer term, sincere praise and personal gestures are far more effective and more economical than awards of money alone. In the end, a program that combines monetary reward systems and satisfies intrinsic, self-actualizing needs may be the most potent employee motivator.

EMPLOYEE PERFORMANCE APPRAISALS

An employee performance appraisal is a process often combining both written and oral elements whereby management evaluates and provides feedback on employee job performance, including steps to improve or redirect activities as needed. Documenting performance provides a basis for pay increases and promotions. Appraisals are also important to help staff members improve their performance and as an avenue by which they can be rewarded or recognized for a job well done. In addition, they can serve a host of other functions, providing a launching point from which companies can clarify and shape responsibilities in accordance with business trends, clear lines of management-employee communication, and spur reexaminations of potentially hoary business practices. During an economic downturn, performance appraisals may be used as the key factor in determining which employees should be cut during downsizing. Joel Myers notes in *Memphis Business Journal* that "in many organizations, performance appraisals only occur when management is building a case to terminate someone. It's no wonder that the result is a mutual dread of the performance evaluation session something to be avoided, if at all possible. This is no way to manage and motivate people. Performance appraisal is supposed to be a developmental experience for the employee and a 'teaching moment' for the manager."

PERFORMANCE APPRAISAL AND DEVELOPMENT

While the term *performance appraisal* has meaning for most small-business owners, it might be helpful to consider the goals of an appraisal system. They are as follows:

1. To improve the company's productivity
2. To make informed personnel decisions regarding promotion, job changes, and termination
3. To identify what is required to perform a job (goals and responsibilities of the job)
4. To assess an employee's performance against these goals
5. To work to improve the employee's performance by naming specific areas for improvement, developing a plan aimed at improving these areas, supporting the employee's efforts at improvement via feedback and assistance, and ensuring the employee's involvement and commitment to improving his or her performance.

All of these goals can be more easily realized if the employer makes an effort to establish the performance appraisal process as a dialogue in which the ultimate purpose is the betterment of all parties. To create and maintain this framework, employers need to inform workers of their value, praise them for their accomplishments, establish a track record of fair and honest feedback, be consistent in their treatment of all employees, and canvass workers for their own insights into the company's processes and operations.

A small business with few employees or one that is just starting to appraise its staff may choose to use a prepackaged appraisal system, consisting of either printed forms or software. Software packages can be customized either by using a firm's existing appraisal methods or by selecting elements from a list of attributes that describe a successful employee's work habits such as effective communication, timeliness, and ability to perform work requested. Eventually, however, many companies choose to develop their own appraisal form and system in order accurately to reflect an employee's performance in light of the business's own unique goals and culture. In developing an appraisal system for a small business, an entrepreneur needs to consider the following:

1. Size of staff
2. Employees on an alternative work schedule
3. Goals of company and desired employee behaviors to help achieve goals
4. Measuring performance/work
5. Pay increases and promotions
6. Communication of appraisal system and individual performance
7. Performance planning

Size of Staff. A small business with few employees may choose to use an informal approach with employees. This entails meeting with each employee every 6 months or once a year and discussing an individual's work performance and progress since the last discussion. Feedback can be provided verbally, without developing or using a standard appraisal form, but in many cases, legal experts counsel employers to maintain written records in order to provide themselves with greater legal protections. As a company increases its staff, a more formal system using a written appraisal form developed internally or externally should always be used, with the results of the appraisal being tied to salary increases or bonuses. Whether the appraisal is provided verbally or in writing, a small-business owner needs to provide consistent feedback on a regular basis so that employees can improve their work performance.

Alternative Work Schedules. Employees working alternative work schedules working at home, working part-time, job-sharing will most likely need to have their performance appraised differently than regular full-time staffs in order to be fairly evaluated. An alternative work schedule may require different duties to perform a job and these new responsibilities should be incorporated into the appraisal. A small-business owner should also be careful to ensure that these employees are treated fairly with regard to both the appraisal and resulting promotions.

Company Goals and Desired Performance. The performance of employees, especially in a smaller firm, is an essential factor in any company's ability to meet its goals. In a one-person business, goal setting and achieving is a matter of transforming words into action, but moving the business towards its goals in a larger firm means that the employer has to figure out each person's role in that success, communicate that role to him or her, and reward or correct the person's performance. It also means that the appraisal should incorporate factors such as collaborative ability and sense of teamwork, not just individual performance.

Measuring/Assessing Performance. Once a list of tasks and attributes is developed, a small-business owner or manager needs to determine how to measure an employee's performance on these tasks. Measurement provides another objective element to the appraisal. Ideally, measurement would be taken against previous performance, whether of the individual employee, the group, or the company at large. If a company is just developing its appraisal system or does not have a baseline performance to measure against, it should develop realistic goals based on business needs or on the similar performance of competitors.

Pay Increases and Promotions. When developing an appraisal system, a small-business owner needs to consider

the connection between the appraisal and pay increases or promotions. While performance feedback for development and improvement purposes may be given verbally, a written summary of the individual's work performance must accompany a pay increase or promotion (or demotion or termination). It is crucial, therefore, that a manager or small-business owner regularly document an employee's job performance.

The method of pay increases impacts the appraisal as well. If a small business uses merit-based increases, the appraisal form would include a rating of the employee on certain tasks. If skill-based pay is used, the appraisal would list skills acquired and level of competency. Appraisals and resulting salary increases that take into account group or company performance should include the individual's contributions to those goals.

Communicating the System. A performance appraisal system is only effective if it is properly communicated and understood by employees. When devising an appraisal system for his or her company, an entrepreneur may want to consider involving staff in its development. Supporters contend that this promotes buy-in and understanding of the plan, as well as ensuring that the appraisal takes into account all tasks at the company. If the small-business owner is unable to involve her staff, she should walk through the system with each employee or manager and have the manager do the same, requesting feedback and making adjustments as necessary.

Communicating Performance and Planning. Part of the appraisal system is the actual communication of the performance assessment. While this assessment may be written, it should always be provided verbally as well. This provides an opportunity to answer any questions the employee may have on the assessment as well as provide context or further detail for brief assessments. Finally, the employee and the entrepreneur or manager should make plans to meet again to develop a plan aimed at improving performance and reaching agreed-upon goals for the following review period. This planning session should relate company and group goals to the individual's tasks and goals for the review period and provide a basis for the next scheduled review.

TYPES OF APPRAISALS AND ASSESSMENT TERMS

Types of employee appraisal fall into four main categories: traditional, self-appraisal, employee-initiated reviews, and 360-degree feedback.

Traditional. In a traditional appraisal, a manager sits down with an employee and discusses performance for the previous performance period, usually a single year. The discussion is based on the manager's observations of the employee's abilities and performance of tasks as noted in a job description. The performance is rated, with the ratings tied to salary percentage increases. However, as David Antonioni notes in *Compensation & Benefits*, "The traditional merit raise process grants even poor performers an automatic cost of living increase, thereby creating perceived inequity.... In addition, most traditional performance appraisal forms use too many rating categories and distribute ratings using a forced-distribution format." Antonioni suggests the appraisal form use just three rating categories outstanding, fully competent, and unsatisfactory as most managers can assess their best and worst employees, with the rest falling in between.

Self-Appraisal. Somewhat self-explanatory, the self-appraisal is used in the performance appraisal process to encourage staff members to take responsibility for their own performance by assessing their own achievements or failures and promoting self-management of development goals. It also prepares employees to discuss these points with their manager. It may be used in conjunction with or as a part of other appraisal processes, but does not substitute for an assessment of the employee's performance by a manager.

Employee-Initiated Reviews. In an employee-initiated review system, employees are informed that they can ask for a review from their manager. This type of on-demand appraisal is not meant to replace a conventional review process. Rather, it can be used to promote an attitude of self-management among workers. Adherents to this type of review process contend that it promotes regular communication between staff and managers. Detractors, though, note that it is dependent on the employees' initiative, making it a less than ideal alternative for some workers with quiet, retiring personalities or confidence issues.

360-Degree Feedback. The performance appraisal process known as 360-degree feedback refers to feedback on an employee's performance being provided by the manager, different people or departments an employee interacts with (peer evaluation), external customers, and the employee himself. This type of feedback includes employee-generated feedback on management performance (also known as upward appraisals). As a company grows in size, a small-business owner should consider using 360-degree feedback to appraise employees. Communication in a business of ten people varies widely from that of a company of 100 persons, and 360-degree feedback ensures that an employee's performance is observed by those who work most closely with him. Small-business owners or managers can either include the feedback in

the performance review or choose to provide it informally for development purposes.

LEGAL ISSUES

Given that the results of a performance appraisal are often used to support a promotion, termination, salary increase, or job change, they are looked at very closely in employee discrimination suits. If a terminated employee's previous performance appraisals do not thoroughly align with the reasons given for termination, the business owner may find the legal scales weighted against him or her. Besides providing a written summary of the appraisal to the employee, a small-business owner would be well-advised to ensure the following with regards to the system at large:

- Job expectations as well as the appraisal system and its impact on employee's work status are adequately communicated to all employees
- Performance measures are related to the job being performed
- Managers or co-workers providing input into the appraisal must be sufficiently trained as to be able to provide objective input
- Employees are given timely feedback on performance and a reasonable amount of time and support in improving their performance

CRITICISMS OF THE PERFORMANCE APPRAISAL SYSTEM

Although most businesses utilize some kind of performance appraisal system, some critics have argued that such a system has no net positive benefits for a company. In a column for *Entrepreneur*, Aubrey C. Daniels does not recommend the use of traditional performance appraisals at all. Daniels notes that from his own anecdotal surveys, most people view appraisals primarily as a method of calling out underperformers and establishing a justification for future termination. However, to use an annual performance appraisal as an opportunity to point out an employee's unsatisfactory job performance suggests a failure of the daily employee oversight and feedback a small-business owner or manager should provide on an ongoing basis. Verbal or written notification of poor job performance should be communicated to an employee as soon as possible, which provides the employee the best chance to correct the problem and also lessens the potential harm suffered by the company.

In addition, appraisals that rely upon a forced distribution to rank employees with the highest-ranked employees getting the best raises, and the lowest-ranked being terminated may not take into account the objective quality of the employee's job performance. For example, even if every employee in the workplace performs at levels that meet or exceed expectations, someone still must be chosen as the best, while someone else is chosen as the worst. This problem is only exacerbated in small businesses, where the relatively low number of employees does not constitute a large enough sample for this kind of distribution. Another potential pitfall of this system is that employees in the middle neither the best nor the worst may not receive adequate guidance on the positives and negatives of their work performance. General Electric CEO Jack Welch famously used a forced distribution method, referred to as "rank and yank." Although Welch credited the process with bringing about General Electric's success during the late twentieth century, many workplace experts disagree.

For business owners who wish to utilize performance appraisals, assistance in developing a system is available through a variety of sources including consultants, periodicals and books, and software. In addition, given the legal implications of appraisals, small-business owners should have their companies' performance assessment processes, including training of managers and employees, reviewed by a qualified attorney.

EMPLOYEE PRIVACY

Rights to privacy are anchored fundamentally by the Fourth Amendment of the U.S. Constitution, which provides against unreasonable searches and seizures in the citizen's home, but the prohibition applies to government and does not cover every and all places where the citizen spends time. This right has been gradually enlarged, but these developments have little or no bearing on the workplace. The citizen as an employee has rather limited rights to privacy in the workplace. During the hiring process, candidates may not be asked questions relating to sex-related issues, age, race, disability, religion, national origin, and veteran's status prohibitions arising from the Civil Rights Act's antidiscrimination mandates. His or her personnel records at the company are also protected by law and may not be arbitrarily published. With these few exceptions, no rights to privacy exist unless they are actually granted by the employer.

Due to the widespread use of the Internet in the workplace, there is ever-increasing pressure to expand privacy rights to include private documents and files that may coexist with company files on business computers. In 2002, as a result of the highly publicized corporate scandals involving companies such as Enron and WorldCom, the Sarbanes-Oxley Act was passed. It significantly ratcheted up record-keeping requirements and elevated e-mail to the status of official documentation to be safeguarded for litigation purposes. The debate continues as to whether the Sarbanes-Oxley Act does more harm than good. According to a *New York Times* article published in January 2010, fewer tech start-ups went public from 2008 to 2009 than in the previous two years. Many blame this on the added expense and time required of publicly held companies to fulfill the requirements laid out in the Sarbanes-Oxley Act.

ISSUES OF WORKPLACE PRIVACY

Legitimate claims by an employee that his or her privacy has been violated on the job ultimately rest on whether or not the employer, at its option, created a reasonable expectation of privacy by the employee. An employer, for example, who explicitly states in a company policy that all activities on the job must be company-related and private activities must be pursued off-site has by this policy *removed* such expectations. On the other hand, in a company that lacks such a policy and where it is common for employees to use their break time to do personal tasks at their desks pay bills and such a reasonable expectation of privacy may be held up in court. The small business wishing to avoid ambiguous situations is well advised to publish a policy; the policy may prohibit or allow private activities, but if it allows them, then the privacy created by this policy must also be respected.

Employees, on the other hand, are most prudent if they recognize that no privacy rights actually exist and act accordingly. Some of the issues are highlighted next.

Searches and Seizures. An employer has the right to inspect personal belongings (bags, purses, briefcases, cars, lockers, desks, etc.), except when the employer has created a reasonable expectation of privacy. These expectations can be raised if the employee is given a key to a desk or if the employer has disseminated a written policy explicitly stating that it will not make such inspections.

Monitoring Computer, E-mail, Internet, and Fax Use. Businesses have some significant rights in this regard: they own the equipment. But if these resources are knowingly made available for private employee use then a reasonable expectation of privacy has been created. Management must therefore refrain from looking at data the employee claims are private. If criminal activity is suspected, appropriate law enforcement officials will, of course, have access to such data.

Monitoring Telephone Calls. Companies are allowed to monitor calls to make sure that they are business-related and to record them for training purposes.

Surveillance and Investigation. Many surveillance methods (cameras, ID checkpoints, etc.) are legal; so are investigations of employees provided that they are reasonable and undertaken for work-related purposes.

Drug Testing. These policies have been validated by the courts, although criticism of the practice remains intense in some quarters. Drug testing is a popular measure in many industries, and it is specifically mandated by legislation in the transportation industries. In other industries and for many small businesses, the attitude towards drug testing is quite different. Drug testing can be expensive, disruptive, and unpopular among employees.

TRENDS AND CYCLES

As Lucas Conley reported in *Fast Company*, "In the 1830s, workers at New England's textile mills lived in company houses, worked in company factories, and worshipped at the company church. Attendance was mandatory. Milton

Hershey and Henry Ford are both famous for having hired detectives to keep an eye on their employees outside of work. Ford even created his own sociological department, staffed by 50 inspectors who kept tabs on autoworkers' behavior off the job. Misbehave, and your wallet got a little lighter come payday."

Corporate policies ultimately reflect the general culture on the one hand and changing economic and legal realities on the other so that permissive and scrutinizing policies have a cyclical nature. The economic expansion that began after World War II, which has endured a few relatively brief downturns, produced an expansive atmosphere that led to improvements in employee benefit packages and employee rights. The global financial crisis that began in 2008 has slowed the expansion and in some cases halted it. The high unemployment that resulted left employees more focused on getting or keeping a job than the benefits that came with it.

In the early twenty-first century, the trend has been decidedly toward "scrutiny," especially of e-mail and unwelcome pornography on business computers. Conley reported on this trend, citing data from the American Management Association (AMA). In 1997 15 percent of large U.S. companies monitored the e-mail of their employees; in 1999, the percent had increased to 27 percent, in 2001 to 47 percent, and in 2003 to 52 percent. A 2007 survey by the AMA of U.S. companies with 100 or more employees showed that of the 43 percent of companies that monitored e-mail, 73 percent did so with automated technology and 40 percent by hiring someone to read company e-mail. Because of kibitzing on e-mail, more and more companies are installing automated tracking systems that filter sites visited by people using corporate systems and alerting the powers-that-be when suspicious sites are frequent destinations. E-mail use and adult Web sites are not the only concerns of these companies that monitor employee Internet use. According to the AMA, employees accessing game sites, social networking sites, entertainment sites, and shopping and auction sites are also issues.

Technology to do this sort of electronic spying is constantly improving. But the corporate motivations behind such activities were hard to assign unambiguously to spying: the Sarbanes-Oxley Act has rigorously tightened rules on record keeping; courts have ruled that e-mail has the status of real documents. Many software packages are designed to search e-mail by content in order to archive it by appropriate categories. If in that process abuses of corporate systems are detected, it is not surprising that some companies take corrective action.

PRIVACY IN THE SMALL BUSINESS

There is less privacy in a small business (as there is less privacy inside a family) than in larger groupings: employees and their managers interact more; everyone knows everyone else; slacking off by employees is more easily noticed, indeed tends to be felt by others immediately, and, often, slackers are corrected by peer pressure before their offenses ever reach the manager's or the owner's attention. In the well-run business, management deals with abuses quickly and effectively. Indeed, from a small business perspective, there is something contemptible about automated tracking systems or the boss secretly searching through an employee's desk after work. There are more straightforward ways of dealing with problems.

EMPLOYEE REFERENCES

Employee references are the positive or negative comments about an employee's job performance provided to a prospective employer. In most cases, a prospective employer will contact a person's current or former employer to seek references as part of the process of considering that person for a new position. Prospective employers check references during the interview process in order to ensure that a candidate's assertions about his or her job skills and work experience are accurate. In fact, obtaining references is one of the most important parts of the hiring process because it

can provide valuable information that sets one candidate apart from others and facilitates a sound hiring decision.

Although seeking references has a number of benefits for the prospective employer, providing references can be a complicated issue for the current or former employer. As Olga Aikin pointed out in *People Management*, companies that provide references have a duty both to the employee who is the subject of the reference and to the prospective employer who is the recipient of the reference. Giving a negative reference may expose the company to legal liability if the former employee does not get a desired job and decides to sue for defamation or slander. But providing a falsely positive reference or failing to disclose potentially damaging information can leave the company open to legal liability as well.

If a candidate is selected for a position on the basis of a reference and then commits a crime or causes harm to another person while on the job, the new employer might sue the provider of the reference. Several court decisions have held a former employer liable for crimes committed by a former employee in a new job because that employer had provided a positive reference and failed to notify the prospective employer about one or more negative aspects of the former employee's performance. As a result of these dual sources of liability, providing references sometimes leaves small-business owners stuck in the middle. "The issue of references is always controversial, involving a balance of employers' fears of legal liability, interests in providing relevant information to prospective employers, and concerns for fairness to former employees," Ellen Harshman and Denise R. Chachere wrote in the *Journal of Business Ethics.*

AVOIDING LEGAL LIABILITY WHEN PROVIDING REFERENCES

Due to growing fears of legal action, many companies have tried to avoid the legal liability involved in providing employee references by enacting policies that strictly limit the information they are willing to supply. When asked for a reference, these companies will not provide any assessment of an employee's job performance. Instead, they will only confirm the person's job title, dates of employment, and salary. "Due to legal ramifications, corporate executives are increasingly wary of being specific about former employees and their work histories," Max Messmer wrote in *Business Credit.* "Providing references can be a double-edged sword." In fact, Messmer noted that 74 percent of Fortune 1000 companies have a policy limiting employee references to a confirmation of basic employment information. However, half of the executives polled said they were willing to bend the company rules in order to give positive references for their best performers.

In January 2010, a former top executive of Dunkin' Brand filed a $5 million lawsuit against his former employer for negative references, defamation of character, and loss of employment opportunities. The former employee asserted that Dunkin' breached a severance agreement stating that details about his departure would be kept confidential. Lawsuits like this one emphasize the importance of good judgment and good policy when it comes to giving references for or discussing former employees.

According to Robert A. Siegel and Anne E. Garrett in the *Los Angeles Business Journal* small-business owners have two main options in providing employee references without exposing themselves to legal liability. First, as noted above, they can simply verify the candidate's basic employment information without making any positive or negative assessment of his or her performance or qualifications. This is known as a "no comment" reference. It has become the policy at a wide range of companies, despite the fact that the prospective employer gains very little information upon which to base a hiring decision. In his 2009 book *HR for Small Business*, Charles Fleischer offers an option where the employer adapts the *no comment* policy. In this case, the former employee gives written approval of the contents of the reference letter and frees the employer from any liability for releasing the information.

The second main option open to small-business owners is to provide a "full disclosure" reference. This type of reference often consists of a letter containing all the relevant facts of a person's employment, including an appraisal of his or her performance and potential. Experts suggest that an employer cannot be held liable for defamation in providing this type of reference as long as it is made without malice and the information is based on credible evidence. In fact, several states have enacted laws protecting employers from civil liability when they provide references that include job performance information. But some employers still choose to play it safe by only providing information based on performance appraisals that were signed by the former employee.

"In making a decision between the two alternatives, employers will have to balance the value of full disclosure to prospective employers against the risks of litigation presented by that choice," Siegel and Garrett wrote. "While full disclosure is viewed by many observers as the most desirable course, and it is clear that many employers will decide to select that alternative in the future, employers should do so with care in order to avoid litigation challenges by unhappy employees."

TIPS FOR EMPLOYERS CHECKING REFERENCES

With so many companies limiting the reference information they are willing to provide about former employees, small-

business owners often face a challenge in obtaining the information they need to make sound hiring decisions. In his article, Messmer supplied a series of suggestions for small-business owners to use in obtaining references for prospective employees. First, he noted that companies should inform all prospective employees that their backgrounds will be checked carefully prior to hiring. It may be helpful to obtain written approval from all candidates to check their references, as well as a signed release allowing former employers to speak freely without fear of legal liability.

Messmer also suggested that the small-business owner, or the person doing the hiring, call prospective employees' references themselves, rather than delegating the task to a human resources representative. It may be helpful to learn something about the candidate's former employer in advance in order to establish trust during the call. If the former employer is reluctant to provide much information perhaps due to a company policy limiting employee references Messmer suggests that the small-business owner try to engage him or her in conversation by asking open-ended questions. If all else fails, Messmer recommends at least reading parts of the candidate's resume to the former employer and asking him or her to confirm the information it contains.

Other suggestions for small-business owners include making sure the references are legitimate by calling a central switchboard number at the former employer's offices and asking for the person providing the reference, and checking several references for each candidate to be certain of obtaining a clear picture of their qualifications. The Internet may offer another source of basic information about some potential employees. However, small-business owners should keep in mind that the same antidiscrimination laws apply to checking references that apply to interviewing: they cannot ask about a candidate's age, marital status, race, or religion, or use that information in their hiring decisions. In filling sensitive positions, it may be helpful to hire an outside firm to conduct a detailed background check.

Although the process of checking references may be time-consuming, it is a vital part of making good hiring decisions. According to Messmer "it is important not to overlook this important step in the employment process, because one poor hiring decision can affect the productivity of an entire department. Reference checking is hard work and not without pitfalls, but with a little extra effort it can be one of the most useful tools in making the right hiring decisions."

EMPLOYEE REGISTRATION PROCEDURES

When a business hires new employees, it is legally obligated to make sure that certain information about the new hires is provided to relevant government agencies. This information, which is provided by employees who fill out specific forms on their first day of employment, is used for tax purposes and to ensure that they are legally eligible to work in the United States.

The primary documents necessary for employee registration with the government are the Federal Tax Withholding Form (W-4), state and local tax withholding forms, and the Employment Eligibility Verification Form (I-9). Companies may also have specific forms for emergency notification and other critical information. The content of each form, as well as its purpose, should be fully explained to each employee.

TAX WITHHOLDING FORMS

"As an employer you have a tremendous fiduciary responsibility to collect and withhold taxes from employees on virtually every paycheck you issue," wrote Bob Adams in his *Adams Streetwise Small Business Start-Up.* "Throughout the United States, you must withhold an appropriate amount for federal income and other earnings-related taxes. Many states and some municipalities also require the payment of an income or other tax on earnings."

A cornerstone of the federal tax-gathering system is the federal W-4 form. This form, also known as the Employee's Withholding Allowance Certificate, provides

the Internal Revenue Service with the filing status and withholding allowances of each employee. Once a new hire has determined his or her filing status and number of withholding allowances, the employer uses IRS tables to determine how much federal income tax should be withheld from the employee's wages. (Employers should understand that under this arrangement, they are essentially acting as agents for the taxing authority; the money that is withheld belongs to the taxing authority, even if possession has not been formally transferred.)

Where applicable, employers also have to withhold state and local income taxes from worker paychecks. States and municipalities have dramatically different arrangements in this regard; some states for instance, have no state income tax, while others have fairly sizable ones. Employers who wish to keep up to speed on their requirements, if any, in this area should contact their local and state tax agencies for information on specific employee registration procedures.

EMPLOYEE ELIGIBILITY

The other major employee registration procedure that small-business owners need to pay attention to is the completion of the federal Form I-9. This document assures the U.S. Citizenship and Immigration Services (CIS, formerly the U.S. Immigration and Naturalization Service) that the employee is legally eligible to work in the United States. The Form I-9 is filled out by both the employee and the employer. For further information, consult the CIS Web site at http://uscis.gov/graphics/index.htm. The I-9 does get updated, and the current version can always be downloaded from the CIS Web site. CIS is a bureau of the Department of Homeland Security.

The recession that began in December 2007 caused unemployment rates to rise to 10 percent by 2010. While the U. S. economy did pick up near the end of 2009, businesses remained cautious about hiring additional employees even if they needed them. In 2010 President Barack Obama and key lawmakers in Washington supported a *payroll tax holiday* to incentivize hiring for small businesses and to keep the economy moving forward.

EMPLOYEE REINSTATEMENT

In the past, it was a rare occurrence if an employee left a company and then returned to it at a later date, either in the same position or a completely new one. Many companies strictly enforced policies that discouraged this sort of hiring of ex-employees, while the employees themselves would consider it an embarrassment to have to return to their former workplace after failing to achieve success at another job. But times have changed this type of activity has become a very common practice. In fact, it is so common that the term "boomerang employee" was coined to describe it. Boomerang employees seem to be most common in technology fields, but can also be found in other work sectors (retail, for instance) as well.

When an employee leaves a company, he or she may have no intention of ever returning. But just to be on the safe side, the employee should make absolutely sure not to burn any bridges with the former employer. In most cases, the last impression can be the strongest one it can even overshadow years of dedicated service. By leaving on good terms, the employee creates more options for a possible return, especially if the new job does not meet expectations. It is especially prudent to leave on good terms if the company has had to enact mass layoffs, as many did after the 2008 recession began. By 2010 some companies were beginning to hire again, and having left gracefully may give a former employee an advantage over a new hire. It is also wise for employees to keep in touch via phone calls, e-mails, or simple friendly letters in order to keep a pulse on the goings-on of the company. The practice of keeping in touch can also benefit the employer, who can use the ex-employee as a network source to find other talent within their particular industry.

There are other ways in which a boomerang employee can be valuable to a company. Many times when the employee leaves, he or she moves on to another company that allows him or her to gain new skills and more experience. In most instances, this allows the employee to perform at a higher level than before, and even can qualify him

or her for a different and more skilled position. In addition, the employee's familiarity with the company from his or her previous tenure can only help make the transition back a positive experience for all involved. The company benefits because it is getting a known commodity rather than a fresh face that may have to undergo extensive training to become familiar with the inner workings of the company.

The allure of hiring former employees who understand the particular corporate culture has created a new trend in online social and career networking. Companies that recognize the benefit of boomerang employees have begun to create online networks for their alumni. In her 2010 article for the *Houston Chronicle*, L. M. Sixel explained it this way: "The online sites . . . are a way for ex-employees to connect with their former bosses and former co-workers and maybe boomerang back, often with newly acquired skills."

Furthermore, studies have shown that boomerang employees tend to stick around longer in their second go-around with a company proving to be more loyal than employees who are in their first stint with the company. Still, the employer should consider the feelings of his current employees (the ones who did not leave) and make sure that the rehire does not cause dissent within the ranks (especially if the boomerang employee gets a hefty raise and better position). In addition, both the employer and employee should be aware of policies that cover things like benefits, vacation time, the restoration of seniority, and other office perks in this type of situation.

EMPLOYEE RETENTION

Employees leave a company to get a better job, and for other reasons. It has cost the business money to hire and to train them; over time they have become more and more useful; to replace them will cost money. It frequently happens that the most effective employees have the most enterprise and initiative and also hold the better jobs. They tend also to be among the first to look for greener pastures and leave a greater hole behind. For these reasons retaining employees is an issue in every business. Human resource experts emphasize *benefits* or *meaning* as ways to hold on to valued employees. The first approach sees success in rewards (better pay, fringe benefits) the second in making jobs more valuable (training, advancement, interest). Most observers suggest a blend of approaches.

But retention also arises in the broader context of economic trends and affects different elements of the workforce in different ways. Thus employee retention is not much discussed in times of economic downturn: employees tend to be hunkered down and glad they have a job at all. This was the scenario after the global economic meltdown that occurred in 2008. Layoffs were rampant during this time, and it was not until 2010 that companies began to consider hiring again. People who managed to retain their jobs during this difficult time often worked longer hours and took on additional tasks in an effort to keep their jobs.

In expansive times companies are beating the bushes for people, and opportunities abound. At different times different skills are greatly in demand, and turnover in these skills is high as companies bid up the jobs. In the 1980s and into the 1990s computer programmers and analysts enjoyed a surge of attention until employers found ways to ease the pressure by outsourcing this type of work to India and elsewhere. Meanwhile, in good times as in bad, the most qualified and enterprising employees are always in demand and always mobile.

FOCUSING THE RETENTION EFFORT

Employee retention is usually discussed in a too narrow context and is therefore treated as an unalloyed good thing, like gold. This view arises because both the hiring and training processes are costly and employees increase in value, from the company's perspective, as they become ever more experienced. But employee turnover can also be a benefit. As *Management Today* reported in 2006, "At least one multinational distinguishes between what it rather elegantly calls 'regretted' and 'non-regretted' types of staff turnover. Bosses in that company worry if regretted turnover is too high but also worry if non-regretted turnover is too low, suggesting that managers are not

pushing the wrong'uns out of the door fast enough." In the view of most seasoned managers, it is rather a truism that the good ones leave and the not-so-good hang around forever. The unnamed multinational cited by *Management Today* had its finger on the pulse. Retention must not be isolated from good personnel management generally. In well-run organizations, personnel policies will be designed around the mission of the business, recognizing that turnover is both unavoidable and sometimes necessary.

WHY EMPLOYEES STAY

Employees stay with a company either because the business satisfies their needs and uses their abilities to an optimum extent (the ideal case) or because they just cannot find another job (the worst case).

Job satisfaction is a complex consequence of the total corporate identity. It obviously includes compensation and fringe benefits as a minimum, but surveys keep reporting that most employees want to "make a contribution" or want to "make a difference." They will feel that they are achieving this goal if their skills are fully used, if the balance between discipline and freedom is right, and if the overall mission of the company makes good social sense. Ambitious employees also require that some path of advancement be at least visible to them.

Creating a satisfying and meaningful company culture is another way to ensure that the best employees stick around. In a 2009 interview, former CEO of eBay Meg Whitman discussed what the "character of a company" means to her. "I think it means the set of values and principles by which you run the company that really begin to become part of the DNA of the company.... And it's almost the sense that you know what to do." Whitman said.

Given this general idea of a meaningful company culture, it is fairly obvious that retention policies based simply on reward mechanics (increase health coverage, add a child-care service) will be inadequate. Retention will work best if the company's values are very clear, supportive of employee aspirations, and implemented to provide both "rewards" and "scope" within the means of the business. In actual practice, far too many companies provide excellent reward systems and yet are populated with alienated employees because corporate policies seem irrational, bureaucracy is stifling, the motives of management appear to be pure ambition, and the corporate goal seems to be meaningless growth. Yet, employees stay because they cannot easily replace the rewards. In contrast some businesses often small ones offer meager rewards but a meaningful work environment, and yet still manage to keep their employees.

RETENTION IN SMALL BUSINESS

Small businesses on average pay lower salaries than larger firms. Data from the U.S. Census Bureau for 2001, for instance, show that companies with fewer than 100 employees had payrolls of $29,138 per employee; companies with 100 or more employees had payrolls of $37,265 per employee a difference of $8,127 a year. Census data from 2006 reveals very little change to these statistics; it shows that employees at the larger companies make $8,498 more per year than those at companies with fewer than 100 employees. Data on employee benefits were not provided, but small businesses also offer fewer benefits. Thus small business has a distinct disadvantage in holding on to employees. If employee retention depended entirely on compensation and fringe benefits, small businesses (which employ somewhat over a third of all people in companies) would eventually lose their employees. But retention is based on the total employment situation, and in that context small businesses have advantages over the large employers: 1) employees are closer to management and interact with management more intensively; 2) there are fewer layers; the owners are visible and not "princely" figures someone reads about; 3) the work situation is more organic (more like a family, less bureaucratic); 4) employees usually have more scope; they are required to do more things, wear more hats, and are therefore more fully utilized; and 5) the mission of small businesses is almost always clearer, more immediately felt; contact with the customer may be frequent; feedback is good; and therefore employees "make more of a difference." Thoughtful small-business owners will do their best to exploit these natural advantages to counter the natural disadvantage of having less to offer.

EMPLOYEE RETIREMENT INCOME SECURITY ACT (ERISA)

The Employee Retirement Income Security Act of 1974 (ERISA) is a U.S. federal law that regulates most private sector employee benefit plans, including 401(k) plans, profit-sharing plans, simplified employee pension (SEP) plans, and Keogh plans. Originally intended to address the problem of embezzlement from plan funds by trustees, ERISA sets minimum standards to ensure that such plans are established and maintained in a fair and financially sound manner. The law obligates employers to provide plan participants with the benefits they are promised, and establishes strict penalties for those who fail to do so. It also sets forth vesting requirements time periods over which employees gain full rights to the money invested by employers on their behalf. ERISA governs most employer-sponsored pension plans, but does not apply to those sponsored by businesses with fewer than twenty-five employees.

ERISA outlines a number of requirements for administrators of employee benefit plans. For example, those who manage plan funds are required to manage them in the exclusive interest of plan participants and beneficiaries. In other words, employers are not allowed to use retirement funds set aside by employees for their own purposes. ERISA also requires plan administrators to avoid transactions that would create a conflict of interest, and to respect limitations on the percentage of employee benefit plan funds that can be invested in employer securities.

ERISA also sets rules governing the disclosure of information about the financial condition of benefit plans to participants and to the U.S. government. For example, administrators are required to furnish participants with a summary plan description (SPD) covering their rights and benefits under the plan. In addition, employers must file Form 5500 annually with the Internal Revenue Service to report the financial condition and other information about the operation of the plan. ERISA provides for civil and criminal penalties of up to $1,000 per day for failing or refusing to comply with these annual reporting requirements.

In 1996 the Health Insurance Portability and Accountability Act (HIPAA) amended ERISA to improve the continuity of health insurance coverage for employees who terminate their employment with a company. The amendment prohibits employers from discriminating against employees on the basis of health status and sets rules regarding preexisting conditions. The Health Information Technology for Economic and Clinical Health (HITECH) Act was passed in 2009 to enhance HIPAA privacy rules and increase consequences for breaches.

The Consolidated Omnibus Budget Reconciliation Act (COBRA), initially passed in 1985, enhanced the provisions of ERISA. The COBRA provisions enable workers to continue health coverage after losing their jobs and other specified conditions. The American Recovery and Reinvestment Act of 2009 (ARRA), established to boost the struggling U. S. economy during the financial crisis that began in 2008, temporarily altered COBRA by reducing the premiums paid by individuals who experienced "involuntary termination" and lost their employer-sponsored health benefits. The insured paid 35 percent of his or her COBRA premium, and the insurer received a tax credit for the remaining 65 percent. Other important amendments to ERISA include the Newborns' and Mothers' Health Protection Act, the Mental Health Parity Act, and the Women's Health and Cancer Rights Act.

Starting in 2008 and continuing into the early 2010s, the Department of Labor (DOL) has reviewed and revised its rules governing investment advice given to participants in retirement plans. In August 2008, during the administration of President George W. Bush, the DOL published a proposed regulation. Several days before the end of Bush's second term, the DOL announced publication of a final rule to make investment advice more accessible for millions of Americans. According to a press release issued on January 16, 2009, "the final rule includes a class exemption expanding the availability of investment advice."

Despite the publication of this final rule in the January 21, 2009 edition of the *Federal Register*, the incoming administration of President Barack Obama decided to continue reviewing these rules in preparation for issuing another revised rule. The new rules still under preparation as of early 2010 are likely to overturn this provision, which Obama administration officials state would have allowed advisers affiliated with mutual fund and brokerage firms to provide investment advice. According to Phyllis Borzi, assistant secretary of labor for the DOL's Employee Benefits Security Administration in the Obama administration, the new rules will be more direct and streamlined and will stress the fiduciary duty of plan sponsors to act carefully in choosing and monitoring service providers.

EMPLOYEE REWARD AND RECOGNITION SYSTEMS

In their 2009 book *The Daily Carrot Principle* Adrian Gostick and Chester Elton asked the question: Are your employees engaged *and* satisfied? That is, not just engaged and not just satisfied, but both. In making the distinction, the authors observed that a business may never realize the full potential of a merely satisfied employee, and it may not be able to retain an engaged but not necessarily satisfied employee. Employee reward and recognition programs are one way to create an engaged and satisfied workforce.

REWARD VS. RECOGNITION

Although these terms are often used interchangeably, reward and recognition systems should be considered separately. Employee reward systems refer to programs set up by a company to reward performance and motivate employees on individual or group levels. They are normally considered separate from salary but may be monetary in nature or otherwise have a cost to the company. While previously considered the domain of large companies, small businesses have also begun employing them as a tool to lure top employees in a competitive job market as well as to increase employee performance.

As noted, although employee recognition programs are often combined with reward programs they retain a different purpose altogether. They are intended to provide a psychological, not financial, benefit. Although many elements of designing and maintaining reward and recognition systems are the same, it is useful to keep this difference in mind, especially for small-business owners interested in motivating staffs while keeping costs low.

DIFFERENTIATING REWARDS FROM MERIT PAY AND PERFORMANCE APPRAISAL

In designing a reward program, a small-business owner needs to separate the salary or merit pay system from the reward system. Financial rewards, especially those given on a regular basis such as bonuses and profit sharing, should be tied to an employee's or a group's accomplishments and should be considered "pay at risk" in order to distance them from salary. By doing so, a manager can avoid a sense of entitlement on the part of the employee and ensure that the reward emphasizes excellence or achievement rather than basic competency.

Merit pay increases, then, are not part of an employee reward system. Normally, they are an increase for inflation with additional percentages separating employees by competency. They are not particularly motivating since the distinction that is usually made between a good employee and an average one is relatively small. In addition, they increase the fixed costs of a company as opposed to variable pay increases, such as bonuses, which have to be "re-earned" each year. Finally, in many small businesses teamwork is a crucial element of a successful employee's job. Merit increases generally review an individual's job performance, without adequately taking into account the performance within the context of the group or business.

DESIGNING A REWARD PROGRAM

The keys to developing a reward program are as follows:

- Identification of company or group goals that the reward program will support
- Identification of the desired employee performance or behaviors that will reinforce the company's goals

- Determination of key measurements of the performance or behavior, based on the individual or group's previous achievements
- Determination of appropriate rewards
- Communication of program to employees

In order to reap benefits such as increased productivity, the entrepreneur designing a reward program must identify company or group goals to be reached and the behaviors or performance that will contribute to this. While this may seem obvious, companies frequently make the mistake of rewarding behaviors or achievements that either fail to further business goals or actually sabotage them. If teamwork is a business goal, a bonus system rewarding individuals who improve their productivity by themselves or at the expense of another does not make sense. Likewise, if quality is an important issue for an entrepreneur, the reward system that he or she designs should not emphasize rewarding the *quantity* of work accomplished by a business unit.

Properly measuring performance ensures the program pays off in terms of business goals. Since rewards have a real cost in terms of time or money, small-business owners need to confirm that performance has actually improved before rewarding it. Often this requires measuring something other than financial returns: reduced defects, happier customers, more rapid deliveries.

When developing a rewards program, an entrepreneur should consider matching rewards to the end result for the company. Perfect attendance might merit a different reward than saving the company $10,000 through improved contract negotiation. It is also important to consider rewarding both individual and group accomplishments in order to promote both individual initiative and group cooperation and performance.

Lastly, in order for a rewards program to be successful, the specifics need to be clearly spelled out for every employee. Motivation depends on the individual's ability to understand what is being asked of her. Once this has been done, the original communication should be reinforced with regular meetings or memos promoting the program. Communications are best kept simple but frequent to ensure staff members are kept abreast of changes to the system.

TYPES OF REWARD PROGRAMS

There are a number of different types of reward programs aimed at both individual and team performance.

Variable Pay. Variable pay or pay-for-performance is a compensation program in which a portion of a person's pay is considered "at risk." Variable pay can be tied to the performance of the company, the results of a business unit, an individual's accomplishments, or any combination of these. It can take many forms, including bonus programs, stock options, and one-time awards for significant accomplishments. Some companies choose to pay their employees less than competitors but attempt to motivate and reward employees using a variable pay program instead. Good incentive pay packages provide an optimal challenge, one that stretches employees but remains in reach. If too much is required to reach the goal, the program will be ignored.

Bonuses. Bonus programs have been used in American business for some time. They usually reward individual accomplishment and are frequently used in sales organizations to encourage salespersons to generate additional business or higher profits. They can also be used, however, to recognize group accomplishments. Indeed, increasing numbers of businesses have switched from individual bonus programs to one which reward contributions to corporate performance at group, departmental, or companywide levels.

According to some experts, small businesses interested in long-term benefits should probably consider another type of reward. Bonuses are generally short-term motivators. By rewarding an employee's performance for the previous year, they encourage a short-term perspective rather than future-oriented accomplishments. In addition, these programs need to be carefully structured to ensure they are rewarding accomplishments above and beyond an individual or group's basic functions. Otherwise, they run the risk of being perceived as entitlements or regular merit pay, rather than a reward for outstanding work. Proponents, however, contend that bonuses are a perfectly legitimate means of rewarding outstanding performance, and they argue that such compensation can actually be a powerful tool to encourage future top-level efforts.

Profit Sharing. Profit sharing refers to the strategy of creating a pool of monies to be disbursed to employees by taking a stated percentage of a company's profits. The amount given to an employee is usually equal to a percentage of the employee's salary and is disbursed after a business closes its books for the year. The benefits can be provided either in actual cash or via contributions to employee's 401(k) plans. A benefit for a company offering this type of reward is that it can keep fixed costs low.

The idea behind profit sharing is to reward employees for their contributions to a company's achieved profit goal. It encourages employees to stay put because it is usually structured to reward employees who stay with the company; most profit sharing programs require an employee to be vested in the program over a number of years before receiving any money. Unless well managed, profit sharing may not properly motivate individuals if all

receive the share anyway. A team spirit (everyone pulling together to achieve that profit) can counter this, especially if it arises from the employees and is not just management propaganda.

Stock Options. Previously the territory of upper management and large companies, stock options have become a popular method of rewarding middle management and other employees in both mature companies and start-ups. Employee stock-option programs give employees the right to buy a specified number of a company's shares at a fixed price for a specified period of time (usually around 10 years). They are generally authorized by a company's board of directors and approved by its shareholders. The number of options a company can award to employees is usually equal to a certain percentage of the company's shares outstanding.

Like profit sharing plans, stock options usually reward employees for sticking around, serving as a long-term motivator. Once an employee has been with a company for a certain period of time (usually around 4 years), he or she is fully vested in the program. If the employee leaves the company prior to being fully vested, those options are canceled. After an employee becomes fully vested in the program, he or she can purchase from the company an allotted number of shares at the strike price (or the fixed price originally agreed to). This purchase is known as "exercising" stock options. After purchasing the stock, the employee can either retain it or sell it on the open market with the difference in strike price and market price being the employee's gain in the value of the shares.

Offering additional stock in this manner presents risks for both the company and the employee. If the option's strike price is higher than the market price of the stock, the employee's option is worthless. When an employee exercises an option, the company is required to issue a new share of stock that can be publicly traded. The company's market capitalization grows by the market price of the share, rather than the strike price that the employee purchases the stock for. The possibility of reduction of company earnings (impacting both the company and shareholders) arises when the company has a greater number of shares outstanding. To keep ahead of this possibility, earnings must increase at a rate equal to the rate at which outstanding shares increase. Otherwise, the company must repurchase shares on the open market to reduce the number of outstanding shares.

One benefit to offering stock options is a company's ability to take a tax deduction for compensation expense when it issues shares to employees who are exercising their options. Another benefit to offering options is that while they could be considered a portion of compensation, current accounting methods do not require businesses to show options as an expense on their books. This tends to inflate the value of a company. Companies should think carefully about this as a benefit, however. If accounting rules were to become more conservative, corporate earnings could be impacted as a result.

GROUP BASED REWARD SYSTEMS

As more small businesses use team structures to reach their goals, many entrepreneurs look for ways to reward cooperation between departments and individuals. Bonuses, profit sharing, and stock options can all be used to reward team and group accomplishments. An entrepreneur can choose to reward individual or group contributions or a combination of the two. Group-based reward systems are based on a measurement of team performance, with individual rewards received on the basis of this performance. While these systems encourage individual efforts toward common business goals, they also tend to reward underperforming employees along with average and above average employees. A reward program that recognizes individual achievements in addition to team performance can provide extra incentive for employees. In their 2008 book *Organizational Behavior*, Ricky W. Griffin and Gregory Moorhead note the benefits of group incentives over individual incentives. They warn that "plans oriented mainly toward individual employees may cause... disruptive behaviors, such as sabotaging a coworker's performance, sacrificing quality for quantity, or fighting over customers. A group incentive plan, on the other hand, requires that employees trust one another and work together."

RECOGNITION PROGRAMS

For small-business owners and other managers, a recognition program may appear to be merely extra effort on their part with few tangible returns in terms of employee performance. While most employees certainly appreciate monetary awards for a job well done, many people merely seek recognition of their hard work. For an entrepreneur with more ingenuity than cash available, this presents an opportunity to motivate employees.

Nor will the entrepreneur be far off the mark. As Patricia Odell reported, writing for *Promo*, "Cash is no longer the ultimate motivator." Odell cited data from the Forum for People Performance Management and Measurement at Northwester University which had discovered that non-cash awards tend to be more effective; the exception was rewarding increasing sales. "The study found," Odell wrote, "that non-cash awards programs would work better than cash in such cases as reinforcing organizational values and cultures, improving teamwork, increasing customer satisfaction and motivating specific behaviors among other programs."

In order to develop an effective recognition program, a small-business owner must be sure to separate the program from the company's system of rewarding employees. This ensures a focus on recognizing the efforts of employees. To this end, although the recognition may have a monetary value (such as a luncheon, gift certificates, or plaques), money itself is not given to recognize performance.

Recognition has a timing element: it must occur so that the performance recognized is still fresh in the mind. If high performance continues, recognition should be frequent but cautiously timed so that it does not become automatic. Furthermore, like rewards, the method of recognition needs to be appropriate for the achievement. This also ensures that those actions which go furthest in supporting corporate goals receive the most attention. However, an entrepreneur should remain flexible in the methods of recognition, as different employees are motivated by different forms of recognition. Finally, employees need to understand clearly the behavior or action being recognized. A small-business owner can ensure this by being specific in what actions will be recognized and reinforcing this by communicating exactly what an employee did to be recognized.

Recognition can take a variety of forms. Structured programs can include regular recognition events such as banquets or breakfasts, employee of the month or year recognition, an annual report or yearbook which features the accomplishments of employees, and department or company recognition boards. Informal or spontaneous recognition can take the form of privileges such as working at home, starting late or leaving early, or long lunch breaks. A job well done can also be recognized by providing additional support or empowering the employee in ways such as greater choice of assignments, increased authority, or naming the employee as an internal consultant to other staff. Symbolic recognition such as plaques or coffee mugs with inscriptions can also be effective, provided they reflect sincere appreciation for hard work. These latter expressions of thanks, however, are far more likely to be received positively if the source is a small-business owner with limited financial resources. Employees will look less kindly on owners of thriving businesses who use such inexpensive items as centerpieces of their reward programs.

In her 2010 article for the *Coloradoan*, Katy Piotrowski discussed additional ways for small businesses with limited resources to communicate appreciation for employees. Piotrowski presented a few simple yet meaningful ideas from motivational speaker and author Bob Nelson. Nelson's method could be described as it's-the-thought-that-counts style of employee recognition. This approach requires more effort and less money, which makes it ideal for some small businesses. Nelson advocates anything from a handwritten thank-you note attached to a paycheck to a rah-rah board where employees can publicly post notes to co-workers for a job well done.

Both reward and recognition programs have their place in small business. Small-business owners should first determine desired employee behaviors, skills, and accomplishments that will support their business goals. By rewarding and recognizing outstanding performance, entrepreneurs will have an edge in a competitive corporate climate.

EMPLOYEE RIGHTS

Employee rights arise from federal and state laws that, over time, have established various rules that govern the employer-employee relationship. More broadly viewed, the phrase is often used to refer to rights not explicitly mentioned in law but inferred from legal protections. An example of this is a "right not to be bullied" derived

from legislation mandating a safe work place and prohibiting hostile working environments. Many employees also assume that they have by right what they actually have at the employer's option. An example of that is paid holidays and paid vacations; these benefits are nowhere mandated by law but almost universally offered as employment benefits.

Employee rights fall under seven categories: 1) union activity the right to organize and to bargain collectively; 2) working hours and minimum pay; 3) equal compensation for men and women doing the same or similar work for the same employer; 4) safety and health protection in the work environment and related workers' compensation; 5) unemployment benefits; 6) nondiscriminatory hiring and promotion practices; 7) family and medical leave; and 8) ability to complain without retaliation (whistleblower protection). Additional rights are guaranteed under state laws, but these vary: for instance, some states mandate a higher minimum wage than does the federal government. Sometimes considered as rights are prohibitions imposed on employers against child labor which include limitations on what kind of work employees under eighteen may perform.

A partial listing of the most important federal laws that embody employee rights includes the following:

- Americans with Disabilities Act covers rights of the disabled.
- Age Discrimination in Employment Act covers age discrimination.
- Civil Rights Act covers racial discrimination and sexual harassment.
- Equal Pay Act mandates equal pay for men and women.
- Fair Labor Standards Act (FLSA) principally relates to hourly workers and minimum pay.
- Family and Medical Leave Act covers maternity, paternity and medical leave.
- Federal Unemployment Tax Act covers unemployment compensation.
- Occupational Safety and Health Act covers safety at work and workers' compensation.
- The Wagner Act original labor union legislation followed by many other laws.
- The Whistleblower Protection Act covers whistleblowers, but federal employees only.
- The Genetic Information Nondiscrimination Act (GINA) of 2008 prohibits employment discrimination based on a predisposition for a medical condition.

One of the more important categories of rights relates to discrimination. Companies hiring people may not discriminate on the basis of seven categories: sex, age, race, national origin, religion, physical disability, or veteran status. These categories are labeled "classes"; all the categories taken together are referred to as "protected classes." Employees have the right to be considered for employment regardless of the class to which they belong and everyone belongs minimally to three of these in having a gender, an age, and being a member of a race. Furthermore, the employer is prohibited from discussing the class-status of an employee during an employment interview even inferentially. It is prohibited, for instance, to ask: "Are you sure, Richard, that you'll do well in a caring environment, like nursing?"

Based on Title VII of the Civil Rights Act, the Equal Employment Opportunity Commission issued guidelines for defining and enforcing Title VII's requirements titled *Guidelines on Discrimination Because of Sex* (Code of Federal Regulations 29CFR1604.11). This regulation initially introduced the concept of conduct that has "the purpose or effect of unreasonably interfering with an individual's work performance or creating an *intimidating, hostile, or offensive working environment.*" [Emphasis added.] The regulation was last revised in the late 1990s. The emphasized phrasing has gradually come to be claimed inclusive of more than just sexual conduct such as bullying or aggressive religious or political advocacy on the job. As yet the concept has not been enlarged, but developments in the twenty-first century serve as an illustration of the manner in which employee rights established for one purpose can gradually expand to others. An earlier development along these lines was the passage of the Pregnancy Discrimination Act (1978), amending Title VII, whereby the concept of discrimination on the basis of sex was used to expand its definition to include pregnancy.

There were several employee rights bills up for vote in 2010, but as of early 2010 there was uncertainty if all or any would become law. The Employee Free Choice Act (EFCA), if passed, would alter the interactions between unions and company managers. The Employment Non-Discrimination Act (ENDA), which has been introduced into Congress many times before but has not been passed, would prohibit discrimination based on gender identity or sexual orientation. In addition, proposed amendments to existing laws, if passed, would enhance employees rights in the workplace. It is important for businesses to pay close attention to these possible changes to the law. Penalties for noncompliance can be significant. In a 2010 article, Liane A. Janovsky, a labor and employment lawyer, suggested that "every company, no matter how small, should

delegate at least one person with the task of monitoring changes in the law [that] affect the terms and conditions of work."

Employee Rights that Aren't. Most employees believe that they have rights they do not have under law. The most common categories have to do with paid time off. A large majority of employees (77 percent in 2005) enjoyed paid vacations and holidays but 79 percent of those working in 1999 had such benefits at one point but since that time had lost the privilege. Similarly, most people believe that they will be paid for time spent on jury duty but only 69 percent actually had such benefits; and only 48 percent of people were paid for military absences. With very large numbers of people enjoying certain benefits but at the employer's option a sense of entitlement arises. Often, if times are good, such benefits eventually turn into perceived rights.

EMPLOYEE SCREENING PROGRAMS

Every business wants trustworthy, qualified employees especially small firms where every employee counts and interpersonal dynamics often assume heightened importance. As a result, preemployment screening programs have become a part of the business landscape. According to a 2004 survey by the American Management Association, 63 percent of companies test employees medically before employment; and earlier AMA surveys showed that 43 percent of responding members also tested prospective employees in job skills, psychological fitness, and basic competency in math and literacy. Screening programs generally also include some combination of reference and credit checks, verification of employment, investigations into any criminal activity (where allowed by law), and physical and drug testing. Testing before hiring is more efficient than doing so on the job: those who fail need not be engaged. Screening programs can assist in ensuring a proper fit between employer and employee. "A pre-employment test that costs less than $10 can sometimes save a company the thousands it costs to replace a bad match, or the legal fees to defend against liability lawsuits for negligence in hiring a troubled or troublesome employee," wrote Gilbert Nicholson in *Workforce*. "Tests range from evaluating cognitive skills to identifying personality traits, and can help employers avoid bad apples and match good ones to the right jobs."

Despite the potential value of screening programs, not all companies use such methods. Businesses engaged in industries with traditionally high turnover rates (e.g., restaurants) may determine through cost-benefit analysis that benefits do not warrant the up-front expenditure.

During tough economic times, like the years following the 2008 credit crisis, companies struggling with their bottom line may opt out of the preemployment testing that was once a part of their hiring system. Medical testing may be the first to go since it is the most expensive type of screening. However, Teresa Long, of the Institute of WorkComp Professionals, advises against this. In a 2010 article on preemployment screening, she asked businesses to consider the high costs of workers' compensation claims that may result from not properly screening potential employees. For instance, a worker with a preexisting medical condition that becomes worse on the job could end up filing a worker's compensation claim with the current employer. Proper screening can prevent this from occurring.

Companies that do engage in workforce screening tend to take one of two routes: they create and administer their own test or use established tests or the services of a screening company. "Some companies are so specialized, it makes sense to tailor their own instrument to the

unique features of their organization," said one testing executive in *Workforce.* "But that usually requires a company with a human-relations team skilled in test development." In addition, some small-business owners choose to execute their own screening programs, but use existing tests to do so. The Buros Institute, Inc. at the University of Nebraska-Lincoln (www.unl.edu/buros) maintains a Tests in Print resource that lists more than 3,500 commercially available screening tests and may be a good first stop. Finally, many businesses prefer to outsource the entire program. When hiring a screening company to check out prospective employees, it is important that the company itself be fully qualified. Checking it out including checking with longtime users of the service is good practice.

Companies using screening should be aware of local, state, and federal laws against discrimination. These may impact both the questions asked of candidates as well as reference, credit, and other checks. Aptitude tests should be job-related and uniformly implemented. This goes for any preemployment test. The U.S. Equal Employment Opportunity Commission Web site states that "the test or selection procedure must be job-related and its results appropriate for the employer's purpose." Many local and state governments prohibit questions related to criminal convictions. A business should note the difference between an arrest and a conviction: merely having been arrested proves nothing.

Screening protects a business against possible lawsuits. "With the tort of negligent hiring now recognized in a majority of the states, employers have been forced to defend a growing number of suits seeking redress for crimes committed by employees, usually thefts or assaults that victimize customers or co-workers," wrote David Shaffer and Ronald Schmidt in "Personality Testing in Employment." Courts may hold companies responsible for injuries their employees inflict on others while on the job. Companies found liable in a negligent hiring suit may be held responsible for punitive damages, medical bills, and lost wages. For a small business, such a suit could be potentially devastating. But it should be noted that if a prospective employee has a criminal record, a company's liability in a lawsuit after employment depends on the relevance of the crime to the job.

Fortunately, legal experts say that legal liability on either of these two fronts is unlikely provided that the company in question is careful in creating, maintaining, and monitoring the various aspects of its program. To ensure protection against legal trouble, business owners are well-advised to consult a specialist in employment law before establishing any of the following potential elements of a screening program:

Previous Employment and References. Employers should review resumes and employment histories for gaps in employment. In regards to references, the employer should be sure to contact specific business references as opposed to merely friends and family of the prospective employee. Finally, companies may choose to contact other individuals not listed as references such as previous co-workers, who may provide additional background on the employee. This check may be subject to local or state laws or require the consent of the applicant.

Credit and Vehicle Checks. These may be done through credit agencies used by banks, stores, and others. While checking an applicant's credit and vehicle records is not conclusive regarding qualifications for employment, these records may give an indication of an applicant's dependability or honesty.

Criminal Records. As noted, the use of criminal record searches may be subject to local or state laws against discrimination. Small-business owners and managers also must weigh whether the applicant's previous arrest or crime would have a direct bearing on the work that he or she would be doing.

IQ or Personality Tests. Businesses sometimes also use personality or IQ tests to augment less formal interviews in order to round out or verify their impressions of a prospective employee. Outside agencies can run a battery of tests on applicants and provide employers with profiles on each candidate. A small business can also take advantage of current software or standardized tests to handle at least a portion of such testing. Many companies choose to outsource testing and thus cut down the number of applicants for closer view.

Physical Screening or Drug Tests. These are often handled by a qualified clinic or laboratory. Prospective employees provide blood or urine samples to the contracted agency. The company is then sent results and can make a determination regarding employment.

EMPLOYEE STOCK OWNERSHIP PLANS (ESOPS)

An Employee Stock Ownership Plan, or ESOP, is a qualified retirement program in which employees receive shares of the business rather than stock. ESOPs are said to be "qualified" because they qualify for federal income tax deferral until the stock is turned into cash at retirement. ESOPs are in most respects similar to 401(k) plans except that, instead of cash, the company providing the ESOP "pays in" its own stock. But, as in 401(k) plans, all full-time employees must be eligible provided that they meet certain age and service requirements. Unlike a 401(k) plan, contributions to an ESOP by the employer do not become the property of the employee until after specified vesting periods are satisfied. Under both programs, employees receive monetary benefits on retirement or in the event of death or disability. The chief difference between ESOPs and 401(k)s is that, in the latter, the funds paid in are invested in a diversified portfolio; in the ESOP they hold only the company's own stock. The advantages and risks of ESOPs derive from this difference.

An ESOP offers employers two advantages. First, the company gets significant tax breaks. It can, for example, borrow money through the ESOP for expansion or other purposes and then deduct both the repayment and interest when it pays back the loan. In the case of ordinary loans, only interest payments are tax deductible. In addition, the business owner who sells his or her stock holdings to the ESOP can often defer or even avoid capital gains taxes associated with the sale of the business. In this way, ESOPs have become an important tool in succession planning for business owners preparing for retirement.

A less tangible advantage many employers experience when forming an ESOP is an increase in employee loyalty and productivity. Employees become owners of the company; having a stake in it, their relationship to the company changes. An ESOP therefore provides a financial incentive but also something that goes beyond future compensation. Small businesses are at a disadvantage against large companies because on average they provide less compensation and fewer benefits. An ESOP therefore helps small businesses recruit and retain employees by offering ownership benefits. There is some data to suggest that ESOPs do improve productivity and market performance. According to a 2008 survey of members done by the ESOP Association, nearly 90 percent of ESOPs performed better than the stock market during 2008. Nearly the same number report that creating an ESOP was "a good business decision that has helped the company" a figure that is consistent over the 18 years the association has been conducting its survey.

The onset of a recession in 2008 brought new legislative attention to the problem of how to help struggling businesses. Promoting ESOPs was seen as a sound economic policy by a small group number of lawmakers. In August 2009, Senator Blanche Lincoln (D-AR) introduced the ESOP Promotion and Improvement Act of 2009. This legislation would provide more amenable tax status for ESOP companies and would remove certain biases against ESOP companies by the Small Business Administration. This law would make it clear that a non-ESOP small business currently eligible for any Small Business Administration program would still be eligible for the same SBA program even if it became a majority-owned ESOP company. A similar bill, the S Corporation ESOP Promotion and Expansion Act of 2009, was introduced in the House of Representatives in September 2009 by Congressman Ron Kind (D-WI). As of 2010, both bills have been referred to committee.

CHARACTERISTICS OF COMPANIES WITH ESOPS

The first ESOP was created in 1957, but the idea did not attract much attention until 1974 when plan details were laid out in the Employee Retirement Income Security Act (ERISA). The number of businesses sponsoring ESOPs expanded steadily during the 1980s as changes in the tax code made plans more attractive for business owners. Although the popularity of ESOPs declined during the recession of the early 1990s, the programs expanded during the mid- to late 1990s. According to the National Center for Employee Ownership, the number of companies with ESOPs grew from 9,000 in 1990 to 10,000 in 1997. Sources vary about current levels of ESOP participation. According to the ESOP Association, there were 11,500 ESOPs with 10 million participants at the end of 2006. However, in their 2008 book, *Understanding ESOPs*, Corey Rosen and Scott Rodrick stated there were

still about 10,000 ESOPs in 2007, covering 10.5 million employees. There is no certain way to verify these estimates since, as the ESOP Association states, "the overwhelming majority of ESOP companies are privately held and do not file public reports with the SEC."

What is known for certain is that there are 330 ESOPs in publicly traded companies those that are required to report to the Securities and Exchange Commission (SEC) a figure that represents just 3 percent of the estimated number of ESOPs. This small percentage of companies accounts for approximately 50 percent of the estimated 10-11.5 million employee owners. The ESOP Association makes other estimates of ESOP characteristics that provide a schematic picture of the kinds of companies that make use of this retirement tool:

Approximately 4,000 ESOP companies are majority-owned by the ESOP.

Approximately 2,500 are 100 percent owned by the ESOP.

About 2 percent of ESOP companies are unionized.

A majority of ESOP companies have other retirement plans to supplement their ESOP.

Fewer than 2 percent of ESOP companies were in financial difficulties when they established their ESOP.

ESTABLISHING AN ESOP

In order to establish an ESOP, a company must have been in business and shown a profit for at least 3 years. One of the main factors limiting the growth of ESOPs is that such plans are relatively complicated and require strict reporting, making them expensive to establish and administer. Steve Miller, writing for *Top Producer*, provided estimates of $35,000 to $50,000 for establishing ESOPs; annual fees for stock appraisals and record keeping are between $5,000 and $10,000. Appraisals are necessary in the case of closely held corporations that are not publicly traded in order to satisfy federal law. These costs are substantial but they are tax deductible.

Employers can choose between two main types of ESOPs, loosely known as basic ESOPs and leveraged ESOPs. They differ in the ways in which the ESOP obtains the company's stock. In a basic ESOP, the employer simply contributes securities or cash to the plan every year like an ordinary profit sharing plan so that the ESOP can purchase stock. Contributions are tax-deductible up to a maximum equivalent to 15 percent of payroll. In contrast, leveraged ESOPs obtain bank loans to purchase the company's stock. The employer can then use the proceeds of the stock purchase to expand the business or to fund the business owner's retirement nest egg. The business can repay the loans through contributions to the ESOP that are tax-deductible up to a maximum of 25 percent of payroll.

ADVANTAGES OF ESOPS

An ESOP can also be a useful tool in facilitating the buying and selling of small businesses. For example, a business owner nearing retirement age can sell his or her stake in the company to the ESOP in order to gain tax advantages and provide for the continuation of the business. Some experts claim that transferring ownership to the employees in this way is preferable to third-party sales. Third-party sales have negative tax implications if successful. But buyers may be difficult to find; and after the transaction, collecting installment payments may turn out to be difficult or costly. Using the ESOP, more certain results are possible. The ESOP can borrow money to buy out the owner's stake in the company. If, after the stock purchase, the ESOP holds more than 30 percent of the company's shares, the owner can defer capital gains taxes by investing the proceeds in a Qualified Replacement Property (QRP). QRPs can include stocks, bonds, and certain retirement accounts. The income stream generated by the QRP can help provide the business owner with income during retirement.

ESOPs can also prove helpful to those interested in buying a small business. Many individuals and companies choose to raise capital to finance such a purchase by selling nonvoting stock in the business to its employees. This strategy allows the purchaser to retain the voting shares in order to maintain control of the business. At one time, banks favored this sort of purchase arrangement because they were entitled to deduct 50 percent of the interest payments as long as the ESOP loan was used to purchase a majority stake in the company. However, this tax incentive for banks was eliminated with the passage of the Small Business Jobs Protection Act of 1996.

In addition to the various advantages that ESOPs can provide to business owners, sellers, and buyers, they also offer benefits to employees. Like other types of retirement plans, the employer's contributions to an ESOP on behalf of employees are allowed to grow tax-free until the funds are distributed upon an employee's retirement. At the time an employee retires or leaves the company, he or she simply sells the stock back to the company. The proceeds of the stock sale can then be rolled over into another qualified retirement plan, such as an Individual Retirement Account (IRA) or a plan sponsored by another employer. Another provision of ESOPs gives participants upon reaching the age of fifty-five and putting in at least 10 years of service the option of diversifying their ESOP investment away from company stock and toward more traditional investments.

The financial rewards associated with ESOPs can be particularly impressive for long-term employees who have participated in the growth of a company. Of course, employees encounter some risks with ESOPs, too: their retirement funds are invested in the stock of one small company, and an ESOP may become worthless if the sponsoring company goes bankrupt. However, this occurance has been relatively rare, accounting for approximately 1 percent of ESOP firms.

Although 1996 legislation opened the door for S corporations to establish ESOPs, the plans continue to be much more attractive for C corporations. In general, ESOPs are likely to prove too costly for very small companies, those with high employee turnover, or those that rely heavily on contract workers. ESOPs might also be problematic for businesses that have uncertain cash flow; companies are contractually obligated to repurchase stock from employees when they retire or leave the company. Finally, ESOPs are most appropriate for companies that are committed to allowing employees to participate in the management of the business. Otherwise, an ESOP might tend to create resentment among employees who become part-owners of the company and then are not treated in accordance with their status.

EMPLOYEE STRIKES

Strikes may affect a small business in one of two ways. First, its own employees may go on strike or carry out some collective action functionally equivalent to a strike. Second, the small business may be unable to conduct its usual business because some other company or industry is experiencing labor disruptions and thus denies the business vital services or supplies.

STATUS AND TRENDS IN UNIONIZATION

Employee or labor strikes are called by labor unions usually after a strike-vote by its membership. The strike may be directed at a single organization or may be industry-wide. Two major trends in unionization suggest that small business is very unlikely to be unionized and therefore directly threatened by a strike. Based on data from the U.S. Bureau of Labor Statistics (BLS), in the period from 1964 to 2009, union members have declined from 29.3 percent to 12.3 percent of the labor force. Even as the total unionized workforce has declined, the private sector's share of total union labor has declined and the share of the public sector has increased. In 1983, for example, private sector union employees were 67.2 percent of all union laborers; the public sector share was 32.4 percent. By 2005 the private sector share was 52.6 percent, the public sector share 47.4 percent.

As a consequence of this general decline in the unionized workforce, labor stoppages have also declined. Major work stoppages involving 1,000 or more workers averaged 352 per year in the 1950s, 283 in the 1960s, 289 in the 1970s, 83 in the 1980s, 35 in the 1990s, and 20 in the 10-year period 2000-2009. According to U.S. Bureau of Labor Statistics released in February 2010, there were only five labor stoppages involving 1,000 or more workers in 2009, the lowest figure since BLS began its records in 1947.

In 2005 union membership was highest in the transportation and utilities industries in the private sector (24 %) and lowest in finance and related services (2.3 %). In construction and manufacturing, union membership was 13 percent of the labor force; in wholesale and retail (where the largest number of small businesses operate) the rate was 5.2 percent. In professional and business services, another important small business sector, the rate was 2.7 percent. Furthermore, unions target for organization efforts large operations rather than small for pure cost/benefit reasons. Therefore, unionized small businesses are rare. Finally, most unions call strikes only when grievances are of long standing and long unresolved. Not surprisingly, a search of the business literature does not turn up any cases of small businesses affected by strikes. In his 2009 book *Labor Relations*, Arthur Sloane noted that teachers, cab drivers, secretaries, writers,

and auto workers represented parts of the unionized labor force in 2009. This showed that while unions may be declining in numbers, the types of industries they represent was more varied by 2010 than ever before.

TWO HARDEST HITTING STRIKES OF 2009

The United Auto Workers (UAW) Local 218 held a strike against Bell Helicopter Textron in 2009 which went on for 27 business days. The striking workers numbered 2,500, making the total lost man hours nearly 68,000 days in all. While this strike was the longest strike of 2009 where more than 1,000 employees were involved, the strike that involved the highest number of employees in 2009 was the Transport Workers Union's 5,500-strong strike against the Southeastern Pennsylvania Transportation Authority.

In total, five major strikes in 2009 caused approximately 13,000 workers from various industries to stop working. These five strikes created a total of 124,000 lost days of operations. From this it can be seen that even though unions are experiencing a decline in memberships, they still retain power to impact companies. In addition, the impact on small businesses when various modes of transportation, freight, and delivery companies experience strikes can be devastating. An example of this was the strike by Lufthansa Airlines pilots after 2009 negotiations for fair wages were unsuccessful. The bottleneck in goods delivered when strikes like this arise often have an impact that cannot be resolved in weeks even though a strike itself may only go on for just several days.

TYPES OF STRIKES

The National Labor Relations Board (NLRB) provides legal protections for economic strikes and strikes based on unfair labor practices. In the first category, workers attempt to garner improvements in their wages, benefits, hours, or working conditions. An unfair labor practices strike is called when the employer allegedly violates NLRA rules that protect workers during collective bargaining. But strikes are not always effective for unions; sometimes, the owner merely replaces the striking workers.

The small-business owner faced with a labor organizing action is well advised, early in the process, to consult with a competent labor lawyer in order to get guidance on how to comply with NLRA regulations. Fundamental rules to observe include:

1. The business must bargain in good faith throughout the process. Workers have a fundamental right under U.S. law to organize and to bargain collectively.
2. The business must provide the union with all information to which the latter is legally entitled. Under U.S. labor law, unions can request information about management's plans regarding various operational aspects of the business during the strike. For example, the union can ask for information about where the business plans to get replacement workers and the wages that they will be paid.
3. The business has and can exercise rights of its own. It can freely communicate its own plans to employees, point out how they differ from the union's proposals, and ask employees to vote on the business's final offer. In many strike situations, the business has the option of utilizing replacement workers without penalty.

AVOIDING OR MANAGING A STRIKE

In the case of a small business especially where contact between management and the work force is closer avoiding a strike is obviously the best strategy. If the shop was unionized during the current ownership's tenure, that fact alone should have signaled to the management that something was drastically out of order. Unionization is fundamentally an adversarial process intended to force the business to behave in certain ways by threatening to deny the business an indispensable resource. If the union shop was acquired, the new owner can build a new relationship with labor and, often, after some period of time during which the labor force has learned to trust the management even succeed in decertifying the union. If, despite best efforts, a strike appears unavoidable, early planning and effective implementation are the only ways to minimize damage. Such planning will include at minimum:

- Obtaining early legal counsel to determine if hiring replacement workers will be possible and, if it is, making early arrangements for such help.
- Effectively communicating with suppliers and customers to tailor deliveries to the new situation and to warn customers of impending problems affecting prompt shipment of products. Where possible, inventories might be built up in advance.
- Communicating effectively with nonstriking employees to maintain morale.
- In the most drastic situation (more likely in a small than a large business) planning termination of operations, up to bankruptcy, if the strike will cripple the business.

EMPLOYEE SUGGESTION SYSTEMS

The term "employee suggestion systems" refers to a variety of efforts businesses make to solicit and utilize input from their employees in hopes of achieving cost savings or improving product quality, workplace efficiency, customer service, or working conditions. These efforts range from simply placing suggestion boxes in common areas to implementing formal programs with committees to review ideas and rewards for those that are adopted. The ideas generated can range from simple quality of work life improvements, like putting a refrigerator in the coffee room, to larger streamlining issues that can save the company thousands of dollars per year, like switching all salespeople's cellular phones from individual contracts to a group contract with a discount vendor. "Suggestion programs create a win-win situation," Kate Walter wrote in *HR Magazine*. "More involvement and input for employees and improved efficiency and cost-savings for employers." The twenty-first century has brought new ways to implement employee suggestion systems; businesses of any size have had their CEO or other high-ranking officers request input from all employees on a range of topics, including how to deal with the struggling real estate market following the subprime mortgage crisis of 2008, and how employees might save money for a small business by using personal handhelds for work purposes of course, with some incentive to do so.

"Companies that set up effective suggestion systems are finding that employees have great ideas that can lower costs, increase revenues, improve efficiency, or produce greater quality," said Charles Martin, author of *Employee Suggestion Systems: Boosting Productivity and Profits*. "Employees work together better as a team and often submit ideas as a team. And they begin to think more like managers, looking beyond the scope of their own jobs." How to lower costs is the most common topic that "higher ups" will ask workers about. In 2010 Kentucky governor Steve Beshear reached out to government employees, asking them how the state could lower operations costs. Beshear stated, "Input from employees is a vital part of the Smart Government Initiative and we need people from all levels and areas to take a look around and let us know if they think their agency or any other areas of state government could be operating more efficiently. Every dollar we can save through these cost-saving measures will help preserve jobs." In this sense, employee input can help workers save their own jobs, a meaningful occurrence when unemployment is high, like it was in 2008 and 2009.

Some companies assume that since they cultivate an open relationship between employees and management, ideas for improvements will surface informally, without explicit prompting. But experts note that formal suggestion systems encourage employees to really think about their jobs and want to participate in the operation of the company. Formal suggestion systems let employees know that their ideas are valued. Such systems may even increase motivation and foster loyalty and teamwork among employees. And these benefits come in addition to the positive impact employee suggestion systems can have on a company's bottom line. "There's no denying that the real expert is the person who does the job; therefore, that's the best place to go when improvements are sought," consultant Tomas Jensen, president of the Center for Suggestion System Development, told Susan Wells, as published in *HR Magazine*. "Millions of dollars are being saved by listening to the company's greatest asset its human resource." Wells went on to discuss a

study by Employee Involvement Association (EIA) which uncovered savings of more than $624 million in 2003 in forty-seven companies in which 450,000 people participated in programs.

Employee Suggestion Systems can be set up to foster a sense of informality that might make it more comfortable for employees to come forward. Creating a Facebook group, for example, gives employees of small and medium-sized businesses a chance to discuss business issues, list thoughts and ideas, make suggestions, and comment on the ideas and suggestions of other employees and officers. Tying in Twitter accounts to Facebook accounts allows everyone from the company president to the most junior worker to connect instantaneously via BlackBerry or iPhone. This creates a virtual space where contributions can be made on the fly, concisely, and from anywhere in the world. This can be extremely effective, since such forums assign the same level of importance to those "lowest on the totem pole" as they do to executives, making it easier for workers on the ground to suggest things they would never dream of saying to the boss's face.

ELEMENTS OF A SUCCESSFUL SUGGESTION SYSTEM

"The goal of a successful suggestion system is to tap the reservoir of ideas and creative thinking of all employees for the improvement of the working process and products," Robert F. Bell wrote in *IIE Solutions.* "To do so requires proper understanding by everyone of the process, management support of the system, encouragement and meaningful rewards, and a structure to make sure nothing falls through the cracks." The elements of a successful employee suggestion system can be divided into four main areas: management support, program structure, program visibility and promotion, and recognition and rewards.

Management Support. The first element of a successful employee suggestion system is to demonstrate buy-in from top management. Managers must show enthusiasm and commitment toward the program if it is to generate the desired results. A small-business owner might begin by sharing his or her vision for the company with employees. Employees who understand the company's overall mission are more likely to submit valuable ideas that will help the company achieve its goals. The next step might be to make sure line managers support the suggestion system and do not feel threatened by it. It is also important for managers to raise the topic frequently in meetings and incorporate the positive results of employee suggestions into periodic progress reports. Managers should also be encouraged to submit suggestions themselves, although they should not generally be rewarded for ideas that fall under their normal strategic planning responsibilities.

Program Structure. The next element of a successful employee suggestion system is structure. Experts recommend placing responsibility for program development and implementation with a single administrator. This person should begin by selecting a committee of employees from all parts of the organization and representing various demographic groups to help administer various phases. The administrator and employee committee should then develop clear rules to guide employee efforts in providing suggestions. Suggestion programs tend to be more successful when employees are encouraged to make reasonable suggestions within the parameters of their own work experience. "The real goal is to generate as many ideas as possible, and, over time, to improve the quality of the suggestions through feedback and encouragement," Bell noted. It is important to develop a clear policy statement that covers all aspects of the suggestion program and make sure that both managers and employees understand it. If employees view the process as open and above-board, it will help eliminate any suspicion about how ideas are reviewed and rewarded.

Program Visibility. Another important element of successful employee suggestion programs is visibility. After all, employees cannot be expected to participate in a program if they are not made aware of it. Experts recommend launching suggestion programs in a highly public manner, with announcements, newsletters, and parties. Employees should come away with the idea that management intends to give full consideration to all suggestions and plans to act on the best ones in a timely manner. The suggestion system itself should also be widely publicized and promoted. Once the system has been introduced, it is important to follow up with ongoing promotional activities in order to maintain employee interest.

Recognition and Rewards, Another vital element of successful employee suggestion systems is recognizing participants and providing rewards for good ideas. Employees are much more likely to participate in a suggestion program if the ideas they submit receive quick and thoughtful responses from management. Experts recommend setting a timetable in which receipt of an idea will be acknowledged (ranging from 24 hours with electronic systems to 1 week with more traditional systems). Then employees should be notified within 30 days whether their ideas will be adopted. Even in cases where an idea is not used, the employee who submitted it should be thanked for his or her participation in the program. It may be helpful to provide a small, tangible reward for employees who submit an idea to the suggestion system for the first time, such as a T-shirt, pen, or umbrella.

To ensure the success of a suggestion system, it is also important to publicize the suggestions used and their

positive impact on the company. One way to do this might be to hold an annual dinner honoring the people who made suggestions over the course of the year. Many companies also establish reward systems for employee ideas that lead to cost savings or process improvements. For example, some companies distribute a fraction of all the savings provided by the employee suggestion system as part of their annual profit sharing programs. Experts acknowledge that it can be complicated to develop an appropriate reward system that recognizes valuable employee contributions without creating jealousy and resentment among fellow employees. Some suggest that this task might best be delegated to an employee advisory committee. The key is to evaluate ideas based on factors like innovation and ingenuity as well as monetary value when establishing rewards.

COMMON REASONS SUGGESTION SYSTEMS FAIL

"In some companies employees send a flood of useful ideas to upper management. In others the bottoms of suggestion boxes are coated with dust," wrote a contributor to *Executive Female*. "What's the difference? It's not the quality of the employees but the quality of leadership they receive." There are a number of reasons that suggestion systems might fail to generate a positive response among employees. In his article for *IIE Solutions*, Bell outlined several common problems companies experience in implementing and administering suggestion systems.

For example, employees may feel reluctant to offer suggestions if they believe that management is not truly interested in their ideas. If the company issues only a lukewarm invitation for suggestions or creates an atmosphere that might be perceived as intimidating, then employee suggestions are unlikely to be forthcoming. The company would probably experience similar problems in eliciting suggestions if management was unclear about who was invited to participate in the program or placed too many strict rules on participation. For example, allowing only certain people to make contributions during a virtual meeting, and limiting the time that those invited have to make suggestions are two approaches that will make employees feel that their contributions are not important. They will then stop giving ideas, even if they have a thought that could reshape the way the company runs or increase profit margins. Sometimes the best system to make employees feel like their suggestions are valued is a good old-fashioned meeting, or even an informal barbecue where people from all levels can exchange thoughts and ideas for improvements.

Other common problems with employee suggestion systems involve management's response to suggestions. Employees are unlikely to participate in the program if they experience a slow response, or no response, to their suggestions. An example of this was the uninviting "top-down only" method for suggestions at San Diego's *Union-Tribune* newspaper before a major overhaul of the employee suggestion system of 2010. The company culture warmed up to a more progressive approach in the first quarter of 2010, and employees were incentivized with cash bonuses for ideas regarding revenue production, improvements in working conditions, and ways to cut company costs.

A suggestion system can also fail if there is no clear explanation of the acceptance or rejection of suggestions, or if employees perceive that management is making biased judgments about which suggestions to approve. If employees feel like they are being forced to make suggestions, the ideas presented will most likely not be as valuable as those contributed in a more relaxed environment. Suggestion systems tend to create problems for an organization when the rewards offered for good ideas are inconsistent or unpredictable. When offering incentives for suggestions, the value of the incentive needs to be on par with the value of the idea passing out cookies at a company sit-down when an employee gives a great idea that can revolutionize the company's working conditions will only insult the value of suggestions. It is important to offer bonuses commensurate with ideas after all, if the idea had come from an outside consultant, it would have cost the company thousands of dollars.

The evolution of employee suggestion systems is likely to start moving faster than ever before. With IT systems creating all sorts of new virtual landscapes, more places to discuss, ruminate, offer up ideas, and comment on the suggestions of others will become available. The simplicity with which suggestions can be made means that most likely, more suggestions will actually get where they are meant to go. Social media allows thousands to review ideas as opposed to the old suggestion box, where ideas were for the boss's eyes only. A changing world of technology will make most things more transparent, and this will likely be advantageous for employee suggestion systems.

EMPLOYEE TERMINATION

Employee termination is the release of an employee against his or her will. Termination may be, at will, for cause, or for lack of work. The process is unavoidably painful: it imposes a certain degree of pain on the terminated employee, and can also cause the person who is doing the terminating to feel badly. It may also be difficult to terminate an employee who has a family, even if he or she was not performing well. Terminations, however, are a necessary part of business life and must be carried out promptly when the need for such actions becomes obvious in order to preserve the health of the enterprise.

TERMINATION AT WILL

An employment-at-will doctrine emerged in the United States in the mid-nineteenth century and came to be applied in both state and federal courts throughout the late 1800s and early 1900s. Concise interpretations of the doctrine were rendered by the California Supreme Court in 1910: "Precisely as may the employee cease labor at his whim or pleasure, and, whatever be his reason, good, bad, or indifferent, leave no one a legal right to complain; so, upon the other hand, may the employer discharge, and whatever be his reason, good, bad, or indifferent, no one has suffered a legal wrong."

Employees have retained their rights to be employed at will, but employers' rights to terminate workers at will have been modified over time based on the circumstances of the termination. The federal Wagner Act of 1935 made it illegal for companies to fire employees because they were engaged in union activity. Subsequent laws and court decisions during the mid-twentieth century reflected increasing concern about "wrongful discharge," implying that circumstances do exist in which it is legally wrong for a company to fire a worker. During the 1960s and 1970s, particularly, Congress enacted a number of new laws to protect workers from wrongful discharge in all types of cases, including those related to bias, whistle-blowing, and other factors.

The practical consequences of this legal evolution have been that employment-at-will remains theoretically in force but is hemmed in principally by many employee rights related to discrimination to such an extent that legal advisors to business almost never unambiguously and forth-rightly recommend using the right. This is understandable. Every employee belongs to several of the so-called protected groups in that they have an age, a gender, a race, a sexual preference, in some cases a disability. It is always at least possible for an employee discharged at will to claim that the *real* motive behind the firing was motivated by bias. To avoid unnecessary lawsuits, many employers use work-arounds although these are not exactly publicized.

Nevertheless at-will employment continues to be the rule in most businesses in the 2010s. The majority of employees understand this right as reciprocal to their own right to quit at any time either party can quit or fire with or without notice in most cases. The small-business employer's right is also indirectly maintained by the fact that those inclined to sue prefer to sue deep pockets, but the small-business owner must be prepared to handle complaints, investigated by state or local agencies. The practice of at-will termination also implies significant discipline on the part of the small-business manager who cannot simultaneous rely on the at-will policy and also give an explanation to the terminated employee which amounts to a list of other reasons than simply the employer's naked will.

TERMINATION FOR BEHAVIOR

Employees may be dismissed for cause, one of which is employee behavior. Common behaviors that lead to terminations include absenteeism and tardiness; unsatisfactory performance; lack of qualifications or ability; changed job requirements; improper Internet use; and gross misconduct.

Misconduct might involve drug abuse, theft, or other breaches of company or public policy, including exposing intellectual property or giving outside parties log in information for a company server. The term "behavior-related" distinguishes this type of termination from "trait-related" dismissals; traits are immutable characteristics of the employee, such as color of skin or physical disability. Trait-related terminations may be legal if the employer can prove that the trait keeps the employee from performing a job satisfactorily. However, those cases are uncommon.

Employers may terminate workers based on any type of behavior they deem unacceptable, although laws and court interpretations of these laws have protected some types of behavior when the employer's retaliatory action is deemed: 1) a violation of public policy; 2) a violation of an implied contract between the employer and the employee; or 3) an act of bad faith. An act of bad faith is vaguely defined: it is simply a recognition of an employer's duty to treat employees fairly. For example, it might be considered illegal for a company to fire a worker because he refused to engage in an activity a reasonable person would consider excessively dangerous or hazardous.

One illustration of a public policy violation would be a company that fired a worker because she refused to engage in an unlawful act, such as falsifying public financial documents or giving false testimony in court. Another example would be firing an employee who exercised a statutory right, such as voting in an election or worshiping at a church. A third type of infraction in this category would be dismissal of an employee for reasons stemming from his exercising a right to perform an important public obligation.

Violations of implied contracts occur when a company dismisses a worker despite the existence of an insinuated promise. For example, if an employer conveys to a worker that he will receive long-term employment in an effort to get the employee to take a job, it could be liable if it fired the worker without what the courts deem "just cause" or "due process." Implied contracts often emanate from interviews, policy manuals, or long-term patterns of behavior by the employer in a relationship with an employee.

Even when an employer acts in good faith and does not violate the public trust or an implied contract, it can be legally liable for dismissing a worker for other reasons. Specifically, a business may be found liable if it cannot prove that: 1) its decision to dismiss an employee is not founded on bias against a protected minority; or 2) the firing does not produce inequitable results. Suppose, for instance, that a company decided to fire all managers who did not have a college degree. Doing so, however, resulted in the dismissal of a disproportionate number of legally protected minorities from its workforce. The company could be held liable if it could not show that having a college degree was necessary effectively to execute the duties of the position.

Steps in a Behavior-Related Termination. Because of the legal risks inherent in dismissing employees, most companies terminate workers for behavior-related causes only after administering a progressive disciplinary and counseling process. Besides legal reasons, studies show that most companies try to correct behavior out of a perceived moral obligation to the employee. Furthermore, many employers benefit economically from correcting employee behavior, rather than terminating workers, because of the high costs of employee turnover.

Correctional efforts do not always succeed, however. In instances when termination does prove necessary, business experts cite several basic steps that employers can take to ease the blow for the targeted employee, minimize damage to workplace morale and community standing, and shield themselves from legal liability. These steps are described below.

DOCUMENTED POLICY IN TERMINATION: THE COMPANY HANDBOOK AND OTHER METHODS

Develop clear, written policies for termination and follow them unswervingly. These policies should be readily accessible to employees in an employee handbook. To keep employees from the excuse they were never given a handbook or that it was lost, making the handbook a downloadable PDF on the company Web site is a great safeguard. In a 2010 *Wall Street Journal* article, Colleen Debaise noted, "After you draft a handbook, make sure you have it reviewed by an attorney familiar with employment law. Your handbook should contain a disclaimer clearly stating that it's not a legal contract (that way you're free to end someone's employment at will)." The cliché "Get it in writing" is also apt: an employee's signature on a document that states that he or she received and understood the employee handbook could become the handiest little document in a company's history if that employee decides to file a judgment against his or her former employer.

Termination guidelines should include definitions of poor performance and gross misconduct, detailed descriptions of the review procedures that may lead to termination, and policies regarding severance, future employment references, and the return of company property, including laptops and handheld devices. In addition, employees must know that they are responsible for giving managers the log in name and password for any online service they used for the company, including

Constant Contact, social media marketing, FTP sites, Web site builders, blogs, and so on.

Document reasons for termination over time, in quantifiable terms where possible. This is best done using trackable timetables or through e-mails organized into folders categorized by employee names. In addition, information should be backed up on external drives; even documenting in a notebook dedicated specifically to logging employee activity is a good idea in the event of a computer or network crash.

AFTER TERMINATION

Conduct a termination meeting with the employee in a professional manner. The company representative conducting the meeting should be trained in dealing with the wide array of emotions anger, denial, shock that typically appear during such times. If the company has been experiencing high numbers of layoffs, it is still just as important to make the termination process as intimate as possible so that employees who were regarded highly understand they are not being let go because of personal performance. Personal attention from a manager will not pay the worker's bills, but it will allow him to walk away with his self-esteem still intact.

Give credit for positive contributions. Many experts contend that the shock of termination can be eased somewhat if they hear positive feedback about some aspect of their work performance. "Even in a termination based on performance, prompted by the fact that acquired skills were not adequate for a particular situation, the person's assets and liabilities can still be acknowledged," wrote Richard Bayer in *Business Horizons.* "A termination-for-performance should not be an occasion for abuse."

Prepare an information package for the terminated employee that outlines all elements of any severance package, including benefits and assistance options. Depending on laws and company policies, the company may provide severance pay, unemployment compensation, compensation for earned vacation days, career and placement counseling, ongoing health insurance, or other post-termination benefits.

REDUCTIONS IN FORCE (RIF)

Reductions in force (RIF) also known as work force reductions, downsizing, right-sizing, restructuring, and reorganization may include a number of methods of eliminating worker hours, including layoffs. Employee terminations in such cases are usually the result of surplus labor caused by economic factors, changing markets, poor management, or some other factor unrelated to worker behavior. Because work force reductions make a company vulnerable to many of the same legal risks inherent in behavior-related terminations, companies usually terminate workers by means of a carefully planned and documented process. The process is typically conducted in two stages: 1) selecting the workers to be dismissed and then terminating them; and 2) providing benefits to ease the transition, including severance packages, unemployment compensation, and outplacement services.

Selecting and terminating employees is handled carefully because most profit-maximizing organizations are obviously concerned about losing talent or diluting the effectiveness of the company. But care must also be taken to ensure that the reductions do not violate state and federal laws. As with behavior-related terminations, downsizing terminations cannot be based on bias against protected minorities, or even unintentionally result in an inequitable outcome for a protected group. In fact, extensive legislation exists to protect disabled workers, racial minorities, workers over the age of forty, women, and other groups.

In addition to bias-related laws, moreover, companies must comply with a battery of laws specifically directed at corporate layoffs. For example, the federal Worker Adjustment and Retraining Notification (WARN) Act of 1988 requires companies with 100 or more employees to file at least 60 days prior notice before conducting mass layoffs or work force reductions. Among other stipulations, the notice must be in writing and addressed to employees and specified government workers.

The second stage of the downsizing process, outplacement, is also heavily influenced by legislation aimed at protecting employees. But it is also used to maintain the morale of the workforce and to enhance the public image of the company conducting the workforce reduction. Outplacement usually includes two activities: counseling and job search assistance. Counseling occurs on both the individual and group levels. Both are necessary to help the displaced worker: 1) develop a positive attitude; 2) correctly assess career potential and direction, including background and skills, personality traits, financial requirements, geographic constraints, and aspirations; 3) develop job search skills, such as resume writing, interviewing, networking, and negotiating; and 4) adjust to life in transition or with a new employer.

Many companies assist with the job search by hiring a job-search firm to help their terminated employees find new work. In addition to providing some or all of the counseling services described above, job-search companies act as brokers, bringing together job hunters and companies looking for employees. Job-search companies can expedite the job hunting process by eliminating mismatches from the interview process and by helping both parties to negotiate employment terms. In some cases, the former employer will reimburse job hunting costs as part of the severance package of benefits.

HOW NOT TO TERMINATE: FAUX PAS OF THE TWENTY FIRST CENTURY

Urban myths have circulated since the advent of e-mail and text messaging that someone got fired via SMS or AIM, BlackBerry Messenger, or even through a MySpace message or comment. While many of these stories are myths, it is indeed true that some employers have chosen to fire employees by way of e-mail or text message. In late December 2009, trucker Randy Dakin received two text messages from his employer, Arrow Trucking. The first text told Dakin to turn his truck in at the next acceptable drop off site, and the following text offered him a bus ticket to get home. Arrow truckers all over the country received similar text messages, and a Facebook group page was set up as a crisis management maneuver to help stranded truckers get home.

HowIGotLaidOff.com, a Web site set up in 2009 where people could air grievances against employers, was inundated with stories of how firings could have been handled better. One member of the site notes in his entry "Fired by Text!", "Thought everything was fine but out of the blue I get a text message, not a call, not a letter and not even a face to face even though 'my boss' was in my town." These are just two stories of a termination method that caused unnecessary anguish to employees and can be disadvantageous to a business as well. Handling a termination in a brash and uncaring manner can harm a company's reputation and cause increases in employee theft or destruction of property.

EMPLOYEE THEFT

Employee theft is a considerable problem for many companies, but its precise extent is poorly documented. The U.S. Census Bureau does not track employee theft as a category but refers researchers to the Annual Retail Theft Survey conducted by Jack L. Hayes International. The U.S. Bureau of Justice Statistics publishes data on larceny, theft, and embezzlement but not in categories that permit inference of the extent of employee involvement. In 2008 twenty-two major retailers experienced $6 billion in losses caused by theft. According to the president of Jack L. Hayes International, Mark R. Doyle, "For the 3rd consecutive year, both the apprehensions and recovery dollars from shoplifters and dishonest employees rose; up 7.26% and 21.64% respectively."

The Hayes International survey identifies what might be called mid-level cases of employee theft. Minor theft is the taking for at-home use of rolls of adhesive tape or boxes of paperclips, for instance, a very widespread practice. Major theft is of the magnitude reported by Leslie Shiner writing for *The Journal of Light Construction.* Shiner analyzed the case of a high-end remodeling firm where the sole bookkeeper of the organization had embezzled $550,000 during a 7-year engagement caught in the end because the business owner could not understand how, despite very profitable contracts, his company never seemed to have any money. Shiner reported on a small-business case. Major fraud by very high-ranking employees of businesses like Enron are the theft-peak of the employee crime pyramid.

FORMS OF EMPLOYEE THEFT

Employee theft may be grouped into four major categories: 1) manipulation of company records either to embezzle money outright or to hide the theft of goods; 2) direct theft of inventory, products, or cash; 3) abuse of power in order to aid and abet thievery by partners; and 4) theft of information for sale to others or for direct use (e.g., credit card theft).

Records. Employees directly involved in financial administration and with access to company checks and corporate records may engage in forging company checks for personal use. Creating ''ghost payroll entries'' and then paying ''phantom'' employees is another method, sometimes quite elaborate in implementation, involving phony time cards. Forged billings by nonexistent vendors is another method with the accounts payable clerk writing checks to him- or herself when paying the fake billing. Employees also destroy paper records so that ''lost shipments'' cannot be traced or fake orders to cover items missing from inventory through their own thefts.

Direct Theft. In its simplest form employees simply take cash from cash registers to which multiple individuals have access or dip into petty cash resources generally easily accessible to several employees. Direct theft of valuable products or materials invariable relies upon trust (the employee comes and goes, often with a truck, stashes goods away, is never checked) or opportunity (the employee has access to the warehouse and the warehouse is not effectively guarded). This is especially common in small businesses where employers cannot afford enough employees to ''keep each other honest.''

Abuse of Position. In one form of this abuse, known as ''sweethearting,'' an employee grants a friend a discount or rings up fewer items than are packaged for taking out or rings up a cheaper item than the item that leaves the store actually cost. The goods acquired in this manner may later be shared. Individuals taking inventory may abuse this privileged status by counting fewer items than are present and, if this ''mistake'' is not detected, the culprit can later ''adjust'' the inventory by taking the uncounted items home.

Stealing Information An increasing proportion of attacks on computer systems take place from within the company. The target of this type of thievery is protected personal data, such as credit card information, which, in the wrong hands, can be turned into cash. More sophisticated forms of such theft are conducted in order to sell information to third parties.

When it is necessary for new employees to have access to places on a network where vital and proprietary information is stored, it is important to know that they are trustworthy. Until they have proven their loyalty, installing a key stroke tracker on an employee's work computer can help managers and business owners see trends in employee activity. The tracker will tell unequivocally whether the employee is getting onto the server for information and dropping it into an external USB jump drive or e-mailing the information to himself or to other outside parties.

If at all possible, employers should not let new employees have access to highly confidential information. Intellectual property, especially that which has not yet been patented or trademarked, can be stolen rather easily. If dishonest employees have access to company information on a Virtual Private Network (VPN), they can hack into the network from home or any other place where they have Internet access. While this is illegal, it is also extremely difficult to prove, and most small-business owners do not have the money to cover the cost of computer or network forensics. Even if they do, they have to get a warrant for an employee's personal computer not exactly the easiest thing to procure.

SIGNS OF EMPLOYEE THEFT

Managers and small-business owners need to be aware of telltale signs which, when they frequently repeat, may be the tracks of a thief at work inside the company. A useful checklist to keep in mind mentally includes the following:

- Missing records (such as shipping and receiving bills).
- Company checks that bounce.
- Unfamiliar company names. For example, someone is surprised that the company is doing business with XYZ and then adds: ''Who *is* XYZ anyway?''
- Customer complaints about missing, late, or short deliveries.
- Hefty payments made for ''miscellaneous'' purposes in employee expense claims.
- Frequent and puzzling mix-ups in inventory.
- Managers who insist on performing clerical duties.

ROOKIE VERSUS VETERAN: WHO'S THE BIGGEST LIABILITY?

Most employers worry about the newest employees because they have not yet proved themselves to be trustworthy. Sadly, it is often the case that the oldest employees those who have been trusted for years take advantage of the trust their employer has in them. New employees are not the likeliest for theft because they generally do not have access to confidential material, money, or assets that older, trusted employees have. Because the employer trusts the old ''true blue'' employee, he or she may give them unprecedented

access to all manner of information and property. In 2010 employment attorney John Palter told the Canadian Press, "Generally, it takes someone with a high level of access to the various accounting systems and a high level of trust from management to be able to perpetrate the fraud." Palter went on to note, "There should not be one individual that is exclusively responsible for the accounting."

While it is important to have a watchful eye on new employees who have not had the chance to exhibit their trustworthiness, it is also important to keep all employees at enough of a distance emotionally and socially that they do not feel safe enough to take advantage of the unassuming small-business owner. It may seem sad or unfair, but the reality of employee theft shows that small-business owners stand to lose the most when they do not review their own bills, books, and observe trends in employee behavior.

STOPPING EMPLOYEE THEFT

In the well-run small business employees are trusted to be honest but sensible policies and practices will be in place to detect the loss of product and closely monitor financial and administrative transactions. Some of the tools include the following:

1. Clear Policy and Good Example. The company will have and will publish its ethical stance and its managers will be seen to adhere to it strictly in spirit and in action, inside and out, with customers, vendors, and employees alike.
2. Hiring Orientation. Newly hired employees must leave their orientation session fully aware that the company has zero tolerance for any kind of irregularity and the dire consequences that will follow pilfering, never mind theft.
3. Adequate Controls. Controls will be in place so that physical goods are locked up, protected at night, and closely checked on paper. In a small business particularly, where time is difficult to find, the owner will, nonetheless, show a keen interest in accounting details, probe into them occasionally, and not simply let the "number crunchers" drift unsupervised. Financial controls will include some of the following:
    - Checkbooks will be locked up, and access to cash and checks will be given only to authorized employees.
    - Few individuals will have the authority to write a check, by preference one writing and one signing the check.
    - More than one person will have insight into the total finances so that "lone wolf" strategies are forestalled.
    - Handling of cash will always be accompanied by documentation.
    - Books will be audited at intervals not necessarily known to accounting people in advance.
    - Cash will be rapidly and immediately deposited rather than accumulating in cash registers.
    - All invoices will be formally checked against deliveries before vendors are paid.

THE NEXT GENERATION IN EMPLOYEE THEFT PREVENTION

New technologies can help small-business owners watch points of sale in real time and prevent employee theft. Within seconds of something unusual happening, a manager or business owner can walk from the back office to the register and probe the situation.

An example of such technology is the Aloha Restaurant Guard, made by Radiant Systems, which reported in a 2010 press release, "By monitoring all POS activities in real time, Aloha Restaurant Guard is able to generate reports that identify trends consistent with more than a dozen restaurant scams to help stop profit losses and minimize the effects of fraudulent behavior." This system not only tells restaurant owners what is happening with trends in sales and potential employee theft, it also deters theft. When employees know a a high-tech system such as Aloha is in place, the likelihood of theft drops. When employees do not know Aloha is in place, the results can be very revealing. Jim Nichols, owner of Nichols Restaurant in California, stated that by using Aloha Restaurant Guard "We discovered that more than 40 percent of our employees were stealing, and in one instance with a single person, the overall theft equated to a loss of $10,000 per year."

EMPLOYER IDENTIFICATION NUMBER (EIN)

A federal employer identification number (EIN), also sometimes referred to as a tax identification number, is a nine-digit code that businesses use to identify themselves for tax reporting, banking, and other purposes. Sole proprietorships without employees are allowed to use the owner's Social Security number for tax reporting purposes, but they may also use an EIN if it is more beneficial, easier, or expedites an online tax return for his or her small business. But any company that has employees other than the owner in addition to all partnerships, limited liability companies, and corporations must instead apply for and use an EIN. The EIN is specific to a certain business, like a Social Security number is specific to a certain person. Therefore, if an individual or group owns more than one business, a separate EIN is required for each one.

There are several situations in which a business person should apply for an EIN. For example, an EIN may be needed in order to start a new business (other than a sole proprietorship with no employees) or upon the purchase of an existing business. An EIN is also needed when a business undergoes a change in its organization type (i.e., from a sole proprietorship to partnership or corporation) or when it hires employees for the first time. Some businesses may require an EIN in order to create a pension plan or form a trust. Still others find that they must have an EIN for banking purposes (many banks hold commercial accounts under EINs and personal accounts under Social Security numbers).

Businesses are required to file for an EIN as soon as it is needed for one of the above-mentioned reasons. In order to be assigned an EIN, the company must file Form SS-4, the Application for Employer Identification Number, with the Internal Revenue Service (IRS). The forms are available at all IRS and Social Security offices, or they can be downloaded from the IRS Web site. No application fee applies, and while the form can take several weeks to process, it usually only takes anywhere from a few minutes to a few days unless the EIN paperwork is being drawn up by an attorney for a larger enterprise. If any business tax forms are due in the meantime, the small-business owner should simply write "applied for" in the space for the company's EIN. In addition to the federal EIN, states that charge their own income tax often require businesses to file for a state EIN.

The individual can apply for an EIN in various ways. Possibly the easiest way to do so is on the Internet. For those who would rather not use the Internet, the next fastest way to apply for an EIN is by telephone. The IRS provides a toll-free number (800-829-4933) which may be called anytime between 7 a.m. and 10 p.m. local time, Monday through Friday. An "assistor," to use the the IRS term, will take information from the caller and issue the EIN over the telephone. Other methods are by fax, mail, and over the Internet. To explore the most handy approach, the individual can examine the relevant pages at the IRS's Web site (see the references below).

DEPARTMENT OF LABOR CHANGES IN EIN RULES

Before December 2000, if an employer changed his or her EIN, the Department of Labor required that he or she also fill out a new Labor Conditions Application (LCA) because it was nearly always presumed that a change in EIN meant a change in business type, ownership, or industry. From 2001 forward, however, a Labor Conditions Application has generally only been required if a company relocates (especially if the relocation includes the relocation of existing employees), changes its corporate identity entirely, or if there is a merger or sale of the company or corporation.

Sometimes, an EIN is maintained even after a company is sold to a new owner. In this instance, the new owner of the company may or may not have to fill out a new LCA, but he or she must be aware that it is his or her responsibility to report any changes in the business to the District Director of Internal Revenue and the Social Security Administration to ensure that all laws are followed with respect to taxation of the company, as well as its employees.

An employer identification number is a useful tool and a necessary one for those who wish to employ workers for their small business. In most cases, if an entrepreneur is launching an LLC, S-corp, or X-corp, it is in his or her best interest and the best interest of the new company to enlist the services of a business lawyer. While it may seem costly at the time, the help of an experienced attorney can help small-business owners avoid the pitfalls associated with filling out their own application when the venture is a larger one. Entrepreneurs who buy existing businesses may not have to but may benefit from applying for a new EIN just in case the previous business owner created a less than desirable reputation associated with that employer number. In the world of business, the EIN is as much a company's identity as a Social Security number is in the daily life of an individual. It must be cared for, kept from abuse and theft, and used responsibly by the business owner who wishes to succeed.

EMPLOYMENT APPLICATIONS

The employment application is an important part of the hiring process: it provides employers with clear and relevant information about applicants. An application is also a legal document and becomes a part of a person's permanent file once he or she is hired. A start-up small business without such an application can write its own or acquire forms from vendors; if the form is produced in-house, it is advisable to have it checked by a qualified attorney to avoid violating civil rights statutes at federal and state levels.

APPLICATION CONTENTS

Applications contain questions designed to help the employer make a hiring decision. In essence, they reorganize the information the employer typically finds on a résumé while also furnishing additional information that can be helpful in making hiring decisions. Application contents typically include the following:

- Statement by the business that it is an equal opportunity employer and that it is the policy of the business to provide opportunities to all qualified persons without regard to race, creed, color, religious belief, sex, age, national origin, ancestry, physical or mental handicap, or veteran's status.
- Name, address, phone number, and other relevant contact information.
- Position the applicant is seeking within the company.
- Hours of availability.
- Expected salary.
- Past experience. This will make up the majority of the application form, for it is common for companies to request a listing of all positions that an applicant has held over the past 3 to 5 years. This section may include a request for supervisor names and reasons for leaving previous positions.
- Educational background. This typically includes schools attended, years attended, and degrees attained.
- Other information. This might include questions about the applicant's experience with computer software programs and other office equipment, or it might ask the person to describe hobbies and other interests. This section of the application can be a tricky one for employers, as some questions may violate legal parameters. A good rule of thumb for small-business owners weighing whether to include questions of this type is always to make sure that the responses could be pertinent to making a hiring decision.
- Closing statement. The statement at the end of an application usually includes legally worded information for the applicant about the application, including permissible uses of the information contained therein. The employer should mention on the document that the company is an equal opportunity employer, and legal experts recommend that employment applications include a statement regarding the right of the hiring company to check references and verify information on the application. The employer should state clearly that falsifying any

information on an application can be considered grounds for dismissal.

- Signature of applicant.

Again, it is advisable to have a homemade employee application checked by an attorney in order to avoid potential complications.

POTENTIAL PITFALLS

There are several possible pitfalls in designing an application form. On an application form, it is not permissible to pursue any of the following lines of questioning:

- Questions about the applicant's age, race, sex, religion, national origin, physical characteristics, sexual orientation or other personal information that violates Equal Employment Opportunity Commission (EEOC) guidelines.
- Questions about the applicant's health history or handicaps (if any) that violate the Americans with Disabilities Act (ADA).
- Questions that violating any state regulations (individual states may have regulations concerning employer rights to inquire about past salary history, referral sources, credit, access to transportation, or personal emergency information). It is important to check for state guidelines in employment applications before putting together a business application.
- In New Mexico and California, it is also illegal to include a box on an application asking whether an individual has ever been convicted of a felony or misdemeanor. This change was designed to ensure greater access to work for former convicts. As of 2010, New Mexico and California were the only states with such a ban, but other states may follow.

READY MADE APPLICATIONS

In the Internet age, the start-up business can quite readily find carefully written employment applications on the Internet. The ubiquity of the Internet has also inspired many companies to have applicants fill out their application forms online. These online forms allow companies to showcase their available jobs to workers from a wider area and to collect more applications without the need for in-person contact, giving companies a wider pool of potential employees. Online hiring portals can provide opportunities for employers to hire workers on a temporary basis or for full-time work. Many employers use these sites to find applicants from lower-cost offshore locations where employees are willing to complete projects on a freelance basis for less than what it would cost to hire individuals in the United States.

USING THE APPLICATION

The application should be given to every person applying for a position from outside the company. It should be required regardless of level of position, so that all potential employees have a similar experience and receive similar treatment. Normally, a separate, abbreviated application form is used for people who are already employed by the company who wish to apply for positions elsewhere within the company.

Once the application has been received by the company, it needs to be directed to the appropriate person or persons to process the application and determine whom to hire. Managing and tracking applications can prove to be a challenge for some businesses, especially those in which multiple individuals are involved in the hiring process or those which receive large numbers of applications. Numerous software providers offer Applicant Tracking Software designed to facilitate the process of collecting, evaluating, and processing employment applications. According to a Gartner RAS Core Research published in December 2009, "despite a faltering economy, the e-recruitment software market continues to grow at a healthy pace." The growth and demand for this applicant management software is driven by an increased number of applicants, stronger challenges in complying with employment laws (such as protection of private employee data), and by an increased occurrence of internal job mobility driven by a poor economy and recruitment freezes.

Some laws require employers to retain applications, whether the person is hired or not, for up to 1 year after the date the application is made. The employer is not usually required to reconsider the applications on file as new positions become available, but they must have record of the applications made to the company.

EMPLOYMENT CONTRACTS

Employment contracts replace the normal hiring arrangement between employer and employee with a legal document in which the employment relationship is spelled out in substantial detail. Important elements of employment contracts deal with compensation, bonuses, stock options, severance packages ("golden parachutes"), fringe benefits (currently and after retirement), noncompete requirements including disclosure of internal information ("postemployment confidentiality"), and nonsolicitation of current employees after severance. Less obvious but equally binding forms of an employment contract are frequently used. These usually take the form of an agreement the employee is asked to sign during the employment process. The agreement commits the employee to hold certain types of information confidential and may also prohibit the employee from working for a competitor in any relationship for some specified period of time, for example, 3 years. These lower forms of the employment contract, significantly, provide no special compensation for doing what is asked: they are conditions of employment.

BACKGROUND AND TRENDS

Employment contracts became a standard method of attracting high-powered, high-profile executives to a corporation. In the expansionary decades following World War II, personal qualities and charisma became associated (rightly or wrongly) with corporate performance; in consequence market forces worked in such a manner that such contracts became rather surprisingly rich packages. The much-courted executive was able to secure, well in advance of doing anything at all, guarantees of high compensation and reward, including a golden parachute. Public resistance to this broad trend did not translate into regulatory action (including self-regulatory action) until the spectacular corporate scandals surrounding Enron and WorldCom surfaced between 2001 and 2003.

Golden parachutes again came under fire during the financial crisis and bailout package occurring in 2008. In the Emergency Economic Stabilization Act, the federal government pledged $700 billion to help struggling banks, insurance companies, and other Wall Street firms in an effort to bolster the U.S. economy. This policy came under fire because it initially did not contain sufficient restrictions on executive compensation, including golden parachutes.

Public outrage was fueled by reports of failing companies receiving bailout money and then paying out large salaries, bonuses, and incentives to executives despite the poor state of their finances. In one widely reported incident, Alan H. Fishman acted as the CEO for Washington Mutual (WAMU) for a total of 17 days before the company failed and was sold to JP Morgan Chase. As a term of his contract, Fishman received a $11.6 million golden parachute.

The initial bailout plan did nothing to address such situations although it did cap tax deductions for salaries over $500,000. In response to voter outrage, limitations were imposed on golden parachutes but those limitations would not affect existing employment contracts that already promised golden parachutes to current executives. Furthermore, the limitations affected golden parachutes only for those who were fired or whose companies failed despite the influx of bailout money. One U.S. congressman, Peter DeFazio (D-Ore), was quoted in an article on *CNN Money.com* as saying that "The golden parachutes have been exchanged for camouflage parachutes."

Employment contracts, especially of the exuberant variety, appear to be rarely used by small businesses except in certain contexts namely to secure the owner a reasonable retirement income after the business is sold or terminated.

CRAFTING AN EMPLOYMENT CONTRACT

Business owners who are considering introducing employment contracts into their operations should consider the following:

- Employment contracts imposed unilaterally by the employer, rather than by genuine mutual agreement, are at substantial risk in the courts. If the employee is found to have entered into the contract under duress, the agreement will be struck down.
- Employment contracts are an effective means of mitigating the risk of business damage at the hands of ex-employees. This is the motivation behind confidentiality and noncompete clauses. The confidentiality clauses are easier to enforce. A noncompete clause written so that the employee

appears unable to practice an occupation will likely be ignored. If it is challenged in court, the court will side with the employee. State law may significantly curb an employer's ability to impose noncompete clauses.

- Employment contracts should, ideally, maintain the rights of the employer to terminate employment "at will." Such clauses need to be present in the contract even if specific periods of employment are specified. If an "at will" clause is present, of course, the contract must specify how an employee with a 3-year contract will be compensated if the contract is terminated after a year.
- Termination "for cause" should always be present and the triggering causes specified, such as legal offenses, dishonesty, or fraud.
- Employment contracts indeed all contracts should be vetted by a competent attorney. Many states regulate such contracts, and the owner may be unaware of these regulations.
- Employment contracts should be used only for legitimate business relationships. Compensation for services rendered should be reasonable and should be distributed only when they are in fact completed. This element is of particular relevance to family-owned enterprises, which sometimes turn to employment contracts as part of their overall succession plan.
- Employment contracts are not "one-size-fits-all." Employers should recognize that managers and executives can and should be rewarded in different ways, depending on their contributions to the company.
- Severance arrangements should be reviewed on a regular basis to determine their suitability for inclusion in employment contracts. Most severance packages are classified as ERISA (Employment Retirement Income Security Act) welfare benefits.
- Dispute resolution mechanisms are often incorporated into employment contracts. This arbitration language is sometimes limited to certain specified issues within the contract (authority of employee, divisions of intellectual property, bonus calculations, etc.), thus leaving other aspects of the contract to the courts. Other employment agreements, however, include "blanket" arbitration clauses that provide for arbitration of all disputes between the employer and the employee under contract.

EMPLOYMENT INTERVIEWS

Interviewing is an integral part of the hiring process. It provides small-business owners with their primary opportunity to learn about a candidate's work experience, education, and interpersonal abilities, as well as characteristics such as enthusiasm that are rarely conveyed in résumés. Similarly, the interview process often provides would-be employees with their best opportunity to inquire about various aspects of company operations and expectations.

BEFORE THE INTERVIEW

Before beginning the interview, the manager must define the skills needed to fill the position. This, along with careful applicant research and candidate selection, helps to ensure a smooth interview process.

Critical Skills. To secure the right person for a job, the manager must define the necessary skills for the job, often called the critical skills. These describe exactly the skills a person needs successfully to perform the tasks. Sample critical skills could be phrased as "facility with communication," "high degree of organization," or "ability to work

well independently." Critical skills are expanded upon in the job description and help guide the manager during the selection process and then provide structure for the position throughout employment.

Applicant Research. Applicants must be researched before the interview. The most common methods of receiving candidate information are the résumé and cover letter, generated by the applicant, or the employment application, generated by the company. These records can be very informative. Not only do they provide basic background/historical information, but the presentation can also provide glimpses into the applicant's suitability for employment. A manager, for instance, should watch for such problems as typographical errors, spelling errors, or incomplete information about the applicant. Likewise, attention should be paid to the length of time an applicant has spent at a position, the responsibilities they were given in successive positions, and the chronological information on the résumé. Frequent job changes, declining responsibility, or gaps in employment are all items that should be pursued for clarification. None of these call for immediate rejection of a candidate, but any could signal a potential area of exploration.

Employers are also turning to social networking Web sites to find more information about potential candidates. A search of an applicant's name can reveal a Facebook page, MySpace page, LinkedIn profile, and a wealth of other information about a candidate. These sources can be an excellent way to learn information that a candidate might not openly share with an employer. For example, inappropriate pictures on a social networking Web site or a reference on a Web site that hints at illegal or unethical behavior can be a tipoff that an applicant would not be a wise hire.

Employers should also be aware of a rise in résumé and cover letter fraud. According to a 2008 report published by Career Directors International, at least 30 percent of résumés contain factual errors or untruths. This trend towards embellishing a résumé is driven in part by increased joblessness caused by the 2008 and 2009 recession. Dishonest applications can serve as grounds for terminating employment, but employers should check facts as much as possible to avoid hiring the applicant in the first place.

Selecting Candidates. Not all people who apply will be qualified for the position. The manager selects candidates for the position from the entire group of applicants, choosing individuals who demonstrate the best skills for the open position in their written presentation.

When putting together an interview schedule, a manager needs to balance the desire to interview all qualified people with the practical necessity of concluding the search in a timely fashion. Managers should consider the time frame for the hiring decision, the amount of time available to interview, and select candidates carefully. A good rule of thumb is to allow from 30 to 60 minutes per interview; then add 15 minutes in between interviews, to prevent back-to-back interviews. Small-business consultants caution that a day of back-to-back interviews can tire the interviewer and hinder his or her ability to make a well-reasoned decision.

THE INTERVIEW

Time well spent in the interviewing process can prevent a poor hiring decision. A survey conducted by the SurePayroll system reported that three out of four small-business owners surveyed reported making a poor hiring decision at least once, resulting in the employment of an individual who was at best unhelpful and at worst detrimental to a company. In fact, 12 percent of respondents reported that the hiring mistake resulted in a financial loss of more than $10,000 for each erroneous hire.

Preparation is the key to a successful interview. It is important not to scrimp on time during the interview and to let the candidate do the majority of the talking. The space for the interview should be ready, and the interviewer should have already prepared questions for the discussion.

Environment. The interviewer sets the tone for the meeting and can make the candidate feel at ease or uncomfortable. To insure a successful interview, the space should be free of distractions and interruptions such as telephone calls or the presence of other employees. There should be minimal barriers between interviewer and candidate (desks or tables); and the interviewer should always offer the candidate coffee, soda, or water. A courteous and professional manner is best, without presenting an environment that is too formal.

Behavioral Interviewing. Though there are many kinds of interviewing techniques, behavioral interviewing allows the interviewer to focus on likely future performance based on past behavior. This is one of the most popular interviewing techniques, and it is effective precisely because it focuses on specific situations and examples, not hypothetical situations. It requires that candidates draw on past experience to describe what they actually did in specific work situations, and this discourages "made up" answers or hypothetical exaggerations. It thus provides potentially valuable insights into how a candidate is likely to approach issues and problems he or she may face in the company's work environment.

Types of Questions. Interview questions are designed to explore the candidate's previous work experience, education, and other areas which will enable the interviewer to determine if the candidate has the best match of critical skills for the position. There are many types of questions.

The biggest mistake interviewers make is to ask only factual questions during an interview. Often, an interviewer asks questions that illicit a yes or no or other single response answer: "When did you join the company?" or "How long were you in the position?" Such questions limit the candidate's response; they do not require the candidate to consider or analyze any specific problem or situation.

Open-ended questions allow the candidate to expand on a topic, describing experiences and actual situations. They keep the candidate talking and the interviewer listening. The focus of open-ended questions is always on past performance, using wording such as "Give me an example of . . . ", "Explain the nature of your duties at . . . ", "Tell me about a time when you . . . " Such questions are the basis of behavioral interviewing and focus on specific examples of past behavior how a candidate performed in a specific circumstance.

Probing questions are used to uncover more information than the original answer given. If a candidate answers with "yes" or "no" or a very general response, the interviewer can probe by encouraging the candidate to elaborate on a point within the answer. Very specific questions should be asked when probing. Specific questions encourage a candidate to expand on a general answer.

Avoid leading questions which direct the candidate to a specific answer and do not encourage an honest, spontaneous response. If leading, the interviewer may nod to encourage a particular response or may stack two or more questions guaranteed to produce a desired answer. This merely encourages the candidate to respond with the answer the interviewer wants to hear.

While these types of questions are often used, some companies are interested in new ideas concerning interviews. Career Industry Megatrends reported an increase in alternative interviewing styles in 2008 and 2009. New interviewing formats include "speed interviewing," where recruiters meet multiple employees at the same time and interview as many as fifteen candidates at once. A growing number of candidates are also asked to submit to "fishbowl" interviews, in which employers present a case study or scenario and ask the candidate to respond. To conduct a fishbowl interview, a person should monitor a candidate's behavior carefully to determine his level of commitment, his ability to work in a team, and his logical and problem-solving skills.

Closing the Interview. When closing the interview, the interviewer should first offer to answer any questions the candidate may have. Basic factual information about the company and position should be readily available. It is important to make the follow-up process clear to the candidate. If there are other candidates to interview, the candidate should be informed of this and know when to expect a decision. It is always advisable to thank the candidate for interviewing, and to try to leave him or her with the most favorable impression possible of the company, regardless of whether the person is offered the job.

Team Interviewing. In the current atmosphere of work teams and group decision making, it may be desirable to have a group interview the candidate. "Use as many sets of ears as possible," counseled Michael Santo in *Agency Sales Magazine.* "This team interview approach helps catch the true response of the candidate. The team interview has an added benefit of keeping the interview focused on the more critical areas, as it is less likely that all the members of the interview team will be drawn into conversations that are not insightful and could cross into areas that may have legal ramifications."

When this team-based approach is deemed appropriate, every member of the team should have all of the information about the candidate prior to the interview, including copies of the person's résumé, cover letter, and application. The questions each member of the team will ask can be planned in advance, so the candidate will not be asked the same question by more than one member of the team.

LEGAL ASPECTS OF INTERVIEWING

Interviewing is subject to both state and federal laws that define employment discrimination in all aspects of employment. It is worthwhile to check for any state hiring regulations that might apply. The main federal regulations for hiring include:

1. The Civil Rights Act of 1964 (Title VII)
2. The Age Discrimination in Employment Act of 1967 (ADEA)
3. The Americans with Disabilities Act of 1990 (ADA)
4. The Uniformed Services Employment Reemployment Rights Act of 1994 (USERRA)
5. The Immigration Reform and Control Act of 1986

Together, these acts forbid a company to discriminate in hiring on the basis of sex, age, race, national origin, religion, physical disability or veteran status. These are called protected classes, so questions about any of these topics during an interview are illegal.

The interviewer must avoid all questions that could seem legally questionable, such as those about height, weight, age, marital status, religious or political beliefs, dependents, birth control, birthplace, race, and national origin. Generally, it is a good rule to measure a question's necessity by the role it plays in the determination of a candidate's ability to perform a job.

TURNING SOMEONE DOWN

Once the job is offered and accepted by a candidate, other candidates should immediately be notified that

they have not been selected for the position. A rejection is best done by phone it is immediate, and it allows the manager personally to thank the candidate for taking the time to interview. When unable to phone, a letter of rejection is suitable. Although the candidate may ask, it is not necessary to be extremely specific about the types of qualities that the person lacks. An exact description of what was lacking in the candidate may open the manager to lawsuits for unfair hiring practices and discrimination.

The importance of making the right hiring decision is crucial in staffing a business. It means nothing short of selecting the right person for the right job at the right time. Since the interview is often the most decisive factor in determining who is hired for a specific position, business consultants contend that the importance of mastering the interview process should be appreciated; indeed, the interview process is ultimately an important factor in determining workforce quality and satisfaction.

EMPLOYMENT OF MINORS

Businesses in some industries rarely utilize minors as employees, but in many other sectors teenagers comprise a large component of the total work force; indeed, some enterprises engaged in various retail, restaurant, and other businesses rely on minors to a considerable degree. The primary advantage associated with employing minors is that compensation is far less costly than if the employer were to hire adults. But employers should be aware of the various legal restrictions that state and federal agencies have placed on the employment of minors, and they should also be cognizant of the particular challenges and rewards that accompany the decision to hire teenagers.

LEGAL CONSIDERATIONS

In addition to state laws, which have varying rules regarding child labor and compulsory school attendance laws, employers should be familiar with the federal government's Fair Labor Standards Act (FLSA). The rules in the FLSA differ from individual states in some respects; in cases where differences exist, the stricter law prevails.

Ignorance of state and federal child labor laws will not save employers from fines, which can be quite substantial. "Many companies have discovered that there are two sides to the child labor issue," wrote Steven Slutsky in *Journal of Business Strategy.* "On the one hand, minors can be a cost-effective and flexible supplement to your core work force. But on the other hand, the penalties for violating the child labor laws can be steep." In fact, after the passage of the Genetic Information Nondiscrimination Act of 2008 (GINA), the maximum fine that can be assessed by the Department of Labor's Wage and Hour Division is much steeper than before. (This aspect of GINA amended the Fair Labor Standards Act, also known as FLSA.) Under the revised law, the penalties for a child labor violation that causes serious injury or death were raised from $11,000 to $50,000. The new legislation also mandated that penalties may be doubled for repeat or willful violations of child labor laws regarding injuries. Changes to general child labor laws also raised the civil fine for employing child laborers to $11,000 per incident, up from $10,000 prior to the 2008 amendments. A $10,000 criminal fine upon conviction remains in effect, while a repeat violator can also face imprisonment for up to 6 months. These latter measures were taken for the purpose of punishing employers whose violations contributed to the death or significant injury of a minor.

According to Kilpatrick Stockton, LLP, the increased penalties for injuries or death that result from child labor "dramatically raise the stakes for employers that employ workers under the age of eighteen." In 2009 a penalty was assessed under the new GINA laws against Demon Demo Inc. when an employed teenager died after falling from the second floor of a mall during a demolition. Demon Demo Inc. was fined the maximum penalty of $50,000, which sent a strong warning to

companies to ensure the safety of minors and avoid employing minors in potentially hazardous situations.

Slutsky admitted that the likelihood of an employer being singled out by the Department of Labor for a random compliance audit is remote unless the company is active in a high-risk industry. "But don't assume that the DOL won't find out about child labor law violations," he warned. "Word usually gets back to the agency in the form of complaints from underage employees or their parents or even unions. The publicity factor is involved here as well, since violations that result in injuries or death often are picked up by the media."

Small-business owners, then, should make sure that they and their supervisory personnel, if any are fully aware of what minor employees are permitted to do. First, it is important to recognize that employees can be broken down into three age groups: workers who are eighteen years old or older, and thus regarded as adults under the law; youngsters who are sixteen or seventeen years old; and minors who are fourteen or fifteen years old. (Employment of children under the age of fourteen is severely restricted, although parents who employ their children enjoy greater leeway.)

Restrictions on Minors Under Age Eighteen. According to the Department of Labor, minors under the age of eighteen are not allowed to perform jobs that the department has classified as detrimental to their physical safety, mental safety, and health. These restrictions forbid minors from operating (or setting up, repairing, adjusting, or cleaning) any power-driven machines, including woodworking machinery, metal forming machines, punching and shearing machines, paper products machines, circular and band saws, bakery machines, meat-processing equipment, or hoisting apparatus (forklifts, cranes, derricks, freight elevators). Since February 2005, under revised DOL regulations, minors under seventeen are also restricted to the types of cooking activities in which they may engage. They may not drive on the job except under certain circumstances and only if they have a valid state license, have completed state-approved driver education, and have no record of moving violations. In addition, minors are prohibited from engaging in the following activities at their place of employment:

- Operating motor vehicles or assisting as outside help on those vehicles.
- Working in any capacity on roofing, wrecking, or demolition jobs.
- Working in mining operations, unless in office, maintenance, or repair capacities away from the mine site.
- Working in areas where explosives (fireworks, dynamite, ammunition, etc.) are manufactured or stored.
- Working in logging or sawmilling operations.
- Assisting in the manufacture of brick, tile, and kindred products.
- Working at tasks that require exposure to radioactive substances.
- Undertaking excavation work (exceptions are made for manual excavation in trenches and building excavations, provided the dig does not exceed 4 feet in depth).

It should be noted that exceptions to some of these rules may be made for minors who are participating in recognized apprenticeship programs. On a practical basis, however, these restrictions mean that minors are of limited use in nonoffice settings to businesses engaged in construction, manufacturing, and the like. Still, manufacturers and construction firms do maintain staff devoted to clerical work and custodial duties, and minor employees may be suitable for these slots. The above restrictions generally have little impact on businesses looking for cashiers, salespersons, stocking personnel, and other positions that do not require handling of motor-driven equipment.

Restrictions on Minors Age Fourteen and Fifteen Additional restrictions have been put in place by both federal and state agencies concerning the employment of fourteen- and fifteen-year-old minors. "The environment in which fourteen-year-olds and fifteen-year-olds do their work also plays an important role in determining whether the duties are permissible," cautioned Slutsky. "For example, although workers in this age group may clean, wrap, seal, label, weigh, price, and stock produce, they can't perform these tasks in a freezer. And while they may assemble, pack, and shelve merchandise as can sixteen-year-olds and seventeen-year-olds they can't do it in a warehouse or rooms where manufacturing and processing work takes place." Moreover, owners of construction and transportation companies should be aware that minors under age sixteen may not perform any kind of work (including office work) on the construction site or transportation medium. Other areas in which fourteen- and fifteen-year-olds are restricted from working include boiler/engine rooms, meat coolers, and places where products are being loaded or unloaded from conveyors or railroad cars.

In addition, fourteen- and fifteen-year-old teens are not allowed to work before 7:00 a.m. or after 7:00 p.m. during the school year. They are also not permitted to work during school hours. Finally, these minors may only work certain numbers of hours. During periods of the year when school is in session, fourteen- and fifteen-year-old minors may work no more than 3 hours a day on school days, no more than 18 hours total a week, no more than 8 hours a day on nonschool days, and no more

than 40 hours total during weeks in which school is not in session (summer, vacation breaks).

Of course, rules change from time to time, and occasional checks are therefore a good idea. The business owner can easily check the DOL Web site www.dol.gov/whd/childlabor.htm to see what is new.

USING MINORS EFFECTIVELY

Small-business owners and employment analysts agree that the key to securing skilled and motivated minors as employees lies at the very beginning, with the application and interview. Remarkably, some employers tend to lump teenage employees together into one indistinguishable mass, but in reality, dramatic differences exist within this demographic group (and all other demographic groups, for that matter) in such areas as punctuality, honesty, ambition, talent, intelligence, and all-around quality. In order to find top-notch minor employees, small-business owners are encouraged to pay close attention to the information provided in the job application form. Are the students high academic achievers in high school? Do they participate in extracurricular activities? Do they provide good references, such as former employers, school teachers, or school administrators?

In addition, employers should take the time to conduct a thorough interview with minor applicants, even if it is for a part-time, entry-level position. Every employee plays a part in shaping company culture, and every new hire has the potential to influence other employees for good or ill. This is particularly true for businesses that have a significant number of minor employees. For example, an employer who hires a minor for a floor sales position only to discover that the new hire has a previously undetected predilection for emotionally distant, "cool" behavior may find other emotionally malleable and previously customer-friendly staffers adopting some of the same mannerisms.

Employers who hire minors also need to recognize that, as Bess Ritter May wrote in *Supervision*, "adolescence is a transitional period. Those who are in this age group are forming their personalities and identities." This sometimes awkward period of development will likely manifest itself in all phases of the teenager's life, including work. But while employers may experience some frustration dealing with teenagers who are buffeted by school, societal, and peer pressures, they can take comfort in the fact "that it's easy to train these kids since they have little or no prior work experience and have consequently acquired little or no work-related bad habits," wrote May. "Most intelligent youngsters can also be instructed quickly concerning specific business systems and procedures, pick up and remember new things easily and have few or no preconceived ideas concerning how specific workplace tasks should be handled. Such aptitudes have surprised and astonished many supervisors." Observers also note that younger people often have considerable aptitude for office work that is done on computers, since a much greater emphasis is placed on that area in today's school environment.

Minor employees may require closer supervision than other employees. Often, they are unfamiliar with various facets of the workplace, and they may be so intimidated that they will be reluctant to ask questions about issues or tasks that they do not fully understand. Employers should anticipate this and do two things: first, fully explain projects and tasks, and second, maintain a work environment that is clearly receptive to questions. In addition, employers should adopt a firm, positive, and constructive manner in various areas of training. This includes communication that may be necessary to correct errors. Adopting a tactful, reasonable, but firm approach in such instances is important, wrote May, because "adolescents who are starting out on their first or second jobs are often more sensitive to corrections concerning their work by those who are older and (presumably) wiser. Such youngsters do not always understand that it is only their skills that are being faulted and not their innate characters and consequently are often very defensive."

Finally, employers should at all times remain cognizant of the importance of adhering to state and federal laws. "Conduct periodic check-ups of your compliance with child labor law," Slutsky counseled business owners. "Be sure to keep your managers up to date on the child labor issue. Make sure they are not hiring new employees without obtaining proper age documentation, and then key them into which employers are minors and what type of job duties they may perform. After all, it won't do your company much good if you are well-versed in the laws, but the managers who directly oversee workers are unaware of the requirements." In addition, small-business experts recommend that owners (or knowledgeable managers) establish a regular practice of reviewing underage employees' schedules to try and prevent violations.

EMPLOYMENT PRACTICES LIABILITY INSURANCE

Employment practices liability (EPL) insurance is a type of coverage that protects businesses from the financial consequences associated with a variety of employment-related lawsuits. EPL may cover lawsuits involving a company's directors and officers, negligence lawsuits affecting a company's human resources department, and liability lawsuits over fiduciary duty. EPL can also protect against charges of racial or age discrimination, sexual harassment, wrongful termination, or noncompliance with the Americans with Disabilities Act. Finally, EPL insurance can help protect businesses against legal conflicts that flare up between employees and third parties, such as vendors or customers, if a third-party coverage endorsement is secured as part of the EPL policy.

The market for EPL insurance coverage began to expand with large companies in 1991 and grew rapidly as employment-related lawsuits exploded in the wake of the passage of two important pieces of legislation: the Americans with Disabilities Act (ADA) of 1990 and the Civil Rights Act of 1991. As reported by Barbara Bowers in *Best's Review*, in the period from 1999 to 2003 employees brought more than 403,000 charges under all laws with the Equal Employment Opportunity Commission (EEOC). In 2008 alone, more than 95,402 charges were brought under various EEOC protection legislation, including the Title VII prohibitions against discrimination, the ADA protections against discrimination, and the Equal Pay Act. The number of suits filed in 2008 rose 6 percent, showing a turnaround in the gradual decline of employment litigation that had been occurring between 2004 and 2008. In general, EEOC claims cost employers around $40 million dollars annually. A wave of job losses related to the 2008 and 2009 economic recession has contributed to a rise in litigation related to wrongful termination that many employers are concerned about.

While the average award for claims against small businesses is fairly low, between $20,000 and $40,000, this can still do significant damage to a small firm's bottom line. Insurance costs are also high: EPL insurance pricing is usually built on a formula based on employment size, with, for example, $400 premium per employee for the first fifty and then lesser additional amounts for larger groupings. A minimum annual premium of $1,000 is common.

Obviously the small-business owner must weigh risks and costs very carefully. Standard liability insurance policies do not provide adequate coverage for employment-related risks. If such risks are high, buying EPL insurance may be a reasonable expenditure. The life savings of the small-business owner are often tied up in the company and may have to be protected.

But EPL insurance policies should be studied carefully before reaching a decision. Policies vary wildly, both in terms of price and breadth of coverage. "The problem is exacerbated by the difficulty of quantifying the risk-management value of particular policy provisions," wrote Stephen J. Weiss in *Directors and Boards*. "For comparative valuation purposes, how do you properly account for the fact that [one policy] covers six employment practices violations, and has six exclusions and restrictive definitions, whereas [another policy] covers fifteen employment practices violations but has fifteen exclusions and restrictive definitions?"

In order to secure the EPL coverage that best fits the business, analysts counsel owners and executives to heed the following basic considerations:

Negotiate to build a policy that offers comprehensive coverage. Small-business owners should select a reasonably priced policy, then make appropriate modifications. This is standard operating practice for insurers, and it can help ensure that the company is not left vulnerable to gaps in coverage. For instance, Weiss noted that "virtually all policies cover traditional wrongful employment practices such as harassment, discrimination, and wrongful termination of employment. However, employment practices law is rapidly evolving and the definition of

'wrongful act' in many policies has not kept pace with the creation or popularization of additional causes of action [such as] claims alleging 'negligent hiring, training, and supervision.'" Weiss also observed that many standard EPL policies expressly disclaim coverage for punitive damages. But he added that determined business owners can often negotiate shortfalls in either wrongful-act definitions or punitive damages coverage without the payment of additional premiums.

Negotiate for control of legal decisions when claims are filed. "Before you buy a policy, make sure what rights to retain counsel that it gives you," wrote Tim Bland in *Memphis Business Journal.* "Many policies give the insurance company the right to designate counsel of its own choosing.... [In such cases] more often than not it will focus more on the costs of the attorney, rather than the quality of representation the attorney provides." He also noted that some EPL policies require that the company consent to financial settlements that are approved by the insurer or forfeit their coverage. As a result, "your right to influence the selection of defense counsel and defense strategy should be clearly set forth in the policy."

Examine losses covered under the policy. The majority of employment practices business insurance policies provide coverage of back pay, lost benefits, and legal fees. However, front pay, fines, penalties, punitive damages, and cost of accommodations and travel are often not covered. "Look carefully at what types of losses are covered," counseled Bland. "A policy that looks cheap on the front end may end up costing dearly if it does not cover all losses you could face in a lawsuit."

Another possible option for small businesses in need of EPL insurance is a Business Opportunity Plan (BOP). A BOP provides basic property coverage for computers and other office equipment, plus liability protection for work-related accidents. In some cases, a BOP might also include business interruption coverage that will maintain the company's income stream for up to a year if a catastrophe disrupts business. Many BOPs also offer optional coverage against power failures and mechanical breakdowns, liability for workplace practices (including discrimination, sexual harassment, and compliance with the Americans with Disabilities Act), professional liability, and other risks.

EMPOWERMENT ZONES

Empowerment zones (EZs) are economically distressed communities designated by government for aid. The aid is intended primarily to lift the communities out of poverty by stimulating business enterprise and creating jobs. "Empowerment" is thus a somewhat euphemistic or hopeful term. The chief characteristic of targeted communities is poverty. Most of the actual dollars earmarked for empowerment zones are intended to be spent on infrastructure development. Support for business is indirect and takes the form of tax credits. To be sure, a business has to be doing well enough to *owe* taxes before credits are meaningful. Tax benefits are governed by complex rules that specifically identify classes of employees (they must be poor), types of property (they must be "qualified under the poverty rate criteria"), and types of equipment (they must be *on* qualifying property). From the viewpoint of the communities themselves, a major motive for being designated an EZ was eligibility for up to $40 million in outright grants. Empowerment zones are designated as rural or urban; rural programs are administered by the U.S. Department of Agriculture (USDA) and the urban programs are run by the U.S. Department of Housing and Urban Development (HUD). EZs were created by the Empowerment Zones and Enterprise Communities Act of 1993. Many EZ

program benefits afforded by both the USDA and HUD expired at the end of 2009.

HISTORICAL BACKGROUND

Government initiatives to reduce poverty by tax incentives to business have a long history. The first EZ arose in the United Kingdom. In 1978, Sir Geoffrey Howe, a senior Conservative member of the British Parliament, announced plans for "enterprise zones" to help improve economic conditions in the dock districts of London. After the Conservative Party took power in 1979 under prime minister Margaret Thatcher, the British government created the first enterprise zones in 1981. The system implemented in the United Kingdom reduced government restrictions in order to encourage the formation of new businesses in impoverished areas. It met with limited success, however, because it did not fund infrastructure upgrades in urban areas later found to be necessary for new businesses to succeed.

The first enterprise zone legislation in the United States was passed in 1987 as Title VII of the Housing and Community Development Act. The act did not offer tax incentives but was intended to relax federal regulations and to coordinate the efforts of existing programs in the designated zones. HUD received applications from 270 distressed communities for assistance under the program, but political maneuvering prevented the designation of any enterprise zones during the 1980s.

The Empowerment Zones and Enterprise Communities Act, passed by Congress in 1993, corrected for some of deficiencies of the U.K. experience and the U.S. experience under Title VII: it was designed to provide incentives to business through the tax code, provide bonding authority for infrastructure development, and offered distressed communities an attractive grant program. The act is frequently referred to as EZ/EC.

THREE ROUNDS

Developments under EZ/EC (and modifying legislation passed since 1993) are classified by the term "rounds" because three rounds of national competition have taken place in which communities vied for EZ/EC designation. The first took place in 1994, the second in 1998, the third in 2001. Benefits offered empowerment zones changed slightly between Round I and Round II and again between Round II and III, the last changes in part due to the provisions of new legislation, the Community Renewal and New Markets Initiative of 2000. The provisions of all three rounds ended on December 31, 2009. Although some expected the federal government to expand the program especially after the Economic Stimulus Act of 2008 increased the investment and expensing limits for EZ and RC zones the EZ program was largely allowed to lapse in 2009 and no attempt was made to renew the program or establish new EZs in early 2010.

While most rural and urban EZ/EC programs expired on December 31, 2009, the HUD program continued to allow Work Opportunity Tax Credits (WOTC) for workers hired through September 2011. The WOTC offers a $2400 tax credit for the first year of employment for younger new employees hired in EZ zones.

Two investment incentives were also allowed to continue in the HUD EZ program after 2009; one of these was the Partial Gross Income Exclusion of Capital Gains. This program allows private investors to avoid capital gains taxes on part of qualifying small business stock. To qualify, investors could not be a corporation and had to hold qualifying stock from specific small businesses in EZ zones other than District of Columbia EZ zones. The investors also had to have held the stock for over 5 years. Stock bought through the year 2014 qualified for this benefit. As well, the HUD EZ program Qualified Zone Academy Bonds incentive did not lapse after 2009. This incentive allows local and state governments to issue no-interest bonds in order to fund public education.

PROGRAM RESULTS

The aims of the program were to bring in private enterprise to disadvantaged areas, with the government acting as a partner for private investment. Administrators hoped that empowerment zones would stimulate jobs, business growth, business expansion, private investment, building, and homeownership in designated areas. It was hoped that by making specific areas empowerment zones, these areas would stabilize. The HUD claimed that 480,000 new jobs were created in EZ/RC zones between 2007 and 2008, creating $2 billion worth in employment credits, thanks to the EZ program.

According to Michael B. Katz in his 2008 book, *The Price of Citizenship: Redefining the American Welfare State*, the actual success of the EZ program may not have matched its lofty goals. According to Katz, an audit of four EZs by the U.S. Office of the Inspector General revealed that all four showed signs of problems and slower economic growth than was expected. Critics of the EZ program noted that political conflict and poor organization created limited real benefits for EZ program participants. According to Katz and others, the problem with the EZ program is that it misdiagnosed the problems of certain communities. The EZ program assumed that more economic benefits would profit all disadvantaged areas, instead of tackling issues such as poverty concentration and discrimination, two issues often central to the economic outcomes of disenfranchised areas.

ENDORSEMENTS AND TESTIMONIALS

On the presumption that people are more likely to buy products other people people they know have already bought and liked, marketers the world over have used endorsements and testimonials to promote their products. People know celebrities and endow them with greater wisdom; how, after all, could someone become a celebrity and rich beyond the wildest dreams unless they were brighter, smarter, and more savvy? People also live vicariously through the lives of the famous and wish to do as they do. Thus at least runs the marketing script. Therefore endorsements are associated with well-known figures. People also respect what their neighbors are saying (at least some of their neighbors). Testimonials are made by ordinary people, but advertisers chose such ordinary people because they resemble the "typical" neighbor, the "typical" sports fan, the "typical" purchaser of a riding mower. A hybrid between celebrity and trusted source is the "doctor" endorsement using actual doctors or figures in white coats.

Is all this true? And does it work? Very substantial sums of money have been and continue to be expended to see if advertising works in general and also on testing how it works in particular cases. Proving the effectiveness of advertising remains more art than science and produces results similar to polling. It is certainly true that celebrities draw the attention of people watching TV, listening to the radio, and leafing through papers and magazines. It is certainly true that doctors, and experts in general, are held in high regard. It is also a matter of observation that in practice undecided buyers will tend to poll family, friends, and neighbors which supports the effectiveness of testimonial-style advertising.

TYPES OF ENDORSEMENT

There are several different types of endorsement, including those by celebrities, experts, consumers, and organizations.

Celebrity Endorsements. Celebrities chosen to endorse products are almost always in some way linked to the product or service being sold. Famous male sports figures will *not* be endorsing facial creams; they will be selling athletic shoes or clothing. People unfamiliar with a product category (e.g., snowmobiles) may have difficulty even recognizing the celebrities chosen to promote it but insiders will know exactly who the celebrity is. For this reason, celebrity endorsement is not restricted solely to multimillion dollar ad campaigns but may be utilized by a small business in a local market featuring, for example, a well-known local TV host or the regional winner of a beauty contest. The crucial element is that the targeted audience should recognize the celebrity and trust her or his endorsement. As *Marketing Week* pointed out, advertisers benefit if the endorsement is genuine. Thus it is better to recruit a celebrity already known to use a product than simply to pay a famous face for mouthing some vaguely favorable opinion. Based on federal law, endorsements must be genuine.

Under new FTC guidelines published in 2009, celebrities as well as advertisers are liable for any comments made as part of testimonials or endorsements. Celebrities are therefore held accountable for any misleading comments they may make as part of a testimonial. As well, since 2009 the FTC expects celebrities to disclose their relationship to advertisers when making endorsement- or testimonial-related comments on television, social media, or other contexts outside of traditional advertisements.

Expert Endorsement. The expert doing the endorsement should *be* an expert. Furthermore the expert must also have evaluated the product or service using appropriate techniques; he or she must be qualified in the relevant area. A surgeon is not by definition an expert on pharmacology. The endorsement should be backed up by tests, evaluations, and product comparisons. Many advertisements attempt to create an "air" of expertise in the presentation of a fictitious expert, but close examination

will show that the ad does not meet the requirements of an expert presentation.

Consumer Endorsements. These endorsements feature actual users of the product or service being sold. Advertising utilizing customer testimonials must reflect the typical experiences of customers and the genuine feelings and findings of the consumer being highlighted as further developed below. Changes made in 2009 to the FTC's Guides Concerning the Use of Endorsements and Testimonials in Advertising require that testimonials from customers used in advertisements clearly indicate what typical results can be expected from a product or service. Earlier FTC guidelines allowed advertisers to feature customers with atypical results as long as the advertisement included fine print indicating that such results might not be typical.

Organizational Endorsements. Endorsements from organizations must reflect the consensus of the organization, and must comply with that organization's standards of formal endorsement. In addition, the organization in question has to be independent (rather than one created wholly or partially for the purpose of promoting the advertising firm's products or services).

LEGAL RESTRICTIONS ON USE

Numerous federal and state laws prohibit advertising that misleads or deceives consumers. The Federal Trade Commission (FTC) is the primary law enforcement agency in the United States in this regard. Its powers range from issuing "cease and desist" orders in cases where "unfair or deceptive acts or practices in commerce" are found to arguing cases in various courts of law (these courts can hand down massive fines and other penalties to violators of endorsement restrictions).

The FTC offers several general considerations on endorsement/testimonial use. For example, it states that "Endorsements must reflect the honest opinions, findings, beliefs, or experience of the endorser. Furthermore, an endorsement may not convey any express or implied representation that would be deceptive if made directly by the advertiser." The agency also stipulates that while the endorsement message does not have to contain the exact phraseology used by the endorser, " the endorsement may not be presented out of context or reworded so as to distort in any way the endorser's opinion or experience with the product. An advertiser may use an endorsement of an expert or celebrity only so long as it has good reason to believe that the endorser continues to subscribe to the views presented." With this in mind, the FTC urges businesses to fulfill this obligation periodically and whenever a change in the product or service's function, performance, or material composition is made.

According to the FTC, advertisers also may not state that the endorser uses the product or service being marketed unless the endorser was in fact a user at the time the endorsement was made. "Additionally," states the agency, "the advertiser may continue to run the advertisement only so long as he has good reason to believe that the endorser remains a bona fide user of the product."

The FTC provides particularly strong protections to ordinary consumers utilized in advertising campaigns. Key stipulations of this type of endorsement include: 1) the consumer endorsement should be representative "of what consumers will generally achieve with the advertised product in actual, albeit variable, conditions of use"; and 2) consumer endorsements should be clearly marked as such.

Finally, the FTC requires full disclosure of "material" connections. Under these rules, advertisers must disclose all compensation being paid to endorsers, and must divulge any potentially compromising relationships between themselves and the endorser (for example, family or employee relationships). "When there exists a connection between the endorser and the seller of the advertised product which might materially affect the weight or credibility of the endorsement"

In December 2009, the FTC announced new changes and updates to existing policies regarding testimonies and endorsements. The new rules were especially designed to address social media and online media, including blogs, social networking sites such as Twitter, Web sites, and other media not as prevalent when FTC guidelines were first established. Many experts have been concerned that citizens including individuals who are not well-versed in advertising ethics and FTC guidelines are often advertising online. These new publishers may be eager to rely on expert testimony but the very nature of some new online media makes transparency more challenging. It is simple for blog writers to assert that a celebrity or expert endorses their product, but determining exact relationships between product, writer, and endorser is often challenging.

As a result, the FTC instituted a number of new rules regarding testimonials and endorsements in new media. Chief among these is a new policy which requires the relationship between the advertiser and endorser to be clearly indicated. If bloggers or other writers in social media receive free products or money from advertisers or product manufacturers, the FTC requires that these relationships be disclosed to readers. These new rules may especially impact small businesses, which tend to rely heavily on social networking and new media to advertise. In fact, one reason the FTC addressed testimonials and endorsements in social networking and new media is because this form of marketing is more popular. According

to the Word of Mouth Marketing Association, companies spent $1.35 billion on social media marketing in 2007, and that figure is likely to grow throughout the 2010s.

In 2009 the FTC also updated its rules regarding testimonials and endorsements in more traditional advertising and media. Under new 2009 FTC guidelines, for example, no paid endorsements may make misleading or false claims. Also, if a company sponsors a research study or pays a research company to conduct research on its behalf and then uses the results of that research in an advertisement as expert testimonials, the ad must show the true connection between the company and the (paid) research.

IMPLEMENTING EFFECTIVE ENDORSEMENTS AND TESTIMONIALS

In addition to adhering to existing laws and regulations governing use of endorsements and testimonials for advertising purposes, business experts cite several other considerations that should be weighed by business owners. Some of these considerations are unique to specific types of endorsements (i.e., celebrity or consumer testimonials, which are the two types most frequently utilized), while others are common to all four types.

For example, celebrity testimonials while potentially valuable in attracting attention to a firm's products and services also have a higher risk factor. For example, media attention on celebrity athletes, singers, and other personalities can turn negative quickly. In these instances, products or services with which the celebrity is associated can be stained by implication. For this reason, companies include "opt-out" clauses in most contracts so that they can end a business relationship quickly and without penalty if the celebrity's reputation is compromised.

Moreover, some analysts question the value of celebrity endorsements in increasing public allegiance to a product or service, especially if the public figure in question is of limited stature (generally, the only type of celebrity whose endorsement is within the financial grasp of small and mid-size companies). They instead urge companies to consider customer testimonials, which are widely regarded as more honest and believable, and less expensive and time-consuming to create. "Testimonials given by satisfied customers are far, far more effective than testimonials given by celebrities because the customer-to-be knows the celebrity is paid for their endorsement," stated businessman Murray Raphel in *Direct Marketing*. "Testimonials are easy to find. They are live, in person and visit your place of business every day in person, on the phone, or through the mail, fax, or Internet."

Another element of consumer endorsements that needs to be addressed is assurance of legality. All types of endorsements need to be specified in written form. But unlike the celebrity, expert, or association forms of endorsement, in which contracts are expected to be long and detailed, customer testimonials are usually relatively short and simple release forms. "When we originally asked our lawyer for a 'release form' he gave us (literally) a five page single spaced document!," recalled Raphel. "That will scare any potential testimonial-giver, no matter how much they like you or your business." Small-business owners, then, are urged to obtain legal advice that will enable them to adopt and utilize short, easy-to-understand contracts that will not intimidate customers.

ENTERPRISE RESOURCE PLANNING (ERP)

Enterprise resource planning (ERP) is a method of using computer technology to link various functions, such as accounting, inventory control, and human resources, across an entire company. ERP is intended to facilitate information

sharing, business planning, and decision making on an enterprise-wide basis. ERP came into sharp visibility in the mid-1990s and is still enjoying a great deal of popularity. According to Ellen F. Monk and Bret J. Wagner, in their 2009 book, *Concepts in Enterprise Resource Planning*, the growing importance of ERP in business results from a paradigm shift. While previously businesses focused on separate business functions such as marketing or taking orders in 2008 and thereafter companies began to focus on business processes, or groups of company activities, that had a direct result on a customer's experience. ERP has become an important part of this paradigm shift, as it allows businesses to look at groups of activities or functions in a business in order to see how the interactions between these areas of business affect the company and the customer.

ERP HISTORY

Most early ERP systems consisted of mainframe computers and software programs that integrated the various smaller systems used in different parts of a company. Since the early ERP systems could cost up to $2 million and take as long as 4 years to implement, the main market for the systems was Fortune 1000 companies.

"Throughout the 1990s, most large industrial companies installed enterprise resource planning systems that is, massive computer applications allowing a business to manage all of its operations (finance, requirements planning, human resources, and order fulfillment) on the basis of a single, integrated set of corporate data," Dorien James and Malcolm L. Wolf wrote in *The McKinsey Quarterly*. "ERP promised huge improvements in efficiency for example, shorter intervals between orders and payments, lower back-office staff requirements, reduced inventory, and improved customer service. Encouraged by these possibilities, businesses around the world invested some $300 billion in ERP during the decade."

By the late 1990s sales of ERP systems began to slow. Some manufacturers had encountered implementation problems. However, other factors began to influence ERP systems both in design and deployment. Many companies developed close relationships with customers and suppliers and began conducting business over the Internet on a massive scale. Small PC-based networks became much faster, more flexible, and cheaper than mainframes. In 2006 *American Banker* magazine polled experts in banking who saw ERP as a new tool in business-to-business electronic commerce, with ERPs communicating with one another over the Web. After the slow recovery from the economic downturn of 2008 and 2009, ERP became even more closely associated with Web-based systems which have also lifted it into prominence again.

BENEFITS AND DRAWBACKS OF ERP

ERP is an attractive solution because it offers so many potential uses. For example, the same system can be used to forecast demand for a product, order the necessary raw materials, establish production schedules, track inventory, allocate costs, and project key financial measures. Another important benefit of ERP systems is that they allow companies to replace a tangle of complex computer applications with a single, integrated system.

ERP is also a useful monitoring tool for businesses, allowing companies to manage, oversee, and improve internal control systems and all aspects of a business. By increasing controls and integrating various aspects of a business in one platform, ERP can help companies increase efficiency, improve response rates to marketplace changes, and reduce costs. Because ERP systems are so integrated, they provide a "big picture" view of a company, so that leaders can analyze how accounting is affecting inventory, for example, and make changes. Most ERP systems also provide logs and reports, which allow companies to analyze all aspects of a business and ensure that a company complies with any requirements or legislation. For example, a 2009 study published in *Management Accounting Quarterly* showed how ERP systems were able to help companies comply with the Sarbanes-Oxley Act of 2002 (SOX), a piece of federal legislation designed to prevent accounting and corporate scandals.

Despite these potential benefits, however, ERP systems continue to extract a cost. Implementation requires substantial time commitments from the company's information technology (IT) department or outside professionals. In addition, because ERP systems affect most major departments in a company, they tend to create changes in many business processes. Putting ERP in place thus requires new procedures, employee training, and both managerial and technical support. As a result, many companies find the changeover to ERP a slow and painful process. Once the implementation phase is complete, some businesses have trouble quantifying the benefits they gained from ERP.

According to the study published in *Management Accounting Quarterly*, ERP has other potential drawbacks as well. Authors of the study note that since ERP narrows control of various aspects of a company to those few people with ERP system access or authorization, it can create the opportunity for fraud. Also, since ERP systems contain large amounts of data, businesses using ERP have a greater responsibility for ensuring that their systems comply with all relevant privacy guidelines. Privacy can be violated with ERP quite easily, since large amounts of information are stored in one place. The study's authors also noted that the ERP may permit incorrect business

decisions to be made. Again, integrating and combining unrelated business systems in one platform is not always advantageous.

ERP SOLUTIONS FOR SMALL BUSINESSES

As sales of ERP systems to large manufacturing companies began to slow, some vendors changed their focus to smaller companies. It is easy to see why a large company may need ERP solutions: they have many business functions, departments, and areas to integrate and manage, but small businesses can also benefit from ERP. Even the smallest one-person business still has many functions. Improving control, coordination, and efficiency of these functions can have an even more dramatic impact on a small business than on a large corporation, according to Monk and Wagner.

Of course, small and medium-sized companies as well as those involved in service rather than manufacturing industries have different resources, infrastructure, and needs than the large industrial corporations who provided the original market for ERP systems. Vendors had to create a new generation of ERP software that was easier to install, more manageable, required less implementation time, and entailed lower start-up costs. Many of these new systems were more modular, which allowed installation to proceed in smaller increments with less support from information technology professionals. Other small businesses elected to outsource their ERP needs to vendors. For a fixed amount of money, the vendor would supply the technology and the support staff needed to implement and maintain it. This option often proved easier and cheaper than buying and implementing a whole system, particularly when the software and technology seemed likely to become outdated within a few years. In 2008 major ERP vendors included SAP, Oracle, Microsoft Dynamics, and Sage Group. Marketing efforts of the leaders continued to be on large business clients and concentrated on automating manufacturing, distribution, human resources, and financial systems. But numerous smaller vendors are active in the market serving smaller business clients and focused on niche applications.

ERP AND THE INTERNET

ERP development often involves vendors making the software available to client companies on the Internet. Known as hosted ERP or Web-deployed ERP, this model has contributed to making ERP systems available to smaller businesses. When a company chooses to run its ERP systems through a Web-based host, the software is not purchased by or installed at the client company. Instead, it resides on the vendor's host computer, where clients access it through an Internet connection.This is sometimes known as Software as a Service, or SaaS.

Another trend in EPR solutions is increased functionality. Increasingly, ERP solutions are designed to manage and handle all business functions in one system, reducing the need for redundant information processing and information which is stored in more than one place. This has increased the speed and effectiveness of ERP while also reducing lag times. Increased functionality and the Internet have also made ERP solutions important for e-business. Many later ERP programs developed in 2008 and later allow companies to integrate and manage both online and physical stores and business functions.

ERP EXPANDS ALONG THE SUPPLY CHAIN

Traditional ERP systems were concerned with automating processes and connecting disparate information systems within a business enterprise. But during the late 1990s, an increasing number of businesses turned their focus outward, toward collaboration and forging technological links to other companies in the supply chain. "Increasingly, manufacturers in developed countries are becoming part of the design and production line of their customers," Richard Adhikari wrote in *Industry Week*. "Tight scheduling requires automating the supply chain and enterprise resource planning functions and implementing electronic communications links." ERP vendors have responded to this trend by integrating ERP systems with other types of applications, such as e-commerce, and even with the computer networks of suppliers and customers. These interconnected ERP systems are known as extended enterprise solutions. A key component of this is Supply Chain Management (SCM) software which has become standard with many ERP systems.

ERP systems have expanded to include several new functions. For example, application integration functions link ERP to other software systems that affect the supply chain. Visibility functions give companies an overview of inventory and its status as it moves through the supply chain. Supply chain planning software helps create optimal plans for producing and delivering goods. Similarly, Customer Relationship Management (CRM) software customizes the way that a supplier deals with each customer individually. In many cases, vendors package ERP and CRM in the same software. ERP has also been adapted to support e-commerce by facilitating order fulfillment and distribution, simplifying the process of electronic procurement, and tracking information about customers and their orders. Many ERP solutions developed in 2008 and later also include Customer Self-Service (CSS) Software, which allows customers to report problems or ask questions quickly and easily. In addition, many ERP

solutions include Sales Force Automation (SFA) Software, which automates many sales-related functions.

CHOOSING AN ERP VENDOR

In her article, "ERP: Is It the Ultimate Software Solution?" Constance Loizos outlined a series of factors for small businesses to consider in choosing an ERP vendor. For example, she emphasized that implementing an ERP system is a major information technology decision that requires time and resources, so companies should avoid choosing a vendor too quickly. Instead, she recommended that small businesses evaluate their needs carefully and come up with a list of business issues they expect the ERP system to help them address. Loizos also suggested that companies research potential ERP vendors thoroughly, looking at their reputations in the industry but also checking references and interviewing previous clients. She recommended avoiding multiple vendors if possible, and ensuring that the vendor chosen is appropriate for the small business's future growth and expansion plans. Finally, she noted that companies should ensure that project funding is in place before a contract is signed.

FACTORS IN A SUCCESSFUL ERP IMPLEMENTATION

Once a small business has decided to install an ERP system and selected a vendor, there are a number of steps the company can take to ensure a successful implementation. In his article, "ERP Goes Mid-Market," Gary Forger noted that the ERP implementation is more likely to succeed if the company positions it as a strategic business issue and integrates it with a process redesign effort. Of course, the ERP system should fit the company's overall strategy and help it serve its customers. It may also be helpful to find a passionate leader for the project and select a dedicated, cross-functional project team. The small-business owner should make certain that these individuals have the power to make decisions about the ERP implementation process.

Forger recommended that companies attack the implementation project in short, focused stages, working backward from targeted deadlines to create a sense of urgency. It may be helpful to begin with the most basic systems and then expand to other functional areas. Forger also suggested using change management techniques to manage the human dimension of the project, since ERP requires a great deal of support from affected areas of the company. Finally, he emphasized that once the ERP system is in place, companies need to interpret the data collected carefully and accurately if the system is to contribute to business planning.

ENTREPRENEURSHIP

Entrepreneurship is the vocation of an entrepreneur, or someone who assumes the risk and management of a business or enterprise. Entrepreneurship is valued in American culture and has therefore come to be applied to all manner of business activities, including situations in very large corporations where the managers are not genuinely at risk but develop new ideas within an existing framework.

Academic students of the entrepreneurial phenomenon have emphasized different aspects of behavior in business. Josef Schumpeter (1883 1950), the Austrian economist, associated entrepreneurship with *innovation*.

Arthur Cole (1889 1980), Schumpeter's colleague at Harvard, associated entrepreneurship with purposeful activity and the creation of *organizations.* The management guru Peter Drucker (1909 2005) defined entrepreneurship as a *discipline.* "Most of what you hear about entrepreneurship is all wrong," Drucker wrote in *Innovation and Entrepreneurship* (1985). "It's not magic; it's not mysterious; and it has nothing to do with genes. It's a discipline and, like any discipline, it can be learned." Drucker argued that entrepreneurship extends to all types of organizations.

The academic approach to this subject has tended to be analytical in order to generate laws of business. One of Cole's intentions, for example, was to integrate the entrepreneurial phenomenon into a general theory of economics; thus he spoke of it as one of several production factors. In an essay in *Journal of Economic History* in 1953, he wrote, "Entrepreneurship may be defined in simplest terms as the utilization of one productive factor of the other productive factors for the creation of economic goods." Much of Drucker's work related to management, particularly the management of large organizations; not surprisingly, he saw entrepreneurship in terms of a methodology of management.

The actual entrepreneurial experience somewhat demystifies the concept: entrepreneurs often stumble across opportunities, follow peculiar interests, or make something useful because they cannot find it elsewhere. History also highlights intangible aspects of the entrepreneurial personality: such individuals tend to be open-minded, curious, inquisitive, innovative, persistent, and energetic by temperament, thus showing many of the characteristics highlighted by the academics. However, the notion that entrepreneurs are risk-takers is not confirmed: rather, entrepreneurs are risk-averse but good at minimizing risk.

Paul Hawken, in *Growing A Business*, wrote: "Entrepreneurial change depends on static situations, and these are provided in abundance by government, large corporations, and other institutions, including educational ones. We need both entrepreneurial and institutional behavior. Each feeds on the other. The role of the former is to foment change. The role of the latter is to test that change." The distinction will ring true to anyone engaged in small business, especially those who have taken it up after working in a large organization. Change is difficult inside large, bureaucratic structures; it is easier to accomplish in a small firm. In the beginning, no committees need to make an input and no chain of command needs to be followed.

OPPORTUNITY RECOGNITION

Opportunity recognition refers to locating an entry point in a market where a successful business can be established. This is one of the first steps that an entrepreneur takes when beginning a venture, and one of the most important. Some may mistake opportunity recognition for innovation or new ideas, but the two are different. It is difficult to start a business based solely on a new idea. Consumers need to be found who are willing to pay for the new idea, and a place in the market needs to be available so that the idea can be turned into a product or service at a low enough cost to eventually create a profit. Opportunity recognition consists of seeking out these consumers and market niches.

Good opportunity recognition comes from a combination of alertness and business sense. A successful entrepreneur will find a need that is not being provided for, a group of people that a particular service has not yet reached, or a product that has not been marketed to a particular group. Technology has been a traditionally fertile industry for opportunity recognition. Apple created the iPod to fill a need for MP3 players that were both portable and stylish. The lithium-ion battery made modern electronic devices possible by finding a niche for long-lasting, compact batteries that had superior recharge capabilities to older nickel-cadmium batteries. A skilled entrepreneur, however, can find opportunities in existing markets without depending on technological inventions.

RAISING CAPITAL

Another vital step in entrepreneurship is resource acquisition. This refers to acquiring a business location and any required hardware or supplies, but most resource acquisition is centered around raising capital to fund the assets of the business. Most entrepreneurs do this through credit, taking out a variety of business and venture-oriented loans.

Small-business entrepreneurs can often seek microloans, or loans around $50,000 dollars or less, from certain lenders, especially if they have failed in obtaining a loan from a larger lender. Others use eligible receivables to receive an asset-based loan from banks, conditional on payments from customers. Smaller loans can often be obtained online at such sites as prosper.com or lendingclub.com, where small lenders gather to offer loans with short duration (1 to 3 years, usually), usually no more than $25,000.

Capital raised from loans depends largely on a bank's willingness to support an entrepreneurial endeavor. Loans backed by the Small Business Administration have a much better chance of working out, but the SBA is restricted by frequent changes in business legislation.

Other entrepreneurs prefer to raise the money themselves to finance assets such as property and supplies. This is easier for a career entrepreneur who can channel funds from one business venture into another. Others may prefer to start a more established and traditional business to raise money before switching to a different focus or market.

POPULAR ENTREPRENEURIAL TRENDS FOR SMALL BUSINESSES

When looking for opportunities and consumers, entrepreneurs should keep an eye on developing trends in business, a good sign of how easy it will be to enter a particular market. Watching new legislation can also help. Due to government incentives, eco-friendly services and products have become popular in the early 2010s. Trends in banking and lending have led to a rise in small-time lender businesses, which are expected to grow throughout the decade as well.

As the baby boomer generation ages and others join them in retirement, many entrepreneurs are beginning to invest in products and services aimed at seniors, from technology assistance to dating services. Others are watching educational trends and noting increases in retraining and applications for new degrees, which is opening the market for education programs and education assistance businesses.

Other types of businesses tend to be successful over the long term. Focusing on local goods and products is often easier for entrepreneurs and can lead to successful businesses development. Discount retail companies are often popular and easier to start than full price independent stores, and trends in health and wellness have also improved chances for health food and supplement entrepreneurs.

THE ENTREPRENEURIAL PERSONALITY

Scholars, psychologists, analysts, and writers continue to define that elusive something called the "entrepreneurial" personality, but while the results usually include some of the same words (creative, innovative, committed, talented, knowledgeable, self-confident, lucky, persistent, and others), actual entrepreneurs (like actual artists, scientists, discoverers, and leaders in every walk of life) come in a bewildering variety.

When preparing to start an entrepreneurial venture, business owners or business starters should make sure they have the qualities that entrepreneurs need to succeed. Entrepreneurs have excellent motivation and a passion for what they are doing that drives them to win in their market. Without this motivation it is difficult to finish an entrepreneurial activity. Entrepreneurship is also defined by nonconformity: if the business owner is not being innovative or independent, he or she is not technically an entrepreneur. Entrepreneurship requires self-discipline, since most entrepreneurs need to set their own hours and make their own goals.

Entrepreneurs also need to be willing to work very hard, especially when first starting a venture. Those without a good work ethic, or without the ability to devote large amounts of time to the business, will probably not be able to manage an entrepreneurial venture successfully. Entrepreneurs also need to know how to save money, since frugality is one of the most important qualities for those involved in business start-ups. Costs can quickly escalate for new businesses, and saving money wherever possible can provide much-needed funds elsewhere.

ENVIRONMENTAL AUDIT

Environmental audits are reviews of a company's operations and processes to determine compliance with environmental regulations. Audits cover buildings and building sites; activities and procedures; industrial and commercial developments; and engineering hazard and operability studies. According to Barry F. McNeil and Brad D. Brian, in their 2007 book *Internal Corporate Investigations*, companies have become increasingly reliant on agencies for licensing and permits, and this has lead to an increase in internal environmental audits, since licensing agencies have the right to inspect businesses and often require documentation of environmental compliance.

Environmental audits can be costly, but failure to carry out such audits can have much more expensive, and sometimes prohibitively expensive, consequences. They are therefore undertaken when mandated by law or prudence. Two major types of audits are conducted: 1) site inspection related to buying and selling land; and 2) operational audits carried out either voluntarily in order to avoid or reduce penalties or because they are mandated under law. Environmental audits can be internal or can be conducted by outside consultants.

There are many issues which an environmental audit can address. Audits can address a company's disposal, storage, discharge, and other practices, and it can examine discharge and disposal equipment to check for any equipment or process flaws that may violate environmental standards. An environmental audit can also help ensure that employees are not exposed to harmful substances. This is crucial, since Occupational Safety and Health Administration (OSHA) guidelines are very strict on this issue, and any company exposing its workers to toxins may face considerable fines from the Environmental Protection Agency (EPA), as well as civil legal action. Environmental audits also help companies uncover any illegal dumping or other environmental violations carried out by unscrupulous employees. This is vital, especially in larger companies, since the company as a whole is liable, even if only one dishonest employee was violating environmental laws. Finally, environmental audits can help a company gather the documentation it needs to satisfy permit- and license-granting agencies.

SUPERFUND ESAS

Small-business owners are most likely to encounter environmental audits in the context of real estate transactions. In December 1980 Congress passed the Comprehensive Environmental Response Cleanup and Liability Act (CERCLA), better known to the general public as the Superfund program. Superfund legislation is aimed at controlling and cleaning up sites contaminated with hazardous wastes and to pin the costs of clean-up on those who contaminated or own the site. Essentially, if a site is found to be contaminated, the landowner or operator (and other parties connected to the property) are responsible for environmental cleanup costs. This liability extends to the owner/operator even if the site was contaminated by *previous* owner/operators and, in most cases, even if the current owner/operator was unaware of the contamination.

In 2008 the EPA published an "Interim Approach to Applying the Audit Policy to New Owners," designed to help new business owners complete an environmental audit on their properties and deal with any violations present before they acquired a property. The EPA report was designed to encourage new property owners to run an audit and self-report any noncompliance issues. The policies toward new owners of a business allowed them to report noncompliance issuing from a previous owner and face no penalties for noncompliance of the past business owners. This allowed new business owners to discover, report, and correct any noncompliance issues without fear of penalties.

Many permit violations relating to environmental matters are held as misdemeanors or civil violations, opening a company to strict liability or civil suits and penalties. Federal regulations permit penalties of up to $33,500 per environmental violation. Multiple violations can easily result in penalties in the millions of dollars.

Not surprisingly, owners of land wishing to sell it, potential buyers doing "due diligence" before buying a site, and lenders standing by to finance such deals have spent or have caused to be spent substantial amounts of money on environmental site assessments (ESAs). These are performed by environmental auditing companies (frequently small businesses); an ESA can ensure that a property is "clean." ESAs come in a modest and expensive versions known respectively as Phase I and Phase II. Phase I audits are based on documentation about the site's history to determine if it was ever used for manufacturing or waste storage. If not, good. If yes, Phase II. Phase II is expensive because it may involve actual soil and groundwater testing. Phase I audits begin at around $1,000 but may cost more if the property is large; Phase II audits begin at around $8,000 and go up from there.

SELF POLICING AUDITS

The U.S. Environmental Protection Agency (EPA) has been operating a program under which regulated entities (companies and other institutions) voluntarily monitor their own compliance with environmental regulations and, if they find themselves in violation, report such breaches to the EPA. The EPA calls this program *Self-Policing: Discovery, Disclosure, Correction and Prevention of Violations.*. The policy is often referred to as the Audit Policy. Regulations governing this program were issued

by EPA in 1996 and then in revised format in April 2000. Between 2000 and 2007, the EPA dealt with violations involving nearly 10,000 facilities and 3,500 businesses.

The fundamental logic underlying self-policing is that it costs the agency much less money than ferreting out offenders, proving that violations have occurred (which may require extensive sampling and testing protocols), and litigating cases in the courts. To achieve this cost and potential environmental benefit, EPA policy offers the regulated community special incentives to self-police: self-policing entities avoid substantial penalties for violations that they report; EPA foregoes referral of such volunteers for criminal prosecution; and EPA refrains from asking for audit reports from the entity to which it has a right under law.

Penalties assessed by EPA under environmental laws include two components. The first is the economic gain the company achieves by *not* controlling its pollution; the second component is based on the gravity of the offense, such as the amount of spillage or air emissions and the toxicity of the chemicals permitted illegally to escape. Under self-policing, all penalties based on "gravity" are cancelled if the polluter complied with all of EPA's rules in carrying out its audit. If the polluter complied with the rules but failed to have in place a systematic method of detecting violations, 75 percent of gravity-based penalties are forgiven. Penalties based on "economic gain" continue to apply.

To avoid penalties, the entity must meet nine conditions reproduced from EPA regulations as follows:

- **Systematic discovery** of the violation through an environmental audit or the implementation of a compliance management system.
- **Voluntary discovery** of the violation was not detected as a result of a legally required monitoring, sampling or auditing procedure.
- **Prompt disclosure** in writing to EPA within 21 days of discovery or such shorter time as may be required by law. Discovery occurs when any officer, director, employee or agent of the facility has an objectively reasonable basis for believing that a violation has or may have occurred.
- **Independent discovery and disclosure** before EPA or another regulator would likely have identified the violation through its own investigation or based on information provided by a third-party.
- **Correction and remediation** within 60 calendar days, in most cases, from the date of discovery.
- **Prevent recurrence** of the violation.
- **Repeat violations** are ineligible, that is, the specific (or closely related) violations have occurred at the same facility within the past 3 years or those that have occurred as part of a pattern at multiple facilities owned or operated by the same entity within the past 5 years; if the facility has been newly acquired, the existence of a violation prior to acquisition does not trigger the repeat violations exclusion.
- **Certain types of violations** are ineligible, such as those that result in serious actual harm, those that may have presented an imminent and substantial endangerment, and those that violate the specific terms of an administrative or judicial order or consent agreement.
- **Cooperation** by the disclosing entity is required.

EXISTING AUDIT AND DISCLOSURE REQUIREMENTS

Many corporate studies on environmental and safety issues, whether conducted internally (by employees) or externally (by outside consultants/experts under contract), must be disclosed to appropriate government agencies and the general public. For instance, companies are required to submit permit applications, emission reports, and other information to government agencies under the Clean Air Act, the Clean Water Act, and other environmental laws. The Federal Community Right to Know Act is another law that places specific obligations on companies. Under this law, firms are obliged to disclose the size, nature, and identity of storage and releases of toxic substances. In late 2009 the EPA released the Clean Water Act (CWA) Enforcement Action Plan, which strengthened penalties for environmental violations and made public access to company environmental data somewhat easier. The plan was released, in part, in response to worries about low enforcement rates for environmental violations.

Companies also often engage in a wide array of other environmental and safety evaluations to assess cost and level of compliance. The practice of voluntarily checking compliance with environmental regulations through the practice of self-auditing has garnered considerable support from state lawmakers as well. Environmental self-audits receive significant legal protections. In many states, companies can report violations and self-audit in exchange for lower sanctions. The body of law in these states maintains that companies can voluntarily test for violations and correct all previously undetected problems without legal penalty. Companies that report violations avoid financial penalties and receive additional time to rectify problems. Most significant of all, the results of self-audit tests and programs in these states receive significant legal protections from public disclosure.

Confidentiality privileges have been heavily criticized in some quarters. The Environmental Protection Agency (EPA), environmental groups, and other observers charge that environmental self-audit laws, when buttressed with secrecy protections, allow polluters to violate environmental statutes without suffering any adverse consequences. Detractors of secret audit privileges also contend that decreased visibility of environmental practices and decisions will produce increased "corner-cutting" in the realms of health and safety.

Supporters of increased audit secrecy privileges claim that increased confidentiality would actually encourage greater stewardship of the environment. Advocates say that if businesses do not have to publicly disclose information found in internal compliance studies which might otherwise be used as "roadmaps" by litigants in civil or criminal cases the company's owners and managers will be more likely to engage in thorough studies of their true level of compliance with environmental regulations. A 2008 study published in the *Journal of Law, Economics, and Organization* found that companies are more likely to disclose environmental violations if they are protected from severe punishment and if they had recently faced a penalty for such a violation.

ENVIRONMENTAL LAW AND BUSINESS

Environmental laws in the United States protect air and water resources and control certain aspects of land-use as well, particularly disposal of wastes on land. Basic laws are federal but many states have laws of their own, often more stringent than that of the federal law. Laws on the books also control the environment in the workplace and noise levels caused by machinery, especially aircraft. Regulations on food purity and the safety of drugs frequently have environmental aspects. And the management of radiating substances is also within the compress of "environmental law." The chief regulatory agencies are the U.S. Environmental Protection Agency (EPA) and the Nuclear Regulatory Commission (NRC), but some thirteen other agencies are directly and yet others indirectly involved in enforcing laws. All states also have environmental agencies.

Environmental law in its current form developed in the 1960s and culminated in the passage of the National Environmental Policy Act of 1969. The following major pieces of legislation entirely or partially administered by EPA as well as the NRC constitute the corpus of environmental law as shown below:

EPA-administered laws are the following:

- Federal Food, Drug, and Cosmetic Act (FFDCA), 1938, amended through 2007
- The Freedom of Information Act (FOIA), 1966, amended through 2007.
- National Environmental Policy Act of 1969 (NEPA). Basic environmental law.
- The Clean Air Act (CAA), 1970, amended through 2009.
- The Occupational Safety and Health Act (OSHA), 1970, amended through 2007.
- Federal Insecticide, Fungicide and Rodenticide Act (FIFRA), 1972, amended through 1996.
- The Endangered Species Act (ESA), 1973, amended through 1996.

- The Safe Drinking Water Act (SDWA), 1974, amended through 1996.
- The Resource Conservation and Recovery Act (RCRA), 1976, amended through 1984.
- The Toxic Substances Control Act (TSCA), 1976, under review for amendment as of 2010.
- The Clean Water Act (CWA), 1977, amended through 1987.
- Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund), 1980, amended through 1986 (by the Superfund Amendments and Reauthorization Act (SARA). Deals with hazardous waste sites.
- The Emergency Planning & Community Right-To-Know Act (EPCRA), 1986, amended through 2009.
- The Superfund Amendments and Reauthorization Act (SARA), 1986.
- The Pollution Prevention Act (PPA), 1990.
- The Oil Pollution Act of 1990.
- Food Quality Protection Act (FQPA), 1996.
- Chemical Safety Information, Site Security and Fuels Regulatory Relief Act, 1999. Amends the Clean Air Act.

NCR administered laws:

- Atomic Energy Act of 1954, as amended. Basic law on nuclear energy.
- Energy Reorganization Act of 1974.
- Uranium Mill Tailings Radiation Control Act of 1978.
- Nuclear Waste Policy Act of 1982.
- Low-Level Radioactive Waste Policy Amendments Act of 1985.

Other major agencies involved in the implementation of these laws include the following:

- Army Corps of Engineers Regulates construction projects on navigable waters; coordinates administration of Superfund cleanups; engages in construction projects to protect wildlife on shorelines and in navigable waters; and other projects.
- Consumer Product Safety Commission Charged with enforcement of various enabling acts designed to protect consumers, including responsibility for protecting consumers from toxic (hazardous) chemicals.
- Council on Environmental Quality (CEQ) Oversees compliance with the National Environmental Policy Act (NEPA) by agencies throughout federal government.
- Bureau of Land Management Manages federally owned lands, which total over 350 million acres, as well as the resources on those lands, including timber; oil, gas and minerals; rivers and lakes; plants, animals, and fish and their habitats.
- Federal Energy Regulatory Commission Regulates dams and hydroelectric power.
- Federal Maritime Commission Certifies that ships carrying oil and hazardous materials have the ability to cover the cost of any spills.
- Food and Drug Administration Charged with enforcement of statutes designed to protect the public from harmful food or drugs. Also works with the EPA to protect the public from hazards associated with pesticide residues in food.
- Mine Safety and Health Administration Regulates to protect the health and safety of workers in mines and to protect the public from hazards associated with mining.
- National Institute for Occupational Safety and Health (NIOSH) Under jurisdiction of the Centers for Disease Control (CDC), conducts research on the effects of toxic substances on humans, the results of which are used by OSHA, EPA, and other agencies.
- National Park Service Charged with managing the various parks that comprise the nation's national park system.
- Occupational Safety and Health Administration Regulates to protect the health and safety of workers within workplaces (excluding mining).
- U.S. Fish and Wildlife Service Manages the National Wildlife Refuge System.
- U.S. Forest Service Manages public forest resources for lumbering, mining, farming, grazing, and recreation.

CATEGORIZING LAWS

As the old Tom Lehrer song, "Pollution," put it: "If you visit American city,/You will find it very pretty./Just two things of which you must beware:/Don't drink the water and don't breathe the air." The song appeared in 1965 and was, in a way, background music to the development of environmental legislation. The verses, however, pinpoint the chief rationale behind most environmental legislation: it is to protect human health and welfare by keeping fundamental resources, like air and water, clean and usable.

Once basic legislation was in place, it came to be extended to preventing poisons reaching people indirectly through plant life and food species in toxic substances and hazardous waste legislation. Modern law goes further and also protects species endangered by human activity and regulates how industry must treat and restore land disturbed by such activities as mining. Many modern pieces of legislation also try to limit health effects caused by direct exposure to toxic substances. For example, laws regarding hazardous materials in the workplace were tightened considerably during the first decade of the twenty-first century.

Air and Water. Air and water pollution control legislation sets strict limits on what kinds of pollutants may be emitted to the environment in what concentrations over defined periods of time so that small amounts deemed permissible are emitted in small quantities ensuring mixing and dispersion. Emission laws result in emission standards, which may change over time. Economic pressures act at times to loosen the standards; public pressure acts to tighten them. Whatever the standard, enforcement activity may be energetic or lax, and the type of enforcement itself may be the result of policy. In addition to setting standards, the laws also specify technological means of treating effluent streams; the specifics of how to do that are elaborated in regulations. The regulations are detailed, down to specific chemicals and specific circumstances of emission. Since cities, as public bodies, are a large source of polluted water (sewage), federal law also provides financial grants to partially pay for the building of water and sewer treatment plants.

Control in these categories is based both on an administrative and a physical "process," the former requiring permits, monitoring, and periodic audits; the latter governing actual pollution control processing. Federal regulatory action in these two areas (as elsewhere) takes place through the publication of proposed regulations on which public comment is invited, followed by final regulations which incorporate some and reject other suggestions by interested parties.

Solid Wastes. Federal law does not regulate land disposal of ordinary urban and commercial waste by prescribing methods, but federal guidelines describe best practice. Regulatory action may be present indirectly if groundwater contamination results from landfill leachates and, in consequence, safe drinking water standards are not met. Incineration of wastes falls under air pollution laws. State laws and regulations do control solid wasteland disposal, but requirements vary from state to state.

Toxic and Hazardous Wastes. Handling of such wastes is tightly regulated relating to transport, storage, and disposal of wastes. To the extent that such wastes are liquefied before processing or are incinerated, water and air regulations apply. Many decades of haphazard toxic/hazardous waste disposal preceded the emergence of environmental regulations so that many hundreds of "legacy" sites still exist. Superfund legislation controls both the cleanup process and the assignment of responsibility for the cleanup.

Drinking Water. Federal law relating to drinking water is a standard-setting process under which maximum levels of contaminants are set. Federal regulators take into account water purification technology in setting or revising standards; attempts to tighten standards are usually triggered by improvements in treatment technology and resisted because new methods have higher costs.

Other Areas. The protection of endangered species takes multiple forms, including prohibitions against hunting, protection of habitats from development or restrictions on access to and exploitation of resources inside habitats. Nuclear materials handling is a world unto itself in which very tight safeguards are prescribed for every aspect of nuclear materials handling including in such "nonatomic" environments as medical laboratories. Storage, transport, labeling, and handling of toxic and hazardous materials in the workplace are covered by Department of Transportation and OSHA regulations again aimed at protecting people directly involved and the broader population outside the workplace in case of fires or disasters.

THE SMALL BUSINESS CONNECTION

The small business is touched in one way or another by environmental law even in businesses that do very little or very basic manufacturing. If solvents and lubricants are used, which will be likely in a machine or in a printing shop; or if chemicals are used, say in a flower shop or gardening enterprise, environmental laws will be applicable. Any hazardous materials which employees may be exposed to inevitably concerns not only environmental laws but OSHA regulations as well. Even printer ink cartridges and old computer monitors usually involve environmental laws, as these items must be disposed of in prescribed ways. A careful inspection of the business, looking for chemicals, fire hazards, and inspecting the type of waste generated may be worthwhile unless the owner keeps up-to-date on the subject. A good means of doing so is through product vendors who usually provide information or track legal restrictions on chemicals closely. Trade publications also routinely report on new regulator developments in the industry they cover and thus provide early warning signals that action may be necessary to get on the right side of environmental law.

Small businesses are faced with a number of challenges when it comes to environmental laws. First, many small businesses assume that environmental laws do not really touch them if they do not deal with environmental waste. For this reason, many small businesses do not consider environmental laws until they are taken to court by a group, employee, or client. However, small businesses need to be careful to comply with all necessary environmental laws. Even small, one-person businesses often require permits and licenses, and the bodies providing permits and licenses often require businesses to meet basic environmental standards. Companies can protect themselves by running environmental audits. Third-person companies offer these services at reasonable costs, and new business owners may even be able to deduct some of these expenses. In many cases, finding and correcting a problem quickly leads to no penalties and helps prevent legal action and greater penalties down the road.

If a company is found to be in violation of environmental laws, the company will usually receive notice as well as a request to correct the problem. Violators may be charged fines and penalties, which can easily reach millions of dollars. Mediation is attempted if the issue cannot be resolved. For a small percentage of the most persistent violators, legal action is the most likely result, according to the Organisation for Economic Co-operation and Development's 2009 pamphlet, *Ensuring Environmental Compliance: Trends and Good Practices*.

According to Fred Steingold's 2008 book *Legal Forms for Starting & Running a Small Business*, one area where small businesses are often affected by environmental laws is new property ownership. When companies acquire new business property or a new business, the past owner's mistakes may include environmental noncompliance. In most cases, the new owner becomes liable for these mistakes and violations. Steingold recommends that new businesses add a clause requiring the seller of a business property or business to warranty that there are no environmental law violations on-site and to agree to indemnify the buyer in the event that existent noncompliance issues are found after the purchase.

ENVIRONMENTAL LAW IN THE 2010S

In the past, companies have been able to hide behind trade secret legislation and other regulations in avoiding environmental legislation. For example, asbestos has not been banned, despite well-documented links between that product and cancer. In late 2009 President Barack Obama proposed sweeping federal legislation that would toughen environmental laws, creating stricter testing and greater federal authority to ban products known to be toxic from consumer products and from workplaces. Under the new proposals, companies would have to be more transparent when sharing information about their products and manufacturers would have to test existing and new products widely for safety and environmental compliance.

ENVIRONMENTAL MANAGEMENT

In the business setting, environmental management involves the planning and processes by which a company reduces its pollution, waste, and consumption of natural resources in

order to minimize the organization's impact on the surrounding environment. With consumers increasingly demanding that businesses demonstrate an environmental conscience, companies of all types and sizes must develop strategies that balance economic and business growth with environmental awareness and protection.

Attitudes toward the environment began to change in the United States after World War II. At that time, patriotism among Americans was at a record high, and there was a swell of public interest in preserving the natural beauty and resources of the country. However, it was not until 1963 that American businesses became caught up in the wave of "green" sweeping across the nation. That was when New York's utility company, Consolidated Edison, announced plans to build a power plant on Storm King Mountain in the Hudson River Valley, an area widely recognized and revered as a unique American wilderness. Individuals and groups from diverse sectors of the public rallied together to protect the natural beauty and cultural significance of the region. Their efforts tied the case up in legal battles for more than a decade before the people finally won that conservation fight against big business.

Environmental concerns swiftly rose to the top of the U.S. political agenda. President Richard Nixon signed into law the National Environmental Policy Act on January 1, 1970. The act required that all branches of government give due consideration to the environment before undertaking any major federal action which had a significant environmental impact. That same year, on April 22, the first Earth Day rallies took place in most major cities. The message became crystal clear the public at large was embracing environmental responsibility not only on an individual level, but in industry as well. The federal government acknowledged the mass shift in perspective by passing thousands of new environmental laws and ordinances over the next decade. The most significant new laws included the 1970 amendments to 1963 clean air legislation, which collectively became known as the Clean Air Act; the Federal Water Pollution Control Act of 1972, which became known as the Clean Water Act after amendments were added in 1977; and the Comprehensive Environmental Response Cleanup and Availability Act of 1980, more commonly known as Superfund, which addresses cleanup of hazardous waste sites. In 1992 the International Organization for Standardization (ISO) published the ISO 14000 series of standards for environmental management by organizations in the global marketplace. In the twenty-first century these standards continue to provide the goals and principles by which the environmental status of businesses is assessed.

CLEAN AIR ACT

The Clean Air Act (1970) is the federal law that regulates air emissions from any stationary or mobile source. The legislation authorizes the U.S. Environmental Protection Agency (EPA) to create National Ambient Air Quality Standards (NAAQS) that are designed to protect public health and the environment in every state. It sets maximum pollutant standards and directs each state to develop and apply State Implementation Plans for appropriate industrial sources located within the state's borders. The act was amended in 1977 to impose new deadlines for achieving NAAQS in many states. It was amended again in 1990 to address issues of acid rain, ground-level ozone, stratospheric ozone depletion, and air toxins.

The Clean Air Act affects U.S. businesses in several ways. For example, organizations may be required to control air pollution through end-of-line methods, which involve capturing pollutants produced during industrial pipeline processes and removing them from the air. Businesses may also be required to implement preventive measures designed to reduce the amount of pollutants produced from business operations in the first place. In either case, the cost of compliance with Clean Air Act regulations can be quite high, especially for small businesses. However, the act has been good news for the environment. Between 1970 and 2009, the Clean Air Act helped to diminish emissions from major air pollutants in the United States by an estimated 48 percent, equating to a reduction of approximately 109 million tons of toxic fumes.

CLEAN WATER ACT

The Clean Water Act is a 1977 amendment to the Federal Water Pollution Control Act of 1972, which established the fundamental structure for regulating the discharge of pollutants into bodies of water in the United States. The law gives the EPA authority to determine effluent standards on an industry-by-industry basis, to set water quality standards for all contaminants in surface waters, and to enforce provisions of the act in regard to state governments. The legislation makes it illegal for businesses to discharge any pollutant into lakes, rivers, streams, wetlands, coastal areas, and other navigable waters without a federal permit. It also requires businesses to reduce the amount of their pollutant discharges over time. The 1977 amendments specifically address toxic pollutants.

By the close of the 1990s, the EPA had expanded the scope of the Clean Water Act beyond industrial-point sources alone to include pollution from indirect sources as well, such as chemicals from agricultural runoff or erosion from logging or construction activities. According to the EPA, these diffuse sources make about 40 percent of the nation's waterways too contaminated for

fishing or swimming. The broader application of the act has significant implications for businesses, which must take into account that the law not only applies to discharges of pollution from industrial factory pipes but also to incidental pollution resulting from the operational activities of smaller enterprises.

COMPREHENSIVE ENVIRONMENTAL RESPONSE CLEANUP AND AVAILABILITY ACT

Under CERCLA (1980), the EPA was given the authority to respond directly to the release or potential release of hazardous pollutants onto sites that may jeopardize public health or the environment. It created a federal "superfund" that established requirements regarding cleanup of contaminated sites and set liability parameters for individuals and businesses who are deemed responsible for site contamination. The act, also known as Superfund, gives the EPA the power to track down parties responsible for any contaminant release and assure their participation in the cleanup. Consider the April 2010 oil spill from the explosion and sinking of the Deepwater Horizon oil rig in the Gulf of Mexico. While the EPA is responsible for oversight of the cleanup efforts, BP, which leases the rig, is responsible for paying the bulk of the expenses tied to remediation, cleanup, and damages caused by the spill. The oil behemoth willingly accepted liability in this case, but some companies faced with staggering costs and negative publicity do not acquiesce so readily. To address this issue, the Superfund Act gives the EPA the ability to use various enforcement tools, such as orders and consent decrees, to obtain private party cleanup. The organization may also recover costs from financially viable individuals and businesses upon completion of a response action. The bulk of the funding for cleanup, however, generally comes from the $1.6 billion Superfund that is fed by government-mandated tax fees imposed on chemical and petroleum companies. The EPA is authorized to implement CERCLA in all fifty states and U.S. territories, with Superfund site identification, monitoring, and response activities in states coordinated through state environmental protection or waste management agencies.

Liability for contamination under Superfund includes the current owner or operator of the site; prior owners/operators of the site during or after the time of contamination; businesses or individuals who handle waste disposal or transportation; and other parties such as title companies and real estate agents associated with the sale or lease of the site. This wide net can have substantial ramifications for small-business owners who may find themselves liable for environmental cleanup costs even if the site was contaminated without their knowledge or during the tenure of a previous owner/operator.

On January 11, 2002, President George W. Bush enacted the Small Business Liability Relief and Brownfields Revitalization Act that amends CERCLA and gives some liability relief to small businesses in certain circumstances. Generally, it allows small businesses that are unable or limited in their ability to pay cleanup costs to settle expeditiously for a smaller liability amount and to use alternative payment methods to meet the reduced financial obligation. It also expands the contiguous landowner and innocent landowner defenses that may be brought under the act. The first provides a degree of protection to property owners whose site is contaminated by off-site sources, such as trickledown waste from a neighboring farm or manufacturing plant. The second expands the definition of innocent landowner to include easements and leases as well as deeds as being contractual relationships eligible for potential liability protection. These situations are handled on a case-by-case basis.

Regardless of the new measures, the best protection for small businesses continues to be prevention. Small-business owners should consider hiring an auditing firm to conduct an environmental site assessment (ESA) to ensure that their property is free from contamination. Ideally an ESA should be performed prior to purchasing a property, but it can also be helpful in the case of presently owned or occupied sites as well. In some cases, it may even be mandated. For instance, financial institutions may require an ESA before loaning to a business seeking to borrow against the equity of a property. A Phase I ESA starts at a cost of about $1,000 and involves examination of public records to determine whether the site was previously used for purposes that might cause contamination, such as manufacturing operations or hazardous materials storage. The expense for a Phase II ESA starts at around $8,000 and is warranted if suspicious findings arise during a Phase I assessment. A Phase II ESA involves obtaining and testing soil and other samples from the site to appraise types and degrees of contamination.

ISO 14000

The ISO 14000 series of environmental standards was created as a result of the 1992 Rio Summit on the Environment. The standards arose out of a perceived need to create internationally accepted criteria in the areas of environmental management systems, environmental auditing, environmental performance evaluation, environmental labeling, life-cycle assessment, and environmental aspects in product standards for all types and sizes of businesses operating across diverse geographical, social, and cultural conditions.

One of the most significant ISO 14000 standards is ISO 14001, which requires organizations to have an environmental policy in place that is fully supported by senior management. The policy must outline the company's environmental practices for the edification of staff, regulators, and the general public. The policy must clarify the company's compliance with environmental legislation and emphasize the firm's commitment to continuous improvement in the environmental arena. ISO 14001 and the other series standards are more than mere guidelines for most businesses. As "green" becomes an important new competitive frontier, businesses are finding that they need to achieve ISO certification in environmental management in order to compete in the global marketplace. More and more, ISO 14000 environmental management system registration is becoming a key requirement for conducting business in many regions and industries across the globe.

ENVIRONMENTAL MANAGEMENT SYSTEMS

According to the EPA, "an Environmental Management System (EMS) is a set of processes and practices that enable an organization to reduce its environmental impacts and increase its operating efficiency" through systematic management of environmental and health safety matters. It involves a continuous cycle of planning, implementing, reviewing, and enhancing the procedures and activities the enterprise undertakes to achieve its environmental objectives. Those objectives are set out in the company's environmental policy. The policy is a statement by the enterprise's top management outlining their intentions and principles in regard to the organization's environmental performance. Essentially, the policy provides the framework for all planning and action through the EMS.

Many businesses use the ISO 14000 EMS model to create their own environmental management system. While the specific elements of the EMS will vary by company based on resources and objectives, the environmental management systems that follow the ISO 14000 model typically share four main components. These are: planning, doing, checking, and acting.

Environmental Planning. The planning stage involves identifying environmental aspects and setting environmental goals. The specific steps include identifying all the ways the business impacts the environment, becoming familiar with legal and other requirements to which the business must adhere, establishing goals and targets to improve environmental performance, and drafting a written program to achieve the stated goals. The plan also documents key elements of environmental management, such as policies, responsibilities, standard operating procedures, best practices, recordkeeping, reporting, training, and compliance review and enforcement.

Implementation and Operation. This is considered the "doing" phase of the EMS. It includes the development of operational controls. It defines the structure of the EMS and assigns responsibilities for the various aspects of environmental management. This phase also outlines training needs and determines how those needs will be met by the organization. In addition, it involves setting up internal and external communication channels to ensure that both company personnel and appropriate parties outside the organization are aware of the EMS and have the ability to provide input. The information management component also includes procedures for document control and for management of operations that have environmental impact. An emergency preparedness and response program is usually incorporated into the EMS at this stage as well.

Checking. The checking component of the EMS includes the methods used for monitoring business processes, assessing the impact of those processes on the environment, and maintaining records of audits and results. These audits and records help to establish a chain of information and action that is integral in providing the company with added protection from certain liabilities in the event of an environmental incident.

Corrective Action. The final phase of the EMS model involves identifying and implementing corrective actions required to fix and prevent recurrence of environmental problems discovered during the monitoring phase. These corrective actions are designed to help the business ensure compliance, optimize efficiencies, and reduce environmental impact the company's environmental footprint, so to speak.

The development and maintenance of any environmental management system involves initial and ongoing costs for the business related to personnel resources, technology requirements, and operational adjustments. However, investment in an EMS can pay off in terms of both organizational and environmental benefits. For example, an effective EMS can help a business to increase efficiency and innovation, reduce costs, attract and retain customers and markets, enhance its public image, and boost employee morale. It can also help companies prevent pollution, conserve resources, improve environmental performance and compliance, reduce or mitigate liability risks, enhance their image with regulators and investors, raise awareness of environmental issues and responsibilities, and qualify for environmentally based recognition and incentive programs. One such program is the EPA's National Environmental Performance Track Program.

The program was established in 2000 to recognize and reward businesses and public entities that consistently surpass regulatory requirements, partner with their community, and excel in protecting the environment and public health. To qualify for membership in the program, a business needs to show that it has a proven record of regulatory compliance, a commitment to continuous improvement, a mechanism for public outreach, and an environmental management system in place.

BUSINESSES GO GREEN

There is considerable evidence that U.S. businesses have moved beyond grudging compliance with local, state, and federal environmental regulations toward eagerly embracing green concepts throughout the organization as a way to gain competitive advantage. It is the classic carrot-and-stick scenario regulatory compliance is the troublesome stick, and increased market advantage is the welcome carrot, especially for businesses hungry for new ways to differentiate themselves from the competition. For green-savvy businesses, adopting an environmentally friendly perspective may involve redesigning manufacturing processes to minimize waste production and recycle waste end products, economizing energy use throughout business operations, designing products that meet environmental standards so they can be marketed as environmentally friendly, and partnering with recognized environmental organizations to align strategies and increase influence. These are just a few of the vast and varied tactics businesses can employ when going green. Specific examples from recent years include DuPont's development of a fabric made from cornstarch to replace polyester, Electrolux's introduction of solar-powered lawn mowers and saws lubricated with vegetable oil, MacDonald's partnership with the Environmental Defense Fund aimed at reducing fast-food waste and the use of styrofoam packaging, and U.S. auto manufacturers's addition of fully or partially electric cars onto their assembly lines.

Certainly there are strong incentives driving business attitudes toward increased responsibility for their environmental impact. Aside from growing awareness about the need to protect land, water, and air from becoming dump sites for waste, there is also an increasing understanding that the Earth's finite natural resources and certain waste products can be recycled into viable new products. At the same time, some activists are going further by boycotting and campaigning against businesses labeled as "brown," meaning they are not friendly to the environment. In an article for the *Social Contract Journal*, Otis Graham describes the significance of the trend toward environmental responsibility: "The Greening of American Business is now a train moving on the tracks, and since manufacturing corporations account for 40 percent of GNP, their active and positive participation in the search for a lighter human impact on the earth is essential for progress."

The train appears to be moving full steam ahead. Environmental management has become a hot issue for businesses large and small. American consumers expect businesses today to be more than environmentally aware, and they want their employers, community businesses, and even the industrial giants to be environmentally friendly. Senior executives and managers are increasingly being held liable for their organizations' environmental performance, so the burden is on them to develop, implement, and maintain a corporate strategy that balances business needs with those of the greater environmental good.

ENVIRONMENTAL PROTECTION AGENCY (EPA)

The U.S. Environmental Protection Agency (EPA) was created on December 2, 1970, by executive order of President Richard Nixon to "permit coordinated and effective government action on behalf of the environment." Fifteen different environmental programs from various federal offices were combined and placed under the jurisdiction of the newly created EPA. The EPA was designed to serve as an "umbrella agency" through which most federal environmental laws, regulations, and policies would be administered.

EPA'S ORGANIZATION

The administrator of the EPA is appointed by the president of the United States and approved by the Senate, along with a deputy administrator, nine assistant administrators, an inspector general, and a general counsel. The inspector general is responsible for investigating environmental crimes, and the general counsel provides legal advice. Within the EPA are four "program" offices: 1) Air and Radiation; 2) Water; 3) Pesticides and Toxic Substances; and 4) Solid Waste and Emergency Response. There is also an office for Research and Development which works in coordination with each of the four program offices.

The main office of the EPA, which is located in Washington, D.C., oversees implementation of national environmental laws and programs, directs the EPA's regional offices and laboratories, and submits budget requests to Congress. Research is conducted through the EPA's main office and at its regional field laboratories. There are ten regional EPA offices and field laboratories which work directly with state and local governments to coordinate pollution control efforts. The EPA uses a portion of its federal funding to provide grants and technical assistance to states and local governmental units that seek to prevent pollution.

OBJECTIVES, POWERS, AND PROGRAMS

The EPA's powers and programs are established through legislation passed by Congress. (Such legislation delegating powers to an agency is known as "enabling" legislation.) Today the EPA is charged with the administration of a myriad of federal environmental laws dealing with air and water pollution, drinking water quality, radioactive wastes, pesticides, solid wastes, and noise pollution. In general, the EPA develops standards or regulations pursuant to environmental statutes; enforces those standards, regulations, and statutes; monitors pollutants in the environment; conducts research; and promotes public environmental education. For this, the EPA receives funding from the federal government and is charged with federally funded projects. For example, in the 2009 American Recovery and Reinvestment Act, the EPA became responsible for over $7 billion in projects across the nation.

The EPA has five main objectives, called "core functions." These are: 1) Pollution Prevention, which is also known as "source reduction"; 2) Risk Assessment and Risk Reduction, which is the task of identifying those issues which pose the greatest risks to human health and the environment and taking action to reduce those risks; 3) Science, Research, and Technology, which involves research designed to develop innovative technologies to deal with environmental problems; 4) Regulatory Development, which involves developing standards for operations of industrial facilities including, for example, standards for air emissions of pollutants pursuant to Clean Air Act permits and standards for discharge of effluents under Clean Water Act permits; and 5) Environmental Education, which involves developing educational materials and providing grants to educational institutions.

COORDINATION WITH OTHER ENVIRONMENTAL PROGRAMS

In its pollution control efforts the EPA works closely with state and local governments. During the early 1980s, efforts to downsize federal government led the EPA to hand over more responsibility for enforcement of regulatory programs to state and local governments. States are encouraged to pass their own statutes and regulations which meet or exceed the requirements of federal statutes such as the Clean Air Act and the Clean Water Act. Upon certification by the federal EPA, such states take over day-to-day enforcement of a specific statutory program and of the regulations pertaining to that program. As a result, businesspeople in many states find that their day-to-day contact with enforcement officials regarding environmental statutes and regulations is with a state counterpart to the EPA rather than the federal EPA. However, even when a state has been certified to administer such a program, the federal EPA continues to oversee the state's enforcement activities. It provides assistance to state officials and sometimes

participates directly in major enforcement actions against violators of environmental laws.

The EPA also works closely with other federal environmental control agencies, such as the National Oceanic and Atmospheric Administration and the U.S. Coast Guard. The National Oceanic and Atmospheric Administration engages in long-range research on pollution problems, especially problems affecting the ocean and the atmosphere. The EPA works with the Coast Guard on flood control, dredging activities, and shoreline protection. Since 1970 the EPA has worked closely with the Council on Environmental Quality (CEQ), a relatively small executive agency which was created pursuant to the National Environmental Policy Act. Its mission is to advise the president on federal policy and action in the environmental area and to ensure that other federal agencies comply with NEPA. Compliance with NEPA requires all federal agencies to pursue environmentally sound policies and prepare an Environmental Impact Statement (EIS) before undertaking any major action that might significantly affect the environment.

CHALLENGES FACING THE EPA

In late 2009 and early 2010, EPA faced a number of new challenges. Legal challenges to the 1972 Clean Water Act from big business, for example, forced the agency to focus on larger, navigable streams. This has led to some confusion regarding regulations and some contamination of smaller waterways. In 2010 the EPA announced that larger businesses emitting carbon dioxide would face tougher restrictions and regulations on pollutants in 2011. Smaller businesses including hospitals and dry cleaning businesses would not face increased regulations until 2016, while medium-sized businesses would face increased controls in late 2011. The announcement sparked confusion over which companies would be affected and when. Adding to the confusion, Congressional efforts were launched in late 2009 to prevent the EPA from having the power to enforce the new rules. In addition, creating federal environmental rules controlled by one agency is challenging in a political climate where many states have their own (conflicting) rules about the environment, pollutants, and waterways.

The EPA has also been trying to reach out to small businesses, since small companies often erroneously believe that environmental laws do not affect them. For the small business, the EPA offers the Small Business Gateway, a series of Web sites designed to answer frequently asked questions and show small businesses how to find the environmental law information they need.

EQUAL EMPLOYMENT OPPORTUNITY COMMISSION

The Equal Employment Opportunity Commission (EEOC) was established to enforce provisions of Title VII of the Civil Rights Act of 1964. Title VII forbids discrimination in the workplace based on race, age, disability, religion, sex, or national origin. Title VII covers all phases and aspects of employment including but not necessarily restricted to hiring, termination of employment, layoffs, promotions, wages, on-the-job training, and disciplinary action. Businesses covered by Title VII include employers in the private sector with fifteen or more employees (twenty or more employees in age discrimination allegations), educational institutions, state and local governments, labor unions with fifteen or more

members, employment agencies, and, under certain circumstances, labor-management committees.

Originally, government-owned corporations, Indian tribes, and federal employees were not covered under the provisions of Title VII; the latter group was protected from discriminatory practices by Executive Order 11478, which was administered and enforced by the U.S. Civil Service Commission. In 1978, however, federal equal employment functions were transferred to the EEOC. Title VII which, along with the rest of the 1964 Civil Rights Act, became operational on July 2, 1965 has since been amended several times over the years. Key amendments include the Equal Opportunity Act of 1972, the Pregnancy Discrimination Act of 1978, and the Civil Rights Act of 1991. The EEOC is also responsible for enforcing the Equal Pay Act of 1963, the Age Discrimination in Employment Act of 1967, the Rehabilitation Act of 1973 (including amendments to Section 501 prohibiting employment discrimination against federal employees with disabilities), and the Americans with Disabilities Act of 1990. Today, the EEOC provides oversight and coordination of all federal regulations, practices, and policies affecting equal employment opportunity.

ORIGINS OF THE EEOC

Title VII and the EEOC trace their beginnings to World War II federal defense contracts. Faced with the threat of a ''Negro march'' on Washington to protest discrimination in hiring of defense contract workers, President Franklin D. Roosevelt issued Executive Order 8802 in 1941. This order called for the participation of all U.S. citizens in defense programs regardless of race, creed, color, or national origin. The order also established the Fair Employment Practices Committee (FEPC), which by 1943 was processing 8,000 employment discrimination complaints annually. The powers of the FEPC were decidedly limited. While the committee discouraged discrimination within the defense industry, it lacked the legal clout to enforce its desires. Over the next several years, presidents Harry S. Truman and Dwight D. Eisenhower both established committees on government contract compliance, but again enforcement power was absent. Only when President John F. Kennedy created the President's Committee on Equal Employment Opportunity were one of these groups given enforcement powers. Even in this case, however, the committee's legal authority was limited. Moreover, Kennedy's Committee on Equal Employment Opportunity, like its predecessors, dealt only with discrimination within businesses that had government contracts, not workplace discrimination in the overall private sector. The Civil Rights Act of 1964 changed this by addressing discrimination in all areas of employment.

EEOC ENFORCEMENT ACTIVITIES

The Equal Employment Opportunity Commission's enforcement program manages tens of thousands of charges annually. In 2009, for example, the EEOC saw 93,277 charges of discrimination in the private sector. The EEOC received another 2,728 cases or charges indirectly from Fair Employment Practices Agencies (FEPAs) at the state and local level in 2009. Of these cases in 2009, the EEOC was able to achieve resolutions in 85,980 cases.

In the EEOC system, charges are prioritized into one of three categories for purposes of investigation and resource allocation: A (top priority charges to which offices devote substantial investigative and settlement efforts); B (charges deemed to have merit but needing additional investigation); and C (charges judged to be unsupported or not under the EEOC's jurisdiction, and thus are not pursued). In Fiscal Year 2009 alone, the EEOC obtained nearly $294.1 million in benefits for charging parties through settlement and conciliation, providing assistance and settlements for more than 17,491 people facing discrimination.

Under EEOC rules of operation and investigation, settlements between disputing parties are encouraged at all stages of the process. With this in mind, the EEOC maintains a mediation-based alternative dispute resolution program. ''The mediation program,'' states the EEOC, ''is guided by principles of informed and voluntary participation at all stages, confidential deliberation by all parties, and neutral mediators.'' In FY 2009, the EEOC resolved more than 8,498 charges via its mediation program and through this program was able to secure over $121.6 million in financial benefits for victims of discrimination.

FILING A COMPLAINT WITH THE EEOC

Anyone who feels that he or she has suffered workplace discrimination because of his or her race, age, physical disability, religion, sex, or national origin is eligible to file a complaint with the EEOC. Complaints or charges are generally filed at an EEOC office by the aggrieved party or by his or her designated agent. All charges must be filed in writing, preferably but not necessarily on the appropriate EEOC form, within 180 days of the occurrence of the act that is the reason the complaint is being filed. Complaints may be filed at any one of fifty district, area, local, and field EEOC offices throughout the United States.

Upon receiving a discrimination charge the EEOC defers that charge to a state or local fair employment practices agency. This agency has either 60 or 120 days to act on the complaint (the allotted time depends on several factors). If no action is taken on the state or local

level within that time the charge reverts back to the EEOC, which processes the charge on the 61st or 121st day. This becomes the official filing day of the complaint. Within 10 days of the filing date the EEOC notifies those parties charged with discrimination. The EEOC subsequently undertakes an investigation of the charge. If the investigation shows reasonable cause to believe that discrimination occurred, the Commission launches conciliation efforts. The reaching of an agreement between the two parties signals closure of the case. If such an agreement cannot be reached, the EEOC has the option of filing suit in court or the aggrieved party may file suit on his or her own. If no violation of Title VII is found, the EEOC removes itself from the case, though the party charging discrimination is still free to file suit in court within a specified time.

EEOC PROGRAMS

The Equal Employment Opportunity Commission has established numerous programs designed to inform the public of EEOC activities and responsibilities. The Technical Assistance Program (TAPS) is a 1-day educational seminar for unions and small and mid-size employers. This program highlights the rights of employers and employees under Title VII. The Expanded Presence Program sends contact teams to areas that would otherwise have little immediate accessibility to the EEOC. The EEOC also sponsors a Federal Dispute Resolution Conference, aids state and local fair practices employment agencies, and maintains liaison programs with unions, civil rights organizations, and various federal, state and local government agencies.

Two programs which the EEOC decided to focus on in 2009 and beyond included the LEAD Initiative and Youth@Work. The LEAD (Leadership for the Employment of Americans with Disabilities) Initiative is designed to offer people with disabilities opportunities in federal government work and to raise the number of disabled workers in federal employment from the current 1 percent of the federal government workforce. Youth@Work is designed to inform minors about their rights as employees and inform employers hiring youth about ways to avoid harassment and discrimination in the workplace. Youth@-Work is designed to create positive first-job experiences for teens and their employers.

HIGHER BUDGETS, MORE FILINGS

The EEOC's budget appropriation for FY 2009 was $343 million, while its FY 2008 budget was $329 million. Its roster of full-time employees stood at 2,556 at the end of FY 2009, an increase of about 155 new workers over the previous year. In anticipation of new filings stemming from new laws and after enduring hiring freezes, the EEOC hired new investigators, attorneys, support staff, paralegals, statisticians, and labor economists to help investigate and challenge discrimination in the workplace.

In the 2010s, the EEOC expects an increase in the number of charges and filings, due in part to new legislation and rules. The agency has already seen an increase in the number of cases due to the Lilly Ledbetter Fair Pay Act of 2009 and the Americans with Disabilities Act Amendments Act of 2008. The Lilly Ledbetter Fair Pay Act of 2009 extends the 180-day statute of limitations in equal pay cases. Under the new law, each new check issued with the contested pay extends the statute of limitations another 180 days. The Americans with Disabilities Act Amendments Act of 2008 defines normal, everyday activities and disabilities differently and more broadly than previously.

In addition to the increased filings as a result of these changes, the EEOC also began in late 2009 to enforce Title II of the Genetic Information Nondiscrimination Act of 2008. This legislation prohibits discrimination based on genetic data. That is, under this act, family medical history, genetic test results, and other information used to gauge a person's genetic predisposition to illness or conditions cannot be used when making employment decisions.

The EEOC may be contacted at the following address: U.S. Equal Employment Opportunity Commission, 1801 L Street, N.W., Washington, DC 20507; 202-663-4900. The EEOC also maintains a Web site at www.eeoc.gov.

EQUIPMENT LEASING

A lease is in essence an extended rental agreement under which the owner of the equipment allows the user to operate or otherwise make use of the equipment in exchange for periodic lease payments. In leasing terminology, the owner is the lessor, the user is the lessee. Equipment leasing is a popular option for companies of all sizes. The Equipment Leasing Association of America estimates that 80 percent of all companies lease at least some of their equipment, and the organization estimates that large equipment leasing increased by 32 percent between 2006 and 2007. While companies of all sizes lease equipment, equipment leasing is particularly favored by many small businesses, which often have fewer options because of limited capital.

CATEGORIZATIONS

The two primary types of leases are operating and long-term or "capital" leases. Operating leases are characterized by short-term, cancelable terms; the lessor bears the risk of obsolescence and enjoys such benefits as depreciation, including, if applicable, accelerated depreciation. These leases are generally preferable when the company needs the equipment for a short period of time. Under the usual terms of operating leases, a lessee can usually cancel the lease, assuming prior notice, without a major penalty. Operating leases are also known as supplier financing or vendor financing and they allow businesses to rent new or used equipment. According to *The Rational Guide to Building Small Business Credit* by Barbara Weltman and Vicki Raeburn, most commercial equipment leases are operational leases.

Long-term, "capital," noncancelable leases, also known as full payout or financial leases, are sources of financing for assets the lessee company wants to acquire and use for longer periods of time. Most financial leases are "net" leases, meaning that the lessee is responsible for maintaining and insuring the asset and paying all property taxes, if applicable. Financial leases are often used by businesses for expensive capital equipment.

In addition to these two basic leasing models, a considerable variety of other lease arrangements are often used. These leases, each of which combine different financial and tax advantages, are actually hybrids of financial and operating leases that reflect the individual needs of lessor companies. For example, full-service leases are leases wherein the lessor is responsible for insurance and maintenance (these are commonplace with office equipment or vehicle leases). Net leases, on the other hand, are leases wherein the lessee is responsible for maintenance and insurance. Leveraged leases, meanwhile, are arrangements wherein the cost of the leased asset is financed by issuing debt and equity claims against the asset and future lease payments.

The Size of the Ticket. Leases are also classified as "small ticket," "medium," and "large ticket" leases based on the value of the equipment to be leased. The small ticket lease covers items up to $100,000 in value; large ticket leases cover items costing more than $2 million. The medium, of course, is the area in between. The small ticket lease is of special interest to the small business because getting approval for such leases rarely involves much more effort than qualifying for a credit card. As the values of equipment rented increase, obtaining the lease comes more and more to resemble a major loan application.

A Bumpy Playing Field. Small-business owners need to keep in mind that lease rates can vary considerably from one lease company to another. Lease companies also may charge different rates for the same piece of equipment depending on various characteristics of the business that is seeking the lease. Factors that can impact the lease rate include the credit history of the lessee, the nature of equipment wanted by the lessee, the length of the lease term, and whether the lessee or lessor is the primary beneficiary of tax credits associated with the transaction. The Equipment Leasing Association of America predicted that new industry rules may make it harder for companies to secure equipment leases in the early 2010s, after the economic downturn in 2008 and 2009. The organization noted that many banks and lending institutions have instituted new, tougher lending rules designed to prevent high rates of repossession and nonpayment.

WHY LEASE?

Companies can finance their capital equipment by debt or equity. Capital leases are a form of debt-equity financing since such leases act like loans, must be recorded as liabilities on balance sheets, and are also treated as liabilities by the Internal Revenue Service. Operating leases, however, permit the company to obtain equipment with virtually no up-front capital outlay and with the lease payments treated as a deductible cost of business. For most small businesses, therefore, the principal motive for leasing is cash flow the ability to get equipment *now* without a major expenditure of cash. Small businesses also benefit from the fact that lease payments are fixed and therefore are easy to budget for, unlike lines of credit or other loans which can increase in cost over time. Finally, leases are easier to obtain than many types of business loans, since the equipment acts as collateral. Therefore, new small businesses that are facing challenges in fund-raising can still procure the equipment they need for their business through leasing.

Some companies able to purchase still prefer to lease because their tax situation is such that they cannot benefit from the depreciation. They may also wish to maintain a debt-equity ratio that will attract new investment more easily, and leasing rather than investment will accomplish that end. Leasing is not counted as a debt and therefore maintains a debt-equity ratio which does not depress the value of the business. For some companies, engaged in a rapidly evolving technological market, using leased equipment under short-term leases permits them to exchange new and better equipment more rapidly than would ownership of a capital lease. For both small and large companies, leasing tends to offer a wider array of choices than simple purchasing. Some companies with ready capital prefer leasing because it frees more capital for investment opportunities, business growth, and working capital. That is, leasing ensures that companies are not left equipment-rich and capital-poor.

LEASING CHECKLIST

The elements of a lease agreement worth pondering in advance by the small business are on the following checklist. Each item should be viewed in light of the ultimate goal.

- Lease duration. If equipment needs are likely to change rapidly, a shorter lease period, even at a higher cost, may be desirable. When the equipment is standard, lowest price may be available for the longest duration.
- Payment due the lessor. This is one of several financial aspects the small business must consider in light of its projected cash flow.
- Financial terms (date of the month that payment is due, penalties for late payment, etc.). Since leases are usually designed to help a small business improve cash flow, it is also good to check whether security deposits or other initial costs need to be handled at the start of a lease. Some leasing companies charge two lease payments on the first month as a surety. Another thing to check is whether a personal guarantee is required on the equipment. If so, the business owner may be held personally liable if the company ceases to exist and the lease payments stop.
- Residual values, purchase options. If the lease is just another way of purchasing equipment, the terminal point of the lease becomes important.
- Market value of equipment. The business needs to assess insurance costs (especially in capital leases). It is also worthwhile to ensure that leased equipment is new or used, as desired by the business.
- Tax responsibility. As outlined above, operating and capital leases have different tax implications.
- Updating or cancellation provisions especially important when technological changes are swift.
- Lessee renewal options.
- Penalties for early cancellation without good cause.
- Miscellaneous options (security deposits, warranties).
- Removal fees. At the end of the lease term, the lessee must usually pay for the costs associated with returning the equipment back to the vendor. If the equipment is large and the vendor is located far away, this can be a substantial cost to consider.

FINDING A LEASING COMPANY

Business consultants and longtime equipment lessees agree that leasing companies vary considerably in terms of product quality, leasing terms, and customer service. Small-business owners should approach a number of lease companies if possible to inquire about lease terms. They should then carefully study the terms of each outfit's lease agreements and check into the reputation of each company (present and former customers and agencies like the Better Business Bureau can be helpful in this regard).

Finally, it is also important for entrepreneurs and business owners to take today's fast-changing technology into account when considering an equipment leasing arrangement. When dealing with computer systems or those heavily based on electronics, the owner is well advised to locate leasing companies that specifically service such needs and offer, up front, lease arrangements that facilitate rapid change.

EQUITY FINANCING

A company can finance its operation by using equity, debt, or both. Equity is cash paid into the business either the owner's own cash or cash contributed by one or more investors. Equity investments are certified by issuing shares in the company. Shares are issued in direct proportional to the amount of the investment so that the person who has invested the majority of the money in effect controls the company. Investors put cash into a company in the hope of sharing in its profits and in the hope that the value of the stock will grow (appreciate). They can earn dividends of course (the share of the profit) but they can realize the value of the stock again only by selling it.

Cash obtained by incurring debt is the second major source of funding. It is borrowed from a lender at a fixed rate of interest and with a predetermined maturity date. The principal must be paid back in full by the fixed date, but periodic repayments of principal may be part of the loan arrangement. Debt may take the form of a loan or the sale of bonds; the form itself does not change the principle of the transaction: the lender retains a right to the money lent and may demand it back under conditions specified in the borrowing arrangement.

While many businesses use a combination of debt and equity financing, especially to raise initial capital, all businesses need to determine what form of financing they will lean on more heavily. Most lenders offer one form of financing or the other. Also, as Justin G. Longenecker, J. William Petty, Leslie E. Palich, and Carlos W. Moore, authors of the 2009 book, *Small Business Management: Launching and Growing Entrepreneurial Ventures*, point out, the decision regarding equity financing is best made early in a company's history. This is because equity financing can impact the long-term financial life and the organizational structure of a company.

EQUITY DYNAMICS

The dynamics of investing cash in a business be it the owner's cash or someone else's revolve around risk and reward. Under the provisions of bankruptcy law, creditors are first in line when a business fails and owners (including investors) come last and are therefore at a higher risk. Not surprisingly, they expect higher returns than lenders. For these reasons the potential outside investor is very interested in the owner's personal exposure in the first place and the exposure of other investors secondarily. The more the owner has invested personally, the more motive he or she has to make the business succeed. Similarly, if other people have invested heavily as well, the prospective new investor has greater confidence.

The liquidity of the investment is another point of pressure. If a company is privately held, selling stock in that company may be more difficult than selling the shares of a publicly traded entity: buyers have to be privately found; establishing the value of the stock requires audits of the company. When a company has grown substantially and thus its stock has appreciated, pressures tend to build to "take it public" in order to let investors cash out if they wish. But if the company pays very high dividends, such pressures may be less the investors hesitant to "dilute" the stock by selling more of it and thus getting a smaller share of the profit.

Debt-Equity Ratio. If the company also used debt as a way of financing its activities, the lender's perspective also plays a role. The company's ratio of debt to equity will influence a lender's willingness to lend. If equity is higher than debt, the lender will feel more secure. If the ratio shifts the other way, investors will be encouraged. They will see each of their dollars "leveraging" a lot more dollars from lenders. The U.S. Small Business Administration, on its Web page titled "Finance Start-Up," draws the following conclusion for the small business: "The more money owners have invested in their business, the easier it is to attract [debt] financing. If your firm has a high ratio of equity to debt, you should probably seek debt financing. However, if your company has a high proportion of debt to equity, experts advise that you should increase your ownership capital (equity investment) for additional funds. That you way won't be over-leveraged to the point of jeopardizing your company's survival."

According to Longenecker and his colleagues in *Small Business Management*, small businesses often benefit by having some debt financing and some equity financing, as some debt financing can increase the return on investment for investors and therefore attract more investors to the business. In fact, the authors assert that in most cases, where a business's return on its assets is larger than the debt cost, the return on equity will improve as the company uses more debt financing.

Control. For the business owner control is an important element of equity dynamics. The ideal situation is that in

which 51 percent of the equity invested is the owner's own guaranteeing absolute control. But if substantial capital is needed, this is rarely possible. The next best thing is to have many small investors another difficult condition for the start-up to create. The larger each investor is, the less control the owner may have, especially if things get rocky. Some companies try to offer only limited partnerships to investors, hoping to secure financing without losing control over business decisions. However, attracting investors is harder when financing agreements are structured in this way.

ADVANTAGES AND DISADVANTAGES

For the small business the chief advantage of equity is that it need not be paid back. In contrast, bank loans or other forms of debt financing have an immediate impact on cash flow and carry severe penalties unless payments terms are met. Equity financing is also more likely to be available for start-ups with good ideas and sound plans. Equity investors primarily seek opportunities for growth; they are more willing to take a chance on a good idea. They may also be a source of good advice and contacts. Debt financiers seek security; they usually require some kind of track record before they will make a loan. Very often equity financing is the *only* source of financing.

The main disadvantage of equity financing is the above-mentioned issue of control. If investors have different ideas about the company's strategic direction or day-to-day operations, they can pose problems for the entrepreneur. These differences may not be obvious at first, but may emerge as the first bumps are hit. In addition, some sales of equity, such as limited initial public offerings, can be complex and expensive and inevitably consume time and require the help of expert lawyers and accountants.

SOURCES OF EQUITY FINANCING

Equity financing for small businesses is available from a wide variety of sources. Some possible sources of equity financing include the entrepreneur's friends and family, private investors (from the family physician to groups of local business owners to wealthy entrepreneurs known as "angels"), employees, customers and suppliers, former employers, venture capital firms, investment banking firms, insurance companies, large corporations, and government-backed Small Business Investment Corporations (SBICs). According to Peri H. Pakroo, in *The Small Business Start-Up Kit*, the vast majority of new businesses (81 %) receive their initial financing through family and friends. Only 2 percent receive venture capital funding.

It is important to note that equity financing obtained through friends and personal savings is not without risk. If a business does not succeed, the business owner may feel personally responsible for losing the investments of friends and family. In the event of an unsuccessful business, relationships with friends and family who have invested heavily in the business may become strained. Some friends and family who become investors may assume that they can make business decisions or offer suggestions, creating further problems, especially for the business owner who wishes to retain control. It is a good idea for the business owner not to rely on friends and family too heavily for financing. If there is no option, the owner should at the very least create solid business contracts and agreements and work to create matching funding from elsewhere so that the investments of loved ones are not unduly jeopardized. Also, using personal savings for equity financing may pose a problem if the business owner wishes to incorporate later. When creating a corporation, it is very important to keep personal finances and business expenses separate.

Venture capital firms often invest in new and young companies. Since their investments have higher risk, however, they expect a large return, which they usually realize by selling stock back to the company or on a public stock exchange at some point in the future. In general, venture capital firms are most interested in rapidly growing, new technology companies. They usually set stringent policies and standards about what types of companies they will consider for investments, based on industries, technical areas, development stages, and capital requirements. As a result, formal venture capital is not available to a large percentage of small businesses.

Closed-end investment companies are similar to venture capital firms but have smaller, fixed (or closed) amounts of money to invest. Such companies themselves sell shares to investors; they use the proceeds to invest in other companies. Closed-end companies usually concentrate on high-growth companies with good track records rather than start-ups. Similarly, investment clubs consist of groups of private investors that pool their resources to invest in new and existing businesses within their communities. These clubs are less formal in their investment criteria than venture capital firms, but they also are more limited in the amount of capital they can provide.

Large corporations often establish investment arms very similar to venture capital firms. However, such corporations are usually more interested in gaining access to new markets and technology through their investments than in strictly realizing financial gains. Partnering with a large corporation through an equity financing arrangement can be an attractive option for a small business. The association with a larger company can increase a small business's credibility in the marketplace, help it to obtain additional capital, and also provide it with a source of expertise that might not otherwise be available.

Equity investments made by large corporations may take the form of a complete sale, a partial purchase, a joint venture, or a licensing agreement.

The most common method of using employees as a source of equity financing is an Employee Stock Ownership Plan (ESOP). Basically a type of retirement plan, an ESOP involves selling stock in the company to employees in order to share control with them rather than with outside investors. ESOPs offer small businesses a number of tax advantages, as well as the ability to borrow money through the ESOP rather than from a bank. They can also serve to improve employee performance and motivation, since employees have a greater stake in the company's success. However, ESOPs can be very expensive to establish and maintain. They are also not an option for companies in the very early stages of development. In order to establish an ESOP, a small business must have employees and must be in business for 3 years.

Private investors are another possible source of equity financing. A number of computer databases and venture capital networks have been developed in recent years to help link entrepreneurs to potential private investors. A number of government sources also exist to fund small businesses through equity financing and other arrangements. Small Business Investment Corporations (SBICs) are privately owned investment companies, chartered by the states in which they operate, that make equity investments in small businesses that meet certain conditions. There are also many hybrid forms of financing available that combine features of debt and equity financing.

METHODS OF EQUITY FINANCING

There are two primary methods that small businesses use to obtain equity financing: the private placement of stock with investors or venture capital firms; and public stock offerings. Private placement is simpler and more common for young companies or start-up firms. Although the private placement of stock still involves compliance with several federal and state securities laws, it does not require formal registration with the Securities and Exchange Commission. The main requirements for private placement of stock are that the company cannot advertise the offering and must make the transaction directly with the purchaser.

In contrast, public stock offerings entail a lengthy and expensive registration process. In fact, the costs associated with a public stock offering can account for more than 20 percent of the amount of capital raised. As a result, public stock offerings are generally a better option for mature companies than for start-up firms. Public stock offerings may offer advantages in terms of maintaining control of a small business, however, by spreading ownership over a diverse group of investors rather than concentrating it in the hands of a venture capital firm.

Entrepreneurs interested in obtaining equity financing must prepare a formal business plan, including complete financial projections. Like other forms of financing, equity financing requires an entrepreneur to sell his or her ideas to people who have money to invest. Careful planning can help convince potential investors that the entrepreneur is a competent manager who will have an advantage over the competition. Overall, equity financing can be an attractive option for many small businesses. But experts suggest that the best strategy is to combine equity financing with other types, including the entrepreneur's own funds and debt financing, in order to spread the business's risks and ensure that enough options will be available for later financing needs. Entrepreneurs must approach equity financing cautiously in order to remain the main beneficiaries of their own hard work and long-term business growth.

ERGONOMICS

Ergonomics is the process of changing the work environment (equipment, furniture, pace of work, etc.) to fit the physical requirements and limitations of employees rather than forcing workers to adapt to jobs that can, over time, have a debilitating effect on their physical well-being.

Companies of all shapes and sizes have increasingly recognized that establishing an ergonomically sensitive work environment for employees can produce bottom-line benefits in cutting absenteeism, reducing health care costs, and increasing productivity. After careful analysis of the workplace environment and the tasks that their employees have to perform, the most progressive of these firms have taken steps to modify that environment (whether in a shop floor or an office) better to fit the physical needs and abilities of workers.

The Occupational Safety and Health Administration (OSHA), an element of the Department of Labor, defines ergonomic disorders (EDs) as a range of health ailments arising from repeated stress to the body. These disorders, which include repetitive strain injuries (RSIs), musculoskeletal disorders (MSDs) and cumulative trauma disorders, may affect the musculoskeletal, nervous, or neurovascular systems. They typically strike workers involved in repetitious tasks or those whose jobs require heavy lifting or awkward postures or movements. These ailments often occur in the upper body of workers, causing injuries in the back, neck, hands, wrists, shoulders, and elbows. Carpal tunnel syndrome is the most well-known of these maladies, but thousands of employees have also fallen victim to tendonitis and back injuries over the years. Ergonomics experts say that EDs are particularly prevalent in certain industries. Cashiers, nurses, assembly line workers, computer users, dishwashers, truck drivers, stock handlers, construction workers, meat cutters, and sewing machine operators are among those cited as being most at risk of falling victim to ergonomic disorders. Céline McKeown, author of the 2007 book, *Office Ergonomics: Practical Applications*, notes that increased use of computers in the workplace has led to more injuries caused by extended periods of sitting in front of a computer. According to McKeown, correct posture, a good chair, and good workstation design can be instrumental in preventing these common injuries.

According to the Occupational Safety and Health Administration, work-related MSDs strike 1.8 million American workers each year. "These injuries are potentially disabling and can require long recovery periods," wrote Charles Jeffress in *Business Insurance*. Jeffress was OSHA's assistant secretary of labor at the time of writing. "For example," Jeffress wrote, "workers need an average of 28 days to recuperate from carpal tunnel syndrome, which is more time than necessary for amputations or fractures." According to the Bureau of Labor Statistics, in 2008 39 percent of all illness and injuries in the workplace was due to strains and sprains. MSDs comprised 29 percent of all workplace injuries and illnesses, with 317,440 MSDs reported in 2008. Most MSDs in 2008 occurred in the moving and transportation industries. Workers needed an average of 30 days to recuperate before returning to work.

A 2009 study, published in the conference proceedings, *Ergonomics and Health Aspects of Work with Computers*, examined the balance theory model of M. J. Smith and P. Carayon-Sainfort, which suggests that factors outside of work as well as work conditions can create a risk of ergonomic disorders. The research study concluded that when external and workplace stress exceeds a worker's capacity, the conditions become ideal for any injury. Prolonged exposure to these types of stressors can increase the risk of musculoskeletal disorders.

OSHA has cited a set of risk factors that contribute to the likelihood of repetitive strain injuries such as carpal tunnel syndrome. These include:

- Performing the same motion or pattern of motions for more than 2 hours at a time.
- Using tools or machines that cause vibrations for more than 2 hours a day.
- Handling objects that weigh more than 25 pounds more than one time in a work shift.
- Working in fixed or awkward positions for more than 2 hours a day.
- Performing work that is mechanically or electronically paced for more than 4 hours at a time.

In the mid-1990s, the issue of ergonomics became a subject of considerable debate between unions and industries. The AFL-CIO, for instance, called RSIs and job-related back injuries "the nation's biggest job safety problem," contending that more than 700,000 workers miss work each year because of these ailments. Certainly, for workers who are debilitated by carpal tunnel syndrome or some other injury, the consequences can be dire. Long-term disability (with its attendant diminishment of financial well-being) is a real possibility for many workers who fall victim to RSIs. Some unions subsequently asked OSHA to impose minimum ergonomic standards, and OSHA responded by beginning work on basic ergonomic standards for businesses. The agency completed work on their proposal in the late 1990s; in 2000 the administration of President Bill Clinton issued regulations requiring businesses to reimburse injured workers' medical costs, inform workers about repetitive-motion injuries, and compensate them at nearly full salary (90 percent for first 90 days missed) if they miss work due to ergonomic-related injuries. Supporters contended that these new ergonomics program standards would prevent an average of 600,000 ergonomic/musculoskeletal disorders annually (and 4.6 million work-related musculoskeletal injuries over 10 years) and generate $10 billion in savings each year.

Business owners and other opponents, though, claimed that compliance with the new ergonomics standards constituted an unfair burden on small businesses. Some business interests estimated the rules would cost as

much as $100 billion annually (OSHA placed the cost of the new regulations to businesses at $4.5 billion a year). Critics also contended that OSHA overstated the extent of the problem of ergonomic disorders in the workplace. In March 2001, the George W. Bush administration joined with the Republican-controlled Congress to reverse these new work safety rules. This move was widely applauded by small-business owners and various business groups but, not surprisingly, denounced by labor unions and other workers' groups.

In 2009 OSHA proposed new rules which would require employers to report musculoskeletal disorders to health authorities and keep records about such disorders. Currently, such injuries are reported to OSHA in reports under a subheading "all other illnesses." Lobby groups representing business interests voiced concerns that any such moves would place an additional burden of costs on employers.

Whatever the prevailing regulatory atmosphere, numerous business enterprises in a wide variety of industries have shown an increased interest in factoring ergonomics in to their operational strategies, heeding business consultants who claim that an ergonomically sensitive environment can produce major economic benefits for companies. They point out that businesses boasting such environments often see a lower rate of absenteeism, lower health care expenses, lower turnover rates, and higher productivity than do other businesses in the same industry.

For small-business owners, building an ergonomically sensitive work environment can depend on a number of different factors. While instituting an additional work break or two during the workday (a simple step that is sometimes cited as a deterrent to development of carpal tunnel syndrome and other repetition-related injuries) does not require the business owner to make any additional capital expenditures, instituting physical changes can be significantly more expensive, especially for established businesses that are small. Buying ergonomic furniture or making significant changes in assembly line layout can be quite expensive, and while the owner of a new business may choose to take ergonomics into account with his or her initial investment, it may be more difficult for the already-established small-business owner to replace still-functional equipment and furniture. Each small-business owner must determine whether the long-term gains that can be realized from establishing an ergonomically sound workplace (employee retention, productivity, diminished health costs, etc.) make up for the added financial investment (and possible debt) that such expenditures entail.

Since 2003 OSHA has published industry-specific guidelines for preventing ergonomic disorders. These voluntary guides are not legislation and are not enforceable, but do contain guidelines useful to both employers and employees in preventing workplace injuries, specifically musculoskeletal disorders. They are a free resource available to workers and employers committed to preventing workplace ergonomic disorders.

ESTATE TAX

Estate taxes are taxes levied on the value of an estate when it is passed to heirs upon the death of its owner. Estate taxes are often informally referred to as "death taxes" or a "death tax." In the simplest terms, the taxable value of an estate is the gross value of all assets within the estate upon the death of its owner, plus life insurance proceeds, minus outstanding liabilities and the cost of settling the estate. From the resulting value allowable deductions can be made and a well-planned estate is able to minimize the

tax owed through the proper applications of these deductions. When an estate includes the assets from a family farm or a family business, higher deductions are available. Calculating the taxable portion of an estate is a complicated task usually taken on by the executor of an estate, a person named in the decedent's will.

A key feature of the estate tax is that the entire value of an estate is not taxed, resulting in an exemption from this tax for most Americans. Changes in tax law brought about by the Economic Growth and Tax Relief Reconciliation Act (EGTRRA) of 2001 changed estate taxes significantly. EGTRRA increased the exemption rate every 2 years from $1 million in 2003, to $2 million for 2006 to 2008, to $3.5 million in 2009. EGTRRA set the tax to expire completely in 2010, with a "sunset clause" in the law to bring back the estate tax in 2011 in its pre-EGTRRA form, with an exclusion amount of $1 million. EGTRRA also gradually reduced the top marginal federal estate tax rate to a low of 45 percent in 2009.

These changes reduced the already small number of estates subject to federal estate taxes; in 2006 less than 1 percent of all U.S. estates were liable for federal estate taxes; by 2009 that percentage was down to just 0.24 percent. Thus, nearly all Americans are able, if necessary, to pass on all of their assets to heirs on a federal tax-free basis. Many estates, upon the death of one spouse, will transfer, tax free, all assets to the surviving spouse, so long as he or she is a U.S. citizen. The question of estate taxes is, in this way, postponed only to arise again upon the death of the surviving spouse.

ESTATE TAX HISTORY

Many experiments with transfer taxes were undertaken before the federal government enacted the Revenue Act of 1916, which introduced the modern-day income tax and also contained an estate tax with many features of today's system. The act was signed into law during a period of buildup to World War I. This was a time of growing budget deficits. There was also a general concern about the risks posed to a democracy by large concentrations of wealth, the era of the "robber baron" being very much in the lifetime of those governing at the time.

The estate tax rose almost immediately as the United States entered World War I. It continued rising thereafter and reached a top rate of 77 percent for the largest estates during the depression of the 1930s. The rates and the sizes of the estates affected by those rates fluctuated throughout much of the twentieth century. During the late 1960s and early 1970s tax reformers were focused on trying to close the many tax loopholes that had evolved over time. These efforts culminated in a 1976 tax bill that rewrote estate taxation and established the system in place for the rest of the twentieth century.

ARGUMENTS FOR AND AGAINST THE ESTATE TAX

The estate tax is a contentious political issue, subject to frequent debate and likely to continue to undergo yet more change in the 2010s. From 2005 to 2007, efforts were made by the Republican-controlled Congress to make the repeal of the estate tax permanent, but those efforts failed, and when control of Congress switched to the Democratic Party after the 2006 mid-term elections, those efforts were effectively killed. While Democrats retain control of Congress, it seems unlikely that the estate tax repeal will be made permanent, but as political control of Congress remains uncertain in the future, the issue of the estate tax is unlikely to disappear for long.

The positions taken in favor of and against an estate tax tend to rest upon deeply held beliefs. How somebody answers the following questions is a sure predictor of where that person stands on the questions of estate taxation: Do the country's richest citizens owe an extra debt to society? Do they have, in Theodore Roosevelt's words, a "peculiar obligation" to those less fortunate? Estate tax supporters would tend to answer the questions posed in the affirmative.

Supporters of the Estate Tax. Perhaps the principal argument in support of an estate tax is that it helps to make the tax burden on Americans more progressive. Proponents of an estate tax argue that such a tax serves to safeguard against the concentration of wealth and political power in the hands of a tiny minority. This in turn, they suggest, is essential for a healthy democracy. There is an implicit assumption amongst supporters of an estate tax about what is in the common good, and that, as the old French saying goes, "noblesse oblige" (nobility obliges).

The maintenance of a vibrant economy is aided by many commonly funded goods a national infrastructure of roads, waterways, airports, and the like; an educational system open to all; an effective system of public safety and security; a just legal and political system, among others. Those who are most fortunate benefit particularly from these systems and institutions, according to estate tax proponents. They should, consequently, be willing to pay a fair share towards their maintenance.

Critics of the Estate Tax. Critics of the estate tax list three primary objectives to the taxing of accumulated wealth. First, they argue that this form of tax ends up double taxing earned income since at least a portion of any estate is made up of earned income. Second, opponents of an estate tax claim that it has a chilling effect on savings rates and on economic growth by stifling society's proven wealth builders and job creators. Third, those

who wish to repeal the estate tax often state that this tax is a particular burden to family businesses and farms and makes it more difficult to pass on these assets to the next generation who can continue the businesses.

Paul J. Gessing, Director of Government Affairs for the National Taxpayers Union, explains the fundamental objection to an estate tax this way: "While the economic case against the death tax is persuasive enough, the moral case is even more powerful. Because it taxes virtue living frugally and accumulating wealth the tax wastes the talent of able people, both those engaged in enforcing the tax and the probably even greater number engaged in devising arrangements to escape the tax."

Complicating the debate about whether to modify the existing estate tax or repeal it all together is the stark reality of a budget deficit that has grown in every year since 2000 and is forecast by the Congressional Budget Office to continue growing annually for some time. A repeal of the estate tax would exacerbate these annual budget deficits by reducing tax revenues by $20 billion to $60 billion a year.

ESTATE TAX PAYMENT OPTIONS

Usually, taxes on an estate are due 9 months after the death of the estate holder. However, estates involving farms and closely held businesses have the option of making installment payments instead. These installment payments may be spread out over as many as 14 years, and in the first 5 years, only interest is due. Interest charged on the taxes due from these business-related estates is set by the Internal Revenue Service at 4 percent. This permits a business to absorb more easily the cost of estate taxes. The deferred payment plan is jeopardized if the business is broken up or sold during the repayment period. A failure to meet the installment payment schedule may also jeopardize the deferred payment plan.

Minimizing Liability. Managing a business includes taking steps to minimize the tax liability as much as possible. For family-owned, closely held businesses, this planning may include planning around the estate taxes that may be due upon the death of one of its principals. Proper business and estate planning can usually prevent any unexpected or onerous tax burdens.

One step that many companies take in preparing for an expected estate tax bill is to buy life insurance on the owner or owners. The policy should be owned by the company or a life-insurance trust and the proceeds should be kept out of the deceased owner's taxable estate. Planning ahead is very important in this process since many techniques for reducing tax liability require time to implement. The use of "gifting" is one such technique. This involves the annual gift giving that is tax free as long as it does not exceed $12,000 per recipient. The gifts can be in the form of stock or other assets.

Transferring ownership of a business through buy-sell agreements, partnerships, trusts, or outright gifts is a key component in many of the planning strategies available to minimize or eliminate estate tax liability. Business experts caution that taking such steps may be even more important and also even more complicated when a small business is owned by two or more family members, since the business can potentially be hit with estate taxes every time one of the owners dies.

The formation of a family limited trust is another way in which to minimize potential estate tax liability. In the most basic terms, a family limited partnership allows the business to be transferred to the next generation at considerably less than its full value. This reduces the size of the estate and thus the amount of federal taxes owed. Other trusts may also be formed for use in a comprehensive plan but the use of trusts is complicated and is best handled by financial planning experts.

Because of the need for outside expertise, the job of tax planning, and in particular estate tax planning, is a costly one. The expense of such planning is, in fact, one of the arguments used by those who wish to see the estate tax repealed. But, as is true with most business activities, one must deal with the realities of the environment in which one does business. Until the uncertainty surrounding the future of the estate tax is clarified by Congress, family-owned businesses are wise to make thorough and prudent plans for succession, plans that include measures to minimize the potential for estate tax liability.

EUROPEAN UNION (EU)

The European Union (EU), formerly known as the European Community (EC), developed in the 1950s to encourage and oversee political and economic cooperation between numerous European nations. In the over half-century since it was formed, the EU has gradually succeeded in becoming the dominant governing economic body in Europe. Although the EU has not succeeded in forming an entirely unified market of the sort governed by the United States, it now affects nearly every aspect of business in its member states, and standardization and cooperation have made it much easier for foreign companies to do business throughout Europe.

HISTORY

The EU had its origins in an upsurge of warfare that began in 1870 with the Franco-Prussian war and continued through two world wars. With World War II barely over, Winston Churchill gave a speech at Zurich University in which he called for "a kind of United States of Europe." Churchill's was a prominent voice but he expressed what many other leaders in Europe were feeling at the time. Two years later Belgium, France, Luxembourg, the Netherlands, and the United Kingdom formed the West European Union aimed at mutual defense; that same year sixteen other nations joined to form the Organization for European Economic Cooperation (OEEC) to oversee implementation of the U.S.-created Marshall Plan. OEEC later evolved into OECD (Organization for Economic Cooperation and Development), with the United States and Japan joining as well.

Communities: Coal, Atomic Energy, Economics. In 1951 Belgium, West Germany, Luxembourg, France, Italy, and the Netherlands established the European Coal and Steel Community (ECSC) empowered to make decisions about these industries for the group as a whole. Jean Monnet, who had given an influential speech about this subject in 1950, was named as the ECSC president. ECSC was a great success. In 1957 the same six countries created the European Atomic Energy Community (EURATOM) and the European Economic Community (EEC) to handle atomics and economic development in the same way, principally by removing trade barriers and creating a "common market." These "communities," focused on specific areas, were a step toward a greater union.

Maastricht and Beyond. Milestones along the way were the merger, in 1967, of the three "communities" under a single Commission alongside a Council of Ministers and a European Parliament. In 1979 member countries' populations participated in direct elections of members of this parliament. Elections have been held at 5-year intervals since. The Treaty of Maastricht, signed in 1992, created the European Union itself by enabling member states to cooperate in defense and in the areas of justice and home affairs as well. Since 1992 a series of treaties have expanded cooperation, increased the size of the Union, and created a European currency.

Common Policies and Market and a Single Currency The collective aim of these arrangements had always been greater efficiency and the achievement of economic power on a larger and more coordinated scale. Removal of trade barriers, common policies in many fields (agriculture, culture, energy, food purity, transportation, trade), and a common point for negotiating trade and aid agreements have been aims. The EU formed an economic and monetary union in part to implement some of these goals; it created the European Central Bank and projected the use of a single currency, the euro. The euro became the official currency in 2002 of twelve of the then fifteen members: Belgium, Germany, Greece, Spain, France, Ireland, Italy, Luxembourg, the Netherlands, Austria, Portugal, and Finland. Denmark, Sweden, and the United Kingdom retained their own currencies. The eurozone the area in which the euro is the official currency has since expanded to encompass sixteen of the EU's twenty-seven countries. Since it was first introduced, the euro has become an important global currency, and its value

relative to the U.S. dollar has increased from $0.89 when first introduced in 2002 to $1.43 at the end of 2009.

Expansion and Consolidation. In 2002 the EU voted to admit ten additional countries, most of them formerly communist states. In consequence, in 2003, Cyprus, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Slovakia, and Slovenia joined the EU. The Treaty of Nice, which came into force on February 1, 2003, regulated the newly enlarged union. In 2004 the twenty-five member states proposed an EU constitution which would have replaced existing EU treaties with a single governing document. The European Constitution failed to achieve ratification in 2005 when it was rejected by voters in France and Holland. However, the Treaty of Lisbon, which was signed in 2007 and went into force in December 2009, contained most of the changes proposed in the EU Constitution, including the creation of a permanent presidency and foreign minister.

STRUCTURE

The EU's several governing bodies oversee different aspects of the Union's operations. In the past, each country in the Union took turns acting as chairman, with the position changing hands every 6 months, and the operations of different commissions were largely separated. Under the Treaty of Lisbon, important changes were made in the EU's political structure, voting power, and relationships among the EU's governing bodies. There is now a long-term president of the European Council, and the legislative power of the European Parliament the members of whom are directly elected by the people of each nation has been expanded. There is a tighter integration of governing bodies and a more explicit division of powers between the member states and the Union.

Despite these changes, the EU has not yet become a sovereign entity comparable to the United States. Although the EU has been gradually evolving in that direction, the EU was and largely remains an economic venture intended to present to the world a single, large market like that of the United States. In this respect, the EU has largely been successful, though with some limitations and qualifications. Regulations and import laws are now standardized, making it much easier for foreign businesses dealing with European customers. Instead of dealing with twenty-seven separate states, each with specific rules, foreign businesses can deal with a single set of standards and requirements set by the European Parliament and various other agencies of the EU. But the eurozone covers only sixteen of the EU's twenty-seven member states, forcing those doing business throughout the EU to continue operating with a variety of national currencies. The failure of the European Constitution in 2005, and the fact that many member states have not moved to accept a continent-wide currency, shows the continued reluctance of some EU members to embrace a fully integrated political and economic system such as the one that functions in the United States.

EXPENSE ACCOUNTS

Expense accounts, also called expense allowances, are plans under which companies reimburse employees for business-related expenses. These expenses include travel, entertainment, gifts, and other expenses related to the employer's business activity. Of particular interest to businesses and their employees is the tax treatment of business-related expenses, the types of expenses for which employees will be reimbursed, and the manner in which those reimbursements are made.

For tax purposes a company's expense account plan is either accountable or nonaccountable. An "accountable" plan must meet the certain requirements of the Internal Revenue Service: there must be a business connection; expenses must be substantiated (usually through a receipt); and any amount received by an employee in excess of actual expenses must be returned to the employer. Substantiation means that the employer must be able to identify the specific nature of each expense and determine that the expense was business-related. Expenses may not be aggregated into broad categories, and they may not be reported using vague terminology. If the company's plan

is in fact an accountable plan, then all money received by an employee under the plan is excluded from the employee's gross income. It is not reported as wages or other compensation, and it is exempt from withholding.

Companies that fail to require employees to substantiate their expenses or allow employees to retain amounts in excess of substantiated expenses are considered by the IRS to have "nonaccountable" plans. Funds employees receive under nonaccountable plans are treated as income, subject to withholding, and such expenses are deductible by the employee only as a miscellaneous itemized deduction. Even then, the expenses are deductible only if they exceed 2 percent of the employee's adjusted gross income.

The tax laws affecting business-related expenses change at intervals as the IRS revises its regulations based on its own experience and on economic changes. In 1994, for example, deductions for meal expenses were reduced from 80 percent to 50 percent. In 2008 the level was changed back to 80 percent. When gas prices began increasing significantly in the middle of the first decade of the twenty-first century, the IRS began raising the standard mileage rate for operating one's own vehicle. In 2008 the deduction was raised to 50.5 cents per mile for the first half of the year and then increased again mid-year to 58.5 cents.

Changes are also triggered by the passage of new legislation. The corporate scandals of Enron and World-Com resulted in legislation, the Sarbanes-Oxley Act of 2002, which requires much closer tracking and record keeping by publicly traded corporations. Sarbanes-Oxley is unlikely to affect most small businesses, but fall-out in the form of tightened record-keeping requirements or revised per-diem rates permitted by the IRS is a concern.

For this reason, it is in the best interests of both employer and employee that all affected parties have a complete understanding of expense accounts and reimbursable expenses. Employees who find that they are incurring business-related expenses need to determine from their employer exactly what types of expenses are reimbursable, and companies especially small business owners need to make sure that employees do not take advantage of expense account policies with excessive spending on lodging, food, and entertainment never mind fraudulent reporting thereof. In an effort to control spiraling travel and other business-related expenses, some companies have developed reimbursement policies that spell out in detail the various travel expenses that qualify for reimbursement.

SPECIFIC EXPENSE ACCOUNT POLICIES FOR THE SMALL BUSINESS

Small-business owners are encouraged to document carefully all business-related expenses, both for tax purposes and to minimize their exposure to expense account fraud by employees. Specific steps and policies that should be considered include:

1. Establish strong internal control systems for tracking expense accounts and activities. These systems include written policies for expense reporting and reimbursement, including what can and cannot be expensed, regular schedules for submitting expense account reports, and original documentation requirements (receipts) for confirmation of expenses. In her 2009 book *Taxpertise*, Bonnie Lee suggested that businesses take as many expenses as the law permits, but since laws can sometimes be vague she also recommended over-documenting for some less-standard expenses. For instance, if a person has a business dinner at his or her home, Lee advised keeping the grocery receipt, the invitation, and maybe even a photograph of the event in case verification of this expense is required in an audit.
2. Institute report procedures to verify legitimacy of submitted expenses. Steps that can be taken in this regard include uniform standards for review of expense reports, comparisons of year-to-year costs, comparisons of submitted mileage expenses with actual mileage information for areas traveled (which can be obtained easily via various Internet travel sites). It is also important to make certain that the person processing the receipts and expense accounts is aware of possibility of this type of fraud. In 2009 a New York University employee was found to have been pulling receipts out of a liquor store trash can near campus and turning them in as his own receipts for reimbursement. The university reimbursed him $409,000 over 6 years. It was not until a student worker became suspicious that the deceit was discovered. This fraud could have been discovered much earlier had there been more a careful examination of the receipts the employee was turning in.
3. Establish and maintain careful hiring practices, including comprehensive background/reference checks, before hiring new employees. Companies that take the extra effort to find quality employees for their work force are less vulnerable to fraudulent activity.
4. Be careful not to institute unreasonably stingy policies. Expense accounts, if left unmonitored, can develop into a significant source of income loss for small businesses. But owners and managers should also realize that today's competitive business environment requires many companies to devote considerable financial resources to entertaining clients

and business partners in order to ensure a stable and positive relationship.

EXPORT-IMPORT BANK

The United States Export-Import (Ex-Im) Bank, first established in 1934 by an executive order of President Franklin D. Roosevelt, was made an independent agency of the executive branch in 1945. It was created to help finance U.S. exports to industrializing and developing markets by providing loans, credit guarantees, and insurance. According to the agency's Mission Statement, "Ex-Im Bank enables U.S. companies large and small to turn export opportunities into real sales that help to maintain and create U.S. jobs and contribute to a stronger national economy." In its decades-long history, the agency has supported hundreds of billions of dollars in U.S. exports, and it continues to make efforts to improve U.S. exports. With American exports sagging because of the recession that began in 2008, and the United States already suffering from a large trade imbalance the trade deficit was nearly $400 billion in 2009 the Ex-Im Bank has adopted President Barack Obama's goal of doubling U.S. exports in 5 years.

Because of its mandate, the Ex-Im Bank is one of the most viable sources of financing for small and mid-sized exporters. As the agency states, "No transaction is too large or too small. On average, 85% of our transactions directly benefit U.S. small businesses." In Fiscal Year 2009, the bank approved a total of 2,891 transactions, with 2,540 of these transactions 88 percent involving small businesses. The bank authorized a total of $21 billion in loans, guarantees, and export-credit insurance, of which $4.4 billion were in direct support of small businesses. The importance of the Ex-Im Bank is underscored by the continued reluctance of many banks to make loans for international trade purposes, despite the growing consensus that international markets are a potentially lucrative new area for many small businesses to explore.

As Jan Alexander wrote in *Working Woman*, "You've seen the statistics on the economic benefits of exporting. You've read the success stories about small companies that quadrupled their revenues through international sales. All you need is a little extra cash to get things started." But since "loan officers in the U.S. have a tendency to see nearly all foreign markets as unpredictable and all loans associated with foreign expansion as very risky," said Alexander, organizations like the Export-Import Bank and the Small Business Administration (SBA) "have a mandate to help American businesses each step of the way, offering instruction and support in everything from identifying viable foreign markets to closing and financing the deal." The Export-Import Bank confirms as much in its own words. "We want to ensure that no innovative small company loses the opportunity to make a foreign sale because it lacks working capital or competitive export financing," stated one Ex-Im executive in *Business America*.

Indeed, organizations such as the Ex-Im Bank are widely recognized as a valuable resource for small businesses that might otherwise be wholly muscled out of international markets by larger competitors. "Small business and middle market companies must be aware of the existence of export financing programs that can help them increase their export sales by providing access to competitively priced working capital financing," said William Easton in *Business Credit*. "Historically, small businesses and middle market companies have experienced a significant competitive disadvantage in obtaining working capital financing versus larger Fortune 500 companies." The programs maintained by the Ex-Im Bank are designed to address these competitive disadvantages.

PRIMARY EX IM PROGRAMS

The primary way in which the Ex-Im Bank aids small and medium-sized U.S. exporters is through one or more of its financing programs. These are summarized as follows:

Working Capital Guarantee Program (WCGP). The Working Capital Guarantee Program, which is operated

in conjunction with the SBA's Export Working Capital Program, assists small business exporters in obtaining the capital they need to purchase inventory or raw materials, market exports, or engage in manufacturing activities. The program guarantees 90 percent of the principal and interest on working capital loans extended by commercial lenders to eligible exporters, provided the loan is fully collateralized (through inventory, accounts receivable, or other means). The loan amount may be used for a variety of business purposes, including purchase of raw materials, purchase of inventory, or manufacturing expenses (including cost of labor, engineering, and other services).

Export Credit Insurance Program. The Export-Import Bank makes available credit insurance to qualified small businesses. This insurance, which may be obtained directly or via an insurance broker, consists of a wide variety of policies designed to protect businesses against losses incurred in developing countries, where commercial and political developments can trigger defaults. In FY 2009, small businesses received $2.7 billion in credit insurance authorizations out of a total of $6.5 billion provided to businesses of all sizes. Specifically, this program: 1) protects the exporter against the failure of foreign buyers to make payment because of national political and/or economic developments; 2) encourages exporters to offer international buyers competitive terms of payment; and 3) gives exporters and their lending institutions greater financial flexibility in handling overseas accounts receivable (policies are assignable from the insured exporter to financial institutions).

Small Business Insurance Policy Program. The Export-Import Bank provides short-term (no more than 180 days) policies designed to address the unique credit requirements of smaller, newer exporters. Under the policy, Ex-Im Bank assumes 95 percent of the commercial and 100 percent of the political risk involved in extending credit to the exporter's overseas customers. "This policy frees the exporter from 'first loss' commercial risk deductible provisions that are usually found in regular insurance policies," stated the Ex-Im Bank. "It is a multi-buyer type policy which requires the exporter to insure all export credit sales. It offers a special 'hold-harmless' assignment of proceeds which makes the financing of insured receivables more attractive to banks."

Short-Term Single Buyer Program. This option is available to exporters who do not wish to insure all their short-term credit sales under a multibuyer policy when they are in fact making single or multiple sales to the same buyer. The policy offers 90 percent to 100 percent coverage for both political and commercial risks of default, depending on buyer, term of sale, and type of product. It has no deductible, and small businesses are eligible for special reduced premiums.

Other notable programs offered by the Ex-Im Bank include:

- Umbrella Policy. This allows state agencies, export trading and management companies, insurance brokers, and other agencies to act as intermediaries between the Bank and their clients.
- Medium-Term Insurance. This comprehensive (100 percent) coverage is available to exporters of capital goods or services in amounts of $10 million or less and terms up to 5 years.
- Guarantees to Foreign Buyers. Various loans and guarantees of commercial financing can be extended to foreign purchasers of U.S. capital goods and related services.
- Guarantees of repayment protection for private sector loans to buyers of U.S. capital goods and related services.
- Programs supporting the export of environmentally beneficial goods and services and renewable energy. In FY 2009, the bank authorized $363 million in financing that supported an estimated $640 million in exports of environmentally beneficial goods and services, and it authorized $101 million for transactions that supported U.S. renewable energy exports.
- Seminars and Briefing Programs. Available to members of the small business community, these discussions and seminars cover a variety of exporting topics.

More information on these and other Ex-Im offerings can be obtained by contacting the bank's central headquarters in Washington, D.C., or one of its regional offices across the United States. More information on these centers, or on any of the institution's other programs and services, can be obtained by calling 1-800-565-EXIM or accessing the bank' Web site at http://www.exim.gov. In addition, the United States maintains fourteen U.S. Export Assistance Centers (USEACs) that serve as one-stop centers for export-related services of the Ex-Im Bank and other agencies, including the Small Business Administration and the Department of Commerce.

EXPORTING

Any enterprise doing business in the United States can also sell goods and services to customers located in foreign countries. A business engaged in such transactions is said to be exporting or to be an exporter. In functional terms the business is still doing what it always does selling and delivering goods or services but now across a border. The special phrase is used because export trade involves unusual arrangements. Exporting brings special benefits to the U.S. economy as a whole; for this reason government assistance is available to the business wishing to sell abroad ranging from technical and marketing assistance to financing and guarantees of various sorts. Trade assistance is available to the small business from the Small Business Administration (SBA), the Export-Import Bank, the U.S. Department of Commerce (DOC), and frequently also from state government agencies. Trade associations also provide substantial services to the small business.

Under normal circumstances the small business will "run into" or "chance upon" export opportunities in the course of doing business by meeting potential buyers at a trade show, for example, by attending some event sponsored by a governmental agency, or hearing of some unusual opportunity. Businesses located in states that border Canada or Mexico sometimes "grow up" exporting as a matter of course. In the Internet age businesses also sometimes get leads and inquiries because they have Web pages visible to foreigners; then, following up one or more promising leads, the business will discover the difficulties of exporting, learn the way to do it by getting help from a government agency, and, after a while, discover that it has added a substantial bit of sales to its business. Another natural route into exporting comes from the owner's personal interests in a foreign country; in the pursuit of that interest, business linkages may develop as well.

WHO, WHY, AND WHY NOT

Most advice to small business about exporting what to do, what to avoid, how to go about it comes from experts in government agencies who actively participate in brokering foreign trade. The broad consensus of such expertise may be summed up under three rules: 1) the business should be doing well in the domestic market before it attempts to sell abroad; exporting is not a cure for a faltering enterprise; 2) the business should have an innovative or unusual product or service in order to differentiate itself; and 3) the business should first do the necessary homework before incurring expenses some of which may well be wasted. SBA's guide shows the following advantages and disadvantages:

Advantages include some of the following:

- Increased sales and profits.
- Reduced dependence on local markets.
- Leveraged use of corporate technology and know-how.
- Potentially less seasonal variation in sales.
- Full use of production capacity.
- Better information about foreign competition.

These positives are balanced by some negatives:

- Need for additional staff.
- Higher travel expenses.
- Product modification for the new market.
- New promotional material.
- Higher administrative costs.
- Need for additional financing.
- Need for special export licenses.
- Slower payment of receivables.

The SBA comments on this list as follows. "The disadvantages may justify a decision to forego direct exporting at the present time, although your company may be able to pursue exporting through an intermediary. If your company's financial situation is weak, attempting to sell into foreign markets may be ill-timed. The decision to export needs to be based on careful analysis and sound planning." The list of negatives also suggests that the business owner has a fairly steep mountain of knowledge to climb: exporting is *not* business as usual.

EXPORT CHANNELS

Businesses will typically choose to sell to foreign markets directly or through intermediaries, the channel likely to be chosen because the opportunity came to the business in a certain way. A business that began exporting in response to an inquiry by a foreign retailer, for instance, will likely sell directly and then, later, applying the experience gained in the process, expand by contacting other retailers. Instead of a retailer, inquiries may have come from foreign individuals by way of the Internet and direct sales to the final customers may become the type of exporting in the business. If the impetus came by way of a solicitation from an export management or an export trading company (EMCs and ETCs respectively), the business is likely to cut its teeth in a relationship with one of these intermediaries and thus begin indirect exporting.

Direct Exporting. Direct exporting may involve the business in selling abroad and, if entirely managed in-house, will require the business to master the administrative requirement of exporting in order to deliver the goods to the customer. If selling costs are high or the administrative learning curve proves to be steep, employment of sales agents already skilled in the process may be an alternative. A commonly utilized method is to use specialized distributors. These can be found through the Department of Commerce's Agent/Distributor Service program, trade associations, and U.S. and foreign chambers of commerce located in targeted foreign markets. The legal agreement between a company and a distributor can be tricky enough so that using a legal or accounting professional in its review may be advisable.

If the business has no leads as yet and wishes to find foreign buyers, the Small Business Administration recommends several different approaches. Advertising in trade journals especially the DOC's widely read *Commercial News USA* is commonly cited as an effective way of publicizing a small business's product line to overseas markets, as are catalog and video/catalog exhibitions. Trade shows and trade missions are other potentially valuable avenues to explore, but the SBA also encourages small-business owners to be proactive in their approach to finding buyers for their products. "Rather than wait for potential foreign customers to contact you," suggests the SBA, "another option is to search out foreign companies looking for the particular product you produce" by investigating information held on the DOC's Economic Bulletin Board and other government and business sources.

Indirect Exporting. Export management companies represent the interests of a range of companies; acting as agents for their client companies, EMCs solicit and transact business with prospective foreign buyers. Unlike distributors, however, they do not handle financial matters. The business is responsible for its own debt collection. EMCs typically handle market research, assess the viability of various distribution channels, arrange financing, handle export logistics (prepare invoices, arrange insurance, etc.), and provide legal advice on trade matters. Some EMCs also provide help in negotiating export contracts and after-sales support.

Export trading companies are similar to EMCs in many functional respects, but their standing is more neutral. ETCs act as agents between buyers and sellers, directly paying manufacturers for goods that they subsequently sell to purchasers. Since a small business does not have to rely on the end purchaser to receive compensation under this arrangement, an ETC is seen as a fairly risk-free indirect exporting option. ETC cooperatives, meanwhile, are described by the SBA as U.S. government-sanctioned cooperatives of companies with similar product lines who are interested in securing increased foreign market share. Agricultural interests and trade associations have enjoyed notable success with such cooperatives over the years.

Finally, small companies that choose not to enter into any of the above agreements may still explore foreign markets through agreements with export merchants or via a practice commonly known as "piggyback exporting." Export merchants or agents are businessmen and women who will purchase and repackage products for export. They assume all risks associated with selling the goods, but analysts caution that such arrangements can also compromise a business's control over the pricing and marketing of its product in key markets. Piggyback exporting, meanwhile, is a practice wherein another company armed with an already-established export distribution system sells both its own products and those of other, often smaller enterprises who are not similarly equipped.

WHERE TO GET HELP

A wide range of sources are available to help the small-business owner research these issues. Trade associations, exporters' associations, state and federal government agencies, and foreign governments are all potential sources of valuable information.

Relevant trade associations include the Small Business Exporter's Association, the American Association of Exporters and Importers, the National Association of Export Companies (NEXCO), the National Federation of Export Associations (NFEA), and the National Federation of International Trade Associations (NFITA). In addition, there are in the United States more than 5,000 trade and professional organizations with a wide range of industry specializations, many of which actively promote exporting among their members. The federal government, meanwhile, maintains a number of agencies that can be tremendously helpful to the small-business owner who is pondering expansion into international markets. These

include the United States and Foreign Commercial Service (US&FCS), the Small Business Administration and its various programs (Service Corps of Retired Executives-SCORE, Small Business Development Centers-SBDCs, Small Business Institute-SBI), and the International Trade Administration (ITA), which is an arm of the U.S. Department of Commerce. Resources available through the ITA include international trade specialists and District Export Councils (DECs). The latter groups, which are scattered around the country, are comprised of thousands of executives with experience in international trade who have volunteered their time to help small businesses.

Finally, the U.S. government maintains several databases that can provide small-business owners with important data on various exporting factors. These are the SBA's Automated Trade Locator Assistance System (SBAtlas), the National Trade Data Bank (NTDB), and Foreign Trade Report FT925. SBAtlas provides current market information to SBA clients on world markets suitable for their products and services. Foreign Trade Report FT925, meanwhile, provides users with a monthly breakdown of imports and exports by Standard Industrial Trade Classification (SITC) number for each country. The National Trade Data Bank, which is maintained by the Department of Commerce, includes thousands of government documents on various aspects of export promotion and international economics. The DOC also operates the Trade Opportunity Program (TOP), which provides companies with current sales leads from international firms seeking to buy or represent their products or services, and maintains the Commercial Service International Contacts List, which provides the name and contact information for foreign agents, distributors, and importers interested in working with U.S. exporters.

WHERE TO FINANCE

Government agencies are able to provide financial help for small businesses that want to break into the export market or expand their export operations. The Export-Import Bank of the United States and the Small Business Administration are two of the most helpful agencies. In Fiscal Year 2009, the bank approved a total of 2,891 transactions, with 2,540 of these transactions 88 percent involving small businesses. The bank authorized a total of $21 billion in loans, guarantees, and export-credit insurance, of which $4.4 billion were in direct support of small businesses. Nor was FY 2009 unusual for the Ex-Im Bank. To be sure, these small businesses were unlikely to have been two- or three-employee shops but substantially larger (the bank did not provide a size breakdown). Nevertheless, the sheer numbers involved suggest that smallness is not a barrier to exporting. The SBA adds, by way of confirmation (in its introduction to *Breaking into the Trade Game: A Small Business Guide*) that small businesses represent 97 percent of all U.S. exporters.

The SBA runs two specialized export loan guarantee programs: 1) the Export Express Program, which provides loans of up to $250,000 for exporters just getting started; and 2) the Export Working Capital Program, a co-guaranteed program with the Export-Import Bank, which focuses solely on export transaction financing with loans of up to $2 million. In its response to the recession that began in 2008, the federal government took strong action to improve the export viability of small businesses. The American Recovery and Reinvestment Act of 2009 provided the SBA with extra funds for its loan guarantee programs and allowed the SBA to waive certain fees in order to make it easier for small businesses to finance export operations.

EXPORTING—FINANCING AND PRICING

The financing of export sales concerns arrangements to get payment for the goods shipped or the services provided exactly the same issue domestically as well, but in the foreign setting the seller's power and leverage, ability to

assess creditworthiness, and his or her ability to collect are constrained by distance and differences in the legal system. For this reason export financing is a specialty and is handled as a distinct transaction of all export deals. Export pricing, similarly, is the same issue as domestic pricing but it must be based on the conditions prevailing in a foreign economy as well as on the currency-exchange market

MODES OF PAYMENT

In the overwhelming majority of business-to-business transactions domestically, the payment mechanism used is "open account," meaning that goods are shipped by the seller and then billed, with payment expected within 30 days. Occasionally the seller will require "payment in advance" from customers who have a poor credit rating or credit history. Occasionally as well, by prior arrangement, goods are shipped "on consignment" to a buyer, meaning that payment is received only after the buyer in turn has sold the goods and not before.

All three of these modes of payment are used in foreign trade, but because of the special situation prevailing between distant sellers and buyers in different countries, what best suits the seller very rarely pleases the buyer, and vice versa. The respected foreign buyer, for example, does not want to pay in advance risking that some little business far away fails to deliver. The relatively weak seller does not wish to sell on open account risking very costly collection efforts if the buyer, far away, fails to pay. Shipping on consignment has the same risks for the seller, with the additional problem of waiting for a sale hundreds or thousands of miles away. For these reasons two other major forms of payment are commonly used in foreign trade: letters of credit and documentary collection.

Letters of Credit. Letters of credit (LCs) are issued by banks and, in effect, guarantee that the importer's credit is good. Under this arrangement, the bank makes payment to the importer. Financial experts note that if a letter of credit comes from a U.S. bank, it virtually eliminates the commercial credit risk of an export sale. In other words, the exporter is assured of receiving his or her due compensation for the sale. The terms of an irrevocable letter of credit cannot be changed without the express permission of the exporter once it has been opened. The letter of credit also extends some protection to importers: it includes steps that ensure that the exporter has fully complied with the terms of sale discussed in the LC. But some importers balk at the added costs that LC arrangements bring on them. LC's generally cost an additional 1 percent of the contracted amount, a percentage that is not insignificant when operating with a small profit margin.

Documentary Collection. Documentary Collection, also known as a draft, is roughly equivalent to cash on delivery. Under this system of payment, a draft is drawn that requires the buyer to make payment either on sight (sight draft) or by a specified date (time draft). Legal possession of the products does not pass from the exporter to the importer until the draft has been paid or accepted. Analysts note that this arrangement serves to protect both parties, although an exporter may still have to pursue legal options to secure payment if the buyer defaults.

Trade Financing. Trade financing is borrowing specifically for an export venture, with the loan backed by the export inventory and the accounts payable due to the seller after completion of the sale. Trade finance loans are self-liquidating, meaning that proceeds of the sale are first used to pay off the loan; the remainder, thereafter, is credited to the borrower. These are project-oriented loans and quite unlike ordinary working capital loans. If the business does not need up-front money for raw materials and labor, it may still wish to engage in more limited trade financing, especially if payments of receivables are likely to be slow. This type of financing involves sales of the receivables to a third party or borrowing on the receivables themselves.

Sources of trade financing are: 1) banks; 2) factoring houses; 3) export trading companies; 4) export management companies; 5) private trade finance companies; and 6) U.S. government agencies.

The small business's local bank may be a very good source of financing if it is experienced in international trade, has a department specializing in such business, or is affiliated with another bank with which it routinely deals on such transactions. For trade financing particularly, the U.S. Small Business Administration (SBA) recommends the business owner to work with an experienced international banker. As always when obtaining any kind of credit, but especially in dealing with a bank on international ventures, the owner should anticipate having to provide financial statements, business plans, and other documentation all depending on the size and nature of the transaction.

Factoring houses purchase export receivables but at a discount. They may also act as middlemen (the word "factor" means "agent," derived from "doer"). They will purchase exports but at a certain percentage below invoice value; the percentage rate will be dependent on, among other things, the intended market and the type of buyer. Under this arrangement, the exporter does not receive full value for its goods but gets paid immediately and does not have to worry about future collection hassles with foreign customers who are tardy with their payments. Export trading companies (ETCs) and export management companies (EMCs) provide assistance in arranging financing for exporters. In addition they may

offer a wide range of potentially helpful other services, including international market research, legal assistance, insurance, administration, warehousing and distribution, and product design. Private trade finance companies provide a range of financing options to small businesses in exchange for fees, commissions, or outright involvement in the transactions under consideration.

Finally, small-business owners may choose to seek assistance from the government. Several federal agencies and some state agencies maintain programs that offer financial aid to small enterprises seeking to sell to foreign markets. Two of the SBA's programs offer specialized export loan guarantee programs. The Export Express Program provides loans of up to $250,000 for exporters just getting started, while the Export Working Capital Program focuses solely on providing financing for export transactions with loans of up to $2 million.

Businesses may also seek loans through the Small Business Investment Company (SBIC), the Department of Agriculture's Commodity Credit Corporation (CCC), or the Export-Import Bank of the United States (Ex-Im Bank). The latter an independent federal agency charged with assisting U.S. exporters of goods and services through a wide range of programs is widely considered one of the most viable sources of financing for small businesses. The bank's mission includes helping businesses "in financing the export of U.S. goods and services to international markets," and it is particularly oriented towards helping small businesses. An average of around 85 percent of the Ex-Im Bank's annual transactions directly benefit U.S. small businesses. In Fiscal Year 2009, 88 percent of the bank's 2,891 transactions involved small businesses, and the bank authorized $4.4 billion in direct support of small businesses. The importance of the Ex-Im Bank's operations increased during the 2008 2009 credit crisis, when it became even more difficult for all businesses, and small businesses in particular, to obtain credit.

Some small-business owners choose to secure financing for deals in moderate- to high-risk emerging markets through the Overseas Private Investment Corporation (OPIC), another independent federal agency that guarantees or provides project loans to American companies in developing nations around the world. There are also export assistance programs maintained in cooperation with various state governments.

PRICING FOR THE FOREIGN MARKET

Pricing for the foreign market as for the domestic is a circular process which involves market research to determine current pricing structures in the targeted market, estimating the cost of production to see if prevailing prices can support the production, projecting a tentative price, testing it in the market if possible, and then making changes in production, packaging, distribution, and marketing until the "right" price emerges. The difference lies in such factors as currency conversion, difficulties in getting information, additional costs associated with foreign trade which may impose higher costs (fees, licenses, etc.), translation costs, special packaging requirements, and higher costs of money (if payments are slow or must be discounted to factoring companies).

It is obvious from this brief sketch above that the business with good market contacts and well-developed sources of information will be more successful in setting the right price yielding the maximum profit than a business largely groping in the dark or pricing entirely by analogy to the domestic market.

SBA's principal guide (*Breaking into the Trade Game: A Small Business Guide*) recommends that the business develop its cost picture based on the marginal-cost method, assuming that export sales are "additional" sales. Under this method, all costs are classified as fixed or variable. If the business is profitable now and the owner does not need to add buildings or machinery to produce for export, these "fixed" costs are excluded from the costing and only "variable" costs of raw materials, purchased parts, energy, and labor are measured. To these costs are added export costs unique to that business along with prorated overhead costs. Thus if the export sale represents 8 percent of total sales, 8 percent of overhead costs would be added. The anticipated profit would then be added to determine a tentative initial price from the business's own point of view.

With price initially set, the business needs some data about pricing in the target market. According to the SBA, "pricing information can be obtained in several ways: a) from overseas distributors and agents of similar products of equivalent quality; b) whenever feasible, traveling to the country where your products will be sold to gather information; and c) through the U.S. Commercial Service which can assist in determining appropriate prices through its *Customized Sales Survey*." The federal government also offers customized market research and due diligence reports on potential overseas business partners through Export.gov. Export.gov also links to various government agencies with public databases that offer guidance, market research information, and business leads.

Foreign Pricing. Prices obtained must be translated to U.S. dollars before comparisons to the business's own "tentative price" can be made. If the business has a genuinely innovative product, comparisons will not be exact because products now sold may not offer the company's superior features. But the "market prices" will be an indicator both of the venture's feasibility and likely

degree of success. If pricing in the market is generally lower but the company's product has desirable features, a green light may flash immediately if those features are obvious. If not, marketing expenses may have to be raised and the process of pricing iterated. Sometimes the "feature" of the company's product may be precisely that it is inexpensive yet in all other ways equivalent. In that case, too, additional costs may be indicated to get the message of quality and durability across or, if the price differential is high in favor of the seller, perhaps the price needs to be hiked.

Currency values fluctuate, in some markets more than others. In the early twenty-first century, the value of the U.S. dollar relative to major world currencies has fluctuated quite significantly. For instance, from February 2009 to September 2009, the exchange rate from U.S. dollars to European euros went from $0.79 to $0.68, a drop of approximately 14 percent. For this reason the SBA recommends that small businesses new to exporting arrange transactions in U.S. dollars; that is, they should both price their goods and request payment for them in U.S. dollars. If a buyer balks at conducting the transaction in U.S. dollars, an exporter can still protect him- or herself through factoring or hedging. Hedging guarantees a set exchange rate through the use of option and forward contracts, but these types of transactions involve the small business in activities likely to be far removed from its core business.

The small business pursuing export business with some care and tenacity will, needless to say, develop a fairly extensive circle of advisors and participants so that neither its financing nor its pricing activities will be taking place in a vacuum. Aside from having something of real value to sell, the most important factor for success will be information about the market, about methods of financing, channels of distribution, and (not least) about the customer. The more extensive the business's contacts and the more intensive its relationships, the better will be its information and the more refined will be its pricing.

FACILITY LAYOUT AND DESIGN

Facility layout and design is an important component of a business's overall operations, both in terms of maximizing the effectiveness of the production process and meeting the needs of employees. The basic objective of layout is to ensure a smooth flow of work, material, and information through a system. The basic meaning of facility is the space in which a business's activities take place. The layout and design of that space impact greatly how the work is done the flow of work, materials, and information through the system. The key to good facility layout and design is the integration of the needs of people (personnel and customers), materials (raw, finishes, and in process), and machinery in such a way that they create a single, well-functioning system. In his 2010 book *Facilities Planning*, James Tomkins points out that facilities planning has gone from being a science to being a strategy. Within the competitive global marketplace, Tomkins says, "it is important to recognize that contemporary facilities planning considers the facility as a dynamic entity and that a key requirement for a successful facilities plan is its adaptability and its ability to become suitable for new use."

FACTORS IN DETERMINING LAYOUT AND DESIGN

Small-business owners need to consider many operational factors when building or renovating a facility for maximum layout effectiveness. These criteria include the following:

1. Ease of future expansion or change. Facilities should be designed so that they can be easily expanded or adjusted to meet changing production needs. "Although redesigning a facility is a major, expensive undertaking not to be done lightly, there is always the possibility that a redesign will be necessary," said Howard J. Weiss and Mark E. Gershon in their book *Production and Operations Management*. "Therefore, any design should be flexible.... Flexible manufacturing systems most often are highly automated facilities having intermediate-volume production of a variety of products. Their goal is to minimize changeover or setup times for producing the different products while still achieving close to assembly line (single-product) production rates."
2. Flow of movement. The facility design should reflect a recognition of the importance of smooth process flow. In the case of factory facilities, the editors of *How to Run a Small Business* state that "ideally, the plan will show the raw materials entering your plant at one end and the finished product emerging at the other. The flow need not be a straight line. Parallel flows, U-shaped patterns, or even a zig-zag that ends up with the finished product back at the shipping and receiving bays can be functional. However, backtracking is to be avoided in whatever pattern is chosen. When parts and materials move against or across the overall flow, personnel and paperwork become confused, parts become lost, and the attainment of coordination becomes complicated."
3. Materials handling. Small-business owners should make certain that the facility layout makes it possible to handle materials (products, equipment, containers, etc.) in an orderly, efficient, and preferably simple manner.

4. Output needs. The facility should be laid out in a way that is conducive to helping the business meet its production needs.
5. Space utilization. This aspect of facility design includes everything from making sure that traffic lanes are wide enough to making certain that inventory storage warehouses or rooms utilize as much vertical space as possible.
6. Shipping and receiving. The J. K. Lasser Institute counseled small-business owners to leave ample room for this aspect of operations. "While space does tend to fill itself up, receiving and shipping rarely get enough space for the work to be done effectively," the institute wrote in *How to Run a Small Business.*
7. Ease of communication and support. Facilities should be laid out so that communication within various areas of the business and interactions with vendors and customers can be done in an easy and effective manner. Similarly, support areas should be stationed in areas that help them to serve operating areas.
8. Impact on employee morale and job satisfaction. Since countless studies have indicated that employee morale has a major impact on productivity, Weiss and Gershon counsel owners and managers to heed this factor when pondering facility design alternatives: "Some ways layout design can increase morale are obvious, such as providing for light-colored walls, windows, space. Other ways are less obvious and not directly related to the production process. Some examples are including a cafeteria or even a gymnasium in the facility design. Again, though, there are costs to be traded off. That is, does the increase in morale due to a cafeteria increase productivity to the extent that the increased productivity covers the cost of building and staffing the cafeteria." Internet-based companies such as Google put a strong emphasis on creating an environment that positively effects company morale. These companies believe more strongly in people than systems.
9. Promotional value. If the business commonly receives visitors in the form of customers, vendors, and investors, the small-business owner may want to make sure that the facility layout is an attractive one that further burnishes the company's reputation. Design factors that can influence the degree of attractiveness of a facility include not only the design of the production area itself, but the impact that it has on, for instance, ease of fulfilling maintenance and cleaning tasks.
10. Safety. The facility layout should enable the business to effectively operate in accordance with Occupational Safety and Health Administration guidelines and other legal restrictions.

"Facility layout must be considered very carefully because we do not want to constantly redesign the facility," summarized Weiss and Gershon. "Some of the goals in designing the facility are to ensure a minimum amount of materials handling, to avoid bottlenecks, to minimize machine interference, to ensure high employee morale and safety, and to ensure flexibility. Essentially, there are two distinct types of layout. *Product layout* is synonymous with assembly line and is oriented toward the products that are being made. *Process layout* is oriented around the processes that are used to make the products. Generally, product layout is applicable for high-volume repetitive operations, while process layout is applicable for low-volume custom-made goods."

DIFFERENCES BETWEEN OFFICE AND FACTORY LAYOUTS

Offices and manufacturing facilities are typically designed in much different ways a reflection of the disparate products that the two entities make. "A factory produces things," wrote Stephen Konz in *Facility Design.* "These things are moved with conveyors and lift trucks; factory utilities include gas, water, compressed air, waste disposal, and large amounts of power as well as telephones and computer networks. A layout criterion is minimization of transportation cost." Konz pointed out, however, that the mandate of business offices is to produce information, whether disseminated in physical (reports, memos, and other documents), electronic (computer files), or oral (telephone, face-to-face encounters) form. "Office layout criteria, although hard to quantify, are minimization of communication cost and maximization of employee productivity," wrote Konz.

Layout requirements can also differ dramatically by industry. The needs of service-oriented businesses, for instance, are often predicated on whether customers receive their services at the physical location of the business (such as at a bank or pet grooming shop, for instance) or whether the business goes to the customer's home or place of business to provide the service (as with exterminators, home repair businesses, plumbing services, and so forth). In the latter instances, these businesses will likely have facility layouts that emphasize storage space for equipment, chemicals, and paperwork rather than spacious customer waiting areas. Manufacturers may also have significantly different facility layouts, depending on the unique needs that they have. After all, the production challenges associated with producing jars of varnish or mountaineering equipment are apt to be considerably different than those of making truck chassis or foam beach toys. Retail outlets comprise yet another business sector that has unique facility layout needs. Such establishments typically emphasize sales floor space, inventory logistics,

foot-traffic issues, and overall store attractiveness when studying facility layout issues.

Konz also observed that differences in factory and office layouts can often be traced to user expectations. "Historically, office workers have been much more concerned with status and aesthetics than factory workers," he noted. "A key consideration in many office layouts is 'Who will get the best window location?' To show their status, executives expect, in addition to preferred locations, to have larger amounts of space. Rank expects more privacy and more plush physical surroundings." In addition, he stated, "Offices are designed to be 'tasteful' and to 'reflect the organization's approach to business dealings.'" Conversely, in the factory setting, aesthetic elements take a back seat to utility.

Given these emphases, it is not surprising that, as a general rule, office workers enjoy advantages over their material production brethren in such areas as ventilation, lighting, acoustics, and climate control. Some modern companies will go a step further and create an office environment that does not just satisfy employees but inspires them, too. In a 2009 interview, the CEO of internet retailer Zappos.com, Tony Hsieh, talked about the conference-room decorating competition that ensued after one team in the merchandising department turned a conference room into a simulated log cabin. "The week after, the team sitting next to them said, we can outdo them. The next thing we knew, within two or three months, all 20 or so conference rooms were all decorated by different teams," Hsieh said. The right environment for any company will likely combine efficiency and value in a way that fits the company culture and goals.

FACILITY MANAGEMENT

Facility management is the coordination of the physical workplace with the people and work of an organization. It is the integration of business administration, architecture, and the behavioral and engineering sciences. In the most basic terms, facility management encompasses all activities related to keeping a complex operating. Facilities include grocery stores, auto shops, sports complexes, jails, office buildings, hospitals, hotels, retail establishments, and all other revenue generating or government institutions.

Responsibilities associated with facility management typically include a wide range of function and support services, including janitorial services; security; property or building management; engineering services; space planning and accounting; mail and messenger services; records management; computing, telecommunications and information systems; safety; and other support duties. It is the job of the facility manager to create an environment that encourages productivity, is safe, is pleasing to clients and customers, meets government mandates, and is efficient.

One of the primary aspects of good facilities management is flexibility. The litheness of many facilities managers has been challenged during the global economic crises that began in 2008. In an interview during the 2009 European Facility Management Conference, John McGee, Chair of the Board of Directors of the International Facility Management Association (IFMA) discussed these new challenges. He said, "In hard times, budgets get reduced, projects get deferred and maintaining a positive flow becomes more difficult. Facility management professionals are critical to the business in these times including leading the prioritization of maintenance projects, staying in control of day-to-day building costs, reducing energy consumption and advising on where to defer and where to invest in building improvements."

DIFFERENT BUSINESSES AND THEIR DIFFERENT FACILITY NEEDS

The term "facility" is used to refer to a broad spectrum of buildings, complexes, and other physical entities. "The

only thread common among these entities is the fact that they are all *places*," wrote Alan M. Levitt in *Disaster Planning and Recovery: A Guide for Facility Professionals.* "A 'facility' may be a space or an office or suite of offices; a floor or group of floors within a building; a single building or a group of buildings or structures. These structures may be in an urban setting or freestanding in a suburban or rural setting. The structures or buildings may be a part of a complex or office park or campus."

The key is to define the facility as a physical place where business activities are done, and to make facility management plans in accordance with the needs and demands of those business activities. After all, the facility needs of a movie theatre, a museum, a delicatessen, a plastics manufacturer, and a bank are apt to be considerably different, even though there will likely be certain basic needs that all will share (furniture, office space, air conditioning systems, light fixtures, etc.). Good facility management is concerned with addressing those needs in the best and most cost-effective ways possible. Indeed, facility management encompasses a wide range of responsibilities, including the following:

- Monitoring organization efficiency. The coordination of personnel, machines, supplies, work in progress, finished products, and deliveries must all be done if a plant is to be successful.
- Ensuring that the business receives the most it can for its facility-related expenditures (this is often done through standardization of companywide needs so that high-volume purchases of necessary products can be made).
- Real estate procurement, leasing, and disposal (or facility construction, renovation, and relocation).
- Ensuring that the divergent processes, procedures, and standards present in a business complement rather than interfere with one another.
- Monitoring all aspects of facility maintenance and upkeep so that the business can operate at highest capacity.
- Tracking and responding to environmental, health, safety, and security issues.
- Ensuring facility compliance with relevant regulatory codes and regulations.
- Anticipating future facility needs in areas as diverse as fluorescent light procurement, new space for expanded assembly lines, automation, and wiring for new computer networks.
- Educating the work force about all manner of standards and procedures, from ordering office supplies to acting in the event of a disaster.

THE EVOLVING CHARACTER OF FACILITY MANAGEMENT

Facility management has traditionally been associated with janitorial services, mailrooms, and security. Since the middle of the twentieth century, facility management has evolved into a demanding discipline. Factors driving the complexity of the facility manager's job are numerous. For example, facilities have become much larger and more complicated, often relying on computerized and electronic support systems that require expertise to operate and repair. Personal computer networks, sophisticated telecommunications systems, and other technological tools have significantly increased the requirements of facility management since the 1970s.

Of course, many other factors have had an effect on the challenges of facility management. For example, the newfound corporate cost-consciousness that emerged during the 1980s generated an emphasis on operational efficiency. Writing in *IIE Solutions,* Steven M. Price summarized the facility manager's situation: "Facilities professionals are being asked to contain costs while achieving maximum beneficial use that is, to achieve more with less." In addition, philosophical changes such as increased reliance on teamwork, cross-functional teams, and telecommuting have created new spacing and infrastructure demands. Finally, the responsibilities of facility managers have continued to broaden into all areas of facility upkeep, including insuring that the business adheres to regulatory requirements in such areas as handicapped access, hazardous material handling and disposal, and other "safe workplace" issues.

The end result of new technology, efficiency pressures, and government regulations has been an expansion of the facility management role. By the 1990s, facility managers were often highly trained and educated and prepared to wear several hats. Depending on the size of the complex, the manager will likely be responsible for directing a facility management and maintenance staff. In addition to overseeing the important duties related to standard maintenance, mailroom, and security activities, he or she may also be responsible for providing engineering and architectural services, hiring subcontractors, maintaining computer and telecommunications systems, and even buying, selling, or leasing real estate or office space.

For example, suppose that a company has decided to consolidate five branch offices into a central computerized facility. It may be the facility manager's job to plan, coordinate, and manage the move. The manager may have to find the new space and negotiate a purchase. And he or she will likely have to determine which furniture and equipment can be moved to the new office, and when and how to do so with a minimal disruption of the operation. This may include negotiating prices for new

furniture and equipment or balancing needs with a limited budget.

The facility management department may also furnish engineering and architectural design services for the new space, and even provide input for the selection of new computer and information systems. Of import will be the design and implementation of various security measures and systems that reduce the risk of theft and ensure worker safety. The manager will also be responsible for considering federal, state, and local regulations. He or she will need to ensure that the complex conforms to mandates associated with the Americans with Disabilities Act (ADA), clean air and other environmental protection regulations, and other rules. The ADA dictates a list of requirements related to disabled employee and patron access with which most facilities must comply, while clean air laws impose standards for indoor air quality and hazardous emissions. Similarly, other laws regulate energy consumption, safety, smoking, and other factors that fall under the facility manager's umbrella of responsibility.

By the twenty-first century, sustainability had become an increasingly important aspect of facilities management. This was due in part to the U.S. Green Building Council (USGBC) developing Leadership in Energy and Environmental Design, better known as LEED. LEED provides standards and ratings for environmentally friendly and sustainable building design, construction, and management.

FACILITY MANAGEMENT IN THE FUTURE

Analysts have suggested that evolving business realities in the realms of process improvement, cost containment, speed-to-market accelerations, quality control, sustainability, and workplace arrangements and concepts will all have a big impact on future notions of facility management. The challenge for facility managers will be to integrate knowledge workers into a dynamic business environment of global competition, technological developments, security threats, and changing values. Steven M. Price, in his *IIE Solutions* article titled "Facilities Planning: A Perspective for the Information Age" laid out four primary precepts that will likely form the underpinnings of future financial management planning:

1. Understanding the evolving nature of knowledge-based business. "The new workforce and the content of its work is migrating from a bureaucratic control of resources and the movement of materials through a process toward a highly flexible and networked organization whose added value is exploiting specialized knowledge and information to solve complex problems," wrote Price.
2. Understanding workspace trends. Price and other business analysts believe that computing and communications technologies are fundamentally transforming the workplace landscape. As shared jobs, telecommuting, home-based businesses, flexible work hours and other trends make further inroads in the business world, facility management philosophies will have to keep pace.
3. Understanding how new technologies have removed old restrictions on conducting business. This, said Price, basically entails recognizing that "the removal of physical limitations caused by transportation and communications technology has changed the scope, strategy, and structure of the business world."
4. Understanding "Job Factor" basics. Price noted that IBM and other companies have developed facility management philosophies that study the interaction of all job factors, including those of physical environment and job content.

CONTRACT FACILITY MANAGEMENT

Increasing numbers of large businesses are choosing to outsource their facility management tasks to specialized facility management companies that operate the complex for the owner on a contract basis. This arrangement has become more common in part because of the increasing scope and complexity of facility management. Companies that hire contract managers prefer to focus on other goals, such as producing a product or providing a service. Many of these firms find that outsourcing facility management duties to a specialist reduces costs and improves operations.

Contract facility managers may be hired to manage an entire complex or just one part of a large operation. For example, some companies hire contract managers that specialize in operating mailrooms or providing janitorial services. In any case, the company expects to benefit from the expertise of the manager or management firm it hires. A contractor that manages data processing systems, for example, may bring technical know-how that its employer would have great difficulty cultivating in-house. Likewise, a recreation facility owner that employs a facility manager specializing in the operation of sport complexes may benefit from the contractor's mix of knowledge related to grounds keeping, accounting and reporting, and sports marketing, among other functions.

Besides expertise and efficiency, several other benefits are provided by contract facility managers. One such benefit is the reduced liability to owner's or occupant's for personnel. By contracting a firm to manage one of its factories, an organization can substantially reduce its involvement in staffing, training, worker's compensation expenses and litigation, employee benefits, and worker grievances. It also

eliminates general management and payroll responsibilities. Rather than tracking hours and writing checks for an entire staff, it simply pays the facility management company. In addition, a company that hires a facility management firm can quickly reduce or increase its staff as it chooses without worrying about hiring or severance legalities.

Whether a small business chooses to outsource or maintain internal control of its facility management processes the ultimate goals are the same. As Raymond O'Brien commented in *Managing Office Technology*, "both the in-house facility management department and outsourced services must recognize that the facility management business is changing. While, traditionally, interior planning has been driven by preconceived notions of what is appropriate, business today increasingly is not being conducted in a traditional manner or in traditional locations.... Changing roles, combined with changing technology, drives the environment of the future."

Although he concurred that the field of facility management is in a state of flux at the moment, O'Brien argued that quality facility management could became an even greater advantage for attentive businesses in the future: " [Facility management] offers those with entrepreneurial spirit enormous opportunity. Whether working within a corporation or as an outsourced service provider, imaginative facility managers can find myriad ways to improve service to the company or the client while creating an interesting, challenging position for themselves."

FACTORING

Factoring is a form of financing in which a business sells its receivables to a third party or "factor company" at a discounted price. Under this arrangement, a factor company agrees to provide financing and other services to the selling business in return for interest and fees on the money that it advanced against the seller's accounts receivables. Businesses in need of cash can thus secure about 80 percent of their accounts receivables' face value. In rare cases, a higher percentage can be secured, but in most instances 20 percent of the value of the accounts receivable is held in reserve until the accounts are collected.

Factoring is a tool used by many established firms to avoid the cash flow problems that arise because of a customer's slow payment patterns. Economic downturns are often accompanied by an elongation of the average invoice payment time. Cash is the lifeblood of a business. Managing it efficiently is essential for success. It is often a lack of cash flow rather than a lack of sales that prevents companies from developing beyond their initial stages. Factoring agreements are one way that businesses with established sales can, for a price, guarantee smooth cash flow. Since factoring is a practice based on lending against accounts receivable, it is not a realistic source of capital for start-ups.

The global financial crises that began in 2008 was a challenge for some factoring institutions, including one of the largest, CIT Group. Companies directly or indirectly dependent on CIT grew concerned when in July 2009 CIT was in danger of collapsing. At that time CIT functioned as the factor for approximately 2,000 manufacturers and suppliers. These companies provided products to about 300,000 retailers in the United States.

CIT had 60 percent of the factoring market, which meant that if the company did fail, no other company could pick up the pieces right away. In the end, CIT held on until the end of 2009 when it was forced to file bankruptcy.

HOW FACTORING WORKS

There are two primary financing agreements entered into by factor companies, recourse and nonrecourse financing. Recourse financing is an agreement under which the borrower maintains the responsibility for any bad debt or uncollectible invoices that it has issued. Nonrecourse financing is the term used when the factor company bears the risk of collecting from its client's clients. It takes on the responsibility for collecting and covers uncollectible invoices.

The factoring process varies from agreement to agreement but the basics are similar in most situations. A business that is working with a factoring company, upon invoicing its clients, will send a copy of each invoice issued to the factoring company. On receipt of the invoices, the factoring company immediately provides its client with 80 to 85 percent of the value of the invoices received.

Once the outstanding invoices are paid by the business's customers to the factoring company it pays the business the remaining 20 percent of the value of those invoices less prearranged charges. Factoring charges include a fee and interest on the 80 to 85 percent paid in advance of collections.

In some respects, the factoring process is roughly comparable to credit card arrangements. Just as MasterCard buys a retailer's receivables and pays the store as soon as a sale is made, factoring companies do much the same thing on the wholesale level. For example, assume a toaster manufacturer ships a $150,000 order to one of its customers. Rather than waiting for the customer to pay, the manufacturer can sell the receivables to a factor, receiving up to 85 percent of the $150,000 total as soon as the goods leave the shipping dock and an invoice is sent. This speeds the collection process. The balance is paid, less factoring charges, when the factor collects from the toaster manufacturer's customer.

Small-business owners should be aware that factoring is different in several fundamental respects from bank financing. For one thing, it is much more expensive. Factoring charges can cost between 2 percent and 10 percent of sales. Arrangements for fees vary widely, depending on the credit quality of the borrower's customer account balances and the range of services that are purchased from the factor. In addition, small-business owners should recognize that utilizing a factor company is an all-or-nothing proposition. Factors generally demand 100 percent of a client's receivables. They will not limit their efforts to those receivables considered marginal or high risk.

GROWTH OF FACTORING

Even though factoring carries some risks for small enterprises, it is regarded as a viable short-term cash management tool, and factor companies are an increasingly mainstream choice for small-business owners seeking capital. According to data from the World Bank, the volume of business handled by factors in the United States increased 15.2 percent between 1998 and 2003. In 2005, total worldwide factoring volume was over $1 trillion.

Factoring companies usually include a range of accounts receivable services as a part of their overall service. These services include such things as bookkeeping, collections, and credit verification. By reducing the in-house cost of managing these tasks it is more likely that a business will be able to justify the cost of working with a factoring company.

Although the cost of working with a factoring company is high, it may still be more cost effective than offering customers a 6 percent early payment discount in order to encourage the early payment of invoices. A factor will provide a business with cash almost immediately upon shipping a product whereas early payment discounts will usually only bring in payments marginally sooner than would be the case without the discount. Working with a factor is far more likely to offer substantial cash flow benefits than simply speeding up the collection period. The growth of factoring suggests that many companies are finding it a profitable way in which to help manage cash flow.

SELECTING A FACTOR

Selecting a factor is much like selecting any other service provider. The objective is to find the best price for the services provided. A variety of institutions, including bank subsidiaries and finance companies, provide factoring services. These companies can be found in several different ways, though the easiest is online searching. The Commercial Finance Association offers an online database of its members and their service offerings, as does the International Factoring Group and the EU Forum for the Factoring and Commercial Finance Industry.

Several considerations that should be weighed by the small-business owner in making fee arrangements with a factor. These include:

- Recourse. Small business enterprises that elect to go with a recourse factor (in which they bear final responsibility for collecting monies owed) over nonrecourse factors (where the factor company bears that responsibility) will find that they may gain lower fees and more money from the factor in return for increasing their risk.

- Customer Base. The larger the number of customers a business has, the more cost advantages the factor can offer the business. Automation provides factors with significant economies of scale when a large number of customers are involved.
- Creditworthiness of Customers. Factor companies will assess the creditworthiness of a business's clients and use this as an important element in pricing the factoring services for that business. Factors will not purchase substandard customer balances.
- Size and Age of the Average Invoice. Smaller receivables that have been on the books for a while will result in less advantageous factoring arrangements for small-business owners than will large, current receivables.
- Factor Preferences. Some factors tend to work with larger businesses, while others concentrate their efforts on smaller enterprises. Large factor companies tend to focus their attention on companies that have at least $10 million in annual sales, while smaller factor companies sometimes known as "re-factors" may provide services to companies with annual sales as low as $300,000.
- Industry Knowledge. Most factors that reach agreements with small businesses will have a fairly solid understanding of the industry and competitive environment in which those businesses operate. Such factor companies can provide help to small businesses in determining who they should (and should not) extend credit to. In addition, factor companies can be helpful in settling upon credit limits for both new and existing customers.
- System Compatibility. Most businesses in today's environment have implemented automated processes to calculate and monitor accounts receivable and cash applications of cash received. Small-business owners should make sure that their systems are compatible with those of the factor before agreeing to a factoring arrangement.
- Collections. As indicated above, this can be a tricky area for the small-business owner. Handing over collection duties to a factor company is expensive, and overaggressive collection efforts on their part can damage a small business's relations with legitimate clients. In his 2010 book *Optimizing Back Office Operations*, Zahid Khalid warned against small businesses using factoring for accounts receivable for this very reason. "A factor may well jeopardize the business relationship between a buyer and a supplier by using aggressive collections techniques. After all, the factor's discount fees are tied to the collection of the invoice." he wrote. However, factor companies often have better luck in collecting money owed than do small business enterprises, which have more limited resources to dedicate to the collections process. Business owners should recognize, however, that the factor is only interested in business transactions in which their client is owed money. Factors will not be responsible for nonpayment that is attributed to other issues, such as vendor disputes or defective merchandise.

FAMILY LIMITED PARTNERSHIP

Family limited partnerships (sometimes known as FLPs and pronounced "flip" by tax experts) are a popular tool utilized by owners of family businesses who wish to pass on their companies to their children while minimizing the federal tax burden that sometimes accompanies such a transfer. The family limited partnership is a legal agreement that allows business owners and their children to address tax issues, business-succession, and estate-planning needs all at once. In simple terms, a parent may transfer assets, such as a family business, into a family limited partnership formed with the children. The parents, as general partners, maintain control of the assets. The children are limited partners. The assets that are transferred to the FLP are restricted less liquid, harder to sell and consequently, their value is discounted for tax purposes. The result is that a typical business may have a discounted tax value of 20 to 50 percent under its pre-FLP value. After the older family member dies, the FLP is taxed as part of his or her estate but the amount due is reduced since the value within the FLP has been reduced. Thus, a tax saving is realized. The resulting reduction in tax burden has propelled family limited partnerships to the forefront of estate-planning techniques.

ESTATE PLANNING IN THE FAMILY OWNED BUSINESS

When considered in the context of family-owned businesses, estate planning is basically the practice of transferring ownership of the family business to the next generation. Families must plan to minimize their tax burden at the time of the owner's death so that the resources can stay within the company and the family. The complexity of American tax law, however, makes it necessary for most estate planning to be undertaken with the assistance of professionals in the realms of accounting and law.

Since estate planning is such a vital element of long-term family business strategies, consultants encourage business owners to establish an estate plan as soon as their enterprise becomes successful, and to make sure that they update it as necessary as business or family circumstances change. A variety of options are available that can help a business owner defer or otherwise minimize the transfer taxes associated with handing down a family business. A marital deduction trust, for example, passes property along to a surviving spouse in the event of the owner's death, and no taxes are owed until the spouse dies. It is also possible to pay the estate taxes associated with the transfer of a family business on an installment basis, so that no taxes are owed for 5 years and the balance is paid in annual installments over a 10-year period.

CURRENT ESTATE TAX RATES

Changes in estate tax law have resulted in a great reduction in the number of estates that are subject to **any** federal estate taxes. In fact, in 2009 only 0.24 percent of all U.S. estates were affected by federal estate tax, leaving 99.76 percent able, if necessary, to pass on all of their assets to heirs on a federal tax-free basis. State taxes on inherited property are another subject. Each state assesses its own estate tax.

In 2001 the Economic Growth and Tax Relief Reconciliation Act (EGTRRA) was passed. This act substantially changed federal estate and gift tax laws. The new law increased the exemption rate every 2 years from $1 million in 2003 to $2 for 2006 to 2008 to $3.5 million in 2009. EGTRRA set the tax to expire completely in 2010, but a "sunset clause" in the law will bring back the estate tax in 2011 in its pre-EGTRRA form, with an exclusion amount of $1 million. Unless Congress votes to repeal the tax altogether (as of early 2010, no such vote had occurred), or to change exclusion and tax rates, there will be significant differences in estate taxes between 2010 no estate taxes at all and 2011 higher rates and a lower exclusion. This unusual situation has led to many jokes along the lines of the one in the title of a 2006*Money* magazine article: "Could You Please Die Sometime in 2010?"

While a total permanent repeal would obviously remove a major obstacle in estate planning, the consensus among observers is that permanent repeal is not likely to occur in the immediate future, if at all, and that in fact Congress is unlikely to take action to address the return of the pre-2001 estate tax exemption level and tax rates. While this has led to frustration among estate planners and business consultants, they are recommending that their clients plan to face a significantly more burdensome estate tax for the foreseeable future. Family limited partnerships are one useful tool for preparing to minimize estate taxes now and in the uncertain tax environment of the future.

ADVANTAGES OF FAMILY LIMITED PARTNERSHIPS

The primary purpose of family limited partnerships is to blunt the impact of estate taxes. Estate taxes can hit family businesses hard because the full value of a parent's business may be included in the parent's estate when he or she dies. The estate tax is one of the highest taxes levied. It is only borne by individuals with very large estates. Under 2009 rules, the first $3.5 million of an individual's estate is exempt from federal estate tax, but amounts above the exempt portion are subject to a tax rate of 45 percent. The nominal tax rate depends on the size of the estate. For example, an estate of $4 million would result in a tax payment of 45 percent of $500,000, or $225,000. This

represents a nominal tax rate of only 5.6 percent. For an estate of $10 million, the tax payment is 45 percent of $6.5 million, a nominal tax rate of 29 percent. Thus, the more successful the family business, the higher the nominal tax rate and the more incentive there is to take steps to dampen the financial impact of this tax.

One way to dampen the impact of this tax is to make use of Internal Revenue Service (IRS) rules that allow individuals to make annual gifts to other individuals without incurring gift taxes. These gifts reduce the size of the estate, potentially bringing it below the exemption level and in any case reducing the nominal rate of estate tax paid. The other way to elude the full brunt of the estate tax is by forming an FLP.

A basic family limited partnership operates as follows. The parents (or a single parent) retain a general partnership interest in the property as little as 1 percent and give limited-partnership interests to their children, usually over a number of years. The general partner, or partners, retain complete control over the assets in the partnership, and no management authority is given to the limited partner(s).

In the most basic terms, a family limited partnership allows the business to be transferred to the next generation at considerably less than its full value. This reduces the size of the estate and thus the amount of federal taxes owed. Indeed, observers indicate that these discounts can amount to as much as 50 percent of a business's value. The discounted valuation occurs because the shares cannot be easily sold or otherwise transferred and because such partnership interests do not carry any voting rights or control in the business in question. Since the gifted shares are discounted, the partnership pays lower gift taxes on those shares. For example, if a $15,000 limited partnership share is appraised at $8,000, the parents can transfer that share to a child plus $4,000 worth of something else in a single year and stay within the $12,000 annual tax exclusion on gifts. Second, this reevaluation also applies to the shares in the FLP that the parents continue to hold. Third, because the parents are transferring shares out of their estate, they are reducing the value of the estate for annual tax purposes as well.

OTHER CONSIDERATIONS

Many estate planners and business consultants encourage their clients to look into FLPs for tax reasons, but they note that family business owners should weigh some other nontax factors as well. These include:

Lawsuit Protection. A family limited partnership may serve as asset protection in the case of a lawsuit. Because the assets within an FLP are not the personal property of its partners, any legal judgement against one of the partners does not include the assets held by the FLP. The portion of the plaintiff's assets that are located within the FLP are thus protected from a legal judgment until disbursements are made from the FLP to the partner.

Timing of the Formation of the Limited Partnership. Estate planners and business consultants warn that the Internal Revenue Service will not necessarily approve a family limited partnership if it is transparently obvious that the FLP was formed simply to skirt paying taxes. Family-business owners who attempt to institute an FLP a few weeks before their death from some foreseeable illness will likely find their efforts blocked.

Divorce. In most instances, a child's ownership of limited partnership shares will not be impacted by a divorce action by his or her parents, but business owners seeking to ensure protection for their child can take a couple of steps to provide additional insurance. Since limited partners (children) receive their shares as a gift and are not permitted to vote or otherwise exercise any authority in the partnership, the child's shares will not be considered part of the marital assets. Instead, they will remain the sole and separate property of the child. The key, say legal experts, is to make sure that the shares were never formally made part of the marital property.

Expense of Setting Up an FLP. Establishing a family limited partnership can be somewhat expensive, although the price tag depends in large part on the size of the company, the value of its assets, the number of intended minority owners, and other factors. In 2009 a family-owned company would need to have a value in excess of $3.5 million (or $7 million if a husband and wife team were partners in the business) before it would have any estate tax liability upon the death of its principal, but in the absence of Congressional action on the estate tax in 2010, that will drop to $1 million ($2 million for a husband and wife partnership) in 2011. If the value of the firm exceeds this threshold the cost of setting up an FLP will likely be justified by the savings it will be able to generate by reducing the tax obligations due upon the transfer of the company.

Compatibility with Business. FLPs are better suited to some businesses than others. The effectiveness of FLPs is greatest when used in family companies related to real estate or companies whose business relies greatly on capital assets. For service-oriented companies firms that do consulting, computer networking, software development, landscaping, child care, as well as small retailers, for example the vehicle is not as beneficial since firms of this kind tend not to have large asset balances that they wish to protect from taxation.

Increased Risk of IRS Audits. Although family limited partnerships can be very valuable, and their use is increasing, accountants and estate planning attorneys do caution family-business owners that the use of an FLP will almost certainly lead to an IRS audit. This is not a reason to avoid forming an FLP but it does emphasize the need to do so with care and to keep thorough and complete documentation on its formation and activities.

A string of recent court cases in which the IRS successfully challenged the legitimacy of particular FLPs can provide guidelines to follow in forming FLPs that will withstand an IRS challenge. In his *Daily Record* article titled "Commentary: IRS Looks More Kindly on Family Limited Partnerships That Serve Business," Gary Williams explains why FLPs based on true family-owned businesses are more likely to survive an IRS challenge. He states that "commentators think you'll be on safest ground if the FLP includes an active family business or investment that requires active management by the FLP's partners, such as rental property."

Another measure that can be taken to improve one's likelihood of a successful audit outcome is to have the business appraised by an experienced, respected professional who can provide a solid valuation.

Dissatisfaction Among Minority Owners. Ironically, some family businesses find that FLPs actually spark difficulties between parents and their children, despite the formidable savings that such a plan can provide and the ultimate aim reduced estate taxes upon succession of the partnership. This is certainly not always the case; many families put together family limited partnerships that garner tax savings without a ripple of internal dissension or dissatisfaction. But it is a factor that can crop up, depending on the personalities and financial situations of the persons involved. When conflict arises it is usually caused by the minority owners who may feel constrained, unable to sell their shares and convert them into a liquid asset as desired. This feeling of not having control often manifests in the form of harassing the management, criticizing business decisions, lobbying for dividends, and generally causing unrest.

Need for Professional Guidance. Establishing a family limited partnership is a complex estate-planning strategy, made even more complicated by the uncertainty of the regulatory environment. Consequently, business owners are strongly encouraged to secure qualified legal or accounting help in setting up such plans.

FAMILY AND MEDICAL LEAVE ACT

The Family and Medical Leave Act (FMLA) provides employees who qualify with up to 12 work weeks of unpaid, job-protected leave in a 12-month period for specified family and medical reasons. It also requires group health benefits to be maintained during the leave as if employees were continuing to work instead of taking leave. The employer can elect to use the calendar year, a

fixed 12-month fiscal year, or a 12-month period prior to or after the commencement of leave as the 12-month period. The Act became effective on August 5, 1993, and applies to **all** companies who employ fifty or more people. It is primarily administered and enforced by the U.S. Department of Labor' s Employment Standards Division, Wage and Hour Division.

ELIGIBILITY FOR FMLA

To qualify for FMLA benefits, an employee must: 1) work for an employer who employees fifty or more people; 2) have worked for that employer for a total of 12 months; 3) have worked at least 1,250 hours over the previous 12 months; 4) work at a location in the United States or in any territory or possession of the United States where at least 50 employees are employed by the employer within 75 miles. This latter stipulation exempts many small-business owners from FMLA rules and guidelines.

But while FMLA does not apply to small businesses that employ fewer than fifty people, it does apply to small and mid-size companies that employed fifty or more employees in 20 or more work weeks in the current or preceding calendar year. FMLA also applies to all public agencies, including local, state, and federal employers; large companies; and school administrations.

Leave Entitlement. There are several different situations under which employers subject to FMLA must grant eligible employees unpaid leave from work without penalty. Reasons include:

- Situations in which the employee is unable to work because of illness or other health difficulties.
- Placement with the employee of a child for adoption or foster care.
- Birth and care of the newborn child of the employee.
- Caring for an immediate family member with serious health difficulties (immediate family members are defined as spouse, child, or parent).

In addition, spouses employed by the same company or agency are jointly entitled to a combined total of 12 work weeks of family leave for the birth and care of a newborn child, for placement of a child for adoption or foster care, or to care for a parent suffering from a serious health condition.

Additionally, H.R. 4986, as part of the National Defense Authorization Act of 2008, amended the 1993 FMLA action to permit spouses, sons, daughters, parents or next of kin to take 26 weeks of FMLA leave to care for members of the armed forces (including those in the National Guard or Reserves) or based on any qualifying exigency arising out of an eligible family member's service.

Finally, depending on the circumstances, some employees may be able to take leave in blocks of time or by scaling back their normal work schedule. In addition, employers or employees may sometimes choose to use accrued paid leave to cover some or all of the FMLA leave.

Illnesses and Other Conditions Covered Under FMLA. The FMLA was written so that employees who have family members in "serious health condition" or who themselves are in such condition can use the law to protect their job during the time that they are on leave. The Department of Labor defines "serious health condition" as an illness, injury, impairment, or physical or mental condition that involves any of the following:

- Any period of incapacity or treatment connected with overnight stays in a hospital or other residential medical care facility, and any period of incapacity or subsequent treatment in connection with such inpatient care.
- Continuing treatment by a health care provider that includes any period of incapacity due to: 1) a health condition (including treatment of, or recovery from) lasting more than 3 consecutive days, and any subsequent treatment or period of incapacity relating to the same condition; 2) pregnancy or prenatal care; 3) a chronic serious health condition which continues over an extended period of time, requires periodic visits to a doctor or other health care professional, and may involve occasional episodes of incapacity (diabetes, asthma); 4) permanent or long-term conditions for which treatment may not work (cancer, stroke); 5) absences to receive treatments for restorative surgery or for a condition which would likely result in incapacitation for more than 3 days if not treated (radiation or chemotherapy treatments for cancer).
- In 2009 updates to the FMLA rule clarified certain issues regarding eligibility for FMLA. For example, the Department of Labor's Wage and Hour Division released a piece of legislation, called the Final Rule (RIN 1215-AB35), that became effective on January 16, 2009. Among other provisions, this "Final Rule" provided additional clarity on the definition of a serious health condition. While the original individual definitions of serious condition were retained, the new rule stipulated that the condition should require more than 3 full consecutive days of incapacity as well as two visits to a health care provider.

EMPLOYER REQUIREMENTS UNDER FMLA

Employers who are subject to FMLA regulations must maintain group health insurance coverage for any employee taking FMLA leave whenever that employee already had that insurance. The employer is not allowed to make any changes in the terms of that insurance coverage, either. There are some situations, however, where an employer may be able to recover any insurance premiums that it paid out to maintain health coverage for an employee if that worker fails to return to work from FMLA leave.

In instances where the employee does return from FMLA leave, that employee is entitled to be restored to his or her original job, or to an equivalent job, complete with equivalent pay, benefits, and other terms of employment. Moreover, FMLA stipulates that an employee cannot lose any employment benefit that he or she earned prior to using FMLA leave once the employee returns to work. There are exceptions to the above rules, but they come into play only in extreme circumstances wherein returning an employee to his or her previous station will cause "substantial and grievous economic injury" to the business. Obviously, such circumstances arise only when the company is in deep financial jeopardy.

Employers who are subject to FMLA law are required to post notices that explain the Family and Medical Leave Act in the workplace. These notices are approved by the Secretary of Labor. Companies that willfully violate this requirement are subject to fines. This requirement is part of a general mandate that directs employers to inform employees of all pertinent aspects of FMLA, including employee responsibilities.

In addition, 2009 amendments by the Department of Labor altered these notice requirements, separating required notice into three different categories: general notice, eligibility notice and designation notice. Under these new provisions, employers must make employees aware of the possibility of FMLA leave and must make them aware, within five days of receiving notice of an illness or injury, whether it qualifies for FMLA leave.

STEPS TO SECURING FMLA LEAVE

Employees who wish to take advantage of the Family and Medical Leave Act must adhere to certain steps so as to soften the impact on the businesses where they are employed. Workers using FMLA must first provide 30 days' advance notice of their intention to take leave in all instances where advanced notice is possible. In addition, some employers require employees using FMLA to do some or all of the following:

- Provide medical certification supporting the need for leave.
- Provide second or third medical opinions (at the employer's expense).
- Give periodic recertification of health status.
- Provide periodic reports on employee status and intentions regarding returning to work.
- Adhere to limitations on intermittent leave.

In their article for *Entrepreneur*. Steven C. Bahls and Jane Easter Bahls admitted that adhering to the FMLA can be difficult for employers, but they also claimed that businesses benefit by retaining good employees. "Keeping a job open for months, tracking the employee's illness, determining if medical certification is adequate, keeping records on which absences are covered and which are not clearly, it's not easy to administer an FMLA leave and avoid legal trouble," they wrote. "And there remains the possibility of abuse of the system. Still, try to keep in mind what your employees gain from knowing there's a good job waiting on the other side of their problems, and what your company gains by retaining a valued employee."

FAMILY-OWNED BUSINESSES

A family-owned business may be defined as any business in which two or more family members are involved and the majority of ownership or control lies within a family. Family-owned businesses may be the oldest form of business organization. Farms were an early form of family business in which private life and work life were intertwined. In urban settings it was once normal for a shopkeeper or doctor to live in the same building in which he or she worked and family members often helped with the business as needed.

Since the early 1980s the academic study of family business as a distinct and important category of commerce has developed. Today family-owned businesses are recognized as important and dynamic participants in the world economy. According to the U.S. Bureau of the Census, about 90 percent of American businesses are family-owned or controlled. Ranging in size from two-person partnerships to *Fortune* 500 firms, statistics from the Small Business Administration Office of Advocacy report that these businesses accounted for just over half of the nation's private sector employment and over half of the gross national product in 2009. Family businesses may have some advantages over other business entities in their focus on the long term, their commitment to quality (which is often associated with the family name), and their care and concern for employees. But family businesses also face a unique set of management challenges stemming from the overlap of family and business issues.

ISSUES IN FAMILY BUSINESSES

A family business can be described as an interaction between two separate but connected systems the business and the family with uncertain boundaries and different rules. Graphically, this concept can be presented as two intersecting circles. Family businesses may include numerous combinations of family members in various business roles, including husbands and wives, parents and children, extended families, and multiple generations playing the roles of stockholders, board members, working partners, advisors, and employees. Conflicts often arise due to the overlap of these roles. The ways in which individuals typically communicate within a family, for example, may be inappropriate in business situations. Likewise, personal concerns or rivalries may carry over into the workplace to the detriment of the firm.

These issues may be especially true when husbands and wives work together. This trend has become so common, according to the Clearinghouse on Entrepreneurship Education (CELCEE) Digest, that a special term has been coined for these couples: "copreneurs." However, despite the prevalence of married couples running a business together some studies suggest that approximately 30 percent of businesses are run by husband/wife teams the situation is rife with potential pitfalls.

Not only do married couples running a business together face many of the same issues as those faced by other family businesses, but they also face added pressures caused by their status as husband and wife.

For example, because both individuals are self-employed within the same company, the entire family income is dependent upon the success of the business. This can lead to heightened levels of stress, especially when combined with the long working hours necessary to make the business succeed. (Copreneurs in Canada work an average of 86 combined hours per week, as opposed to the 74 combined hours worked by non-coprenuer couples.) In addition, Craig Aronoff, co-chairman of the Family Business Consulting Group and founder-director of the Cox Family Enterprise Center at Kennesaw State University in Kennesaw, Georgia, reports that many married couples become consumed with talking about the business at home, at the expense of both the marriage and their personal happiness levels, as home becomes an extension of business rather a place to relax.

In order to succeed, a family business must keep lines of communication open, make use of strategic planning tools, and engage the assistance of outside advisors as needed. Everyone involved in the family business and especially husband and wife teams must also be cognizant of the fundamental need to keep family and business separate and not to allow the business relationship to supersede the family ties in importance.

Family versus Non-family Employees. There are a number of common issues that most family businesses face at one time or another. Attracting and retaining nonfamily employees can be problematic because such employees may find it difficult to deal with family conflicts on the job, limited opportunities for advancement, and the special treatment sometimes accorded family members. In addition, some family members may resent outsiders being brought into the firm and purposely make things unpleasant for nonfamily employees. But outsiders can provide a stabilizing force in a family business by offering a fair and impartial perspective on business issues. Family business leaders can conduct exit interviews with departing nonfamily employees to determine the cause of turnover and develop a course of action to prevent it.

Employment Qualifications. Many family businesses also have trouble determining guidelines and qualifications for family members hoping to participate in the business. Some companies try to limit the participation of people with certain relationships to the family, such as in-laws, in order to minimize the potential for conflicts. Family businesses often face pressure to hire relatives or close friends who may lack the talent or skill to make a useful contribution to the business. Once hired, such people can be difficult to fire, even if they cost the company money or reduce the motivation of other employees by exhibiting a poor attitude. A strict policy of only hiring people with legitimate qualifications to fill existing openings can help a company avoid such problems, but only if the policy is applied without exception. If a company is forced to hire a less-than-desirable employee, analysts suggest providing special training to develop a useful talent, enlisting the help of a nonfamily employee in training and supervising,

and assigning special projects that minimize negative contact with other employees.

Salaries and Compensation. Another challenge frequently encountered by family businesses involves paying salaries to and dividing the profits among the family members who participate in the firm. In order to grow, a small business must be able to use a relatively large percentage of profits for expansion. But some family members, especially those who are owners but not employees of the company, may not see the value of expenditures that reduce the amount of current dividends they receive. This is a source of conflict for many family firms and an added level of difficulty in making the necessary investments into the business for continued success. To ensure that salaries are distributed fairly among family and nonfamily employees, business leaders should match them to industry guidelines for each job description. When additional compensation is needed to reward certain employees for their contributions to the company, fringe benefits or equity distributions can be used.

Succession. Another important issue relating to family businesses is succession determining who will take over leadership or ownership of the company when the current generation retires or dies. The key to avoiding conflicts about who will take over a business is having a well-defined plan in place. A family retreat, or a meeting on neutral ground without distractions or interruptions, can be an ideal setting to open discussions on family goals and future plans, the timing of expected transitions, and the preparation of the current generation for stepping down and the future generation for taking over. When succession is postponed, older relatives who remain involved in the family firm may develop a preference for maintaining the status quo. These people may resist change and refuse to take risks, even though such an attitude can inhibit business growth. The business leaders should take steps gradually to remove these relatives from the daily operations of the firm, including encouraging them to become involved in outside activities, arranging for them to sell some of their stock or convert it to preferred shares, or possibly restructuring the company to dilute their influence.

Family business leaders can take a number of steps in order to avoid becoming caught up in these common pitfalls. Having a clear statement of goals, an organized plan to accomplish the goals, a defined hierarchy for decision making, an established plan for succession, and strong lines of communication will help to prevent many possible problems from arising. All family members involved in the business must understand that their rights and responsibilities are different at home and at work. While family relationships and goals take precedence at home, the success of the business comes first at work.

When emotion intrudes upon work relationships, something that happens in all businesses from time to time, and the inevitable conflicts between family members arise, the manager must intervene and make the objective decisions necessary to protect the interests of the firm. Rather than taking sides in a dispute, the manager must make it clear to all employees that personal disagreements will not be allowed to interfere with work. This approach should discourage employees from jockeying for position or playing politics. The business leader may also find it useful to have regular meetings with family members and to put all business agreements and policy guidelines in writing.

THE PLANNING PROCESS

Strategic planning, centering around both business and family goals, is vital to successful family businesses. In fact, planning may be more crucial to family businesses than to other types of business entities, because in many cases families have a majority of their assets tied up in the business. Since much conflict arises due to a disparity between family and business goals, planning is required to align these goals and formulate a strategy for reaching them. The ideal plan will allow the company to balance family and business needs to everyone's advantage.

Family Planning. In family planning, all interested members of the family get together to develop a mission statement that describes why they are committed to the business. In allowing family members to share their goals, needs, priorities, strengths, weaknesses, and ability to contribute, family planning helps create a unified vision of the company that will guide future dealings.

A special meeting called a family retreat or family council can guide the communication process and encourage involvement by providing family members with a venue to voice their opinions and plan for the future in a structured way. By participating in the family retreat, children can gain a better understanding of the opportunities in the business, learn about managing resources, and inherit values and traditions. It also provides an opportunity for conflicts to be discussed and settled. Topics brought to family councils can include: rules for joining the business, treatment of family members working and not working in the business, role of in-laws, evaluations and pay scales, stock ownership, ways to provide financial security for the senior generation, training and development of the junior generation, the company's image in the community, philanthropy, opportunities for new businesses, and diverse interests among family members. Leadership of the family council can be on a rotating basis,

or an outside family business consultant may be hired as a facilitator.

Business Planning. Business planning begins with the long-term goals and objectives the family holds for themselves and for the business. The business leaders then integrate these goals into the business strategy. In business planning, management analyzes the strengths and weaknesses of the company in relation to its environment, including its organizational structure, culture, and resources. The next stage involves identifying opportunities for the company to pursue, given its strengths, and threats for the company to manage, given its weaknesses. Finally, the planning process concludes with the creation of a mission statement, a set of objectives, and a set of general strategies and specific action steps to meet the objectives and support the mission. This process is often overseen by a board of directors, an advisory board, or professional advisors.

Succession Planning. Succession planning involves deciding who will lead the company in the next generation. Unfortunately, nearly one-third of family-owned businesses do not survive the transition from the first generation of ownership to the second, and only 13 percent of family businesses remain in the family over 60 years. Problems making the transition can occur for any number of reasons: 1) the business was no longer viable; 2) the next generation did not wish to continue the business, or 3) the new leadership was not prepared for the burden of full operational control. Lack of planning, however, is by far the most common underlying reason for a company to fail in the generational transition. At any given time, a full 40 percent of American firms are facing the succession issue, yet relatively few make succession plans. Business owners may be reluctant to face the issue because they do not want to relinquish control, feel their successor is not ready, have few interests outside the business, or wish to maintain the sense of identity they have for so long gotten from their work.

But it is vital that the succession process be carefully planned before it becomes necessary due to the owner's illness or death. Family businesses are advised to follow a five-stage process in planning for succession: initiation, selection, education, finance preparation, and transition.

- In the initiation phase, possible successors are introduced to the business and guided through a variety of work experiences of increasing responsibility.
- In the selection phase, a successor is chosen and a schedule is developed for the transition. Analysts almost unanimously recommend that the successor be a single individual and not a group of siblings or cousins. To some degree, by selecting a group, the existing leadership is merely postponing the decision or leaving it to the next generation to sort out.
- During the education phase, the business owner gradually hands over the reins to the successor, one task at a time, so that he or she may learn the requirements of the position.
- Finance preparation involves making arrangements so that the departing management team can withdraw funds enough to retire. The more time is used in preparing for the financial implications of this transition the more likely a business will be able to avoid being burdened in the process.
- In the transition phase, the business changes hands, and the business owner removes himself or herself from the daily operations of the firm. This final stage can be the most difficult, as many entrepreneurs experience great difficulty in letting go of the family business. It helps when the business owner establishes outside interests, creates a sound financial base for retirement, and gains confidence in the abilities of the successor.

A *BusinessWeek* article titled "Family Business Succession Issues" highlighted potential pitfalls in succession of businesses and made suggestions to avoid them. For example, the article stated that dividing assets and shares among family members can lead to problems if part of the family ends up owning the company's real estate, while other family members own the company itself. Instead, the article suggested redesigning the capital structure of the company to allow retiring members to sell their shares to new generations. This would ensure orderly ownership transfers and provide capital to those who are retiring.

Estate Planning. Estate planning involves the financial and tax aspects of transferring ownership of the family business to the next generation. Families must plan to minimize their tax burden at the time of the owner's death so that the resources can stay within the company and the family. Unfortunately, tax laws today provide disincentives for families wishing to continue the business. Heirs are taxed upon the value of the business at a high rate when ownership is transferred. Due to its complexity, estate planning is normally handled by a team of professional advisors that includes a lawyer, accountant, financial planner, insurance agent, and perhaps a family business consultant. An estate plan should be established as soon as the business becomes successful and then updated as business or family circumstances change.

One technique available to family business owners in planning their estate is known as "estate freeze." This technique enables the business owner to "freeze" the value

of the business at a particular point in time by creating preferred stock, which does not appreciate in value, and then transferring the common stock to his or her heirs. Since the majority of shares in the firm are preferred and do not appreciate, estate taxes are reduced. The heirs are required to pay gift taxes, however, when the preferred stock is transferred to them.

A variety of tools are available that can help a business owner defer the transfer taxes associated with handing down a family business. A basic will outlines the owner's wishes regarding the distribution of property upon his or her death. A living trust creates a trustee to manage the owner's property not covered by the will, for example during a long illness. A marital deduction trust passes property along to a surviving spouse in the event of the owner's death, and no taxes are owed until the spouse dies. It is also possible to pay the estate taxes associated with the transfer of a family business on an installment basis, so that no taxes are owed for 5 years and the remainder are paid in annual installments over a 10-year period. Other techniques exist that allow business owners to exclude some or all of their assets from estate taxes, including a unified credit/exemption trust, a dynamic trust, and an annual exclusion gift. Since laws change frequently, retaining legal assistance is highly advisable.

ASSISTANCE IN PLANNING

A professional family business consultant can be a tremendous asset when confronting planning issues. The consultant is a neutral party who can stabilize the emotional forces within the family and bring the expertise of working with numerous families across many industries. Most families believe theirs is the only company facing these difficult issues, and a family business consultant brings a refreshing perspective. In addition, the family business consultant can establish a family council and advisory board and serve as a facilitator to those two groups.

Advisory boards can be established to advise the company's president or board of directors. These boards consist of five to nine non-family members who meet regularly to provide advice and direction to the company. They too can take the emotions out of the planning process and provide objective input. Advisory board members should have business experience and be capable of helping the business to get to the next level of growth. In most cases, the advisory board is compensated in some manner.

As the family business grows, the family business consultant may suggest different options for the family. Often professional nonfamily managers or an outside CEO are recruited to play a role in the future growth of the business. Some families simply retain ownership of the business and allow it to operate with few or no family members involved.

THE FUTURE OF FAMILY BUSINESSES

In a 2006 *BusinessWeek* article titled "Taking the Pulse of Family Business," Tracy Perman explained two broad trends in the realm of family business in the twenty-first century. Pelman suggested that the aging of the baby boom generation signaled a coming ownership change for many family businesses within the next 10 years. Second, Pelman predicted that more and more of these businesses would be taken over by women, continuing a trend that has been visible since the beginning of the new century.

Statistics from the American Family Business Survey conducted by MassMutual, Kennesaw State University, and the Family Firm Institute in 2007, suggest that this change has already begun to take place. The survey reports that, in 2007, 24 percent of businesses surveyed reported having a female CEO, as compared to only 10 percent of those surveyed in 2002 and 5 percent in 1997.

Some family-owned businesses are finding that it is no longer assumed that children will wish to take over a family business. If the founders of a firm wish to keep it in the family's hands, they should be sure to take proactive measures to attract future generations to the business.

- Expose family members to all aspects of the business, including employees, customers, products, and services.
- Define the business's attractive qualities in terms that will appeal to the listener.
- Recognize those factors that have the potential to dissuade family members from staying involved in the business. These factors can range from personal interests that lie in other areas to conflicts with other family members.
- Reward family members who decide to join or stay with the family business. The "price" successors pay to join and operate a family business may include giving up career options that they find financially and personally attractive. It may seem to a new family member coming into a family business that he or she is suffering a loss of privacy. Conflicts may arise between parent and child when their management styles conflict. A business may make compromises, such as making it possible for the successor to spend more time with his or her family or hiring an interim senior manager to buffer conflicts between parent and child. But the company's "cost" and the successor's "price" must be affordable to both.
- Give family members outlets to explore their ideas, interests, and concerns.

The rewards of a family-owned business are many, as are the challenges. Those family members who manage the family business should enjoy the business itself if they are to be successful and pass along a sense of enthusiasm for the business when the time comes for them to hand over the reins.

FEASIBILITY STUDY

A feasibility study is done by an organization in order to determine if a particular action makes sense from an economic and operational standpoint. Such a study is usually designed to provide an overview of the essential issues related to a course of action being considered. The goal is to test the feasibility of a proposed course of action and to identify any "make or break" issues that would argue against the action being taken or suggest that a successful outcome would be unlikely.

Businesses find it helpful to conduct a feasibility study whenever they anticipate making an important strategic decision. For example, a company might perform a feasibility study to evaluate a proposed change in location, the acquisition of another company, a purchase of major equipment or a new computer system, the introduction of a new product or service, or the hiring of additional employees. A feasibility study is advisable as a means of fully studying an action in advance of taking the action. This allows managers a chance to make a full assessment of the impact that any major changes they are considering may have before implementing the change.

A feasibility study can also be helpful in securing financing. For example, an article titled "Real Estate Development Feasibility Studies" by Web-Berater, Inc., explained that within the real estate industry, one of the advantages of a feasibility study is that it allows lenders and investors to understand the potential risks and rewards of a project. This benefit can translate to other industries as well. Firms or companies seeking loans, venture capital, or other means of financing can use a feasibility study to demonstrate the potential success of a project, considering all market and project variables that could affect the investor's potential return. This study can be part of a well-organized business proposal or plan and can give investors greater insight into why the project will be a success.

As David E. Gumpert wrote in his book *How to Really Create a Successful Business Plan*, "Although [an unsuccessful feasibility study] may appear to be a failure, it's not. The failure would have been if you had invested your own and others' money and then lost it due to barriers you failed to research in advance."

Business owners who are concerned about the cost associated with a feasibility study may also wish to consider the possibility that the study may be tax deductible. According to Sec. 195(a) of the Internal Revenue Service tax code, deductions for start-up expenses are not permitted for a business. However, a 2006 *Encyclopedia Britannica* article suggested that "To be able to take a current deduction, the taxpayer would have to prove that it is already engaged in a certain trade or business under Sec. 162 and is simply expanding said trade or business." Thus, if a business is already in operation and

is considering a new project or acquisition, the expenses of such a study may be offset by the potential tax deduction.

STEPS IN CONDUCTING A FEASIBILITY STUDY

The main objective of a feasibility study is to determine whether a certain plan of action is likely to produce the anticipated result that is, whether it will work, and whether it is worth doing economically. Although the primary objective of the study is dedicated to showing the outcomes of specific actions, it should begin with an evaluation of the entire operation.

A good feasibility study would review a company's strengths and weaknesses, its position in the marketplace, and its financial situation. It would also include information on a company's major competitors, primary customers, and any relevant industry trends. This sort of overview provides small-business owners and managers with an objective view of the company's current situation and opportunities. By providing information on consumer needs and how best to meet them, a feasibility study can also lead to new ideas for strategic changes.

The second part of a good feasibility study should focus on the proposed plan of action and provide a detailed estimate of its costs and benefits. In some cases, a feasibility study may lead management to determine that the company could achieve the same benefits through easier or cheaper means. For example, it may be possible to improve a manual filing system rather than purchase an expensive new computerized database. If the proposed project is determined to be both feasible and desirable, the information provided in the feasibility study can prove valuable in implementation. It can be used to develop a strategic plan for the project, translating general ideas into measurable goals. The goals can then be broken down further to create a series of concrete steps and outline how the steps can be implemented. Throughout the process, the feasibility study will show the various consequences and impacts associated with the plan of action.

While feasibility studies can be formatted in a number of different ways, the key is to create an organized, well-ordered document that presents the information in a clear and useful manner. If an individual is preparing a feasibility study for a particular purpose, a specific organizational structure may be required. For example, the Community Renewable Energy Feasibility Fund (CREFF) in Oregon put forth guidelines for feasibility studies to be conducted by those awarded CREFF grants. The CREFF requested that feasibility studies contain:

- An abstract stating the general purpose, goal, and scope of the project.
- A project description describing key components of the project, including any environmental impact and regulatory compliance issues
- An economic analysis of the cost, financing, and revenue
- A conclusion, including recommendations

While every report may be somewhat different, these general categories should typically be contained in any comprehensive feasibility study.

In some cases, a company may wish to hire a qualified consultant to perform a feasibility study. To be able to provide a meaningful analysis of the data, the consultant chosen should have expertise in the industry. It is also important for small businesses to assign an internal person to help gather information for the feasibility study. The small-business owner must be sure that those conducting the study have full access to the company and the specific information they need.

FEDERAL TRADE COMMISSION (FTC)

The Federal Trade Commission (FTC) was established as an independent administrative agency pursuant to the Federal Trade Commission Act of 1914. The purpose of the FTC is to enforce the provisions of the Federal Trade Commission Act, which prohibits "unfair or deceptive acts or practices in commerce." The Clayton Antitrust Act (1914) also granted the FTC the authority to act against specific and unfair monopolistic practices. The FTC is considered to be a law enforcement agency, and like other such agencies it lacks punitive authority. Although the FTC cannot punish violators that is the responsibility of the judicial system it can issue cease and desist orders and argue cases in federal and administrative courts.

Today, the Federal Trade Commission serves an important function as a protector of both consumer and business rights. While the restrictions that it imposes on business practices often receive the most attention, other laws enforced by the FTC such as the 1979 Franchise Rule, which directed franchisors to provide full disclosure of franchise information to prospective franchisees have been of great benefit to entrepreneurs and small-business owners. All business owners should educate themselves about the guidelines set forth by the FTC on various business practices. Some of its rules can be helpful to small businesses and entrepreneurs, while businesses that flout or remain ignorant of the FTC's operating guidelines are apt to regret it.

CREATION OF THE FTC

The FTC was created in response to a public outcry against the abuses of monopolistic trusts during the late nineteenth and early twentieth centuries. The Sherman Antitrust Act of 1890 had proven inadequate in limiting trusts, and the widespread misuse of economic power by companies became so problematic that it became a significant factor in the election of Woodrow Wilson to the White House in 1912. Once Wilson assumed the office of the presidency, he followed through on his campaign promises to address the excesses of America's trusts. Wilson's State of the Union Message of 1913 included a call for extensive antitrust legislation. Wilson's push, combined with public displeasure with the situation, resulted in the passage of two acts. The first was the Federal Trade Commission Act, which created and empowered the FTC to define and halt "unfair practice" in trade and commerce. It was followed by the Clayton Antitrust Act, which covered specific activities of corporations that were deemed to be not in the public interest. Activities covered by this act included those mergers which inhibited trade by creating monopolies. The FTC began operating in 1915; the Bureau of Operations, which had previously monitored corporate activity for the federal government, was folded into the FTC.

The FTC is empowered to enforce provisions of both acts following specific guidelines. The offense must fall under the jurisdiction of the various acts and must affect interstate commerce. The violations must also affect the public good; the FTC does not intervene in disputes between private parties. As noted, the FTC lacks authority to punish or fine violators, but if an FTC ruling such as a cease and desist order is ignored, the FTC can seek civil penalties in federal court and seek compensation for those harmed by the unfair or deceptive practices.

Since 1914 the Federal Trade Commission Act and the Clayton Act have been amended numerous times, thus expanding the legal responsibilities of the FTC. Some of the more notable amendments are:

- Webb-Pomerene Export Trade Act of 1918. This act promoted exports by encouraging cooperative activities.
- Robinson-Patman Act of 1936. This act strengthened the Clayton Act and addressed pricing practices of suppliers and wholesalers.
- Wool Products Labeling Act of 1939. This act ensured the purity of wool products.
- Lanham Trademark Act of 1946. This act required the registration and protection of trademarks used in commerce.
- Fair Packaging and Labeling Act of 1966. This act legislated against unfair or deceptive labeling and packaging.
- Truth in Lending Act of 1969. This legislation offered increased protection to consumers by requiring that companies provide full disclosure of credit terms and limit consumer liability concerning stolen credit cards; it also established regulations for advertising for credit services.
- Fair Credit Reporting Act of 1970. This act established regulations and fair operating practices for credit reporting agencies.
- Magnuson-Moss Warranty-Federal Trade Commission Improvement Act of 1975. This legislation expanded the authority of the FTC by allowing it to seek redress for consumers and civil penalties for repeat offenders. It also increased the FTC's authorization to pursue violations "affecting commerce" rather than violations "in commerce." This was an important distinction. Under the terms of the act, manufacturers are not required to warrant their products but if they do they must specify whether their warranties are "full" or "limited." The

law also introduced rules requiring businesses to explain any limitations on warranties in writing.

- FTC Franchise Rule of 1979. This rule requires franchisors to provide prospective franchisees with a full disclosure of relevant information about the franchise.
- Telemarketing and Consumer Fraud and Abuse Prevention Act of 1994. This law, commonly referred to as the "Telemarketing Sales Rule," was put together in response to widespread consumer complaints about fraudulent and bothersome telemarketing practices. The act imposed meaningful curbs on such activities.
- The Children's Online Privacy Protection Act of 1998. This act protects children's privacy by giving parents the tools to control what information is collected from their children online. Under the act, operators of commercial Web sites and online services that include children as their intended audience are obliged to carry out a list of actions meant to protect children and (in some cases) to assure parental knowledge of a child's online activity.
- Do-Not-Call Registry Act of 2003. This act authorizes the FTC, under sections of the Telemarketing and Consumer Fraud and Abuse Prevention Act, to implement and enforce a do-not-call registry to be established and run by the commission. The registry is nationwide in scope, applies to all telemarketers (with the exception of certain nonprofit organizations), and covers both interstate and intrastate telemarketing calls. Commercial telemarketers are not allowed to call a number that is on the registry, subject to certain exceptions.
- Fair and Accurate Credit Transactions Act of 2003. This act's provisions are designed to improve the accuracy of consumers' credit-related records. It gives consumers the right to one free copy of their credit report a year from the credit reporting agencies, and consumers may also purchase for a reasonable fee a credit score along with information about how the credit score is calculated. The act also includes provisions to prevent and mitigate identity theft, to enable consumers to place fraud alerts in their credit files, and to grant consumers additional rights with respect to how their information is used.

AMENDED FRANCHISE RULES

In 2008 the FTC made changes to rules governing the relationship between franchisee and franchisor. Under the Amended Franchisor Disclosure Rule, franchise applicants who are not considered "sophisticated investors" must receive additional disclosures about any lawsuits filed by franchisor in the previous year, as well as information about any legal settlements. In addition, the agreement must disclose information about the renewal policy, as well as disclosure about the number of franchise outlets and any changes that occurred to that number. The disclosure changes were mandated by July 1, 2008.

In 2009 the FTC updated its guidelines concerning the use of endorsements and testimonials in advertising for the first time since 1980. The new guidelines, which became effective December 1, 2009, mandated that if a consumer comments on his experience with a product in an advertisement and that experience was atypical, the advertisement must include a disclosure detailing the standard results most customers can expect, as opposed to simply stating "Results may vary." In addition, the guidelines emphasized that all connections between advertisers and endorsers must be disclosed, extending this requirement to bloggers and word-of-mouth marketers that review products online. Finally, the guidelines changed the rules on celebrity endorsements, making both celebrities and manufacturers liable for false or unsubstantiated claims and requiring celebrities to disclose their connection with companies when endorsing any products.

FTC BUREAUS

The FTC is administered by a five-member commission. Each commissioner is appointed by the president for a 7-year term with the advice and consent of the Senate. The president chooses from its ranks one commissioner to be chairperson. The chairperson appoints an executive director with the consent of the full commission; the executive director is responsible for general staff operations.

Three bureaus of the FTC interpret and enforce jurisdictional legislation: the Bureau of Consumer Protection, the Bureau of Competition, and the Bureau of Economics.

Bureau of Consumer Protection. The Bureau of Consumer Protection is charged with protecting the consumer from unfair, deceptive, and fraudulent practices. It enforces congressional consumer protection laws and regulations issued by the commission. In order to meet its various responsibilities, the bureau often becomes involved in federal litigation, consumer and business education, and conducts various investigations under its jurisdiction. The bureau has divisions of advertising, marketing practices, credit, and enforcement.

Bureau of Competition. The FTC's Bureau of Competition is responsible for antitrust activity and investigations involving restraint of trade. The Bureau of Competition

works with the Antitrust Division of the U.S. Department of Justice, but while the Justice Department concentrates on criminal violations, the Bureau of Competition deals with the technical and civil aspects of competition in the marketplace.

Bureau of Economics. The Bureau of Economics predicts and analyzes the economic impact of FTC activities, especially as these activities relate to competition, interstate commerce, and consumer welfare. The Bureau provides Congress and the executive branch with the results of its investigations and undertakes special studies on their behalf when requested.

APPLICATIONS FOR COMPLAINTS

The FTC becomes aware of alleged unfair or deceptive trade practices as a result of its own investigations or complaints from consumers, business people, trade associations, other federal agencies, or local and state governmental agencies. These complaints become known as "applications for complaints" and are reviewed to determine whether or not they fall under FTC jurisdiction. If the application does fall under FTC jurisdiction, the case can be settled if the violator agrees to a consent order. This is a document issued by the FTC after a formal and in some cases public hearing to hear the complaint. Consent orders are handed down in situations where the offending company or person agrees to discontinue or correct the challenged practices. If an agreement is not reached via a consent order, the case is litigated before an FTC Administrative Law Judge. After the judge has handed down his or her decision, either the FTC counsel or the respondent can appeal the decision to the commission. The commission may either dismiss the case or issue a cease and desist order. If a cease and desist order is issued, the respondent has 60 days to take all necessary steps to obey the order or launch an appeal process through the federal court system.

For further information on the FTC, its various responsibilities, and its impact on small-business owners, contact the agency at one of the following addresses: Federal Trade Commission, CRC-240, Washington, D.C. 20580, or online at www.ftc.gov.

FICA TAXES

FICA taxes arise from the 1937 Federal Insurance Contribution Act (FICA). These taxes include contributions to both the federal Social Security and Medicare programs, and must be paid by all American workers, whether they are employed by a company or are self-employed. The way in which the payment is made varies, but anyone employed for pay owes FICA taxes.

Small businesses that employ persons other than the owner or partners are required to withhold FICA taxes, along with regular income taxes,from the wages paid to employees. These taxes are remitted on a monthly or semi-weekly basis, depending on the quantity owed. Businesses are also required to make regularly scheduled reports to the Internal Revenue Service (IRS) about the amount of taxes owed and paid. Businesses are not required to withhold FICA taxes on wages paid to independent contractors. Self-employed persons are responsible for paying their own FICA taxes directly to the IRS on a quarterly basis.

FICA taxes are assigned to two programs, and the tax rate for each program is different. In 2009 the employer was required to withhold 6.2 percent of the first $106,800 of an employee's income for the Social Security portion of the employee's FICA taxes. The Medicare portion is 1.45 percent of the employee's entire income. The full employee's portion of the FICA tax is therefore 7.65 percent on the first $106,800 of income, and 1.45 percent on all income over $106,800. The FICA tax percentages have remained constant since 1990 but the top income rate taxable for Social Security is adjusted annually.

In addition to the portion withheld from employees, employers are required to match the 7.65 percent employee contribution, so that the total FICA contribution is 15.3 percent. Employers must withhold appropriate percentages from employee paychecks to ensure that the full tax obligation is met. These percentages are set forth in tax withholding tables published annually by the IRS. The tables are updated each year to reflect changes or tax credits put into place that affect an individual's tax

liability. For example, in 2009 and 2010, a tax credit called the Making Work Pay credit was in effect. This tax credit allowed individuals a tax credit worth up to 6.2 percent of their income. Individuals making $75,000 and couples making $150,000 and under were eligible for this credit. The maximum amount of credit an individual could receive under the Making Work Pay credit was $400. This meant that many people were able to pay $400 less in taxes. However, unlike previous tax credits, individuals did not simply receive a refund of $400 from the IRS. Instead, the IRS adjusted the withholding tables that determined the amount of FICA taxes an employer would withhold, so individuals received the credit over the course of the year in the form of higher paychecks. The IRS hoped that structuring the credit this way would encourage taxpayers to spend the credit and bolster the economy, instead of using it to pay off debts or saving the credit.

Self-employed persons are required to pay both the employer and employee portions of the FICA tax. This means self-employed individuals face a higher tax burden than individuals employed by an employer as they must pay the entire 15.3 percent of Social Security and Medicaid taxes themselves. This additional burden is often referred to as the "self-employment tax."

The timeliness of FICA tax payments to the IRS is very important. The IRS penalizes late payers with significant penalties and interest. The regular income taxes and the portion of the FICA taxes that are withheld from employees' wages each pay period must be remitted to the IRS monthly (or semi-weekly in the case of an employer whose payroll taxes owed exceed $50,000 in the period), along with a Federal Tax Deposit Coupon (Form 8109-B). Small businesses as well must pay in a timely manner, remitting Estimated Quarterly Tax payments using Schedule SE (Form 1040). FICA tax payments also must be reported on Form W-2, the Annual Statement of Taxes Withheld, which must be sent to all employees and to the Social Security Administration before January 31 of the following year.

Small businesses are also required to maintain specific employment records regarding FICA tax withholding and remittance in order to meet federal requirements. These records, which must be kept for every employee, include the amount of each payment subject to FICA taxes, the amount of FICA tax collected from each payment, along with the date, and an explanation for any difference between the amount subject to FICA taxes and the amount of tax collected.

Many small businesses fall behind in paying their FICA taxes or filing the associated reports at some time during their existence. A company struggling with cash flow may opt to pay suppliers and worker salaries in order to stay in business, rather than remitting its FICA tax withholdings on time. This is a very bad practice, however, because significant interest and penalties apply for late payment or nonpayment of FICA taxes. In fact, the Trust Fund Recovery Penalty allows the IRS to hold a small-business owner or accountant personally liable for 100 percent of the amount owed, even in cases where the business has gone bankrupt. "Therefore, it is critical that owners and officers be aware of their liability if they are directly or indirectly responsible for withholding tax deposits," Carl Grassi wrote in *Crain's Cleveland Business.* "Those owners and officers taking a passive role within a business should remove themselves from the financial affairs to help ensure that they will not be made responsible for unremitted withholding taxes."

There are certain situations in which small businesses can avoid owing FICA taxes. For example, special rules apply to sole proprietorships and husband-and-wife partnerships that pay their minor (under eighteen) children for work performed in the business. These small businesses receive an exemption from withholding FICA taxes from their children's paychecks and are also not required to pay the employer portion of the FICA taxes. In this way, the parent and child each save 7.65 percent, for a total of 15.3 percent. In addition, the child's wages can still be deducted from the parents' income taxes as a business expense.

There is no limit on how much children can earn and still receive the FICA tax exemption, although the payments only escape taxation completely if they are below the standard deduction, which was $5,700 in 2009. Even if the payments do not escape taxation completely, they will still be taxed at the child's lower rate. However, it is important that the wages paid to the child are reasonable for the job performed, and that the hours worked by the child are carefully documented, so it will be clear to the IRS that the child has not been paid for nothing. In addition, parents should note that their child's financial aid for college may be reduced if he or she earns more than $1,750 per year.

FIDUCIARY DUTY

Fiduciary duty is a legal requirement of loyalty and care that applies to any person or organization that has a fiduciary relationship with another person or organization. A fiduciary is a person, committee, or organization that has agreed to accept legal ownership or control and management of an asset or group of assets belonging to someone else. Some examples of fiduciary relationships might include an investment manager to participants in a pension plan, a majority stockholder in a corporation to minority investors, the members of a partnership to one another, a banker to customers, an attorney to a client, or even a parent to a child.

A fiduciary duty is one of complete trust and utmost good faith. While fiduciaries take legal title to assets, the assets do not belong to them. Rather, legal title allows fiduciaries to administer and manage the assets for a temporary period and for a specific purpose. In taking control of another's assets, fiduciaries also agree to manage those assets in accordance with the wishes of the individual who established the fiduciary relationship. The powers and duties of fiduciaries are often established in a document that formally establishes the fiduciary relationship. The conduct of fiduciaries is governed by common law as well as by specific federal and state laws. The Uniform Fiduciaries Act and the Uniform Trustees' Powers Act serve as models for state legislation.

Fiduciaries owe two main duties to their clients: a duty of loyalty and a duty of care. The duty of loyalty requires that fiduciaries act solely in the interest of their clients, rather than in their own interest. Thus fiduciaries must not derive any direct or indirect profit from their position, and must avoid potential conflicts of interest. The duty of care requires that fiduciaries perform their functions with a high level of competence and thoroughness, in accordance with industry standards.

Corporate directors have a special fiduciary duty to their shareholders. They are accountable not only for the safekeeping of assets but also for their efficient and effective use. Directors may not profit personally at the expense of, or contrary to, the corporation's shareholders. In other words, corporate directors must place the interests of shareholders above their own interests. The concept of fiduciary duty has a wide variety of other applications in the business world.

FEDERAL BAILOUT

The federal bailout of several corporations in 2008 and 2009 as a result of the global financial crisis illustrates fiduciary duty on a large scale. At the urging of the administration of President Barack Obama, the government became a majority shareholder of General Motors in summer 2009, pumping more than $6 billion into the company after it suffered record losses and was forced to declare bankruptcy. In this case, the government decided it had a fiduciary duty to GM to help guide the company back to profitability and prevent it from completely dissolving. President Obama argued that allowing GM to go under would prove disastrous not only to thousands of the company's workers, but to other auto parts suppliers and related companies that relied heavily on GM's business.

As part of GM's reorganization, the government forced out CEO Rick Wagoner and installed an interim CEO, Ed Whitacre, to lead the company until a permanent chief executive was found. Whiteacre's fiduciary duty was to help return the company to profitability by selling off underperforming units, advocating for faster change within the corporate structure, and paying back federal debt.

In a similar showing of fiduciary duty, the government poured billions of dollars into financial services firm Citigroup in late 2008. Spearheaded by the administration of President George W. Bush, the plan entailed the government absorbing more than $300 billion in loans on behalf of the company and then investing another $20 billion to help right the struggling firm. Again, the government's fiduciary duty in this case included absorbing Citigroup's debt risk while investing new money to help the firm continue operating. Even while acting in its fiduciary role, however, the government became sharply critical of Citigroup in summer 2009 when it was revealed that the company would pay 738 employees at least $1 million each in bonuses, which had been contractually stipulated prior to the bailout.

Employee Benefit Plans. One particular area of concern for small businesses is the expanded definition of fiduciary duty that applies to employers that offer certain types of benefit plans to their employees. Employers that offer

employee benefit plans such as 401(k) plans or other types of pension plans are bound by the definition of fiduciary duty set forth in the Employee Retirement Income Security Act of 1974 (ERISA). ERISA, in regulating employee benefit plans, established higher standards of fiduciary duty for individuals who have control over a plan's assets than had existed for other types of fiduciaries under common law.

Under ERISA, each pension plan must have a named fiduciary. In many cases, the named fiduciary is the CEO or CFO. It is common for the CEO or CFO to designate someone else to act as the administrator, fiduciary, and manager of the pension or retirement plan itself. It is important, however, to note that designating another person or entity to manage a plan does not relieve the CEO or other named fiduciary of ultimate responsibility. The named fiduciary has a responsibility to monitor the performance of all others responsible for the plan.

In spelling out fiduciary duties with regard to employee benefit plans, ERISA covers the duty of loyalty, the duty to use prudence, and the duty to comply with the plan. The duty of loyalty means that fiduciaries must act in the best interests of the plan and its participants. If fiduciaries are also plan participants, they must subordinate their own interests to those of the plan. In cases where plan participants form a diverse group with different interests, it may be difficult to balance the interests of all concerned.

ERISA expands the concept of care beyond that found in common law. Section 1104(a)(1) of ERISA states that a fiduciary shall discharge his duties with respect to a plan "with the care, skill, prudence, and diligence under the circumstances then prevailing that a prudent man acting in a like capacity and familiar with such matters would use in the conduct of an enterprise of a like character and with like aims." Thus, fiduciaries of employee benefit plans must discharge their duties with adequate expertise. The courts have found that fiduciary duties were breached when nonexpert laypersons failed to seek independent qualified counsel when making decisions affecting plan assets. Plan fiduciaries are under an obligation not only to use their special skills and expertise, but also to engage qualified advisers and managers if they lack the expertise themselves.

The prudent person standard, as expressed in ERISA, also requires that fiduciaries "diversify the investments of the plan so as to minimize the risk of large losses, unless under the circumstances it is clearly prudent not to do so." ERISA also highlights prohibited transactions. Additional specific duties of plan fiduciaries may be set forth in the plan document, and fiduciaries have a duty to administer the plan "in accordance with the documents and instruments governing the plan." Fiduciary duties outlined in the plan document must be consistent with ERISA.

Retirement plan fiduciaries are advised, in an *HR Focus* article from 2006, to address the following points in order to assure that they are covering all of their fiduciary responsibilities under ERISA.

- Ensure that the plan fiduciaries have adopted a statement of investment policies to be followed by the trustee and investment manager. This must include compliance with ERISA requirements of prudence, diversification, and avoidance of prohibited transactions. The statement of investment policy should be reviewed periodically and updated as necessary.
- Ensure that the named fiduciary submits a report at least annually to the company's board on plan administration and compliance with ERISA and the Internal Revenue Code.
- The named fiduciary must regularly review the performance of all other fiduciaries involved in administering and servicing the plan. Documentation of these reviews should also be maintained.
- Obtain an unqualified opinion on the plan's financial statement.
- Have a policy or procedure for the selection, retention, and monitoring of the plan's service providers.
- Ensure that the policy or procedure for selection of service providers is thorough, includes a check of credentials, educational preparation, and professional associations.
- Consider the service providers' general financial condition, credit or other ratings.
- Verify that the service providers are not performing multiple services for the company that could create a possible conflict of interest.
- Check to make sure that "free" services from the service provider are actually free.
- Make sure that the service provider's fees are clearly defined and that they are reasonable and within industry standards.

Under ERISA, retirement plans are not extensions of the companies that establish them. They are entirely separate entities and should be seen as holding assets in trust. These assets must be managed solely in the interest of the plan, its participants and beneficiaries.

FINANCE COMPANIES

Commercial finance companies are one option for entrepreneurs seeking small business loans. Commercial financing institutions generally charge higher interest rates than banks and credit unions, but they are also more likely to approve a loan request. Most loans obtained through finance companies are secured and the assets used as collateral can be seized if the entrepreneur defaults on the loan.

Consumer finance companies make small loans against personal assets and provide an option for individuals with poor credit ratings. Commercial finance companies provide small businesses with loans for inventory and equipment purchases and are a good resource of capital for manufacturing enterprises. Insurance companies often make commercial loans as a way of reinvesting their income. They usually provide payment terms and interest rates comparable to a commercial bank but require a business to have more assets available as collateral.

"In general, finance companies want to see strong assets to back up a loan and will monitor those assets much more carefully," one expert told *Entrepreneur*. "For that reason, they can loan more against the assets. So chances are a smaller business might get a larger loan from a finance company" than from a bank. Paola Banchero of *Kansas City Business Journal* noted that commercial finance companies have also grown because they are more flexible in arranging loan repayment schedules than banks. Whereas banks typically require a 7-year repayment schedule on term loans and 15-year schedules for loans on commercial property, finance companies may extend payment schedules up to 10 years for term loans and up to 25 years for loans on commercial real estate.

Commercial finance companies come in all shapes and sizes. The size of the firm usually has some bearing on the exact services it offers. The nation's largest finance firms (including Citigroup and JPMorgan Chase) have established networks of offices across the country, and they sometimes offer lending services that even banks do not. For example, JPMorgan Chase which loaned more than $633 billion in fiscal year 2009 offers small-business loans not offered by all banks. But as Cynthia Griffin noted in *Entrepreneur* noted, "in addition to the mega players, the commercial finance industry is populated by hundreds of smaller firms." These firms generally make asset-based loans, providing services to small-business owners who are unable to secure loans from their banks.

RECESSIONARY PRESSURES

Finance companies experienced sustained growth during much of the first decade of the twenty-first century. However, in 2008 and 2009, the global financial crisis and economic recession hit finance companies hard. Consequently, many small businesses lost access to once-trusted lenders. A downturn in business activity or consumer income, as was the case during this time, can severely restrict lending, making recovery for a finance company even more difficult.

FINANCIAL ANALYSIS

Financial analysis is an aspect of the overall business finance function that involves examining historical data to gain information about the current and future financial health of a company. Financial analysis can be applied in a wide variety of situations to give business managers the information they need to make critical decisions. The ability to understand financial data is essential for any business manager. Finance **is** the language of business. Business goals, objectives, and their outcomes are set in financial terms. Among the skills required to understand and manage a business is fluency in the language of finance the ability to read and understand financial data as well as present information in the form of financial reports.

The finance function in business involves evaluating economic trends, setting financial policy, and creating long-range plans for business activities. It also involves applying a system of internal controls for the handling of cash, the recognition of sales, the disbursement of expenses, the valuation of inventory, and the approval of capital expenditures. In addition, the finance function reports on these internal control systems through the preparation of financial statements, such as income statements, balance sheets, and cash flow statements.

Finally, finance involves analyzing the data contained in financial statements in order to provide valuable information for management decisions. In this way, financial analysis is only one part of the overall function of finance, but it is a very important one. A company's accounts and statements contain a great deal of information. Discovering the full meaning contained in the statements is at the heart of financial analysis. Understanding how accounts relate to one another is part of financial analysis. Another part involves using the numerical data contained in company statements to uncover patterns of activity that may not be apparent on the surface.

Financial analysis is not only important in ascertaining the well-being of a small business: customers use financial data to determine whether to do business with a specific firm. Once-obscure financial data can become critical when markets come under stress. For instance, a decline in deposits at a bank would suggest that its corporate and individual customers are increasingly withdrawing funds. A decline in deposits among all the banks in a country would further indicate lessened business demand in that country. Especially in a stressful economy, people depend on financial analysis when looking to do business with a company. Furthermore, financial analysis can uncover specific problem areas before they spiral out of control.

Economic downturns make financial analysis all the more important to the small-business owner. The recession of 2008 and 2009 was very difficult for many small businesses. Those that utilized financial analysis, however, were better prepared for a potential slowdown in business. Some even profited as a result. Some states have initiated programs aimed at helping small businesses recover from big-bank layoffs. For instance, the owner of a North Carolina insulation company sought a financial analysis of his business from BizBoost, a state program utilizing state and federal funds. As Elizabeth Olson wrote in the *New York Times* in 2010, "his insulation business got help from a BizBoost expert who did a financial analysis of his books, developed cash-flow projections, helped him ready his finances to seek an angel investor and helped him produce a 5 percent increase in revenue in a tough year."

DOCUMENTS USED IN FINANCIAL ANALYSIS

Different parties bring different approaches to financial analysis. For instance, suppliers and short-term creditors may be most concerned with liquidity and near-term cash-generating capacity. Bondholders might target a company's long-term cash-generating ability. Potential investors typically look at measures of profitability and risk. Management, of course, focuses on all aspects of financial analysis to move forward with daily operations.

The three main sources of data for financial analysis are a company's balance sheet, income statement, and cash flow statement.

Balance Sheet. The balance sheet outlines the financial and physical resources that a company has available for business activities in the future. It is important to note, however, that the balance sheet only lists these resources and makes no judgment about how well they will be used by management. For this reason, the balance sheet is more useful in analyzing a company's current financial position than its expected performance. Investors often scrutinize a

balance sheet to ascertain a business' net worth when considering a potential investment.

The main elements of the balance sheet are assets and liabilities. Assets generally include both current assets (cash or equivalents that will be converted to cash within one year, such as accounts receivable, inventory, and prepaid expenses) and noncurrent assets (assets that are held for more than 1 year and are used in running the business, including fixed assets like property, plant, and equipment; long-term investments; and intangible assets like patents, copyrights, and goodwill). Both the total amount of assets and the makeup of asset accounts are critical to financial analysts.

The balance sheet also includes two categories of liabilities: current liabilities (debts that will come due within 1 year, such as accounts payable, short-term loans, and taxes) and long-term debts (debts that are due more than 1 year from the date of the statement). Liabilities are important to financial analysts because businesses have the same obligation to pay their bills regularly as individuals, while business income tends to be less certain. Long-term liabilities are less important to analysts, since they lack the urgency of short-term debts, though their presence does indicate that a company is strong enough to be allowed to borrow money.

Income Statement. In contrast to the balance sheet, the income statement provides information about a company's performance over a certain period of time. Although it does not reveal much about the company's current financial condition, it does indicate its future viability. The main elements of the income statement are revenues, expenses, and net profit or loss. Revenues consist mainly of sales, though financial analysts may also note the inclusion of royalties, interest, and extraordinary items. Likewise, operating expenses usually consist primarily of the cost of goods sold, but can also include some unusual items. Net income is the "bottom line" of the income statement. This figure is the main indicator of a company's accomplishments over the statement period.

Cash Flow Statement. The cash flow statement is similar to the income statement in that it records a company's performance over a specified period of time. The difference between the two is that the income statement also takes into account some noncash accounting items such as depreciation. The cash flow statement strips away all of this and shows exactly how much actual money the company has generated. Cash flow statements show how companies have performed in managing inflows and outflows of cash. It provides a sharper picture of a company's ability to pay bills, creditors, and finance growth than any other financial statement.

ELEMENTS OF FINANCIAL HEALTH

A company's overall financial health can be assessed by examining three major factors: its liquidity, leverage, and profitability. All three of these factors are internal measures that are largely within the control of a company's management. It is important to note, however, that they may also be affected by other conditions such as overall trends in the economy that are beyond management's control.

Liquidity. Liquidity refers to a company's ability to pay its current bills and expenses. In other words, liquidity relates to the availability of cash and other assets to cover accounts payable, short-term debt, and other liabilities. All small businesses require a certain degree of liquidity in order to pay their bills on time, though start-up and very young companies are often not very liquid. In mature companies, low levels of liquidity can indicate poor management or a need for additional capital. Of course, any company's liquidity may vary due to seasonal variations, the timing of sales, and the state of the economy. The recession of 2008 and 2009, for instance, forced liquidity down for a great number of small businesses.

Companies tend to run into problems with liquidity because cash outflows are not flexible, while income is often uncertain. Creditors expect their money when promised, and employees expect regular paychecks. However, the cash coming in to a business does not often follow a set schedule. Sales volumes fluctuate as do collections from customers. Because of this difference between cash generation and cash payments, businesses should maintain a certain ratio of current assets to current liabilities in order to ensure adequate liquidity.

Leverage. Leverage refers to the proportion of a company's capital that has been contributed by investors as compared to creditors. In other words, leverage is the extent to which a company has depended upon borrowing to finance its operations. A company that has a high proportion of debt in relation to its equity would be considered highly leveraged. Leverage is an important aspect of financial analysis because it is reviewed closely by both bankers and investors. A high leverage ratio may increase a company's exposure to risk and business downturns, but along with this higher risk also comes the potential for higher returns.

Profitability. Profitability refers to management's performance in using the resources of a business. Many measures of profitability involve calculating the financial return that the company earns on the money that has been invested. Most entrepreneurs decide to start their own businesses in order to earn a better return on their money than would be available through a bank or other low-risk investments. If profitability measures demonstrate that this is not occurring, particularly once a small business has

moved beyond the start-up phase, the entrepreneur should consider selling the business and reinvesting his or her money elsewhere. However, many factors can influence profitability measures, including changes in price, volume, or expenses, as well the purchase of assets or the borrowing of money.

PERFORMING ANALYSES WITH FINANCIAL RATIOS

Measuring the liquidity, leverage, and profitability of a company is not a matter of how many dollars the company has in the form of assets, liabilities, and equity. The key is the proportions in which such items occur in relation to one another. A company is analyzed by looking at ratios rather than just dollar amounts. Financial ratios are determined by dividing one number by another, and are usually expressed as a percentage. They enable business owners to examine the relationships between seemingly unrelated items and thus gain useful information for decision making. Financial ratios are simple to calculate, easy to use, and provide a wealth of information that cannot be gotten elsewhere.

In addition to giving the small-business owner more perspective, financial ratios are used by a variety of interests in the business world when examining small businesses. For instance, credit managers utilize ratios of prospective clients when determining whether to extend credit. Bankers similarly use them to decide whether to grant loans. They have even been used to forecast certain financial events, including impending bankruptcy. While financial ratios are valuable tools, the small-business owner should also be cautious when using them. In certain cases, financial ratios can be misleading for various reasons, including wide latitude in current accounting requirements and availability of data for certain industries. The Generally Accepted Accounting Principles (GAAP) give companies considerable leeway in reporting their finances.

Virtually any financial statistics can be compared using a ratio. Small-business owners and managers only need to be concerned with a small set of ratios in order to identify where improvements are needed. Determining which ratios to compute depends on the type of business, the age of the business, the point in the business cycle, and any specific information sought. For example, if a small business depends on a large number of fixed assets, ratios that measure how efficiently these assets are being used may be the most significant.

There are a few general ratios that can be very useful in an overall financial analysis. To assess a company's liquidity, analysts recommend using the current, quick, and liquidity ratios. The current ratio can be defined as Current Assets / Current Liabilities. It measures the ability of an entity to pay its near-term obligations. Though the ideal current ratio depends to some extent on the type of business, a general rule of thumb is that it should be at least 2:1. A lower current ratio means that the company may not be able to pay its bills on time, while a higher ratio means that the company has money in cash or safe investments that could be put to better use in the business.

The quick ratio, also known as the "acid test," can be defined as Quick Assets (cash, marketable securities, and receivables) / Current Liabilities. This ratio provides a stricter definition of the company's ability to make payments on current obligations. Ideally, this ratio should be 1:1. If it is higher, the company may keep too much cash on hand or have a poor collection program for accounts receivable. If it is lower, it may indicate that the company relies too heavily on inventory to meet its obligations. The liquidity ratio, also known as the cash ratio, can be defined as Cash / Current Liabilities. This measure eliminates all current assets except cash from the calculation of liquidity.

The debt/equity ratio measures a company's leverage. Defined as Debt / Owners' Equity, this ratio indicates the relative mix of the company's investor-supplied capital. A company is generally considered safer if it has a low debt to equity ratio that is, a higher proportion of owner-supplied capital although a very low ratio can indicate excessive caution. In general, debt should be between 50 and 80 percent of equity.

Finally, analysts recommend the return on equity (ROE) ratio to measure a company's level of profitability, defined as Net Income / Owners' Equity. This ratio indicates how well the company is utilizing its equity investment. ROE is considered one of the best indicators of profitability. It is also a good figure to compare against competitors or an industry average. Experts suggest that companies usually need at least 10 to 14 percent ROE in order to fund future growth. If this ratio is too low, it can indicate poor management performance or a highly conservative business approach. On the other hand, a high ROE can mean that management is doing a good job, or that the firm is undercapitalized.

In conclusion, financial analysis can be an important tool for small-business owners and managers to measure their progress toward reaching company goals and how they compete with larger companies within an industry. When performed regularly over time, financial analysis can also help small businesses recognize and adapt to trends affecting their operations. Financial analysis is integral in measuring a company's success from the perspective of bankers, investors, and outside analysts.

FINANCIAL PLANNERS

Financial planners are individuals who advise people and companies about how to invest their assets. Most financial planners are professionals who help their clients with a variety of financial tasks and tools in making investment decisions to plan for the future.

A financial planner, unlike a Certified Financial Planner or Chartered Financial Consultant, is a title that is self-bestowed; it may be used by anyone. As a result, small-business owners wishing to hire a financial planner must be diligent in obtaining referrals, checking qualifications and licenses, and inquiring about fees. "The real pros can help you map out a route to goals like retirement and estate planning, asset allocation, and tax and cash-flow planning," Laura Koss-Feder wrote in an article for *Money*.

A good financial planner will conduct an in-depth interview to gather information about the client's income, expenses, assets, liabilities, future goals, and risk tolerance. The planner will use this information to develop a detailed, written financial plan specifically for the client. Financial planners may steer their clients toward a wide range of investment products, including stocks, bonds, mutual funds, money market accounts, independent retirement accounts (IRAs), and insurance. In most cases, clients receive monthly or quarterly reports detailing the progress of their investment portfolios.

FINDING A GOOD FINANCIAL PLANNER

"There is no shortage of good financial planners, but the challenge is to identify them among as many as 450,000 stockbrokers, insurance salespeople, and outright cranks who claim to be effective planners. Unlike, say, a plumber, hairdresser, or neurosurgeon, a financial planner does not necessarily have to open a book, take an exam, or otherwise demonstrate any competence before hanging out a shingle," Koss-Feder explained. Federal regulatory efforts have ramped up since 2008, however, when financial advisor Bernard Madoff was found to have defrauded investors billions of dollars in the largest Ponzi scheme (fraudulent investment operation) in history.

Meanwhile, the recession of 2008 and 2009 caught many financial planners and their clients off guard and has since put financial planning in a new light. More financial planners expect their small-business clients to be more skeptical and demanding of their services, writes Jeffrey Kosnett in *Kiplinger' Personal Finance*. In Kosnett's opinion, "Whether you go with a big firm or a smaller outfit, a planner's philosophy, not who he or she represents, is the key to your satisfaction."

The first step in finding a good financial planner is obtaining referrals from friends and business associates, preferably those who are in similar financial situations and have similar financial needs. If personal recommendations are not available, trade groups such as the National Association of Personal Financial Advisors, the Financial Planning Association, and the Certified Financial Planner Board of Standards provide referrals for their members.

After obtaining referrals, experts recommend that small-business owners interview at least three potential planners before making a decision. First impressions are critical when interviewing a financial planner, writes Suze Orman, a financial expert and best-selling author. Key first impressions include a planner who invites you to his or her office ("If they come to you, it's a sign they have too much time on their hands," says Orman), and a planner who invites both you and your spouse (if you have one) to understand the household financial picture fully.

It may be helpful to examine financial plans that each planner has prepared for clients with similar circumstances, and to gather information about the problems the planners have solved for other clients. Although it may

not be necessary if the referral comes from a trusted friend, the small-business owner may wish to contact some of these clients directly and ask about the planners' strengths and weaknesses, responsiveness to phone calls, and willingness to explain things. Since financial planners often work with other professionals such as attorneys and accountants the small-business owner may wish to ask for professional references as well.

The interview itself is a crucial part of the process. Orman warns that any financial planner who immediately decribes what types of investments the client must pursue should be treated with a wary eye. Investments are only a small part of the small-business owner's overall financial needs. In an initial interview, a financial planner should clarify a few key issues, including wills and living revocable trusts; all debts including mortgage; a FICO (credit) score and its impact on financial dealings; insurance and retirement needs; potential college costs; and investment goals for the next 5 years minimum.

The next step in hiring a financial planner is to conduct a thorough examination of his or her qualifications and experience. Experts recommend that financial planners have a strong background in finance, accounting, banking, stock brokerage, or a related field, as well as 5 years' experience. Potential financial planners should also be able to show proof that they are licensed with regulatory bodies. In order to obtain a credential such as Certified Financial Planner (CFP) or Chartered Financial Consultant (ChFC), a planner must pass a series of tests, take continuing education courses, and comply with a code of ethics. In addition, financial planners who provide advice about securities must file a disclosure document known as an ADV with the Securities and Exchange Commission (SEC). They are required to show potential clients Part II of this document upon request, which gives information on their educational background, qualifications, fees charged for services, and any business affiliations that could cause a conflict of interest. Although financial planners are not obliged to show clients Part I of their ADVs, small-business owners may want to avoid any planner who is unwilling to do so, as Part I outlines any disciplinary problems the planner has experienced.

FEE BASED OR COMMISSION BASED PLANNERS

The final step in hiring a financial planner is to find out how the planner will be compensated through client fees or brokerage commissions. Fee-based planners charge their clients various fees depending on the type of work they perform. In contrast, commission-based planners do not charge their clients up-front fees, but instead take a commission on the investments they recommend. Commission-based planners generally work with their clients to create an investment plan for free, then charge commissions ranging from 1 percent on money-market accounts to 90 percent of first-year insurance premiums. Some experts, including Orman, prefer fee-based planners since they will be more likely to be objective and avoid the potential for conflict of interest. However, the fees charged can be expensive; according to Koss-Feder, the average fee to create a basic financial plan is more than $1,100. Koss-Feder concluded, however, that "As long as you have confidence in the planner, it really doesn't matter which type you choose as long as you know how he is making his money,". The fee structure should always be spelled out in a written agreement.

Until an atmosphere of trust develops between the small-business owner and the financial planner, it may be best to start slowly, by investing around 25 percent of assets. The amount can then increase over time if the client is satisfied with the planner's performance. Lorayne Fiorillo, in *Entrepreneur*, recommended that in order to establish a strong relationship with a financial planner, small-business owners "treat your financial advisor and his or her staff with respect. Don't call your advisor with paperwork questions; that's a job for his or her assistant. If you have a complex question, call when the stock market is closed your advisor will have more time to talk. Most of all, keep the lines of communication open."

FINANCIAL RATIOS

Financial ratios are relationships determined from a company's financial information and used for comparison purposes. Examples include such measures as return on investment (ROI), return on assets (ROA), and debt-to-equity, to name just three. These ratios are the result of dividing one account balance or financial measurement with another. Usually these measurements or account balances are found on one of the company's financial statements balance sheet, income statement, cash flow statement, or statement of changes in owner's equity. Financial ratios can provide small-business owners and managers with a valuable tool for measuring their progress against predetermined internal goals, a certain competitor, or the overall industry. In addition, tracking various ratios over time is a powerful means of identifying trends in their early stages.

Financial ratios are used by bankers, investors, and business analysts to assess a company's financial status. For example, credit managers may look at basic ratios when deciding to extend credit to a small business. Likewise, bankers examine ratios before deciding on loan requests. Because financial ratios are instrumental to a small business' ability to receive financing, Congress has taken a closer look at them. The recession of 2008 and 2009 impeded the ability of many small businesses to obtain capital. Some small-business advocates have suggested that too much focus is placed on ratios in determining financing, and that struggling small businesses should not automatically be disqualified for assistance based on ratios that fail to meet certain credit benchmarks.

Ratios also enable analysts to make an accurate assessment of the competitive edge of a small business, even against an industry powerhouse. Charles Moyer, James McGuigan, and William Kretlow wrote in their 2009 book *Contemporary Financial Management*, "The total profits of IBM normally are many times those of Apple, because IBM is a much larger firm than Apple. By computing a ratio such as net profits divided by total assets, the relative performance of the two firms can be assessed more accurately." By utilizing financial ratios, the same comparison is possible for even the smallest business.

Ratios are calculated by dividing one number by another, such as total sales divided by number of employees. Ratios enable business owners to examine and measure the relationships between items. They are simple to calculate, easy to use, and provide small-business owners with insight into what is happening within their business, insights that are not always apparent upon review of the financial statements alone. Ratios are aids to judgment and cannot take the place of experience. But experience with reading ratios and tracking them over time will make any manager a better manager. Ratios can help to pinpoint areas that need attention before problems arise.

Virtually any financial statistics can be compared using a ratio. In reality, however, small-business owners and managers only need to be concerned with a small set of ratios in order to identify where improvements are needed.

It is important to keep in mind that financial ratios are time-sensitive; they can only present a picture of the business at the time that the underlying figures were prepared. For example, a retailer calculating ratios before and after the Christmas season would get very different results. In addition, ratios can be misleading when taken singly, though they can be quite valuable when a small business tracks them over time or uses them as a basis for comparison against company goals or industry standards.

Effective ratio analysis depends on keeping a few key factors in mind. First, ratios highlight potentially strong or weak areas within a small business. Additional analysis is often necessary to determine whether those areas are indeed strong or weak. Second, a financial ratio should be scrutinized to determine its true meaning. A low ratio, for instance, could be influenced by a low numerator or high denominator. Any conclusions should be withheld before the numerator and denominator are examined. Third, a financial ratio is meaningful only when compared to a standard, such as a stated management goal or an industry ratio trend. Finally, differences in accounting techniques should be closely considered when comparing financial ratios between two different firms to avoid wrong conclusions.

Perhaps the best way for small-business owners to use financial ratios is to conduct a formal ratio analysis on a regular basis. The raw data used to compute the ratios should be recorded on a special form monthly. Then the relevant ratios should be computed, reviewed, and saved for future comparisons. Determining which ratios to compute depends on the type of business, the age of the business, the point in the business cycle, and any specific information sought. For example, if a small business depends on a large number of fixed assets, ratios that measure how efficiently these assets are being used may be the most significant. In general, financial ratios can be broken down into four main categories, with several specific ratio calculations prescribed within each:

1) profitability or return on investment; 2) liquidity; 3) leverage; and 4) operating or efficiency.

PROFITABILITY OR RETURN ON INVESTMENT RATIOS

Profitability ratios provide information about management's performance in using the resources of the small business. Many entrepreneurs decide to start their own businesses in order to earn a better return on their money than would be available through a bank or other low-risk investments. If profitability ratios demonstrate that this is not occurring, particularly once a small business has moved beyond the start-up phase, entrepreneurs for whom a return on their money is the foremost concern may wish to sell the business and reinvest their money elsewhere. However, it is important to note that many factors can influence profitability ratios, including changes in price, volume, or expenses, as well as the purchase of assets or the borrowing of money. Some specific profitability ratios follow, along with the means of calculating them and their meaning to a small-business owner or manager.

Gross profitability: Gross Profits/Net Sales. This measures the margin on sales the company is achieving. It can be an indication of manufacturing efficiency or marketing effectiveness.

Net profitability: Net Income/Net Sales. This measures the overall profitability of the company, or how much is being brought to the bottom line. Strong gross profitability combined with weak net profitability may indicate a problem with indirect operating expenses or nonoperating items, such as interest expense. In general, net profitability shows the effectiveness of management. Though the optimal level depends on the type of business, the ratios can be compared for firms in the same industry.

Return on assets: Net Income/Total Assets. This indicates how effectively the company is deploying its assets. A very low return on asset, or ROA, usually indicates inefficient management, whereas a high ROA means efficient management. However, this ratio can be distorted by depreciation or any unusual expenses.

Return on investment 1: Net Income/Owners' Equity. This indicates how well the company is utilizing its equity investment. Due to leverage, this measure will generally be higher than return on assets. ROI is considered to be one of the best indicators of profitability. It is also a good figure to compare against competitors or an industry average. Experts suggest that companies usually need at least 10 to 14 percent ROI in order to fund future growth. If this ratio is too low, it can indicate poor management performance or a highly conservative business approach. On the other hand, a high ROI can mean that management is doing a good job or that the firm is undercapitalized.

Return on investment 2: Dividends +/- Stock Price Change/Stock Price Paid. From the investor's point of view, this calculation of ROI measures the gain (or loss) achieved by making an investment over a period of time.

Earnings per share. Net Income/Number of Shares Outstanding. This states a corporation's profits on a per-share basis. It can be helpful in further comparison to the market price of the stock.

Investment turnover: Net Sales/Total Assets. This measures a company's ability to use assets to generate sales. Although the ideal level for this ratio varies greatly, a very low figure may mean that the company maintains too many assets or has not deployed its assets well, whereas a high figure means that the assets have been used to produce good sales numbers.

Sales per employee: Total Sales/Number of Employees. This can provide a measure of productivity. This ratio will vary widely from one industry to another. A high figure relative to one's industry average can indicate either good personnel management or good equipment.

LIQUIDITY RATIOS

Liquidity ratios demonstrate a company's ability to pay its current obligations. In other words, they relate to the availability of cash and other assets to cover accounts payable, short-term debt, and other liabilities. All small businesses require a certain degree of liquidity in order to pay their bills on time, though start-up and very young companies are often not very liquid. In mature companies, low levels of liquidity can indicate poor management or a need for additional capital. Any company's liquidity may vary due to seasonality, the timing of sales, and the state of the economy. But liquidity ratios can provide small-business owners with useful limits to help them regulate borrowing and spending. Some of the best-known measures of a company's liquidity include:

Current ratio: Current Assets/Current Liabilities. This measures the ability of an entity to pay its near-term obligations. "Current" usually is defined as within 1 year. Though the ideal current ratio depends to some extent on the type of business, a general rule of thumb is that it should be at least 2:1. A lower current ratio means that the company may not be able to pay its bills on time, while a higher ratio means that the company has money in cash or safe investments that could be put to better use in the business.

Quick ratio (or "acid test"): Quick Assets (cash, marketable securities, and receivables)/Current Liabilities. This provides a stricter definition of the company's ability to make payments on current obligations. Ideally, this ratio should be 1:1. If it is higher, the company may keep too much cash on hand or have a poor collection program for accounts receivable. If it is lower, it may indicate that the

company relies too heavily on inventory to meet its obligations.

Cash to total assets: Cash/Total Assets. This measures the portion of a company's assets held in cash or marketable securities. Although a high ratio may indicate some degree of safety from a creditor's viewpoint, excess amounts of cash may be viewed as inefficient.

Sales to receivables (or turnover ratio): Net Sales/ Accounts Receivable. This measures the annual turnover of accounts receivable. A high number reflects a short lapse of time between sales and the collection of cash, while a low number means collections take longer. Because of seasonal changes this ratio is likely to vary. As a result, an annual floating average sales-to-receivables ratio is most useful in identifying meaningful shifts and trends.

Days' receivables ratio: 365/Sales to receivables ratio. This measures the average number of days that accounts receivable are outstanding. This number should be the same or lower than the company's expressed credit terms. Other ratios can also be converted to days, such as the cost of sales to payables ratio.

Cost of sales to payables: Cost of Sales/Trade Payables. This measures the annual turnover of accounts payable. Lower numbers tend to indicate good performance, though the ratio should be close to the industry standard.

Cash turnover: Net Sales/Net Working Capital (current assets less current liabilities). This reflects the company's ability to finance current operations, the efficiency of its working capital employment, and the margin of protection for its creditors. A high cash turnover ratio may leave the company vulnerable to creditors, while a low ratio may indicate an inefficient use of working capital. In general, sales five to six times greater than working capital are needed to maintain a positive cash flow and finance sales.

LEVERAGE RATIOS

Leverage ratios look at the extent to which a company has depended upon borrowing to finance its operations. As a result, these ratios are reviewed closely by bankers and investors. Most leverage ratios compare assets or net worth with liabilities. A high leverage ratio may increase a company's exposure to risk and business downturns, but along with this higher risk also comes the potential for higher returns. Some of the major measurements of leverage include:

Debt to equity ratio: Debt/Owners' Equity. This indicates the relative mix of the company's investor-supplied capital. A company is generally considered safer if it has a low debt to equity ratio that is, a higher proportion of owner-supplied capital though a very low ratio can indicate excessive caution. In general, debt should be between 50 and 80 percent of equity.

Debt ratio: Debt/Total Assets. This measures the portion of a company's capital that is provided by borrowing. A debt ratio greater than 1.0 means the company has negative net worth and is technically bankrupt. This ratio is similar, and can easily be converted to, the debt to equity ratio.

Fixed to worth ratio: Net Fixed Assets/Tangible Net Worth. This indicates how much of the owner's equity has been invested in fixed assets (i.e., plant and equipment). It is important to note that only tangible assets (physical assets like cash, inventory, property, plant, and equipment) are included in the calculation, and that they are valued less depreciation. Creditors usually like to see this ratio very low, but the large-scale leasing of assets can artificially lower it.

Interest coverage: Earnings before Interest and Taxes/ Interest Expense. This indicates how comfortably the company can handle its interest payments. In general, a higher interest coverage ratio means that the small business is able to take on additional debt. This ratio is closely examined by bankers and other creditors.

EFFICIENCY RATIOS

By assessing a company's use of credit, inventory, and assets, efficiency ratios can help small-business owners and managers conduct business more effectively. These ratios can show how quickly the company is collecting money for its credit sales or how many times inventory turns over in a given time period. This information can help management decide whether the company's credit terms are appropriate and whether its purchasing efforts are handled in an efficient manner. The following are some of the main indicators of efficiency:

Annual inventory turnover: Cost of Goods Sold for the Year/Average Inventory. This shows how efficiently the company is managing its production, warehousing, and distribution of product, considering its volume of sales. Higher ratios over six or seven times per year are generally thought to be better, although extremely high inventory turnover may indicate a narrow selection and possibly lost sales. A low inventory turnover rate, on the other hand, means that the company is paying to keep a large inventory, and may be overstocking or carrying obsolete items.

Inventory holding period: 365/Annual Inventory Turnover. This calculates the number of days, on average, that elapse between finished goods production and sale of product.

Inventory to assets ratio: Inventory/Total Assets. This shows the portion of assets tied up in inventory. Generally, a lower ratio is considered better.

Accounts receivable turnover: Net (credit) Sales/Average Accounts Receivable. This gives a measure of how quickly

credit sales are turned into cash. Alternatively, the reciprocal of this ratio indicates the portion of a year's credit sales that are outstanding at a particular point in time.

Collection period: 365/Accounts Receivable Turnover. This measures the average number of days the company's receivables are outstanding, between the date of credit sale and collection of cash.

SUMMARY

Although they may seem intimidating at first glance, all of the aforementioned financial ratios can be derived by simply comparing numbers that appear on a small business's income statement and balance sheet. Small-business owners would be well-served by familiarizing themselves with ratios and their uses as a tracking device for anticipating changes in operations.

Financial ratios are also an important tool for small-business owners and managers to measure their progress toward reaching company goals, as well as how they compete with larger companies. Unfortunately, many small-business owners fail to prepare even the most basic ratios, an oversight that could prove disastrous. Ratio analysis, when performed regularly over time, can help small businesses recognize and adapt to trends affecting their operations. Yet another reason small-business owners need to understand financial ratios is that they provide one of the main measures of a company's success from the perspective of bankers, investors, and business analysts. Often, a small business's ability to obtain debt or equity financing will depend on the company's financial ratios.

Despite all the positive uses of financial ratios, however, small-business managers are still encouraged to know the limitations of ratios and approach ratio analysis with a degree of caution. Ratios alone do not provide all the information necessary for decision making. But decisions that are made without looking at financial ratios are made without all the available data.

FINANCIAL STATEMENTS

Financial statements are written records of a business's financial situation. They include standard reports like the balance sheet, income or profit and loss statements, and cash flow statement. They stand as one of the more essential components of business information, and as the principal method of communicating financial information about an entity to outside parties. For these reasons, it is critical that financial statements truthfully reflect the financial well-being of a business entity; failure to do so can lead to bankruptcy and potential legal difficulties.

In a technical sense, financial statements are a summation of the financial position of an entity at a given point in time. Generally, financial statements are designed to meet the needs of many diverse users, particularly present and potential owners and creditors. Financial statements result from simplifying, condensing, and aggregating masses of data obtained primarily from a company's (or an individual's) accounting system.

FINANCIAL REPORTING

According to the Financial Accounting Standards Board (FASB), financial reporting includes not only financial statements but also other means of communicating financial information about an enterprise to its external users. Financial statements provide information useful in investment and credit decisions and in assessing cash flow prospects. They provide information about an enterprise's resources, claims to those resources, and changes in the resources. According to a 2010 FASB report, "For all financial liabilities measured at fair value, including financial liabilities without a principal amount and financial liabilities that are not held for payment of contractual cash flows, an entity would present on the face of the performance statement significant changes in fair value related to changes in the entity's credit standing. That information would be presented separately for financial liabilities for which certain changes in fair value are presented in other comprehensive income and financial liabilities for which all changes in fair value are presented

in net income." Essentially, an entity has the responsibility and the duty to be above board with all creditors, partners, stakeholders, and other parties with a vested financial interest in the financial health of the entity. The FASB understands that small businesses and corporations alike can spark small- and large-scale financial crises when financial statements are inaccurate whether intentional or not.

Financial reporting is a broad concept encompassing financial statements, notes to financial statements and parenthetical disclosures, supplementary information (such as changing prices), and other means of financial reporting (such as management discussions and analysis, and letters to stockholders). Financial reporting is but one source of information needed by those who make economic decisions about business enterprises. Even in the broader realm of financial reporting, financial statements hold tremendous value. In his 2009 book, *Financial Statements: A Step by Step Guide to Understanding and Creating Financial Reports*, Thomas R. Ittelson discussed the importance of measurement. The author noted that the unit of measurement must be quantified and must be agreed on by all parties within the entity, and any others who have a stake in the entity. It is when finances cannot be accurately measured that misunderstandings occur. The universal measurement of finances has for decades been the U.S. dollar. While it may seem this is an easy unit of measurement, inflation and the dollar's worth when pitted against other currencies (such as the euro) has to be considered.

The primary focus of financial reporting is information about earnings and its components. Information about earnings based on accrual accounting usually provides a better indication of an enterprise's present and continuing ability to generate positive cash flows than that provided by cash receipts and payments.

MAJOR FINANCIAL STATEMENTS

The basic financial statements of an enterprise include the: 1) balance sheet (or statement of financial position); 2) income statement; 3) cash flow statement; and 4) statement of changes in owners' equity or stockholders' equity. The balance sheet provides a snapshot of an entity as of a particular date. It lists the entity's assets, liabilities, and in the case of a corporation, the stockholders' equity on a specific date. The income statement presents a summary of the revenues, gains, expenses, losses, and net income or net loss of an entity for a specific period. The income statement is similar to a moving picture of the entity's operations during this period of time. The cash flow statement summarizes an entity's cash receipts and cash payments relating to its operating, investing, and financing activities during a particular period. A statement of changes in owners' equity or stockholders' equity reconciles the beginning of the period equity of an enterprise with its ending balance.

Items currently reported in financial statements are measured by different attributes (for example, historical cost, current cost, current market value, net reliable value, and present value of future cash flows). Historical cost is the traditional means of presenting assets and liabilities.

Notes to financial statements are informative disclosures appended to the end of financial statements. They provide important information concerning such matters as depreciation and inventory methods used, details of long-term debt, pensions, leases, income taxes, contingent liabilities, methods of consolidation, and other matters. Notes are considered an integral part of the financial statements. Schedules and parenthetical disclosures are also used to present information not provided elsewhere in the financial statements.

Each financial statement has a heading, which gives the name of the entity, the name of the statement, and the date or time covered by the statement. The information provided in financial statements is primarily financial in nature and expressed in units of money, usually dollars or euros. The information relates to an individual business enterprise. The information often is the product of approximations and estimates, rather than exact measurements, though they should not be the result of "massaging the numbers." The financial statements typically reflect the financial effects of transactions and events that have already happened (i.e., historical).

Financial statements presenting financial data for two or more periods are called comparative statements. Comparative financial statements usually give similar reports for the current period and for one or more preceding periods. They provide analysts with significant information about trends and relationships over 2 or more years. Comparative statements are considerably more significant than are single-year statements. Comparative statements emphasize the fact that financial statements for a single accounting period are only one part of the continuous history of the company. Quarterly earnings reports also allow a company, its investors, stakeholders, and the public at large compare one fiscal quarter with another. For most publicly traded companies, quarterly earnings reports are available on the company Web site or elsewhere on the Internet.

Interim financial statements are reports for periods of less than a year. The purpose of interim financial statements is to improve the timeliness of accounting information. Some companies issue comprehensive financial statements while others issue summary statements. Each interim period should be viewed primarily as an integral part of an annual period and should generally continue to use the generally accepted accounting principles (GAAP)

that were used in the preparation of the company's latest annual report. Financial statements are often audited by independent accountants for the purpose of increasing user confidence in their reliability. Statements available online, such as those posted on Yahoo! Finance, are available to the public. At the end of a company reporting, financial analysts will ask questions answered by company officers. This allows the public, investors, and stakeholders to obtain answers from experts. Entire reports are typically available for at least 90 days online, and links to the live report can be e-mailed to interested parties 2 weeks in advance so they can listen in real time.

Every financial statement is prepared on the basis of several accounting assumptions: that all transactions can be expressed or measured in dollars; that the enterprise will continue in business indefinitely; and that statements will be prepared at regular intervals. These assumptions provide the foundation for the structure of financial accounting theory and practice, and explain why financial information is presented in a given manner.

Financial statements also must be prepared in accordance with generally accepted accounting principles, and must include an explanation of the company's accounting procedures and policies. Financial advisors and internal auditors of the company will want to make these standards well known and relatively easy to understand so that there is no room for misinterpretation when external auditors come to call.

Standard accounting principles call for the recording of assets and liabilities at cost; the recognition of revenue when it is realized and when a transaction has taken place (generally at the point of sale), and the recognition of expenses according to the matching principle (costs to revenues). Standard accounting principles further require that uncertainties and risks related to a company be reflected in its accounting reports and that, generally, anything that would be of interest to an informed investor should be fully disclosed in the financial statements. This can be as easy as an e-mail, newsletter, or even a text message that lets investors know that there is new information available on the investor relations page of the company Web site.

ELEMENTS OF FINANCIAL STATEMENTS

The Financial Accounting Standards Board has defined the following elements of financial statements of business enterprises: assets, liabilities, equity, revenues, expenses, gains, losses, investment by owners, distribution to owners, and comprehensive income. According to FASB, the elements of financial statements are the building blocks with which financial statements are constructed. The FASB definitions, articulated in its "Elements of Financial Statements of Business Enterprises," are as follows:

- **Assets** are probable future economic benefits obtained or controlled by a particular entity as a result of past transactions or events.
- **Comprehensive income** is the change in equity (net assets) of an entity during a period from transactions and other events and circumstances from nonowner sources. It includes all changes in equity during a period except those resulting from investments by owners and distributions to owners.
- **Distributions to owners** are decreases in net assets of a particular enterprise resulting from transferring assets, rendering services, or incurring liabilities to owners. Distributions to owners decrease ownership interest or equity in an enterprise.
- **Equity** is the residual interest in the assets of an entity that remains after deducting its liabilities. In a business entity, equity is the ownership interest.
- **Expenses** are outflows or other uses of assets or incurring of liabilities during a period from delivering or producing goods or rendering services, or carrying out other activities that constitute the entity's ongoing major or central operation.
- **Gains** are increases in equity (net assets) from peripheral or incidental transactions of an entity and from all other transactions and other events and circumstances affecting the entity during a period except those that result from revenues or investments by owner.
- **Investments by owners** are increases in net assets of a particular enterprise resulting from transfers to it from other entities of something of value to obtain or increase ownership interest (or equity) in it.
- **Liabilities** are probable future sacrifices of economic benefits arising from present obligations of a particular entity to transfer assets or provide services to other entities in the future as a result of past transactions or events.
- **Losses** are decreases in equity (net assets) from peripheral or incidental transactions of an entity and from all other transactions and other events and circumstances affecting the entity during a period except those that result from expenses or distributions to owners.
- **Revenues** are inflows or other enhancements of assets of an entity or settlement of its liabilities (or a combination of both) during a period from delivering or producing goods, rendering services, or other activities that constitute the entity's ongoing major or central operations.

SUBSEQUENT EVENTS

In accounting terminology, a subsequent event is an important event that occurs between the balance sheet date and the date of issuance of the annual report. Subsequent events must have a material effect on the financial statements. A "subsequent event" note must be issued with financial statements if the event (or events) is considered to be important enough that without such information the financial statement would be misleading if the event were not disclosed. The recognition and recording of these events often requires the professional judgment of an accountant or external auditor. Such individuals will be more likely to scrutinize the books than internal auditors in many cases. They are not under the pressure of the company culture and therefore are more likely to report objectively to investors and public authorities.

Events that effect the financial statements at the date of the balance sheet might reveal an unknown condition or provide additional information regarding estimates or judgments. These events must be reported by adjusting the financial statements to recognize the new evidence. Events that relate to conditions that did not exist on the balance sheet date but arose subsequent to that date do not require an adjustment to the financial statements. The effect of the event on the future period, however, may be of such importance that it should be disclosed in a footnote or elsewhere.

PERSONAL FINANCIAL STATEMENTS

The reporting entity of personal financial statements is an individual, a husband and wife, or a group of related individuals. Personal financial statements are often prepared to deal with obtaining bank loans, income tax planning, retirement planning, gift and estate planning, and the public disclosure of financial affairs. Given that estate and death tax laws face significant changes in 2010 and again in 2011, it is extremely important that personal financial statements contain the most recent information on any changes to an estate or any trusts or assets held therein.

For each reporting entity, a statement of financial position is required. The statement presents assets at estimated current values, including intellectual property, liabilities at the lesser of the discounted amount of cash to be paid or the current cash settlement amount, and net worth. A provision should also be made for estimated income taxes on the differences between the estimated current value of assets. Comparative statements for one or more periods should be presented. A statement of changes in net worth is optional.

DEVELOPMENT STAGE COMPANIES

A company is considered to be a development stage company if substantially all of its efforts are devoted to establishing a new business and either of the following is present: 1) principal operations have not begun; or 2) principal operations have begun but revenue is insignificant (such as the first 3 years of an S-corp). Activities of a development stage enterprise frequently include financial planning, raising capital, research and development, personnel recruiting and training, and market development.

A development stage company must follow generally accepted accounting principles applicable to operating enterprises in the preparation of financial statements. In its balance sheet, the company must report cumulative net losses separately in the equity section. In its income statement it must report cumulative revenues and expenses from the inception of the enterprise. Likewise, in its cash flow statement, it must report cumulative cash flows from the inception of the enterprise. Its statement of stockholders' equity should include the number of shares issued and the date of their issuance as well as the dollar amounts received. The statement should identify the entity as a development stage enterprise and describe the nature of development stage activities. During the first period of normal operations, the enterprise must disclose its former developmental stage status in the notes section of its financial statements.

FRAUDULENT FINANCIAL REPORTING

Fraudulent financial reporting is defined as intentional or reckless reporting, whether by act or by omission, that results in materially misleading financial statements. Fraudulent financial reporting can usually be traced to the existence of conditions in either the internal environment of the firm (e.g., inadequate internal control), or in the external environment (e.g., poor industry or overall business conditions). Excessive pressure on management, such as unrealistic profit or other performance goals, can also lead to fraudulent financial reporting. Financial fraud committed by way of inaccurate financial statements is nothing new. In his 2009 book *How to Read a Financial Report*, John A. Tracy explains how important it is to understand financial statements and ensure that they are accurately measured. He notes, "The general view is that the new rules of governing financial reporting and auditing will make the stock market a fairer place to invest money. But we shouldn't let our guard down. The first defense is, as always, to have a clear-minded understanding of financial statements and the limits of financial reporting."

The legal requirements for a publicly traded company when it comes to financial reporting are, not surprisingly, much more rigorous than for privately held firms. They

became even more rigorous in 2002 with the passage of the Sarbanes-Oxley Act. This legislation was passed in the wake of the bankruptcy filing in 2001 by Enron and subsequent revelations about fraudulent accounting practices within the company. Enron was only the first in a string of high-profile bankruptcies. Serious allegations of accounting fraud followed and extended beyond the bankrupt firms to their accounting firms. The legislature acted quickly to fortify financial reporting requirements and stem the decline in confidence that resulted from the wave of bankruptcies. Without confidence in the financial reports of publicly traded firms, no stock exchange can exist for long.

The Sarbanes-Oxley Act is a complex law that imposes heavy reporting requirements on all publicly traded companies. Meeting the requirements of this law has increased the workload of auditing firms. In particular, Section 404 of the Sarbanes-Oxley Act requires that a company's financial statements and annual report include an official write-up by management about the effectiveness of the company's internal controls. This section also requires that outside auditors attest to management's report on internal controls. An external audit is required in order to attest to the management report.

Private companies are not covered by the Sarbanes-Oxley Act. However, analysts suggest that even private firms should be aware of the law as it has influenced accounting practices and business expectations generally.

AUDITING

The preparation and presentation of a company's financial statements are the responsibility of the management of the company. Published financial statements may be audited by an independent certified public accountant. In the case of publicly traded firms, an audit is required by law. For private firms it is not, although banks and other lenders often require such an independent check as a part of lending agreements.

During an audit, the auditor conducts an examination of the accounting system, records, internal controls, and financial statements in accordance with generally accepted auditing standards. For example, a 2010 audit of Comcast revealed that local government fees had not been properly charged by Comcast for consumer use of 911 service. Another inconsistency was found on the Comcast books less than a month before the audit revealed that the company had "over collected" a utility tax to customers for nearly 12 straight months. Audits of decades past would not typically have gone deep enough to find multiple errors. However, leery stakeholders and risk-averse government agencies result in deeper and longer investigations for nearly all private sector entities. In the steps of an audit, the auditor expresses an opinion concerning the fairness of the financial statements in conformity with generally accepted accounting principles. Four standard opinions are possible:

1. Unqualified opinion. This opinion means that all materials were made available, found to be in order, and met all auditing requirements. This is the most favorable opinion that can be rendered by an external auditor about a company's operations and records. In some cases, a company may receive an unqualified opinion with explanatory language added. Circumstances may require that the auditor add an explanatory paragraph to his or her report. When this is done the opinion is prefaced with the term, "explanatory language added."
2. Qualified opinion. This type of opinion is used for instances in which most of the company's financial materials were in order, with the exception of a certain account or transaction.
3. Adverse opinion. An adverse opinion states that the financial statements do not accurately or completely represent the company's financial position, results of operations, or cash flows in conformity with generally accepted accounting principles. Such an opinion is obviously not good news for the business being audited; nonetheless,adverse opinions have been more prevalent since 2008. Auditors are rendering more and more adverse opinions because audits are almost always very detailed, go much further beyond the surface, and take longer as a result. The likelihood of finding inaccuracies goes up exponentially in these cases. The American Institute of Certified Public Accountants (AICPA) offers free support for auditors, including a hotline where those conducting audits can ask questions about even the most obscure standards. Availability of tools like the AICPA hotline make it easier for auditors to investigate deeper and more capably.
4. Disclaimer of opinion. A disclaimer of opinion states that the auditor does not express an opinion on the financial statements, generally because he or she feels that the company did not present sufficient information. Again, this opinion casts an unfavorable light on the business being audited.

The auditor's standard opinion typically includes the following statements, among others:

The financial statements are the responsibility of the company's management; the audit was conducted according to generally accepted auditing standards; the audit was planned and performed to obtain reasonable assurance that the statements are free of material misstatements, and the audit provided a reasonable basis for an expression of an opinion concerning the fair presentation of the audit.

The audit report is then signed by the auditor and a principal of the firm and dated.

FIREWALLS

A firewall is a computer security device that is situated between a small business's internal network and the Internet. It can work at either the software or the hardware level to prevent unwanted outside access to the company's computer system. Many small businesses will simply have a firewall through their Microsoft antivirus protection or through another antivirus program, such as Avast, Norton, or AGV. Matthew Sarrel, writing for *PC Magazine*, provided the following information about firewalls: "A firewall must contain a stateful packet inspection (SPI) engine, which examines the content of packets and grants access to your network only if the traffic appears legitimate." A "stateful" engine is electronics parlance for software able to remember its earlier states, usually by saving values in memory. Sarrel continued: "Firewalls can also block inappropriate inbound and outbound traffic based on rules or filters. Internet Protocol (IP) filtering, for example, can block employees behind the firewall from accessing or receiving mail from specific IP addresses. Also, traffic can be blocked based on your network card's unique identifier, called a MAC (media access control) address. Many firewalls can control traffic using keyword and domain filters, letting you block traffic to specific sites. More sophisticated firewalls let you create complex rules." The firewall thus acts as a guard, identifying each packet of information before it is allowed to pass through. It is one of the most effective forms of protection yet developed against hackers operating on the Internet.

Ideally, a firewall will detect intruders, block them from entering the company's computer network, notify the system administrator, record information about the source of the attempted break-in, and produce reports to help authorities track down the culprits. Since firewalls can be set to monitor both incoming and outgoing Internet traffic, they can also be used to prevent employees from accessing games, social sites such as MySpace or Facebook, and adult sites on the Internet.

Despite the potential advantages of firewalls, however, some small businesses remain unprotected. Owners sometimes believe that firewalls are too expensive or demand too much technical expertise. Business owners may have an outside contractor doing information technology (IT) work, and this person may not report important changes or make updates to the firewall software or hardware frequently enough to keep the network protected. Some small-business owners believe that no hacker would be interested in the information contained on their computers. Wrong! Intruders often seek unprotected computers to serve as unknowing transmitters for spam mail. Later the company may discover this when many sites that *have* protected themselves refuse the company's own mail. Many hackers also seek to disrupt companies' operations just because they can. A small business may lose valuable information or cause itself no end of hassle by failing to erect a firewall.

EVALUATING THE NEED FOR A FIREWALL

Any computer connected to the Internet is vulnerable to hackers. Networked computers require more robust protection than freestanding machines. The freestanding machine connected to the Internet may be sufficiently protected by software arrangements and the protection provided to its e-mail by the Internet portal operator.

Although firewalls have a number of potential advantages, they do not provide foolproof protection and also

have some potential disadvantages. As Steffano Korper and Juanita Ellis wrote in *The E-Commerce Book*, firewalls cannot protect against computer viruses or against data theft by authorized users of a company's computer network. In addition, firewalls have some expense. Ideally they will be installed by a service organization.

Some small businesses avoid the need for a firewall by using a simple security measure known as "air gapping." This means that the company's computer network is kept completely separate from the Internet. One method of air gapping involves accessing the Internet only from a standalone computer not connected to the internal network; that machine, of course, will not hold any valuable or confidential information. This approach may be cheap but will not serve an organization that actively uses the Internet in its business operations. Another method involves only running Web servers that outsiders can reach on a secure system belonging to an Internet Service Provider (ISP).

Many small businesses decide not to hire an IT person or have a firewall professionally installed because they do not see the need for it. The truth is, they may have been right not so long ago. However, Web 2.0 applications are growing in numbers, especially among social networking sites like Facebook and Twitter. Essentially, any Web site that does not require a user to refresh the browser because it updates itself should be used on a network equipped with a "next-generation" enterprise firewall.

TYPES OF FIREWALL PROTECTION

The hardware security systems that act as firewalls vary in configuration and sophistication. One relatively simple device involves using a router which controls the sending and receiving of messages equipped with packet filters to examine the messages. This system can be configured to block traffic to or from certain Internet destinations or all unknown destinations. This type of security system is relatively inexpensive and easy to set up, but it also offers only minimal protection from hackers. In addition, some packet filters and other methods for blocking incoming or outgoing information can cause a slowdown in computer programs or Internet speed. A slightly more sophisticated and secure system is a proxy server. A proxy server works by stopping all incoming and outgoing traffic for inspection before forwarding it. One advantage of this type of system is that it can create a log of all messages sent and received. In their 2010 edition of *Cisco ASA: All-in-One Firewall, IPS, Anti-X, and VPN Adaptive Security Appliance*, Jazib Frahim and Omar Santos discuss the advantages that proxy servers offer to small and medium-sized businesses that have multiple servers. Proxy servers allow for protection against extremely specific Web-server intrusions or assaults. In addition, proxies offer accelerated request times because they can cache information. Even with all of these advantages, there are downsides. Proxy servers can be difficult to install, hard to deploy on large networks, and can also make Internet use less convenient for employees.

Both routers and proxy servers have one major disadvantage in terms of the security they provide. These systems base their evaluation and approval of messages on the header, which lists the sender, recipient, source, and destination. But hackers can easily create false headers to fool the filtering systems. One way to overcome this problem is through type enforcement, which also scans the content of messages. Another system, already mentioned, is the stateful inspection firewall; it uses an even more sophisticated method of verifying the sources of messages. Finally, it is possible to use any combination of routers, filters, proxy servers, and firewalls to create a layered security system. A large company like Motorola, for example, might place a firewall at the outside of the system and connect it to a gateway computer, then connect that machine to a router with packet filters, and finally connect the router to the internal computer network.

NETWORK MAPPING AND SECURITY

Network mapping is important for understanding where everything is on a network, especially for large, complex networks. In addition, Nmap, an advanced network scanner, offers methods for finding anomalies on a network or finding viruses or places where hackers may have "dropped off" something that could harm the network or allow the hacker to grab information when they want to. Nmap utilizes lines of code that are thousands of characters long. Complexity aside, Nmap can be an excellent choice for medium to large companies because it offers a higher level of protection along with several other amenities that bigger corporations may take advantage of, including version detection, script scanning, and operating system detection.

TIPS ON BUYING A FIREWALL

Before purchasing a firewall, a small-business owner should consider what type of information must be protected, and how severe the consequences of an attack might be. These factors will help determine how much money and time the company should spend on the firewall purchase. It is important to remember that the true costs of a firewall include installation and setup, training, maintenance, and regular updates. In addition, understanding the distinctions between different products and installing the product properly requires technical expertise and may involve hiring an outside computer expert.

Firewall protection comes in a wide variety of forms. Some basic firewall software is available for free on the

Internet. These simple packages can be downloaded and installed fairly easily, but they provide fewer options for users and do not offer technical support in case of problems. Other firewall and antivirus protection can be purchased online and offer better protection, but based on the industry a firm is in, and how sensitive the information it deals in is, certain firewalls may be more effective than others. Many other software solutions are available at retail computer stores or from an IT expert who buys the programs or hardware at wholesale or cost and passes them along to his or her clients at a price marked up at fair market value. The most sophisticated firewalls are complete hardware systems that can cost thousands of dollars.

When evaluating possible firewalls, it may be helpful to look for product reviews in computer magazines or on the Internet. Once the purchase decision has been made and the firewall is up and running, it is important to test the product. Many firewalls are breached by hackers due to faulty installation or configuration. In fact, Emery recommends having a team of technically minded employees try to break into the system from outside. This exercise may help the internal experts understand the strengths and limitations of the firewall, as well as how it fits into the context of the small business's overall computer security policy.

FISCAL YEAR

A fiscal year is any 52-week period used consistently by an organization for the purposes of financial reporting and policy setting. It may or may not correspond with the typical calendar year of January to December. A company may choose to designate a different time period as its fiscal year as a way of recognizing seasonal variations in its business, as a method of minimizing its tax burden, or for any number of other reasons.

Fiscal years are used by companies as the basis on which to report financial information. To be useful, information must reach decision makers frequently and promptly; therefore a fiscal year must be broken down into quarters that best represent the seasons of the given industry. To provide this timely information, accounting systems are designed to produce periodic reports at regular intervals. As a result, the accounting process is based on the time period principle. It is important that periodic reports be written and handled in a timely manner because they are the documents that investors, stakeholders, advertisers, consumers, and others use to make important decisions about their relationship with the company in question. Quarterly or fiscal yearly reports are typically available via the Internet. In addition, press releases announcing the date and time of the reports as well as press releases written after the report that discuss the highlights are often available from the company Web site as well as investor relations pages.

According to the time period principle, an organization's activities are identified with specific time periods, such as a month, a 3-month quarter, or a year. Then, financial statements are prepared for each reporting period. The time-periods of the fiscal year, which are also sometimes referred to as budgetary years, are covered by the reports. They are called accounting periods and the data revealed by accountants is reported in a timely manner. Most organizations use 1 year as their primary accounting period and prepare annual financial statements. However, nearly all organizations also prepare interim financial reports that cover 1 or 3 months of activity.

The beginning and end of a fiscal year and the reporting periods therein become extremely important in

the event of an internal or external audit. All documentation on record must reflect what was reported in the previous quarter or fiscal year. Any unreported income or other discrepancies between what is reported and what is found on the books often triggers an audit of some kind. This was the case with some of the financial institutions that collapsed during the economic crisis in 2008.

HOW FISCAL YEAR PERIODS ARE DETERMINED

The annual reporting period or company's fiscal year is not always the same as the calendar year ending December 31. In fact, an organization can adopt a fiscal year consisting of any 12 consecutive months. An acceptable variation of this rule is to adopt an annual reporting period of 52 weeks.

Companies that do not experience much seasonal variation in sales volume within the year often choose the calendar year as their fiscal year. On the other hand, companies that experience major seasonal variations in sales often choose a fiscal year that corresponds to their natural business year. The natural business year ends when sales activities are at their lowest point during the year. For example, the natural business year for retail merchants ends around January 31, after the Christmas holidays and the January pre-inventory selling seasons. As a result, retailers often start their fiscal year on February 1 each year.

The federal budget of the U.S. Government for 2009 extended from October 1, 2008, to September 30, 2009. This period designates when certain economic activities of the federal government will take place. For example, in 2009 President Barack Obama presented his 2010 budget, in which he named his priorities as health care, education, cleaner energy in the United States and abroad, and other issues. The budget is set up by the federal fiscal calendar to best suit the needs of both government and U.S. citizens. The president submits his budget each year for the coming fiscal year.

Individual states within the United States have their own fiscal calendars as well. For example, the State of Texas has designated a fiscal year that extends from September 1, 2009, through August 31, 2010. Texas uses this fiscal year for financial reporting and for establishing basic policies, such as those setting the base fares for travel on state business. The fiscal year and a state's budget can prove to be a daunting document to craft, for no matter what the fiscal budget includes or does not include, someone's interest somewhere will not be met. No matter how well thought out a fiscal year budget is, there will be those on both sides of the aisle who will take issue with it; the same is true for fiscal budgets in business.

Just as different states have different fiscal years, so do different countries. In some countries, the fiscal year will be adhered to by all business entities as well as the government, while in other countries, private and public sectors have their own separate fiscal years. In every case, the fiscal budget of a given country will reflect governmental and societal priorities that affect both private citizens and private sector businesses.

FIXED AND VARIABLE EXPENSES

Business expenses are categorized in two ways: fixed expenses and variable expenses. Fixed expenses or costs are those that do not fluctuate with changes in production level or sales volume. They include such expenses as rent, insurance, dues and subscriptions, equipment leases, payments on loans, depreciation, management salaries, and advertising. Fixed expenses will vary depending on the industry in which a company operates and other factors.

Variable costs are those that respond directly and proportionately to changes in activity level or volume, such as raw materials, hourly production wages, sales commissions, inventory, packaging supplies, and shipping costs. For some companies, variable expenses may include the cost of transportation. From 2007 through early 2009, the surge in gas prices caused many small businesses to figure out a way to place this cost into variable expenses and still remain profitable.

Bookkeeping and accounting systems track activities by assigning each transaction to a particular account phones, travel expense, Internet, materials purchase, technology (laptops, servers, enterprise networks, software, and hardware). The accounts are all given a number of defining attributes and among those is a designation of fixed expense or variable expense. This is important because most business planning activities require that expenses be easily segregated into these two categories. Those managing businesses soon learn how crucial it is to track expenses in a way that helps to make planning, forecasting, marketing, and bidding as easy as possible.

Although fixed costs do not vary with changes in production or sales volume, they may change over time. As new technologies are developed that make running a business or marketing it easier or faster, the cost associated with these measures must also be calculated into the budget and expenses. As a result, fixed costs are sometimes called period costs because of the era of the business in which they entered. Some fixed costs, such as advertising and promotional expenses, are incurred at the discretion of a company's management, while others are not. It is important to remember that all nondiscretionary fixed costs will be incurred even if production or sales volume falls to zero.

Although production and sales volume are the main factors determining the level of variable costs incurred by a company, these costs also may fluctuate in relation to other factors. These include changes in suppliers' prices or seasonal promotional efforts to attract consumers during holidays, after the release of a new product or service, or during a drop in sales due to low consumer activity. Some expenses may have both fixed and variable elements. For example, a company may pay a sales person a monthly salary (a fixed cost) plus a percentage commission for every unit sold above a certain level (a variable cost).

It is important to understand the behavior of the different types of expenses as production or sales volume increases. Total fixed costs remain unchanged as volume increases, while fixed costs per unit decline. For example, if a bicycle business had total fixed costs of $1,000 and only produced one bike, then the full $1,000 in fixed costs must be applied to that bike. On the other hand, if the same business produced ten bikes, then the fixed costs per unit decline to $100. Variable costs behave differently. Total variable costs increase proportionately as volume increases, while variable costs per unit remain unchanged. For example, if the bicycle company incurred variable costs of $200 per unit, total variable costs would be $200 if only one bike was produced and $2,000 if ten bikes were produced. However, variable costs applied per unit would be $200 for both the first and the tenth bike. The company's total costs are a combination of the fixed and variable costs. If the bicycle company produced ten bikes, its total costs would be $1,000 fixed plus $2,000 variable, which equals $3,000, or $300 per unit.

It is very important for small-business owners to understand how their various costs respond to changes in the volume of goods or services produced. The breakdown of a company's underlying expenses determines the profitable price level for its products or services, as well as many aspects of its overall business strategy. A small-business owner can use a knowledge of fixed and variable expenses to determine the company's break-even point (the number of units or dollars at which total revenues equal total costs, so the company breaks even), and in making decisions related to pricing goods and services.

Economies of scale are another area of business that can only be understood within the framework of fixed and variable expenses. Economies of scale are possible because in most production operations the fixed costs are not related to production volume; variable costs are. Large production runs therefore "absorb" more of the fixed costs. An example is a printing run. Setting up the run requires burning a plate after a photographic process, mounting the plate on the printing press, adjusting ink flow, and running five or six pages to make sure everything is correctly set up. The cost of setting up will be the same whether the printer produces one copy or 10,000. If the set-up cost is $55 and the printer produces 500 copies, each copy will carry 11 cents' worth of the set-up cost the fixed costs. But if 10,000 pages are printed, each page carries only ¢0.55 of set-up cost. The reduction in cost per unit is an economy due to scale.

Determining the fixed and variable expenses is the first step in performing a break-even analysis, which determines the number of units that must be sold in order to break even financially. This analysis provides a small-business owner with a great deal of valuable information, and it can be used to answer a number of important questions, such as whether a planned expansion or the purchase of new technology will be profitable. Knowing how to work with information about fixed and variable expenses can be particularly helpful for individuals who are considering buying a small business. Many businesses, particularly franchises, are reluctant to give out information about projected profits, but will provide information about costs and unit prices. The potential purchaser can then use this information to calculate the number of units and the dollar volume that would be needed to make a profit, and determine whether these numbers seem realistic.

FLEXIBLE BENEFIT PLANS

Flexible benefit plans allow employees to choose the benefits they want or need from a package of programs offered by an employer. Flexible benefit plans may include health insurance, retirement benefits such as 401(k) plans, and reimbursement accounts that employees can use to pay for out-of-pocket health or dependent care expenses. In a flexible benefit plan, employees contribute to the cost of these benefits through a payroll deduction of their before-tax income, reducing the employer's contribution. In addition, the ability to pay for benefits with pre-tax income lowers an employee's taxable income while raising the amount of their take-home pay an added "benefit." In the short term, companies obviously benefit from sharing costs with employees. But a business may also choose to cap its future contributions to benefits by passing along increased costs to employees through these plans.

Flexible benefit plans were increasingly popular with employers in the first few years of the twenty-first century, but as the economic crisis that began in 2008 clamped down on the finances of major corporations and other businesses, one of the first things to go were benefit packages, especially for retired employees receiving pensions and health care packages. Health and child-care costs have risen tremendously over the past several decades. This has had a major effect on a business' ability to offer benefits, although many employees still expect to receive some package of benefits as a result of employment. By 2010, however, the high level of unemployment had muted this expectation significantly.

Even during upswings in business and consumer activity, small businesses in particular are often unable to take advantage of the economies of scale that larger companies can use to their advantage in securing benefits programs. These companies, as well as larger ones, have subsequently sought palatable means by which their employees can contribute to the cost of benefits. One option is a flexible benefit plan. Indeed, many businesses started offering flexible benefits in order to retain a competitive benefits package for employees. There are several types of flexible benefit plans, including cafeteria plans and flexible spending accounts.

CAFETERIA PLANS

A type of flexible benefit plan known as a cafeteria plan enables employees to choose between receiving some or all of an employer's nontaxable benefits or receiving cash or other taxable benefits such as stock. These plans were established by the Revenue Act of 1978 and are regulated by Section 125 of the Internal Revenue Code. Only certain benefits can be offered under a cafeteria plan, though employers may offer any or all of these benefits. These include: health and group life insurance as well as medical reimbursement plans for noninsured expenses; disability, dental, and vision coverage; day care or elder care; 401(k) plans; and vacation, mental health, and personal days. Tuition assistance and other fringe benefits are exempt from the plans, even if they are not taxable. Funding for cafeteria plans may come from the employer, employee or both. Often, the employee receives a spending credit, with which he or she may choose to "buy" benefits from a list of options such as health insurance and life insurance. The benefits themselves may be provided in cash or via actual coverage.

In order to ensure these plans are fair to all employees and to limit the number of changes employees can make to their plan, the Internal Revenue Service (IRS) has set up a number of restrictions. For example, employees are unable to carry over unused credits or benefits to the next plan year. In addition, employers need to be sure that no more than 25 percent of the tax-favored benefits go to "highly compensated" employees. These employees could be officers earning above a certain salary range or those who have a percentage of ownership in the company greater than 1 percent (if they earn over $150,000) or greater than 5 percent (for others).

FLEXIBLE SPENDING ACCOUNTS

A flexible spending account (FSA) is a tax-deferred savings account established by an employer to help employees meet certain medical and dependent-care expenses that are not covered under the employer's insurance plan. FSAs allow employees to contribute pre-tax dollars to an account set up by their employer. They can later withdraw these funds tax-free to pay for qualified health insurance premiums, out-of-pocket medical costs, day care provider fees, or private preschool and kindergarten expenses. According to a 2010 *Cypress Times* article, "These [FSAs]may be offered in conjunction with other employer-provided benefits as part of a cafeteria plan. And, employers have complete flexibility to offer various combinations of benefits in designing their plan. You do not have to be covered under any other health care plan to participate."

There are three main types of FSAs. First, premium-only plans, which allow employees to set aside funds to pay medical and life insurance premiums. Second, unreimbursed medical expense plans, which allow employees to set aside money for projected health care expenses not covered by insurance. Third, dependent care reimbursement plans, which allow employees to set aside money for day care of dependent children. Employees must prove they have a legitimate expense in order to be reimbursed from these accounts. Invoices from health care professionals or day care facilities would serve this purpose. However, employees must also prove that the claim has not been reimbursed by other coverage, such as a spouse's insurance. Funds placed in reimbursement accounts generally must be used during the calendar year in which they were contributed; otherwise, the employee forfeits the funds. For this reason, participating in a flexible spending account requires careful planning on the part of both employees and employers.

In the fierce public debate over how the U.S. health care system can be improved, many have suggested that flexible benefits for medical care could alleviate a large part of the problem. According to a February 2010 *Wall Street Journal* article, "To bring down costs, we need to change the incentives that govern spending. Right now, $5 out of every $6 of health-care spending is paid for by someone other than the person receiving care insurance companies, employers, or the government. Individuals are insulated from the reality of what their decisions cost." The authors of this article suggest costs can be lowered by breathing new life into the flexible medical account. The suggestion is that flexible accounts allow those who would otherwise be uninsured have something that relatively closely reflects what the insured have at their disposal. This may be especially helpful to those who face chronic health issues at least a modicum of health care could be provided at no out-of-pocket cost.

SET UP AND TAX IMPLICATIONS

A small business can manage its own flexible benefit plan with the proper software. Since these plans are under the watchful eye of the IRS, it is important that record keeping and benefit payments be accurate and timely. Many companies hire an outside firm to manage their plan, which reduces internal headaches but at a higher cost to the company.

Employer contributions to cafeteria plans are tax deductible for the employer and are not subject to income tax for the employee. The contributions are taken before taxes, and therefore are not subject to Social Security (FICA) or federal unemployment (FUTA) taxes unless the monies are contributed to 401(k) plans. Many states follow the same guidelines regarding state taxes but companies should check with their accountant or the state's tax department to be sure.

Obviously, flexible benefit plans are not without their drawbacks. But for small businesses looking to attract and retain key personnel with competitive benefit packages while keeping their own costs low, they can be an attractive alternative to standard benefit plans. Further information about setting up and administering flexible benefit plans is available from the Employee Benefits Institute of America at www.ebia.com.

FLEXIBLE SPENDING ACCOUNT (FSA)

A flexible spending account (FSA) is a tax-deferred savings account established by an employer to help employees meet certain medical and dependent-care expenses that are not covered under the employer's insurance plan. Established under Section 125 of the Internal Revenue Code, FSAs were once known as medical Individual Retirement Accounts (IRAs). FSAs allow employees to contribute pre-tax dollars to an account set up by their employer. They can later withdraw these funds tax-free to pay for qualified health insurance premiums, out-of-pocket medical costs, day care provider fees, or private preschool and kindergarten expenses.

FSAs provide an attractive benefit for many employees, and they also offer tax savings for both employees and employers. As the cost of providing health insurance to employees rose in the late 1990s and early twenty-first century, many companies greatly increased the employee portion of the insurance premium. Co-pays and deductibles increased as well in an attempt to manage the overall premium cost.

Often confused with a Medical Spending Account (MSA), a flexible spending account is quite different, though both can be used for medical expenses and both offer their own distinct pros and cons. For example, in the 2010 edition of their book, *Flexible Spending Accounts and Medical Savings Accounts: A Comparison*, John Lyke and Chris Peterson discuss such distinctions and why they are important. For example, both FSAs and MSAs offer tax exemption on deductions for medical expenses, but an FSA also offers no limit to contributions while MSA contributions must be limited to an agreed upon percentage of the insurance deductable for a given medical expense.

The use of a health care FSA is one way in which employers may help their employees to self-fund with tax-free dollars the growing costs that they are asked to bear for their partial company-funded health insurance. During 2008 and 2009, flex accounts of all kinds would seem to have been beneficial to both employers and employees faced with rising medical costs and widespread financial crisis. Sadly, a start-up or small business could hardly have started offering FSAs while simultaneously figuring out how they would keep employees on the payroll.

TAX BENEFITS OF FSAS

Internal Revenue Service (IRS) guidelines allow employees to make contributions to employer-sponsored FSAs out of pre-tax income. Thus employees save federal and state income taxes, as well as the employee portion of Social Security taxes, on the amount they authorize their employer to withdraw from their paychecks and place in the FSA each year. By reducing their taxable income, employees can increase their take-home pay while adding to funds they can use if needed for early retirement (by way of layoff), medical expenses in the absence of full medical coverage, or for cash payment of a car or other big-ticket item after filing for Chapter 13 Bankruptcy. For example, say that an employee of ABC Company whose annual salary was $50,000 contributed $5,000 to an FSA in 2010. This action would reduce the employee's taxable income to $45,000. If the employee typically paid taxes amounting to 30 percent of her income, she would save $1,500 in taxes for 2010. Furthermore, the money contributed to an FSA is not taxable for the employee when it is withdrawn, provided it is used to pay for qualified medical or dependent-care expenses.

Employers also receive a tax benefit by establishing flexible spending accounts. Employers are not required to pay the employer portion of the Social Security tax which amounts to 7.65 percent of each employee's taxable income on employee contributions to FSAs. In effect, payroll taxes are reduced by 7.65 percent of the total employee contributions to the FSA.

In the earlier example, say that ABC Company is a small business with ten employees and an annual payroll of $500,000. Without the tax advantage of an FSA, the company would owe Social Security taxes of 7.65 percent on its total payroll of $500,000, or $38,250, in 2010. But if, in a most optimistic scenario, all ten employees each contributed the maximum allowable contribution of $5,000, the company's taxable payroll would be reduced by $50,000, and the company would save $3,825 in taxes for the year. Combined with the tax savings of $1,500 per employee, the total tax reduction for the company and its workers resulting from the FSA would be $18,825 for the year.

In reality, a company can expect a participation rate closer to 20 percent. In a 2005 *Business Insurance* article titled "Grace Period Complicates FSAs," Jerry Geisel states that "Currently, about 15 percent of eligible employees

contribute to health care FSAs, with employees contributing on average between $1,100 and $1,200 a year."

One potential reason for low participation rates has to do with the "use it or lose it" rule limiting the ability to cumulate funds in an FSA account. Money deposited into an FSA account is forfeit if not used in the benefit year. It is forfeit by the employee and received back by the company. Until 2005, when the IRS issued an FSA grace period amendment, all funds contributed to an FSA had to be used within 1 year. The dates for that year were defined as the company's benefit plan year, a period which may or may not correspond with the calendar year. Since 2005 a company may amend its FSA Plan document to incorporate a 2.5-month grace period. According to the 2010 IRS.gov FAQ on flexible spending accounts, "Amounts in the account at the end of the plan year cannot be carried over to the next year. However, the plan can provide for a grace period of up to 2.5 months after the end of the plan year. If there is a grace period, any qualified medical expenses incurred in that period can be paid from any amount left in the account at the end of the previous year. Your employer is not permitted to refund any part of the balance to you." Anything not used within this period would be forfeit. Proponents of the grace period hope that it will reduce concerns about losing money and encourage participation in FSA plans, especially for employees of small to medium-sized businesses.

LEGAL REQUIREMENTS FOR FSAS

Employers are required to follow the guidelines established in Section 125 of the Internal Revenue Code when setting up an FSA. The first step involves preparing a plan document that states the conditions for eligibility, the benefits provided, and the rules that apply to implementation of the FSA. The employer must distribute these rules to eligible employees in the form of an office memorandum and are encouraged to send through the company e-mail network to maintain a history proving the documents were sent by the employer and received by employees. The rules should be followed consistently to avoid potential challenges, such as the appearance of discrimination based on age, gender, race, or sexual orientation. Employers are also required to file Form 5500 with the U.S. Department of Labor each year, as well as complete a series of nondiscrimination tests outlined by the IRS.

Each part of the process of implementing and administering an FSA plan for employees involves legal requirements. These requirements apply to the plan document, summary plan description, nondiscrimination testing, government filings, claims administration, and plan updates. Since compliance with these requirements tends to be complex, and since the IRS imposes serious penalties for noncompliance, most companies outsource FSA administration to a third party. The costs of outsourcing these administrative tasks are high. While some experts say that such costs may be offset by the tax saving that FSA plans generate along with the savings associated with any funds forfeit by participants, the high cost of administering and maintaining FSAs is one reason why they are not ubiquitous in the 2010s.

Any employer considering an FSA for her firm must be careful to plan for the potential cash flow needs that may be generated by early disbursements. If an employee agrees to have $2,500 withheld from his paychecks for deposit into his FSA account during the year, those funds must be available to him as needed, which may be within the first month of the year. Since the money going into his account will be collected over a 12-month period, the company must have cash reserves set aside to address cash disbursements that occur prior to collections. Entrepreneurs and owners of small firms should not take this responsibility lightly. Those who do take it too lightly could end up (almost literally) robbing Peter to pay Paul. When unforeseen variables crop up, such as a sharp drop-off of consumer activity due to an economic crisis, the company may go bankrupt from raiding its own coffers to pay out an employee's medical expenses.

USING FSAS FOR DEPENDENT CARE EXPENSES

Employers can set up FSAs in a number of ways, depending on what options their employees would find most valuable. For example, FSAs can cover only health insurance premiums, or they can only be used to reimburse medical expenses not otherwise covered by the employer's health insurance plan. FSAs can also cover only dependent care expenses, or they can offer a full plate of benefits including both health care and dependent care.

Dependent care reimbursement FSAs have become increasingly common in recent years. Employees with children can use these accounts to cover day care and educational expenses up to and including private kindergarten.

With a dependent care FSA, employees can begin making pre-tax contributions when a child is born and continue until the child completes kindergarten. The maximum contribution is $5,000 annually per child. The employee decides how much to contribute based on his or her anticipated child-care expenses for each year. The employer deducts that amount in installments from the employee's gross pay each pay period and sets the money aside in an FSA. The employee's income taxes are calculated based on his or her remaining pay, which reduces taxable income. The employee can withdraw money from the FSA tax-free to make tuition payments. In most cases, employees are required to submit proof that their deductions are put toward qualifying dependent care expenses. They may opt to do this with receipts from doctors,

childcare providers, or other providers. The receipts are submitted to the employer, or in some cases, directly to the third-party flex account plan provider.

FSAS: A PASSING FAD OR REEMERGING TREND?

In October 2009 a proposal to cap the tax-free advantages of the FSA was discussed by the U.S. Senate Finance Committee. The holders of FSAs averaged incomes of $55,000. In the minds of many, this was perceived as a way to tax the working poor, and a misuse of what the flex account was intended for in the first place. Those who benefit from flex accounts do not do so just because these accounts lower taxes. They actually use the accounts to purchase items they need to deal with chronic illness or full-time dependent-care. Despite discussion of a cap, no significant Congressional action was taken that year.

In March 2010 an FSA holding company called XpressFlex in Idaho closed and was placed under FBI investigation. This raised concerns about the reliability of such companies. According to an article in the *Idaho Statesman* by Bill Roberts, "Despite tons of federal regulations on how the plans are supposed to work, there are probably more conditions for being a barber or a manicurist than for being a third-party administrator, said Jeffrey Mandell, a Boise attorney with 28 years of experience in retirement, 401(k) and flex-spending account law." Without any kind of financial protection, flex accounts can be vulnerable to third parties that run an inferior or unlawful businesses. But does that mean poorly run operations like XpressFlex have killed the industry? Hardly. In fact, more investment specialists and financial experts are taking a new interest in FSAs and other types of flex accounts, mainly because if used properly by both employers and employees, FSAs can save money. They also offer employees a way to purchase things they may medically need that their insurance plans will not cover, including glasses, carpal tunnel surgery, and orthopedic/ergonomic equipment.

In the first quarter of 2010, tax professional Robert Flach argued the point for FSAs. He noted in an installment of his "Tax Tips" that the flex account is still attractive and will only become more so in the years to come. Flach wrote, "Under a medical FSA you get an above-the-line deduction for 100% of qualified medical expenses paid through the plan." FSAs serve employers and employees well, but they must be managed properly by both parties and used to the letter of the law.

FLEXIBLE WORK ARRANGEMENTS

Flexible work programs are work arrangements wherein employees are given greater scheduling freedom in how they fulfill the obligations of their positions. The most commonplace of these programs is flextime, which gives workers far greater leeway in terms of the time when they begin and end work, provided they put in the total number of hours required by the employer. Other common flexible working arrangements involve job-sharing, compressed work weeks, and telecommuting.

Supporters of flexible work programs hail them as important recognition of the difficulties that many employees have in balancing their family obligations and their work duties, and they note that such programs can make a company more attractive to prospective employees. Critics contend, however, that while flexible employment initiatives do attempt to redress some longtime inequities in the work life-family life balance, ill-considered plans can have a deleterious impact on a company. These opinions are waning, however, and in many industries, virtual and

mobile offices and telecommuting are becoming a standard option for many small, medium, and large businesses.

PRIMARY FLEXIBLE WORK PROGRAMS

Flexible work arrangements can take any number of forms, from basic flextime programs to innovative child- and elder-care programs.

- Flextime. This is a system wherein employees choose their starting and quitting times from a range of available hours. These periods are usually at either end of a "core" time during which most company business takes place. Formerly regarded as a rare, cutting-edge workplace arrangement, flextime is now commonly practiced in a wide variety of industries. Where flextime was once only used in factories and call centers, it is now used by industry professionals, including IT workers, editors for news teams, teachers, and even everyday career persons working for small businesses.
- Compressed Work Week. Under this arrangement, the standard work week is compressed into fewer than 5 days. The most common compressed work week is 4 10-hour days. Other options include 3 12-hour days or arrangements in which employees work 9- or 10-hour days over 2 weeks and are compensated with an extra day or two of time off during that time.
- Flexplace. This term encompasses various arrangements in which an employee works from home or some other nonoffice location. Telecommuting is the most commonly practiced example of this type of flexible employment, and it has never been easier. Using handheld devices, laptops smaller than many books, virtual offices in the car, the advent of Skype, webcams, and a number of other hardware and software options, people everywhere are telecommuting in every thinkable industry. With increasing numbers of people working as contractors or operating their own businesses from home, telecommuting from a virtual office allows small-business owners to provide for their clients while keeping their overhead low.
- Job Sharing. Under these arrangements, two people voluntarily share the duties and responsibilities of one full-time position, with both salary and benefits of that position prorated between the two individuals.
- Work Sharing. These programs are increasingly used by companies that wish to avoid layoffs. It allows businesses to temporarily reduce hours and salary for a portion of their workforce while maintaining the number of employees. In this way, struggling businesses can reduce benefits as well. While it may not sound very attractive, this option allows workers to maintain their careers in the face of harsh economic climates and allows companies to stay afloat during similar circumstances.
- Expanded Leave. This option gives employees greater flexibility in terms of requesting extended periods of time away from work without losing their rights as employees. Expanded leave, which can be granted on either a paid or unpaid basis, is used for a variety of reasons, including sabbaticals, maternity leave (especially for high-risk pregnancies) education, community service, family problems, and medical care (most medical reasons for expanded leave are now largely covered by the terms of the Family and Medical Leave Act).
- Phased Retirement. Under these arrangements, the employee and employer agree to a schedule wherein the employee's full-time work commitments are gradually reduced over a period of months or years.
- Partial Retirement. These programs allow older employees to continue working on a part-time basis, with no established end date. Some companies offered partial retirement or early retirement packages to senior employees in 2007 through 2009 to encourage them to accept retirement sooner than anticipated. This would allow these companies to hire younger workers at lower wages and often diminish the cost of a longtime employee's overall benefits package.
- Work and Family Programs. In these programs employers provide some degree of assistance to their employees in the realms of child-care and elder-care. The best-known of these programs are in-house facilities providing care for the children of employees, but even basic flextime programs can ease child-care logistics for employees.

Family work programs are also quite prevalent in the telecommuting world. Working mothers are among the majority of at-home workers as many wish to stay with their children without being entirely tethered to motherhood on a full-time basis. Many of these women agree that while parenting is their main focus, being able to maintain a career that offers promotions, benefits, and the ability to add to the family income is of great importance.

While this trend is increasing greatly in the United States, it is also becoming more prevalent in other countries, too. According to a March 2010 article by Radhika Raj on www.DNAindia.com, "In The Regus Business Tracker survey, 64 per cent of Indian business leaders said they will recruit more mothers on a flexible-time basis over the next 24 months. The finding indicates that Indian

work culture is, overall, keen to help employees achieve a balance between work and family responsibilities."

ADVANTAGES OF FLEXIBLE WORK PROGRAMS

Defenders of flexible work initiatives point to the competitive advantages that such programs bring to companies that offer these sorts of programs. Perhaps the single most cited reason for introducing a flexible work environment is employee retention. Indeed, many businesses contend that the recent trend toward flextime and other programs has made it necessary for them to introduce their own programs or risk losing valued employees. "Another business argument for flexible work arrangements is that they allow companies to match the peaks and valleys of activity," wrote Elizabeth Sheley in *HRMagazine*. "More organizations have shifted their focus to how potential changes in schedule will affect the product. Reduced absenteeism, though often overlooked, is also a legitimate business rationale; flexible options not only strengthen commitment, but also give employees more time to handle the very situations that sometimes lead to absenteeism."

Proponents also note that, in many respects, flexible work programs provide a way for businesses to increase employee loyalty without resorting to making fundamental changes in their operations. Indeed, Sheley observed that "the most popular flexible work options are those that involve the least change. Flex-time and compressed work weeks, for example, call for the same number of hours, at the same workplace, as in traditional work arrangements."

In addition, some supporters of flexible work arrangements argue that such programs can actually have a positive impact on the productivity of employees. They contend that employees who are better able to attend to family needs through flextime are more likely to be contented and productive, while good employees who telecommute may get even more work done if they are freed up from office interruptions.

Business can also use flexible programs to address institutional problems. For instance, a small or mid-sized business that is crammed into a small facility or office may want to explore telecommuting programs in order to relieve the situation without resorting to an expensive relocation or expansion. This option is also attractive to those employees who commute long distances to the office. Saving on gasoline and wear and tear on a car can be as much an incentive to stay with a company as a raise or new benefits. Finally, proponents say the flexible work programs can be beneficial to companies by enhancing their public image and expanding the number of hours during which customers can be serviced.

DISADVANTAGES OF FLEXIBLE WORK PROGRAMS

Flexible work programs have many apparent advantages, but critics point out that ill-conceived programs can have a negative impact on businesses, and they add that even good programs often present challenges that a business has to address.

First of all, business owners and managers need to recognize that flexible work arrangements are not always appropriate for all people, jobs, or industries. Telecommuting and other "flexplace" arrangements, for example, can be disastrous (or at the very least a productivity drain) if used by employees who are unwilling or unable to put in a full day of work amid the nonwork temptations (television, pleasure reading, visiting social networking sites like Facebook and MySpace, housecleaning, etc.) of a home setting. Other companies, meanwhile, find that employees "flex" in and out of the business at such different hours that overhead costs increase due to longer hours of operation necessitated by allowing employees to work on several shifts as opposed to all being there at the same time. Manufacturing output suffers when those who would typically work in teams are not present for the same full shift time they would have shared in the past. This latter factor makes flextime a difficult fit for many manufacturing facilities. In a manufacturing setting where many of the factory operations depend on a single set of operational hours across operations, flextime is simply not an option; therefore small businesses that operate in these sectors may be well advised to stick with workers who are accustomed to a regular, nine to five, Monday through Friday workweek. Firms that utilize a work-cell team manufacturing concept will almost assuredly not be able to offer flextime.

Critics also contend that flex programs often leave managers in exceedingly difficult situations. "Far too often, flex is embraced... for its 'family-friendly' aspects long before the corporate support needed to manage it takes root," wrote Martha H. Peak in *Management Review*. "In these companies, flex policies are outlined in the employee manual but implementation is left up to individual managers. Then, when managers try to implement these programs, they discover that to be fair, flex requires them to treat different employees differently." Small-business owners who wish to implement flexible work arrangements such as condensed workweeks and telecommuting are well advised to understand exactly how it will work for their unique enterprise. A good idea may be to start small with a pilot program and extend the flextime option to other employees once it has been proven to work with a small group first.

Finally, many observers argue that businesses launch flexible work plans without adequate preparation.

"I know that flex is a basic element of family-friendly and that family-friendly is a requisite for competitive companies," stated Peak. "But it takes more than a statement in the policy manual to institutionalize flex. It takes new methodologies to measure job success and investment in technologies to keep employees in constant communication."

INSTITUTING A FLEXIBLE WORK ENVIRONMENT

Business experts and companies that have instituted flexible work programs offer a variety of recommendations to businesses that are pondering a move to a flexible work environment.

Research. Business owners should research the pros and cons of instituting a flexible work program in their company. Every company's needs and operating environment are different; just because a flex program worked for one business does not necessarily mean that it will work for another company. Conversely, a program that fails in one firm may work in another. Detailed research into the needs and pressures of both the operations and the employees of each business, then, is a necessary component of any decision. So is an honest assessment of the qualities of the business's work force.

The benefits of flexible work arrangements are more far reaching than just saving on overhead and being able to tend to family issues. Along with potential increases in productivity, there is evidence that both physical and mental health can improve as a result of giving employees more options. "In a review of 10 previous studies that included more than 16,000 people, researchers from Durham University and University of Newcastle, both in the U.K., and the University of Montreal found that having the ability to have more flexible work options in order to meet personal needs was associated with improvements in blood pressure, sleep quality, and overall mental health due to a reduction in stress." noted Denise Reynolds, in her March 2010 article, "A Flexible Work Arrangement May Have Health Benefits."

A company that is blessed with a work force of dedicated and conscientious employees is far more likely to be productive in a flex environment than is one that is saddled with a heavy sprinkling of unmotivated employees. A thorough and honest assessment of a company's existing workforce as well as future labor needs is important in determining whether a flexible work program is likely to succeed for that company.

Guidelines. Guidelines and systems of flex program administration should be created that: 1) address all business needs; and 2) stand up to tests of fairness and comprehensiveness. The process used to create guidelines for a flexible work program should include steps to ensure that new policies are compatible with existing company objectives. Issues like eligibility, application processes, reversibility, and changes to employee status should be plainly addressed. Finally, companies should formalize guidelines to head off complaints about favoritism or unfair treatment. Because a balanced and equitable treatment of all employees is important, the terminology used in the formal guidelines should be as general as possible family obligations may be used instead of child-care obligations, for example.

Control. Ultimately, a flexible work program is only worth keeping if it benefits a company's financial, strategic, and production goals. A key to making sure that those needs are met is to maintain control of the program. Employees and work teams can be very helpful in shaping flexible work guidelines, but business owners and managers should oversee discussions of potential changes to improve a flex work plan or schedule, and should encourage workers to participate in group think sessions to get the best out of everyone's suggestions. Business considerations such as profit margins, overhead cost, and supply and demand should remain paramount in any discussion of flextime and other options. Professionals forced to telecommute should know they still report to someone who is their boss. Likewise, managers and business owners must learn to respect the rules they put in place and learn to manage workers in a changing office environment.

Evaluation. Businesses should evaluate their flex work programs on a regular basis. Too many businesses introduce workplace flexibility programs that are flawed, but rather than review the program and make the necessary corrections, they ask their personnel (managers and eligible employees alike) to reshape their responsibilities, priorities, and planning to match the flawed program. Other companies launch good programs that lose their effectiveness over time because of neglect. Instead, business managers and owners need to practice continuous improvement in their workplace flexibility programs, just as they do in other aspects of their operations. "Fine-tune the program," wrote Sheley. "The evaluation process will provide at least some of the information necessary to make the adjustments that will make a workplace flexibility program of optimum benefit to both the company and its employees."

CONTINUED CHANGE IN FLEXIBLE WORK PROGRAMS

Looking ahead, it seems clear that flexible work programs will continue and will be used more frequently. With the rapid spread of high-speed connections to the Internet in homes and offices alike, the tools necessary to make flexible work programs successful are multiplying. Creating a

flexible work program suitable for a particular business and company will continue to be an individual endeavor but one that is made ever easier with new technologies and communication tools. The need for greener working environments is also an advantage of flex programs, especially telecommuting and remote operations, including global meetings by way of Skype or Vonage. Flex plans evolve as the need for a 24-hour workday and 7-day workweek continue to grow and intensify.

FLOW CHARTS

A flow chart, flow diagram, or idea tree is a graphical representation of a process or system that details the sequencing of steps required to create output. A typical flow chart uses a set of basic symbols to represent various functions and shows the sequence and interconnection of functions, concepts, or facts with lines and arrows. Flow charts can be used to document virtually any type of business system, from the movement of materials through machinery in a manufacturing operation to the flow of applicant information through the hiring process in a human resources department. Idea trees and technical flow charts can also be used to chart the progress of technology and software programming, or to brainstorm in group settings.

Each flow chart is concerned with one particular process or system. It begins with the input of data or materials into the system and traces all the procedures needed to convert the input into its final output form. Specialized flow chart symbols show the processes that take place, the actions that are performed in each step, and the relationship between various steps. Flow charts may include different levels of detail as needed, from a high-level overview of an entire system to a detailed diagram of one component process within a larger system. In any case, the flow chart shows the overall structure of the process or system, traces the flow of information and work through it, and highlights key processing and decision points.

Flow charts are an important tool for the improvement of processes. By providing a graphical representation, they help project teams to identify the different elements of a process and understand the interrelationships among the various steps. Flow charts may also be used to gather information and data about a process as an aid to decision making or performance evaluation. For example, the owner of a small advertising agency who hopes to reduce the time involved in creating a print ad might be able to use a flow chart of the process to identify and eliminate unnecessary steps. Though flow charts are relatively old design tools, they remain popular among computer programmers working on systems analysis and design. In recent years, many software programs have been developed to assist business people in creating flow charts.

CONSTRUCTING FLOW CHARTS

Flow charts typically utilize specialized symbols. Some of the main symbols that are used to construct flow charts include:

- A round-edged rectangle to represent starting and ending activities, which are sometimes referred to as terminal activities.
- A rectangle to represent an activity or step. Each step or activity within a process is indicated by a single rectangle, which is known as an activity or process symbol.

- A diamond to signify a decision point. The question to be answered or decision to be made is written inside the diamond, which is known as a decision symbol. The answer determines the path that will be taken as a next step.
- Flow lines show the progression or transition from one step to another.

Constructing a flow chart involves the following main steps: 1) define the process and identify the scope of the flow diagram; 2) identify project team members who are to be involved in the construction of the process flow diagram; 3) define the different steps involved in the process and the interrelationships between the different steps (all team members should help develop and agree upon the different steps for the process); 4) finalize the diagram, involving other concerned individuals as needed and making any modifications necessary; and 5) use the flow diagram and continuously update it as needed.

SMARTDRAW 2010 AND OTHER FLOW CHART SOFTWARE

There are several programs (such as SmartDraw 2010) that make it easy to create flow charts. SmartDraw allows users to draw and create diagrams in various Windows programs, including Excel, PowerPoint, and Word. Other flow chart design programs include Visio, Edraw, and FlowBreeze. All of these programs have revolutionized the way flow charts are made, making it faster and easier than ever to make flow charts for business presentations, seminars, and workshops. Organizing data for performance evaluations can be done with the click of a mouse, since it is easy to edit information about one employee to the next. The usual flow chart symbols diamonds, rectangles, and other activity and process symbols are built into the software programming and can be inserted with shortcut keys decided by the individual user to his or her preference. While there are free programs that can be downloaded on the Internet to design flow charts, the best options continue to be commercial software packages that come with manuals and support.

Flow charts and idea trees are an integral part of teaching, explaining, and learning the facts of a given situation. Raw data that is often complex or difficult to digest becomes more palatable, and often a recognizable pattern can be discerned by just about anyone. With constant changes and upgrades to flow chart software, flow charts have been revolutionized from scrawls on graph paper to an easy-to-understand method for delivering information and making decisions based on an illustration of the facts at hand.

FOCUS GROUPS

A focus group is a marketing research tool in which a small group of people engages in a roundtable discussion of selected topics of interest in an informal setting. Typically eight to ten individuals comprise a focus group, though data from Dun and Bradstreet reveals that as few as six and as many as twelve may also be optimal depending on the product, service, or other focus. The focus group discussion is typically directed by a moderator who guides the discussion in order to obtain the group's opinions about or reactions to specific products or marketing-oriented issues, known as test concepts. The moderator may lead the group members through a presentation or have them follow along on their own display system or tablet, choosing options as they move through the discussion of a given topic.

While focus groups can provide marketing managers, product managers, and market researchers with a great deal of helpful information, their use as a research tool is limited in that it is difficult to measure the results objectively. In addition, the cost and logistical complexity of focus group research is frequently cited as a deterrent, especially for small companies. Nonetheless, many small businesses find focus groups to be a useful means of staying close to consumers and their ever-changing attitudes and feelings. By providing qualitative information from well-defined

target audiences, focus groups can aid businesses in decision making and in the development of marketing strategies and promotional campaigns. Ultimately, a small-business owner has to decide whether focus groups are a useful tool there are those who are staunch supporters of this tool and others who adamantly oppose it.

APPLICATIONS

Traditionally, focus groups have been used by makers of consumer products to gather qualitative data from target groups of consumers. They are often used in the new product development process, for example, to test consumer reaction to new product concepts and prototypes. When Google released its second handheld device, the MyTouch, it depended on input from those who owned its predecessor, the 3G. Focus groups are also used to test marketing programs, as they can provide an indication of how consumers will react to specific advertising messages and other types of marketing communications. In this way, focus groups can help advertising and promotion managers position a particular product, service, or institution with respect to their target audience. Reactions to new types of product packaging can also be tested with focus groups. With mass retailers like Wal-Mart and Carrefour, packaging may need to change from one region to another depending on input from focus groups or marketing analysts. In addition, many companies have used focus groups as a tool to learn more about consumer habits, product usage, and service expectations.

As focus groups increased in popularity during the 1980s and 1990s, they were increasingly used to explore relatively narrow information niches. For example, pharmaceutical companies convened focus groups consisting of medical professionals to test concepts related to new drug products. The legal profession used focus groups to improve the quality of their cases. Nonprofit organizations used focus groups to test fundraising campaigns. Focus groups have also been used in industrial settings by business-to-business marketers. Smartphone manufacturers have used focus groups to determine what apps people find most useful and what kind of service they feel they would benefit most from.

CHARACTERISTICS

A key factor in determining the success of focus groups is the composition of the group in terms of the participants' age, gender, race, income, occupation, geographic location, and product usage and knowledge. Focus group participants are generally selected on the basis of their use of, knowledge, attitudes, or feelings about the products, services, or other test concepts that are the subject of the focus group. In selecting participants, the objective is to find individuals who can knowledgeably discuss the topics at hand and provide quality output that meets the specified research objectives.

The most common method of selecting participants for focus groups is to use some type of database that contains demographic, psychographic, and lifestyle information about a large number of consumers. Such databases are available from a variety of commercial vendors. A list of desired characteristics is drawn up and matched with the database to select participants for focus groups. These characteristics may include purchase behavior, attitudes, and demographic data such as age and gender. The goal is to select participants who would likely be in the target audience for the products, services, or concepts being tested. The idea is to gain an understanding of how a product or service is perceived by consumers who would have an interest in it. For this reason, it may be useful to let the members of the focus group choose the group rather than the other way around. Placing an ad on CraigsList.com or a social media site will make the idea for the focus group public, and interested parties can call or e-mail the group director about their interest and what qualifies them.

There is no absolute ideal in terms of the number of participants. Different moderators are comfortable with different sizes of focus groups, but most consultants encourage companies to utilize groups comprising eight to ten participants. Those who prefer this size focus group contend that it is large enough to provide a range of perspectives and make it difficult for one or two individuals to dominate the discussion. (Moderators should guard against such developments.) Groups that include more than ten participants are usually more difficult for moderators to control. Group interaction in larger groups is also more difficult, and moderators have a harder time stimulating discussion. In addition, it is often more difficult for a moderator to spend time following up on an opinion voiced by one individual when there are a dozen or more participants.

Focus groups that are relatively homogeneous in terms of age, gender, and product usage generally work better than more wide-ranging groups. When it is desirable to obtain data from different age and gender groups, most experts recommend scheduling a series of focus groups using homogeneous participants. They claim that group dynamics tend to become inhibited in mixed-gender or age-focus groups. In addition, specific topics can be explored in greater depth when there is homogeneity among the participants with regard to usage of or attitudes toward the products being tested. For example, teenage cell phone users are not likely to open up about how quickly or not they can text on a new phone they are testing in a group with people old enough to be their parents. Likewise, parents testing a new phone are not likely to note that they

like the built-in Global Positioning System because it helps them keep track of the child carrying the phone.

MODERATORS

Moderators play an important role in determining the success of focus groups. Well-trained moderators can provide a great deal of added value in terms of their past experience, skills, and techniques. On the other hand, poorly trained moderators are likely to fail to generate quality output from their focus groups. In addition to professional, full-time focus group moderators, other types of individuals who often serve as moderators include professional researchers, academicians, marketing consultants, psychologists or psychiatrists, and company representatives.

Focus group moderators serve as discussion leaders. They try to stimulate discussion while saying as little as possible. They are not interviewers. They usually work from a guide that provides them with an outlined plan of how the discussion should flow. If they are from a focus group consultancy firm, this guide will have been written by the consultancy. The guide includes topics to be covered and probing questions that can be used to stimulate further discussion. Moderators try to include everyone in the discussion. They allocate available time to make sure the required topics are covered. When the discussion digresses, it is up to the moderator to refocus the group on the topic at hand.

SESSIONS

When setting up a focus group session, it is important to give careful consideration to the physical setting where it will take place. The location should be one that encourages relaxed participation and informal, spontaneous comments. The focus group facility must be of adequate size and have comfortable seating for all of the participants. Living room and conference room settings both provide good locations for focus groups, but public places, such as restaurants and auditoriums, are generally regarded as too distracting for gaining optimal results. In selecting a focus group site it is also important to make it geographically convenient for the participants. Locations that are hard to find or in out of the way places may cause delays and scheduling problems. Finally, sites should be determined with an eye toward the schedules and locations of managers and executives who should be in attendance.

The facility should also be relatively soundproof, to minimize outside noises and distractions. While focus group sessions are almost always audiotaped and many are videotaped, client company representatives usually like to observe their focus groups firsthand. With this in mind, many focus group discussion areas are equipped with one-way mirrors that allow company representatives to observe without intruding. Having company representatives in the same room as the focus group is the least desirable arrangement.

Once the facility, moderator, and participants have been selected, typical focus group sessions begin with an introduction. During the introductory part of the session, the moderator welcomes the participants, informs them of what will take place during the session, and generally sets the stage for the discussion to follow. It is extremely important that the moderator is given an objective and a list of priorities from the business owner or manager. Moderating a focus group without a clear picture of the desired outcome is a fatal flaw that can turn what might have been a successful focus group into a socializing session or worse, an open floor for grievances about a product or service.

Prior to the main discussion there is usually a warm-up phase. The warm-up is designed to make the participants feel at ease. During the warm-up participants generally introduce themselves to the group. General topic discussions, usually related to the specific topics that will be covered later, also form part of the warm-up stage. These general discussions help participants focus their attention. They also provide the moderator with some insight into the different participants.

Gradually the moderator moves the level of discussion from general topics to more specific ones. The moderator may present different concepts for discussion. These include the test concepts for which the group was convened. The moderator may choose to use props to focus the group's attention. Typical props include product samples, actual or concept ads, concept statements that participants read together, photographs, and television commercials.

Once all of the test concepts have been discussed and evaluated by the group, the moderator moves the discussion into a wrap-up phase. During this phase, the best concepts are identified and their strengths and weaknesses discussed. Participants may be asked to write down their reactions to what they have seen and discussed. During this final phase, any outstanding issues that were omitted are covered. When all of the substantive discussions have been completed, the moderator closes the session by thanking the participants and giving them any final instructions. Participants should leave with a positive feeling about the experience and the company, if the company that arranged the focus group has been identified. After the participants have left, it is standard practice for the moderator and the client company observers to have a discussion. Checking in with participants via e-mail to offer them a chance to respond with input they may have held back during group time is also a great way to get additional feedback. If the focus group

was assembled and moderated by an outside consultancy firm, the business owner will want to discuss what other options they have for getting ongoing feedback through the company Web site or social networking site such as Facebook.

Following the conclusion of the focus group or series of focus group sessions, the moderator may prepare a report for the client company. The report generally provides a written summary of the results of the session or sessions as interpreted by the moderator. Focus group reports may be either very detailed or a simple summary of the discussion. In some cases the client company may not require a written report.

ONLINE FOCUS GROUPS

Online focus group sessions permit business owners and managers to observe group discussions directly without going to the time and expense of traveling to the locale in which the exercise is taking place. Using the Internet as a medium to conduct focus groups is a logical and vastly superior successor to videoconferencing. Videoconferencing enabled companies to conduct focus group research without incurring major business travel expenses. But equipment glitches, the logistical challenge of gathering observers at a central location, and the expense of purchasing and implementing this high-tech option made it a decidedly imperfect vehicle. The invention of video streaming technology, however, as business writer Alf Nucifora observed, "now means that focus groups can be observed 'live' from the comfort of one's desk.... A camera captures all the action close-up... and broadcasts the action via video streaming to an unlimited number of viewers who can watch real-time from the comfort of their desktop computers at any time, in any place." The completed focus group session can then be saved in computer-readable form for future use. In addition, if the desired captive demographic are users from all over the world, say business professionals between the ages of twenty-five and forty who use a given technology when they travel, an Internet survey conducted via Microsoft Live Meeting or Skype can be extremely useful.

Analysts cite online focus groups as a particularly exciting development for small-business owners with limited resources. *Business Week* noted that traditional focus group research can take several months and a great deal of expense (as much as $100,000) to complete. But growing numbers of market research firms offer online focus group research services for less than $5,000 a session, the results of which can be studied and tabulated within a matter of weeks. Still, not all business ventures are equally suited to pursue this electronic alternative. "If your customers aren't tech-savvy, or if your product relies heavily on touch and taste, you may be wiser to foot the bill for a traditional group," counseled *Business Week*. "But if all you require is a quick glimpse into your customers' minds, an online group could be the way to go."

FORECASTING

Forecasting can be broadly considered as a method or a technique for estimating many future aspects of a business, government budget, or other operation. Planning for the future is a critical aspect of managing any organization, and small business enterprises are no exception. Indeed, their typically modest capital resources make such planning particularly important. In fact, the long-term success of both small and large organizations is closely tied to how well the management of the organization is able to foresee its future and to develop appropriate strategies to deal with likely future scenarios. Intuition, good judgment, voluntary internal auditing, and an awareness of how well the industry and national economy are doing may give the manager of a business firm a sense of future market and economic trends. Nevertheless, it is not easy to convert a feeling about the future into a precise and useful number, such as next year's sales volume or the raw material cost

per unit of output. Forecasting methods can help estimate many such future aspects of a business operation.

The goal of forecasting is to come as close to possible to an accurate picture of the future. But, as with other forms of fortune telling, it can never be fully accurate. There are simply too many interactive variables. A change in any one of these may cause the forecasted scenario to change. For example, unexpected shocks to the economy, as occurred after the terrorist attacks of September 11, 2001, and the financial meltdown of 2008, are extremely difficult to anticipate and plan around. Such extreme situations are, happily, very rare. But there are far more subtle events that may also cause major changes in the assumptions upon which a forecast is based, including sharply increased material costs resulting from war or other military action, the unexpected bankruptcy or buyout of a large competitor, a natural disaster that halts exporting or importing in a given region, or an increase in demand due to an unexpected fashion trend shift. Despite the fact that forecasting is an imprecise art, a company must do the best it can to plan for the future, and an important part of this planning is forecasting.

The task of forecasting can be approached in a number of ways, and the best forecasting outcomes are usually the result of applying several forecasting methods. To supplement their judgment, forecasters rely on a variety of data sources and forecasting methods. For example, forecasting may involve the use of econometric models that can take into account the interactions between economic variables. In other cases, the forecaster may employ statistical techniques for analyzing sets of historical data referred to simply as time series. Other frequently used data sources are recent consumer surveys and forecasts produced by other institutions industry associations, investment banks, and economists, generally.

FORECASTING AND ITS PRACTICAL APPLICATIONS

In an era in which forecasts drive entire supply chain networks, forecasting is an increasingly critical organizational capability. Forecasting the future may sound like a lofty and theoretical activity when in reality it is a practical business tool like many others. Here is an example. How should a business go about preparing the quarterly sales volume forecasts for their primary product, say, window-glass? The company will certainly want to review the actual sales data for window glass over the last few years. Suppose that the forecaster has access to actual sales data for each quarter over the 15-year period the firm has been in business. Using these historical data, the forecaster can see the general level of sales but more importantly, he or she can also determine what pattern the sales history produces, what trends are visible. A thorough review of the data may reveal some type of seasonal pattern, such as peak sales occurring in the spring as people do spring-cleaning and others prepare to sell their homes during the summer school break. In addition, if the forecaster is able to identify other factors that influence sales, like weather patterns or housing starts, historical data on these factors can also be used in generating forecasts of future sales volumes. The forecasting may get tricky for the window-glass company owner when he or she calculates how many environmentally friendly windows will be sold. Given that this trend is a relatively new one, and that the first few fiscal years of a trend may not give reliable data about sales in the next several years, it will not be easy to forecast how many double- or triple-paned windows will be sold to those buying them specifically to "green-fit" their homes.

FORECASTING METHODS

Academics divide forecasting methods into two broad categories: qualitative and quantitative. The division of forecasting methods into qualitative forecasting and quantitative forecasting is based on the availability of historical time series data. If historical data and time series are available, than quantitative methods may be used. If not, qualitative methods are the only option.

Qualitative Forecasting Methods. Qualitative forecasting techniques generally employ the judgment of experts to generate forecasts. A key advantage of these procedures is that they can be applied in situations where historical data are simply not available. Even in situations where such data are available, quantitative forecasting methods are a useful addition to successful forecasting.

Three important qualitative forecasting methods are: the Delphi method, scenario writing, and the subject approach.

Delphi Method. In the Delphi method, an attempt is made to develop forecasts through "group consensus."

A group of experts in a particular field participates. Usually, a panel of these experienced people is asked to respond to a series of questionnaires. The panel members, who should ideally come from a variety of backgrounds (marketing, production, management, finance, purchasing, etc.) are asked to respond to an initial questionnaire. A second questionnaire is then created which incorporates information and opinions gathered in the responses to the first questionnaire. The second questionnaire is then distributed. Each panelist is asked to reconsider and revise his or her initial response to the questions based on the new information. This process is continued until some degree of consensus among the panelists is reached. It should be noted that the objective of the Delphi method is not to produce a single answer at the end. Instead, it attempts to

produce a relatively narrow range of opinions a range into which most of the panelists' opinions fall.

Scenario Writing Method. According to the 2010 book *Future Ready: How to Master Business Forecasting* by Steve Morlidge and Steve Player, scenario planning involves "the creation of a limited number of credible, but different, alternative 'futures' based on very different assumptions about the world: the political, economic, social, and technological, and increasingly, environmental context. The aim is not to predict the future in any precise sense but to identify how the organization might be vulnerable to a significant and sudden change in external milieus and what new opportunities such a shift might throw up." Under the scenario writing approach, the forecaster starts with different sets of assumptions. For each set of assumptions, a likely scenario of the business outcome is charted. Thus, the forecaster generates several different future scenarios (corresponding to different sets of assumptions). The decision maker or business person is presented with the different scenarios and has to decide which scenario is most likely to prevail.

A Subjective Approach Method. The subjective approach allows individuals participating in the forecasting decision to arrive at a forecast based on their feelings, ideas, and personal experiences. Many corporations in the United States have started to use the subjective approach. Internally, these subjective approaches sometimes take the form of "brainstorming sessions," in which managers, executives, and employees work together to develop new ideas or to solve complex problems. At other times, the subjective approach may take the form of a survey of the company's salespeople. This approach, which is known as the sales force composite or grass roots method, is relied on because salespeople interact directly with purchasers and it is assumed therefore that they have a good feel for which products will or will not sell and in what quantities.

The advantage of using the salespeople's forecasts is that salespeople are highly qualified to explain the demand for products, especially in their own territories. The disadvantage is that salespeople may tend to be optimistic in their estimates since optimism is a characteristic often found in good salespeople. Also, those working in sales may fear that a low sales forecast will lead to layoffs in the sales area. The opinions of salespeople should not be relied on to the exclusion of all else for one additional reason. Salespeople may not be aware of impending changes in other related areas, such as availability of raw materials, national economic developments, or the arrival of a formidable new competitor.

Quantitative Forecasting Methods. Quantitative forecasting methods are used when historical data on variables of interest are available. These methods are based on an analysis of historical data concerning the time series of the specific variable of interest. There are two quantitative forecasting methods. The first uses the past trend of a particular variable in order to make a future forecast of the variable. In recognition of this method's reliance on time series, it is commonly called the "time series method." The second quantitative forecasting method also uses historical data. This method is often referred to as the causal method because it relies on the use of several variables and their "cause-and-effect" relationships. Examples of variables that may have this cause-and-effect relationship are: 1) interest rate levels and levels of disposable income; 2) winter weather patterns and demand for heating oil; 3) increasing gas prices and a decline in demand for sport utility vehicles (SUVs). By studying the time series data on two or more variables that have a cause-and-effect relationship with the item for which a forecast is needed, effort is made to incorporate as many relevant factors as possible into the forecast.

In practice, most business people use some combination of these methods and techniques in trying to plan for the future and put together accurate forecasts. With each cycle of forecasting, more is learned about what factors to consider and how to weight their importance in projecting future events.

401(K) PLANS

A 401(k) plan is a tax-deferred, defined-contribution retirement plan. The name comes from a section of the Internal Revenue Code that permits an employer to create a retirement plan to which employees may voluntarily contribute a portion of their compensation on a pre-tax basis. This section also allows the employer to match employee contributions with tax-deductible company contributions, or to contribute additional funds to employee accounts at the company's discretion as a form of profit-sharing. Earnings on all contributions are allowed to accumulate tax-deferred until the employee withdraws them upon retirement. In many cases, employees are able to borrow from their 401(k) accounts prior to retirement at below-market interest rates. In addition, employees may decide to roll over funds in their 401(k) accounts to another qualified retirement plan without penalty if they change jobs.

Popularity of 401(k) plans has grown significantly over the last two decades. For the first time ever in 1997, 401(k) type defined-contribution plans surpassed the more traditional defined-benefit pension plans in terms of the total retirement assets held by each. And the growth of defined-contribution plans continued thereafter. According to the Employee Benefit Research Institute, as of the close of 2006, defined-contribution plans held 67 percent of private-sector retirement assets, compared with 31 percent in defined-benefit pensions. The 401(k) plan has a reasonably short history, yet it has already changed the face of retirement planning in America.

HISTORY

The 401(k) provision was created in 1978 as part of that year's Tax Revenue Act, but went largely unnoticed for 2 years until Ted Benna, a Pennsylvania benefits consultant, devised a creative and rewarding application of the law. Section 401(k) stipulated that cash or deferred-bonus plans qualified for tax deferral. Most observers of tax law had assumed that contributions to such plans could be made only after income tax was withheld, but Benna noticed that the clause did not preclude pre-tax salary reduction programs.

Benna came up with his innovative interpretation of the 401(k) provision in 1980 in response to a client's proposal to transfer a cash-bonus plan to a tax-deferred profit-sharing plan. The now-familiar features he sought were then an audit-inducing combination: pre-tax salary reduction, company matches, and employee contributions. Benna called his interpretation of the 401(k) rule "Cash-Op," and even tried to patent it, but most clients were wary of the plan, fearing that once the government realized its tax revenue-reducing implications, legislators would pull the plug on it.

Luckily for Benna and the millions of participants who have since utilized his idea, the concept of employee savings was gaining political ascendancy at that time. Ronald Reagan had made personal saving through tax-deferred individual retirement accounts, or IRAs, a component of his campaign and presidency. Payroll deductions for IRAs were allowed in 1981 and Benna hoped to extend that feature to his new plan. He established a salary-reducing 401(k) plan even before the Internal Revenue Service had finished writing the regulations that would govern it. The government agency surprised many observers when it provisionally approved the plan in spring 1981 and specifically sanctioned Benna's interpretation of the law that fall.

401(k) plans quickly became a leading factor in the evolving retirement benefits business. From 1984 to 1991, the number of plans increased more than 150 percent, and the rate of participation grew from 62 percent to 72 percent. The number of employees able to participate in 401(k) plans rose to more than 48 million by 1991 from only 7 million in 1983, and Benna's breakthrough earned him the appellation "the grandfather of 401(k)s." As expected, the government soon realized the volume of salary reductions it was unable to tax and tried to quash

the revolution the Reagan administration made two attempts to invalidate 401(k)s in 1986 but public outrage prevented the repeal.

The advent of 401(k) plans helped effect a philosophical shift among employers, from the provision of defined-benefit pension plans for employees to the administration of defined-contribution retirement plans. In the past, companies had offered true pension plans that guaranteed all individuals a predetermined retirement benefit. But after 1981, rather than providing an employer-funded pension, many companies began to give employees the opportunity to save for their own retirement through a cash or deferred arrangement such as a 401(k). This change helped level the playing field for small businesses, which were now able to offer the same type of retirement benefits as many larger employers. Small businesses thus found themselves better able to attract and retain qualified employees who may previously have opted for the security of a large company and its pension plan.

THE BASICS OF 401(K) PLANS

In benefits parlance, employers offering 401(k)s are sometimes called "plan sponsors" and employees are often known as "plan participants." Most 401(k)s are qualified plans, meaning that they conform to criteria established in the Economic Recovery Tax Act of 1981 (ERTA). ERTA expanded upon and refined the Employee Retirement Income Security Act of 1974 (ERISA), which had been enacted to protect participants and beneficiaries from abusive employer practices and created guidelines that were intended to ensure adequate funding of retirement benefits and minimum standards for pension plans.

Basic eligibility standards were set up with this legislation, though they have changed frequently since and may vary slightly from plan to plan. As of 2010, an employee had to be at least twenty-one years of age and have put in up to 1 year of service with the company to begin participating in the 401(k) program. Some union employees, nonresident aliens, and part-time employees were excluded from participation. The human resource departments of many businesses offer new employees a summary plan description that further describes their specific 401(k) eligibility requirements.

401(k) plans incorporate many attractive features for long-term savers, including tax deferral, flexibility, and control. Taxes on both income and interest are delayed until participants begin receiving distributions from the plan. Rollovers (the direct transfer of 401(k) funds into another qualified plan, such as a new employer's 401(k), an IRA, or a self-employed pension plan), as well as emergency or hardship loans for medical expenses, higher education tuition, and home purchases, allayed participants' fears about tying up large sums for the long term. While there are restrictions on these loans' availability, terms, and amounts, the net cost of borrowing may be quite reasonable because the interest cost is partly offset by the investment return.

Employees may also receive lump sum distributions of their accounts upon termination. If an employee elects to take his or her distribution in cash before retirement age, however, the employer is required by law to withhold 20 percent of the distribution. If the account is rolled over into another qualified plan, nothing is withheld. Employees' self-determination of investments has allowed tailoring of accounts according to individual needs. For example, younger participants may wish to emphasize higher-risk (and potentially higher-return) investments, while employees who are closer to retirement age can focus on more secure holdings. These features have been refined over the years through legislation, especially after the government realized the tax revenue losses engendered by the popular plans.

Passage of the Economic Growth and Tax Relief Reconciliation Act of 2001 (EGTRRA) changed the taxation landscape in the United States. With respect to 401(k) plans, several changes were made. For the most part these changes helped to increase the amount that individuals and companies are able to contribute to 401(k) plans on a tax-deferred basis.

As of 2010, the amount an employee could defer annually under such programs was set at $16,500. In addition, the sum of employer and employee contributions to one individual's account was set at either 100 percent of annual compensation or $49,000, whichever was higher. The employer was further limited to an annual contribution of 15 percent of total payroll, including both employee deferrals and employer matching and profit-sharing contributions. Finally, the amount of compensation that could be considered in determining an employee's deferral was limited to $245,000 per year. The contribution limits and percentage rates used to calculate plan-wide limits change from year to year and make the administering of these plans a very complex task.

These limits tend to restrict senior executives and other highly paid employees more than the majority of employees. Mandatory "top-heavy" tests prevent 401(k) programs from favoring highly compensated employees by restricting the amount that a company's top earners can contribute to 401(k) plans. Known as "nondiscrimination tests" in the benefits industry, top-heavy rules separate employers and employees into two groups: those who are highly compensated and all the rest. The amount that the highly paid employees may defer is based upon what the lower-paid employees deferred during the year. If the average lower-paid employee only contributed 2 percent of his or her compensation to the corporate

401(k), for example, highly paid employees may only divert 4 percent of their pay. Benefits and tax specialists have, of course, devised strategies to circumvent these restrictions, such as 401(k) wraparounds, "rabbi trust arrangements," and other "non-qualified" plans that consciously and legally operate outside the bounds of "qualified" 401(k)s. Such plans are costly to administer and run and are not often seen in small company settings.

ADVANTAGES AND DISADVANTAGES OF 401(K) PLANS

The shift from defined-benefit plans to defined-contribution plans such as 401(k)s has had both positive and negative ramifications. On the downside for employees is their need to shoulder more of the financial burden for their retirement. Compared to defined-benefit plans, defined-contribution plans are risky. Instead of a federally guaranteed pension payout upon retirement, 401(k) plan holders make their own investments which offer the hope of great gains but also contain the potential for great losses. The story of Enron, which filed for bankruptcy in 2001, and the stock market declines of the first decade of the twenty-first century, both showed what could happen to investments in a 401(k) plan.

The recession and global financial collapse of 2008 and 2009 greatly eroded the retirement savings of hundreds of thousands of American workers. The average 401(k) balance before the downturn was $78,000, a number that dropped to $56,000 less than 2 years later. Among large companies, more than 25 percent suspended matching contributions. Only half of American workers were covered by any employer-provided plan in the wake of the collapse. In response, the federal government stepped in to shore up 401(k) rules. For instance, the administration of President Barack Obama proposed new restrictions that would prohibit broker-dealer investment advisers with potential conflicts of interest from providing biased advice to unknowing 401(k) plan participants.

Most observers have applauded the movement towards greater reliance on 401(k) plans in spite of the losses stemming from and controversy surrounding them. The federal government has made some headway in in encouraging businesses that offer 401(k) plans to automatically enroll employees.. Meanwhile employees have gained greater control over their retirement assets. The plans provide immediate tax advantages as the contributions are not subject to federal income taxes or to most state and local taxes. They also provide long-term tax advantages, as earnings accumulate tax-free until withdrawal at retirement, when withdrawals can presumably receive favorable tax treatment. In addition, 401(k)s offer loan provisions that many other pension plans lack.

For employers, 401(k) plans offer many advantages. For example, employers have been able to share or entirely eliminate their pension contributions. In addition, if employers do choose to contribute, the employer too gets a tax deduction. 401(k)s have evolved into a valuable perk to attract and retain qualified employees. Employers can even link contributions to a profit-sharing arrangement to increase employee incentive toward higher productivity and commitment to the company. By enabling employees to become active participants in saving and investing for their retirement, 401(k) plans can raise the level of perceived benefits provided by the employer.

Small-business owners can set up a 401(k) plan by filling out the necessary forms at any financial institution (a bank, mutual fund, insurance company, brokerage firm, etc.). There are several types of 401(k) plans that may be used, one of which is the SIMPLE 401(k) plan. The Department of Labor Web site explains that this sort of plan was especially created so that small businesses could have an effective cost-efficient way to offer retirement benefits to their employees. "A SIMPLE 401(k) plan is not subject to the annual nondiscrimination tests that apply to the traditional plans. The employer is required to make employer contributions that are fully vested. This type of 401(k) plan is available to employers with 100 or fewer employees who received at least $5,000 in compensation from the employer for the preceding calendar year. In addition, employees that are covered by a SIMPLE 401(k) plan may not receive any contributions or benefit accruals under any other plans of the employer," according to the Department of Labor.

The fees involved in establishing and administering a 401(k) plan can be relatively high, since sponsors of this type of plan are required to file Form 5500 annually to disclose plan activities to the IRS. The preparation and filing of this complicated document can increase the administrative costs associated with a plan, as the business owner may require help from a tax advisor or plan administration professional. Fortunately, for companies with fewer than 100 employees, a SIMPLE 401(k) plan is an option that entails fewer fees and administrative costs.

FRANCHISING

Franchising is a kind of licensing arrangement wherein a business owner, known as the "franchisor," distributes or markets a trademarked product or service through affiliated dealers, who are known as "franchisees." While these franchisees own their establishments, terms of franchising agreements typically require them to share operational responsibilities with the franchisor.

Franchising has emerged as an integral part of America's commercial landscape. Indeed, companies as diverse as McDonald's, The Gap, and Jiffy Lube owe their ubiquitous presence in the marketplace to the practice. PriceWaterhouseCoopers estimated that franchises would garner more than $860 billion in annual sales in the year 2010. Franchising experienced double-digit growth during the middle of the first decade of the twenty-first century, although the recession of 2008 and 2009 slowed that growth considerably.

Franchising has been embraced by many entrepreneurs eager to run their own company. But the characteristics of a franchising business are dissimilar in some crucial respects from those of other start-up businesses. Some businesspeople have even gone so far as to characterize franchisees as glorified employees of the franchisor, the company that owns the trademark and business concept that the franchisees use. Other observers find this description of the relationship to be misleading and simplistic, but they also acknowledge that there are many aspects of franchising that a prospective small-business owner should learn about before entering into such an agreement.

Different kinds of franchising arrangements are commonly found in the United States today. Business format franchises are the most popular of the franchise types. Under this arrangement, the franchisee pays an initial fee and an ongoing royalty to the franchisor in exchange for a proven business operation and identity. Benefits of this package include the franchisor's name and its product line, marketing techniques, production and administration systems, and operating procedures. A second option is to pursue a product or trade name franchise in which the franchisee becomes part of a franchisor's distribution network. Some small-business owners choose to combine their resources under the banner of a single operating network. These affiliate franchises are thus able to pool their assets together for purchasing, advertising, and marketing visibility purposes.

BENEFITS OF FRANCHISE OWNERSHIP

There are many significant advantages to franchise ownership. In most instances, an entrepreneur who decides to buy a franchise is purchasing a business concept with a proven track record of success. In addition, a franchise agreement provides instant name recognition for the business, which can be a huge advantage if the name enjoys a solid reputation in the marketplace. But franchising provides benefits in many other areas of business operation as well, as detailed below.

Advertising and Promotion. Franchisees benefit from any national advertising campaigns launched by the corporation with which they have gone into business. In addition, many franchisors provide their franchisees with a wide range of point-of-sale advertising materials, ranging from posters to mobiles to brochures. Since such materials are often expensive to produce, they would otherwise be beyond the reach of some individual franchisees.

Operations. Franchisors provide franchisees with a wide range of help in the areas of administration and general operations. The entrepreneur who becomes a franchise owner is instantly armed with proven products and production systems; inventory systems; financial and accounting systems; and human resources guidelines. Many franchisors also provide management training to new franchisees and ongoing seminar workshops for established owners.

Buying Power. Franchisees are often able to fill inventory needs at discount prices because of their alliance with the franchisor, which typically has made arrangements to buy supplies at large-volume prices. This is an increasingly great advantage since franchisees compete with national chains, conglomerates, buying consortiums, and other

large franchises. The small-business person who purchases in small quantities cannot easily compete in terms of buying power. By becoming a franchisee, a business has the collective buying power of the entire franchise system.

Research and Development. Most small-business owners are able to devote little time or money to research and development efforts. Franchising, then, can provide a huge lift in this regard, for many franchisors maintain ongoing research and development systems to develop new products and forecast market trends.

Consulting Services. It is in the franchisor's best interest to do all it can to ensure the success of all of its franchisees. As a result, the entrepreneur who decides to become a franchisee can generally count on a wide range of training and consulting services from the larger company. Such services can be particularly helpful during the start-up phase of operations.

DRAWBACKS OF FRANCHISE OWNERSHIP

While the benefits of franchising are many and varied, there are well-documented drawbacks, as detailed below, that should be considered as well.

Cost. The initial franchise fee, which in some cases is not refundable, can be quite expensive. Some fees are only a few thousand dollars, but others can require an up-front investment of several hundred thousand dollars. In addition, some franchisors require their franchisees to pay them regular royalty fees a percentage of their weekly or monthly gross income in exchange for permission to use their name. Some franchisors also require their franchise owners to help pay for their national advertising expenditures. Other costs include insurance, initial inventory purchases, and other expenses associated with equipping a new business.

Limited Control. Franchisees are subject to many franchisor regulations concerning various aspects of business operation and conduct. As the Federal Trade Commission (FTC) acknowledged to prospective franchisees in its *Buying a Franchise: A Consumer Guide*, "these controls may significantly restrict your ability to exercise your own business judgment." Areas in which franchisors generally wield significant control include the following:

Site Approval. Many franchise agreements include stipulations that give the franchisor final say in site selection. Some franchisors also limit franchise territories, and while such restrictions generally prevent other company franchisees from impinging on a franchisee's territory, they can also act to restrict the franchisee's ability to relocate once it has become established.

Operating Restrictions. Franchise agreements include many instructions on the ways in which a franchisee must conduct business. These encompass all aspects of a business's operation, from operating hours to accounting procedures to the goods or services that are offered. "These restrictions may impede you from operating your outlet as you deem best," commented the FTC. "The franchisor also may require you to purchase supplies only from an approved supplier, even if you can buy similar goods elsewhere at a lower cost."

Appearance. Many franchisors cultivate a certain readily recognizable look to their outlets, for they know that such standards, when applied consistently, contribute to national recognition of the company name and its products and services. Franchisees generally accept these regulations willingly, for these standards of appearance in the areas of decor, design, and uniforms have proven to be part of a winning formula elsewhere. This is just as well, for the franchise owner who does wish to make changes in his business's appearance often has little freedom to do so.

Association with the Franchisor. For the small-business owner whose franchise is attached to a highly regarded, financially robust franchisor, the association can be a powerful positive in his or her business. Business experts note, however, that a franchise outlet can suffer severe damage if its franchisor is beset with financial difficulties or public relations problems. "If the franchisor hits hard times, you'll most likely feel them as well," noted the editors of the *Small Business Advisor*. "You are inevitably tied to the franchisor, not only by contract, but by concept, name, product, and services sold."

Prospective franchisees, then, need to weigh many factors in their decision making about entering the world of franchising. But most small-business consultants acknowledge that these factors usually boil down to a couple of fundamental concerns. The choice of becoming a franchisee or starting a stand-alone business hinges on the answers one gives to two important questions: Is risk sufficiently mitigated by the trademark value, operating system, economies of scale, and support process of the franchise to justify a sharing of equity with the franchisor? Is my personality and management style compatible with sharing decision-making responsibilities with the franchisor and other franchisees?"

SELECTING A FRANCHISE

It is imperative for prospective franchise owners to make an intelligent, informed decision regarding franchise selection, for once a contract has been signed, the franchisee

has committed himself to the enterprise. But the selection process can be a bewildering one for the unprepared entrepreneur. Franchise opportunities are available in a wide array of industries, each of which offers its own potential benefits and drawbacks. The International Franchise Association (IFA), for instance, tracks ten different franchise business lines in its reporting. The association forecast that personal service, quick-service restaurants, and business services would see the largest output gains in 2010. Sectors anticipated to experience employment declines included lodging and commercial and residential services. Every franchisor has its own strengths and weaknesses. Several business areas, then, need to be investigated as part of any effective franchise selection process.

Analysis of Self. Experts counsel prospective franchise owners to evaluate their own personal strengths and weaknesses before signing any franchise contract. Prospective franchisees should also have an understanding of their ultimate business and personal objectives before beginning the search for an appropriate franchise. The entrepreneur who is most interested in achieving financial security may want to look in an entirely different industry than the entrepreneur who hopes to land a franchise that will enable him or her to devote more time to family life.

Analysis of Industry and Market. Prospective franchise owners need to evaluate which industries interest them. They also need to determine whether the franchisor's principal goods or services are in demand in the community in which he or she hopes to operate. Other industry-wide factors, such as the cost of raw materials used and the amount of industry competition, need to be weighed as well. The latter issue is a particularly important one, for it can be a fundamental factor in a franchisee's success or failure. The presence of some competition, for instance, often indicates a healthy demand for goods or services in that industry area. A dearth of competitors, though, might indicate that demand is low (or nonexistent). Similarly, the presence of several competitors might necessitate an examination of whether the market can support another provider in that area, or whether a business might have to take meaningful market share from already existing businesses in order to survive.

Analysis of Franchisor. Entrepreneurs interested in franchising should be knowledgeable about the strengths and weaknesses of companies that offer such arrangements. Factors that should be considered include the franchisor's profitability, organizational structure, growth patterns, public reputation, litigation history, financial management capabilities, fee requirements, and relationship with other franchisees.

Perhaps the best source of information on these and many other issues is the franchisor's disclosure document. This important document, which must be given to prospective franchise owners at least 14 calendar days before any contract is signed or any deposits are owed, usually takes the form of the Franchise Disclosure Document (FDD). The FDD contains important information on key aspects of the franchisor's business and the nature of its dealings with franchisees. Information contained in the FDD includes a franchise history; audited financial statements and other financial history documents; franchise fee and royalty structures; background on the franchise's leading executives; terms of franchise agreements; estimated start-up costs for franchisees (including equipment, inventory, operating capital, and insurance); circumstances under which the franchisor can terminate its relationship with a franchisee; franchisor training and assistance programs; franchisee advertising costs (if any); data on the success (or lack thereof) of current and former franchisee operations; and litigation history.

Some prospective franchise owners pay less attention to a company's litigation history than other information included in the FDD, but a company's past litigation experiences can, in some cases, provide important insights into the franchisor's business ethics and operating style. "The disclosure document tells you if the franchisor, or any of its executive officers, has been convicted of felonies involving, for example, fraud, any violation of franchise law or unfair or deceptive practices law, or are subject to any state or federal injunctions involving similar misconduct," noted the FTC. "It also will tell you if the franchisor, or any of its executives, has been held liable or settled a civil action involving the franchise relationship. A number of claims against the franchisor may indicate that it has not performed according to its agreements, or, at the very least, that franchisees have been dissatisfied with the franchisor's performance. Prospective franchisees should be aware that some franchisors may try to conceal an executive's litigation history by removing the individual's name from their disclosure documents."

The inclusion of other information on a franchisor's business dealings with franchisees is up to the discretion of the franchisor. For example, while franchisors are required by law to provide prospective franchisees with documentation of expected start-up costs, they are not required to provide long-term earnings projections. Those who do provide such information are obligated by the FTC's Franchise Rule to have a reasonable basis for the claims they make and provide prospective franchisees with written information substantiating their projections.

It is important, then, to utilize other sources of information in addition to the disclosure document when pondering a move into the world of franchising. For

example, the FTC advises prospective franchisees to show FDDs to an advisor such as an attorney. Small-business consultants often urge prospective franchisees to conduct interviews with franchisor representatives about various business issues. Other sources of information often cited include financial institutions (for financial evaluations of the franchisor), state agencies (for information on franchisee rights in the state in which the franchisee is operating), the Better Business Bureau (for news of possible complaints against the franchisor), industry surveys, and associations (such as the Franchise Brokers Association and the International Franchise Association).

Many experts also encourage prospective small-business owners to interview current and former franchisees associated with the franchisor. Would-be franchisees can thus gain firsthand information on a great many business subjects, including the likely size of total investment, hidden or unexpected costs, satisfaction with franchisor performance (in training, advertising, operating, etc.), franchisee backgrounds, and business trends in the industry. Franchisee lists can be a valuable resource, but consultants caution their clients to make certain that they receive a complete list, rather than a list of selected franchisees who are compensated by the franchisor for giving positive appraisals of the company.

FRANCHISING LAWS

The United States has developed an extensive regulatory system designed to govern franchising practices throughout the business world. Chief among the federal guidelines are the FTC's Code of Federal Regulations. In addition, many state governments have fashioned pieces of legislation that directly impact on franchising operations. A good many of the laws governing franchising both at the state and federal level are expressly designed to protect prospective small-business owners from unscrupulous franchisors who misrepresent themselves.

Franchising experts commonly urge prospective franchisees to enlist the help of an attorney during the franchise selection process. Indeed, since franchising is such a complicated business, many entrepreneurs secure an attorney's services throughout the process. Legal assistance is especially helpful when the time comes to sign the franchise or license agreement, the document that lays out the terms of the partnership between a franchisee and a franchisor. "The franchise agreement is the foundation on which your franchise is built," stated the *Entrepreneur Magazine Small Business Advisor*. "The agreement gives both parties a clear understanding of the basis on which they are going to continue to operate."

The franchise contract covers all aspects of the franchisee-franchisor agreement, from record keeping to site selection to quality control provisions. The contract is designed to cover both relatively minor issues such as sign display requirements to matters of major importance, such as the franchisee's schedule of royalty payments and required insurance provisions. Franchise agreements also include a section devoted to detailing the length of the contract and any possibilities for extending the terms of the contract beyond the termination date. Long-term agreements (15 years or more) give franchisees more security, though this can be problematic if their relations with the franchisor take a bad turn. Since shorter terms do make it easier for franchisors to rid themselves of underperforming or troublesome franchisees, some prefer to go this route. Others, however, place a higher value on securing the franchisee royalties that often pour in under the longer agreements.

Information included in the franchise contract includes the following:

- Accounting and record-keeping provisions
- Existence (and terms) of any performance quotas
- Fairness of the franchise fee
- Fairness of the royalty arrangement
- Franchisor's continuing services to franchisee
- Insurance protection (if any) under franchisor's patent or liability insurance coverage
- Operating provisions (including quality control, human resource management, and other areas)
- Restrictions (if any) on business activities outside the franchise
- Restrictions (if any) on selling the franchise
- Start-up investment required
- Termination or default terms (as well as arbitration clauses)
- Terms of contributions, if any, to parent company's national advertising campaigns
- Terms of inventory and ordering practices
- Terms of renewing the franchise agreement
- Territorial protections

Given the scope of its coverage, and its importance as the binding legal document between franchisee and franchisor, the franchise contract is, in its final form, an imposing and complicated document. Again, the importance of the agreement makes it imperative that prospective franchise owners consult with an attorney before signing the contract.

Although the 2008 and 2009 recession dealt a serious blow to franchising businesses, industry players had renewed optimism heading into the 2010s. Tight credit plagued the industry throughout 2008 and 2009, and many franchisees

considered that financing (or lack thereof) would continue to be a problem in the early 2010s. Other concerns included sales and development issues. However, many franchisees have expressed hope that the industry would continue to solidify as the economy slowly recovered.

FREELANCE EMPLOYMENT/ INDEPENDENT CONTRACTORS

Freelance employees, also known as independent contractors (ICs), are individuals who work on their own, without a long-term contractual commitment to any one employer. A freelance employee usually performs services or completes work assignments under short-term contracts with several employers, or clients, who have the right to control only the final result of the individual's work, rather than the specific means used to get the work done. Examples of positions held by ICs range from doctors and computer programmers to maids and farm workers. Freelance employment can offer a number of advantages to individuals, including flexible work arrangements, independence, variety, and some tax deductions. It can also hold some pitfalls, however, such as assuming risk in business dealings, paying self-employment taxes, and taking personal responsibility for health insurance, disability, and retirement coverage.

Specifically, individuals who are classified as ICs can deduct work-related expenses for tax purposes. In contrast, the first 2 percent of expenses is not deductible for those classified as employees. In addition, ICs often qualify for tax deductions for using part of their home as an office and for salaries paid to other people, while employees usually do not. ICs also have the benefit of sheltering 20 percent of their annual income, or up to $49,000, for retirement, while employees are limited to $16,500 annually. Finally, ICs must pay the full amount of Social Security and Medicare taxes and make quarterly estimated tax payments to the federal government. Employers must withhold taxes for their employees and pay half of their Social Security and Medicare taxes.

Freelance employment boomed in the United States during the 1980s, as many companies sought to reduce their payroll costs in order to remain competitive. Instead of hiring new employees and paying an additional 30 percent or more in payroll taxes and benefits, many companies chose to make "work-for-hire" arrangements with ICs. Small businesses can gain several advantages from such arrangements. For example, employers are not responsible for paying taxes for freelance employees, and they avoid the high costs of providing health insurance, paid vacation and sick leave, and other benefits often granted to regular, full-time employees. In addition, employers that use ICs relieve themselves of the risk of costly litigation over hiring, promotion, firing, and other employment practices. These employers simply file Form 1099 with the government to report the total compensation paid to each IC for the year.

There are also disadvantages to using ICs instead of hiring a staff. The loyalty of a freelance worker is not likely to be as great as that of an employee who is a part of the organization. The knowledge that an IC gains about how a company likes things done is also in greater jeopardy than would be the case with an employee. Thus the investment in working with somebody is more easily lost with an IC. However, small businesses often lack the financial security to make the longer-term commitment that taking on an employee requires. Hiring freelancers

is, consequently, an attractive option when help is needed.

By the twenty-first century, freelancing became a full-fledged phenomenon, with thousands of people trading corporate life for a chance to be their own boss. As a result, a plethora of opportunities are now available for workers considering freelancing, and the Internet is a valuable tool both to freelancers and firms looking to create new work relationships with ICs. Web sites such as Craigslist, oDesk, and Elance stand out as first-stop destinations for daily updated freelance job opportunities in multiple industries (some sites take a cut of a freelancer's pay from successfully engaged contracts, while others charge fees to companies for listing freelance positions). Internet companies also employ freelance workers in various ways, enabling ICs to work from their home computers. One such firm, Demand Media, regularly hires freelance writers and editors to create and update profiles that are read by millions of Web users on different media sites. Not only do freelance workers easily scour job listings online, they also utilize Web tools to get paid for their work without having to wait for a check to arrive by mail. For instance, PayPal is one prominent company that enables freelance workers to set up direct deposit of earnings from their contract work.

Despite its allure, freelancing is just as vulnerable to economic conditions as the rest of the corporate world. Recessions, like the one in 2008 and 2009, tend to thin out available freelance jobs. For instance, the number of temporary workers in the United States declined from 2.5 million in March 2008 to 1.8 million in March 2009, according to the Bureau of Labor Statistics.

IRS SCRUTINY

The boom in freelance employment has led to increased scrutiny by the Internal Revenue Service (IRS). The IRS uses Form SS-8 to determine whether workers are employees or ICs. The form includes a list of questions that can be answered by either a business owner or worker. Reclassification of ICs is an agency priority, since fraudulent IC arrangements are estimated to cost the government between $6 billion and $20 billion per year in tax revenue. The IRS would also argue that it is attempting to protect individuals from unfair treatment by employers such as being fired and then rehired as an IC without benefits but few of the reclassifications have involved exploited low-wage laborers, because they generate minimal tax revenues.

The main cause of dissention over current application of the law is that it often tends to penalize individuals who wish to be classified as ICs and take advantage of tax breaks (as well as the small businesses that depend on them), while it often fails to protect individuals who should be classified as employees and be eligible for benefits. For example, the IRS would be likely to review the case of a highly paid engineer who markets her services to several companies as an IC and deducts various expenses of doing business. However, the IRS would be unlikely to review the case of a migrant farm worker who is employed by a large producer but, as an IC, makes less than minimum wage and receives no disability or old-age benefits.

The economic downturn of 2008 and 2009 prompted a sharper focus on worker classification. Recessionary pressures led some employers to classify certain employees as contractors in an effort to save on labor costs. The IRS, in turn, promised to increase investigations of and prosecutions against employers that abused the law as stipulated in the Internal Revenue Code. "It's not surprising why, considering that independent contractors can be much cheaper than full-time workers," wrote Sarah Johnson in *CFO*. "With contractors, who receive a 1099 tax form instead of a W-2, companies don't have to pony up for unemployment insurance, workers' compensation, health benefits, or Social Security taxes."

ELEMENTS OF THE IRS WORKER DETERMINATION

Form SS-8 helps the IRS determine whether a certain worker should be classified as an employee or an IC. Typically, both a small-business owner and a worker will fill out their own form and return them to the IRS for review. A formal letter of determination is then sent to the firm and a copy is forwarded to the worker, except in rare cases when no formal determination is issued. Once a determination is made, a worker may claim for a refund or credit within 3 years from the date of the original return or 2 years from the date when the tax was paid, whichever comes last.

Form SS-8 is divided into five parts, with each part featuring a series of questions pertaining to a specific category as it relates to the worker-company relationship. The main issue underpinning Form SS-8 is who sets the work rules: employees must follow rules set by their bosses, while ICs set their own rules. The hours during which a job is performed is one determination of work rules. For example, if the employer dictates an individual's work hours or pays an individual by the hour rather than by the job, that individual is likely to be considered an employee rather than an IC. Likewise, if the employer requires that an individual work full time or not be employed by another company simultaneously, that individual would appear to be an employee. On the other hand, an individual who sets her own hours, receives payment by the job, and divides her time between work for several different employers would probably be classified as an IC.

Other questions involve who provides the tools and materials needed to complete the work. For example, an

individual who works at an employer's facility and uses the employer's equipment would be considered an employee, while one who works at a separate location and provides his own equipment would be classified as an IC. Another element of the form involves termination of the work relationship. Employees can usually quit their jobs at will and can also be fired by their employers. However, a freelance employee would have a contractual obligation to complete a specific amount of work for an employer, and neither party could break the agreement without cause. Finally, an IC usually pays his own expenses of doing business and takes the risk of not receiving payment when work is not completed in accordance with a contract, while an employee is usually reimbursed for business-related expenses by the employer and receives a paycheck whether his work is completed or not.

FREELANCE EMPLOYMENT AND SMALL BUSINESSES

The rules governing ICs affect small businesses in two significant ways. First, many entrepreneurs are themselves freelance employees, and they must understand and adhere to the IRS guidelines in offering services to clients. Otherwise, they risk being reclassified as an employee of their client in an IRS audit of the same. An entrepreneur who is reclassified as an employee of a major client loses a variety of tax breaks and other advantages of self-employment.

In order to be considered ICs, entrepreneurs must establish that they are in business for themselves for the purpose of making a profit. They might demonstrate that their enterprise is a business rather than a hobby or the work of an employee by registering a business name, obtaining an occupational permit or license, establishing an office, soliciting clients, and printing stationery and business cards. Even if the majority of work will be performed for one client, entrepreneurs should make clear their intention of soliciting work from other clients.

Next, the entrepreneur should subject his or her business activities to the IRS via Form SS-8 to avoid the appearance of being an employee. The entrepreneur should sign a contract specifying an amount of work that will be completed by a certain deadline. The contract should include a specific disclaimer stating that this work will be performed as an IC. The entrepreneur should also be certain to obtain a 1099 form (a statement of miscellaneous income) from the client for tax purposes, rather than a W-2 form (a statement of income from employment).

The rules governing ICs affect small businesses in another significant way. Many small businesses lack the resources to hire permanent employees to provide support for short-term projects or to provide expertise in highly technical fields, so instead they enlist the services of ICs. In these cases, it is to the benefit of the small-business owner as well as the IC to spell out the details of the work arrangement in a contract. The small-business owner should also choose freelance employees carefully to be sure that they present themselves as being in business to make a profit.

G

GENDER DISCRIMINATION

Gender discrimination, also known as sexual discrimination, is any action that specifically denies opportunities, privileges, or rewards to a person (or a group) because of gender. The practice of letting a person's gender become a factor when deciding who receives a job or a promotion is gender discrimination. When gender is a factor in other decisions about employment opportunities or benefits, that too is gender discrimination. While most discrimination charges claim that a woman (or women) was discriminated against in favor of a man (or men), there have also been cases where men have claimed that they have been discriminated against on the basis of gender. These cases are usually referred to as "reverse discrimination."

Court rulings handed down through the years have determined that a company's responsibility not to discriminate based on sex begins even before an individual is hired. Companies can be held liable if preemployment screening or testing is determined to be discriminatory, if applications ask unacceptable questions designed to screen for sex, or if the overall selection process is deemed to be unfair. One of the main indicators that gender discrimination has occurred in the hiring process involves the qualifications of the job applicants. While a slight difference in qualifications between a female and a male candidate does not automatically indicate gender bias (if a lesser qualified male candidate is hired instead of a female candidate, that is), a drastic difference in qualifications has almost always been upheld by the courts as a sure sign of gender discrimination. For example, if a male who dropped out of high school without receiving a diploma is hired in an administrative position over a female who had obtained her master's degree, then it is likely bias was a factor.

In addition to gender discrimination in hiring and other circumstances, there is a particular form of sexual discrimination called sexual harassment. This form of discrimination involves inappropriate words or actions of a sexual nature directed at one employee by another. To meet the criteria for harassment, the behavior in question must be both unwanted and sexual in nature. The U.S. legal system has determined that there are two main types of sexual harassment, the first being "quid pro quo," or "this for that," which occurs when one employee offers another employee a job or benefit in exchange for sexual favors, or threatens to deny that job or benefit unless sexual favors are granted. The second type of sexual harassment is referred to as "hostile work environment." In these types of cases, an employee, or a group of employees, repeatedly make lewd comments or suggestive noises, make unwanted sexual advances, or otherwise use sex to create a work environment that is intimidating or threatening to others.

FEDERAL LAWS STRONGLY PROHIBIT GENDER DISCRIMINATION

Since the social unrest of the 1960s, the federal government has been actively involved in preventing gender discrimination in the workplace. One of the most important laws covering gender discrimination on the job is the Civil Rights Act of 1964 specifically, Title VII of that act, which strictly prohibits all forms of discrimination on the basis of race, color, religion, sex, or national origin in all aspects of employment. Written during a tumultuous

period in American history when many people expected the federal government to right social wrongs, the law was a monumental piece of legislation that changed the American employment landscape.

The law was passed after heated debate in both the Senate and the House of Representatives. It stated that it was unlawful for an employer to "fail or refuse to hire or to discharge any individual, or otherwise discriminate against any individual with respect to his compensation, terms, conditions, or privileges or employment, because of such individual's race, color, religion, sex, or national origin." The law covers hiring, dismissals, compensation, and all other aspects of employment, while also covering actual employment opportunities that are available. Examples of gender discrimination or sexual harassment that would fall under the scope of the act include:

I. An employee who alleges that his or her manager only promotes male employees and keeps females in entry-level positions.

II. An employee who alleges that a manager or other person in power tells jokes or makes statements that are demeaning, insulting, or offensive to women.

III. A manager who makes it clear, either through his actions or words, that he wants to have sexual relations with a female employee.

IV. A manager who asks inappropriate and unnecessary questions about a female employee's sex life.

V. A manager who touches his female employees in inappropriate ways without consent.

The law covers businesses with fifteen or more employees and applies to all private, federal, state, and local employers. In many states, businesses with fewer than fifteen employees face the same rules thanks to local or state statutes. In addition to the hiring provisions, the law dictates that employers cannot limit or segregate employees based on sex in any way that would adversely affect their chances at promotions. It does allow for two narrow exceptions to the law. Businesses may use a *bona fide* seniority or merit system to measure performance and earnings based on a quantity or quality measuring system, and employers may use ability tests to determine the most qualified candidates for a job as long as the test does not discriminate by gender in any way.

The Civil Rights Act was originally intended to address only racial discrimination. Just as the law was about to be passed, however, Representative Howard Smith of Virginia added the word "sex" to one of the opening sentences, meaning the law would also prevent sexual discrimination. This was a controversial action, as many people saw it as an attempt to kill the bill. The argument made by critics was that Smith added the word sex to the law knowing that many people would oppose the addition and the bill would be defeated, thus preventing racial protection from occurring as well. Smith denied this accusation and swore he had added the provision after working with the National Women's Party. Whatever his motivation, thanks to the efforts of Representative Martha Griffiths and others, the revised bill was passed into law.

One year before the landmark civil rights legislation act was passed, one specific problem regarding gender discrimination had also been addressed by the U.S. Congress. Until 1963, it was legal for employers to pay women lower wages for the same job performed by men. During World War II, when many women worked at jobs traditionally held by men while the men fought in the war, there had been an attempt by the National War Labor Board to get companies to pay women the same rate as men, but that attempt failed miserably. In fact, most of the women lost their jobs when the men came home from the war.

Before 1963 newspapers routinely ran separate Help Wanted sections in the classifieds one for men, and one for women. It was not uncommon for the same job to be posted in both sections, but with different and much lower pay scales for women. In 1963 women earned 59 percent of what men earned for the same job; in other words, for every dollar a man earned, a woman earned 59 cents.

The Equal Pay Act of 1963 was intended to end that discrepancy. The law stated that "no employer... shall discriminate, within any establishment in which such employees are employed, between employees on the basis of sex by paying wages to employees in such establishment at a rate less than the rate at which he pays wages to employees of the opposite sex in such establishment for equal work on jobs the performance of which requires equal skill, effort, and responsibility, and which are performed under similar working conditions." The only exemptions to the law were for seniority, established merit systems that paid all employees based on job performance, systems that paid wages based on the quantity or quality of the work produced, and wage differences that were based on some factor other than sex.

While the law did not put an end to unequal pay, it did improve things in many cases. Between 1964, when the law went into effect, and 1971, more than $26 million in back pay was issued to women as a result of court cases filed after the law was passed. Two cases that made their way through the U.S. court system *Schultz v. Wheaton Glass Co.* (1970) and *Corning Glass Works v. Brennan* (1974) modified the 1963 law by eliminating common loopholes. The ruling in the Schultz case said that jobs only had to be "substantially equal" rather than identical to earn protection under the law. In the Corning Glass case, the U.S. Supreme Court decided that companies could not pay women a lower wage than men simply

because there was a "lower going rate" for female employees in the local marketplace. The court ruled that the only reason such a lower rate existed was because male employees would refuse to work for the lower rate that was offered to women.

The Equal Pay Act officially gives women protection under the law in regards to equal pay for equal work, but inequities still exist in almost every employment sector. According to the Institute for Women's Policy Research, women working full time in 2009 earned 80.2 cents for every dollar earned by a man, down from the historical high of 81 cents in 2005. African American and Latina women were among the hardest hit by the gender wage gap. Gender discrepancies also exist when it comes to unemployment.

Above and beyond standard sexual discrimination, sexual harassment has been the centerpiece of numerous court cases and legal decisions that have established government standards regarding harassment. In 1998 the U.S. Supreme Court made two important rulings that have had a significant effect on harassment claims. In *Burlington Industries, Inc. v. Ellerth*, the court ruled that, even if an employee did not report incidents of alleged harassment when they occurred, the company was still liable for the behavior of the employee who committed the offense. In *Faragher v. City of Boca Raton*, the court held that an employer could be held liable for harassment if a supervisor made threats regarding punishment if an employee did not have sex with him, even if those threats were never carried out. Together, the two decisions made it clear that the court holds companies strictly liable for actions carried out by supervisors who have direct authority over the person they are harassing, if the supervisor can alter the victim's employment status through hiring, firing, or refusal to promote.

THE EQUAL EMPLOYMENT OPPORTUNITY COMMISSION

To oversee the federal civil rights legislation, including the Equal Pay Act, a separate administrative body was created as part of the Civil Rights Act of 1964. The Equal Employment Opportunity Commission (EEOC), was created to enforce laws that prevent discrimination based on race, sex, color, religion, national origin, disability, or age when hiring, firing, or promoting employees. Four groups race, color, sex, and creed were given "protected status" under the law, which was to be upheld by the EEOC. The commission is an independent regulatory body that has the power to launch investigations, file lawsuits, and create programs to eliminate discrimination.

The EEOC has been a controversial organization throughout its history. Liberal politicians believe that the agency was long overdue and that it is absolutely imperative that it be proactive in identifying and fighting discrimination in the courts, while conservatives believe that the organization is a perfect example of "big government" that intrudes far too deeply into citizens' lives. The agency's strong enforcement of affirmative action policies (which actively seek to promote minorities over equally qualified nonminorities in order to address past discrimination) has been its most controversial action, as many Americans oppose affirmative action.

STEPS TAKEN BY EMPLOYERS TO END GENDER DISCRIMINATION

To prevent gender discrimination or sexual harassment from occurring in the workplace, more and more employers are adopting a zero tolerance policy towards all acts of discrimination. This usually includes the creation of an official written policy against discrimination that is circulated to all employees, as well as education and training courses for all managers (and often for all employees). In addition, the companies have to show that they are serious about implementing and enforcing the new policy by creating disciplinary standards for violations of the policy.

Another step employers can take is to conduct a thorough investigation every time a claim of discrimination or harassment is lodged. If a company identifies a situation where it believes discrimination has occurred and the company is going to be held liable, it can ease the amount of punishment handed down if it conducts a thorough in-house investigation that culminates in appropriate action taken against the person who committed the discrimination, up to and including dismissal of that employee.

When managers are trained to recognize instances of sexual discrimination or harassment, they should be told one thing above all others not to try to handle the complaint by themselves. Instead, they should always immediately notify the human resources department that an incidence of discrimination or harassment has been reported and needs to be investigated. If the training is also provided to all employees, primary efforts should be spent on teaching employees what is and is not considered to be appropriate behavior and on helping employees understand each other better so that they can work together more effectively.

THE CURRENT STATE OF GENDER DISCRIMINATION

While many cases of sexual discrimination or harassment involve men victimizing women, there is a new backlash that has seen allegations of reverse sexual discrimination. Of 13,867 sexual harassment charges filed with the EEOC in 2008, 16 percent were filed by men, up 12 percent from the late 1990s, according to *US Fed News*. In 2008 a school administrator in Elmsford, New York,

lodged a reverse sexual discrimination suit against the local school district after the board suspended him when his affair with a female assistant principal was revealed. Deputy superintendent Michael Senno claimed he ended the affair with Sandra Calvi Muscente, the assistant principal, in 2006, after which she became angry and threatened him. Senno alleged the district practiced reverse gender discrimination by punishing him but not Muscente in any way, according to *The Journal News* of White Plains, New York.

In another case, the EEOC filed suit against Lawry's, a Southern California upscale steakhouse, on behalf of a male busboy who claimed he was denied a higher-paying position as a waiter. The restaurant hired only women for those positions, a policy that had started in 1938. The restaurant agreed to settle in 2009 and pay $500,000 to male workers who were denied positions as waiters.

In addition to reverse discrimination cases, there have also been recent instances of same-sex sex discrimination cases. While the EEOC holds that Title VII of the Civil Rights Act *does* protect against same-sex sex discrimination, the courts have been reluctant to rule on the matter. In 1998 however, the U.S. Supreme Court reversed the ruling of a lower court and in so doing held that same-sex sex discrimination was in fact covered by Title VII because the law referred to sex in every context. In a case involving Dillard's, the EEOC won a $110,000 court judgment in 2009 to settle a same-sex harassment lawsuit involving two male employees. The court found that an Orlando Dillard's enabled a sexually hostile work environment for men by not responding to complaints regarding verbal and physical sexual harassment by a male manager against two men who worked there. In addition to the monetary reward, Dillard's was also required to distribute sexual harassment prevention policies to its workforce, conduct sexual harassment training, and submit to monitoring for 3 years.

Discrimination against employees on the basis of gender (as well as race, national origin, age, or disability) is wrong. It may also be very costly. Charges of employment discrimination that are successfully brought before the EEOC are usually resolved, in part, by issuing the plaintiff a monetary award. The trend towards larger awards has been steady and although it is unclear whether that trend will continue, some people clearly believe that it will. For example, in 2010 the EEOC settled with a Washington State tire retailer for $2 million over claims the company failed to hire qualified women for tire-changing positions at locations in several Western states. The company additionally agreed to maintain antidiscrimination policies and procedures as well as implement training for managers and employees as stipulated under Title VII. In a similar case, the EEOC won $11.7 million from Wal-Mart to settle claims that the retailer failed to hire qualified women at a distribution center. As a result, a new form of commercial liability insurance emerged in the late 1990s in answer to the rising costs associated with employment discrimination actions. It is called Employment Practices Liability Insurance (EPLI) and it may one day be a standard policy within commercial insurance packages.

Avoiding the need for such an insurance policy is, of course, preferable. Establishing serious policies to prevent discrimination is essential. Making these efforts visible and apparent to all will help to create a work environment free of discrimination, or at least one in which discriminatory acts are brought to the attention of management right away.

GLOBAL BUSINESS

Global business refers to international trade whereas "a global business" is a company doing business across the world. The exchange of goods over great distances goes back a very long time. Anthropologists have already established that long-distance trading took place in Europe in the Stone Age. Sea-borne trading was commonplace in many regions of the world in times predating Greek civilization. Such trade, of course, was not by definition "global" but had the same characteristics. In the sixteenth century all of the populated continents came to be routinely linked by ocean-based communications. Trading activity in the modern sense rapidly followed at the beginning of the seventeenth century; it might be more accurate to say that it "returned" because trading of such character had taken place in Roman times as well.

It is not intended here to discuss globalization. Globalization is a long-standing program advocated by the economically advanced nations to free up international trade across the globe through treaties. It has also come to mean the relocation of production or service activities to places that have much lower labor costs. Global business in the past did not and does not now require what advocates of globalization seek, namely a so-called level playing field. International trade has always had a mixed character in which national organizations and private enterprises have both participated.

GLOBAL ENTERPRISES

Fernand Braudel, a prominent historian of commerce, describes early long-distance trading around the globe from Europe to the Americas and from Europe to India and Asia as speculative ventures funded by high-interest loans from patrons: traders had to pay back double the money they borrowed; failure to pay the money back unless they had been shipwrecked meant a period of slavery until the debt was satisfied. Very high profits could be achieved trading in spices and silk with the "Indies," so such profits justified the risks. In parallel with such private trading, government-sponsored ventures also took to the oceans, and they became the dominant form of international trade shortly before and all through the period of colonialism. Thus Spain exploited its discoveries in South America by shipping gold and silver from America to Europe (setting off a great inflationary period in the process). Global enterprise, thus, in the modern sense, began to develop during the Age of Discovery. It was instrumental in stimulating colonialism. Single merchants or groups of explorers went forth and came back with treasures. Government-sponsored consortia, the early global businesses, followed in the adventurers' wake.

The two earliest global companies, both government chartered, were the British East India Company, begun in 1600, and the Dutch East India Company, established in 1602. Both have now passed into history. The British company dissolved in 1874, but in its nearly 300-year history it had launched and for a long period had practically run the British Empire. The Dutch company was dissolved in 1798 after nearly 200 years of operations in Asia, India, Sri Lanka, and Africa. The Hudson Bay Company, another British-founded monopoly to exploit the North American fur trade, was established in 1670 and is still going so much so that Canadians explain that the company's initials stand for "Here Before Christ." HBC has long since ceased to be a global monopoly and is known today in Canada as a department store.

Early global companies were usually state-chartered *trading* companies. The Danes, the French, and the Swedes all had East India companies. Japan established companies known as the *sogo shosha* ("general trading company") in the nineteenth century. Japan had tried and failed to preserve its isolation. When it opened itself to the world, it channeled trade through these ventures. Great trading companies were and continue to be important in transportation as well; operating shipping supports their activities. A contemporary American example is the privately held Cargill Corporation, which trades internationally in agricultural, food, pharmaceutical, and financial products.

MULTINATIONALS

The term "multinationals" came into currency to designate corporations that operated in at least two different countries, but the actual use of the label applies to corporations that have a global presence. The term is used in a neutral sense simply to indicate very large size and participation in global markets. A more negative connotation of the term is that such corporations are effectively beyond the full reach of national laws because they have a presence in many locations, can move money and resources around at will, and can sometimes escape taxation, and thus represent a power beyond public control.

From the point of view of a seller, a global market is an export market; from the buyer's vantage point, the global market represents imports from abroad. World statistics on international trade are collected by the World Trade Organization (WTO) located in Geneva. According to the WTO, world trade has been steadily

increasing since World War II, a trend that continued for more than six decades. In 2004 the global market for exports was $11.28 trillion. This had increased to $15.33 trillion by 2008. However, the global economic downturn of 2008, which resulted in the first decline in global gross domestic product (GDP) since World War II, also resulted in a steep decline in international trade, driving international trade down by almost 10 percent in 2009. As the Economic Policy Institute put it in a February 2010 report, "The historic collapse in global trade reflects the effects of the recession and financial crisis on both the demand for goods and services, and the impact of widespread shortages of loans needed to finance trade."

Merchandise Trade. In 2008 the largest category of foreign trade was in fuels, which represented 18.2 percent of total world trade. Chemicals was second with 10.9 percent, and Office and Telecom Equipment was third with 9.9 percent. Just ten countries around the world represent over half of all merchandise exports. The ranking of these exporters has remained relatively stable, although China jumped from third (in 2004) to first (by 2009). The same countries are also the top importers, though not in the same order. The United States remains the top importer, followed by Germany, China, France, and Japan. Interestingly, six of the top ten countries achieved a trade surplus while the other four had a trade deficit. The United States has consistently run the largest trade deficits, though that figure has declined sharply since it peak in 2006, and in his 2010 State of the Union Address President Obama announced an initiative to double U.S. exports over the following 5 years.

TOP U.S. TRADING PARTNERS

Trade is by its very nature a reciprocal activity. Not surprisingly, the United States' top eight trading partners, established by adding exports to them to imports received from them, are also in the top fifteen of export and of import viewed separately. These countries are (arranged by total trade volume) Canada, China, Mexico, Japan, Germany, United Kingdom, South Korea, and France. Countries that are part of the top fifteen to which the United States exports, in addition to those just named, are the Netherlands, Belgium, Australia, Brazil, Taiwan, Singapore, and Hong Kong. On the import side, in addition to the largest trade partners, the top fifteen import partners include Taiwan, Venezuela, Malaysia, Italy, Ireland, Saudi Arabia, and India. These listings are for trade results achieved by the end of 2009, but looking back at intervals over several years, much the same results obtain.

Related Parties. When a company imports from or exports to a foreign-based element of its own company a branch, subsidiary, or partner the goods or services nevertheless cross country borders and are handled as foreign trade. According to the U.S. Census Bureau, in 2007, related-party trade accounted for 40.6 percent of all trade, with 47.4 percent of all U.S. imports and 29.6 percent of exports involving these entities. These ratios have been fairly steady over the past decade (in 2001, this kind of trade represented 47 percent of imports and 31 percent of exports). Related party trading is, of course, an indirect measure of globalization, especially the rather high import percentage: it shows that companies are importing goods made by themselves, most likely in lower labor-cost markets, for sale domestically.

BALANCING THE TRADE

In the grand scheme of international trading, a balance in trade has always been the rational goal of sovereign states. Balanced trade means that exports will be the same as imports, one balancing the other. Exports generate the currency with which imports must be bought. A country that persistently experiences trade deficits slides into debt or dependency on foreign investment, which as of 2010 is the situation of the United States. The United States has experienced trade deficits continuously since 1971; it has been able to sustain its way of life only because of foreign investment here. However, in recent years, the United States has succeeded in reducing its trade deficit. The trade deficit in 2004 was $668 billion. It peaked 2 years later at $811.5 billion. By 2007 the trade deficit had declined to $738.6 billion, and it declined further in 2008 to $695.9 billion. A sharp decline occurred in 2009, when the trade deficit dropped to $380.7 billion, though much of this decline can be attributed to the recession of 2008 and 2009.

RESOURCES FOR SMALL BUSINESSES

A wide range of resources are available to help small businesses engage in international trade. A number of federal agencies are dedicated to helping small business expand into foreign markets. These include the United States and Foreign Commercial Service (US&FCS), the Small Business Administration (SBA), and the Commerce Department's International Trade Administration (ITA). The federal government also maintains databases that provide important data on various exporting factors. These are the SBA's Automated Trade Locator Assistance System (SBAtlas), the National Trade Data Bank (NTDB), and Foreign Trade Report FT925. The Department of Commerce (DOC) maintains the Commercial Service International Contacts List; the DOC also operates the Trade Opportunity Program (TOP) to provide companies with sales leads. There are also federal agencies dedicated to helping finance small businesses that want to engage in

export activities. The main one is the Export-Import Bank of the United States, which approved 2,540 small-business transactions for a total of $4.4 billion in 2009. Another helpful agency is the SBA, which runs two specialized export loan guarantee programs, the Export Express Program and the Export Working Capital Program.

GLOBALIZATION

Viewed narrowly, globalization is a governmental policy favoring free trade, open borders, the free movement of capital and goods (but not always of people), elimination of tariffs and price controls (including artificial control of currency values), and the privatization of publicly owned or controlled enterprises. Globalization is also a word used to describe all manner of phenomena associated with such a policy both positive and negative. In the United States, the positive consequences of globalization so far have been inexpensive imports and the ability of companies to invest abroad more easily; the negative consequences have been the loss of jobs to offshore operations and outsourced functions, large trade deficits, and foreign ownership of domestic assets.

HISTORICAL CONTEXT

The International Monetary Fund (IMF), an organization of 186 countries in 2010, suggests in its definition that globalization is something of a natural process. Globalization, according to the IMF, is "a historical process, the result of human innovation and technological progress. It refers to the increasing integration of economies around the world, particularly through trade and financial flows. The term sometimes also refers to the movement of people (labor) and knowledge (technology) across international borders. There are also broader cultural, political and environmental dimensions of globalization."

Trade, of course, is as old as humanity. Anthropologists have traced enormous trade routes that Cro-Magnon man used all across Europe before the dawn of history. Trade over land and by ship became common, the principal trade goods being agricultural products like olives and grains. In preindustrial times high dependence either on exports or imports tended to lead to war as countries tried either to secure their supplies or their markets. Rome became seriously dependent on grain imports from Egypt and eventually conquered its supplier. The British Empire evolved as a series of steps attempting to protect Britain's far-flung trading centers. In modern times oil and gas are the "must have" commodities and are producing international tensions and conflicts. The relevant phrase in the IMF's definition therefore is "increasing integration." Integration implies mutual dependency and therefore the danger of being cut off from essential supplies in times of trouble.

Underlying trade is the uneven distribution of the world's resources. Some people have grain, others have timber. Some can raise animals on plains while others can mine metal in mountains. Given this imbalance in resources, Scottish philosopher and economist Adam Smith (1723 1790) developed in *The Wealth of Nations* (1776) an argument regarding the economic principles of foreign trade: "If a foreign country can supply us with a commodity cheaper than we ourselves can make it, better buy it of them with some part of the produce of our own industry, employed in a way in which we have some advantage." In the nineteenth century economist David Ricardo refined this concept and called it "comparative advantage." Ricardo factored in opportunity costs as well as direct costs. In any

event, the value underlying free trade is that both sides benefit because of differential advantages.

Trade is the expression of economic power, but a more basic power underlies it: political power expressed as force. Trade-based policies in the past have been balanced by policies of autarky, a word defined as "national economic self-sufficiency." No country is genuinely self-sufficient, but attempts to gain the optimum advantage by a mixture of trade and force tends to be practiced at all times. Thus the U.S. government, for instance, despite a broadly favorable view on globalization, continues, as of early 2010, to impose a prohibitive 54-cent-per-gallon tariff on Brazilian ethanol imports. The relative power of a country, the relative importance of a commodity, and the relative influence of vital constituencies within that country combine to determine how much a country will rely on trade, how much on force, and in which categories particularly.

A fundamental reason for opposition to globalization arises from its chief features, integration and therefore mutual dependence. In democratically organized countries, political blocks can only hope to influence their own government, not that of scores of others. However, unreachable foreign governments will influence the local economy. In addition, narrow constituencies that benefit disproportionately from free trade may be able to control the government. The free trade philosophy, based on the vitality of competition, is also opposed by a socialist philosophy, based on the virtue of cooperation.

INSTITUTIONAL EXPRESSION

Globalization is taking place under international treaties to which a majorities of countries are signatories. Traditionally these treaties have been negotiated in "rounds" and have resulted in "agreements." The last "round" was the Uruguay Round in which agreements were signed on April 24, 1994; they went into effect on January 1, 1995, and established the World Trade Organization (WTO). Several other agreements were annexed to the WTO Agreement; these include the General Agreement on Tariffs and Trade (GATT), the General Agreement on Trade and Services (GATS), and the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS). The first GATT was negotiated and signed in 1947. WTO is the successor to all of these agreements.

The WTO is headquartered in Geneva, Switzerland, and has a membership of over 150 countries. The organization describes itself as "the only global international organization dealing with the rules of trade between nations. At its heart are the WTO agreements, negotiated and signed by the bulk of the world's trading nations and ratified in their parliaments. The goal is to help producers of goods and services, exporters, and importers conduct their business."

As of 2010, the WTO continued to be engaged in the Doha Round of negotiations based on the beginning of the current trade agenda launched in 2001 in Doha, Qatar. One of the chief aims of the round, strongly backed by the U.S. government, is further liberalization of trade in agricultural goods and services. WTO ministers have repeatedly stated that development is at the heart of the Doha agenda, which shows that another important aim is solving problems that developing countries have with the implementation of WTO agreements.

U.S. TREATIES AND INITIATIVES

Within the U.S. government, the institutional body managing trade activities is the Office of the United States Trade Representative (USTR), a 200-person organization that takes the lead in negotiating trade agreements. The legal basis of this governmental element is the Trade Expansion Act of 1962, modified by subsequent trade acts such as the Trade and Development Act of 2000.

Official U.S. participation in the globalization movement takes the form of participation in the global agreements that formed the WTO. In addition, the United States is a party to bilateral agreements with Australia, Bahrain, Chile, Israel, Jordan, Morocco, Peru, Oman, and Singapore, and three multilateral, regional free trade agreements. The U.S. also promotes regional initiatives.

The multilateral free trade agreements include APEC (Asia-Pacific Economic Cooperation, signed in 1989), NAFTA (North American Free Trade Agreement, which became effective in 1994), and CAFTA-DR (Central American-Dominican Republic Free Trade Agreement, which went into effect on March 1, 2006 with El Salvador's ratification of the treaty). CAFTA-DR includes the Dominican Republic, Costa Rica, El Salvador, Guatemala, Nicaragua, and Honduras.

The United States is also active in pursuing several free trade initiatives. These include the FTAA Initiative (for Free Trade Area of the Americas, begun 1994), the ASEAN Initiative (Association of Southeast Asian Nations, begun 2002), and the MEFTA Initiative (Middle East Free Trade Area, begun 2003). The United States has met with limited success in these initiatives. It has made bilateral trade agreements with Panama and Colombia; however, as of early 2010, these were awaiting Congressional approval to go into effect. The broader FTAA Initiative is stalled because of disagreement among a number of key nations, however. The Office of the U.S. Trade Representative has established the Enterprise for ASEAN Initiative (EAI) to pursue bilateral free trade agreements with individual members of ASEAN. Since the EAI was launched, the United States has made free trade agreements with Singapore, and it has negotiated with Thailand and Malaysia. Although the United States has not succeeded in the MEFTA Initiative,

it has concluded bilateral trade agreements with Israel, Jordan, Morocco, Bahrain, and Oman.

The United States remains committed to expanding its free trade agreements because of the benefits they represent to U.S. exports. The Web site Export.gov reports significant growth in U.S. exports to countries with which it has free trade agreements, including an increase of over 12 percent from 2007 to 2008 for CAFTA-DR countries and an average growth of over 6 percent for NAFTA members. Overall, the United States has experienced an increase of 8.6 percent in its exports to the seventeen nations with which it has specific trade agreements outside of the WTO.

Most Favored Nations. Special trade agreements *are not the same* as the often-mentioned "most-favored-nation" designations. The Library of Congress Research Service provides the following definition for the latter phrase: "Under the provisions of the General Agreement on Tariffs and Trade (GATT), when one country accords another most-favored-nation status, it agrees to extend to that country the same trade concessions, such as lower tariffs or reduced nontariff barriers, that it grants to any other recipient having most-favored-nation status." Each country, therefore, has its own definition of "most favored nation." All those so designated are treated alike. But some countries may be treated more favorably still. In that case they will not bear the "most favored" label. NAFTA members are an example. The phrasing is unfortunate because one is reminded of George Orwell's novel, *Animal Farm* (1945), in which all the animals are equal, but some are more equal than others, Just so, many nations may be "most favored," but some are more favored than others.

COSTS AND BENEFITS

From the U.S. perspective, globalization has resulted in massive imports of goods available at very attractive prices in major outlets like Wal-Mart. This has helped consumers but has brought hardship on many small-business retailers unable to purchase goods in high quantity in foreign markets at rock-bottom prices. Globalization has not only made it possible to import low-priced goods but also to export well-paid jobs to low-wage regions of the world, thus causing job losses domestically. Lost jobs may be replaced, but the general consequences of intense competition with lower-paid labor elsewhere is to depress income domestically.

The benefits of lower prices sent U.S. consumers on a shopping spree for over a decade. Robert Samuelson reported in *Newsweek* on this phenomenon, citing Sara Johnson of Global Insight: "From 1996 to 2005," Samuelson wrote, "the United States generated almost 45 percent of global growth in consumer spending.... That dwarfs the U.S. share of the world economy, [which is] about 20 percent." A consequence of this was an increase in the U.S. trade deficit from $191 billion in 1996 to a 2006 peak of $811.5 billion. However, the United States reversed the trend of rising trade deficits, at least temporarily. By 2007 the trade deficit had declined to $738.6 billion, and it declined further in 2008 to $695.9 billion. The sharpest decline occured in 2009, when the trade deficit dropped to $380.7 billion, though much of this decline can be attributed to the recession of 2008 and 2009. As the United States and the rest of the world began climbing out of this recession, monthly U.S. trade deficits began rising again. According to the federal government, the trade deficit in December 2009 was $40.2 billion, a rise of almost 10 percent from the November deficit of $36.4 billion. This indicated to some observers that the U.S. economy was on its way to returning to business as usual and that trade deficits would once again be on the rise.

The near-term beneficiaries of globalization are consumers, though the clearest beneficiaries are the stockholders of big multinational corporations that reap the rewards of greatly increased flexibilities in sourcing labor and raw materials while still retaining the large U.S. market. The somewhat conflicting outcomes of globalization are typically justified by appeals to technological progress: the United States can afford to shed jobs and enjoy the benefits of lower prices because the country's prowess in technology and innovation will generate whole new waves of much better employment. Thus goes the argument. However, the argument is, to some extent, a "bird-in-the-bush" rather than a "bird-in-the-hand" argument. For this reason energetic public opposition to globalization has emerged. If it finds political resonance, globalization may in time be slowed or curbed.

GOODWILL

Goodwill is a type of intangible business asset. It is defined as the difference between the fair market value of a company's assets (less its liabilities) and the market price or asking price for the overall company. In other words, goodwill is the amount in excess of the company's book value that a purchaser would be willing to pay to acquire it. A combination of advertising, research, management talent, and timing may give a particular company a dominant market position for which another company is willing to pay a high price. This ability to command a premium price for a business is the result of goodwill. If a sale is realized, the new owner of the company lists the difference between book value and the price paid as goodwill in financial statements.

The sale of a business may involve a number of intangible assets. Some of these may be specifically identifiable intangibles, such as trademarks, patents, copyrights, and licensing agreements, that can be assigned a value. The remaining intangibles, which may include the business's reputation, brand names, customer lists, unique market position, knowledge of new technology, good location, and special skills or operating methods, are usually lumped into the category of goodwill. Although these factors that contribute to goodwill do not necessarily have an assignable value, they nonetheless add to the overall value of the business by convincing the purchaser that the company will be able to generate abnormally high future earnings. In a 2009 article for the *Wall Street Journal*, Emily Maltby wrote that "for some firms for sale, such as professional practices, Internet companies and service firms, the value of intangible assets can range between 55% and 95%."

Although goodwill undoubtedly has value, it is still an intangible asset and as such is not recorded on a company's books. In fact, many companies use a value of $1 for goodwill in their everyday accounting procedures. Many companies could be sold for a premium price based on the good reputation they have established. But such goodwill is never recorded on the books until an actual acquisition occurs. The acquisition price determines the amount of goodwill that is recorded following the purchase of a company. For example, if a small business with assets of $40,000 is purchased for $50,000, then the purchaser records $10,000 of goodwill.

In general, determining the sales price of a business begins with an assessment of its equity, which includes tangible assets such as real estate, equipment, inventory, and supplies. Then an additional amount is added on for intangible assets (sometimes called a "blue sky" amount), which may include things like patent rights, a trade name, a noncompete clause, and goodwill. Experts note that in small-business sales, the combined total of "blue sky" additions should rarely be more than a year's net income, because few purchasers are willing to work longer than that for free. For public companies, the amount of goodwill is often dependent on the vagaries of the stock market. Since the share price determines the purchase price, the value attributed to goodwill may fluctuate wildly during the course of an acquisition.

Standard accounting procedures state that, following an acquisition, the purchaser should amortize goodwill over a period of 15 years using the straight-line method. In other words, one-fifteenth of the original amount attributed to goodwill is deducted each year. Since this write off period is longer than that required for most tangible assets, it is usually a good idea to allocate as much of the purchase price as possible to business equipment. The shorter depreciation period would enable the purchaser to accelerate deductions and thus achieve earlier tax savings.

On occasion, the goodwill booked after the sale of a business may be written down or reduced. Such occasions usually occur because of some larger shift within the market in which the business is active, a shift that causes a reevaluation of the business. An example of such is the mobile phone market. During the twenty-first century the market grew quickly, as many new companies entered the market, and many mergers and acquisitions occurred. In late 2005 and early 2006 T-Mobile and Vodafone announced large write-downs of the goodwill on their books in order to reflect more accurately the competitive marketplace in which they operate.

In March 2009 the Small Business Administration (SBA) changed the rules governing the percentage of an SBA loan that can be applied toward goodwill financing. The SBA capped goodwill financing at $250,000, or 50 percent of the loan amount, depending on which one was lower. However, this move was criticized by many sectors including lenders and business appraisers, and by October

2009 the SBA had increased the cap to $500,000. Prior to the 2009 rules the SBA had few restrictions on goodwill financing.

Over the years, there has been some dissatisfaction expressed with the way that goodwill is handled for accounting purposes. First, since goodwill is sometimes a huge component of a company's acquisition price (particularly in the case of large public companies), the amortization of goodwill can have a significant negative effect on the purchaser's net income. Second, the treatment of goodwill under U.S. law differs from many other countries, which sometimes puts American companies at a disadvantage in international mergers and acquisitions.

GOVERNMENT PROCUREMENT

Many small businesses maintain and increase their operations by working for local, state, and federal government entities. While these businesses may also secure business through the offering of competitive bids on jobs offered by the private sector, small-business owners should be aware of the differences in procuring work from the public and private sectors. The most fundamental difference between the procurement process in the public and private sectors concerns the process itself. Whereas some private companies may have fairly streamlined processes for awarding contracts to outside bidders or may not even bother with competitive bidding at all, if they are comfortable with a certain contractor governments at the local, state, and federal level are all obligated to adhere to a significant body of law designed to ensure that: 1) taxpayer money is spent wisely; 2) contracts are not awarded for less-than-legitimate reasons; and 3) all businesses are provided with a fair opportunity to make their case for the contract in question. Because government buyers are expected to spend taxpayer money wisely, their purchases are usually subject to significant oversight. Formal procurement rules are established to prevent both the reality and appearance of favoritism.

Submitting bids for public contracts can be a frustrating experience for businesses. The process of awarding contracts at the local, state, or national levels is a sometimes cumbersome one that is heavy on bureaucracy. In addition, government contracts are far more exposed to public scrutiny than are private ones. However, business analysts and government procurement officers agree that the potential benefits of securing public contracts far outweigh the disadvantages. After all, local, state, and federal government offices and agencies comprise the single biggest customer block in the nation. For many small businesses, then, government procurement is a potentially lucrative avenue to long-term organizational growth and success.

Government agencies and legislators recognize this reality as well. In recognition of the importance of federal contracts to many small business establishments, U.S. legislation requires that a certain percentage of its contracts go to companies that qualify as small businesses. These goals, which are arrived at through the combined input of the Small Business Administration (SBA) and individual agencies, classify bidding companies not only by their size but also by other classifications (minority-owned businesses, women-owned businesses, businesses located in high unemployment areas, etc.), and government purchasing agents work to fill these slots as well. In fact, some contracts are specifically set aside for the "exclusive participation" of small businesses, small disadvantaged businesses (minority- and women-owned enterprises), and businesses in high unemployment areas.

CHANGES IN GOVERNMENT PROCUREMENT RULES

The foundation of modern-day government contracting at the federal level is based on two laws the Armed Services Procurement Act of 1947 and the Federal Property and Administrative Services Act of 1949. These laws sought to codify all the various contract laws that had sprouted up over the years and provide overarching guidelines on government procurement. The laws also resulted in the creation of two sets of regulations designed to oversee affairs in the realm of government contracts Armed Services

Procurement Regulation (ASPR) for military agencies and Federal Procurement Regulation (FPR) for civilian agencies. These voluminous guidelines, though, were rife with exceptions and alternate procurement procedures, and in 1979, Congress passed the Office of Federal Procurement Policy Act Amendments. These pieces of legislation called on the federal government to develop a single set of simplified procurement regulations for all government agencies.

The result of that directive was the Federal Acquisition Regulation (FAR), which covered all federal agencies. The FAR changed no laws; rather, it was written in simpler language, arranged subject matter in a more logical sequence, and eliminated many of the contradictions and ambiguities that bedeviled everyone. Government business is conducted in accordance with FAR rules, and contractors must comply with its procedures or risk being eliminated from consideration. That same year, Congress also passed the Competition in Contracting Act of 1984 (CICA), which opened up the doors to competitive bidding in numerous areas that had previously only allowed limited bidding practices.

Today, bidding for government contracts at all levels, but especially the state and federal levels, is intense. Many small businesses are in the thick of the competition, fighting for contracts that look to be within their financial and operational grasp. However, making a bid for a government project is a time-consuming process, and consultants often counsel small business enterprises to be selective in their bid choices.

Federal procurement offices have recognized that the process takes a toll on small businesses as well. In 1995 Congress passed the Federal Acquisitions Reform Act, which arranged for a two-phase process of contract awarding in which the agency office selects a limited group of bidders based on their qualifications and general approach to the project, then examines detailed proposals from those "short listed" bidders, choosing the ultimate winner on a "best value" basis. The "best value" method calls for ranking proposals based on the scores each receives for a list of different items that are laid out in the solicitation document. The purchasing agency may award the contract after this evaluation, or it may discuss proposals with those considered competitive and then permit the short-listed bidders to submit their best and final offers.

RESOURCES FOR SOLICITING GOVERNMENT CONTRACTS

Small-business owners currently engaged in soliciting government contracts or weighing the possibility of doing so should make sure that they obtain a copy of the Federal Acquisition Regulation, available online at www.acquisition.gov/FAR. In addition, business owners should be aware that the FAR is updated in two different ways: 1) Federal Acquisition Circulars (FACs) contain changes to the FAR as a result of federal legislation; these are easy to use, because they are distributed as replacement pages that can be instituted in place of outdated FAR regulations. One such FAC was issued in December 2009, but more are sure to be issued throughout the 2010s. 2) Each federal department also has its own materials that supplement not supplant FAR guidelines. Obviously, it is not necessary for potential suppliers to obtain every agency's supplemental FAR guidelines. Business owners should acquire the guidelines from those agencies or departments in which they have particular bidding interests.

The Federal Business Opportunities (FBO) Web site was launched in 2000 to provide information for businesses seeking federal contracts, replacing the *Commerce Business Daily*. Using this Web site, all government agencies notify the public sector of upcoming solicitations and decisions on contracts over $25,000 in value. Through this single portal located at www.fbo.gov commercial vendors seeking federal markets for their products and services can search, monitor, and retrieve opportunities solicited by any entity within the federal contracting community. After the February 2009 passage of the American Recovery and Reinvestment Act (ARRA), new recovery awards and opportunities were made available through this portal as well.

Throughout the first decade of the twenty-first century, the federal government expanded and improved its online information services. In July 2001 the Office of Management and Budget formed the Quicksilver project; by September 2001 Quicksilver had announced twenty-four new electronic procurement initiatives, including the formation of the Integrated Acquisition Environment (IAE). According to its Web site, the goal of the IAE "is to simplify, unify, and streamline the complex federal acquisition process for government buyers as well as vendors and sellers." In addition to government resources, businesses interested in government procurement opportunities can turn to a number of associations, including the Association of Procurement Technical Assistance Centers (APTAC), which represents over 500 procurement professionals who assist businesses that are seeking to compete for federal, state, and local contracts.

METHODS OF SOLICITATION

Small businesses hoping to secure a federal contract will turn to one of three methods of solicitation: Request For Proposals (RFP), Invitation For Bid (IFB), or oral solicitation. RFPs are the most commonly utilized of these solicitation methods.

For smaller contracts, government purchasing agents typically use a simplified system of awarding in order to minimize administrative costs. In such instances, a purchasing agent may simply call a few potential contractors

from their bidders list and ask for a quote, awarding the contract to whoever comes in with the lowest responsible quote. The vast majority of all federal contractual actions are made through simplified procedures. This may seem surprising but one must remember that these smaller purchases are the government's equivalent of buying a cup of coffee or a newspaper, the sort of purchasing that is done routinely to meet recurring needs.

Not surprisingly, awards for larger contracts which can, after all, run into millions of dollars are bestowed only after a more comprehensive process. When a government agency has a project for which it wishes to receive bids it may: 1) ask for sealed bids through the use of an IFB; or 2) negotiate with a bidder on specific terms of the agreement. This latter methodology is more frequently used.

THE SBA'S 8(A) PROGRAM

The 8(a) Program is an SBA program intended to provide assistance to economically or socially disadvantaged business owners. The initiative, which originated out of Section 8(a) of the Small Business Act, provides participants with access to a variety of business development services, including the opportunity to receive federal contracts on a sole-source or limited competition basis.

Becoming a participant in the 8(a) Program is a laborious process but one that may be beneficial for eligible companies that wish to become involved in bidding on federal government projects. The passage of ARRA altered some of the rules of this program to make it easier for the SBA to aid small businesses.

KEYS TO SUCCESSFUL BIDS FOR GOVERNMENT CONTRACTS

Business consultants, executives, managers, and purchasing officers alike note that there are several keys to pursuing government contracts successfully, no matter what their size or other characteristics. For the most part, these are recommendations that hold true when bidding for any large job or project.

Learn about the process and the impact of successful bids on business operations. In addition to conducting basic research on the agencies and project areas in which they are interested, small-business owners need to educate themselves on the nuances of bidding, the repercussions of a successful bid on company operations (workforce allocation, needed facility upgrades, etc.), and a host of other considerations.

Review RFPs on a regular basis. Small-business owners should regularly check FBO.gov to make sure that possible projects do not pass by unnoticed.

Make bids judiciously. Small-business owners should consider many factors when weighing whether to put in a bid on a project, such as current workload, delivery schedule, expectations of the agency, and so on.

Submit a strong proposal in accordance with agency guidelines and time table. Businesses do not always allow for sufficient time to put together an adequately researched and detailed bid. Company leadership should make sure that adequate resources, both in terms of time and effort, are allocated for this purpose. Agencies who receive tardy, incomplete, or shoddy proposals will quickly discard them.

Prepare for the awarding of the project. Businesses are sometimes subjected to pre-award surveys to determine their ability to fulfill all contract obligations; this is especially true if the government office has never worked with the bidder before.

Key competency areas typically examined by government purchasing agents include:

- Adequacy of financial resources, organizational talent, technical knowledge, and operational controls to perform the duties detailed in the contract
- Ability to comply with the required delivery or performance schedule
- Good prior performance record and business reputation
- Access to all production, construction, and technical equipment and facilities necessary for completion of project
- Eligibility to receive the contract under all relevant laws and regulations

Contractors are often asked for extensive information by government purchasing agents, and they should be prepared to hand it over and accommodate surveys and other information-gathering activities by the government office in question. Information that may be requested from the contractor includes financial data, personnel information, and reports on all aspects of production (from technical capability to quality assurance capability), but the agent may also contact suppliers, trade and business associations, customers, financial institutions, and contract administrators of previous government jobs that the company has completed.

INCREASED POPULARITY OF ALTERNATIVES TO LOW BID CONTRACTS

In recent years, various government offices at all levels have followed the federal government's lead and pursued "low-bid" alternatives when awarding contracts to the private sector. In previous eras, cities, counties, states, and federal offices all generally awarded contracts to the lowest responsible bidder, reasoning that such decisions

minimized exposure to charges of favoritism, corruption, and backroom dealing. Both contractors and purchasing agents have observed, however, that this dynamic has undergone considerable change, especially in such high-cost areas as public works projects (building and road construction, etc.).

The use of "best value" and "performance-based" evaluations as a means of deciding on a winning bidder has begun to supplant the exclusive use of the lowest bidder as the deciding factor. Agencies at local levels have increasingly followed the lead of federal offices in this shift. As mentioned above, "best value" calls for ranking various proposals on a range of criteria and selecting the winner based on all those factors, not just price. "Performance-based" contracting, on the other hand, is an arrangement wherein the contract defines the required performance standards for the project but leaves it up to the contractor to devise the means of accomplishing the task in accordance with relevant laws. Several procurement policymaking agencies in the federal government, including the Office of Federal Procurement Policy, have touted performance-based contracting as superior to traditional low-bid contracting in every way, including cost, service, and delivery time.

GREEN MARKETING

Environmentally responsible or "green" marketing is a business practice that takes into account consumer concerns about promoting preservation and conservation of the natural environment. Green marketing campaigns highlight the superior environmental protection characteristics of a company's products and services. Characteristics usually highlighted include reduced waste in packaging, increased energy efficiency of the product in use, reduced use of chemicals in farming, or decreased release of toxic emissions and other pollutants in production.

Marketers have responded to growing consumer demand for environment-friendly products in several ways, each of which is a component of green marketing. These include: 1) promoting the environmental attributes of products; 2) introducing new products specifically for those concerned with energy efficiency, waste reduction, sustainability, and climate control; and 3) redesigning existing products with an eye towards these same consumers. Marketing campaigns touting the environmental ethics of companies and the environmental advantages of their products are on the rise.

Most observers agree that some businesses engage in green marketing solely because such an emphasis will enable them to make a profit. Other businesses, however, conduct their operations in an environmentally sensitive fashion because their owners and managers feel a responsibility to preserve the integrity of the natural environment even as they satisfy consumer needs and desires. Indeed, true green marketing emphasizes environmental stewardship. Green or environmental marketing may be defined as any marketing activity that recognizes environmental stewardship as a fundamental business development and business growth responsibility. This expands, to some extent, the traditional understanding of a business's responsibilities and goals.

In her 2010 article "The Greening of the Internet," Elizabeth Gardner discusses the way Internet retailers are showing their green side to consumers. For instance, online retailer Shoplet.com has a tab on its menu bar called Shop Green. Every product in this section is advertised to be environmentally friendly. Online retailer

Amazon.com launched a certification program in November 2009 that encouraged its suppliers to provide "frustration free" packaging. According to Amazon this means the packaging is "recyclable and comes without excess packaging materials such as hard plastic clamshell casings, plastic bindings, and wire ties." Ideally, this type of packaging also means that the product can be safely shipped in its original box and not inside a shipping box.

REACTIONS TO "GREEN CONSUMERISM"

A number of factors have caused business firms in some industries to incorporate an environmental ethic into their operations. The principal factor, of course, is the growing public awareness of the environmental degradation that has resulted as a consequence of the growth in population and natural resource consumption throughout the world during the last 50 years. The issue is particularly relevant in the United States, which accounts for fully 25 percent of world consumption despite having only 5 percent of the world's population. This growing public awareness of environmental issues has brought with it a corresponding change in the buying decisions of a significant segment of American consumers. Many consumers, and not just the most environmentally conscious, have begun in recent years to incorporate environmental concerns in their personal buying decisions through the purchase and use of products and services perceived to be more environmentally friendly. In some cases, changes in commodity availability have been the motivation behind such shifts in purchasing patterns. For example, the gas price increases seen in 2004 and 2005 caused a sharp decline in sales of sport utility vehicles (SUVs) in favor of hybrid and other flexible-fuel vehicles.

Businesses took heed of this growth in "green consumerism," and new marketing campaigns were devised to reflect this new strain of thought among consumers. Companies with product lines that were created in an environmentally friendly fashion (i.e., with recycled products, comparatively low pollutant emissions, and so on) quickly learned to shape their marketing message to highlight such efforts and to reach those customers most likely to appreciate those efforts (an advertisement highlighting a company's recycling efforts, for instance, is more likely to appear in an outdoor/nature magazine than a general interest periodical).

Ironically, the most environmentally aware consumers are also the ones most likely to view green claims of companies with skepticism. A company's attempt to portray itself as "green" may fall flat if it is perceived to be false advertising, particularly among those most educated about environmental issues. Corporate reputation, then, has emerged as a tremendously important factor in reaching and keeping these consumers. A company that touts its sponsorship of an outdoor-oriented event or utilizes nature scenery in its advertising, but also engages in practices harmful to the environment, is unlikely to gain a significant portion of the green consumer market. Of course, such tactics are sometimes effective in reaching less informed sectors of the marketplace.

One way businesses overcome the skepticism some consumers have of these environmentally friendly claims is to be completely clear about what the company is doing well and what it would like to do better in this realm. For example, in a 2010 interview in *QSR Magazine*, Amanda West, the owner of a restaurant and bakery that offers "quick-service foods that are better for both customers and the environment," discussed the Google spreadsheet she posts on her Web site that details what she does and does not yet do for the environment. This type of transparency allows consumers to feel more secure that claims being made about green practices are likely to be true.

GREEN PRODUCTS

In their book *The Green Consumer*, John Elkington, Julia Hailes, and John Makower discussed several characteristics that a product must have to be regarded as a "green" product. They contended that a green product should not:

- Endanger the health of people or animals
- Damage the environment at any stage of its life, including manufacture, use, and disposal
- Consume a disproportionate amount of energy and other resources during manufacture, use, or disposal
- Cause unnecessary waste, either as a result of excessive packaging or a short useful life
- Involve the unnecessary use of or cruelty to animals
- Use materials derived from threatened species or environments

Life Cycle Analysis. Most analysts agree that the "life" of the product and its parts is one of the most important components in determining whether a product is green or not. Most people think only of the process of creating a product when gauging whether a product is green, but in reality, products impact the environment at several additional stages of their useful lives. Life cycle analysis (LCA) and product line analysis (PLA) studies measure the cumulative environmental impact of products over their entire life cycle, from extraction of the resources used to create the product to all aspects of production (refining, manufacturing, and transportation) to its use and ultimate disposal. These studies are sometimes referred to as "cradle to grave" studies. Since such studies track resource use, energy requirements, and waste generation in order to provide comparative benchmarks,

both manufacturers and consumers can select products that have the least impact upon the natural environment. Some detractors of LCA studies, though while granting that they do provide useful information contend that they are subjective in setting analysis boundaries and claim that it is difficult to compare the environmental impact of disparate products.

GREEN PROMOTION

Perhaps no area of green marketing has received as much attention as promotion. In fact, green advertising claims grew so rapidly during the late 1980s that the Federal Trade Commission (FTC) issued guidelines to help reduce consumer confusion and prevent the false or misleading use of terms such as "recyclable," "degradable," and "environmentally friendly" in environmental advertising. Since that time, the FTC has continued to offer general guidelines for companies wishing to make environmental claims as part of their promotional efforts:

- Qualifications and disclosures should be sufficiently clear and prominent to prevent deception.
- Environmental claims should make clear whether they apply to the product, the package, or a component of either. Claims need to be qualified with regard to minor, incidental components of the product or package.
- Environmental claims should not overstate the environmental attribute or benefit. Marketers should avoid implying a significant environmental benefit where the benefit is, in fact, negligible.
- A claim comparing the environmental attributes of one product with those of another product should make the basis for the comparison sufficiently clear and should be substantiated.

The FTC regulations apply to all aspects and forms of marketing, including labeling, advertising, and promotional materials. In addition to delineating marketing claims that might be regarded as false or misleading, the FTC also provides guidance to businesses on how to make specific claims about environmentally friendly aspects of their operation, in part by clarifying the definitions of such commonly used terms as "recyclable," "biodegradable," and "compostable."

"Organic" is another term commonly used in marketing. Its popularity has grown with the growing demand for organic agricultural products. For a company to promote and label a product as organic, that product must meet the strict guidelines established by the Department of Agriculture (USDA). The guidelines for both production and labeling of organic agricultural goods are laid out in the USDA's National Organic Program Web site located at www.ams.usda.gov/nop/indexIE.htm.

The popularity of green products created a need to regulate and standardize claims about the environmental characteristics of products. Many regulatory guidelines were issued (and remain in force) to accomplish this job. They are designed not only to curb businesses engaged in misleading advertising practices, but also to clarify the regulatory environment for companies and make it easier for the consumer to differentiate between products that are truly "green" and those that are not.

ECO SPONSORING

One avenue commonly used by companies to promote their specific ecological concerns (or polish their overall reputations as good corporate citizens) is to affiliate themselves with groups or projects engaged in environmental improvements. In the simplest form, firms engaged in eco-sponsoring activities contribute funds directly to an environmental organization to further the organization's objectives. Another approach is to "adopt" a particular environmental cause (community recycling programs are popular), thus demonstrating the company's interest in supporting environmental protection efforts. Sponsorships of educational programs, wildlife refuges, and park or nature area clean-up efforts also communicate concern for environmental issues. Environmental organizations charge, however, that some businesses use eco-sponsorships to hide fundamentally rapacious attitudes toward the environment.

ECO LABELING

Another vehicle that has been used with increasing frequency in recent years to convey environmental information to consumers is "eco-labeling." Eco-labeling programs are typically voluntary, third-party expert assessments of the environmental impacts of products. Two firms that are involved in such third-party label verification work are Green Seal and Energy Star.

Eco-labeling programs increase awareness of environmental issues, set high standards for firms to work towards, and help reduce consumer uncertainty regarding a product's environmental benefits. Thus far, however, the U.S. government has resisted instituting an officially sanctioned eco-labeling program.

GREEN PRODUCTION

The color green is closely associated with environmentalism, and therefore "green production," "green enterprise," "green business," and similar phrases are related to the pursuit of positive environmental goals.

Environmentalism arose in the 1960s as the younger, more politically active post-World War II embodiment of an earlier conservation movement. The latter is associated with President Theodore Roosevelt (1858 1919). The first major environmental law, the National Environmental Policy Act of 1969, came just before the first Earth Day was celebrated on April 22, 1970. The 8 years between 1969 and 1976 saw passage of nine fundamental environmental laws.

Environmentalism is an undeniable public movement, ranging from political activism to a more general lifestyle. In general, a majority of people (around three-quarters) are favorably inclined toward the environment; more than half participate in some form of environmental activity (like recycling); and around 30 percent are actively involved in the cause.

This is the general environment in which green enterprise operates. Green products and services have a substantial market and command a premium price. The movement now embraces much more than simply pollution-free manufacturing. Companies also work to produce healthy foods (organically produced, if possible), oppose all manners of artificial ingredients, encourage or create alternative fuels and modes of transportation (e.g., solar power, bicycles), promote and use alternative methods of construction to save energy (e.g., earth-sheltered homes), offer holistic and alternative forms of medicine, and even deal in green investment for ecological movements.

CORPORATE RESPONSE

The corporate response to environmentalism has taken many forms, ranging from exploitation of the phenomenon to deeply committed entrepreneurship and incorporation of green values into products and services.

When a company exploits an environmental movement or trend, it is known as "greenwashing." This variant of whitewashing plays along with eco-friendly practices without fulfilling any specific environmental goals. A greenwashing food company may create new labeling for a product advertising all natural ingredients, but not make any changes to the current recipe or continue to use genetically modified crops for production. More subtle, problematic forms can occur when stores sell organic items that waste more energy in shipping than non-organic items would waste. Greenwashing becomes a problem when it is too easy for companies to represent themselves as environmentally friendly. To combat this, some organizations offer independent environmental certification for businesses that want to prove their eco-friendly practices.

Many companies deliberately make and sell only products that are environmentally superior, have been produced by a nonpolluting process, or are made of natural ingredients. The products offered cover a bewildering variety of products, from building materials and automotive parts to technology and infant toys.

Similarly, there are also corporations in which environmental values are central to corporate values and all operations are deliberately and consciously managed with those principles guiding all choices. Some organizations may be nonprofit and focused on social change, while others are traded publicly and manufacture sustainable goods such as solar-powered water heaters or offer eco-friendly services, such as digital mail delivery. Investment funds sold to environmentally aware investors will feature such stocks.

NATURAL STEP PRINCIPLES AND ISO 14000

The Natural Step Principles were created by Dr. Karl-Henrik Robert of Sweden in 1989, with the help of several leading Swedish scientists. His goal was to create a model for a sustainable society that businesses could

eventually follow and base themselves on. The result became known as the Natural Step, and Natural Step principles became a point of reference for many environmental organizations. There are four concepts that Natural Step is based upon:

- Substances from the earth's crust cannot systematically increase in the biosphere.
- Substances produced by society cannot systematically increase in the biosphere.
- The physical basis for the productivity and diversity of nature must not be systematically deteriorated.
- There must be fair and efficient use of resources to meet human needs.

Ensuing discussion centered around the Natural Step idea, and similar concepts eventually led to further government action, specifically the international ISO 14000 standards. ISO 14000 is only the first standard of a series going beyond ISO 14040 and dealing with environmental management systems and production for businesses across the world. These standards were developed following the United Nations Conference on Environment and Development in Rio de Janeiro, Brazil, in 1992 (informally known as the Earth Summit) and have been widely accepted since.

One important standard of the series is ISO 14001, which makes a provision for an Environmental Management System that businesses can put into practice and then receive international accreditation for (after being inspected by a third party). Other important standards include the ISO 14020s, which govern labeling issues, and the ISO 14040s, which focus on life cycle structures for business. The ISO guidelines that deal with environmental accounting and auditing practices have been replaced by a new set of standards, the ISO 19011.

Small businesses interested in following these protocols can purchase ISO 14000 toolkits (for around $200) that provide the necessary guides and plans, together with check lists and tasks that companies can follow to ensure compliance in their business practices. A good toolkit will also include templates and forms for creating the necessary paperwork.

ENVIRONMENTAL PRODUCTION

All manufacturing processes are regulated under federal and state laws that deal with pollution, waste disposal, land management, and animal husbandry. "Green production," businesses tend to be more proactive in their environmental pursuits and go beyond the laws with four different areas of practice: 1) methods of growing, harvesting, or extracting new raw materials in such a manner that energy is conserved and few or no artificial chemicals are introduced into the process; 2) methods of reusing materials to minimize waste and, indirectly, to save energy; 3) techniques for avoiding where possible high-energy or chemicals-intensive processes; and 4) schemes for processing production wastes back into the system or into secondary uses.

Extraction. Extraction typically involves growing agricultural commodities with minimal or no artificial fertilizers, utilizing natural methods of pest and weed control, and harvesting wild growth with sustainability in mind. People engaged in green production understand that substantial amounts of energy are consumed in making fertilizers and pest/weed-control chemicals and both the extraction and use of energy harms the environment. Chemical methods of control disturb the natural ecosystem and can have far-reaching consequences due to contamination. Modern agriculture and forestry industries have been optimized using energy and chemicals, so "green production" tends to be more costly on average.

Reuse/Recycling. Green production tends to make use of waste materials and residues as raw material. Here again the motivation is to reduce production waste and to capture any energy that might otherwise be lost. Secondary paper mills and electric furnaces to remelt scrap steel are only two popular examples. Companies try to strike a balance between recycling materials and the increased energy and time it takes to reuse them.

Minimizing Energy Use and Toxins. Modern processing has evolved around the use of machines driven by energy and the use of chemical solvents and catalyst in preparing raw materials. Green companies attempt to use less energy and fewer toxic chemicals than in traditional manufacturing processes. Small businesses may be able to use employee labor to complete tasks instead of machinery that would take more energy. Manufacturers investigate alternate methods of producing paper, plastic, and other materials without using the same chemicals. There are many applications throughout industries.

Waste Handling. In green production wastes are intensively managed to keep them useful for immediate recovery, proper disposal, or reuse as energy in on-site furnaces. This may include recycling old chemicals, which most oil refineries practice, or turning organic waste into compost for fertilizer, a step taken by small businesses interested in green production.

THE SMALL GREEN BUSINESS

Small and new businesses are well represented in the green market and have many opportunities to practice green production. Small business typically leads in innovation because it is less weighed down by traditional business models. As the twenty-first century has advanced, small-business owners have been able to practice

green production methods more easily than their larger counterparts.

This is especially true of businesses that can develop local contacts and create production processes or supply lines that are organic in nature. A small market, for instance, is often able to establish connections with local farmers and access organically grown produce. There are also benefits to being a small start-up company as well: using green technology such as scanning instead of hardcopy paperwork, or buying recycled materials and energy efficient assets, is easier when beginning a small business.

Small businesses should also be aware of the government incentives available for using eco-friendly technology and products. These incentives take many forms. There were bonuses for deducting certain types of energy-saving appliances and materials for the 2008 and 2009 tax years, and additional legislation may solidify these tax breaks. The Green Energy Production Act, introduced in 2009, would if passed provide funds for green technology, production, and development grants to be given to businesses throughout the United States. Other green legislation is also being considered. Small businesses interested in these incentives should contact their state business or environmental departments for more information on local programs.

GRIEVANCE PROCEDURES

Grievance procedures are a means of dispute resolution that can be used by a company to address complaints by employees, suppliers, customers, and competitors. A grievance procedure provides a hierarchical structure for presenting and settling workplace disputes. The procedure typically defines the type of grievance it covers, the stages through which the parties proceed in attempting to resolve matters, individuals responsible at each stage, the documentation required, and the time limits by which the grievance must be presented and dealt with at each stage. The best-known application of grievance procedures is as a formal process outlined in labor union contracts.

Grievance procedures do not necessarily have to be so formal and elaborate, and in fact, overly formal grievance procedures often discourage the airing of disputes in a timely manner. In small businesses, the procedures may consist of a few lines in an employee manual or the designation of a single ombudsman to deal with problems as they develop. Peer review of employee concerns is another popular way to address grievances. On the other hand, some larger companies may create an entire department dedicated to fielding complaints from employees or customers.

Whatever form they may take, grievance procedures are intended to allow companies to hear and resolve complaints in a timely and cost-effective manner, before they result in litigation. Knowing that formal procedures are available often encourages employees to raise concerns or question company policies before major problems develop. It also makes managers less likely to ignore problems, because they know that upper management may become involved through the grievance process. In union settings, grievance procedures help protect employees against arbitrary decisions of management regarding discipline, discharge, promotions, or benefits. They also provide labor unions and employers with a formal process for enforcing the provisions of their contracts. The 2008 book

The Labor Relations Process, by William H. Holley, Kenneth M. Jennings, and Roger S. Wolters, stresses the importance of employees submitting grievances in writing. In many cases a written complaint will better convey the problem without an emotional escalation or confrontation that could potentially harm the relationship of the parties involved. The authors suggest that "writing the grievance may be necessary for its rational discussion."

Although having grievance procedures in place is important in both unionized and nonunionized settings, companies must support their written policies with consistent actions if they hope to maintain good employee relations. To make a grievance procedure work, all parties must approach it with the attitude that it serves their mutual interests. Ideally, an effective grievance procedure helps management discover and correct problems within an operation before they cause serious trouble. It can provide a vehicle through which employees can communicate their concerns to upper management.

For grievance procedures to be effective, both parties should view them as a positive force that facilitates the open discussion of issues. In some cases, however, the settling of grievances becomes a sort of scorecard that reinforces an "us versus them" mentality between labor and management. In other cases, employees are hesitant to use the grievance process out of fear of recrimination. Some studies have shown that employees who raise grievances tend to have lower performance evaluations, promotion rates, and work attendance afterwards. This suggests that some employers may retaliate against employees who raise complaints. It is vital that a company's grievance procedures include steps to prevent a backlash against those who choose to use them.

A TYPICAL GRIEVANCE PROCESS

In a union environment, a typical grievance procedure begins with an employee presenting a problem to his or her immediate supervisor within a certain time period after the offending event has occurred. The supervisor then has a set amount of time either to respond or send the grievance on to be addressed by the head of the department. At this point, a union representative enters the negotiations on behalf of the employee. If the situation is still not resolved, the grievance continues up the chain of command to the plant manager and the president of the local union. If the labor union fails to follow the procedures at any point, the contract usually specifies that it must drop the grievance. Conversely, the company is usually obligated to resolve the grievance in the employee's favor if management fails to follow the procedures outlined in the collective bargaining agreement.

If the situation still cannot be resolved, the final step in the grievance process is for both parties to present their side to a predesignated arbitrator. The arbitrator's role is to determine the rights of both parties under the labor agreement, and his or her decision is usually final. The labor contract generally specifies the type of arbitrator used, the method of selecting the arbitrator, the scope of the arbitrator's authority, and the arrangements for the arbitrator's payment. A potential intermediate step involves presenting the grievance to a mediator, whose job is to help the parties solve their own differences before they reach the formal arbitration phase. Mediation is usually less time consuming and expensive than arbitration. According to the authors of *The Essential Guide to Workplace Mediation and Conflict Resolution*, at the point where mediation is necessary the parties in conflict may no longer be able to communicate civilly with each other. Mediation with a trained mediator can create a safe place to open the discussion again and work toward resolving the original conflict. In addition, the mediator may be able to teach the two parties dispute resolution skills that may be helpful in solving future problems.

GROWTH STRATEGIES

The term "growth strategies" refers to the overall plans and tactics that an enterprise follows in order to become larger and more successful. There are a variety of growth

strategies available to businesses of all sizes. These strategies focus on both the internal steps needed to improve company operations, the external actions needed to survive in a highly competitive environment, or sometimes a combination of both perspectives.

Growth strategies typically aim to enhance a company's competitiveness with its current markets and sectors, although some (such as diversifying into new products) expand the company beyond its core focus. Different strategies are often appropriate to companies at different times in their life cycle.

VALUE OF GROWTH STRATEGIES

According to *Inc.* magazine, only one out a thousand companies grow to $250 million in annual revenues, with just 0.036 percent achieving annual sales of $1 billion. Growth strategies are a pathway for small businesses to beat the odds and achieve sustainable expansion over a period of years. Business executives and academic researchers agree that having a strategy detailing how the company will grow is a critical factor in the success of any enterprise.

The degree of business growth increases the likelihood a new venture will survive, according to Xoapiun Chen, writing in the *International Journal of Research in Marketing*. Chen found that new ventures can face complex strategic choices when assembling their growth strategies. He wrote that firms combine technological, financial, and networking capabilities to generate a variety of strategies that include internal and external approaches. "As different growth strategies may require different resources and have different performance implications," Chen wrote, "there is a compelling need to explore how entrepreneurs make strategic choices to achieve growth." Chen found the strategies that gave companies the best odds of survival are product diversity (particularly when supported by partnerships) and expanding into international markets (most effectively achieved via acquisitions).

In a paper published by the *Journal of Business Venturing*, Satyayit Majumdar found that entrepreneurs in smaller firms typically follow one of two growth strategy patterns. One approach is based on relationships, while the other is built around technology. "Growth performance of small organizations depends on many internal and external factors," Majumdar wrote, "but the internal factors are more important than the market variables." The paper also noted that small enterprises are typically more flexible and tend to react more quickly to changes in the competitive environment than larger organizations.

A paper titled "Is Your Growth Strategy Flying Blind?" in the *Harvard Business Review* found that successful companies often thrive by implementing techniques that do not follow common conventional wisdom. For example, while many companies become defensive during an economic downturn, some seize the opportunity to strengthen their business. Rather than slash jobs and expenses, these companies selectively target "pockets" of the enterprise for reductions while leaving other departments untouched. For example, a recession provides opportunities for affordable acquisitions and seizing market share from weaker competitors. A growth strategy that balances the need for cost containment with the ability to take advantage of market conditions allows these companies to expand when others are contracting. For leaders of healthy, financially sound companies, the authors wrote, "We hope our findings are a useful counterweight to their natural tendencies, which can lead to missed opportunities."

TYPES OF GROWTH STRATEGIES

There are a number of proven strategies available that businesses of all sizes can follow to pursue their growth goals. A common way to categorize approaches to growth is by dividing strategies into internal and external groups. *Foundations in Strategic Management* stated, "An internal growth strategy such as market penetration is aimed exclusively at increasing a firm's market share in existing business. Similarly, the external growth strategy of horizontal integration increases market share immediately."

An article in *Inc.* magazine, based on the work of entrepreneur Keith McFarland, organizes strategies by level of risk. McFarland groups the less risky strategies into an "intensive growth" category, which includes selling more products to existing customers or developing new products for new clients. "Integrative growth strategies" are based on acquisitions, which carry more risk but also potentially more reward. The article notes that 75 percent of acquisitions are considered failures because they do not achieve the efficiencies or other value measures that were expected. Another risky category is diversification, in which a company buys other firms that are not related to their core business.

McFarland told *Inc.* that businesses should devise a growth strategy that provides the best results at the lowest levels of risk and effort. He suggested companies begin with less risky strategies and work their way "up the ladder" as they grow. He also advised business leaders to maintain the flexibility to modify their plans as market conditions change.

Strategies that businesses may follow to grow their enterprises include:

- Market penetration (also called invasion), a strategy to sell more of the firm's existing products or services into the markets it currently serves. This approach includes reducing prices or increasing advertising and marketing efforts within a company's existing footprint.

- Market development, finding new markets (or new uses) for current products and services.
- Product/service development, creating new products or services (or modifying existing offerings). The strategy may only target current customers and markets, or it may also seek new prospects and territories. According to Dimitri Tassiopoulos, in his book *New Tourism Ventures, An Entrepreneurial and Managerial Approach*, "It is important to understand that if products/services are not changed then they are dying and eventually the entrepreneur will have to close shop." Tassiopoulos added, "This does not always imply major changes. Sometimes a new menu in a restaurant will do the trick."
- Diversification, the strategy of developing or acquiring new products or services in new markets. This strategy is not as common today as it was in the mid-twentieth century, although it remains in use by such successful conglomerates as General Electric.
- Integration, a strategy based on acquiring another company in order to offer new products or enter new markets.
- Increasing quality or frequency of product/service usage. These strategies rely on such tactics as rewarding frequent or return customers, or finding ways to sell more products to the existing client base.
- Alliances/joint ventures. This strategy calls for joining forces with other companies to develop new products, manufacture goods or enter new markets.
- Horizontal integration, one of the acquisition-based strategies in which a company buys another firm within its current line of business. Merger and acquisition (M&A) activities typically seek to cut costs by integrating the businesses or to bring the buyer a larger market share.
- Vertical integration, in which a company expands its role within its current industry supply chain. This strategy typically involves acquisitions of other firms in the supply chain or joint ventures with those companies. Depending upon the firm's position within the industry, a business may pursue a forward supply chain strategy (getting closer to the final consumer) or backward supply chain (moving towards producers and suppliers of goods used to make the product). It can also pursue both approaches and move simultaneously in both directions.
- Alternate channels, finding new marketing platforms to reach customers. For example, the owner of a chain of retail stores may start selling its clothing through Web sites and catalogs.
- Combined strategy, which calls for merging two or more of the individual strategies into a comprehensive approach. Most companies combine several strategies in order to support their growth goals.

CHOOSING A GROWTH STRATEGY

Not all of these strategies are appropriate for every enterprise. Business owners and managers should consider such factors as the company's size and market position; short- and long-term business plans; the existing business model; and the ability of the existing infrastructure and management team to support an expansion. For example, a company that has implemented all the internal growth strategies at its disposal may need to pursue acquisitions in order to continue expanding.

Managers also have to determine the appropriate rate of growth for their firm. "I always thought expanding my business at a steady pace was a smart move," software entrepreneur Joel Spolsky wrote in an *Inc.* magazine article titled "Does Slow Growth Equal Slow Death?" He continued, "Now I worry that it could potentially kill us." Spolsky decided his company needed to take more risks and grow more quickly to survive in a competitive industry. While refusing to sacrifice quality, Spolsky wrote, "We do have to work closer to the limits of our abilities. We have to invest more of our profits in hiring more sales people and software developers." Otherwise, he concluded, "We're going to end up being the company you've never heard of."

Executives often receive contradictory signals on whether they should pursue innovative strategies or stick to their core abilities, Mark Johnson wrote in a *Business Week* article titled, "Want to Grow? Look at Your Business Model." Johnson suggested companies should first consider why the company has been successful. "Once you know the strengths and limitations of your current business model, you can determine how much it must change to address transformative opportunities or threats," he said. Johnson added the key to growth is not simply increasing revenue; it lies in being profitable in all stages of the broader economic/business cycle.

In *Entrepreneur* magazine, Karin Price Mueller wrote that developing a growth strategy should begin with devising a budget. Owners and managers first should determine how much capital is available, and then consider whether the company needs to borrow more money to meet its goals. Tactics to support expansion strategies include hiring more staff, adding new product lines, upgrading the firm's technology, moving a store to a better location, or simply increasing advertising. Mueller suggested business leaders weigh all their options, calculating

the costs and benefits of each approach before making a decision on which growth strategy to pursue.

Different industries also call for different approaches. For example, *Texas Banking* reported that more banks are relying on cross-selling to their existing customers for increased growth and client retention. The article cited surveys that show 60 percent of customers are likely to stay with their current banks. Spending on marketing activities has also been cut by the industry. Since those and other factors make it more difficult to acquire new customers, financial institutions are focusing more on existing customers. Selling a bank deposit customer a CD or an insurance policy helps banks generate more income from their clients and strengthen the ties with current customers, the article added.

According to the *Harvard Business Review*, companies need to dig deep into the data about their businesses to understand their growth opportunities and challenges. The article, titled "Is Your Growth Strategy Flying Blind?" stated that taking a detailed "granular" approach carries the "largely untapped potential for companies to accelerate their growth and separate from the competition. By looking microscopically at their markets and their current performance relative to rivals', companies can develop far better growth strategies." The article suggested reviewing a company's mergers and acquisition history, market share, and momentum in markets where the firm competes to understand its growth opportunities.

HEALTH INSURANCE OPTIONS

Health insurance is a contractual agreement between an individual or group and an insurance provider through which the insurance provider agrees to pay for some or all of the health care costs incurred by the person or group in exchange for their regular payment of a sum known as a premium. In this way, the insurance company assumes the financial risk of reimbursing health care costs, but it is able to offset that risk by collecting premiums from a large number of people, many of whom will have very low medical expenses. Traditionally, health insurance has been provided as an employee benefit by large companies, so many people have come to think of health insurance as part of an employment compensation package. Self-employed people and small-business owners, lacking such coverage, must wade through the many available options to find plans that meet their own health insurance needs.

ASSESSING A COMPANY'S NEEDS

The type of coverage a business needs depends upon its workforce. For example, a company with a workforce consisting primarily of married people with dependent children will need more comprehensive coverage than a company with a mostly unmarried, childless work force. Many plans can be specifically tailored to the needs of a company's workforce. For example, firms whose employees work at computers may wish to provide eye care as part of their health insurance plans, while other firms may find that employees would value a fitness program.

Many insurance companies offer computer models that enable small businesses to determine the most economical insurance plan given the previous year's health care expenses. Another option that can reduce premiums is pooling insurance with other small businesses through trade associations or other organizations. Experts note that business owners may find it helpful in comparing different plans to ask the providers for references to other small business clients. Even though health insurance coverage can be expensive for small businesses, plan costs are tax deductible. In addition, providing such benefits can help smaller companies compete with larger ones to attract talented employees and can act to reduce employee turnover. It is important to note that, under the terms of the Consolidated Omnibus Budget Reconciliation Act (COBRA), all businesses that employ more than twenty people and offer a group health insurance plan must give employees the option of continuing coverage at their own expense for a limited period of time when they lose eligibility for company-provided benefits.

There are a variety of health insurance plans available from commercial insurance companies, hospital and medical service plan providers, and health maintenance organizations (HMOs). Coverage can generally be purchased on an individual or group basis. Group plans may be handled through an employer or through various organizations, including professional associations, colleges, labor unions, and health cooperatives. These plans usually have lower premiums than individual plans, cannot be canceled, and do not depend on the physical condition of individuals within the group. Most types of policies cover part of the costs of hospitalization, diseases and illnesses, surgery, and injuries from accidents, but the extent of coverage depends on the particular policy. Most policies do not cover cosmetic surgery or self-inflicted injuries. Supplemental

coverage is usually required to pay for eye and dental care, special hazards (such as football, skiing, hunting), rehabilitation services, and travel accidents. Some policies have a deductible that requires the insured to pay a certain amount out-of-pocket before benefits kick in, while others have a copayment that requires the insured to pay a percentage of the costs after satisfying the deductible.

The most popular types of health insurance plans in the United States are: prepaid plans, which include popular managed care options such as HMOs, and fee-for-service plans, which encompass traditional indemnity insurance. Other possibilities include self-insurance, which basically involves a company or individual covering their own health care costs, and medical savings accounts (MSAs), which allow people to set aside money before taxes to be used for medical expenses. In addition, government-backed health care plans are available to federal employees, members of the military, veterans, the elderly, low-income families, Native Americans, and other societal groups.

As a result of the proliferation of health insurance options, deciding upon a plan can be a complicated process for a self-employed person or small-business owner. Experts recommend that individuals and companies choose a plan that protects them against experiencing financial harm from an unexpected injury or illness but is not prohibitively costly to maintain. In deciding on an appropriate amount of coverage, it is important to consider the amount of money available for emergencies, the unusual hazards that may exist, the family or workforce health history, the extent of protection already available, and the level of health care costs in the community.

TYPES OF PLANS

The most common types of health insurance plans are prepaid (also known as managed care) and fee-for-service. Under traditional fee-for-service plans, the insurer pays the insured directly for any covered hospital or physician costs. Under a prepaid plan, insurance companies arrange to pay health care providers for any service for which an enrollee has coverage. The insurer effectively agrees to provide the insured with health care services, rather than reimbursement dollars. Prepaid plans offer the advantage of lower costs, which result from reduced administrative expenses and a greater emphasis on cost control. However, such plans also restrict enrollees' choices as to the doctors and hospitals from which they receive service.

Fee-for-Service. Fee-for-service health insurance plans waned in popularity during the late 1980s and 1990s. In fact, the percentage of insured Americans covered by such plans declined from 96 to 28 percent between 1984 and 1991 and then down to 15 percent by the end of the first decade of the twenty-first century. The primary reason for this decline was that fee-for-service arrangements do not emphasize preventative care or containment of costs. Fee-for-service health insurance plans are available to both individuals and groups. By spreading the costs among a pool of enrollees, group health insurance offers benefits derived from economies of scale. Group insurance generally features lower premiums and deductibles, more comprehensive coverage, and fewer restrictions than individual policies.

Most fee-for-service plans cover basic costs related to hospitalization, including room and board, drugs, and emergency room care; professional care, such as physician visits; and surgery, including any procedures performed by surgeons, radiologists, or other specialists. Insured persons generally have their choice of hospitals and doctors. More inclusive health insurance plans are referred to as major medical insurance. Two types of major medical plans are: 1) supplemental, which provides higher dollar limits for coverage or covers miscellaneous services not encompassed in some basic plans, such as medical appliances and psychiatric care; and 2) comprehensive, which usually covers all costs included in basic and supplemental plans, and may also eliminate deductible and coinsurance requirements. Basic, supplemental, and comprehensive plans usually do not insure dental, vision, or hearing care.

Prepaid Plans. The second major category of health insurance is prepaid, or managed care, plans. Managed care plans typically arrange to provide medical services for members in exchange for subscription fees paid to the plan sponsor. Members receive services from physicians or hospitals that also have a contract with the sponsor. Thus, managed care plan administrators act as middlemen by contracting with both health care providers and enrollees to deliver medical services. Subscribers benefit from reduced health care costs, and the health care providers profit from a guaranteed client base.

Although they serve the same basic function as traditional health insurance, managed care plans differ because the plan sponsors play a greater role in administering and managing the services that the health care providers furnish. For this reason, advocates of managed care believe that it provides a less expensive alternative to traditional insurance plans. For instance, plan sponsors can work with health care providers to increase outpatient care, reduce administrative costs, eliminate complicated claim forms and procedures, and minimize unnecessary tests.

Managed care sponsors accomplish these tasks by reviewing each patient's needs before treatment, sometimes requiring a second opinion before allowing doctors to administer care; providing authorization before hospitalization; and administering prior approval of services performed by specialists. Critics of managed care claim that

some techniques the sponsors use, such as giving bonuses to doctors for reducing hospitalization time, lead to undertreatment. Some plans also offer controversial bonuses to doctors for avoiding expensive tests and costly services performed by specialists.

Managed care plan sponsors also have more of an incentive to emphasize preventive maintenance procedures that help patients avoid serious future health problems and expenses. For instance, they typically provide physicals and checkups at little or no charge to their members, which helps them detect and prevent many long-term complications. Many plans offer cancer screenings, stress reduction classes, programs to help members stop smoking, and other services that save the sponsor money in the long run. Some plans also offer financial compensation to members who lose weight or achieve fitness goals. For example, one plan offers $175 to overweight members who lose 10 pounds and gives $100 to members who participate in a fitness program.

Another difference between traditional insurance and managed care is that members typically have less freedom to choose their health care providers and have less control over the quality and delivery of care in a managed system. Members of managed care plans usually must select a "primary care physician" from a list of doctors provided by the plan sponsor.

Managed care plans can take many forms. The most popular plans are health maintenance organizations (HMOs) and preferred provider organizations (PPOs). Other services that mimic these two plans include point-of-service plans (POSs) and competitive medical organizations. In addition to these established plans, many employers and organizations offer hybrid plans that combine various elements of fee-for-service and managed care options.

The most popular plan, the basic HMO, is the purest form of the managed care concept. HMOs are differentiated by four organizational models that define the relationship between plan sponsors, physicians, and subscribers. Under the first model, called individual practice associations (IPAs), HMO sponsors contract with independent physicians who agree to deliver services to enrollees for a fee. Under this plan, the sponsor pays the provider on a per-capita, or fee-for-service, basis each time it treats a plan member. Under the second model, the group plan, HMOs contract with groups of physicians to deliver client services. The sponsor then compensates the medical group on a negotiated per-capita rate. The physicians determine how they will compensate each member of their group.

A third model, the network model, is similar to the group model, but the HMO contracts with various groups of physicians based on the specialty that a particular group of doctors practices. Enrollees then obtain their service from a network of providers based on their specialized needs. Under the fourth model, the staff arrangement, doctors are actually employed by the managed care plan sponsor. The HMO owns the facility and pays salaries to the doctors on its staff. This type of arrangement allows the greatest control over costs but also entails the highest start-up costs.

A PPO is a variation of the basic HMO. It combines features of both indemnity insurance and HMO plans. A PPO is typically organized by a large insurer or a group of doctors or hospitals. Under this arrangement, networks of health care providers contract with large organizations to offer their services at reduced rates. The major difference from the HMO is that PPO enrollees retain the option of seeking care outside of the network with a doctor or hospital of their choice. They are usually charged a penalty for doing so, however. Doctors and hospitals are drawn to PPOs because they provide prompt payment for services as well as access to a large client base.

Other Options. Various other health insurance options exist for small businesses and self-employed individuals. One possibility is self-insurance, which requires a company to absorb most of the financial risk of its own health care coverage. An outside administrator may handle the paperwork, but the company pays its own claims. Self-insurance can provide a company with greater control over its health care costs and improved cash flow, but it can also be prohibitively expensive in cases of severe illness or injury. As a result, some companies choose to limit their liability by purchasing stop-loss insurance, which covers expenses after they reach a certain limit.

Finally, a company may choose to make health savings accounts (HSAs) available for employees to use in paying for their own health insurance. HSAs were established under federal law with the signing of the Medicare Prescription Drug Improvement and Modernization Act of 2003. HSAs are the successors to the Medical Savings Accounts of the 1990s. In essence, HSAs are personal accounts into which employees may set aside pre-tax dollars that can be used later to pay for health care expenditures. Disbursements from these accounts are tax-free as long as they are used for approved medical expenses. HSAs may be used as the sole form of health insurance vehicle provided by a company or they may be offered as a means of supplementing a more employer-funded type of insurance policy. In most cases, the HSA option is coupled with a high-deductible insurance policy and HSA funds are used to pay for the deductible and other out-of-pocket expenditures that an employee may have.

HEALTHCARE REFORM

The patchwork pattern of health insurance provisions has made it a challenge for small businesses and sole proprietorships to acquire and maintain health insurance. Large

firms have also struggled with the high costs of health care, and with what are often referred to as legacy costs associated with providing health care insurance to retirees. In addition to these challenges, the United States as a whole has faced an increasing health care crisis in the form of un- and underinsured Americans. In the twenty-first century, rising health care costs and the growing number of uninsured Americans led many politicians and citizen interest groups to claim that the United States was facing a health care crisis. A widely cited figure asserted that one in six Americans roughly 45 million people were without healthcare. Healthcare reform was a major issue in the 2008 presidential campaign, with both major-party candidates proposing plans to fix the ailing system. When he took office, President Barack Obama, armed with Democratic majorities in both houses of Congress, began pushing Congress to enact major healthcare legislation. After a year-long battle in which Republicans strongly opposed the Democratic agenda for health care reform, Congress passed the Patient Protection and Affordable Care Act, which President Obama signed into law on March 23, 2010.

While this landmark piece of legislation does not change the health insurance options available to individuals, families, and businesses, it does make a number of significant changes to the provision of health insurance in the United States. While some changes took effect immediately upon passage, the law graduates the activation of certain regulations, programs, and penalties over the course of several years, with many provisions going into effect in September 2010 but some not being applied until as late as 2018. The major provisions of this law are as follows:

- Small businesses will be given tax credits of up to 35 percent to make health coverage for employees more affordable.
- Medicaid eligibility is expanded to include those making up to 133 percent of the poverty level. As of mid-2010, this amount was $29,327 for a family of four.
- State-based health insurance exchanges will be created for the uninsured and self-employed to purchase health insurance. Effective in 2014, separate exchanges will be created to allow small businesses to purchase coverage.
- Individuals and families who make between 100 percent and 400 percent of the poverty level will be eligible for subsidies to purchase health insurance.
- Beginning in September 2010, insurance companies are no longer able to deny coverage to children coverage based on a preexisting condition. This provision wil be applied to everyone with a preexisting condition starting in 2014.
- Starting in 2012, the Medicare Payroll Tax will be expanded to include a 3.8 percent tax on investment income for individuals making more than $200,000 or families making more than $250,000 per year.
- Beginning in 2014, everyone must purchase health insurance or pay annual tax penalties. Employers with more than fifty employees must provide health insurance or pay a fine of $2,000 per worker each year if any worker receives federal subsidies to purchase health insurance.
- Beginning in 2018, insurance companies will pay a 40 percent excise tax on insurance plans worth over $10,200 for individuals or $27,500 for families.

The analysis of this act made by the Congressional Budget Office (CBO) stated that the new law will provide coverage to an additional 32 million people by the time it is fully implemented in 2019. The CBO also estimated that the cost of the coverage components of the law will be $938 billion over the course of 10 years but that the combination of savings to the Medicare and Medicaid programs, along with new taxes and fees, will have the effect of reducing the federal deficit by $124 billion over that same 10-year period.

Despite the passage of a health care reform act, opposition to health care reform still exists. While the ultimate fate of some provisions of the Patient Protection and Affordable Care Act remain politically and constitutionally uncertain, the bulk of the act is likely to go into and remain in effect, leading to significant changes in the health insurance landscape faced by businesses of all sizes.

HEALTH MAINTENANCE ORGANIZATIONS AND PREFERRED PROVIDER ORGANIZATIONS

Health Maintenance Organizations (HMOs) and Preferred Provider Organizations (PPOs) administer the most common types of managed care health insurance plans. Managed care plans typically arrange to provide medical services for members in exchange for subscription fees paid to the plan sponsor usually an HMO or PPO. Members receive services from a network of approved physicians or hospitals that also have a contract with the sponsor. Thus, managed care plan administrators act as middlemen by contracting with both health care providers and enrollees to deliver medical services. Subscribers benefit from reduced health care costs, and the health care providers profit from a guaranteed client base.

Managed care plans emerged during the 1990s as the main alternative to traditional, fee-for-service health insurance arrangements. In a fee-for-service arrangement, employees can go to the hospital or doctor of their choice. The plan reimburses costs at a set rate. For example, the insurance company might pay 80 percent, and the company or individual enrollee might pay 20 percent for all medically necessary services. Although they serve the same basic function as traditional health insurance plans, managed care plans differ because the plan sponsors play a greater role in administering and managing the services that the health care providers furnish. For this reason, advocates of managed care believe that it provides a less expensive alternative to traditional insurance plans. For instance, plan sponsors can work with health care providers to increase outpatient care, reduce administrative costs, eliminate complicated claims forms and procedures, and minimize unnecessary tests.

Managed care sponsors accomplish these tasks by reviewing each patient's needs before treatment, requiring a second opinion before allowing doctors to administer care, providing authorization before hospitalization, and administering prior approval of services performed by specialists. Critics of managed care claim that some techniques the sponsors use, such as giving bonuses to doctors for reducing hospitalization time, lead to undertreatment. Some plans also offer controversial bonuses to doctors for avoiding expensive tests and costly services performed by specialists.

On the plus side, managed care plan sponsors also have more of an incentive to emphasize preventive maintenance procedures that can help patients avoid serious future health problems and expenses. For instance, they typically provide physicals and checkups at little or no charge to their members, which helps them detect and prevent many long-term complications. Many plans offer cancer screenings, prenatal care, stress reduction classes, programs to help members stop smoking, and other services that save the sponsor money in the long run. Some plans also offer financial compensation to members who lose weight or achieve fitness goals.

Another difference between traditional health insurance and managed care plans is that members typically have less freedom to choose their health care providers and have less control over the quality and delivery of care in a managed system. Participants in managed care plans usually must select a "primary care physician" from a list of doctors provided by the plan sponsor. The sponsor pays the health care provider a predetermined price for each covered service. The individual participant may have to meet a deductible and make a small copayment.

The trend away from traditional fee-for-service health care plans has been steady over the past three decades. According to statistics from the U.S. Department of Labor, fee-for-service plans accounted for 96 percent of health care plans offered by medium and large public employers in 1984; by the end of the first decade of the twenty-first century, they accounted for less than 15 percent of employer-provided health insurance. Managed care plans have effectively displaced traditional fee-for-service health insurance plans. However, despite claims that managed care would help employers handle rising health insurance costs, employer costs for health benefits have steadily increased. According to the Bureau of Labor Statistics, employer costs for health benefits were $1.03, or 5.4 percent of total compensation, in March 1999; by March 2009, average cost was $2.00 per hour, or 7.3 percent of total compensation.

Managed health care plans come in three types: health management organizations (HMOs), preferred provider organizations (PPOs), and point of service plans (POSs).

HMOs. HMOs provide a wide range of comprehensive health care services to their members in exchange for a fixed periodic payment. In most cases, participants must select a "primary care physician" from a list of approved providers which usually includes internists, pediatricians, and general practitioners. These doctors act as "gatekeepers" to coordinate all the basic health care needs for their patients. A patient with a knee injury, for example, would be required to see his or her primary care physician, who would then decide whether referral to a specialist for surgery or rehabilitation was warranted. In this way, the primary care physician helps eliminate unnecessary care that would cause an increase in plan costs. Another way in which HMOs seek to reduce costs is by providing care only within a restricted geographical area. Most HMOs provide local service and do not cover visits to doctors or hospitals outside the network except when the patient is traveling or has an emergency.

HMOs can be classified into four organizational models that define the relationship between plan sponsors, physicians, and subscribers. Under the first model, called individual practice associations (IPA), HMO sponsors contract with independent physicians who agree to deliver services to enrollees for a fee. Under this plan, the sponsor pays the provider on a per capita, or fee-for-service, basis each time it treats a plan member. Under the second model, the group plan, HMOs contract with groups of physicians to deliver client services. The sponsor then compensates the medical group on a negotiated per capita rate. The physicians determine how they will compensate each member of their group.

A third model, the network model, is similar to the group model but the HMO contracts with various groups of physicians based on the specialty that a particular group of doctors practices. Enrollees then obtain their service from a network of providers based on their specialized needs. Under the fourth model, the staff arrangement, doctors are actually employed by the managed care plan sponsor. The HMO owns the facility and pays salaries to the doctors on its staff. This type of arrangement allows the greatest control over costs but also entails the highest start-up costs.

For small businesses in the market for a health care plan, HMOs offer relatively low costs, broad coverage, and little administrative work. Many HMOs began establishing plans for smaller companies by the mid-1990s, although some of the larger HMOs still did not provide coverage for individuals. Experts recommend that small-business owners check the financial security of an HMO before signing a contract, since many managed care providers went bankrupt in the early 1990s. Although employees have a reduced ability to choose their own doctors and limited out-of-area coverage with an HMO, they benefit from low out-of-pocket costs, comprehensive services, preventative care, and no claim forms. In addition, there is no waiting period for coverage of preexisting conditions, and no maximum lifetime limits on benefits. Many HMOs also provide other services, like dental care and eye exams.

PPOs. A PPO is a variation of the basic HMO that combines features of traditional insurance with those of managed care. With a PPO, the plan sponsor negotiates discounts with participating doctors and hospitals, then pays them on a fee-for-service basis rather than prepaying. Patients are usually permitted to choose from a fairly extensive list of doctors and hospitals. The patient is required to pay a set amount per visit, and the insurer pays the rest. The amount of the copayment depends on the type of plan. Plans with higher premiums usually feature lower out-of-pocket costs.

The major difference between PPOs and HMOs is that PPO enrollees retain the option of seeking care outside of the network with a doctor or hospital of their choice. They are usually charged a penalty for doing so, however, as the percentage of costs paid by the PPO is reduced. Doctors and hospitals are drawn to PPOs because they provide prompt payment for services as well as access to a large client base. There are still restrictions on patients that are intended to control the frequency and cost of health care services, but not as many as with a typical HMO. PPOs are a popular choice for sole proprietors or owners of very small companies, since they require employees to pay a larger percentage of their own health care costs. Most insurance agents and brokers can provide information on the various PPO plans available to small businesses.

POSs. A point of service plan (POS) is a sort of hybrid health insurance model that combines features of HMOs and PPOs. Like an HMO or PPO, the patient only pays a copayment or low co-insurance for contracted services within a network of preferred providers for what is termed in-network care. However, like traditional fee-for-service insurance, enrollees have the flexibility to seek out-of-network care under the terms of traditional indemnity plans with a deductible and a percentage co-insurance charge.

CONCERNS ABOUT MANAGED CARE

Health care reform has been a major topic of debate for some time, as public concern grew about cost increases and increasing restrictions imposed by managed care health insurance plans, especially HMOs. Even as HMOs increased in popularity during the 1990s, many people came to believe that, as for-profit companies, they placed a greater emphasis on making money than on providing needed care. During the late-1990s and early twenty-first century, the media was full of stories about HMOs

denying medically necessary services to patients, ostensibly in order to control costs.

In formulating a health care reform bill, Congress took into account the public discontent over the provision of services by managed-care providers. The Patient Protection and Affordable Care Act, signed into law on March 23, 2010, by President Barack Obama, contains several key provisions designed to give patients more information and options to ensure that they receive quality care and customer satisfaction. These provisions include:

- The establishment of standards for how health plans use premiums. This provision requires companies to make this information public, and it also requires health care providers to spend 80 to 85 percent of their premium dollars on health-related services.
- The creation of a new Web site to provide citizens with information about health plan options. This provision is intended to enable individuals, families, and small businesses to make more informed decisions about the coverage they select.
- The provision of federal support for states to establish health insurance consumer assistance or health insurance ombudsman programs. Among other services, these programs help consumers file complaints, appeal decisions, and handle enrollment problems.
- The requirement that all new health plans put into practice more helpful processes for appealing claim denials and coverage determinations. States will be required to provide an additional external appeals process to ensure an independent review of health care providers' decisions.

HEALTH PROMOTION PROGRAMS

A health promotion program sometimes known as a wellness program is a type of employee benefit that encompasses the various efforts companies make to promote and maintain their employees' health. Examples of health promotion programs might include company-sponsored smoking cessation training, visits with a nutritionist to receive information about healthy cooking, discounted fitness center memberships, or free cholesterol testing.

Offering health promotion programs to employees provides small businesses with a number of potential benefits. For example, they may decrease their health care costs, increase worker productivity, reduce absenteeism, and encourage employee loyalty. In addition to improving their general health, work-based health promotion programs also make employees feel that the company is concerned about their welfare, which tends to increase their job satisfaction. "Keeping your workers healthy year-round is a great way to decrease absenteeism and improve morale," Ellen Paris wrote in an article for *Entrepreneur.* "Free cancer screenings, educational seminars, and flu shots may not sound like fun perks, but employees appreciate them."

Health promotion programs continue to increase in popularity. In 2009, according to a survey done by Watson Wyatt and the National Business Group on Health (NBGH), about 80 percent of large companies provide employees with health risk surveys that are designed to detect current and potential heath issues. It is up to the employee to decide whether to fill out the survey; however, 60 percent of employers offer some sort of monetary incentive for participation. The results of the survey are viewed by a third party, never by the employer, and then if necessary a nurse, coach, or consultant contacts the employee to help him or her form a wellness plan and begin to make healthier choices.

The financial crisis that began in 2008, along with rising health care costs, have forced employers to reconsider their approach to health care. According to NBGH, a 2010 survey found that 83 percent of large U.S. employers have already overhauled or plan to overhaul

their company's approach to health care by 2012. The result of these changes will likely mean employees will begin to pay more out of their own pocket for health care. However, half of the companies surveyed plan to put more emphasis on prevention and wellness programs, which could diminish health care costs overall.

The U.S. Chamber of Commerce released its guidebook *Healthy Workforce 2010 and Beyond* in December 2009, which serves as a guide to help employers plan and implement wellness programs within their companies. The chamber is also pushing for healthcare reform that would create incentives for businesses to incorporate health promotion into the workplace.

The cost of health promotion programs is relatively low, given the potential savings small businesses might realize in reduced health care costs. Many basic wellness services are available through the employer outreach programs of local hospitals and visiting nurse associations. Another option for companies is to provide employees with access to health information on the Internet. Employers can do this by directing employees to health information already available on the Internet or by creating a resources for the company's own intranet.

Introducing a health promotion program can be an extremely daunting undertaking because its success usually requires meaningful changes in attitudes and behaviors. Changing behaviors and attitudes can be extremely difficult, as anyone who has undertaken to break a bad habit knows. Behaviors related to health risk factors are often among the most challenging to modify, because they are basic lifestyle activities like eating, sleeping, exercising, and smoking. Since people do not easily change their habits without good reason, a successful health promotion program should include some sort of incentive. Incentives may take the form of desirable rewards or undesirable consequences. For the most part, employers implementing health promotion programs find the use of desirable incentives more conducive to establishing a program that projects a positive image.

Inspiring others to change their behavior takes persistence, patience, and time. Because the benefits to be gained by a company from a health promotion program may not manifest quickly, assessments of the success of such a program should be measured only after sufficient time has elapsed. A healthier workforce is a goal that most business owners will agree is desirable, even if it takes time to achieve.

HIGH-TECH BUSINESS

High-technology businesses are those engaged in securing growth and revenue from industry sectors characterized by new and rapidly changing technology. In fact, advanced technology has come to be utilized in so many different industries that members of the business community now often regard it as its own unique industry subset, with applications across the spectrum of the world of commerce. Today, high-tech businesses are involved in industries as diverse as food exporting, retail product design, and oil extraction.

Businesses immersed in the world of high technology range from huge corporations such as Microsoft, Intel, and Amazon.com to small start-ups hoping to be the next huge corporations. The differences between these organizations are many, but it is perhaps more consequential that their leaders whether the president of a multinational computer chip manufacturer or the owner of a 10-employee CAD/CAM outfit share one thing. They understand and recognize the changes that technological advances are bringing to the global marketplace and the opportunities that such changes create. Early and successful adopters of new technologies are often able to gain advantages that enable them to establish new ground in a

market before the technology becomes more widely used and a more standard feature within the market.

Successful high-tech firms are adept at recognizing the possibilities associated with technological advancements, and they nurture corporate cultures that enable them to seize on those opportunities. In his 2009 book *The Essential Web Startup Success Guide*, Bob Walsh discussed the world of hi-tech start-ups in relation to the recession that began in 2008. When he asked Don Dodge, who was at the time Microsoft's business development manager, what entrepreneurs should focus on when considering a start-up, Dodge said, "Is your product a vitamin or a painkiller? Vitamins are nice to have, but pain killers, you got to have it, right? So, the nice-to-haves in bad times... just don't cut it, because people aren't going to spend time or money on things that are nice to have. They are going to focus on real pain points and... spend time and money on things that solve a problem that they have."

CHANGE AND UNCERTAINTY IN THE GLOBAL MARKETPLACE

Observers agree that today's high-tech companies operate in a business world that is changing at an exciting and also unnerving pace. Economists, business executives, consultants, and entrepreneurs alike have fiercely debated the ultimate character of these changes. As the *Economist* observed, "the belief that technology and globalization promise unbounded prosperity and render old economic rules redundant has infected American managers, investors, and politicians with remarkable speed.... Why has the belief in the New Economy spread so quickly? One reason is that some of its elements really do exist. Imports and exports **do** play a bigger role than they did a generation ago. Information technology **is** altering the nature of America's economic output, as well as the ways that companies operate." Indeed, it is this latter factor that is often touted as the most dependable and significant engine of economic growth. After the recession began in 2008, often referred to as the worst financial crisis since the Great Depression, many people contended that the hi-tech industry would be at the forefront of the recovery. After all, exciting new technologies had revolutionized huge areas of the business landscape, from manufacturing to communications and marketing. Neil Gross and John Carey, writing in *Business Week*,, pointed out two other important reasons why observers expected many high-tech businesses to continue to soar: 1) there is a relatively low cost associated with purchasing and implementing the necessary equipment and other infrastructure for high-tech ventures, at least when compared with many other industries; and 2) breakthrough technologies in such areas as computers and communication equipment can be rapidly designed into commodity products.

Moreover, researchers pointed out that unlike other growth sectors, high technology ventures are not limited to larger corporations. Indeed, small business enterprises have carved out an impressive niche in the industry, and they are expected to remain firmly entrenched in the world of high-tech for years to come. "Despite a long list of hurdles," wrote Heather Page in *Entrepreneur*, "high-tech entrepreneurs can still look to the future with well-founded optimism."

KEYS TO LAUNCHING AND MAINTAINING A SUCCESSFUL HIGH TECH BUSINESS

In addition to adhering to commonsense entrepreneurial guidelines do not spread finances too thin, devise a sound marketing strategy, hire good employees, weigh the impact of actions on family people hoping to start or add to a high-technology business should take into account the following keys, many of which concern taking advantage of available opportunities in such areas as education, training, and financing:

Keep up with industry changes. This can be a daunting task, but entrepreneurs who stay up to date on new technologies and innovations, new applications, and changing markets will be far better equipped to spot the gaps in products and services that still dot the high-tech landscape and fill that spot with their own company's offerings.

Make full use of technology transfer opportunities. Many laboratories and research institutions operated by universities, government agencies, and corporations are inclined to share their knowledge and technology with entrepreneurs and other business enterprises in commercial industries. "These types of programs are effectively placing technology in the hands of those most capable of turning it into viable ventures: entrepreneurs," claimed Page. "Moreover, not only is it now easier to identify which technologies can make the shift into the commercial sector, but more systems are being created to facilitate their transfer."

Use the Internet and other Information Technology (IT) markets to full advantage.

Reward and challenge employees. Workforce stability and reliability are important factors in small-business success for just about any entrepreneur, but its importance may be particularly pronounced in one of the fast-paced high-tech industries. Indeed, it is a far more serious matter to replace a software programmer 3 months before a new product launch than it is to replace a cashier or stock person. For many small, high-tech companies, workers are among their most valuable assets; the smart entrepreneur will compensate them accordingly, via salary, benefits, promotion, responsibility, or some combination thereof, to best ensure a high degree of employee retention.

Admit mistakes. Given the rapid pace at which high-tech industries are changing, companies need to be aggressive in their prosecution of new strategies and initiatives. Yet almost inevitably, a high-tech business will sometimes find itself pursuing a product or market that, for whatever reason, comes to look decidedly less appetizing than it appeared when it was first targeted. The key to weathering such disappointments, say many analysts, lies not only in diligent research and detailed planning, but also in pulling the plug on plans that have gone sour rather than pouring additional money and resources into it while competitors pursue more promising avenues.

Explore various funding options. High-technology companies in such areas as communications, networking, the Internet, and various other software applications were major recipients of funding from venture capital companies in the 1990s. This trend declined noticeably in 1999 and 2000 due to convulsions in the stock value of numerous high-tech firms and the economic slowdown that followed over the next few years. The economic crises that began in 2008 with the crash of the real estate market brought with it new challenges for high-tech companies. During the years following the crash, venture capital was harder to secure and banks became more critical about who would be given business loans. However, even during financially difficult times there are options for start-up money, including programs sponsored by federal, state, and regional agencies or governments designed to help secure risk capital and research and development funding. These resources are there due to the fact that hi-tech innovation is now an integral part of financial stability.

HOME OFFICES

A home office is a space within an individual's personal residence that is used for business purposes. It may be a corner of a spare bedroom equipped with nothing more than a desk, or it could be one whole floor of a house filled with the latest in computer and communications devices. Whatever its size and composition, however, the home office is increasingly common in American business today. The number of home-based business is growing, due to technology lowering the entry barriers and the concept becoming more acceptable to clients and colleagues. According to a 2006 U.S. Census Bureau report, 49 percent of all U.S. business are home-based.

Establishing a home office involves a number of important considerations. For example, individuals interested in working out of their homes must gather information on local zoning restrictions, find and set aside an appropriate work area, and gain the support of family and neighbors for the home office. Other considerations include whether the home office will offer sufficient privacy, will be convenient for customers and vendors, and will provide room for future expansion and growth. The expense involved in furnishing a home office and purchasing necessary computers, office supplies, and other equipment is another factor to consider.

The use of part of a home as a business office may enable an individual to qualify for tax deductions. The "home office deduction" allows individuals who meet certain criteria to deduct a portion of mortgage interest or rent, depreciation of the space used as an office, utility bills, home insurance costs, and cleaning, repairs, and security costs from their federal income taxes. Although the Internal Revenue Service (IRS) has set strict regulations about who qualifies for the deduction, about 1.6 million people claim the deduction each year. According to Gloria Gibbs Marullo in an article for *Nation's Business*, the savings can be considerable: a sole proprietor living in a $150,000 home stands to save about $2,500 in actual taxes annually.

HOME OFFICE TAX DEDUCTION

The most important aspects of setting up a home office are the potential tax and legal implications. Home office operators may claim a deduction for those offices on IRS Form 8829 (Expenses for Business Use of Your Home), which is filed along with Schedule C (Profit or Loss From Your Business). There are restrictions, however, which are covered in IRS Publication 587 (*Business Use of Your Home*). Failing to abide by these restrictions may put a red flag on a home office user's federal income tax return, which could result in an audit.

In general, a home office deduction is allowed if the home office meets at least one of three criteria: 1) the home office is the principal place of business; 2) the home office is the place where the business owner meets with clients and customers as part of the normal business day; or 3) the place of business is a separate structure on the property but is not attached to the house or residence. The deduction is figured on the size of the home office as a percentage of the total house or residence. For example, if the total house size is 2,400 square feet and the home office is 240 square feet, 10 percent of the total house is considered used for business. That would allow the business owner to deduct 10 percent of the household's costs for electricity, real estate taxes, mortgage interest, insurance, and repairs as business expenses.

Be warned, however, that the home office deduction cannot be used by everyone who has a home office. A 1993 U.S. Supreme Court decision made the home office deduction more difficult to apply outside of these very carefully worded circumstances. In the case in question, a doctor worked in three different hospitals but did not maintain an office in any of them. Therefore, he established a home office, which he claimed was necessary to keep up with his billing and patient records, and claimed a home office deduction. But the Supreme Court ruled that since the doctor spent most of his working hours visiting patients, the hospitals were his principal place of work, and his home office deduction was denied.

This ruling, which more narrowly defined the concept of "principal place of business" affected a large number of people, particularly professionals such as sales agents who see customers at the customers' places of business. Since the demonstration and sale of the merchandise occurs away from the home office, the IRS ruling says that those offices are not critical to conducting that business. As a general rule, if the income-producing activity takes place away from the office, a deduction is not allowed. On the other hand, a second job conducted exclusively from the home office may qualify for the deduction. The key is that the income must be generated from the home office.

A home office deduction is still possible, however, if the space is set aside exclusively to meet with clients or customers, even if it is not always the principal place of business. The IRS uses an example of a lawyer who works 3 days in an office and 2 days at home in an office set up so that clients can come to his home. The last test for an unchallenged home office deduction is that it can be a separate structure, such as a studio or garage apartment, that is essential for running the business. For example, a floral shop owner who runs a greenhouse on her property would qualify under this rule.

In July 1997, responding to the concerns of small-business advocates, the U.S. Congress passed a tax bill that effectively overturned the 1993 Supreme Court ruling. The legislation redefined an individual's "principal place of business" to include a home office that meets the following two criteria: 1) it is used to conduct the management or administrative activities of a business; and 2) it is the only place in which the small-business owner conducts those management or administrative activities.

Even after meeting the criteria to qualify for the home office deduction, a myriad of different IRS rules apply to exactly what expenses can be deducted. These rules cover depreciation of the home, depreciation of equipment, and how to recover that depreciation if the home is sold. One important thing to note is that the monthly residential telephone charge cannot be deducted, even if most of the calls pertain to the business. However, long distance business-related calls can be deducted. The IRS updates its rules every year and individuals are advised to consult the latest changes on www.irs.gov or work with an accountant to stay within the law on home office deductions.

SETTING UP THE HOME OFFICE

Besides the IRS regulations, some municipal governments have zoning laws that restrict or license home offices. Originally designed to protect residential neighborhoods from becoming commercial zones, the zoning laws have sometimes been strictly interpreted to keep residents from conducting any sort of business from their home, even if it does not have a commercial impact on the rest of the neighborhood. Zoning laws and ordinances may affect such varied issues as parking for customers, access for deliveries, the number and types of employees permitted, and the use of signs or other forms of advertising. As a result, people wishing to set up home offices should check with their city's zoning office and licensing board for restrictions that may apply to the city, or even to their particular neighborhood.

If a home-based business is allowed at the site, the next step is to determine whether a home office is a workable option in the residence. For example, individuals interested in working from their homes must consider where the office should be located, how much it will cost to equip the area for business use, and what

adjustments will need to be made in living arrangements. While a home office offers an entrepreneur a number of tax and lifestyle benefits, it can also pose problems relating to limited space, isolation, household distractions, and security concerns.

Providing that a home office is feasible, the next step is to choose a location for the office. This location may be a spare bedroom, a den or study, a basement, an attic, a garage, a kitchen table, or a corner of a living room. When choosing a location for the home office, entrepreneurs should take into consideration their own working needs, the needs of clients who may visit, and the lifestyle needs of other members of their family. Though it is important for the home office to be located out of the mainstream of household activities, it also should be located in a desirable spot that will offer a pleasant working environment. The location of a home office is very significant. As Paul and Sarah Edwards noted in their book *Working from Home*, "almost every problem people have in working from home... is either aggravated or alleviated by where they put their offices." At a minimum, the location chosen must be large enough to contain a desk and chair, computer and phone equipment, storage and shelf space, and meeting space.

After a location has been determined, the work space must be clearly defined in order to eliminate potential distractions and create a good working atmosphere. "A peaceful marriage of home and office depends on establishing effective boundaries," according to Paul and Sarah Edwards. If no extra room is available in the home, it is possible to use room dividers or office partitions to define the office space creatively. It is vital that the space be well-lit, as lighting is a key contributor to productivity. In addition, if clients are expected to visit the home office, then ideally the office should be the only part of the home they see. Thus if clients will visit regularly, it might be helpful to have an outside entrance to the office space. If a more formal space to meet with clients is needed, the entrepreneur can use a coffee shop with Wi-Fi, rent office space for a day, or pay a monthly fee for a virtual office space that also provides mail, phone, and fax service.

Besides defining the work space, it is important for an individual working out of his or her home to establish specific working hours and stick to them. Home-based business owners should let family, friends, and neighbors know when they are available for socializing and when they will be working. Otherwise, family members may interrupt business activities, or friends and neighbors may impinge upon work time with visits or requests for favors or babysitting services.

After a home office space has been defined, that space needs to be outfitted with the necessary equipment to conduct business activities. In her book *Organizing Your Home Office for Success*, Lisa Kanarek recommended plotting the available office space on a grid in order to help select and organize appropriate furniture and equipment. It may also be helpful to think in terms of vertical space as well as horizontal. For example, it may be possible to install storage shelves above a desk, or to use office walls for bulletin boards, dry-erase boards, or planning calendars. The most important consideration in selecting office furniture, besides fit with the available space, is ergonomics. After all, an average person spends 75 percent of his or her day sitting at a desk. If that desk is the wrong height, or the chair is uncomfortable, the entrepreneur may experience back pain, fatigue, carpal tunnel syndrome, or a variety of other productivity-reducing problems. In addition, Kanarek noted that individuals shopping for home office furniture should avoid the temptation simply to seek out bargains. Poorly designed or constructed furniture will only need to be replaced, which may make it more expensive than selecting high-quality materials in the first place.

When establishing the physical layout of the home office space, it is also important to provide for storage of office supplies and business records. Most home-based businesses require at least one filing cabinet, shelves for books or manuals, and space to store paper and other office supplies. Home-based businesses also need to provide the means for customer contact. Experts recommend establishing a separate phone line for business contacts and equipping it with a reliable answering machine or voice mail system to handle calls during nonbusiness hours. A separate phone line, which can be answered in a professional manner, gives more credibility and control to the small-business owner and also acts to solidify boundaries between an individual's business and personal life. Some entrepreneurs choose not to use their home address in business dealings, either because of the image it projects or to protect their privacy and security. Home-based business owners may want to consider obtaining a post office box, renting an address from an office suite service, or using a mail receiving service as alternatives to using a home address for business correspondence.

Some of the most costly equipment commonly purchased for home offices includes computers, printers, and other technological devices. Business owners should determine what tasks they need to accomplish and then identify the best hardware or software solution. For example, a business that depends upon professional presentations may require a computer system capable of handling complex desktop publishing programs. The next step is to decide whether to buy the best computer model available to meet these needs or to spend less money for an older yet serviceable model. In general, experts recommend that entrepreneurs buy the best computer that they can afford. As technology costs decrease, the entrepreneur should evaluate new solutions that may meet their needs at a lower cost.

The majority of home offices purchase one or more peripheral devices such as a printer, scanner, copier, or fax machine depending on their needs. A multiple function machine encompassing several of these peripherals may be a good way for home offices to save space, although such machines generally entail a trade-off in the quality of any one function. Finally, a home office must also invest in software to perform work on the computer. New computers come with basic word processing, spreadsheet, and presentation software installed. More complex programs can be costly or only available for multiple users, thus out of reach for the home-business. A growing trend is Software as a Service (SaaS), which provides access to software programs that would be prohibitively expensive to home business. SaaS is accessed via Web-based programs or downloaded and available as a subscription or pay-as-you-go. The programs cover a wide variety of functions, from e-mail marketing to customer relationship management to accounting.

A home office can use technology readily available to operate with a professionalism once found only at larger companies. Options include:

- Voice over Internet Protocol (VoIP): Telephone calls are transported over the Internet, rather than telephone lines. This dramatically lowers the call cost, especially for international phone calls. VoIP provides a home office with services previously exclusively used by larger businesses, such as toll-free numbers, multiple local numbers, call conferencing and bridges, and a custom voice mail menu.

The most versatile option for a home business is a VoIP phone that connects directly to the Internet via Wi-Fi or Ethernet and requires a paid service plan. The other common VoIP option is software to route calls through the computer. One popular program, Skype, offers free calls to other Skype users or low-cost calls outside its network.

- Virtual Assistants: A virtual assistant (VA) provides administrative help or more skilled labor on defined tasks such as Web maintenance or customer support, usually from the VA's home via phone, fax, and email.
- Web conferencing: Use of the Internet to conduct live meetings, seminars, or sales pitches with multiple participants. This also allows sharing of desktops, videos, or slide presentations. There are a number of companies that compete in this space and provide the home business owner with access to remote clients.

Small-business owners should investigate the latest and best technology in these and newer areas that fit their business needs. They should also research the reliability of the service providers and when possible ask other small businesses for referrals. Regardless of the provider or technology, it is important to ensure that the Internet connection is secure and that data is backed up by hard drive or through an Internet subscription service such as Carbonite.

For the entrepreneur whose business is at the home office stage, but who craves the social interaction of a more traditional workplace, office-sharing is an alternative that keeps overhead low while providing a social atmosphere. Also called co-working, this type of office plan charges a monthly or annual fee for unlimited access to a co-working building or floor. The space is usually open and designed for social interaction, the technology is newly installed, and private rooms are available for client meetings.

Finally, individuals investing in a home office often need to make significant changes in their insurance coverage to ensure that their business is protected. For example, fire and theft coverage must be expanded to include business equipment, and liability coverage needs to include customers, vendors, and delivery persons visiting the premises. Depending on the type of home-based business, additional coverage may be needed to protect against business interruption, product or workmanship liability, and business use of a vehicle.

HOME-BASED BUSINESS

A home-based business is any enterprise for which the principal administrative and managerial activities take place within an individual's personal residence. People start home-based business ventures for a wide variety of reasons. For example, some people are forced to leave the corporate world as a result of downsizing or early retirement, while others leave voluntarily out of a desire to be their own boss, to avoid the hassles associated with commuting, or to facilitate caring for children or elderly relatives. Whatever the reason, home-based businesses have become a significant trend in recent years. Once viewed as a way for an unemployed person to make some money until a "real" job came along, home-based businesses are now taken much more seriously. Today, home-based businesses run the gamut from consulting firms and advertising agencies to photography studios and freelance writing services.

The main driving force behind the growth of home-based businesses is the increasing capability of computer and communications technology. Broadband Internet connections are widely available, allowing ease of communication with clients and colleagues from around the world. Smart phones with Internet and e-mail connection enable entrepreneurs to be connected to their business while away from their home office. Similarly, sophisticated software programs offering applications in desktop publishing, database management, financial management, and word processing enable one individual to do the work formerly handled by an entire support staff. Rapid improvements in technology have enabled large numbers of home-based business people to earn the same income they could at a regular jobs while also gaining a number of lifestyle benefits. Another important factor in the growth of home-based businesses is the transformation of the American economy from a product orientation to a service orientation. Since service businesses generally have no need to store inventory or run production machinery, they are less disruptive and more adaptable to a neighborhood environment.

According to a 2006 U.S. Census Bureau report, 49 percent of all U.S. business are home-based. Running a business out of the home offers a number of advantages, including time savings, control over working hours and conditions, independence, and flexibility. Starting a home-based business is also considerably cheaper than starting a business in rented facilities. In addition to saving money on overhead expenses, commuting costs, and wardrobe expenditures, many home-based business owners can deduct a portion of their rent or mortgage interest from their personal income taxes.

There are also several disadvantages to home-based businesses, however, including uncertain income, reduced benefits, isolation, and distractions. In addition, home-based business owners, like other self-employed individuals, must be able to handle all sorts of business-related tasks, like bookkeeping, billing, marketing and sales, and tax compliance. Still, home-based businesses do tend to be more successful than other types of small business ventures. According to the editors of *Income Opportunities* magazine in their *Home Business Handbook*, only 20 to 25 percent of home-based businesses fail within 5 years, compared to a failure rate of over 50 percent for all small business ventures. Several organizations are available to assist people in forming home-based businesses, including the Business.gov site (www.business.gov/start/home-based), the Association of Work at Home Women (www.awhw.org), and the National Association for the Self-Employed (www.nase.org).

REQUIREMENTS FOR A SUCCESSFUL HOME BASED BUSINESS

A natural focus for many home-based business owners is an area they are passionate about and enjoy doing. Certain personality traits help the home-based entrepreneur succeed: independence, self-sufficiency, and flexibility. Other keys to success include being able to sell oneself and the business, and staying on top of personal and business finances. Since it is often difficult to associate being at home with working, home-based businesspeople must be able to maintain boundaries between their personal and professional lives. In addition, they require a great deal of self-discipline to overcome the sense of isolation, frequent distractions, and lack of motivation and concentration that commonly affect those working from home.

Formal planning can help ease the transition for a person starting a home-based business. By being aware of the potential pitfalls and creating a plan to overcome them, a home-based business owner can significantly increase his or her chances for success. The main planning tool recommended by experts is a business plan. A formal business plan, which is generally created in anticipation of starting a new business venture and can be revised as the business evolves, includes a description of the business; a statement of purpose; the business model, or how the venture will make money; information about the business's structure, organization, and management; a marketing plan; research into competing products or services; and a financial plan.

The process of gathering information and writing a business plan helps the entrepreneur take an objective, critical look at the business idea and its chances for success. A home-based business may be related to an individual's previous occupation but may also be based upon a hobby or the discovery of a unique business opportunity. In any case, the idea should be evaluated with an eye toward market potential and competition. A common pitfall of home-based entrepreneurs is underpricing services or goods because the business has lower overhead than a traditional

office. The total cost of a product, project, or service should be considered carefully before a price is set, taking into account factors such as health and business insurance, travel time, and the unique skills or contacts the entrepreneur has built over their career.

Once the business is up and running, the business plan sets forth goals and standards for management and serves as an operational tool to measure progress. Although there are many ways to start a home-based business including "moonlighting" while employed full time, working part-time for an employer and part-time at home, and just taking the plunge planning is important to all of them.

After creating a plan for the home-based business, the entrepreneur is ready to put the plan into action. One of the earliest steps involves preparing family members and enlisting their support. The loss of a reliable source of income may cause some anxiety or resentment among other members of the household. In addition, the creation of a home office will probably necessitate changes in family members' schedules or lifestyle. Dealing with such issues in advance can help avoid problems later. Another important step is to establish an area of the home as a business office. The most important consideration when choosing a location for a home office is that it allow the entrepreneur room to work comfortably and efficiently without too many distractions. The office should be as physically separate from the living area of the home as possible and should project an air of professionalism to potential visitors as well as to its occupant.

Other steps in the process of forming a home-based business include selecting a legal structure, filing a fictitious name or "doing business as" statement, and obtaining any needed permits or licenses. The entrepreneur should also evaluate the risks associated with the business venture and make any necessary arrangements for health, life, liability, property, or business interruption insurance. Since it is sometimes difficult for a home-based business to be taken seriously by customers or creditors, it may be helpful to communicate a professional image through stationery and business cards, a separate phone line answered with a formal greeting, and distinct working hours.

OVERCOMING COMMON PROBLEMS

Many people start home-based businesses in the hopes of setting their own work schedules and increasing their free time, but few people realize the careful planning that is required to achieve these goals. In fact, time management is one of the more important challenges a home-based business owner may face. Experts recommend that home-based business owners set up a workable schedule immediately upon starting their ventures in order to establish good habits. In many cases, the limited amount of work available in the early stages of a home-based business's existence may cause the entrepreneur to establish a pattern of running personal errands or watching television during work time. In this way, lethargy and unproductive use of time become ingrained and perpetuate themselves. Instead, downtime that has been reserved for working should be used to market and promote the business.

Once the home-based business gets off the ground, many entrepreneurs tend to go to the opposite extreme and overcommit themselves. In their need to attract clients, they become uncomfortable turning down work. But unlike people who work for a large employer in an outside office, home-based business owners cannot leave their work behind and go home, because home is where their work is. As a result, some entrepreneurs work too many hours and abandon their personal lives, resulting in stress and burnout. Instead, experts recommend that home-based business owners set up realistic work schedules in order to reinforce the boundaries between their personal and business lives. It may be helpful to establish the following day's schedule the previous afternoon and prioritize the activities. The schedule should be realistic and allow for inevitable interruptions. Some experts claim that an important factor in successful time management for home-based business owners is arising early in the morning to get a jump start on work. Others stress the importance of dressing comfortably yet professionally in order to establish a positive psychological state for working. Although these methods do not apply to everyone, it is important for home-based businesspeople to find a pattern that maximizes their productivity and stick with it.

Another common problem faced by those who work from home is isolation. In a standard business environment, people are dealing with co-workers constantly, as well as the noise of ringing phones and running machines. There are also meetings, breaks, and lunch hours that serve to break up the day and provide opportunities for socializing. This contact with other people provides a built-in system of motivation to at least appear busy at work. In contrast, many people who start a home-based business are faced with nothing but a quiet, empty house. Some find it difficult to motivate themselves and succumb to boredom and loneliness. But such isolation does have a positive side: working at home increases productivity by an average of 20 percent, so home-based business owners can often get more work done in less time. Planning is necessary to overcome the negative effects of isolation, however. Experts recommend that home-based business owners schedule interaction with other people on a regular basis, using such means as business meals, outside meetings and appointments, clubs and associations, and networking.

Yet another common problem encountered by home-based business people is frequent distractions that

reduce productivity. In fact, distractions are everywhere for people who work from home. When faced with a difficult work task, it sometimes seems far preferable to run the vacuum, clean out a closet, walk the dog, have a snack, take a nap, raid the refrigerator, pull some weeds in the garden, or do any of the myriad other things that need doing around a normal household. In addition, people who work from home lack the motivation that peer pressure can provide in a regular office. They also face spouses and children who demand time and attention, as well as friends and neighbors who call to chat or stop by to ask favors.

To be successful, home-based business owners need to be aware that time-stealing temptations exist and take steps to counteract digressions before they turn into habits. If distractions seem overwhelming, the first step is to analyze the situation. If the problem lies with household chores, eating, or the television, the solution may be to get the distractions out of sight. If the problem involves family members or friends and neighbors, it may be necessary to have a frank discussion or family meeting concerning work time and free time. Options for resolving people conflicts include moving the office to another part of the house, hiring a babysitter or arranging for day care, or not taking personal calls during business hours. Ideally, an entrepreneur should set up a daily work schedule, try to work diligently for several hours at a time, and then take a break as a reward.

FINANCIAL AND TAX ASPECTS

Like other forms of self-employment, home-based businesses face a number of challenges relating to financial management and tax compliance. Part of the business plan that is prepared prior to forming a home-based business is a financial plan detailing how much it will cost to begin the new venture and keep it running. After the business has been established, it is vital that the entrepreneur set up a good bookkeeping system to manage cash flow and ensure compliance with tax laws. Bookkeeping systems can range from the simple recording of income and expenses in spreadsheet software like Microsoft Excel to more complex, such as the software Quickbooks that can track multiple revenue and expense streams, invoices, and payroll. Experts also recommend that entrepreneurs set up a separate checking account for their home-based businesses in order to document business expenses more efficiently. Canceled checks, paid bills, invoices, sales slips, receipts, and other financial documentation should be kept on file in case of an audit. Another important aspect of financial planning for a home-based business is tracking working capital the difference between current assets (cash, accounts receivable, and inventory) and current liabilities (operating expenses, debts, and taxes) in order to maintain a realistic picture of where the business stands financially.

Taxes become significantly more complicated with a home-based business. Self-employed persons are allowed to deduct business-related expenses from their income taxes. These include wages paid to others, the cost of professional services, shipping and postage charges, advertising costs, the cost of office supplies and equipment, professional dues and publications, insurance premiums, automobile expenses, and some entertainment and travel costs.However, they are also required to pay self-employment taxes. People who work from their homes may be eligible for another tax deduction known as a home office deduction. The home office deduction allows individuals who meet certain criteria to deduct a portion of mortgage interest or rent, depreciation of the space used as an office, utility bills, home insurance costs, and cleaning, repairs, and security costs from their federal income taxes. Although the Internal Revenue Service (IRS) has set strict regulations about who qualifies for the deduction, about 1.6 million people claim the deduction each year. According to Gloria Gibbs Marullo in an article for *Nation's Business*, the savings can be considerable: a sole proprietor living in a $150,000 home stands to save about $2,500 in actual taxes annually.

In general, a home office deduction is allowed if the home office meets at least one of three criteria: 1) the home office is the principal place of business; 2) the home office is the place where the business owner meets with clients and customers as part of the normal business day; or 3) the place of business is a separate structure on the property but is not attached to the house or residence. The deduction is figured on the size of the home office as a percentage of the total house or residence. For example, if the total house size is 2,400 square feet and the home office is 240 square feet, 10 percent of the total house is considered used for business. That would allow the business owner to deduct 10 percent of the household's costs for electricity, real estate taxes, mortgage interest, insurance, and repairs as business expenses.

For many years, the IRS has followed a very strict interpretation of "principal place of business," which prevented some self-employed persons such as an accountant who maintained a home office but also spent a great deal of time visiting clients from claiming the deduction. But in July 1997, responding to the concerns of small-business advocates, the U.S. Congress passed a tax bill that redefined an individual's "principal place of business" to include a home office that meets the following two criteria: 1) it is used to conduct the management or administrative activities of a business; and 2) it is the only place in which the small-business owner conducts those management or administrative activities.

The IRS updates its rules every year and individuals are advised to consult the latest changes on www.irs.gov or work with an accountant to stay within the law on

home office deductions. As home-based businesses continue to play an important role in our economy, institutions and regulations will adapt to working well with these businesses and their unique support requirements.

HOTELING

Hoteling is a term used to describe the practice of providing office space to employees on an as-needed basis instead of by means of a permanent workspace, such as a cubicle or office. Hoteling, often referred to as office hoteling, is made possible with modern office and communication technologies. Computer networks, laptops and other mobile devices, as well as sophisticated wireless communications systems all make moving a person and his or her productive tools from one place to another relatively easy. This, in turn, allows the employer to make more efficient use of office space and thus reduce costs. Hoteling systems tend to work particularly well for organizations whose employees travel frequently.

Hoteling was adopted by many consulting and accounting firms in the late 1990s. It had also found proponents among companies with traveling sales forces or large numbers of telecommuters. Basically, hoteling allows employees who spend a great deal of time off-site to return to the home office and plug a laptop computer into a cubicle for a few hours. Hoteling is reservation-based unassigned seating, and is similar to "free addressing" or "hot desking," in which employees occupy whatever desks or offices are available. Another twenty-first-century trend is "reverse hoteling," which requires employees to register their office space as free when they are out of town or on vacation.

All of these strategies make innovative use of office space in order to accommodate the flexible schedules and work habits of employees. "Today's worker spends less and less time in the office, using it chiefly to touch base or to interact for short periods with team members," Sandra M. Paret explained in the *Dallas Business Journal*. "In a traditional office, up to 50 percent of desks, offices, and workstations are unused at any given point on a typical workday."

THE ALTERNATIVE OFFICING TREND

Hoteling is part of a larger trend known as alternative officing (AO), which encompasses a variety of methods of redesigning office space to reduce costs, improve productivity, adapt to new technology, and accommodate the increased mobility of employees. More and more companies are changing to open office environments with informal meeting rooms, snack areas, project rooms, and focus rooms for individual work. These innovative office designs are intended to foster teamwork and interaction among employees. In turn, alternative officing applies and appeals to employees outside the traditional high-travel jobs of sales and consulting: the category now includes mobile employees who work on the road, from home, or even from the local coffee shop.

While hoteling may save on office space costs, it poses logistical and technological challenges. Work stations should be designed to accommodate multiple employees at different times. Scheduling software must be implemented so companies can plan workspace usage on a daily basis and employees can reserve space from home, on the road, or at the office. There are multiple software solutions for hoteling space management. Telecommunication systems must also have more flexibility, such as floating extensions that can be accessed by the employee at any phone or away from the office.

Small-business owners who consider redesigning their office space to take advantage of hoteling or other alternative officing setups should first identify their goals. Some companies undertake office redesigns in order to improve teamwork and collaboration, while others need to create private areas to improve employee concentration. It may be helpful to conduct a formal workflow analysis or usage pattern study to determine the best use of space.

The most common employee complaints about alternative officing center on a lack of privacy and an office to personalize. Some employees may even feel threatened by the constant state of flux and lack of stability. If employees who need a hoteling space are unable to receive one, they may create unnecessary "just in case" reservations. Other

employees may take over attractive conference rooms or offices without reservations. Both actions undermine the effectiveness of the system and employee morale. Successful implementation of the hoteling system requires more than just the right software. Employees should be treated with respect when reserving rooms, and the system should be monitored in real time to ensure its effectiveness.

It is important to consider the culture of the organization before undertaking an office redesign. Employees at some companies may like the hierarchy provided by a traditional office setting, in which people's status is tied to their office space. Alternative officing, on the other hand, requires people to operate in nonterritorial ways and respect shared space. Small-business owners should investigate a variety of possible arrangements and make sure employees support the plan before making radical changes. "An office redesign can do a lot more than provide a facelift," Katherine C. Berg wrote in the *Dallas Business Journal.* "It can spark productivity, improve employee morale, and ultimately boost the bottom line."

HUBZONE EMPOWERMENT CONTRACTING PROGRAM

The HUBZone Empowerment Contracting Program is an initiative of the U.S. Small Business Administration (SBA) that gives preference in securing federal contracts to small businesses located in "historically underutilized business zones," or HUBZones. There are three types of HUBZones: urban areas as defined by U.S. census figures; "nonmetropolitan counties" or rural areas that meet certain median household income parameters; and Native American lands (lands on federally recognized Indian reservations). As of 2008, there were nearly 14,000 HUBZones in the United States.

The HUBZone program, which was established under the Small Business Reauthorization Act of 1997, provides access to federal contracting opportunities for small businesses that maintain a principal office in one of these areas and employ people who live there. It is intended to improve the economic status of distressed communities by encouraging the growth and long-term viability of small businesses, thus helping to create jobs and attract private investment.

As of October 1, 2000, all U.S. government agencies were required to give preference to HUBZone businesses when awarding federal contracts. The goal of the program was to award 2 percent of federal contracts to HUBZone businesses in 2001, 2.5 percent in 2002, and 3 percent in each year thereafter. In 2000 Federal agencies reported that they had awarded only $663 million in contracts to HUBZone companies, a number that represented 0.33 percent of all primer contracts. This was far short of the goal set for that year. In 2001 the budget for the program was cut sharply and the Small Business Administration (SBA) was forced to maintain the program with limited funds. The program has been maintained, and as of 2009, $8.2 million of the SBA's budget was earmarked for the HUBZone Program.

The SBA is responsible for determining which businesses are eligible for HUBZone contracts, maintaining a list of qualified small businesses, and reporting to Congress on the results of the program. As of 2008, 13,000 firms were HUBZone-certified. To qualify as a HUBZone contractor, a small business must meet the following criteria: it must be a small business according to SBA size standards; it must have a principal office located in a HUBZone; it must be owned or controlled by U.S. citizens; and at least 35 percent of its employees must be HUBZone residents. If any of a firm's locations meet these standards, then the entire company is eligible for HUBZone status. However, in 2008 questions were raised about how closely the SBA checks to ensure that all firms receiving certification for HUBZone status meet these basic requirements. In a 2008 House Committee on Small Business hearing, it was revealed that in a random study of HUBZone firm applications in September 2007, SBA sought out documentation and proof on only 36 percent of firm applications. In only one instance during that month did SBA representatives visit a firm site to confirm that the firm qualified for

HUBZone firm status. Further, the hearing found that the SBA relied heavily on self-reporting from HUBZone-certified firms and only conducted reviews of firm documentation on about 5 percent of HUBZone-certified firms annually.

HUBZone contracts are awarded in three principal ways. When more than one qualified HUBZone business is expected to submit a bid, the contract is awarded competitively at a fair market price. If only one qualified HUBZone business submits a bid, that business can receive a sole source contract at a fair price. In some situations, contracts are awarded via a full and open competition in which qualified HUBZone businesses receive a preference if their bid is less than 10 percent higher than those of other bidders.

In addition to preferences in securing federal contracts, HUBZone businesses also can qualify for higher SBA-guaranteed surety bonds on contract bids. In cases where the HUBZone is also designated as a federal Empowerment Zone/Enterprise Community, small businesses may also qualify for other tax credits and deductions. More about the HUBZone program can be found on the Small Business Administration Web site at www.sba.gov/hubzone.

A Senate bill introduced in early 2010 aimed to reform the HUBZone, specifically by granting the SBA more control over punishing those who commit fraud under the HUBZone program. Under the new law, the SBA would be required to create anti-fraud policies which would ensure that only companies eligible to take part in the HUBZone program do so. The bill would also require companies to ensure that companies in the HUBZone program hire local workers and adhere to other HUBZone program rules. The bill, sponsored by Senators Olympia J. Snowe (R-Maine), Mary L. Landrieu (D-La.), Kit Bond (R-Mo.), and Senator Jeff Merkley (D-Ore.), came after the Government Accountability Office (GAO) released two reports between 2008 and 2009, criticizing some of the ways that the SBA managed the HUBZone program. In the reports, the GAO alleged that the SBA did not adequately screen, manage, or assess companies applying for the HUBZone program, leaving the program open to fraud. Concerns about application times and backlogs were also cited by the GAO, and the Senate bill addresses this by suggesting ways to decrease backlogs and application times.

HUMAN RESOURCE MANAGEMENT

Human Resource Management (HRM) is the term used to describe formal systems devised for the management of people within an organization. The responsibilities of a human resource manager fall into three major areas: staffing, employee compensation and benefits, and defining/designing work. Essentially, the purpose of HRM is to maximize the productivity of an organization by optimizing the effectiveness of its employees. This mandate is unlikely to change in any fundamental way, despite the ever-increasing pace of change in the business world. As Edward L. Gubman observed in the *Journal of Business Strategy*, "the basic mission of human resources will always be to acquire, develop, and retain talent; align the workforce with the business; and be an excellent contributor to the business. Those three challenges will never change."

The importance of HRM extends to small businesses, for while they do not generally have the same volume of human resources requirements as do larger organizations, they too face personnel management issues that can have a decisive impact on business health. As Irving Burstiner commented in *The Small Business Handbook*, "Hiring the right people and training them well can often mean the difference between scratching out the barest of livelihoods and steady business growth . . . . Personnel problems do not discriminate between small and big business. You find them in all businesses, regardless of size."

PRINCIPLES OF HUMAN RESOURCE MANAGEMENT

The paramount HRM principle is a simple recognition that human resources are the most important assets of an organization; a business cannot be successful without effectively managing this resource. Another important principle, articulated by Michael Armstrong in his book *A Handbook of Human Resource Management*, is that business success "is most likely to be achieved if the personnel policies and procedures of the enterprise are closely linked with, and make a major contribution to, the achievement of corporate objectives and strategic plans." A third guiding principle, similar in scope, holds that it is the HR's responsibility to find, secure, guide, and develop employees whose talents and desires are compatible with the operating needs and future goals of the company.

Other HRM factors that shape corporate culture whether by encouraging integration and cooperation across the company, instituting quantitative performance measurements, or taking some other action are also commonly cited as key components in business success.

POSITION AND STRUCTURE OF HUMAN RESOURCE MANAGEMENT

Human resource department responsibilities can be subdivided into three areas: individual, organizational, and career. Individual management entails helping employees identify their strengths and weaknesses; correct their shortcomings; and make their best contribution to the enterprise. These duties are carried out through a variety of activities such as performance reviews, training, and testing. Organizational development, meanwhile, focuses on fostering a successful system that maximizes human (and other) resources as part of larger business strategies. This important duty also includes the creation and maintenance of a change program, which allows the organization to respond to evolving outside and internal influences. Finally, there is the responsibility of managing career development. This entails matching individuals with the most suitable jobs and career paths within the organization.

Human resource management functions are ideally positioned near the theoretic center of the organization, with access to all areas of the business. Since the HRM department or manager is charged with managing the productivity and development of workers at all levels, human resource personnel should have access to and the support of key decision makers. In addition, the HRM department should be situated in such a way that it is able to communicate effectively with all areas of the company.

HUMAN RESOURCE MANAGEMENT KEY RESPONSIBILITIES

Human resource management is concerned with the development of both individuals and the organization in which they operate. HRM, then, is engaged not only in securing and developing the talents of individual workers, but also in implementing programs that enhance communication and cooperation between those individual workers in order to nurture organizational development.

The primary responsibilities associated with human resource management include job analysis and staffing, organization and utilization of work force, measurement and appraisal of work force performance, implementation of reward systems for employees, professional development of workers, and maintenance of work force.

Job analysis consists of determining, often with the help of other company areas, the nature and responsibilities of various employment positions. This can encompass determination of the skills and experiences necessary to adequately perform in a position, identification of job and industry trends, and anticipation of future employment levels and skill requirements. "Job analysis is the cornerstone of HRM practice because it provides valid information about jobs that is used to hire and promote people, establish wages, determine training needs, and make other important HRM decisions," stated Thomas S. Bateman and Carl P. Zeithaml in *Management: Function and Strategy*. Staffing, meanwhile, is the actual process of managing the flow of personnel into, within (through transfers and promotions), and out of an organization. Once the recruiting part of the staffing process has been completed, selection is accomplished through job postings, interviews, reference checks, testing, and other tools.

Organization, utilization, and maintenance of a company's work force is another key function of HRM. This involves designing an organizational framework that makes maximum use of an enterprise's human resources and establishing systems of communication that help the organization operate in a unified manner. Other responsibilities in this area include safety and health and worker-management relations. Human resource maintenance activities related to safety and health usually entail compliance with federal laws that protect employees from hazards in the workplace. These regulations are handed down from several federal agencies, including the Occupational Safety and Health Administration (OSHA) and the Environmental Protection Agency (EPA), and various state agencies, which implement laws in the realms of worker's compensation, employee protection, and other areas. Maintenance tasks related to worker-management relations primarily entail working with labor unions; handling grievances related to misconduct, such as theft or sexual harassment; and

devising communication systems to foster cooperation and a shared sense of mission among employees.

Performance appraisal is the practice of assessing employee job performance and providing feedback to those employees about both positive and negative aspects of their performance. Performance measurements are very important both for the organization and the individual, for they are the primary data used in determining salary increases, promotions, and, in the case of workers who perform unsatisfactorily, dismissal.

Reward systems are typically managed by HR areas as well. This aspect of human resource management is very important, for it is the mechanism by which organizations provide their workers with rewards for past achievements and incentives for high performance in the future. It is also the mechanism by which organizations address problems within their work force, through institution of disciplinary measures.

Employee development and training is another vital responsibility of HR personnel. HR is responsible for researching an organization's training needs, and for initiating and evaluating employee development programs designed to address those needs. These training programs can range from orientation programs, which are designed to acclimate new hires to the company, to ambitious education programs intended to familiarize workers with a new software system.

"After getting the right talent into the organization," wrote Gubman, "the second traditional challenge to human resources is to align the workforce with the business to constantly build the capacity of the workforce to execute the business plan." This is done through performance appraisals, training, and other activities. In the realm of performance appraisal, HRM professionals must devise uniform appraisal standards, develop review techniques, train managers to administer the appraisals, and then evaluate and follow up on the effectiveness of performance reviews. They must also tie the appraisal process into compensation and incentive strategies, and work to ensure that federal regulations are observed.

Responsibilities associated with training and development activities, meanwhile, include the determination, design, execution, and analysis of educational programs. The HRM professional should be aware of the fundamentals of learning and motivation, and must carefully design and monitor training and development programs that benefit the overall organization as well as the individual. The importance of this aspect of a business's operation can hardly be overstated. As Gary Roberts, Gary Seldon, and Carlotta Roberts indicated in *Human Resources Management*, "the quality of employees and their development through training and education are major factors in determining long-term profitability of a small business.... Research has shown specific benefits that a small business receives from training and developing its workers, including: increased productivity; reduced employee turnover; increased efficiency resulting in financial gains; [and] decreased need for supervision."

Meaningful contributions to business processes are increasingly recognized as within the purview of active human resource management practices. Of course, human resource managers have always contributed to overall business processes in certain respects by disseminating guidelines for and monitoring employee behavior, for instance, or ensuring that the organization is obeying worker-related regulatory guidelines. Now, increasing numbers of businesses are incorporating human resource managers into other business processes as well. In the past, human resource managers were cast in a support role in which their thoughts on cost/benefit justifications and other operational aspects of the business were rarely solicited. But as John Johnston noted in his article "Time to Rebuild Human Resources," the changing character of business structures and the marketplace are making it increasingly necessary for business owners and executives to pay greater attention to the human resource aspects of operation: "Tasks that were once neatly slotted into well-defined and narrow job descriptions have given way to broad job descriptions or role definitions. In some cases, completely new work relationships have developed; telecommuting, permanent part-time roles and outsourcing major non-strategic functions are becoming more frequent." All of these changes, which human resource managers are heavily involved in, are important factors in shaping business performance.

THE CHANGING FIELD OF HUMAN RESOURCE MANAGEMENT

Several business trends have had a significant impact on the broad field of HRM. Chief among them are new technologies. Telecommuting, for instance, has become a very popular option for many workers, and HRM professionals have had to develop new guidelines for this emerging subset of employees. In addition, Internet use now poses an HR dilemma. Should a company monitor which Web sites employees visit and take action against those who visit nonapproved sites or shop online at work? Does an employee's social media and blog postings essentially their nonwork life provide grounds for termination? Companies are struggling to answer how employees' online behavior affects their promotion or termination.

Changes in organizational structure have also influenced the changing face of human resource management. Continued erosion in manufacturing industries in the United States and other nations, coupled with the rise in service industries in those countries, have changed the

workplace, as has the decline in union representation in many industries (these two trends, in fact, are commonly viewed as interrelated). In addition, many companies have scrapped or adjusted their traditional, hierarchical organizational structures in favor of flatter management structures. HRM experts note that this shift in responsibility brought with it a need to reassess job descriptions, appraisal systems, and other elements of personnel management.

A third change factor has been accelerating market globalization. This phenomenon has served to increase competition for both customers and jobs. The latter development enabled some businesses to demand higher performances from their employees while holding the line on compensation. Other factors that have changed the nature of HRM in recent years include new management and operational theories like Total Quality Management (TQM), rapidly changing demographics, and changes in health insurance and federal and state employment legislation.

A recent trend is outsourcing all or part of human resource functions. A business may outsource because it is usually less expensive to pay a vendor a set fee rather than an employee's salary and benefits. Companies also outsource specific HRM needs when in-house expertise is lacking, such as training, recruiting, or managing benefit plans.

SMALL BUSINESS AND HUMAN RESOURCE MANAGEMENT

A small business's human resource management needs are not of the same size or complexity of those of a large firm. Nonetheless, even a business that carries only two or three employees faces important personnel management issues. Indeed, the stakes are very high in the world of small business when it comes to employee recruitment and management.

No business wants an employee who is lazy or incompetent or dishonest. But a small business with a work force of half a dozen people will be hurt far more by such an employee than will a company with a work force that numbers in the hundreds (or thousands). Nonetheless, "most small business employers have no formal training in how to make hiring decisions," noted Jill A. Rossiter in *Human Resources: Mastering Your Small Business.* "Most have no real sense of the time it takes nor the costs involved. All they know is that they need help in the form of a 'good' sales manager, a 'good' secretary, a 'good' welder, and so on. And they know they need someone they can work with, who is willing to put in the time to learn the business and do the job. It sounds simple, but it isn't."

Before hiring a new employee, the small-business owner should assess the status of the organization itself. Are current employees being utilized appropriately? Are current production methods effective? Can the needs of the business be met through an arrangement with an outside contractor or some other means? Is the owner spending his or her time appropriately? As Rossiter noted, "any personnel change should be considered an opportunity for rethinking your organizational structure."

Small businesses also need to match the talents of prospective employees with the company's needs. Efforts to manage this can be accomplished in a much more effective fashion if the small-business owner devotes energy to defining the job and actively taking part in the recruitment process. But the human resource management task does not end with the creation of a detailed job description and the selection of a suitable employee. Indeed, the hiring process marks the beginning of HRM for the small-business owner.

Even the smallest business will benefit from documenting and implementing human resource policies that reflect the organization's culture and state and federal employment laws. "To hold problems to a minimum, specific personnel policies should be established as early as possible," wrote Burstiner. "These become useful guides in all areas: recruitment and selection, compensation plan and employee benefits, training, promotions and terminations, and the like." Depending on the nature of the business enterprise (and the owner's own comfort zone), the owner can even involve his employees in this endeavor. In any case, a carefully considered employee handbook or personnel manual can be an invaluable tool in ensuring that the small-business owner and his or her employees are on the same page. Moreover, a written record can lend a small business some protection in the event that its management or operating procedures are questioned in the legal arena.

Some small-business owners also need to consider training and other development needs in managing their employees. The need for such educational supplements can range dramatically. A bakery owner, for instance, may not need to devote much of his resources to employee training, but a firm that provides electrical wiring services to commercial clients may need to implement a system of continuing education for its workers in order to remain viable.

Finally, the-small business owner needs to establish and maintain a productive working atmosphere for his or her workforce. Employees are far more likely to put in their best effort if they feel that they are treated fairly. The small-business owner who clearly communicates personal expectations and company goals, provides adequate compensation, offers opportunities for career advancement, anticipates workforce training and developmental needs, and provides meaningful feedback to his or her employees is far more likely to be successful than the owner who is neglectful in any of these areas.

HUMAN RESOURCE POLICIES

Human resource policies are the formal rules and guidelines that businesses put in place to hire, train, assess, and reward the members of their workforce. These policies, when organized and disseminated in an easily used form, can serve to preempt many misunderstandings between employees and employers about their rights and obligations in the business place. According to a 2009 paper by Kaifeng Jiang and colleagues in the *Academy of Management Proceedings*, human resource policies are specifically "employee-focused policies" which help in the decision making needed for human resources practices. Human resource policies also define what types of human resource processes, programs, and methods a company will use and therefore are important in defining the overall culture of a company.

It is tempting, as a new small-business owner, to focus on the concerns of the business at hand and put off the task of writing up a human resource policy. All business analysts and employment lawyers will advise a new business owner to get a policy down on paper, even if it is a simple one drafted from a boilerplate model. Having policies written is important so that it is clear to all what the policies are and that they are applied consistently and fairly across the organization. Moreover, when issues concerning employee rights and company policies come before federal and state courts, it is standard practice to assume that the company's human resource policies, whether written or verbal, are a part of an employment contract between the employee and the company. Without clearly written policies, the company is at a disadvantage.

Small businesses and especially business start-ups cannot afford to fritter away valuable time and resources on long-drawn-out policy disputes or potentially expensive lawsuits. Having a human resource policy in place from the start can help to avoid this situation. The business owner who takes the time to establish sound, comprehensive human resource policies will be far better equipped to succeed over the long run than the business owner who deals with each policy decision as it erupts. The latter ad hoc style is much more likely to produce inconsistent, uninformed, and legally questionable decisions that may cripple an otherwise prosperous business. For as many small-business consultants state, human resource policies that are inconsistently applied or based on faulty or incomplete data will almost inevitably result in declines in worker morale, deterioration in employee loyalty, and increased vulnerability to legal penalties. To help ensure that personnel management policies are applied fairly, business owners and consultants alike recommend that small business enterprises produce and maintain a written record of their HR policies and of instances in which those policies came into play.

SUBJECTS COVERED BY COMPANY HR POLICIES

Small-business owners should make sure that they address the following basic human resource issues when putting together their personnel policies:

- Equal Employment Opportunity policies
- Recruitment policies
- Employee selection policies
- Employee classifications
- Employee training

- Workdays, paydays, and pay advances
- Incentive and reward policies
- Overtime compensation
- Meal periods and break periods
- Payroll deductions
- Vacation policies
- Holidays
- Sick days and personal leave (for bereavement, jury duty, voting, etc.)
- Performance evaluations and salary increases
- Performance improvement
- Termination policies

According to Jiang and colleagues, a successful human recourse policy must also have some system of implementation. That is, there must be practices in place for actually implementing the ideas and ideals contained in the policy.

Templates that may be used to create a first human resource policy document are available from many sources. Two such sources that are reputable and offer information of a full range of employment issues are the National Human Resource Association and the Society for Human Resource Management (SHRM). Each maintains a Web site with information on the services it provides and pointers to other reputable service providers. Those Web sites are, respectively, www.humanresources.org and www.shrm.org. The SHRM may be especially useful in this regard, as its Web site includes a page dedicated to human resource policy templates. Companies, of course, can also choose to craft their own policies without the use of a template.

A broad spectrum of issues can be addressed in human resource policies, depending on the nature of the business in question. Examples of such issues include promotion policies; medical and dental benefits provided to employees; use of company equipment and resources (access to Internet, personal use of fax machines and telephones, etc.); continuity of policies; sexual harassment; substance abuse and drug testing; smoking; flextime and telecommuting policies; pension, profit-sharing, and retirement plans; reimbursement of employee expenses (for traveling expenses and other expenses associated with conducting company business); child or elder care; educational assistance; grievance procedures; employee privacy; dress codes; parking; mail and shipping; and sponsorship of recreational activities.

ADVANTAGES OF FORMAL HUMAN RESOURCE POLICIES

Small-business owners who have prepared and updated good personnel management policies have cited several important ways in which these policies contribute to the success of business enterprises. Many observers have pointed out that even the best policies will falter if the business owners or managers who are charged with administering those policies are careless or incompetent in doing so, but for those businesses that are able to administer their HR policies in an intelligent and consistent manner, benefits can accrue in several areas:

Communication with employees. A well-written and thoughtfully presented human resource policy manual can establish the tone that a new business person wishes to maintain within his or her business. Such a policy also serves to disseminate information about what employees may expect from the company as well as what the employer expects from the employees regarding work performance and behavior while on the job.

Communication with managers and supervisors. Formal policies can be helpful to managers and other supervisory personnel faced with hiring, promotion, and reward decisions concerning people who work under them.

Time Savings. Prudent and comprehensive human resource management policies can save companies significant amounts of management time that can then be spent on other business activities, such as new product development, competitive analysis, and marketing campaigns.

Curbing litigation. Members of the legal and business communities agree that organizations can do a lot to cut off legal threats from disgruntled current or ex-employees simply by creating and applying a fair and comprehensive set of personnel policies.

Human resource policies can also achieve multiple benefits at once. Alan Price, in his 2007 book, *Human Resource Management in a Business Context*, notes that all aspects of a human resource policy aim to accomplish three things. First, they aim to improve work conditions for individual employees. Second, they contribute to business goals, such as increased productivity or increased efficiency. Third, they can have a society-wide impact. For example, by defining the policies regarding a strike situation, these policies can affect an entire community. In many cases, Price and others argue, the same benefits are gleaned from the same policies. For example, a policy about incentives can help employees enjoy a better and more rewarding work environment and a company attract more qualified employees. Such a policy can also help a community by creating more resources and more cash flow within that community.

MAKING CHANGES TO EXISTING HR POLICIES

Companies typically have to make revisions to established HR policies on a regular basis, as the company grows and as the regulatory and business environments in which it operates evolve. When confronted with the challenge of

updating HR policies, however, it is important for small businesses to proceed cautiously. For example, if an employee asks the owner of a small business if he might telecommute from his home one day a week, the owner may view the request as a reasonable, relatively innocuous one. But even minor variations in personnel policy can have repercussions that extend far beyond the initially visible parameters of the request. If one employee is granted permission to work from home one day a week, will other employees ask for the same benefit? Does the employee expect the business to foot the bill for any aspect of the telecommuting endeavor, such as the purchase of a computer or modem? Do customers or vendors rely on the employee (or employees) to be in the office 5 days a week? Do other employees need that worker to be in the office to answer questions? Is the nature of the employee's workload such that he can take meaningful work home?

Price again makes a few recommendations regarding the writing or rewriting of human resource policies. Specifically, he recommends that business owners ask how their policies affect competence, commitment, cost-effectiveness, and congruence in a company. That is, he advises that businesses evaluate their human resource policies by contemplating how a current policy affects employee commitment to the company, how a policy enhances competence at a company (by attracting, training, or retaining skilled employees), and how a policy helps a company stay on budget. He also recommends that business owners evaluate the feasibility of a human resource policy by considering how the policy encourages cooperation, communication, and like action between different groups within a business (such as management and employees, for example).

Small-business owners need to recognize that changes in HR policy have the potential to impact, in one way or another, every person in the company, *including* the owner. Proposed changes should be examined carefully and in consultation with others in the organization who may recognize potential pitfalls that other managers, or the business owner herself, may have failed to detect. Once a change in policy is made, it should be disseminated widely and effectively so that everyone within the business is working from the same human resource policy at all times.

HUMAN RESOURCES MANAGEMENT AND THE LAW

The field of human resources management is greatly influenced and shaped by the state and federal laws governing employment issues. Indeed, regulations and laws govern all aspects of human resource management recruitment, placement, development, and compensation.

One of the most important pieces of HRM legislation, which affects all of the functional areas, is Title VII of the Civil Rights Act of 1964 and subsequent amendments, including the Civil Rights Act of 1991. These acts made illegal the discrimination against employees or potential recruits for reasons of race, color, religion, sex, and national origin. They force employers to follow, and often document, fairness practices related to hiring, training, pay, benefits, and virtually all other activities and responsibilities related to HRM. The 1964 act established the Equal Employment Opportunity Commission to enforce the act, and provides for civil penalties in the event of discrimination. The net result of the all-encompassing civil rights acts is that businesses must carefully design and document numerous procedures to ensure compliance, or face

potentially significant penalties. Another important piece of legislation that complements the civil rights laws mentioned above is the Equal Pay Act of 1963. This act forbids wage or salary discrimination based on sex and mandates equal pay for equal work, with few exceptions. Subsequent court rulings augmented the act by promoting the concept of comparable worth, or equal pay for unequal jobs of equal value or worth.

Other important laws that govern significant aspects of labor relations and human resource management include the following:

- Davis-Bacon Act of 1931. This law requires the payment of minimum wages to nonfederal employees.
- The Norris-Laguardia Act of 1932. This law protects the rights of unions to organize, and prohibits employers from forcing job applicants to promise not to join a union in exchange for employment.
- The Wagner Act of 1935. This law, also known as the National Labor Relations Act, is the main piece of legislation governing union/management relations, and is a chief source of regulation for HRM departments.
- Social Security Act of 1935. This law was enacted in order to protect the general welfare by establishing a variety of systems to assist the aging, the disabled, and children.
- The Walsh-Healy Public Contracts Act of 1936. This law was designed to ensure that employees working as contractors for the federal government would be compensated fairly.
- Fair Labor Standards Act (FLSA) of 1938. This important law mandated employer compliance with restrictions related to minimum wages, overtime provisions, child labor, and workplace safety. Since the law was crafted, what is considered payment under FLSA has been expanded, so that now many types of wages and earnings not previously considered covered under the FLSA are counted. For example, tips and other forms of remuneration are now considered as pay. Some states provide additional legal protection for employees, and in these cases the federal law does not preempt the state law, allowing employees to have this additional protection in place.
- Taft-Hartley Act of 1947. This law created provisions that severely restrict the activities and power of labor unions in the United States.
- Landrum-Griffin Act of 1959. Also known as the Labor-Management Reporting and Disclosure Act (LMRDA), the Landrum-Griffin Act deals primarily with the relationship between a union and its members. This law grants certain rights to union members and protects their interests by promoting democratic procedures within labor organizations.
- Age Discrimination in Employment Act of 1967. This legislation, which was strengthened by amendments in the early 1990s, essentially protects workers forty years of age and older from discrimination.
- Occupational Safety and Health Act of 1970. This act, which established the Occupational Safety and Health Administration, was designed to force employers to provide safe and healthy work environments and to make organizations liable for workers' safety. Today, thousands of regulations, backed by civil and criminal penalties, have been implemented in various industries to help ensure that employees are not subjected to unnecessarily hazardous working conditions.
- Family and Medical Leave Act of 1993. This law was passed to provide employees who qualify with up to 12 work weeks of unpaid, job-protected leave in a 12-month period for specified family and medical reasons. It also requires group health benefits to be maintained during the leave as if employees continued to work instead of taking leave. The act became effective on August 5, 1993, and applies to companies that employ fifty or more people.
- The Uniformed Services Employment and Reemployment Rights Act (USERRA) of 1994. This act was designed to protect members of the military, armed forces, and reserves. When these employees are away from work due to their duties, they are ensured reemployment or continued employment when their duties end and they return to civilian life.
- The Employee Retirement Income Security Act (ERISA) of 1974. This act concerns health benefits and retirement benefits. The act does not require employers to provide such benefits under law, but it does require employers who do provide such benefits to meet certain criteria.
- The Pension Protection Act (PPA) of 2006. This federal law regulated the retirement saving packages and plans offered by employers. The act offers tax incentives for employees which allow for a more rapid growth of retirement funds and allows employers to sign employees up for automatic retirement funds, among other provisions.

The network of state and federal laws that exist to regulate employment and labor relations is extensive. In many cases, rules only apply to firms with a specified minimum number of employees and thus do not regulate small companies.

However, other regulations apply to all employee/employer relationships, regardless of enterprise size. Companies of all sizes must therefore make an effort to stay abreast of legislative and regulatory developments in this area. Trade associations are a good source of news on new regulations, as is the Society of Human Resource Management (SHRM). The SHRM tracks developments at the state and federal level regarding human resource matters and makes much of this information available on its Web site, located at www.shrm.org.

For small businesses, it is important to distinguish between common practice, federal laws, and state laws. For example, while many companies provide sick leave, there is no federal law requiring employers to provide this benefit. In fact, according to Dana Shilling's 2008 book, *The Complete Guide To Human Resources and the Law*, about half the workforce does not have paid leave benefits. In some states, however, various forms of leave pay are required.

I

INCOME STATEMENTS

An income statement presents the results of a company's operations for a given period, such as a quarter or a year. The income statement presents a summary of the revenues, gains, expenses, losses, and net income or net loss of an entity for the period. This statement is similar to a moving picture of the entity's operations during the time period specified. Along with the balance sheet, the statement of cash flows, and the statement of changes in owners' equity, the income statement is one of the primary means of financial reporting. The key item listed on the income statement is the net income or loss. A company's net income for an accounting period is measured as follows: Net income = Revenues − Expenses + Gains − Losses. Income statements are sometimes referred to as operating statements, profit and loss statements (or P&Ls), statement of operations, or earnings statements. As this multitude of names suggests, income statements vary widely from company to company. Although they contain similar data, income statements from different companies will rarely look alike.

Within the income statement there is a wealth of information. A person knowledgeable about reading financial statements can find, in a company's income statement, information about its return on investment, risk, financial flexibility, and operating capabilities. Return on investment is a measure of a firm's overall performance. Risk is the uncertainty associated with the future of the enterprise. Financial flexibility is the firm's ability to adapt to problems and opportunities. Operating capability relates to the firm's ability to maintain a given level of operations.

According to the 2008 book, *Wow! I'm in Business: A Crash Course in Business Basics?*, by Richard Stim and Lisa Guerin, even small companies require income statements in order to determine accurate profits. Income statements allow companies to see which items, services, and sales generate what profit once costs are subtracted. For small businesses, income statements are important because they can help determine net income before taxes, which is vital when calculating taxes each year.

The income statement should reflect all items of profit and loss recognized during the accounting period, except for a few items that would be entered directly under retained earnings on the balance sheet, notably prior period adjustments (i.e., correction of errors). The main area of transaction that is not included in the income statement involves changes in the equity of owners. The following summary income statement illustrates the format under generally accepted accounting principles:

Revenues	$1,000,000
Expenses	$ (400,000)
Gains (losses) that are not extraordinary	$ (100,000)
Other gains (losses)	$ 20,000
Income from continuing operations	$ 520,000
Gains (losses) from discontinued operations	$ 75,000
Extraordinary gains (losses)	$ 20,000
Cum. effect of changes in accounting principles	$ 10,000
Net income	$ 625,000
Pre-tax earnings per share (2,000 shares)	$ 3.13

TERMS ON THE INCOME STATEMENT

The Financial Accounting Standards Board provides broad definitions of revenues, expenses, gains, losses, and other terms that appear on the income statement in its Statement of Concepts No. 6. Revenues are inflows or other enhancements of assets of an entity or settlement of its liabilities (or both) during a period, based on production and delivery of goods, provisions of services, and other activities that constitute the entity's major operations. Examples of revenues are sales revenue, interest revenue, and rent revenue.

Expenses are outflows or other uses of assets during a period as a result of delivering or producing goods, rendering services, or carrying out other activities that constitute the entity's ongoing major or central operations. Examples are cost of goods sold, operating expense, administrative expense, salaries expense, and interest expense. Depending on the type of business creating the income statement, some types of expense, such as the research and development expense, may be included as a subset of the expense or may be listed on their own. In this section of the income statement, expenses may be listed by type, amount, or whether the expenses are fixed or variable.

Gains are increases in owners' equity (net assets) from peripheral or incidental transactions of an entity and from all other transactions and events affecting the entity during the accounting period, except those that result from revenues or investments by owners. Examples are a gain on the sale of a building and a gain on the early retirement of long-term debt.

Losses are decreases in owners' equity (net assets) from peripheral or incidental transactions of an entity and from all other transactions and events affecting the entity during the accounting period except those that result from expenses or distributions to owners. Examples are losses on the sale of investments and losses from litigation.

Discontinued operations are those operations of an enterprise that have been sold, abandoned, or otherwise disposed. The results of continuing operations must be reported separately in the income statement from discontinued operations, and any gain or loss from the disposal of a segment must be reported along with the operating results of the discontinued separate major line of business or class of customer. Results from discontinued operations are reported net of income taxes.

Extraordinary gains or losses are material events and transactions that are both unusual in nature and infrequent in occurrence. Both of these criteria must be met for an item to be classified as an extraordinary gain or loss. To be considered unusual in nature, the underlying event or transaction should possess a high degree of abnormality and be clearly unrelated to, or only incidentally related to, the ordinary and typical activities of the entity, taking into account the environment in which the entity operates. To be considered infrequent in occurrence, the underlying event or transaction should be a type that would not reasonably be expected to recur in the foreseeable future, taking into account the environment in which the entity operates.

Extraordinary items could result if gains or losses were the direct result of any of the following events or circumstances: 1) a major casualty, such as an earthquake; 2) an expropriation of property by a foreign government; or 3) a prohibition under a new act or regulation. Extraordinary items are reported net of income taxes.

Gains and losses that are not extraordinary refer to material items that are unusual or infrequent, but not both. Such items must be disclosed separately and would be not be reported net of tax.

An **accounting change** refers to a change in accounting principle, accounting estimate, or reporting entity. Changes in accounting principles result when an accounting principle is adopted that is different from the one previously used. Changes in estimate involve revisions of estimates, such as the useful lives or residual value of depreciable assets, the loss for bad debts, and warranty costs. A change in reporting entity occurs when a company changes its composition from the prior period, as occurs when a new subsidiary is acquired.

Net income is the excess of all revenues and gains for a period over all expenses and losses of the period. Net loss is the excess of expenses and losses over revenues and gains for a period.

Generally accepted accounting principles require disclosing earnings per share amounts on the income statement of all public reporting entities. Earnings per share data provide a measure of the enterprise's management and past performance and enables users of financial statements to evaluate future prospects of the enterprise and assess dividend distributions to shareholders. Disclosure of earnings per share for effects of discontinued operations and extraordinary items is optional, but it is required for income from continuing operations, income before extraordinary items, cumulative effects of a change in accounting principles, and net income.

Primary earnings per share and fully diluted earnings per share may also be required. Primary earnings per share is a presentation based on the outstanding common shares and those securities that are in substance equivalent to common shares and have a diluting effect on earnings per share. Convertible bonds, convertible preferred stock, stock options, and warrants are examples of common stock equivalents. The fully diluted earnings per share presentation is a pro forma presentation that shows the dilution of earnings per share that would have occurred if all contingent issuances of common stock that would individually reduce earnings per share had taken place at the beginning of the period.

RECOGNIZING REVENUES AND EXPENSES

There are two methods of accounting for revenues and expenses. The key difference between them has to do with how each records transactions cash coming into and going out of the company.

Cash Basis. Accounting records and statements prepared using the cash basis recognize income and expenses according to real-time cash flow. Income is recorded upon receipt of funds, rather than based upon when it is actually earned; expenses are recorded as they are paid, rather than as they are actually incurred. Under this accounting method, therefore, it is possible to defer taxable income by delaying billing so that payment is not received in the current year. Likewise, it is possible to accelerate expenses by paying them as soon as the bills are received, in advance of the due date.

Accrual Basis. A company using an accrual basis for accounting recognizes both income and expenses at the time they are earned or incurred, regardless of when cash associated with those transactions changes hands. Under this system, revenue is recorded when it is earned rather than when payment is received; expenses are recorded when they are incurred rather than when payment is made. At any one point in time, a company's statements will look very different depending on which accounting method was used in their preparation. Over time, however, these differences diminish since all expenses and revenues are eventually recorded.

Companies using the generally preferred accrual method of accounting use what is called the revenue recognition principle. This Financial Accounting Standards Board (FASB) principle generally requires that revenue be recognized in the financial statements when: 1) realized or realizable; and 2) earned. Revenues are realized when products or other assets are exchanged for cash or claims to cash or when services are rendered. Revenues are realizable when assets received or held are readily convertible into cash or claims to cash. Revenues are considered earned when the entity has substantially accomplished what it must do to be entitled to the benefits represented by the revenues. Recognition through sales or the providing (performance) of services provides a uniform and reasonable test of realization. Limited exceptions to the basic revenue principle include recognizing revenue during production (on long-term construction contracts), at the completion of production (for many commodities), and subsequent to the sale at the time of cash collection (on installment sales).

In recognizing expenses, an effort must be made to match the costs with any revenues for which they are related. This is called the matching principle because expense and revenues are "matched." For example, matching, or associating, the cost of goods sold with the revenues that resulted directly and jointly from the same transaction is reasonable and practical. To recognize costs for which it is difficult to adopt some association with revenues, accountants use a rational and systematic allocation policy that assigns expenses to the periods during which the related assets are expected to provide benefits, such as depreciation, amortization, and insurance. Some costs are charged to the current period as expenses (or losses) merely because no future benefit is anticipated, no connection with revenue is apparent, or no allocation is rational and systematic under the circumstances that is, an immediate recognition principle.

The current operating concept of income would include only those value changes and events that are controllable by management and that are incurred in the current period from ordinary, normal, and recurring operations. Any unusual and nonrecurring items of income or loss would be recognized directly in the statement of retained earnings. Under this concept, investors are primarily interested in continuing income from operations.

The all-inclusive concept of income includes the total changes in equity recognized during a specific period, except for dividend distributions and capital transactions. Under this concept, unusual and nonrecurring income or loss items are part of the earning history of a company and should not be overlooked. Currently, the all-inclusive concept is generally recognized; however, certain material prior period adjustments should be reflected adjustments of the opening retained earnings balance.

FORMATS OF THE INCOME STATEMENT

According to a set of business standards known as Generally Accepted Accounting Principles (GAAP), income statements can have a variety of formats and presentations.The income statement can be prepared using either the single-step or the multiple-step format. The single-step format lists and totals all revenue and gain items at the beginning of the statement. All expense and loss items are then fixed and the total is deducted from the total revenue to give the net income. The multiple-step income statement presents operating revenue at the beginning of the statement and nonoperating gains, expenses, and losses near the end of the statement. However, various items of expenses are deducted throughout the statement at intermediate levels. The statement is arranged to show explicitly several important amounts, such as gross margin on sales, operating income, income before taxes, and net income. Extraordinary items, gains and losses, accounting changes, and discontinued operations are always shown separately at the bottom of the income statement ahead of net income, regardless of which format is used.

Each format of the income statement has its advantages. The advantage of the multiple-step income statement is that it explicitly displays important financial and managerial information that the user would have to calculate from a single-step income statement. The single-step format has the advantage of being relatively simple to prepare and to understand. In some cases, the single-step format is called the "condensed income statement" and the multiple-step income statement is referred to as a "full" or "complete" income statement. According to the 2008 book, *Intermediate Accounting?*, by Loren A. Nikolai, John D. Bazley, and Jefferson P. Jones, whether a business uses the full format or the condensed income statement, it is vital for the business to include all the financial information that might affect any decisions or opinions of readers outside the company.

A study published in the *International Journal of Management* in 2008 suggested that there might be a link between income statement format and the quality of the statement itself. Study authors, for example, found that the way earnings are classified and presented in an income statement may impact the accuracy and forecasts of earnings. The study also suggested that while bottom line earnings are kept the same, the flexibility of the income statement format allowed companies to change expenses from category to category, potentially creating a skewed picture of earnings. The study also found that multiple-step formats of income statements make it harder for readers to compare companies.

According to a 2008 article in the *Journal of Accountancy*, one major change that has occurred to the income statement since 2008 has been electronic. More businesses were relying on a language known as XBRL (eXtensible Business Reporting Language) to transmit income statement data. The attraction of XBRL for income statements is that it imbues each line of information with additional data, such as currency and status.

INCORPORATION

Corporate ownership is one of three broad categories defining the legal ownership structure of a business. The other two broad categories are sole proprietorship and partnership. In a sole proprietorship, the owner is personally liable for his or her business's debts and losses, there is little distinction made between personal and business income, and the business terminates upon the death of the owner or the owner's decision to change the legal character of the firm (by relinquishing part or all of his or her ownership in the enterprise). A partnership is merely joint ownership, and in terms of personal liability, is similar to a sole proprietorship. Sole proprietorships and partnerships are categories of business ownership that may be entered into and dissolved fairly easily. Incorporation, on the other hand, is a more complex process. Incorporating involves the creation of a legal entity that serves as a sort of "person" who can enter into and dissolve contracts; incur debts; initiate or be the recipient of legal action; and own, acquire, and sell goods and property. A corporation, which must be chartered by a state or the federal government, is recognized as having rights, privileges, assets, and liabilities distinct from those of its owners.

In the 1990s, a new form of business structure became available to those operating businesses in many states. By the year 2002 this form, the limited liability company (LLC) or limited liability partnership (LLP), was available in all fifty U.S. states and has become the business form of choice for newly formed businesses. These limited liability entities are the only forms of business structure other than the corporation in which the personal liability of the owners is limited. This feature accounts for their popularity. Also, LLCs can choose to be taxed as corporations, allowing them to enjoy some of the same tax advantages. According to Anthony Mancuso in his 2009 book, *Incorporate Your Business: A Legal Guide to Forming a Corporation in Your State*, LLCs were created to combine some of the most popular features of both the corporation and the sole

proprietorship or partnership. Essentially, LLC status permits business owners to pay business taxes on their personal income tax returns but offers some of the added protection that corporations can provide.

For the majority of small businesses, the relative simplicity and flexibility of the LLC makes it the better choice of business structure. However, there are situations in which incorporation may still be preferable. If a company wishes to do any of the following three things, incorporation is preferable to forming a limited liability company: 1) the company expects to have multiple investors or offer stock to the public; 2) the company wishes to offer extensive fringe benefits to owner-employees; and 3) the company hopes to use stock options or stock bonuses as part of an incentive program. In each of these three instances, Internal Revenue Service (IRS) rules regulating corporations make the desired activity either possible or more easily done than would be the case for limited liability companies.

Mancuso explains that there is a new type of LLC being developed in many states. Known as the series LLC, this new type of entity would allow companies to form series or departments under one LLC. Each series is allowed separate functions, sets of assets, personnel, and sometimes even separate liability. However, currently much remains unknown about series LLCs, since laws surrounding these entities are still being shaped in the early 2010s.

Prospective entrepreneurs and established businesspeople operating sole proprietorships and partnerships are encouraged to weigh several factors when considering incorporating. Indeed, incorporation can have a fundamental impact on many aspects of business operation, from taxes and document keeping requirements to raising capital and owner liability.

ADVANTAGES OF INCORPORATION

- Raising Capital. Incorporation is generally regarded as an indication that the owners are serious about their business enterprise and intend to devote time and resources to the venture for a significant period of time. This factor, as well as the reporting requirements of incorporation and in some cases the owners' more formidable financial resources, make corporations more attractive to some lending institutions. In addition, corporations have the option of raising capital by selling shares in their business to investors. Stockholders know that if the business they are investing in is a corporation, their personal assets are safe if the company gets into litigation or debt trouble.
- Ability to attract and keep more qualified employees. Corporations sometimes offer additional incentives to employees and potential employees, which can be useful when recruiting and retaining a workforce. Due to certain tax advantages that corporations enjoy, they are often able to offer employees additional benefits. Also, corporations can offer employees stock options.
- Ease of Ownership Transfer. Ownership of the company can be transferred fairly easily by simply selling stock (though some corporations attach restrictions in this regard).
- Continued existence. Since corporations are separate legal entities, they remain unaffected by changes of management, ownership, or even the death of owners. They continue to exist unless there is a decision to dissolve the corporation or unless bankruptcy proceedings are leveled against the corporation.
- Separation of executives, managers, and owners. The corporate structure separates these roles and offers each its own rules, duties, and responsibilities. When a business incorporates, part of the paperwork involves assigning these roles, which are largely predefined. This system ensures clarity and transparency and also promotes a good system of checks and balances in the business structure.
- Tax Advantages. Some businesses enjoy lower tax rates under the incorporated designation than they would if they operated as a partnership or sole proprietorship. For instance, business owners can adjust the salaries they pay themselves in ways that impact the corporation's profits and, subsequently, its tax obligations. It can also be easier for a business to invest in pension plans and other fringe benefits as a corporation because the cost of these benefits can be counted as tax-deductible business expenses. Business owners who have incorporated their business can also enjoy "income splitting," which refers to the process by which business profits and personal income are taxed differently. This process allows business profits to be taxed at lower corporate rates and allows business owners to tax their business income as a salary, sometimes enjoying tax breaks on employee benefits as well.
- Liability. This factor is often cited as far and away the most important advantage to incorporation. When a company incorporates, the shareholders or owners of the corporation are liable only up to the amount of money they contribute to the firm. Moreover, while a corporation can be targeted in legal actions such as lawsuits, the personal assets of the company's owners cannot be touched if a judgment is rendered against their establishment since it is recognized as a legal entity separate from the owners/shareholders.

Still, while incorporation provides business owners with far greater liability protection than they would enjoy if they operated as a standard partnership or sole proprietorship, business experts note that certain instances

remain wherein the personal assets of business owners may be vulnerable:

- Many small-business owners who approach banks to secure financing for a new corporation are asked to sign a personal guarantee that assures the lending institution that they will pay back the loan if the corporation is unable to do so. Banks sometimes require similar guarantees from entrepreneurs and small-business owners seeking financial assistance to lease equipment or facilities. Owners are also held personally responsible for ensuring that the corporation makes its required tax payments.
- Protection from liability can also be compromised in situations in which legal action is brought against a director or officer who is alleged to have committed some transgression outside the parameters of his or her job description. In other words, a business owner or shareholder can still be sued for personal actions.
- In some cases, key personnel of a corporation, such as board members or officers, can be held personally liable if the establishment that they operate has been found criminally negligent or guilty of willful criminal acts.
- If a corporation fails to pay some taxes, tax authorities such as the IRS can seek to reclaim these unpaid amounts from the owners and even from the owner's personal assets.
- The personal assets of business owners operating a corporation can also be threatened if it is determined that the business has not been properly established and adequately maintained. In such instances, a plaintiff may claim that the corporation and the owner are one and the same, and therefore the owner's personal assets can be used to satisfy the judgment. This is called "piercing the corporate veil." There are several steps that business owners can take, however, to ensure that their corporation protection is maintained. These include: 1) keeping up with taxes and regulatory requirements; 2) staying in full compliance with guidelines regarding corporate minutes and various organizational bylaws; 3) keeping personal and corporate accounts completely separated from one another; 4) showing proper capitalization by maintaining a satisfactory debt-to-equity ratio; and 5) always treating the business as a separate, professional business enterprise and creating adequate paperwork as well as documentation to show this fact.

DISADVANTAGES OF INCORPORATION

- Regulatory and Record keeping Requirements. Corporate operations are governed by local, state, and federal regulations to a greater degree than are other businesses. Each state has a Business Corporation Act (BCA) or Business Corporation Law, under which corporations are governed. As might be expected, the new business must adhere to state BCA rules as well as all federal regulations. Small businesses may find the extra paperwork burdensome and inflexible, especially if a business is used to a more informal way of doing business. Some business owners who incorporate may feel that adhering to external rules deprives them of some of the control they previously enjoyed over their company.
- Added Cost of Doing Business. Regulatory and record-keeping guidelines and requirements often make it necessary for corporations to make additional investments (in accounting staffing, etc.) devoted to seeing that those legal requirements are met. In addition, there are fees associated with incorporating to which business partnerships and sole proprietorships are not subject. To become a corporation, for example, a business must file articles of incorporation (and pay a filing fee).
- "Double" Taxation. People who are owners of a corporation, and who also work as an employee of the business, can receive financial compensation in two different ways. In addition to receiving a salary or wages for work performed, the owner may also receive a dividend or distribution on the stock that he or she owns. Any distribution of income to stockholders via dividends is taxable, however, if the corporation is organized as a "C corporation." This is sometimes called "double taxation" in recognition of the fact that such income has in reality been taxed twice, first when the corporation paid taxes on its profits, and secondly when the dividends were distributed. Companies that register as an "S corporation," however, are able to avoid this added tax.
- Separation of Finances. While incorporation provides significant protection of owners' personal assets from repercussions of business downturns, it also means that a business owner is not allowed to tap into the corporation's account for assistance in meeting personal debts.

S CORPORATIONS AND C CORPORATIONS

Small-business owners can choose to incorporate as one of two basic types of corporations. The C corporation is the more traditional of the arrangements and is more frequently employed by large companies. With a regular corporation, the business's profits or losses are absorbed directly into the company. With the alternative corporate arrangement the S corporation (also sometimes known

as the Subchapter S corporation) profits and losses pass through to the company's shareholders.

The S corporation option was actually put together by the federal government in recognition of the fact that the operating challenges faced by small and large businesses can often be quite different. Indeed, the S corporation was shaped specifically to accommodate small-business owners. S corporations give their owners the limited liability protections provided by corporate status, while also providing them with a more advantageous tax environment. In fact, S corporation status puts companies in the same basic tax situation as partnerships and sole proprietorships. Whereas C corporations are subject to the above-mentioned double taxation, profits registered by an S corporation are taxed only once, when they reach the company's shareholders.

To qualify as an S corporation, a business must meet the following requirements: 1) it must be a U.S. corporation; 2) it can have only a limited number of shareholders (100 in 2009); and 3) it may not offer more than one class of outstanding stock. In terms of the maximum number of shareholders, starting with taxable years beginning after December 31, 2004, a family may elect to have all the members of the family that hold stock directly or indirectly in an S corporation treated as one shareholder for purposes of the number-of-shareholders limitation. This election may be made by any family member. "Members of the family" are defined as individuals with a common ancestor, lineal descendants of the common ancestor, and the spouses (or former spouses) of such lineal descendants or common ancestor. These are the primary requirements for seekers of S corporation status, although the government has additional stipulations regarding the citizenship of owners/shareholders and affiliations with other business entities. Prospective S corporations must be in accordance with all these restrictions. It is also important to note that corporations cannot switch from S corporations to C corporations and back again. A company wishing to do so will generally need to wait 5 years. For this reason and for the fees involved in incorporation, it is a good idea to consider the long-term plans as well as any upcoming tax changes or regulation changes before deciding what organizational structure a business should have.

THE PROCESS OF INCORPORATION

The actual fees required to incorporate generally amount to several hundred dollars, although the total cost differs from state to state (corporations usually pay both an initial filing fee and an annual fee to the states in which they operate). Hiring an attorney to assist in the process can raise the cost, but several services are available on the Internet to assist businesses with the incorporation process. The Small Business Administration has noted that the owners of a business that is going to be incorporated must agree on several important issues, including the nature of the business; the total number of shares of stock the corporation will make available; the stock that the owners will be able to purchase; the amount of financial investment that each of the owners will make; the bylaws by which the corporation will operate; the management structure of the corporation; and the name under which the business will operate.

Indeed, it is a good idea to reserve the proposed name of the corporation with the state before filing articles of incorporation. The owners of the business must make sure that they have a clear right to that name, since only one corporation may possess any given name in each state. If a business owner files articles of incorporation using a name that already belongs to another corporation, the application will be rejected. Some businesses wishing someday to expand their company beyond the state level may wish to run a more thorough check to ensure that the chosen business name is not used in other states or even countries. The name of the business must also include either *corporation, company, limited* or *incorporated* as part of its legal name; such terms serve notice to people and businesses outside the company that it is a legal entity unto itself and thus subject to different laws than other business types.

Since the corporation will be a legal entity separate from its owners, separate financial accounts and record-keeping practices also need to be established. Once the shareholders have reached agreement on these issues, they must prepare and file articles of incorporation or a certificate of incorporation with the corporate office of the state in which they have decided to incorporate. Any corporation, with the exception of banks and insurance companies, can incorporate under Section 3 of the Model Business Corporation Act.

Business experts also counsel organizers of a corporation to put together a preincorporation agreement that specifies the various roles and responsibilities that each owner will take on in the corporation once it has come into being. Preincorporation agreements typically cover many of the above-mentioned issues and can be supplemented with other legal documents governing various business operations, such as inventory purchases and lease agreements. Preincorporation agreements are also sometimes drawn up with third parties. Such contracts generally address: 1) scope of potential liability; 2) rights and obligations for both the corporation and its organizers once it has been formed; 3) provisions to address business issues if incorporation never occurs for some reason; and 4) provisions for declining the contract once the corporation has been formed.

Once a company has incorporated, stock can be distributed and the shareholders can elect a board of

directors to take formal control of the business. Small corporations often institute buy-sell agreements for their shareholders. Under this agreement, stock that is given up by a shareholder, either because of death or a desire to sell, must first be made available to the business's other established shareholders. Stock issues and shareholder responsibilities are usually fairly straightforward in smaller companies, but larger corporations with large numbers of shareholders generally have to register with state regulatory agencies or the federal Securities and Exchange Commission (SEC).

In addition, incorporation requires the adoption of corporate bylaws. The bylaws, which are not public record, include more specific information about how the corporation will be run. These are the rules and regulations that govern the internal affairs of the corporation, although they may not conflict with the Articles of Incorporation or the corporate laws of the state in which the corporation operates. The bylaws are adopted by the board or the corporation's shareholders and may be amended or repealed at a later date. When preparing bylaws, it is sometimes easiest to start with the model bylaws that typically arrive with corporate kits or incorporation guides, although these may be altered. The bylaws should specify such information as:

- The location of corporate offices
- The names and powers of shareholders and directors
- The date and time for regular shareholders' and board of directors' meetings
- The content of such meetings
- The period of notice required before such meetings
- Voting eligibility
- Voting procedures
- Election procedures for seating directors and officers
- The names and duties of officers
- How financial transactions will be conducted
- The procedures for amending or repealing bylaws
- Stipulations as to whether powers or duties of board of directors may be relegated to ad hoc committees
- Procedures to be followed in the event of a merger with another company or the dissolution of the corporation itself

CORPORATE OWNERSHIP AND CONTROL

The owners of a corporation remain the ultimate controllers of that business's operations, but exercising that control is a more complicated process than it is for owners of partnerships or sole proprietorships. Control depends in part on whether the owners decide to make the corporation a public company, in which shares in the company are available to the general public, or a private or closely held corporation, where shares are concentrated in the hands of a few owners.

In most cases, small businesses have a modest number of shareholders or owners. When it comes to the day-to-day operations of the corporation, shareholders generally have very few powers. They are responsible for electing the board of directors and removing them from office. In smaller corporations, the shareholders can give themselves more operational powers by including provisions in the articles and bylaws of the corporation.

In most cases, however, it is the shareholder-appointed board of directors that runs the company. It is for this reason that companies work hard to keep shareholders happy. Of course, shareholders and stockholders ultimately decide the financial success of a company. If stockholders are unhappy with the direction of a company, they may sell their stocks and shares, driving the stock prices and therefore the perceived value of a company down. Directors are responsible for all aspects of the company's operation, and it is the board that appoints the key personnel responsible for overseeing the business's daily operations. The officers (president, vice president, treasurer, etc.), though appointed by the board of directors, often wield the greatest power in a corporation; indeed, in some corporations, officers are also members of the board of directors. Of course, in situations where only one person owns the incorporated company, he or she will bear many of the above responsibilities.

INCORPORATING IN DELAWARE AND NEVADA

Over the years, many companies have chosen to incorporate in Delaware or Nevada because of those states' business-friendly environment regarding taxation and liability issues. These states offer lower fees in many cases as well as less stringent regulations when compared to other states. But some business experts caution small businesses from automatically casting their lots with these states. Small businesses with a small number of shareholder-employees should probably incorporate within their own state of operation. Although Delaware may offer some tax breaks and potentially more statutory protection from liability for corporate directors than most other states, for a small corporation the advantages are usually outweighed by the disadvantages. For instance, a company incorporated in Delaware but operating elsewhere must appoint someone in Delaware to be an agent for the corporation (there are companies in Delaware that do this). In addition, such a firm will have to pay an annual franchise (corporate) tax to the state of Delaware as well as file an application in its home state to do business as a foreign corporation. This

designation will require the corporation to pay a franchise fee in addition to its usual state income taxes. In fact, paying state income taxes may cancel out any tax advantages offered by Delaware. According to Mancuso, incorporating in a state such as Nevada or Delaware makes the most sense for a large corporation seeking mainly liability benefits from competitors. It is generally not advantageous for smaller businesses.

INDIVIDUAL RETIREMENT ACCOUNTS (IRAS)

An individual retirement account (IRA) is a tax-deferred retirement program in which any employed person can participate, including self-employed persons and small-business owners. In most cases, the money placed in an IRA is deducted from the worker's income before taxes and is allowed to grow tax-deferred until the worker retires. IRA funds can be invested in a variety of ways, including stocks and bonds, money market accounts, treasury bills, mutual funds, and certificates of deposit. Intended to make it easier for individuals to save money for their own retirement, IRAs are nonetheless subject to a number of complex government regulations and restrictions. The amount of annual contributions permitted, and the tax deductibility thereof, is dependent on the individual worker's situation.

The main difference between IRAs and employer-sponsored retirement plans is that IRA funds, although held by a trust or annuity, are under the complete discretion of the account holder as far as withdrawals and choice of investments. For this reason, IRAs are known as self-sponsored and self-directed retirement accounts. Even combination plans that allow employers to make contributions, like Simplified Employee Pension (SEP) IRAs, are considered self-sponsored since they require the employee to set up his or her own IRA account. A special provision of IRAs allows individuals to roll over funds from an employer-sponsored retirement plan to an IRA without penalty.

Proposed legislation in 2010, however, might blur the lines between employer-sponsored plans and IRAs. The administration of President Barack Obama has proposed legislation which would make it mandatory for small businesses of over ten employees to automatically sign up all employees to an IRA if no company retirement plan is offered. Under this legislation, employees would have to opt out of the IRA to prevent part of the paychecks being deposited into the IRA. The legislation, however, would not make it mandatory for employers to match employee IRA contributions. Deposits made into IRAs after this legislation would offer employees a saver's tax credit. This credit would match the contributions employees make into their IRAs with government funds. If such legislation passes sometime during the 2010s, employees might be enrolled in automatic IRAs within a few years.

IRAs were authorized by Congress in 1974 as part of a broader effort to reform laws governing pensions. Recognizing that employers facing intense competition might decide to cut costs by reducing the retirement benefits provided to employees and that government programs

such as Social Security would not be enough to fill in the gaps Congress sought to encourage individual taxpayers to undertake long-term savings programs for their own retirement. The Internal Revenue Service responded by making provisions for individual retirement accounts in section 408 of the tax code. IRAs quickly became recognized as one of the most advantageous and flexible retirement options available, enabling workers to control their own preparations for the conclusion of their working lives.

IRA PROVISIONS

In the original provisions, elective pre-tax contributions to IRAs were limited to $1,500 per year. The maximum annual contribution increased to $2,000 in 1982, but new restrictions were imposed upon workers who were covered under an employer's retirement plan. For example, such workers were not eligible to deduct their total IRA contributions unless their adjusted gross income was less than $25,000 if unmarried, or less than $40,000 if married. A partial deduction was available for single workers who earned up to $35,000 and married workers who earned up to $50,000, but no deductions were allowed for people with higher income levels. These restrictions did not apply to self-employed individuals and others who did not participate in an employer's plan.

For tax year 2010, if Man A is covered by a retirement plan at work, his deduction for contributions to a traditional IRA will be phased out if his modified adjusted gross income is: 1) more than $89,000 but less than $109,000 if he is filing a joint return as a married couple filing a joint return or is a qualifying widower; or 2) more than $56,000 but less than $66,000 if he is filing as the head of household or a single person; or 3) less than $10,000 if he is a married person filing a separate return rather than a joint return.

The way the tax code was written, individuals were intended to begin making regular withdrawals from their IRAs upon retirement. These withdrawals would be considered income and subjected to income tax, in the case of traditional IRAs, which are taxed only when someone withdraws money. However, the individual was presumed to be in a lower tax bracket by this time than they had been during their working years. "Ordinary" distributions from an IRA are those taken when a worker is between the ages of 59 ½ and 70 ½. Though workers are not required to begin receiving distributions until they reach age 70 ½, most establish a regular schedule of distributions to supplement their income during this time.

The total annual distributions from an IRA cannot exceed $150,000 per year, or they are subject to a 15 percent penalty in addition to the regular income tax. "Early" withdrawals, or those taken before a worker reaches age 59 ½, are subject to a 10 percent penalty on top of the regular income tax, except in cases of death or disability of the account holder. In addition, there are ten other reasons that the government will let a person access the money, such as higher education expenses and first-time homeownership. The rules on such distributions are very rigid and one must carefully document any reasons for early withdrawal or face IRS penalties. The early distribution penalty is intended to discourage younger people from viewing an IRA as a tax-deferred savings account.

Legislation passed over the years since the IRA's initial authorization has refined the scope, provisions, and requirements of IRAs so that other forms are available besides the basic, individual "contributory" IRA. As outlined by W. Kent Moore in *The Guide to Tax-Saving Investing*, the different IRA variations include:

1. Spousal IRAs, which enable a working spouse to contribute to an IRA opened for a nonworking partner
2. Third-party-sponsored IRAs, which are used by employee organizations, labor unions, and others wishing to contribute on workers' behalf
3. Simplified Employee Pensions (SEPs), which enable employers to provide retirement benefits by contributing to workers' IRAs
4. Savings Incentive Match Plan for Employees (SIMPLE) IRAs, which require employers to match up to 3 percent of an employee's salary, or $6,000 annually, and also allow employees to contribute another $6,000 per year to their own accounts
5. Rollover contribution accounts, which allow distributions from an IRA or an employer's qualified retirement plan to be reinvested in another IRA without penalty
6. Roth IRAs, which enable single people with an annual income of less than $120,000 and married couples with an annual income of less than $176,000 to make a nondeductible contribution of up to $6,000 per year (as of the 2009 tax year), whether they are covered by an employer's plan or not. The exact amount which can be contributed varies depending on age (older contributors can contribute more), marital status, and income level. There are a number of advantages to the Roth IRA. These include the fact that a person does not need to start taking annual minimum distributions from age 70. Roth IRA withdrawals are also not taxed as traditional IRA withdrawals are.

It is also possible for those earning less than $100,000 per year to convert a regular IRA to a Roth IRA by paying any deferred income tax. Though money placed in Roth IRAs is subject to taxes when invested, the earnings grow tax-deferred and the withdrawals are tax-free after 5 years. After 2009 various requirements were dropped

for those wishing to convert to a Roth IRA, making the process easier. After 2010 conversion to a Roth IRA became even more enticing because there was no longer a $100,000 gross income cap preventing higher income brackets from investing in this type of IRA. However, those wishing to convert to a Roth IRA still must pay income taxes on the amount of money which is converted into the new account.

FACTORS TO CONSIDER

Those interested in opening an IRA should familiarize themselves with the current regulations governing the amounts that may be contributed, the timing of contributions, the criteria for tax deductibility, and the penalties for making early withdrawals. They should also shop around when investigating financial institutions that offer IRAs, such as banks, credit unions, mutual funds, brokerage firms, and insurance companies, inasmuch as fees vary from institution to institution, ranging from no charge to a one-time fee for opening the account to an annual fee for maintaining the IRA. Financial institutions also differ in the amount of minimum investment, how often interest is compounded, and the type and frequency of account statement provided. There is no limit to the number of IRAs an individual can open, as long as he or she does not exceed the maximum allowable annual contribution.

Another important factor to consider, in addition to the trustee of the account, is where the IRA funds should be invested. Individuals have a wide range of investment options available to choose from, including bank accounts, certificates of deposit, stocks, bonds, annuities, mutual funds, or a combination thereof, each offering different levels of risk and rates of growth. According to many investment advisors, the ideal IRA investment is one that is reasonably stable, can be held for the long term, and provides a level of comfort for the individual investor. Most financial advisors advise against playing the stock market or investing in a single security with funds that have been earmarked for retirement, due to the risk involved. Instead, they recommend that individuals take a more diversified approach with their IRAs, such as investing in a growth-income mutual fund, in order to protect themselves against inflation and the inevitable swings of the stock market.

The decision about where IRA funds should be invested can be changed at any time, as often as the individual deems necessary. Switching to a different type of investment or to a mutual fund with a different objective usually only requires filling out a transfer form from the sponsoring financial institution. Since the IRA simply changes custodians in this type of transaction, and never passes through the hands of the individual investor, it is not subject to any penalty or tax, and it is not considered a rollover.

Despite the number of decisions involved, IRAs nonetheless provide an important means for people to save for their retirement. "The advantages of IRAs far outweigh the disadvantages," as Moore noted. "Earnings for either deductible or nondeductible IRAs grow faster than ordinary savings accounts, because IRA earnings are tax deferred, allowing all earnings to be reinvested. Also, IRAs tend to grow at a higher rate than savings accounts, which tend to have a very low interest rate due to their very low risk. Even when withdrawals are made on an IRA, the remaining funds continue to grow as tax-deferred assets."

INDUSTRIAL SAFETY

The issue of industrial safety evolved concurrently with industrial development in the United States. Of central importance was the establishment of protective legislation, most significantly the worker's compensation laws, enacted at the start of the twentieth century, and the

Occupational Safety and Health Act, enacted in 1970. The discussion of industrial safety began to shift in the 1970s from compensation issues to concerns about prevention and studies of the long-term effects of occupational hazards. This shift in emphasis was encouraged by insurance companies who, in order to protect themselves from workers' compensation expenses, found that it made good business sense for them to promote industrial safety programs and research industrial safety issues. Today, industrial safety is widely regarded as one of the most important factors that any business, large or small, must consider in its operations.

Worker's compensation laws vary widely from state to state but have key objectives in common. Employers are required to compensate employees for work-related injuries or sickness by paying medical expenses, disability benefits, and compensation for lost work time. In return, workers are barred in many instances from suing their employers, a provision that protects employers from large liability settlements (of course, employers may still be found liable in instances where they are found guilty of neglect or other legal violations). In his book, *Industrial Safety: Management and Technology,* David Colling contended that "workmen's compensation laws have done more to promote safety than all other measures collectively, because employers found it more cost-effective to concentrate on safety than to compensate employees for injury or loss of life." Other laws that have helped improve industrial safety are the numerous whistleblower protection laws in place. Such regulations allow employees to report unsafe work conditions without fear of punishment or loss of work.

THE CREATION OF OSHA

One of the key developments in industrial safety legislation was the Occupational Safety and Health Act of 1970. The act, which was the first comprehensive industrial safety legislation passed at the federal level, passed nearly unanimously through both houses of Congress. One of the factors contributing to strong support for the act was the rise in the number of work-related fatalities in the 1960s, and particularly the Farmington, West Virginia, mine disaster of 1968, in which seventy-eight miners were killed. The Occupational Safety and Health Act was distinguished by its emphasis on the prevention of rather than compensation for industrial accidents and illnesses. The legislation provided for the establishment of the Occupational Safety and Health Administration (OSHA) and the National Institute of Occupational Safety and Health (NIOSH). Among the key provisions of the act were the development of mandatory safety and health standards, the enforcement of these standards, and standardized record keeping and reporting procedures for businesses.

OSHA regulations cover all private-sector employers with one or more workers and are therefore an area of regulatory law about which small businesses must be aware. OSHA regulations do not, however, cover employers in the public sector (municipal, county, state, or federal government agencies); self-employed individuals; family members operating a farm; or domestic household workers.

OSHA issues regulations governing a wide range of worker safety areas, all intended to meet OSHA's overriding principle that "each employer shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his [or her] employees." OSHA regulations include both safety standards, designed to prevent accidents, and health standards, designed to protect against exposure to toxins and to address the more long-term effects of occupational hazards. "Horizontal" standards apply to all industries whereas "vertical" standards apply to specific industries or occupations. Some of OSHA's standards were adopted from private national organizations, such as the American National Standards Institute, the National Fire Protection Association, and the American Society of Mechanical Engineers. Other standards were developed by OSHA itself, often based on recommendations from NIOSH.

When OSHA drafts a proposal for a permanent standard, it first consults with industry and labor representatives and collects whatever scientific, medical, and engineering data is necessary to ensure that the standard adequately reflects workplace realities. Proposed standards are published in the *Federal Register*. A comment period is then held, during which input is received from interested parties including, but not limited to, representatives of industry and labor. At the close of the comment period, the proposal may be withdrawn and set aside, withdrawn and reproposed with modifications, or approved as a final standard that is legally enforceable. All standards that become legally binding are first published in the *Federal Register* and then compiled and published in the *Code of Federal Regulations.* The cause of industrial safety has also been reinforced by the passage of significant "right-to-know" laws. Right-to-know laws require that dangerous materials in the workplace be identified and that workers be informed of these dangers as well as trained in their safe use.

In addition to federal worker health and safety laws, individual states are permitted to develop and operate their own job safety and health programs. If the state can show that its job safety and health standards are "at least as effective as" comparable federal standards, the state can be certified to assume OSHA administration and enforcement in that state. OSHA approves and monitors state plans, and provides up to 50 percent of operating costs for approved plans.

OSHA's work has not been without criticism. In a 2008 Senate hearing, lawmakers accused OSHA of ineffective enforcement and of not helping workers adequately. Other groups have also claimed that OSHA assists companies too much in ensuring compliance and does too little to levy deterring penalties. In a 2008 article, however, Frank White, senior vice president of human resources firm ORC Worldwide, argued that greater penalties and enforcement cause delays rather than promote health and safety. He recommended that OSHA, industry, and states develop a system which encourages quick action on safety issues.

INDUSTRIAL HAZARDS

One of the important aspects of industrial safety programs is the identification of hazards. Managers typically determine hazards by the examination of accident records, interviews with engineers and equipment operators, and the advice of safety specialists, such as OSHA or insurance companies. Industrial health hazards are typically categorized into three classes: chemical hazards, in which the body absorbs toxins; ergonomic hazards, such as those resulting from improper lifting or repetitive stress; and physical hazards, in which the worker is exposed to temperature extremes, atmospheric pressure, dangerous conditions, or excessive noise.

About one-tenth of industrial accidents result from operating machinery, and these accidents often result in severe injury. Among the most dangerous types of machinery are power presses and woodworking tools, which most commonly cause injury to the hands. A number of mechanisms have been developed to safeguard against such injuries. The simplest of these are barrier guards, in which the moving parts of machinery are enclosed in a protective housing. These safeguards are typically used in conjunction with sensors so that the machine cannot be operated without them. Other types of safeguards include those which prevent a machine from operating unless a worker has both hands properly in place, automated material feeding devices, warning labels, and color coding.

Toxins are most commonly ingested through inhalation, and the most commonly inhaled substances are dust, fumes, and smoke. Toxins are also commonly absorbed through the skin, and this is a bigger problem than many business owners and managers realize. Indeed, some studies indicate that skin disorders result in approximately 200,000 lost working days each year. The most common of these disorders is dermatitis, which is particularly problematic in the food preparation and chemical industries. In industrial workplace environments, some workers are exposed to silica, a toxin which can cause silicosis, skin problems, and respiratory problems. In 2008 OSHA initiated a National Emphasis Program (NEP) to address this issue. In addition, some toxins can cause fire hazards in the workplace. In 2008 OSHA announced that it would again initiate its Combustible Dust National Emphasis Program (NEP) Instruction, which aims to enforce regulations against combustible dusts, or toxins which increase the risk of fire.

Among the most commonly used toxins are industrial solvents. The toxicity of solvents varies widely by type, but the most toxic of these are carcinogens and can cause permanent damage to the nervous system through prolonged occupational overexposure. In addition, organic solvents, such as those made from petroleum, are often highly flammable. Tightly fitted respirators with activated charcoal filters are used to protect against inhalation of organic solvents, particularly in spraying applications in which solvents are atomized. Ventilation systems comprised of fans and ducts are also used to control airborne toxins of all types. Rubber gloves are commonly used to prevent skin absorption of organic solvents.

One of the most rapidly growing types of reported occupational injury is what the U.S. Bureau of Labor Statistics refers to as "disorders associated with repeated trauma." These conditions result from repeatedly performing the same tasks over a prolonged period of time. In 2008 alone, there were 317,440 cases of work-related musculoskeletal disorders (MSDs) across the United States. MSDs are among the most frequent disorders associated with repeated trauma or ergonomics problems. Ergonomic issues have been an increasing concern for OSHA and other groups concerned with industrial safety. Since 2008 OSHA has been adding ergonomics information to its Web site, focusing on industry-specific suggestions and advice for preventing repetitive strain injuries and other ergonomics problems in every industry.

SMALL BUSINESSES AND INDUSTRIAL SAFETY

All companies, including small businesses, are required to keep records on various aspects of their operations that are relevant to employee safety and health. All employers covered by the Occupational Safety and Health Act are required to keep records regarding enforcement of OSHA standards; research records; job-related injury, illness, and death records; and job hazard records.

However, while small businesses must adhere to many of the same regulations that govern the operations or larger companies, there also are several federal industrial safety programs available exclusively to smaller business enterprises, and OSHA and state regulatory agencies both enjoy some discretion in adjusting penalties for industrial safety violations for small companies. For example, OSHA has discretion to grant monetary penalty reductions of up to 60 percent for businesses that qualify as small firms. It also gives smaller firms greater flexibility in certain safety areas

(i.e., lead in construction, emergency evacuation plans, process safety management) in recognition of their limited resources, and provides grants to nonprofit groups with explicit mandates of addressing safety and health issues in small-business settings. Since 2008 OSHA has also been developing its Enhanced Office of Small Business Assistance (OSBA) services and Web site. This Web site offers small businesses useful information and tips about workplace safety.

If an allegation of industrial safety violations is made against an employer to OSHA, OSHA evaluates the complaint to determine the severity of risk to employees. If the allegations do not pose serious or immediate risk to employees of the company against which allegations are made, OSHA will generally contact the company via telephone and give the employer 10 business days to show OSHA that the complaint is not valid or has been resolved. Companies should send OSHA plenty of supporting material, such as photos or documentation, to show compliance. If OSHA determines that a complaint may pose a serious risk to employees, it may contact the employer by telephone. Again, the company should do everything possible to prove to OSHA that compliance with all standards has been reached.

Companies may be visited by OSHA inspectors at any time if a violation of industrial safety standards is reported or suspected. OSHA can and does inflict penalties in the hundreds of thousands of dollars, so it is important for companies to adhere to industrial safety rules and to have a system in place for maintaining a safe workplace. If OSHA finds an industrial workplace in violation of safety standards, OSHA may, in addition to levying penalties, demand that changes are made to the workplace in order to ensure that no violations of safety occur in the future. Sometimes, these mandatory changes can cost more than the penalties.

INDUSTRY ANALYSIS

Industry analysis is a tool that facilitates a company's understanding of its position relative to other companies that produce similar products or services. Industry analysis considers the secondary and primary markets and competitors in an industry and helps companies understand their relative positions in terms of competitors. Utlimately, industry analysis is an important part of any business plan. It is also useful when making business decisions and when attempting a new venture. An industry analysis paints a full picture of an industry and the marketplace, allowing a business to forecast, plan, and make the correct decisions.

"Many small business owners and executives consider themselves at worst victims, and at best observers of what goes on in their industry. They sometimes fail to perceive that understanding your industry directly impacts your ability to succeed. Understanding your industry and anticipating its future trends and directions gives you the knowledge you need to react and control your portion of that industry," wrote Kenneth J. Cook in his book *The AMA Complete Guide to Strategic Planning for Small Business.* "However, your analysis of this is significant only in a relative sense. Since both you and your competitors are in the same industry, the key is in finding the differing abilities between you and the competition in dealing with the industry forces that impact you. If you can identify abilities

you have that are superior to competitors, you can use that ability to establish a competitive advantage."

An industry analysis consists of three major elements: the underlying forces at work in the industry; the overall attractiveness of the industry; and the critical factors that determine a company's success within the industry. According to the 2008 book, *Writing a Convincing Business Plan*, by Arthur R. DeThomas and Stephanie A. Derammelaere, an effective industry analysis can include more facets: 1) a full description of the industry and its characteristics; 2) a description of the forces that influence the business and the industry at large; 3) opportunities available in the company and in the industry; and 4) a historical glance and a forecast of sales, profits, and performance of the industry.

One way in which to compare a particular business with the average of all participants in the industry is through the use of ratio analysis and comparisons. Ratios are calculated by dividing one measurable business factor by another, total sales divided by number of employees, for example. Many of these ratios may be calculated for an entire industry with data available from many reports and papers published by the U.S. Departments of Commerce and Labor.

By comparing a particular ratio for one company with that of the industry as a whole, a business owner can learn much about where her business stands in comparison with the industry average. For example, a small nursing home business can compare its "payroll per employee" ratio with the average for all residential care operators in the United States in order to determine if it is within a competitive range. If the business's "payroll per employee" figure is higher than the industry average, the business may wish to investigate further. Checking the "employees per establishment" ratio would be a logical place to look next. If this ratio is lower than the industry average it may justify the higher per-employee payroll figure. This sort of comparative analysis is one important way in which to assess how one's business compares with all others involved in the same line of work.

One of the most commonly cited models for analyzing the structure of industries was developed by Michael E. Porter in his classic book *Competitive Strategy: Techniques for Analyzing Industries and Competitors.* Porter's five forces are still widely quoted and used today. Porter's model shows that rivalry among firms in industry depends upon five forces: 1) the potential for new competitors to enter the market; 2) the bargaining power of buyers; 3) the bargaining power of suppliers; 4) the availability of substitute goods; and 5) the competitors and nature of competition. These factors are outlined below.

INDUSTRY FORCES

The first step in performing an industry analysis is to assess the impact of Porter's five forces. "The collective strength of these forces determines the ultimate profit potential in the industry, where profit potential is measured in terms of long term return on invested capital," Porter stated. "The goal of competitive strategy for a business unit in an industry is to find a position in the industry where the company can best defend itself against these competitive forces or can influence them in its favor." Understanding the underlying forces determining the structure of the industry can highlight the strengths and weaknesses of a small business, show where strategic changes can make the greatest difference, and illuminate areas where industry trends may turn into opportunities or threats.

Ease of Entry. Ease of entry refers to how easy or difficult it is for a new firm to begin competing in the industry. The ease of entry into an industry is important because it determines the likelihood that a company will face new competitors. In industries that are easy to enter, sources of competitive advantage tend to wane quickly On the other hand, in industries that are difficult to enter, sources of competitive advantage last longer, and firms also tend to benefit from having a constant set of competitors.

The ease of entry into an industry depends upon two factors: the reaction of existing competitors to new entrants; and the barriers to market entry that prevail in the industry. Existing competitors are most likely to react strongly against new entrants when there is a history of such behavior, when the competitors have invested substantial resources in the industry, and when the industry is characterized by slow growth. In their 2008 book *Analysis Without Paralysis: 10 Tools To Make Better Strategic Decisions*, Babette E. Bensoussan and Craig S. Fleisher noted that existing competitors often have tactics that can deter new competition. For example, existing competitors may use their experience in the industry to thwart newcomers or may change their price structure to make entry costs for newcomers unfeasible. Some of the major barriers to market entry include economies of scale, high capital requirements, switching costs for the customer, limited access to the channels of distribution, a high degree of product differentiation, and restrictive government policies.

Power of Suppliers. Suppliers can gain bargaining power within an industry through a number of different situations. For example, suppliers gain power when an industry relies on just a few suppliers, when there are no substitutes available for the suppliers' product, when there are switching costs associated with changing suppliers, when each purchaser accounts for just a small portion of the suppliers' business, and when suppliers have the resources to move forward in the chain of distribution and take on the role of

their customers. Supplier power can affect the relationship between a small business and its customers by influencing the quality and price of the final product. "All of these factors combined will affect your ability to compete," Cook noted. "They will impact your ability to use your supplier relationship to establish competitive advantages with your customers."

Modern industry analysis professionals note that when considering suppliers, companies need to broad in their definitions. In this context, suppliers are not only the vendors supplying inventory or raw materials for a business. As Bensoussan and Fleisher noted, suppliers in this context can also include locations (such as warehouses or airport landing strips), organizations that affect labor (such as unions), and even what the authors call "channels" (such as the media). Bensoussan and Fleisher point out that organizations such as unions, for example, are important to consider in an industry analysis because these groups have the ability to change the power dynamic between business and suppliers. In this context, even a government can act as a supplier, providing authority (in the form of licensing) and other resources needed in a business. All of these suppliers have the power to impact a business directly and must be taken into account in an industry analysis.

Power of Buyers. The reverse situation occurs when bargaining power rests in the hands of buyers. Powerful buyers can exert pressure on small businesses by demanding lower prices, higher quality, or additional services, or by playing competitors off one another. The power of buyers tends to increase when single customers account for large volumes of the business's product, when substitutes are available for the product, when the costs associated with switching suppliers are low, and when buyers possess the resources to move backward in the chain of distribution.

Availability of Substitutes. "All firms in an industry are competing, in a broad sense, with industries producing substitute products. Substitutes limit the potential returns of an industry by placing a ceiling on the prices firms in the industry can profitably charge," Porter explained. Product substitution occurs when a small business's customer comes to believe that a similar product can perform the same function at a better price. Substitution can be subtle for example, insurance agents have gradually moved into the investment field formerly controlled by financial planners or sudden, as when compact disc technology took the place of vinyl record albums. The main defense available against substitution is product differentiation. By forming a deep understanding of the customer, some companies are able to create demand specifically for their products.

Competitors. Competitive battles can take the form of price wars, advertising campaigns, new product introductions, or expanded service offerings, all of which can reduce the profitability of firms within an industry. The intensity of competition tends to increase when an industry is characterized by a number of well-balanced competitors, a slow rate of industry growth, high fixed costs, or a lack of differentiation between products. Another factor increasing the intensity of competition is high exit barriers, including specialized assets, emotional ties, government or social restrictions, strategic interrelationships with other business units, labor agreements, or other fixed costs, which make competitors stay and fight even when they find the industry unprofitable.

INDUSTRY ATTRACTIVENESS AND INDUSTRY SUCCESS FACTORS

"Industry attractiveness is the presence or absence of threats exhibited by each of the industry forces," Cook explained. "The greater the threat posed by an industry force, the less attractive the industry becomes." Small businesses, in particular, should attempt to seek out markets in which the threats are low and the attractiveness is high. Understanding what industry forces are at work enables small-business owners to develop strategies to deal with them. These strategies, in turn, can help small businesses to find unique ways to satisfy their customers in order to develop a competitive advantage over industry rivals.

Success factors are those elements that determine whether a company succeeds or fails in a given industry. They vary greatly by industry. Some examples of possible success factors include quick response to market changes, a complete product line, fair prices, excellent product quality or performance, knowledgeable sales support, a good record for deliveries, solid financial standing, or a strong management team. Cook noted that determining these success factors can help companies determine an effective strategy for maximizing competitive advantage. The first step is to determine whether the company possesses each success factor identified. Then the small-business owner can decide whether the company can and should develop additional success factors.

THE IMPORTANCE OF INDUSTRY ANALYSIS

A comprehensive industry analysis requires a small-business owner to take an objective view of the underlying forces, attractiveness, and success factors that determine the structure of the industry. Understanding the company's operating environment in this way can help the small-business owner to formulate an effective strategy, position the company for success, and make the most efficient use of the limited resources of the small business. According to Porter, a thorough industry analysis can help a company determine its weaknesses and strengths in comparison with the

industry as a whole. This allows a company to create an effective strategy making the best possible use of the five competitive forces. Some of the possible strategies include positioning the firm to use its unique capabilities as defense, influencing the balance of outside forces in the firm's favor, or anticipating shifts in the underlying industry factors and adapting before competitors do in order to gain a competitive advantage.

PREPARING AN INDUSTRY ANALYSIS

There are services which provide industry analysis tools and services. Often, these companies can help provide a business with a ready-made analysis of an industry. However, small businesses may find it useful to create their own industry analysis in order to absorb the information and resources. According to DeThomas and Derammelaere, writing an industrial analysis is not difficult. Small businesses can divide the process into several steps. First, businesses may wish to include an industry analysis summary at the start of their analysis. Next, it is useful to create an industry description, using industry classifications and economic sectors to define the industry and its major players clearly. This section will generally define the scope, geographic boundaries, and other characteristic of an industry.

Next, according to DeThomas and Derammelaere, businesses may wish to write a section outlining the distributors, customers, and suppliers of an industry. A good industry analysis usually includes a separate section which clearly outlines the competition for a business in the industry and in related industries. This section generally includes details about the competition, including the strengths and weaknesses of every competitor. Many industry analysis reports also examine the historical sales and performance within a specific industry and business, as well as projections and forecasts. Another section of the industry analysis may include a description of opportunities within an industry or business, usually with a plan or strategy for making use of these opportunities.

INDUSTRY LIFE CYCLE

Life cycle models are not just a phenomenon of the life sciences. Industries experience a similar cycle of life. Just as a person is born, grows, matures, and eventually experiences decline and ultimately death, so too do industries and product lines. The stages are the same for all industries, yet every industry will experience these stages differently: they will last longer for some and pass quickly for others. Even within the same industry, various firms may be at different life cycle stages. A firm's strategic plan is likely to be greatly influenced by the stage in the life cycle at which the firm finds itself. Some companies or even industries find new uses for declining products, thus extending their life cycle.

STAGES OF THE LIFE CYCLE

The growth of an industry's sales over time is used to chart the life cycle. The distinct stages of an industry life cycle are: introduction, growth, maturity, and decline. Sales typically begin slowly at the introduction phase, then take off rapidly during the growth phase. After leveling out at maturity, sales then begin a gradual decline. In contrast, profits generally continue to increase throughout the life cycle, as companies in an industry take advantage of expertise and economies of scale and scope to reduce unit costs over time.

Introduction. In the introduction stage of the life cycle, an industry is in its infancy. Perhaps a new, unique product offering has been developed and patented, thus beginning a new industry. Some analysts even define an embryonic stage before introduction. An embryonic industry stage, according to Charles Hill and Gareth Jones in their 2008 book, *Strategic Management Theory: An Integrated Approach*, is a stage at which an industry is so new that it may have few or no channels and may be largely unknown or unavailable to the general public. At this stage, there may

be almost no formal production or distribution system. Hill and Jones define the 2008 nanotechnology industry as an embryonic industry.

At the introduction stage, the firm may be alone in the industry. It may be a small entrepreneurial company or a proven company which used research and development funds and expertise to develop something new. Marketing refers to new product offerings in a new industry as "question marks" because the success of the product and the life of the industry is unproven and unknown. At the introduction stage, according to Charles Hill and Gareth Jones, compeititon is very fierce as a few companies try to improve design, price, and distribution.

A firm will use a focused strategy at this stage to stress the uniqueness of the new product or service to a small group of customers. These customers are typically referred to in the marketing literature as the "innovators" and "early adopters." Marketing tactics during this stage are intended to explain the product and its uses to consumers and thus create awareness for the product and the industry. According to research by Michael A Hitt, R. Duane Ireland, and Robert E. Hoskisson, firms establish a niche for dominance within an industry during this phase. For example, they often attempt to establish early perceptions of product quality, technological superiority, or advantageous relationships with vendors within the supply chain to develop a competitive advantage.

Because it costs money to create a new product offering, develop and test prototypes, and market the product, the firm's and the industry's profits are usually negative at this stage. Any profits generated are typically reinvested into the company to solidify its position and help fund continued growth. Introduction requires a significant cash outlay to continue to promote and differentiate the offering and expand the production flow from a job shop to possibly a batch flow. Market demand will grow from the introduction, and as the life cycle curve experiences growth at an increasing rate, the industry is said to be entering the growth stage. Firms may also cluster together in close proximity during the early stages of the industry life cycle to have access to key materials or technological expertise, as in the case of the U.S. Silicon Valley computer chip manufacturers.

Growth. Like the introduction stage, the growth stage also requires a significant amount of capital. The goal of marketing efforts at this stage is to differentiate a firm's offerings from other competitors within the industry. Thus, the growth stage requires funds to launch a newly focused marketing campaign as well as funds for continued investment in property, plant, and equipment to facilitate the growth required by the market demands. However, the industry is experiencing more product standardization at this stage, which may encourage economies of scale and facilitate development of a line-flow layout for production efficiency. At this stage of the process, customers are more aware of the product and industry and branding can generally begin since distribution, initial customers, and product design have been taken care of.

According to Jeffrey S. Harrison and Caron H. St. John, in their 2009 book, *Foundations in Strategic Management*, the growth stage can be divided into two separate growth stages. During the early growth stages, they argue, competition is intense and companies may institute entry barriers to discourage new competitors. For example, companies may build large factories to increase production and market share. They may enter into contracts to secure suppliers or distributors. During the later growth stage, however, as the maturity stage draws nearer, some companies may start to close or go bankrupt due to a slight decrease in demand.

Research and development funds will be needed to make changes to the product or services better to reflect customers' needs and suggestions. In this stage, if the firm is successful in the market, growing demand will create sales growth. Earnings and accompanying assets will also grow and profits will be positive for the firms. Marketing often refers to products at the growth stage as "stars." These products have high growth and market share. The key issue in this stage is market rivalry. Because there is industry-wide acceptance of the product, more new entrants join the industry and, according to some business professionals, more intense competition results. However, according to other professionals, including Charles Hill and Gareth Jones, competition actually slows down at this stage since the industry generally grows enough to absorb new competitors. Hill and Jones, for example, point to the cell phone industry in the United States, which grew from 5 million subscribers in 1990 to 260 million in 2008.

The duration of the growth stage, as all the other stages, depends on the particular industry or product line under study. Some items like fad clothing, for example may experience a very short growth stage and move almost immediately into the next stages of maturity and decline. A popular toy one holiday season may be nonexistent or relegated to the back shelves of a deep-discounter the following year. Because many new product introductions fail, the growth stage may be short or nonexistent for some products. However, for other products the growth stage may be longer due to frequent product upgrades and enhancements that forestall movement into maturity. The computer industry today is an example of an industry with a long growth stage due to upgrades in hardware, services, and add-on products and features.

During the growth stage, the life cycle curve is very steep, indicating fast growth. Firms tend to spread out geographically during this stage of the life cycle and continue to disperse during the maturity and decline stages. As an example, the automobile industry in the United States was initially concentrated in the Detroit area and

surrounding cities. As the industry matured, automobile manufacturers spread throughout the country and internationally.

According to Harrison and St. John, the growth stage is notable because it is during this stage that a "dominant design" emerges. That is, after the innovation of the introductory stage, during the growth stage one design of product or one type of service emerges as the clear preference of customers. Companies must either adapt to this type of design or lose competitiveness.

Maturity. As the industry approaches maturity, the industry life cycle curve becomes noticeably flatter, indicating slowing growth. While sales are expanding and earnings are growing from "cash cow" products, the rate has slowed from the growth stage. In fact, the rate of sales expansion is typically equal to the growth rate of the economy. At this stage, growth in sales usually is driven by increases in replacement needs or increases in the population. The market has become saturated at this stage and few new customers are present in the marketplace.

Some competition from late entrants will be apparent, and these new entrants will try to steal market share from existing products. Thus, the marketing effort must remain strong and must stress the unique features of the product or the firm to continue to differentiate a firm's offerings from industry competitors. Firms may compete on quality to separate their product from other lower-cost offerings, or conversely the firm may try a low-cost/low-price strategy to increase the volume of sales and make profits from inventory turnover. A firm at this stage may have excess cash to pay dividends to shareholders. But in mature industries, there are usually fewer firms, and those that survive will be larger and more dominant. While innovations continue they are not as radical as before and may be only a change in color or formulation to stress "new" or "improved" to consumers. At this stage, many companies focus on reducing the price of production in order to remain competitive. Laundry detergents are examples of mature products.

Decline. Declines are almost inevitable in an industry. If product innovation has not kept pace with other competing products and services, or if new innovations or technological changes have caused the industry to become obsolete, sales suffer and the life cycle experiences a decline. In this phase, sales are decreasing at an accelerating rate. This is often accompanied by another, larger shake-out in the industry as competitors who did not leave during the maturity stage now exit the industry. Yet some firms will remain to compete in the smaller market. Mergers and consolidations will also be the norm as firms try other strategies to continue to be competitive or grow through acquisition and diversification. Companies at this stage often need to worry about excess capacity. That is, during the growth stage, companies in an industry may have created the conditions to meet increased demand. During the mature stage, companies need to scale back in order to remain competitive. For this reason, downsizing is often a part of the mature industry, as is increased automation in order to reduce overhead costs.

PROLONGING THE LIFE CYCLE

Management efficiency can help to prolong the maturity stage of the life cycle. Production improvements, like just-in-time methods and lean manufacturing, can result in extra profits. Technology, automation, and linking suppliers and customers in a tight supply chain are also methods to improve efficiency.

New uses of a product can also revitalize an old brand. A prime example is Arm & Hammer baking soda. In 1969 sales were dropping due to the introduction of packaged foods with baking soda as an added ingredient and an overall decline in home baking. However, new uses for the product as a deodorizer for refrigerators and later as a laundry additive, toothpaste additive, and carpet freshener extended the life cycle of the baking soda industry. Promoting new uses for old brands can increase sales by increasing usage frequency. In some cases, this strategy is cheaper than trying to convert new users in a mature market.

To extend the growth phase as well as industry profits, firms approaching maturity can pursue expansion into other countries and new markets. Expansion into another geographic region is an effective response to declining demand. Because organizations have control over internal factors and can often influence external factors, the life cycle does not have to end. However, once world saturation is reached, the eventual maturity and decline of the industry or product line will result.

INFORMATION BROKERS

Information brokers provide, for a fee, information retrieval from accessible data sources, most often online databases. Information brokering first emerged as a business opportunity for individuals in the mid-1950s. Also known as independent information specialists, brokers often do much more than gather the information. In this day and age, when almost anyone can access huge amounts of data over the Internet, brokers provide a number of special services, including writing reports that analyze the data they obtain, creating internal databases for clients to manage their in-house information, and maintaining current awareness services that update a client whenever new information on a given topic becomes available.

A good broker can save a client time and money. Searching for data can be an arduous and time-consuming process, especially if someone is not an expert at online searching. In addition, most brokers subscribe to online databases that are not available to the public, even on the Internet. Subscriptions to these databases, which often contain high-level professional, business, and scientific information, can cost up to several thousand dollars a year. Clearly, that cost is prohibitive for many small businesses, especially when a one-time information search is all that is needed. Brokers can also search for information in archives, courthouses, and other repositories of data data which might not be available via the Internet at all and which may require careful sifting of resources. Information brokers can also find a variety of information, including information about customers, competitors, an industry, businesses, trademarks, products, real estate, and business opportunities.

Finding a good broker is important. A good broker will tell clients if they actually can find the information for free, but will also make it clear when his or her services are needed. Check to see what online services the broker subscribes to, and how long the broker has been in business. Relatively new information broker businesses may be perfectly legitimate, but business consultants still urge small-business owners to be careful about selecting a specialist without first conducting adequate research into the company's history and other clients. Analysts indicate that the best information brokers in the field often have a background in library science (many brokers have been employed at public or corporate libraries) or have started out working for one of the large database provider companies. Other factors to consider include education, rates, specialty areas, subcontracting capability, and business practices.

When selecting information brokers, it is also important to ensure that they will use legal and ethical means to gather information. This may be especially crucial if a person is hiring information brokers to gather facts about competitors, customers, or an industry. A number of companies calling themselves information brokers may provide information to businesses by gathering customer phone information illegally. Since the passage of the Consumer Telephone Records Act of 2006, such activities carry serious penalties, and companies that hire such unethical information brokers may themselves facing fines and legal action. Business owners should always find out how an information broker will gather information. If someone is hiring data brokers to gather sensitive information (such as information about competitors or customers) it is also advisable to ask data brokers how the information will be kept securely. Clients may wish to ask, for example, what will be done with copies of data after they have received their information or report.

When hiring information brokers, it is also important to note that information brokers tend to define themselves in a myriad of ways. Many information brokers, for example, offer mailing list information exclusively. That is, they gather and sell personal and contact information about customers to businesses interested in creating mass marketing or telemarketing campaigns. Small businesses are often attracted by the idea of getting a complete list of potential customers, but they need to keep in mind that e-mail regulations and other regulations may make this type of broad marketing spam. Other information brokers offer more generalized services, offering any information a business needs. Some information brokers offer information exclusively to certain industries or investors. For this reason, it is often useful to see "information brokers" as something of an umbrella term.

It is important to know that information brokers can do more than collect online data. They can search public records or visit a local library to comb through materials there. Perhaps most importantly, they can, if needed, conduct phone research by interviewing people and then preparing a report based on those interviews. As one broker said in *Searcher* magazine, "The most desired information is, and will continue to be, in people's heads."

In their 2008 book, *Strategic Planning: How to Deliver Maximum Value Through Effective Business Strategy*, Robert Wittmann and Matthias P. Reuter recommend that small businesses do some preliminary research themselves and then hire information brokers to retrieve specific information that is not easily available. Doing some research up front can save small businesses some money and can also ensure that businesses approach information brokers with some facts in hand, streamlining the searches that need to be done and reducing overall information costs.

INITIAL PUBLIC OFFERINGS

An initial public offering (IPO) is the process through which a privately held company issues shares of stock to the public for the first time. Also known as "going public," an IPO transforms a business from a privately owned and operated entity into one that is owned by public stockholders. An IPO is a significant stage in the growth of many businesses, as it provides them with access to the public capital market and also increases their credibility and exposure. Becoming a public entity, however, also involves significant changes for a business, including a loss of flexibility and control for management. In some cases an IPO may be the only means left of financing rapid growth and expansion. The decision to go public is sometimes influenced by venture capitalists or founders who wish to cash in on their early investment.

Staging an IPO is a very time-consuming and expensive process. A business interested in going public must apply to the Securities and Exchange Commission (SEC) for permission to sell stock to the public. The SEC registration process is quite complex and requires the company to disclose a great deal of detailed information to potential investors. The IPO process can take as little as 6 months or as long as 2 years, during which time management's attention is distracted away from day-to-day operations. It can also cost a company roughly $750,000 in underwriting fees, legal and accounting expenses, and printing costs (larger IPOs can cost into the millions, however).

Overall, going public is an enormous undertaking that requires careful consideration and planning. Experts recommend that business owners consider all the alternatives first (such as securing venture capital, forming a limited partnership or joint venture, or selling shares through private placement), examine their current and future capital needs, and be aware of how an IPO will affect the availability of future financing.

According to Jennifer Lindsey in her book *The Entrepreneur's Guide to Capital*, the ideal candidate for an IPO is a small or medium-sized company in an emerging industry, with annual revenues of at least $10 million and a profit margin of over 10 percent of revenues. It is also important that the company have a stable management group, growth of at least 10 percent annually, and capitalization featuring no more than 25 percent debt. Companies that meet these basic criteria still need to time their IPO carefully in order to gain the maximum benefits. Lindsey suggested going public when the stock markets are receptive to new offerings, the industry is growing rapidly, and the company needs access to more capital and public recognition to support its strategies for expansion and growth.

Timing is especially critical. The recession of 2008 and 2009 essentially obliterated the IPO market, with many offerings placed on hold. Even in late 2009, when many analysts suggested the economy may be on an upswing, the domestic IPO market saw many deals priced below their anticipated ranges and several more IPOs postponed. Renewed economic strength, combined with reinvigorated investor interest, often signals a return to a more solid IPO environment.

ADVANTAGES OF GOING PUBLIC

The primary advantage a business stands to gain through an initial public stock offering is access to capital. In addition, the capital does not have to be repaid and does not involve an interest charge. The only reward that IPO investors seek is an appreciation of their investment and possibly dividends. Besides the immediate infusion of capital provided by an IPO, a business that goes public may also find it easier to obtain capital for future needs through new stock offerings or public debt offerings. A related advantage of an IPO is that it provides the business's founders and venture capitalists with an opportunity to cash out on their early investment. Those shares of equity can be sold as part of the IPO, in a special offering, or on the open market some time after the IPO. However, it is important to avoid the perception that the owners are seeking to bail out of a sinking ship, or the IPO is unlikely to be a success.

Another advantage of an IPO is increased public awareness of the company. This sort of attention and publicity may lead to new opportunities and new customers. As part of the IPO process, information about the company is printed in newspapers across the country and disseminated across the Internet. The excitement surrounding an IPO may also generate increased attention in

the business press. There are a number of laws covering the disclosure of information during the IPO process, however, so business owners must be careful not to get carried away with the publicity. A related advantage is that the public company may have enhanced credibility with its suppliers, customers, and lenders, which may lead to improved credit terms.

Yet another advantage of going public involves the ability to use stock in creative incentive packages for management and employees. Offering shares of stock and stock options as part of compensation may enable a business to attract better management talent and to provide them with an incentive to perform well. Employees who become part-owners through a stock plan may be motivated by sharing in the company's success. Finally, an initial public offering provides a public valuation of a business. This means that it will be easier for the company to enter into mergers and acquisitions, because it can offer stock rather than cash.

DISADVANTAGES OF GOING PUBLIC

The biggest disadvantages involved in going public are the costs and time involved. Experts note that a company's management is likely to be occupied with little else during the entire IPO process, which may last as long as 2 years. The business owner and other top managers must prepare registration statements for the SEC, consult with investment bankers, attorneys, and accountants, and take part in the personal marketing of the stock. Many people find this to be an exhausting process and would prefer simply to run their company.

An IPO is extremely expensive. In fact, it is not unusual for a business to pay between $200,000 and $1,000,000 to prepare and publicize an offering. In his article in *The Portable MBA in Finance and Accounting*, Paul G. Joubert noted that a business owner should not be surprised if the cost of an IPO claims between 15 and 20 percent of the proceeds of the sale of stock. Some of the major costs include the lead underwriter's commission; out-of-pocket expenses for legal services, accounting services, printing costs, and the personal marketing "road show" by managers; 0.02 percent filing costs with the SEC; fees for public relations to bolster the company's image; plus ongoing legal, accounting, filing, and mailing expenses. Despite such expense, it is always possible that an unforeseen problem will derail the IPO before the sale of stock takes place (the collapse of Lehman Brothers in late 2008 was one such derailment, after which the IPO market froze up for more than a year). Even when the sale does take place, most underwriters offer IPO shares at a discounted price in order to ensure an upward movement in the stock during the period immediately following the offering. The effect of this discount is to transfer wealth from the initial investors to new shareholders.

The Sarbanes-Oxley Act of 2002 (SOX) placed further regulatory hurdles on businesses intending to file public offerings. Passed in the wake of the corporate scandals involving such firms as Enron, Tyco International, and WorldCom, SOX effectively created an accounting oversight board for public companies. It also strengthened corporate responsibility efforts, required enhanced financial disclosures, set up corporate and criminal fraud accountability standards, and expanded on white-collar crime penalties. In many ways, SOX made the IPO an even more difficult process for business owners, especially after the recession of 2008 and 2009, wrote Steve Schaefer in *Forbes*: "Don't expect the IPO market to retreat to its bubble-happy ways of the late-90s though. Regulatory hurdles like Sarbanes-Oxley have made the IPO process far more rigorous than it was in the days of the tech bubble, and some management teams have no interest in taking their businesses to the public market."

Other disadvantages to filing involve the public company's loss of confidentiality, flexibility, and control. SEC regulations require public companies to release all operating details to the public, including sensitive information about their markets, profit margins, and future plans. An untold number of problems and conflicts may arise when competitors and employees know all about the inner workings of the company. By diluting the holdings of the company's original owners, going public also gives management less control over day-to-day operations. Large shareholders may seek representation on the board and a say in how the company is run. If enough shareholders become disgruntled with the company's stock value or future plans, they can stage a takeover and oust management. (Billionaire activist investor Carl Icahn is the extreme example, having spent decades pursuing corporate hostile takeovers and board proxy fights.) The dilution of ownership also reduces management's flexibility. It is not possible to make decisions as quickly and efficiently when the board must approve all decisions. In addition, SEC regulations restrict the ability of a public company's management to trade their stock and to discuss company business with outsiders.

Public entities also face added pressure to show strong short-term performance. Earnings are reported quarterly, and shareholders and financial markets always want to see good results. Unfortunately, long-term strategic investment decisions may tend to have a lower priority than making current numbers look good. The additional reporting requirements for public companies also add expense, as the business will likely need to improve accounting systems and add staff. Public entities also encounter added costs associated with handling shareholder relations.

THE PROCESS OF GOING PUBLIC

Once a business has decided to go public, the first step in the IPO process is to select an underwriter to act as an intermediary between the company and the capital markets. Joubert recommended that business owners solicit proposals from a number of investment banks, then evaluate the bidders on the basis of their reputation, experience with similar offerings, experience in the industry, distribution network, record of post-offering support, and type of underwriting arrangement. Other considerations include the bidders' valuation of the company and recommended share price.

There are three basic types of underwriting arrangements: best efforts, which means that the investment bank does not commit to buying any shares but agrees to put forth its best effort to sell as many as possible; all or none, which is similar to best efforts except that the offering is canceled if all the shares are not sold; and firm commitment, which means that the investment bank purchases all the shares itself. The firm commitment arrangement is probably best for the small business, since the underwriter holds the risk of not selling the shares. Once a lead underwriter has been selected, that firm will form a team of other underwriters and brokers to assist it in achieving a broad distribution of the stock.

The next step in the IPO process is to assemble an underwriting team consisting of attorneys, independent accountants, and a financial printer. The attorneys for the underwriter draft all the agreements, while the attorneys for the company advise management about meeting all SEC regulations. The accountants issue opinions about the company's financial statements in order to reassure potential investors. The financial printer handles preparation of the prospectus and other written tools involved in marketing the offering.

After putting together a team to handle the IPO, the business must then prepare an initial registration statement according to SEC regulations. The main body of the registration statement is a prospectus containing detailed information about the company, including its financial statements and a management analysis. The management analysis is perhaps the most important and time-consuming part of the IPO process. In it, the business owners must simultaneously disclose all of the potential risks faced by the business and convince investors that it is a good investment. This section is typically worded very carefully and reviewed by the company's attorneys to ensure compliance with SEC rules about truthful disclosure.

The SEC rules regarding public stock offerings are contained in two main acts: the Securities Act of 1933 and the Securities Act of 1934. The former concerns the registration of IPOs with the SEC in order to protect the public against fraud, while the latter regulates companies after they have gone public, outlines registration and reporting procedures, and sets forth insider trading laws. Upon completion of the initial registration statement, it is sent to the SEC for review. During the review process, which can take up to 2 months, the company's attorneys remain in contact with the SEC in order to learn of any necessary changes. Also during this time, the company's financial statements must be audited by independent accountants in accordance with SEC rules. This audit is more formal than the usual accounting review and provides investors with a much higher degree of assurance about the company's financial position.

Throughout the SEC review period which is sometimes called the "cooling off" or "quiet" period the company also begins making controlled efforts to market the offering. The company distributes a preliminary prospectus to potential investors, and the business owners and top managers travel around to make personal presentations of the material in what are known as "road shows." It is important to note, however, that management cannot disclose any further information beyond that contained in the prospectus during the SEC review period. Other activities taking place during this time include filing various forms with different states in which the stock will be sold (the differing state requirements are known as "blue sky laws") and holding a due diligence meeting to review financial statements one last time.

At the end of the cooling off period, the SEC provides comments on the initial registration statement. The company then must address the comments, agree to a final offering price for the shares, and file a final amendment to the registration statement. Technically, the actual sale of stock is supposed to become effective 20 days after the final amendment is filed, but the SEC usually grants companies an acceleration so that it becomes effective immediately. This acceleration grows out of the SEC's recognition that the stock market can change dramatically over a 20-day period. The actual selling of shares then takes place, beginning on the official offering date and continuing for 7 days. The lead investment banker supervises the public sale of the security. During the offering period, the investment bankers are permitted to "stabilize" the price of the security by purchasing shares in the secondary market. This process is called pegging, and it is permitted to continue for up to 10 days after the official offering date. The investment bankers may also support the offering through over-allotment, or selling up to 15 percent more stock when demand is high.

After a successful offering, the underwriter meets with all parties to distribute the funds and settle all expenses. At that time the transfer agent is given authorization to forward the securities to the new owners. An IPO closes with the transfer of the stock, but the terms of the offering are not yet completed. The SEC requires the filing of a number of reports pertaining to the appropriate use of the funds as

described in the prospectus. If the offering is terminated for any reason, the underwriter returns the funds to the investors.

IMPROVING THE PROSPECTS FOR A SUCCESSFUL IPO

For most businesses, the decision to go public is made gradually over time as changes in the company's performance and capital needs make an IPO seem more desirable and necessary. But many companies still fail to bring their plans to sell stock to completion due to a lack of planning. In an article for *Entrepreneur* David R. Evanson outlined a number of steps business owners can take to improve the prospects of an IPO long before their companies formally consider going public. One step involves assessing and taking action to improve the company's image, which will be scrutinized by investors when the time comes for an IPO. It is also necessary to reorganize as a corporation and begin keeping detailed financial records.

Another step business owners can take in advance to prepare their companies to go public is to supplement management with experienced professionals. Investors like to see a management team that generates confidence and respect within the industry, and that can be a source of innovative ideas for future growth. Forming this sort of management team may require a business owner to hire outside of his or her own local network of business associates. It may also involve setting up lucrative benefit plans to help attract and retain top talent. Similarly, the business owner should set about building a solid board of directors that will be able to help the company maximize shareholder value once it has become a public entity. It is also helpful for the business owner to begin making contacts with investment banks, attorneys, and accountants in advance of planning an IPO.

Businesses interested in eventually going public are advised to begin acting like a large corporation well in advance of an IPO. Although many deals involving small businesses are sealed with an informal handshake, investors like to see a pattern of formal, professional contracts with customers, suppliers, and independent contractors. They also favor formal human resource programs, including hiring procedures, performance reviews, and benefit plans. It is also important for businesses to protect their unique products and ideas by applying for patents and trademarks as needed. All of these steps, when taken in advance, can help to smooth a business's passage to becoming a public entity.

The pace of IPOs reached a peak in 1999, when a record 509 companies went public, raising an unprecedented $66 billion. IPO fever was fueled by "dot-coms," or new, Internet-based companies, which accounted for 290 of the initial public stock offerings that year. These fledgling companies went public to take advantage of a unique climate in the stock market, as giddy investors trying to catch the next Internet fad did not demand much in terms of profitability. New, Internet-based companies with limited track records were able to use the public markets as a form of venture capital. In fact, new issues of stock in dot-coms jumped an average of 70 percent on their first day of trading in 1999. By the middle of 2000, however, drops in the tech-heavy National Association of Securities Dealers Automated Quotation (NASDAQ) made investors more cautious and dramatically changed the situation for Internet IPOs. Studies showed that 40 percent of high-tech IPOs were trading below their original offering price by that time. As a result, fifty-two companies decided to cancel or postpone their IPOs in the first 6 months of 2000. During the first 10 months of 2005, 147 IPOs took place, fewer than took place in 2004 (331) but almost twice as many as there had been in 2003 (75). The economic collapse and resulting recession of 2008 and 2009 took an even heavier toll on the IPO market. Schaefer noted that one IPO analyst characterized a healthy IPO market as one that introduces fifteen to twenty offerings each month "... a level it took six months to reach in 2009," Schaefer wrote. In 2010 the IPO market got off to a slightly more optimistic start, with thirty-six filings reported between January 1 and March 5 (and ten withdrawn or postponed during the same period). Business owners must keep a close eye on market conditions and make sure their companies are well positioned and show a strong chance of long-term viability before engaging in an IPO.

INNOVATION

Innovation is the basic driving force behind entrepreneurship and the creation of small businesses. When an individual comes up with an idea that has not previously been explored, or a niche that larger businesses have not been able to exploit, he or she may be able to turn that idea into a successful business venture. "Ideas are the fuel that keep entrepreneurial fires blazing," I. Satya Sreenivas wrote in *Business Journal.* "Savvy entrepreneurs realize the fact that ideas can originate from anywhere at any time, and a random idea could be more worthwhile than a well-researched project."

Of course, not every new idea has the potential to become a successful business. And in many cases, individuals with good, marketable ideas fail to come up with the capital needed to turn their ideas into reality. But innovation is still a necessary first step for small-business success in many instances. Moreover, entrepreneurs cannot afford to stop innovating once they have established a successful business. Innovation applies not only to new business and product ideas, but also to the internal workings of a company. Successful business owners continually innovate with regards to internal systems and processes in order to create and sustain a source of competitive advantage. "The global economy requires that companies generate an unending stream of new products, systems, technologies, and services," Claus Weyrich wrote in *Electronic News.* "And innovation has to be applied to things other than products."

According to Weyrich, sustaining innovation in a business organization requires an understanding of the company's core competencies, an innovative corporate culture, and a systematic approach. He described three phases in the innovation process: 1) the invention phase, in which ideas are generated; 2) the implementation phase, in which the best ideas are selected and developed further; and 3) the market penetration phase, in which ideas are exploited for commercial gain. This process is an ongoing one, with feedback used to close the loop.

Analysts agree that companies of all sizes need to place innovation into a broader context than just traditional research and development. The process of innovation needs to be managed in a structured way. "Companies need to establish a seamless innovation process an enterprise-wide exchange of ideas that will ensure that the information and expertise required to create, market, and service breakthrough products is available and accessible to those who need it," *Chemical Week* contributor Ken Cottrill explained. "If all the people able to extract value from a new product or technology are in the information loop, there is a smaller chance that opportunities will be squandered." Making use of the information resources available within a company allows employees to benefit from "corporate memory." They are better able to focus on innovation because they know where others have been before them.

Innovation is something that takes time, quite literally. To be innovative, people need time to clear their minds, to read about interesting and unrelated fields, and to ponder these things in a non-urgent environment. According to a *Harvard Business Review* study titled "Creativity Under the Gun," people are rarely creative when they are under deadline. "When creativity is under the gun, it usually ends up getting killed. Our study indicates that the more time pressure people feel on a given day, the less likely they will be to think creatively." What is needed to jumpstart the process of innovation is time away from the day-to-day pressures of multitasking. Managers should avoid extreme time pressure when possible and should try to structure work for others so that they too may avoid working under deadline at least part of the time. Part of any program designed to stimulate innovation must be a measure of free time. After all, complex cognitive processing takes time.

It is important to include the whole company in the innovation process, because the germ of an idea can come from anywhere, and the best ideas often grow out of a combination of functional areas. Establishment of a network structure can provide a framework for this desired innovation. A network structure includes cross-functional groups within the company, cross-links between the various groups, and can even include linkages with external parties such as customers and suppliers. "Companies of all sizes can adopt this approach to innovation," said Cottrill. "There is no standard blueprint for these networks, because they are shaped by a company's business goals and organizational structure. However, the individuals who make

up these groups are unified by a common mission and are in regular communication."

Gaining a better understanding of a company's customers can be an enormously effective step in creating a more innovative business. Many small-business owners have an intimate knowledge of their customers, as well as clear metrics, clear direction, and the flexibility to quickly change course if necessary, wrote Andrew Waldeck and Renee Hopkins Callahan in *Forbes*. "Small companies should realize that their close customer connection provides a great springboard for innovation," Waldeck and Callahan continued. "A customer problem is an opportunity to sell that customer another solution. They are responsive, iterative and flexible."

Small businesses face a number of obstacles on the road to effective innovation, the most obvious being limited financial, knowledge, and manpower resources. That does not have to stop innovation, however. Waldeck and Callahan explained that while many small businesses feel they lack sufficient resources to innovate, constraints, in fact, can help innovation. An overabundance of time, money, and people can kill innovation more easily than a lack of those resources, they contended, and small businesses have an edge over larger competitors in several ways: they connect with customers and understand how to frame the conversation around problem areas; they are iterative with regard to strategy and planning to maintain flexibility; they are often open to experimentation with new business models; and because they have limited resources, they do not run into the temptation to throw endless amounts of money, time, and manpower at innovation efforts.

Still, some resources are necessary to innovate. In recent years the federal government has stepped in with a number of innovation resources available specifically to small businesses. The U.S. Small Business Administration administers two competitive programs aimed at helping small-business owners the Small Business Innovation Research (SBIR) program and the Small Business Technology Transfer (STTR) program. Both programs give small businesses a chance to win grants to participate in research and development efforts on behalf of the federal government.

INSURANCE POOLING

Insurance pooling is a practice wherein a group of small firms join together to secure better insurance rates and coverage plans by virtue of their increased buying power as a block. This practice is primarily used for securing health and disability insurance coverage. Those doing insurance pooling are often referred to as insurance purchasing cooperatives.

Small businesses have long complained that insurers hand out discounts to big clients, who have substantial purchasing power and large numbers of employees, and that those insurers too often try to make up those discount losses by hiking rates for their smaller clients. Unable to buy good coverage on their own, smaller companies were forced to rely on pooling plans created and managed by trade associations or other affiliated business groups, or pass on providing coverage altogether. However, another alternative, in which private businesses band together and organize their own pools, has since emerged. Distinct entities have been created to address both health and disability coverage needs.

HEALTH INSURANCE POOLS

Health insurance coverage has long been a difficult benefit for many small businesses to incorporate into their compensation packages. Premiums for even modest health packages constitute a significant outlay for small businesses, and increases in premiums and deductibles attributable to employee illness have resulted in many owners being faced with the unpleasant choice of placing their business at financial risk or ending health insurance for their employees. "Insurers had come to evaluate small firms separately by such factors as claims experience, worker's health status, and even type of business," explained *Nation's Business*. "As a result, many small companies couldn't buy health insurance at any price. Those that did have coverage lived in fear of a single serious illness because it could trigger skyrocketing rates or cancellation of coverage."

Health insurance pools, which are also sometimes called insurance purchasing alliances or health insurance

purchasing co-ops, were originally created to address this problem. They provide group health policies exclusively to small businesses. Rules governing these alliances vary from state to state, with some states offering eligibility to sole proprietorships and others providing coverage to businesses with up to 100 employees. On average, however, these health insurance pools target employers of two to fifty people.

Small businesses that join one of these pools can typically count on the following benefits:

1. A community premium rate that is significantly lower than any individual rate it could demand, because the membership gains collective leverage that forces insurance carriers to modify premium and deductible demands
2. In many cases, premium increases are capped for the first several years of the policy
3. Centralized administration of the policy among all of the companies covered under it, which results in savings in work hours and paperwork
4. Standard rates and benefits that do not fluctuate according to company size or work force health history
5. Selection of plans from multiple insurers (some plans allocate plan selection power exclusively with employers, while others allow workers to select from a menu of plans)

First tried in California in the early 1990s, these types of pools have since spread to other states. Analysts warn, however, that the rules and regulations governing health insurance pools vary considerably from state to state, and note that the laws of a number of states make it unlikely that these alliances will make an appearance within their borders any time soon.

Health insurance purchasing co-ops face other barriers to offering competitive health insurance rates. These include state regulations setting standards for premiums that limit cost savings that can be negotiated; lack of interest or hostility among health plan providers toward a co-op's ability to lure the smallest employers; and insufficient economies of scale that leave co-ops with inadequate negotiating leverage. The number of sick employees can also be pivotal. PacAdvantage, a 6,000-member purchasing co-op in California, closed its doors in 2006 when the cost to care for sick employees at member firms could not be supported by the premiums the co-op charged. As a result, 110,000 people (some very sick) were left to find insurance in the small group or individual markets.

However, several co-ops have surmounted common obstacles to become industry examples. One such co-op, the Cleveland-based Council of Smaller Enterprises, offers access to twenty-five unique health plans for 17,000 area businesses. Each member business can offer up to five plans to employees, and the co-op estimates it saves members $45 million each year in premium costs.

DISABILITY INSURANCE POOLS

Disability insurance pools, also called risk- purchasing groups, operate under the same guiding principles as health insurance alliances. By joining together into one single negotiating group, small businesses can increase their bargaining power when dealing with insurers. These groups are usually composed of companies that hail from the same industry sector and thus face many of the same disability risks.

These disability insurance pools arose in the aftermath of the 1981 Products Liability Risk Retention Act, which for the first time permitted the formation of risk-purchasing groups. The 1986 Risk Retention Act followed up on the original act's provisions to cover all forms of commercial liability insurance, not just products liability. The legislation was an effort to address the growing inability of small-business owners to obtain liability insurance because of its rapidly growing cost. "Risk-retention groups enable companies in the same industry, such as plastics or chemicals, to cut insurance costs by forming what are, in effect, mini insurance companies to self-insure against liability claims," explained Lynn Woods in *Nation's Business*. "Risk-purchasing groups, on the other hand, permit group purchasing of liability coverage."

Interestingly, insurance companies have been among the biggest boosters of this type of disability coverage arrangement. Woods pointed out that "insurance companies find risk-purchasing groups attractive prospects because the companies can save costs in two ways by using a single agent or broker for multiple states and by tailoring a policy for a group based on a similar level of risk."

INTELLECTUAL PROPERTY

Intellectual property (IP) encompasses the intangible assets of a business such as patents, copyrights, trademarks, trade secrets, and unique business practices. Examples of intellectual property include:

- an author's copyright on a book or article
- a distinctive logo design representing a soft drink company and its products
- unique design elements of a Web site
- a patent on a particular process; for example, to manufacture chewing gum.

Intellectual property law covers the protection of copyrights, patents, trademarks, and trade secrets, as well as other legal areas such as unfair competition. In effect, intellectual property laws give the creator of a new and unique product or idea a temporary monopoly on its use. The value of intellectual property to an individual or company is not based on physical properties, such as size and structure. Instead, intellectual property is valuable because it represents ownership and an exclusive right to use, manufacture, reproduce, or promote a unique creation or idea. In this way, it has the potential to be one of the most valuable assets a person or small business can own.

Globally and in the United States, the importance and value of a firm's intellectual property has been increasing over the past few decades. The overall movement in America from a manufacturing to a service economy has shifted the emphasis from tangible assets (factories, warehouses) to intangible assets. Even large and small American firms that are still in the manufacturing business often outsource the actual production to other countries, most notably China. This means the firm's greatest asset is its IP portfolio.

The rise of computers and information technology has also boosted the importance of intellectual property. For most software and information technology firms, the value of their tangible assets is dwarfed in comparison to the value of their IP holdings. In addition, the advent of Web commerce allows an individual with an entrepreneurial idea to create a Web site and begin business operations. Almost the entire value of a small firm such as this resides in its intellectual property.

With IP so important in the business world, it should come as no surprise that nations place great importance on IP protection. According to the U.S. Department of State, countries protect IP "because they know safeguarding these property rights fosters economic growth, provides incentives for technological innovation, and attracts investment that will create new jobs and opportunities for all their citizens."

The laws protecting intellectual property in the United States exist at both the state and federal levels. State laws cover a broad spectrum of intellectual property fields, from trade secrets to the right of publicity. The laws differ somewhat from state to state. At the federal level, the Constitution and legislation authorized under the Constitution deal exclusively with patents and copyrights, and partially with trademarks and related areas of unfair competition.

HISTORY OF INTELLECTUAL PROPERTY LAWS

When the United States was founded, intellectual property was not a major issue, although it was discussed. For instance, while prominent politician James Madison believed that some protection should be granted to books and inventions, he also stated: "Monoplies tho' in certain cases useful ought to be granted with caution, and guarded with strictness agst abuse." The Patent Act of 1790 granted an individual with the exclusive use and license of his invention for a period of 14 years.

Intellectual property protection became an important issue at an international level during trade and tariff negotiations in the nineteenth century, and has remained so ever since. One of the first international treaties relating to intellectual property in the broadest sense was the 1883 International Convention for the Protection of Industrial Property, which was held in Paris. Also known as the Paris Convention, the treaty created there provided protection for such properties as patents, industrial models and designs, trademarks, and trade names. More than 100 countries have signed the Paris Convention treaty, and it has been modified several times. Two of the most important provisions of the treaty relate to the rights of national treatment and priority.

The right of national treatment ensures that those individuals seeking a patent or trademark in a foreign country will not be discriminated against and will receive the same rights as a citizen of that country. The right of priority provides an inventor 1 year from the date of filing a patent application in his or her home country (6 months for a trademark or design application) to file

an application in a foreign country. The legal, effective date of application in the foreign country is then retroactively the legal, effective filing date in the home country, provided the application is made within the protection period. If the invention is made public prior to filing the home country application, however, the right of priority in a foreign country is no longer applicable.

Many U.S. and international laws relating to intellectual property were significantly altered with the 1994 passage of the General Agreement on Tariffs and Trade (GATT). In fact, the member nations that signed the GATT committed themselves to a higher degree of intellectual property protection than had been provided under any earlier multinational treaties. Under the guidance of the World Trade Organization (WTO), all member nations were required to adopt specific provisions for the enforcement of rights and settlement of disputes relating to intellectual property. Under these provisions, trademark counterfeiting and commercial copyright piracy are subject to criminal penalties.

GROWTH OF THE IP MARKET

As the importance of IP has increased, so have the number of patent applications.

Total U.S. Patent Applications, by Year

Year	Patent Applications
1980	112,379
1984	120,276
1988	151,491
1992	186,507
1996	211,013
2000	315,015
2004	382,139
2008	485,312

As IP gained in importance relative to a firm's value, companies began managing their patent licenses more aggressively, seeking to maximize the value of their firm's IP assets. For example, IBM created an IP asset management plan in the 1990s and saw its revenue from this branch increase from $30 million a year to over $1.5 billion in 2000, according to some estimates. Accounting group Ernst & Young estimated that the American patent licensing market was roughly $110 billion in 2000, but that it would grow to $500 billion by 2015.

As the IP licensing market grew, new types of business entities emerged. One of these entities is derisively named a "patent troll." The term was coined by Peter Detkin, then a lawyer at corporate giant Intel. Understood from the perspective of a large company, a patent troll is an entity that creates no products and has no customers but holds patent licenses nevertheless. The troll makes money by threatening actual operating companies with patent infringement lawsuits in order to prompt them to pay settlement fees. A patent infringement lawsuit often includes a work-stop injunction. Because a patent troll has no actual business operations, the work-stop injunction does not affect it adversely; however, a work-stop injunction is an effective threat to an operating business. Operating companies often find it preferable to pay a settlement to a patent troll to avoid a lengthy work stoppage and possible high legal fees.

Small companies, entrepreneurs, and inventors have a different view of the "patent troll" phenomenon. A small company seeking to defend its licenses might be labeled a patent troll by a much larger company. What the term best illustrates is the idea that patent licenses are being aggressively pursued by all manner of entities, and that companies seeking to enter new business fields need to take precautions to fend off possible IP infringement claims.

IP brokerages offer businesses the services they need to protect themselves. A firm seeking to enter a new business field can contact a brokerage specializing in that area. The broker would then match the firm's needs with licenses for the proper patents. By using a broker, the firm (the "buyer") wards off any potential IP infringement suits, and the patent holder (the "seller") receives value for his or her license. While this arrangement has obvious benefits, there are drawbacks as well. Purchase of a particular patent does not guarantee freedom from lawsuits, and the use of a broker typically inflates the overall licensing price.

An alternative to using an IP broker is to buy into a patent pool or consortium. A patent pool is a company devoted solely to purchasing patents, most often in a particular industry or industries. The patent-pooling firm then offers annual memberships to companies operating in that industry. This fee allows them to use all the patents that the pooling firm controls. One such firm, RPX Corporation, has members such as Cisco, Samsung, and TiVo. (Interestingly enough, another such firm, Intellectual Ventures, has Peter Detkin of "patent troll" fame as a managing director.)

While IP licensing seems to be a booming market, there are some indications that this trend might not continue. For instance, a 2006 U.S. Supreme Court ruling (*eBay v. MercExchange*) denied a work-stop injunction against an operating company if the other company (the presumed "patent troll") had no operations in that area. This removed a key component of the patent troll lawsuit approach. Another Supreme Court case, pending as of 2009, could have even greater ramifications. The case, known as *Bilski* concerns the issuing patents for business methods. A Federal Circuit court ruled in 2008 that a patentable method must be tied to a particular machine or apparatus, or must produce

some observable change in an item. Abstract methods (as, for instance, a method for teaching or a method for picking which stocks to invest in) would not be eligible for patents, according to this decision. The U.S. Supreme Court hearings on the case were completed on November 9, 2009. If the Supreme Court upholds the Federal Circuit Court decision, thousands of business method patents could be invalidated. Litigation and patent creation in the area of business methods would subsequently dwindle, thereby lessening the overall IP marketplace.

IMPORTANCE OF INTELLECTUAL PROPERTY PROTECTION

Quite often, the amount of IP protection in a particular country is determined by whether or not it is a net importer or exporter of technology. China, for example, has been a net importer of IP for many years, paying around $2 billion annually in licensing and royalties to American firms, according to the U.S. Bureau of Economic Analysis. Many believe this amount should be even higher. During the early twenty-first century there have been numerous complaints regarding Chinese abuses of IP rights in a host of industries. Several Chinese automobile models look suspiciously like American, Japanese, and European models, and pirated DVDs are common throughout the country, to name just two examples. Yet the situation with counterfeit DVDs is similar to what occurred in the American publishing industry in the nineteenth century, when America was a net importer of IP. On a tour of the United States, English novelist Charles Dickens complained bitterly and often about the fact that American publishers printed and sold thousands of copies of his books and never paid him a cent.

In contrast, the strong protections of intellectual property are now recognized as one of the cornerstones of the formation and growth of small businesses in the United States, especially since the advent of the Internet and other new technologies have placed a premium on new ideas and innovations. Intellectual property allows individuals who come up with a new idea to enjoy the exclusive use of that idea for a certain period of time, which can be a significant monetary incentive for entrepreneurs.

However, intellectual property law is extraordinarily complex, so small- business owners interested in IP issues should consult a legal expert in order to protect themselves to the full extent of the law. "The law on intellectual property... is everywhere both comparatively new and in flux," observed the U.S. edition of the *Economist.*

INTEREST RATES

Lenders profit by arranging for the borrower to pay back an additional amount of money over and above the sum that they borrow. This difference between what is lent

and what is returned is known as interest. The interest on a loan is determined through the establishment of an interest rate, which is expressed as a percentage of the amount of the loan.

Borrowing is a staple in many areas of the U.S. economy. This has resulted in a dizzying array of borrowing arrangements, many of which feature unique wrinkles in the realm of interest rates. Common borrowing and lending arrangements include business and personal loans (from government agencies, banks, and commercial finance companies), credit cards (from corporations), mortgages, various federal and municipal government obligations, and corporate bonds. In addition, interest is used to reward investors and others who place money in savings accounts, individual retirement accounts (IRAs), certificates of deposit (CDs), and many other financial vehicles.

The recession of 2008 and 2009 severely limited the volume of small-business loans in the United States. While large firms were able to tap investor money via the corporate bond market, many small-business owners could only look to banks, many of which were wary of lending to businesses they considered more of a gamble. The crisis prompted the administration of President Barack Obama to unveil new small-business proposals, including a $30 billion fund, aimed at loosening bank loans. Banks that were the largest recipients of federal bailout money (from the Emergency Economic Stabilization Act of 2008) nonetheless reduced small-business loans by $12.5 billion during a 7-month period in 2009. As a result, many small businesses sought alternative financing (considerably more expensive than traditional bank loans) or simply stopped looking for capital until the economy brightened. Meanwhile, some lawmakers proposed taxing banks that received more than $50,000 in stimulus funds, the proceeds of which would finance small-business lending.

TYPES OF INTEREST RATES

The "prime rate" is probably the best-known interest rate. It is the rate at which commercial banks lend money to their best, most creditworthy customers. However, in order to track interest rates logically, one should start with the Federal Reserve's "discount rate." The discount rate is the interest rate that banks are charged when they borrow money overnight from one of the Federal Reserve Banks. Each of the twelve Federal Reserve Banks is a part of the nation's central bank and plays a part in setting the monetary policy of the United States.

Commercial banks pass along the cost of borrowing money when they establish the rates at which they lend money. One factor in establishing those rates is the discount rate established by the Federal Reserve Bank, although other factors play into the calculation. The prime rate is the lowest rate at which commercial banks lend. Although often thought of as a set interest rate, the prime lending rate is not actually a uniform rate. National City Bank may, for example, have one rate while Town Bank has a slightly different rate. As a result, the most widely quoted prime rate figure in the United States is the one published in the *Wall Street Journal*. It publishes an average rate that results from polling the nation's thirty largest banks; when twenty-three of those institutions have changed their prime rates, the *Wall Street Journal* responds by updating the published rate. The prime rate is so well known primarily because it is used as a basis for calculating other interest rates.

Other important interest rates that are used in making capital investment decisions include:

- Commercial Paper Rate. These are short-term discount bonds issued by established corporate borrowers. These bonds mature in 6 months or less.
- Treasury Bill Rate. A Treasury bill is a short-term (1 year or less) risk-free bond issued by the U.S. government. Treasury bills are made available to buyers at a price that is less than its redemption value upon maturity.
- Treasury Bond Rate. Unlike the short-term Treasury bills, Treasury bonds do not mature for at least 1 year, and most of them have a duration of 10 to 30 years. The interest rates on these bonds vary depending on their maturity.
- Corporate Bond Rate. The interest rate on long-term corporate bonds can vary depending on a number of factors, including the time to maturity (20 years is the norm for corporate bonds) and risk classification.

How interest rates are established, why they fluctuate, and why they vary from lender to lender and borrower to borrower are complicated matters. "Real" and "nominal" are two banking terms that will be helpful to know in regard to interest rates. The "real" interest rate on a loan is the current interest rate minus inflation. It is, in essence, the effective rate for the duration of the loan. The "nominal" interest rate is the rate that appears on the loan agreements, the stated rate that does not account in any way for inflation.

FACTORS THAT INFLUENCE INTEREST RATES

Interest rate levels are determined by the laws of supply and demand and fluctuate as supply and demand change. In an economic environment in which demand for loans is high, lending institutions are able to command more lucrative lending arrangements. Conversely, when banks and other institutions find that the market for loans is a tepid one (or worse), interest rates are typically lowered accordingly to encourage businesses and individuals to take out loans.

Interest rates are a key instrument of U.S. fiscal policy. The Federal Reserve determines the interest rate at which the federal government will bestow loans, and banks and other financial institutions, which establish their own interest rates to parallel those of the "Fed," typically follow suit. This ripple effect can have a dramatic impact on the U.S. economy. In a recession, for instance, the Federal Reserve might lower interest rates in order to create an environment that encourages spending. In late 2009 and early 2010, for example, the Federal Reserve kept its prime short-term interest rate at 0.25 percent. Conversely, the Federal Reserve often implements interest rate hikes when its board members become concerned that the economy is "overheating" and prone to inflation.

By raising or lowering its discount interest rate on loans to banks, the Federal Reserve can make it attractive or unattractive for banks to borrow funds. By influencing the commercial bank's cost of money, changes in the discount rate tend to influence the whole structure of interest rates, either tightening or loosening money. When interest rates are high, "tight money" results. This means not only that borrowers have to pay higher rates, but that banks are more selective in judging the creditworthiness of businesses applying for loans. Conversely, when interest rates decline, "easy money" results, meaning it is both cheaper and easier to borrow. The monetary tools of the Federal Reserve work most directly on short-term interest rates. Interest rates charged for loans of longer duration are indirectly affected through the market's perception of government policy and its impact on the economy.

Another key factor in determining interest rates is the lending agency's confidence that the money and the interest on that money will be paid in full and in a timely fashion. Default risk encompasses a wide range of circumstances, from borrowers who completely fail to fulfill their obligations to those that are merely late with a scheduled payment. If lenders are uncertain about the borrower's ability to adhere to the specifications of the loan arrangement, they will often demand a higher rate of return or risk premium. Borrowers with an established credit history, on the other hand, qualify for what is known as the lower prime interest rate.

TERM STRUCTURE OF INTEREST RATES

The actual interest on a loan is not fully known until the duration of the borrowing arrangement has been specified. Interest rates on loans are typically figured on an annual basis, though other periods are sometimes specified. This does not mean that the loan is supposed to be paid back in a year; indeed, many loans especially in the realm of small business do not mature for 5 or 10 years, or even longer. Rather, it refers to the frequency with which the interest and "principal owed" the original amount borrowed are recalculated according to the terms of the loan.

Interest is usually charged in such a way that both the principal lent and the accrued interest are used to calculate future interest owed. This is called compounding. For small business owners and other borrowers, this means that the unpaid interest due on the principal is added to that base figure in determining interest for future payments. Most loans are arranged so that interest is compounded on an annual basis, but in some instances, shorter periods are used. These latter arrangements are more beneficial to the lender than to the borrower, for they require the borrower to pay more money in the long run.

While annual compound interest is the accepted measure of interest rates, other equations are sometimes used. The yield or interest rate on bonds, for instance, is normally computed on a semiannual basis, and then converted to an annual rate by multiplying by two. This is called simple interest. Another form of interest arrangement is one in which the interest is "discounted in advance." In such instances, the interest is deducted from the principal, and the borrower receives the net amount. The borrower thus ends up paying off the interest on the loan at the very beginning of the transaction. A third interest payment method is known as a floating- or variable-rate agreement. Under this common type of business loan, the interest rate is not fixed. Instead, it moves with the bank's prime rate in accordance with the terms of the loan agreement. A small-business owner might, for instance, agree to a loan in which the interest on the loan would be the prime rate plus 3 percent. Since the prime rate is subject to change over the life of the loan, interest would be calculated and adjusted on a daily basis.

THE INTEREST RATE AND SMALL BUSINESSES

Entrepreneurs and small-business owners often turn to loans in order to establish or expand their business ventures. Business enterprises that choose this method of securing funding, which is commonly called debt financing, need to be aware of all components of those loan agreements, including the interest.

Business consultants point out that interest paid on debt financing is tax deductible. This can save entrepreneurs and small-business owners thousands of dollars at tax time, and analysts urge business owners to factor those savings in when weighing their company's capacity to accrue debt. But other interest rate elements can cut into those tax savings if borrowers are not careful. Because interest paid on a loan is tax deductible, while other loan charges and fees are not, it may be in the best interest of a small-business owner to accept a loan with a slightly higher interest rate if it offers fewer handling charges than a similar

loan with a slightly lower interest rate but higher handling fees. The full impact of loan charges and interest rates over time should be made before deciding upon a lender.

Commercial banks remain the primary source of loans for small business firms in America, especially for short-term loans. Small business enterprises that are able to secure loans from these lenders must also be prepared to negotiate several important aspects of the loan agreement which directly impact interest rate payments. Both the interest rate itself and the schedule under which the loan will be repaid are, of course, integral factors in determining the ultimate cost of the loan to the borrower, but a third important subject of negotiation between the borrowing firm and the bank concerns the *manner* in which the interest on a loan is actually paid. There are three primary methods by which the borrowing company can pay back interest on a loan to a bank: a simple- or ordinary-interest plan, a discounted-interest plan, or a floating interest rate plan.

Securing long-term financing is more problematic for many entrepreneurs and small-business owners, and this is reflected in the interest rate arrangements that they must accept in order to secure such financing. Small businesses are often viewed by creditors as having an uncertain future, and making an extended-term loan to such a business means being locked into a high-risk agreement for a prolonged period. To make this type of loan, a lender will want to feel comfortable with the business, the quality of its management, and will want to be compensated for what it sees as higher-than-usual risk exposure. This compensation usually includes the imposition of interest rates that are considerably higher than those charged for short-term financing. As with short-term financing arrangements, interest on long-term agreements can range from floating interest plans to those tied to a fixed rate. The actual cost of the interest rate method that is ultimately chosen appears in interest rate disclosures (which are required by law) as a figure known as the annual percentage rate (APR).

INTERNAL REVENUE SERVICE (IRS)

The Internal Revenue Service (IRS) is the agency of the U.S. Department of the Treasury responsible for collecting federal taxes of all kinds. In addition to income taxes from individuals, companies and organizations, the IRS collects several other kinds of taxes, including Social Security, estate, excise, and gift taxes (they are not responsible for collecting taxes based on the revenue derived from the sale of alcohol, tobacco, or firearms). For the tax year 2008 the IRS reported processing more than 250 million tax returns in it's publication *2008 Data Book.* The net tax collected on these 2008 returns totaled $1.907 billion; 51 percent was from individual income taxes; 37 percent from employment taxes; 10 percent from corporate income taxes; and 3 percent from estate, gift, and excise taxes.

In addition to processing millions of tax returns each year, the Internal Revenue Service's responsibilities include enforcement of U.S. tax laws, distribution of forms and instructions necessary for the filing of tax returns, and provision of counseling for businesses and individuals subject to its regulations.

HISTORY OF THE IRS

The IRS was created by Congress in 1862. During its first years, its money-gathering activities were very modest. Until the Civil War, the United States gathered approximately as much money from customs duties as it did from taxation, and the federal government's financial needs were slight because it offered few programs for its citizens. In 1913 IRS responsibilities increased with the introduction of the federal income tax system. Since that time, the government has imposed steadily higher taxes on its citizenry to pay for national defense, social programs, transportation and other infrastructure, and other aspects of modern American society. As internal revenue gathering increased in scope during the past century, the IRS saw similar growth. In the mid-1990s the IRS employed approximately 86,000 workers. In 2000 it was reorganized into four operating divisions: wage and investment; small business and self-employed; large and mid-size business (those with assets greater than $5 million); and tax exempt and governmental entities. Further information on these divisions can be found on the official IRS Web site (www.irs.gov).

On a small percentage of the more than 250 million tax returns it processes annually, the IRS performs a more detailed tax return examination called an "audit." If an individual or business is audited, the IRS representative conducting the examination typically asks for proof of the various deductions and exemptions claimed on the tax return. Depending on how the audit unfolds, the IRS agent may ultimately decide that additional taxes are owed (or, less frequently, that the taxpayer actually paid too much). Taxpayers who object to these audit findings have the option of appealing to an independent division within the IRS specifically created to deal with such cases. If negotiations still do not satisfy the taxpayer, appeals can be filed in U.S. Tax Court or other federal courts, depending on the nature of the case.

SMALL BUSINESS AND THE IRS

The IRS sponsors several different programs designed to help entrepreneurs and small-business owners fulfill their revenue reporting and taxpaying obligations. These include the Small Business and Self-Employed Tax Center, which is designed to help small-business owners maneuver through the plethora of business tax issues that they face. The center offers information on small-business forms and publications; employer identification numbers; starting, operating, and closing a business; and employment tax fundamentals, among other topics.

The global economic crisis of 2008 and 2009 brought unprecedented challenges to small-business owners. As a result, Congress endeavored to provide tax relief for small businesses. One such proposal aimed to raise the limit on the tax deduction for trade or start-up expenditures from $5,000 to $20,000, according to *Tax-News.com.* For its part, the IRS ordered employees to exercise more leniency on people and businesses having trouble paying their taxes, and coordinated 1,000 open houses on Saturdays for taxpayers to meet in person with IRS representatives. The agency additionally extended a moratorium on penalizing businesses that failed to report transactions considered tax shelters.

THE CHANGING IRS

The rapidly changing face of technology and communications has presented small businesses and multinational corporations alike with a wide array of challenges. The IRS has not been immune to these changes. Indeed, the agency has struggled to modernize its operations, especially in the realm of aging computers, data input, and remittance processing. The agency took a large step toward modernizing tax returns by introducing the Electronic Federal Tax Payment System (EFTPS) in 2001. EFTPS enables taxpayers to log in to a proprietary Web site to enter tax information and make payments. Small businesses are able to take advantage of the system through their own financial institutions, although the IRS recommends checking with an institution to ensure eligibility of use.

With the spread of technologies that facilitate the electronic transfer of data, the data input portion of the IRS's processing task shrinks. The IRS has seen a steady increase in the numbers of tax returns that are filed electronically every year. According to the IRS's publication *2008 Data Book*, more than 100 million tax returns were filed electronically in that fiscal year. The trend towards electronic filing of tax returns is expected to continue. As technologies create new ways in which to pay bills and exchange data so too will the tools used by the IRS to collect taxes.

INTERNATIONAL EXCHANGE RATE

An international exchange rate, also known as a foreign exchange (FX) rate, is the price of one country's currency in terms of another country's currency. Foreign exchange rates are relative and are expressed as the value of one currency compared to another. When selling products internationally, the exchange rate for the two trading countries' currencies is an important factor. Foreign exchange rates, in fact, are one of the most important determinants of a country's relative level of economic health, ranking just after interest rates and inflation. Exchange rates play a vital role in a country's level of trade, which is critical to most every free market economy in the world. Consequently, exchange rates are among the most watched, analyzed, and manipulated economic measures.

Prior to 1971, foreign exchange rates were fixed by an agreement among the world's central banks called the Bretton Woods Accord. This agreement was entered into near the end of World War II. The world was in shambles and the Bretton Woods Accord was established to help stabilize the volatile situation by pegging the U.S. dollar to gold and all other currencies of the world to the U.S. dollar. In 1971 a new agreement was formulated to replace the Bretton Woods Accord, but it was short-lived. In 1973 the world's currencies began to be valued and exchanged based on a free-float system, a system still in place in the 2010s.

The free-float system is a default system of currency trading. It works strictly on supply and demand of currencies. There are no limits on how much currencies can appreciate or depreciate in value measured against other currencies. This can cause volatility, as market forces shift. For example, in 2009 net buyers of dollar assets became net sellers because of the growth in foreign and emerging markets coupled with the weakened U.S. economy. The excess of buyers for dollars contributed to the decline in the dollar that occurred during 2009.

Due to the uncertainty associated with the supply and demand system, central banks and governments have tried to regulate the values of their currencies, but it has become an increasingly costly proposition. Although no longer an official standard, the U.S. dollar remains the benchmark currency.

CURRENCY VALUE FACTORS

A number of factors influence exchange rates. These include all of the following:

- Relative rates of inflation
- Comparative interest rates
- Growth of domestic money supply
- Size and trend of a country's balance of payments
- Economic growth (as measured by the gross national product)
- Dependency on outside energy sources
- Central bank intervention

In addition to these measures of economic activity, the consensus perception of a majority of countries about the overall strength of one country's currency can have a strong impact on how that one country's currency is valued.

Economic events during a recession clearly demonstrate the impact economic factors can have on the value of a currency. In March 2008, for example, the U.S. dollar hit a 12-year low against the Japanese yen and a record low against the euro. The value of the dollar plummeted in the wake of U.S. financial crisis, bailouts, and fears that the Federal Reserve would cut interests rates.

THE FOREIGN EXCHANGE MARKET

As nations and their economies have become increasingly interdependent, the FX market has emerged as a global focal point. With estimated daily turonover reaching $3.98 trillion as of 2007, this is by far the world's largest market. In order to remain competitive in the world economy, it is vital to manage the risk of adverse currency fluctuations. In recent times, the worldwide trend has been toward the consolidation of markets and currencies, as in the case of the European Union.

The largest users of the FX market are commercial banks, which serve as intermediaries between currency buyers and sellers. Corporations and financial institutions also trade currencies, primarily to safeguard their foreign currency-denominated assets and liabilities against adverse FX rate movement. Banks and fund managers trade currencies to profit from FX rate movements. Individuals also are subject to fluctuating FX rates, most commonly when travelers exchange their native currency for a foreign one before embarking on a business trip or vacation.

When the Chicago Mercantile Exchange introduced trading in foreign currency futures in 1972, it enabled all currency market participants, including individual investors, to capitalize on FX rate fluctuations without having to make or take delivery of the actual currencies. Foreign currency futures offer risk management and profit opportunities to individual investors, as well as to small firms and large companies.

There are two types of potential users of foreign currency futures: the hedger and the speculator. The hedger seeks to reduce and manage the risk of financial losses that can arise from transacting business in currencies other than one's native currency. Speculators provide risk capital and assume the risk the hedger is seeking to transfer in the hope of making a profit by correctly forecasting future price movement.

THE EFFECT OF EXCHANGE RATE CHANGES ON BUSINESS

The results of companies that operate in more than one nation often must be "translated" from foreign currencies into U.S. dollars. Exchange rate fluctuations make financial forecasting more difficult for these companies, and also have a marked effect on unit sales, prices, and costs. For example, assume that current market conditions dictate that $1 can be exchanged for ¥125. In this business environment, an American auto dealer plans to import a Japanese car with a price of ¥2.5 million, which translates to a price of $20,000. If that dealer also incurred $2,000 in transportation costs and decided to mark up the price of the car by another $3,000, then the vehicle would sell for $25,000 and provide the dealer with a profit margin of 12 percent.

But if the exchange rate changed before the deal was made so that $1 was worth ¥100 in other words, if the dollar weakened or depreciated compared to the yen it would have a dramatic effect on the business transaction. The dealer would then have to pay the Japanese manufacturer $25,000 for the car. Adding in the same costs and mark up, the dealer would have to sell the car for $30,000, yet would only receive a 10 percent profit margin. The dealer would either have to negotiate a lower price from the Japanese manufacturer or cut his profit margin further to be able to sell the vehicle.

Under this FX scenario, the price of American goods would compare favorably to that of Japanese goods in both domestic and foreign markets. The opposite would be true if the dollar strengthened or appreciated against the yen, so that it would take more yen to buy $1. This type of exchange rate change would lower the price of foreign goods in the U.S. market and hurt the sales of U.S. goods both domestically and overseas.

INTERNET DOMAIN NAMES

An Internet domain name is a string of typographic characters used to describe the location of a specific location online. Formally known as the Uniform Resource Locator or URL, it is often considered to be the address of a certain Web site. Obtaining an Internet domain name is a vital step for small businesses hoping to establish a presence on the Internet. With the U.S. Census reporting e-commerce sales of $127 billion in 2007, up from $107 billion in 2006, having a strong Web presence can be vital for your business growth. "To be a major league team in the Internet game, your business will want a domain name of its own," Vince Emery wrote in *How to Grow Your Business on the Internet.* "These valuable intellectual assets... make the difference in your image between Internet pro and fumbling amateur. Your domain name is more than your address. It tells the world who you are and what you do." Businesses and individuals are registering domain names at high levels. In 2008 roughly eight million new .com domains were registered.

A typical domain name consists of several parts. As an example, consider an auto parts business with the domain www.spareparts.com. The letters "www." before the domain name mean that what follows describes the location of a site on the World Wide Web. The last two or three letters of a domain name or URL are known as its top-level domain. The top-level domain for the sample used earlier, www.spareparts.com, is *.com.* Some of the most common top-level domains include .com, which usually indicates a business or commercial site; .org, which generally describes a nonprofit, charity, or cultural organization site; .gov, which indicates a governmental site; and .net, which is most often used by network-related businesses. In 2010 roughly half of all domain names registered are .com sites, but Buy Domains reports that specialized domain extensions such as .biz, .museum, .name, .aera, .jobs, .net, .org, .travel and .tv could rise in value during the 2010s if .com sites become more and more limited or more expensive. Other common top-level domains are country codes, such as .us for United States and .au for

Australia. Small businesses can put as many subdomains as needed in front of their domain names. For example, the customer service department of the aforementioned auto parts business might be designated as www.service.spareparts.com.

Internet domain names are fairly easy and inexpensive to obtain. The process of registering a domain name involves searching to see if the desired name is already taken, filling out a form online, and paying a fee of around $35 for the first year. Maintaining the domain name requires a small annual fee. But small businesses may find it exceedingly difficult to secure the exact domain name they want. As Jacqueline Emigh noted in *Computerworld*, the supply of available domain names is dwindling rapidly, particularly in the popular .com top-level domain. In some cases, the best domain names are already being used by other individuals or firms. Some larger businesses will register several different domain names in case they might be needed in the future, or in order to protect themselves against competing sites. But in other cases, the best domain names are held by cybersquatters or cyberpirates. These individuals register a number of domain names that are likely to be coveted by businesses in hopes of selling them in the future for a significant profit. This practice has developed into a sort of low-level marketplace in which there are Web sites dedicated to trading purchasing and selling of registered domain names. One such Web-based trading business is located at www.sedo.com.

According to the *Daily Domainer*, the 2007 median sales price for the top 100 reported domain names sales increased from a median price of $124,000 in 2006 to $197,500 in 2007. Statistics also show that many popular domains are simply bought and sold with no development of the site. An estimated 31 percent of these popular domains lead to a developed site, with the majority of sites (55.28%) displaying Pay Per Click ads.

CHOOSING AND REGISTERING A DOMAIN NAME

For small businesses hoping to establish a presence on the World Wide Web, choosing an Internet domain name is nearly as important as choosing a company name. The name must fit the firm's overall marketing strategy and convey a positive message to potential customers. In addition to registering a domain name for the company's Web site, small-business owners might also consider registering the names of major products, important markets, or well-known slogans. As Bill Roberts explained in *Electronic Business*, small-business owners must make sure that the domain names they choose are not overly long and avoid unconventional spellings that may be difficult for people to remember. Since doing business on the Internet immediately exposes companies to international markets, it is also important to be careful of trademark infringement issues and cultural problems in other languages.

There are a number of ways to handle the registration of an Internet domain name. In most cases, an Internet Service Provider (ISP) can register a small business's domain name and maintain the company's Web site on its server. The ISP can conduct an online search to make sure that the domain name does not duplicate any existing name or infringe on the trademark of any other business. Although registering through an ISP can simplify the process for small businesses, it is important for the business to secure ownership of the domain name. Otherwise, it may be difficult to keep the domain name if the company decides to change ISPs.

Small-business owners can also register a domain name through Network Solutions Inc. (NSI), a private company which began registering names in 1993 through a cooperative agreement with the U.S. government. The process involves conducting a free online search, filling out a form on the NSI Web site (www.networksolutions.com), and paying a fee of approximately $35 for a single year of domain name ownership. Finally, small businesses can register domain names through the Internet Corporation for Assigned Names and Numbers (ICANN), a nonprofit organization that has been taking over increased responsibility for the registration process (details are available online at www.icann.org).

With authority from the U.S. government, ICANN has begun addressing the problems of Internet site registration, including the diminishing supply of domain names and the resolution of disputes over names. As Walter Eidson outlined in the *Washington Business Journal*, ICANN implemented a new dispute resolution policy on January 1, 2000, to settle questions over ownership and use of popular domain names. In order to dispute another party's use of a domain name, a small business must prove that the name is identical or confusingly similar to a previously registered trademark and that the other party has no legitimate business interest in it. Businesses are unlikely to prevail in such disputes if the other party registered the name in good faith and is using it for legitimate purposes. But businesses do have recourse in cases where the other party is using the name in bad faith for example, holding it for the purpose of selling it, blocking the legitimate owner from using it, or attracting customers through deception.

INTERNET PAYMENT SYSTEMS

In 2007 manufacturer's e-commerce sales totaled $1,856 billion, while merchant wholesalers had $1,226 billion of e-commerce sales, retailers had $127 billion of e-commerce sales, and e-commerce sales for selected service industries totaled $124 billion. These numbers, reported by the U.S. Census Bureau, displayed growth in every sector from 2006 numbers.

According to a Consumer Internet Purchase Study conducted by leading electronic payments network NYCE, consumers used Internet payment systems to pay for most of the goods or services bought. Payments were dominated by credit card transactions in which credit card information (owner's name, card number, type of card, expiration date) moved over secure communications lines in encrypted form to the vendor. According to the NYCE study, 51.2 percent of people reported paying most often with a major credit card, such as a Visa or MasterCard, with another 27.9 percent of purchases made with other credit cards. Payment also took other forms such as the use of PayPal (the preferred payment choice for 14.9% of consumers), the use of prepaid debit or credit cards (1.9%), Amazon Payments (1.1%) and Google Checkout (0.1%). Although credit cards were the most favored payment method, over 57 percent of respondents reported using PayPal for at least some purchases or transactions. Some of this commerce, of course, took traditional off-line forms: orders were placed over the Internet but payments were arranged over the telephone or sent in before shipments took place; or shipments were made COD (cash on delivery).

SECURITY: THE DOMINANT ISSUE

The most important aspect of Internet payment systems is the security of the transactions, because human contact in online interactions is wholly replaced by images on screens and messages that come and go. The identity of the seller is often difficult for the buyer to confirm. Neither the seller's physical address nor telephone number may be listed on the Web page; the Web page may be a mirage created by images and photographs hiding a scam. The buyer therefore is at least initially wary in online purchasing situations. Can he or she trust this site to: 1) safeguard credit card data; 2) actually ship something in exchange for a payment; and 3) guard its records from Internet bandits after the transaction closes?

In the same manner, the seller cannot see the buyer. When the buyer sends credit card information and the card checks out, the seller still does not know with any certainty that the party on the other end, hidden by the fog of cyberspace, is *real*; the buyer may have stolen the card or may maliciously intend later to deny that he or she actually made a purchase.

According to a study conducted by the Javelin Strategy and Research Center, there was a 22 percent increase in identity theft in 2008 over 2007 numbers, with almost ten million individuals experiencing some form of identity theft. Credit card fraud made up 26 percent of the cases of identity theft, based on complaint data kept by the Federal Trade Commission. These concerns about security are a primary reason why some individuals avoid shopping on the Internet. Of the 322 consumers who responded to the NYSE study that they never shopped online, 43.5 percent expressed security as a primary concern. Of those who shopped online infrequently (three times per year or less), 26 percent also cited security as a primary concern.

In credit card parlance, the word "chargeback" is used to indicate reversals of credit purchases when the buyer disputes having used the card or refuses payment claiming product defects. CyberSource's *2008 Annual Online Fraud Report* states that in 2007 merchants lost an estimated $3.6 billion in revenues due to online fraud, up from 3.1 billion in 2006. Merchants report that approximately half of those losses are the result of chargebacks, and that approximately 1.3 percent of total orders were fraudulent in some way in 2007 (up from 1.1 percent in 2006).

TECHNOLOGICAL DEVELOPMENTS

All communications over the Internet, indeed over any electronic system whatsoever, take place by means of protocols. The sender's and the receiver's systems are both designed to understand the protocol. Using the protocols' preset sequences of codes, the parties are able to establish a common set of rules for the dialogue to follow, not least such details as speed of transmission. This process is also known as handshaking. Once a communications channel is thus established, packets of information may be exchanged, each packet having a header, body, and trailer. Error checking is performed. Both sender and receiver calculate mathematical abbreviation of the message, a single number called its CRC (for cyclic redundancy check). The receiver checks its CRC against the one transmitted by the sender. If the two numbers match, all is well. If the CRCs don't match, the receiver requests retransmission. Packet follows packet until the transmission is terminated using the orderly etiquette prescribed by the protocol.

Heightened levels of security are introduced by using encryption of all or some of the data. One widely used secure method of communication is known as SSL (for secure socket layer), a "layer" of security. SSL is an extension of standard protocols under which the level of security to be used is first established between a pair of communicators. Under SSL, the method of encryption to be used can be set or negotiated and encryption keys are exchanged. Use of encryption in either one or in both directions may be agreed upon. All this, of course, takes place automatically, machines murmuring to each other; users do not have to know the deep details. The cryptographic element, thus, becomes central to the security of the channel.

Modern Internet cryptography is known as public-key cryptography introduced by cryptologists Whitfield Diffie and Martin Hellman in 1976. Before the invention of this method, cryptology required that two parties exchanging encrypted information both had to possess the same key, one in order to encrypt the data and the other to use the same key to decode the message. Public-key cryptography requires two keys: a public key, known to both parties, and a private key, known only to the receiver of the data. Data can only be *en*coded by the public key, therefore the sender must have this key; but the data can only be *de*coded by the private key that the receiver controls. A mathematical relationship between the two keys, known only to the receiver, provides the security. A criminal or hacker who has the public key and the encoded message is virtually unable to derive the private key from these two elements of information. Thus this method is very safe. In a typical transaction the parties exchange public keys. Each encodes its message to the other by using the other's public key; each decodes the message received by its private key. Very sophisticated implementations of these systems are available.

This level of security, while it protects credit card numbers very well, does not guarantee that the credit card holder is not using a stolen card. For this reason the same public-key cryptography is used to encrypt additional information: authentication certificates and digital signatures. The certificates carry information about the parties and the digital signatures, which can be combined with digital date stamps, add yet another layer of authentication to a transaction.

GETTING PAID ONLINE

A small business intending to sell its products online must establish a merchant account at a bank and engage the services of a payment processing firm. The business may wish to begin by looking at processing firms which requently represent banks. Conversely, many banks work with processing firms and will recommend those that they prefer. If the company already accepts credit cards in a store, its natural route is by way of the service bureau it uses for off-line sales. A set-up fee, monthly services fees, and transaction fees levied on the volume itself (ranging from 1.5 to 0.75 percent, depending on volume) should be anticipated. Three basic types of transactions are available: credit card, online check payment, and small-transaction payment systems (where transactions are a few dollars each), A merchant can sign up for one or two or three of these, each having a different cost. A very wide array of such services has developed, and thus a fair amount of homework is implied.

Qualifying for a merchant account may require administrative efforts similar to getting a loan, because the bank will wish to satisfy itself about the business's qualifications. Working with the processing firm will involve the business in installation and testing of card authorization software that will communicate with the processing firm. The processing firm normally handles checking the validity of the credit card number, expiration date, and purchase amount, then provides the merchant with an authorization number. The preferred method for handling online sales is to pass the transaction information along to the payment processing firm for authorization while the customer is still online. An e-mail confirmation completes the transaction.

INTERNET SECURITY

Internet security is aimed at securing information based on computers and in transit between them. In the modern environment the two subjects are closely linked. Neither computers nor the networks that connect them are inherently secure. Computers were subject to attack before the Internet became a public utility, because illegitimate software hidden on commercial diskettes could be fashioned to load itself on a computer and play havoc with data in memory or placed on a fixed drive. The Internet by its very nature is vulnerable, since it was initially conceived of as an open network to facilitate free exchange of ideas and information. According to the Internet Systems Consortium (ISC), which conducts four surveys each year, in January 2008 there were some 556 million Internet *hosts* in operation and billions of computers consulting billions of pages carried by those hosts. Despite best efforts, a system of this size and complexity will inevitably have points of entry that can be abused, and software programs frequently have unknown weaknesses that hackers (for fun) or criminals (for gain) discover and turn to their advantage until the flaws are fixed.

Computer networks hold valuable and often protected private information, not least data on identities; credit cards; financial data; technical, trade, and government secrets; mailing lists; medical records; and so on. These data are vulnerable on the computer and in transit. The Internet, as a connector between computer systems, is also a highway of access to valuable data stores. The vulnerabilities are loss of data through malicious erasure, the acquisition of proprietary information, the manipulation of the data such as illegal withdrawals and transfers of funds, the capture and criminal use of credit cards or identities, and any and all unauthorized uses to which information may be put. Internet security breaches can also potentially have direct physical consequences if systems that control transportation or power systems are hijacked. Computers have become so pervasive, and their networking so universal, that Internet security and security in general are closely linked objectives of society.

FORMS OF ATTACK

Systems disruptions arising from immature teenage hackers, the malicious intent of adults, and the organized activities of pressure groups are the most common forms of Internet attack. These take the form of destructive or simply irritating software programs (viruses) that minimally "send a message," more seriously disrupt operation or cause shutdowns, and in extreme forms cause serious loss of data. Other names associated with viruses are worms, Trojan horses, logic bombs, and sniffers. A common Internet-based crime is the theft of valuable lists either for use or resale by the thief or as a means of blackmailing the target. Finally, spam, unsolicited commercial e-mail, is a nuisance but does not typically rise to the level of a vulnerability.

The National Institute of Standards and Technology (NIST), a government agency, groups potential Internet security issues into five main categories that companies can use to determine how to respond: denial of service, malicious code, unauthorized access, inappropriate usage, and multiple component incidents. Denial of service problems occur when an attack impairs the use of the network by exhausting bandwidth or other network resources. Malicious code refers to a virus, worm, or other malicious program that is installed on a computer or network and adversely affects the host computer. Unauthorized access occurs when a person gains access to a system, data, or

network without permission. Inappropriate use occurs when any person violates the acceptable use of the network, programs, or data on the network. Finally, multiple component incidents occur when a single incident encompasses more than one of the other incident categories.

The first step in responding to a security incident involves determining which of the categories the incident falls into. A person can then take the appropriate steps to deal with that particular incident, such as blocking network access to the unauthorized party or removing the malicious virus program from networked computers.

VULNERABILITIES

Internet vulnerability arises from human factors, failures of "defensive" technologies, and from weaknesses in software products or their interactions.

Access to systems is usually protected by passwords. Careless assignment, use, and storage of passwords is in part a human factor leading to vulnerabilities. The MITRE Corporation, with funding from the U.S. Department of Homeland Security (DHS), maintains Common Vulnerabilities and Exposures (CVE), a dictionary and reference system to databases that hold CVE data by many other organizations.

Perhaps the best-known protection technology is the firewall, a software system that monitors a network's or a single computer's interactions with the Internet. Firewalls are designed to capture, store, and analyze "on the fly" a series of recent commands received from the Internet. The firewall accepts these commands and temporarily puts them in a buffer to look at them before letting them execute. It has its own database of patterns of commands which signal trouble. When it finds such a pattern in its buffer, it ignores that set of commands and thus protects the system.

Virus detection and monitoring programs work by incorporating logic and data which enable them to scan and thus to recognize viruses in their many forms before these are able to do any damage. Virus detection software, of course, is constantly updated as malicious ingenuity creates ever newer attempts at slipping into computers disguised in innocent forms like e-mail attachments. When intruders discover ways to penetrate firewalls or slip viruses past virus detectors, the system becomes vulnerable.

By far the largest number of vulnerabilities are created by undiagnosed weaknesses in operating systems and in ordinary software. Attackers probing systems either know about these weaknesses, or chance across and then learn to exploit them. Software development takes many people. Programs of real use tend to be complex. To test or debug programs developers use "back doors" to enable them to interact with a running program; such back doors are sometimes "left open" but become known by hackers. The same aims are usually achieved in the same way in programming as in other fields; thus skilled developers will know where to look for exploitable features of a software system.

Hi-Tech Obscurity. The diagnosis and cure of security breaches is a hi-tech specialization where even the highly computer-literate indeed skilled programmers will be entirely at sea without help. Three examples of CVE definitions from MITRE, plucked more or less at random, will make the point. CVE 2000-1936, for example, states: "UTStarcom BAS 1000 3.1.10 creates several default or back door accounts and passwords, which allows remote attackers to gain access via (1) field account with a password of '*field', (2) guru account with a password of '*3noguru', (3) snmp account with a password of 'snmp', or (4) dbase account with a password of 'dbase'." Come again? CVE 2006-1136 states: "Buffer overflow in the PostScript file interpreter code for Xerox CopyCentre and Xerox WorkCentre Pro, running software 1.001.02.073 or earlier, or 1.001.02.074 before 1.001.02.715, allows attackers to cause a denial of service via unknown vectors." CVE 2005-4660 states: "IPCop (aka IPCop Firewall) before 1.4.10 has world-readable permissions for the backup.key file, which might allow local users to overwrite system configuration files and gain privileges by creating a malicious encrypted backup archive owned by 'nobody', then executing ipcoprscfg to restore from this backup."

WHAT TO DO

Systems of defense against Internet attacks have evolved side-by-side with the aggression in a kind of serious version of the "Spy vs. Spy" cartoon series made famous by *Mad Magazine.* The four important actions available to individuals and businesses, however small, are: 1) disciplined use of computer systems including careful password and e-mail control; 2) installation and upgrading of firewalls between internal networks and the Internet; 3) alertness to news stories about new viruses and breaches and promptly carrying out public recommendations; and 4) prompt reporting of breaches to the authorities as soon as they are detected.

A 2007 Computer Security Institute survey reported a variety of different security technologies used to protect system data. Ninety-seven percent of companies used basic anti-virus software; 94 percent made use of firewalls; 85 percent used Virtual Private Networks (VPN), 80 percent used anti-spyware tools; 71 percent employed encryption in transit; and 53 percent employed file encryption on files stored on hard drives. The majority of organizations (60%) responded to crimes by first attempting to identify the perpetrator, then patching holes in security (54%), installing software patches (46%), adding additional software (37%), instituting new organization security policies

(33%), reporting the crime to a law enforcement agency (24%), installing additional hardware (23%), and then reporting to legal counsel (18%).

The business owner has the chief responsibility to deny access to his or her systems to individuals who should not be using them. This is normally accomplished by using password control. In the modern environment people are required to use far too many passwords. Not surprisingly, they pick one they like and tend to stick with it. The same password is often used for a number of different online accounts, at home, at the office. The capture of one somewhere can lead to its use elsewhere. In cases where good discipline is enforced, new passwords are issued at intervals, but people tend to forget them, with the consequence that they are often scribbled on the computer monitor lightly in pencil. Such careless practices, needless to say, are in part responsible for major breaches and much damage. Most viruses are transmitted as attachments to e-mails. Opening attachments from unknown e-mail transmitters is generally a bad idea, even when the message sounds plausible. A good rule to follow in such cases is that if the sender *really* wants the recipient to open that mail, he or she will call. Idle curiosity causes many viruses to spread.

Most small businesses with networks will either engage a service firm to maintain and periodically check its system or will have in-house staff managing the function. Firewalls and virus-detection software require periodic maintenance and upgrading. Failure to do so can turn open the company's system to spammers who will use it as a transmission point, using up valuable processor power and eventually causing the company's own mail to be rejected by others or worse. Old virus monitoring packages will be unaware of new worms, Trojan horses, and logic bombs. When news breaks indicating that some software program has a major flaw, producers of the software soon have "patches" ready to repair the vulnerability. It is a nuisance to download and install such patches, but failure to do so may be more costly. As the old saying goes, "Pay me now or pay me later!" Several Web sites provide free virus warnings and downloadable antivirus patches for Web browsers. Examples include www.symantec.com/avcenter and www.ciac.org. The Computer Security Institute provides annual surveys on security breaches at www.gocsi.com. Another useful resource is the National Computer Security Association (www.ncsa.com), which provides tips on Internet security for business owners and supplies definitions of high-tech terms.

Systems breaches should be reported promptly. The business can do so by contacting US-CERT (United States Computer Emergency Readiness Team). This federal organization, formed in 2003, works with the Internet community to raise awareness of security issues and organize the response to security threats. The CERT Web site posts the latest security alerts and also provides security-related documents, tools, and training seminars. Finally, CERT offers 24-hour technical assistance in the event of Internet security breaches. Small-business owners who contact CERT about a security problem will be asked to provide their company's Internet address, the computer models affected, the types of operating systems and software used, and the security measures that were in place.

Small businesses may need to be especially cognizant of updating their security and maintaining good business practices when it comes to protecting their computer data. Data presented at the Visa Security Summit in 2009 suggested that many hackers were turning away from targeting large banks and institutions in favor of hacking small businesses, which tend to have less stringent security systems in place. Charles Matthews, president of the International Council for Small Business, stated in a panel presentation at the Security summit:"As the security becomes better at large companies, the small business begins to look more and more enticing to computer criminals. " Charities and other not-for-profit organizations have also become an increasingly popular target for hackers, as donor lists and information can be valuable and easy to obtain due to lack of expensive or advanced security protections.

For most small businesses, the Internet is a valuable resource. The effort required to play by the rules is relatively low. The costs, both in time and money, can be quite high even for minor problems like having one's server hijacked for spamming. When viruses destroy disks holding valuable data, costs can skyrocket. Caution, alertness, and discipline can prevent the worst of such problems. A good security policy therefore should be high on the agenda of the business owner.

INTERNET SERVICE PROVIDERS (ISPS)

An Internet service provider (ISP) is a company that provides third parties access to the Internet. Many ISPs also offer other related services such as Web site design and virtual hosting. An ISP has the equipment and the telecommunication line access required to have a point-of-presence on the Internet for the geographic area served. An ISP acts as an intermediary between its client's computer system and the Internet. ISPs take several forms and offer a wide variety of services. They generally charge their customers for Internet access depending on their usage needs and the level of service provided.

The first Internet service providers to become widely known were not full ISPs but rather what were known as online services because of their members-only offerings and somewhat limited full Internet access. These were America Online (AOL) and CompuServe.

In the 2010s, ISPs come in all sizes. National ISPs offer Internet access in a broad geographical area. Compared to local ISPs, these companies tend to offer higher-speed connections and greater long-term stability. Many national providers also offer a broad range of services, including long-distance telephone service, Web site hosting, and secure electronic transactions. They are generally a good choice for businesses that operate in several locations and wish to use the ISP for all locations. The main disadvantages of the larger ISPs are that they rarely offer the level of personalized service available from smaller providers, and they may have so many customers that a small business's employees could have trouble gaining access during prime business hours.

Small, independent ISPs operate in many local or regional markets. These companies vary widely in size, stability, and quality of service. On the plus side, their access lines may be less busy than national ISPs. In addition, many smaller providers specialize in offering services to small businesses. Some of these ISPs may visit a small business customer's work site, evaluate the company's Internet access needs, and present different service packages. They may even assign a personal account representative to handle the small business's growing electronic needs.

FINDING AN ISP

The first step in selecting an Internet service provider for a small business is to compile a list of potential vendors. According to Vince Emery in *How to Grow Your Business on the Internet*, there are several sites that list ISPs by geographic region and also include pricing and contact information. The oldest and best-known of these sites is The List (www.thelist.com), a searchable site with information on providers worldwide. Google and other search engines also yield a great deal of information about service providers. Small-business owners might also benefit from calling business associates, professional organizations, chambers of commerce, and local computer users groups to obtain suggestions and references for potential ISPs.

CONSIDERATIONS IN CHOOSING AN ISP

In choosing among the various ISP options, the most important thing to consider is the needs of the business. How much work will be done online and how dependent will the business's communications be on e-mail and other online services? The answer to these questions will determine the range of bandwidth needed a simple dial-up connection or a broad band connection capable of providing a number of people with high-speed connections simultaneously. Determining the bandwidth or speed requirements for the Internet connection may help to limit the number of ISPs to consider.

The next step in choosing an ISP is eliminating those providers that: 1) cost too much; 2) do not offer the services the company needs; or 3) cannot provide the right type of connection. One important factor for small businesses to consider is the availability of technical support. According to William Kilmer in *Getting Your Business Wired*, ISPs vary widely in the level of support they offer to customers. Online services make it easy to set up an Internet account, for example, but may not be able to provide the personal assistance a small-business owner needs. It may be helpful to check the hours that customer support is offered by telephone, and also to inquire about the average time it takes the ISP to respond to requests for assistance.

An important factor to consider in choosing an ISP is the provider's tier rating. ISPs are rated according to their proximity to the backbone of the Internet, known as their point of presence (POP). Tier 1 providers usually big companies like AT&T and Sprint are linked directly to the Internet. Tier 2 providers lease their connections from Tier 1 companies, and so on down the line. The lower an ISP's tier rating, the further its connections lie from the Internet and the slower its access is likely to be. Kilmer recommends that small businesses work with ISPs rated Tier 3 or better.

Other technical considerations in choosing an ISP include the speed and redundancy of its connections. Ideally, an ISP should maintain several different connections to balance traffic and make sure that one is always available in case another fails. Finally, small-business owners may wish to seek out an ISP that offers special packages for small businesses.

NET NEUTRALITY CONCERNS

Since 2000, debate has been raging in the United States regarding the concept of net neutrality and Internet service providers. Net neutrality refers to the concept that all information, sites, and users be granted equal treatment. In other words, no ISP should be able to use its infrastructure to block certain data or make certain data more or less accessible. Certain ISP providers have, over the years, intentionally slowed the transmission of communications across peer-to-peer networks and many have expressed concern that ISPs will begin to block data from competitors or provide priority access to certain data.

Some businesses have also expressed concern that their internet connection will be throttled (limited or slowed) by an ISP provider as a result of excessive use of bandwdith. With the growing use of Voice-Over-Internet Protocol and virtual meetings, these concerns may become more relevant to any small-business owner who has numerous personnel sharing a single ISP account. To cater to concerned business owners, new tools have been created to measure broadband performance, or the speed at which an ISP sends data. These tools, such as Glasnost, are designed to identify ISPs who slow or limit bandwidth to businesses or individuals. *Entrepeneur* and *PC Magazine* recommend that small businesses run Glasnost, at least occasionally, to identify whether their company ISP is throttling their connection.

In 2009 over 100 small-business owners wrote an open letter to the Federal Communications Commission, urging it to adopt a strong net neutrality rule, based upon the belief that net neutrality is essential for small-business owners to advertise and distribute products. An excerpt from the letter, signed by business owners across the country, reads: "It's because of Net Neutrality that small businesses and entrepreneurs have been able to thrive on the Internet. We use the Internet to maintain a Web presence that allows us to reach new customers and showcase our goods, applications and services. We can conduct market research, share content and products in a vast open market, and communicate with clients and with other business owners. The open Internet has provided a platform for innovative ideas to grow. With Net Neutrality, any small business with the right ideas and ambition has the chance to be the next Google, eBay, Amazon or Facebook or even a business that we have yet to imagine. Protecting the open Internet with a strong Net Neutrality rule is essential to fostering innovation and new business models."

INTERNET THREATS

As society and businesses have become increasingly dependent on the Internet for e-mail, communication, and advertising, online security has become a major issue. Internet threats include malicious software programs and various types of "cyber" attacks which can cause computer problems and expose companies and individuals to identity theft, denial of service problems, and other issues. For

a business, Internet threats can cause legal problems, financial losses, and expensive computer repairs. There is evidence that Internet threats have grown in scope and severity. In 2010 Symantec, a popular antimalware software company, reported that 2.9 million new threats were developed in 2009 alone in the form of corrupt code. This number does not include hacker attacks and direct attacks on computers. Some of the more common internet threats are malware, Trojans, worms, and viruses.

Malware. Malware is the short term for "malicious software," a type of software created by fraudsters, programmers, and criminals, usually with the purpose of attacking computers or stealing information from computers. Malware refers to viruses and other types of malicious software which are imbedded in files downloaded on to an unsuspecting computer while the user is browsing the Internet. These files have specific tasks assigned to them by programmers. Often, malware is designed to help criminals steal passwords, user names, and other details from a computer. In other cases, it is designed to help someone gain remote control of a computer in order to use that computer to perpetrate illegal activities.

In fact, one of the major threats of malware is that it allows online criminals, often called cybercriminals, to gain control of computers remotely. Computers that are infected with malware and are controlled by cybercriminals are sometimes known as "zombies." In some cases, cybercriminals gain control of several zombies, and this group of computers is then known as a "botnet." In many cases, a computer user may not know that their computer is a zombie or part of a botnet. The affected computer may continue to function. However, once cybercriminals have compromised the computer through malware, they can use that computer as a zombie or as part of a botnet in order to perpetrate illegal activities. Such computers may be used, for example, to distribute malware to other systems.

A very popular type of malware is spyware. Like most malware, spyware is usually downloaded without a computer user's knowledge, usually while a computer user is surfing the Internet. Spyware programs, once on a computer, allow the creator of the virus to snoop on or monitor the infected computer's browser activities. A spyware virus usually implants "pop-up" ads that will appear on a user's screen periodically. These programs can slow down a computer, cause it to crash, and in some cases even record for the sender the recipient's credit card numbers if it is used to purchase items while online. Spyware is usually a nuisance-level virus but in some cases can pose a more serious threat. When used for monitoring purposes, it can allow someone to gain passwords, banking information, and even e-mail messages of victims.

Viruses. A virus is a program designed to infect and potentially damage files on a computer that receives it. The code for a virus is hidden within a file or program such as a text document or a spreadsheet program and when the file is opened or the program is launched, the virus inserts copies of itself, infecting the computer on which these files are opened. Because of this ability to reproduce itself, a virus can quickly spread to other programs, including the computer's operating system. A virus may reside on a computer system for some time before taking any action detectable to the user. Other viruses may cause trouble immediately. Some viruses cause little or no damage. For example, a virus may manifest itself as nothing more than a message that appears on the screen at certain intervals. Other viruses are much more destructive and can result in lost or corrupted files and data. Viruses may render a computer unusable, necessitating the reinstallation of the operating system and applications. Viruses can even be written to imbed some small miscalculation into, for example, a spreadsheet program. This sort of hidden problem may jeopardize the accuracy of all the work done with the infected program for a long time before it is even detected.

Viruses are written to target program files and macros, or a computer's boot sector, which is the portion of the hard drive that executes the steps necessary to start the hardware and software. Program viruses attach themselves to the executable files associated with software programs and can then attack any file that is used to launch an application, usually files ending with the "exe" or "com" extensions. Macro viruses infect program templates that are used to create documents or spreadsheets. Once infected, every document or spreadsheet opened with the infected program becomes corrupted. Boot sector viruses attack the computer's hard drive and launch themselves each time the user boots, or starts, the computer.

The Internet, with its global reach and rapid delivery times, provides the ideal breeding ground for viruses. Typically, someone who wants to spread a virus does so by sending out an e-mail message containing an infected attachment. The subject line on such a message sounds innocuous, so unsuspecting recipients open the message, unwittingly infecting their computers. More insidious yet, many viruses infect the recipient and then launch e-mail messages using the recipient's e-mail system address book and send themselves out to all of the recipient's list of colleagues, clients, vendors, friends, and family for whom an e-mail is found.

Trojans. Viruses are sometimes classified as Trojan horses. A Trojan horse virus is one that appears harmless on the surface but in reality destroys files or programs. The Trojan horse is named after the famous horse depicted in the tale of the Trojan War. As told in Virgil's famous poem, *The Aeneid*, Greek warriors created a huge wooden

horse and concealed themselves inside it. The horse was placed in front of the gates of Troy, a city the Greeks wanted to destroy. When the people of Troy admitted the horse as a gift, the Greeks were able to emerge from the structure and attack. The Trojan horse virus works the same way. It is often disguised as a functioning bit of software. When a computer user downloads the software, he or she does not realize that some malicious code is inside the software. Once the software is downloaded, the hidden code becomes activated. In some cases, Trojan horses are merely annoying and do some damage to programs and files. In other cases, they allow a programmer remote access to an infected computer.

Worms. A worm is a software program that attacks the computer's operating system and replicates itself again and again, until the system eventually crashes. This type of program often replicates itself by accessing e-mail address books and sending itself via e-mail. While many viruses require a computer user to do something   such as download an infected program   worms can spread themselves. In many cases, worms shut down computers and even cause file damage simply through their fast replication.

Other Internet Threats. While many Internet threats are programs or codes, such as malware, not all threats to security are in the form of codes and programs. Cybercriminals are often inventive in creating new ways to attack computers and computer users. One popular form of Internet threat which uses no codes or programs, for example, is phishing (pronounced as "fishing"). This type of security threat involves sending out a mass e-mailing from a supposedly legitimate company. For example, a cybercriminal may send out a mass mailing that seems to come from a major bank. The e-mail usually tells the recipient that there is a problem with his or her account and asks the recipient to send back an email with the recipient's PIN numbers or account numbers. Once the recipient does this, the cybercriminal can then use this information to access the victim's personal information or even bank accounts. In some cases, cybercriminals are even more subtle. Rather than asking victims to offer PIN numbers and other sensitive information directly, they direct e-mail recipients to click on a link in the e-mail. The link takes the victim to a Web site where malware can then be installed on the victim's computer.

Another widespread online threat is spam. Spam is any form of unsolicited advertising sent via e-mail. In most cases, it is mass-mailed. Generally, spam is little more than a nuisance. It takes up space allotted to legitimate e-mail communication and requires vigilance to delete. In some cases, however, cybercriminals use spam for other purposes. In some cases, spam is sent in such masses that it shuts down e-mail inboxes. In many cases, spam is used to advertise fraudulent companies and products. Some cybercriminals also use spam to send viruses and other malware.

Another very common Internet threat involves the use of public Internet connections. As more customers use wireless devices and laptops, more hotels, restaurants, airports, and other public places offer wireless connections. Unfortunately, most public wireless connections are not secured. This means that other Internet users with minimal computer knowledge can use programs and devices to spy on other Internet users nearby, stealing passwords and information from a neighboring computer. Others use a less high-tech approach to spying, simply peering over computer users' shoulders to see passwords and other information. This is one reason why computer users in public should not do any Internet surfing requiring passwords, credit card numbers, or otherwise sensitive information. Public Internet cafes and public computers are especially dangerous, as the computers in these places can easily have spyware installed by a previous user.

INTERNET THREAT PROTECTION

With new computer viruses and Internet threats appearing daily, keeping a computer or network of computers free of such threats is a daunting task. If, however, one views proper security as a necessary part of running computers, the task becomes just another in the list of things one must do to maintain computers. The following are steps every computer user should follow to protect his or her computer from Internet threats.

1. Install a broad-scope antimalware and antivirus software program to identify and remove viruses and other forms of malware before they can cause any damage. These programs scan or review files that may come from floppy diskettes, the Internet, e-mail attachments, or networks, looking for patterns of code that match patterns in the antivirus software vendor's database of known viruses and other threats. Once detected, the software isolates and removes the virus or code before it can be activated. Computer owners are advised to purchase a program which specifically targets worms, malware, spyware, pop-up ads, spam, and other threats.
2. Install firewalls. Firewalls are software or hardware solutions which block unauthorized access to a computer or network. Computers should have at least a software firewall while company computers and servers should have both types of firewalls.
3. Update the antimalware and antivirus software regularly. Because the number of viruses and malicious programs is increasing all the time, it is important to keep antimalware and antivirus software up to date with information on newly identified viruses and

threats. Antivirus software vendors are constantly updating their databases of information on viruses and making this information available to their customers via their Web sites. It is best to purchase a program that will update on the computer system at least once a day and will scan a system for any malware at least once a week. Some programs will update a few times a day, which is even more effective.

4. Update operating systems and all major software on all computers. Many types of malware and many cybercriminals access computers or exploit computers through known weaknesses in popular computer programs. Frequently updating computers using security patches is a good way to prevent this. Most programs update regularly or can be programmed to update regularly. Computer users can also access software vendor Web sites for the latest updates.
5. Maintain a regular backup procedure for all computers. This procedure may be as simple as keeping copies of important files on disk and it may be as elaborate as a system designed to produce a mirror copy of a system, updating this copy every few minutes. For a small business, the most prudent level of backup probably falls somewhere between these two extremes. Whatever the schedule is, it should include regular and periodic backing up of all computer systems and the remote storage of the backups' media in case of fire, flood, or other catastrophic event.
6. Do not open e-mail from unknown recipients or messages that contain unexpected attachments. A user should delete these types of messages. As a general rule, a user should scan every e-mail attachment for viruses before opening it even an expected attachment as the sender may have unknowingly sent an infected file.
7. Do not check e-mail or do any sensitive work involving passwords or private information when on unsecured or public Internet connections. Some types of Internet use are relatively low-risk. For example, general browsing online for information poses few risks, other than the risk of downloading a virus or malware program accidentally. As long as a computer user has a good malware system in place, there is little risk. However, when using any program such as e-email programs or especially online banking computer users should be aware that such tasks are riskier in that they may provide criminals with important information. Such tasks should be done on a secure computer with a secure Internet connection only and never from a public connection.
8. Instruct all computer users using a network or company computers about Internet security. Simply having a good antimalware and antivirus software package is not enough. Employees should be taught about phishing scams, unsecured Internet connections, and other security threats. Company computers should never be used for personal work and should not be used with unsecured wireless connections.
9. Install spam filters on e-mail programs. Some Web-based programs already come with spam filters. Spam filters reduce the possibility that a curious employee will click on a link in a suspicious e-mail message or will be targeted by a phishing scheme.

While new viruses and Internet threats are constantly appearing and adapting to the changing security environment, there is really only one way to provide protection: constant vigilance.

INTERNSHIPS

Internships are arrangements in which college students and career changers lend their talents to companies in return for an opportunity to develop business skills, learn

about a new industry, and gain exposure to the work environment. Internship programs are set up as either noncompensated or compensated internships. Whether paid or unpaid, an internship position is often quite beneficial to the student who participates, for he or she receives "real world" business experience and an early opportunity to impress potential employers. Employers too benefit from internship programs by obtaining the services of skilled personnel for modest cost and by being exposed to new ideas and perspectives.

Since the economic crisis that began in 2008 and the mass layoffs that followed, more and more people both recent college graduates and people in mid-career are looking at internships as an even more essential way to get a job. According to Steve Rodems of Fast Track Internships (reported by Hillary Chura in the *New York Times*), in 2008 only 1 percent of his clients were career changers, but by 2009 that number had increased to 10 percent.

BENEFITS OF INTERNSHIP PROGRAMS

Internships are seen by college students as potentially valuable tools to explore general career avenues as well as specific companies. Such arrangements can provide them with valuable work experience (both practical and for résumé enhancement) and an opportunity to line up a job before graduation. In addition to securing good work experience, students also may be able to gain academic credit and financial compensation (albeit modest in size) for internships. As Steven Bahls and Jane Easter Bahls observed in *Entrepreneur*, "when an internship is set up through a local college or university, students can often obtain academic credit for their effort. The fact that they're receiving credit, though, doesn't mean they're not also entitled to minimum wage if your business derives immediate benefit from their labor."

Internship programs are also potentially valuable to employers. Unfortunately, some companies continue to regard interns as little more than a free source of labor to catch up on filing and other tedious office tasks. But many business owners and managers realize that internship programs can provide them with an early opportunity to gauge the talents of a new generation of workers and, in many cases, sell themselves as a quality place for students to begin their careers after they graduate.

Internship programs are understandably most prevalent in larger companies. But small companies can realize significant benefits as well. In many respects, interns can be ideal workers for small and mid-sized companies. They are typically hungry to gain experience, eager to perform well, and willing to perform less desirable tasks (although a steady diet of such tasks is apt to wilt their enthusiasm). Moreover, their fresh perspectives often challenge entrenched processes and attitudes that have outlived their usefulness. In addition, internship programs enable businesses to sort through a pool of potential employees. As the weeks pass, intern performances can be evaluated, and the pool can be culled down to good workers who are already familiar with the company. "The organization has the opportunity to observe the student at work and review work habits, technical ability, interpersonal skills, and adaptability before making a full-time commitment," wrote Larry Crumbley and Glenn Sumners in *Internal Auditor*. "Internships substantially reduce the risks in cases where offers of permanent employment might be made. Not only can the organization pre-screen the intern; the student also can learn about the company. The possibility of dissatisfied employees seems far less likely when both employers and employees have clear expectations of each other."

Interns also often prove to be invaluable recruiting tools when they return to campus. "A student returning from an internship with a favorable impression becomes an on-campus advertisement," observed Crumbley and Sumners."Students listen to their peers and often trust their opinions more than those of campus representatives or professors. The cost of recruiting permanent employees is reduced as students become familiar with the opportunities the organization has to offer and top students are attracted to permanent positions."

SETTING UP INTERNSHIPS

Small businesses can benefit enormously when they establish an internship program, but such initiatives should not be launched in haphazard fashion. "Before you bombard colleges with leaflets announcing the availability of internships, decide what it is you want to achieve," counseled Deborah Brightman in *Public Relations Journal*. "These goals will help you determine the length of your program (two months should be a minimum) and the number of interns you should hire. The latter will also depend on your experience in managing an internship program, the available budget and space, and the number of people on staff who are available to supervise and train interns." In addition, companies should have a full understanding of the specific tasks to which interns will be assigned, and make plans to ensure that interns will have an opportunity to receive meaningful feedback on their performance.

A written plan providing details of the plan should then be prepared. This plan serves to educate potential interns and internship directors at colleges and universities, and can serve as a blueprint and guide for the company after the program is launched. "The plan," wrote Brightman, "should cover the program's purpose, recruitment, activities and responsibilities, evaluation, and follow-up steps. Be sure to make those employees who will be involved in the program aware of their parts

before the interns arrive." Once these materials have been created, companies can go about the process of contacting appropriate colleges and universities, many of which have established internship centers in recent years.

The Internet offers resources for publicizing an internship program as well. Bulletin boards exist that offer to match up students and others interested in participating in an internship program with employers offering such programs. Web sites such as www.internshipprograms.com, Craigslist.com, and Monster.com are all places where businesses list available internships.

The interviewing process for internships is not unlike the regular interview process in many respects. Factors such as attitude, academic achievement, and suitability for the job are paramount. Small-business consultants also counsel their clients to set up summer internship programs when possible, since the pool of both full- and part-time students available for internships is deepest at that time of the year.

Internship programs need oversight, and the choice of the supervisor is often essential in determining whether the program will be successful, mediocre, or an outright failure. Business experts recommend that interns be monitored by enthusiastic people who have time to tackle the responsibilities associated with the job. "The internship director should have regular contact with both the interns and their ... supervisors, monitoring the quality of work that's being performed, the experience the interns are gaining, and how happy they and their supervisors are with the program," wrote Brightman. "The supervisor must also be available to mediate any problems, oversee the recruitment process, and handle administrative details such as salary, office space, and evaluations." Finally, the supervisor should be able to handle necessary communications with the intern's university.

DISTINGUISHING INTERNS FROM EMPLOYEES

Internship programs can be tremendously helpful to small businesses, but there are legal hazards associated with such programs of which employers should be aware. "Unless your internship program is essentially educational," caution Bahls and Bahls, "your interns may look suspiciously like employees, who are entitled to the federal minimum wage." Companies that operate internship programs that are found to be *not* primarily educational may run the risk of being found in violation of the Fair Labor Standards Act (FLSA), which applies to all companies with two or more employees and annual sales of at least $500,000.

Bahls and Bahls note that the U.S. Labor Department's *Wage and Hour Field Operations Manual* establishes six criteria for distinguishing interns from employees:

1. Interns may be trained using equipment and procedures specific to the employer, but internship experiences must be akin to experiences that they would be able to gain in a vocational school.
2. Regular employees cannot be displaced by interns, who should be closely supervised. "Farming work out to unpaid interns after a regular employee quits would raise a red flag," wrote Bahls and Bahls.
3. Interns are not guaranteed jobs at the completion of their internship. "If they are," wrote Bahls and Bahls, "the experience looks more like the training period at the start of a new job, for which they'd be entitled to fair wages."
4. Both employer and intern need to understand that training time does not entitle interns to wages.
5. Training should be primarily for the benefit of the intern.
6. Companies providing training to interns, noted Bahls and Bahls, "must derive no immediate advantage from the activities of the intern .... Although an internship program will benefit your business over the long term by providing a pool of trained applicants with familiar work habits, it's not meant to be a source of free labor."

Most business consultants offer soothing advice to small companies that might be scared off by such criteria. They point out that the overwhelming majority of firms that establish internship programs are pleased with them, and as Bahls and Bahls wrote, "while the Labor Department closely adheres to its six criteria, courts tend to look at the spirit of the internship program as a whole."

Business owners and managers also need to be aware that, generally speaking, even unpaid interns have the same legal rights as employees when it comes to protection against discrimination or harassment. "It's best to cover them for workers' compensation, too," wrote Bahls and Bahls, "because if they're injured on the job and not covered, they can sue your business for medical expenses and possibly for negligence, which can subject your business to unlimited damages." However, interns do not have the same rights as employees in the realms of unemployment compensation or termination procedures.

INTERPERSONAL COMMUNICATION

Although interpersonal communication encompasses all forms of communicating, oral, written, and nonverbal, the term is usually applied to spoken communication that takes place between two or more individuals on a personal, face-to-face level. Some of the types of interpersonal communication that are commonly used within a business organization include staff meetings, formal project discussions, employee performance reviews, and informal chats. Interpersonal communication with those outside of the business organization can take a variety of forms as well, including client meetings, employment interviews, or sales visits. In order to understand the principles of effective interpersonal communication, it is helpful to look at the basic process of communication.

The basic process of communication begins when a fact is observed or an idea formulated by one person. That person (the sender) decides to translate the observation into a message, and then transmits the message through some communication medium to another person (the receiver). The receiver then must interpret the message and provide feedback to the sender indicating that the message has been understood and appropriate action taken.

Unfortunately, errors can be introduced during any phase of the communication process. For example, misunderstandings can occur when the sender does not possess a clear idea of the message he or she is trying to communicate, or has a clear idea but is not able to express it well. Errors in the process can also occur when the receiver does not listen carefully, infers a different meaning than what was intended by the sender, or fails to provide feedback. Ultimately, unclear, inaccurate, or inconsiderate business communication can waste valuable time, alienate employees or customers, and destroy goodwill toward management or the overall business.

As e-mail and text messaging become increasingly common forms of communication, it is important for people to pay close attention to the way they communicate with co-workers or employees when using these tools. Much is lost when people do not communicate face-to-face. Body language and tone of voice are no longer part of the equation and cannot be used to help convey meaning or intention in an e-mail or text. Because of this, it is essential to consider how someone else might interpret what is being written in an effort to decrease the likelihood of a misunderstanding.

INTERPERSONAL COMMUNICATION STYLES

In general terms, interpersonal communication can be classified as either one-way or two-way. One-way communication occurs when the sender transmits information in the form of direction, without any expectation of discussion or feedback. For example, a manager may stop by an employee's desk to inform him that a certain project will be due the following day. One-way communication is faster and easier for the sender because he or she does not have to deal with potential questions or disagreement from the receiver but tends to be overused in business situations.

In contrast, two-way communication involves the sharing of information between two or more parties in a constructive exchange. For example, a manager may hold a staff meeting in order to establish the due dates for a number of projects. Engaging in two-way communication indicates that the sender is receptive to feedback and willing to provide a response. Although it is more difficult and time-consuming for the sender than one-way communication, it tends to enable a clearer communications exchange by involving both parties.

In addition to being classified as one-way or two-way, interpersonal communication can also be broken down into a variety of styles, or specialized sets of behaviors. Thomas S. Bateman and Carl P. Zeithaml identified six main styles of interpersonal communication that are used in business settings: controlling, egalitarian, structuring, dynamic, relinquishing, and withdrawal. "Different individuals use different communication styles," the authors noted. "A communicator should realize that some styles are more effective than others in certain situations."

Controlling. The controlling style is a form of one-way communication that is used to direct others and gain their compliance. Managers using this style usually do not want feedback, and they tend to employ power and even manipulation to reinforce their message. Although the controlling style can be effective when it is used on occasion by respected individuals, particularly in times of crisis, it can also alienate workers.

Egalitarian. In contrast, the egalitarian style is a form two-way communication that involves sharing information rather than directing behavior. It is used to stimulate others to express their ideas and opinions in order to reach a mutual understanding. In most situations, particularly when cooperation is needed, it is more effective than the controlling style.

Structuring. The structuring style of interpersonal communication is used to establish schedules or impose organization. Managers using this style would be likely to cite company standards or rules. Though the structuring style may be necessary to inform others of goals or procedures when complex tasks must be performed by a group, it should usually be counterbalanced with the egalitarian style.

Dynamic. The dynamic style is a high-energy approach that uses inspirational pleas to motivate another person to take action. This style can be effective in crisis situations, but it is generally ineffective when the receivers do not have enough knowledge or experience to take the required action.

Relinquishing. The relinquishing style of interpersonal communication is deferential rather than directive. It is highly receptive to the ideas of others, to the point of shifting responsibility for communication to the receiver. For example, a manager employing this style might allow her staff to discuss and develop the final solution to a problem while making little comment. This style is particularly effective when the receivers have the knowledge, experience, and willingness to assume responsibility.

Withdrawal. The withdrawal style is more like a lack of communication. Managers using this style try to avoid using their influence and may indicate a lack of interest or unwillingness to participate in the discussion.

Finally, an often overlooked element of interpersonal communication is being a good receiver, which involves developing listening skills. Good listening skills can be vital in finding a solution to grievances or making successful sales calls. In his 2009 book *Messages: The Communication Skills Book*, Matthew McKay noted that staying silent while someone else is talking is not the same as listening. "Real listening," he says, "is based on the intention to do one of four things: understand someone, enjoy someone, learn something, or give help/solace." One useful listening technique is reflection, in which a person attempts to repeat and clarify the other person's message rather than immediately responding to it with a message of his or her own. Used correctly, reflection can allow managers to view issues from their employees' point of view. Some other keys to effective listening include keeping an open mind rather than allowing emotions to intervene; finding a part of the subject that may have application to your own experience; and resisting distractions such as the speaker's mannerisms or clothing. It also helps to be prepared for the discussion, to take notes as needed, and to summarize the speaker's statements.

Strong interpersonal communication skills, utilizing a variety of styles and techniques, are particularly important for small-business owners who must supervise the work of others. Bateman and Zeithaml described some of the characteristics of supervisors who receive high marks from their employees. First, these managers tend to communicate more than other managers, explaining the reasons behind decisions and providing advance warning of changes. Second, they tend to employ an egalitarian rather than controlling style when communicating with subordinates, asking for instead of demanding their compliance. Third, they tend to take others' needs and feelings into account when communicating. Finally, most effective managers are good listeners, giving careful consideration to employee concerns and taking the time to respond to questions and complaints.

INTRANET

People occasionally confuse the term intranet with the Internet. While there are a lot of similarities between them, they really are two different things. Simply put, the Internet is the global World Wide Web, while an intranet is a private computer network operating within a company. Both the Internet and an intranet use similar communication protocols (like TCP/IP) and offer many of the same functional features like e-mail and bulletin boards. One main difference is that an intranet is an internal and private network. Access to a company network (an intranet) is controlled whereas access to the Internet is open to anyone with physical access. Most company intranets are set up to include Internet access as one of the functions provided to users. As remote access for employees became more desirable in the early years of the twenty-first century, companies have increasingly made the intra-company network available through the Internet via a password-secured portal that limits intranet access to authorized users.

When they were first introduced, intranets were dismissed by critics as the latest in a seemingly endless parade of technological fads and buzzwords. That soon changed as businesses with intranets began to reap benefits that were apparent to others. In recent years, computer developers, including software and hardware giants such as Microsoft and IBM, have sought to tap into the growing intranet market. Microsoft and IBM currently offer the two most popular intranet platforms, Sharepoint (Microsoft) and WebSphere Portal (IBM). Both platforms offer a range of tools that enable companies of all sizes to establish an efficient and powerful intranet. (In 2010, Microsoft introduced an improved suite of intranet tools, Sharepoint 2010.)

SETTING UP AN INTRANET

A company may wish to set up an intranet for many reasons. Among them is the speed of communication that can be gained by the broad bandwidths that are used in intranets. These speeds allow for fast e-mail systems and the rapid exchange of documents. The private internal networks offer security and protection in the form of firewalls as well as password-protected access and secure servers. The use of an intranet allows companies to share information internally easily and in so doing to manage the efforts of many employees quickly. Less paperwork, increased productivity, added flexibility, and versatility are other benefits that may be gained through the use of a well-designed intranet. All of this adds up to a bottom line that is attractive in any business decision: the ability to save money and increase profits.

An **ex**tranet is a part of a company's **in**tranet that can be accessed by users outside of the company. Clients, vendors, suppliers, and business partners are just a few examples of the types of people who would benefit from this type of private network. They can exchange large volumes of data using Electronic Data Interchange (EDI), share exclusive information, collaborate on joint business ventures, participate in training programs, and share services between the companies. An extranet is a way to telecommunicate and share business information securely without having to worry about it being intercepted over the Internet. This is achieved for an extranet in much the same way that it is done for an intranet, namely through the use of extra security and privacy measures which include firewalls, password restrictions, and data encryption.

Intranets may be set up to provide a company with any of a number of functions. Most of these are related to communications in one form or another and use the same basic computer software applications as are used on the Internet. Often these applications are referred to as Web applications but in the context of an intranet it is important to distinguish between the "Web"-like functionality and the fact that it is being applied within an intranet and not on the Internet.

E-mail. The most popular intranet application is interoffice e-mail. This capability allows the employees of a company to communicate with each other swiftly and easily. If the intranet has access to the Internet, e-mail can be accessed through the Internet connection. If the intranet is running without the Internet, special e-mail software packages can be bought and installed so that employees can take advantage of its many benefits.

Electronic Publishing. An intranet has many other different applications that can be utilized by a company. These include the electronic publishing of corporate documents, electronic or Web forms, and interactive database links that allow users to access information. Newsletters, information on benefits and 401(k) enrollment, job listings and classifieds, libraries, stock quotes, maps, historical data, catalogs, price lists, information on competitors' products, and customer service data are just a few examples of these types of applications. In addition, there are several other main applications that are very popular in the intranet format.

E-forms. Every type of company has to deal with forms of some sort. This is another area where paperwork can become a problem for a business. Intranet servers can be equipped with programs that allow for forms to be filled out electronically. They could also be downloaded and printed out by the users themselves, which would cut down on the time it would take to distribute these forms manually.

Organizational policy and procedure manuals are also handy to have on an intranet. Unlike printed hard copies, online manuals can be easily accessed by all employees at any time. They are also easier to organize online, and can be indexed by subject and attached to a search engine to provide for easier navigation through the manual. In addition, changes can be made more quickly and easily when they are in this format. Converting printed materials to Web browser readable formats is fairly simple and requires either an appropriate HTML translator or a way for the original word processor documents to be launched with a specific application.

Intercompany Directories. Phone directories are another useful intranet applications. Again, this type of application cuts down on paperwork and the time and money it takes to produce hard copies of these directories. Instead, employee names, titles, duties, departments, phone and fax numbers, e-mail addresses, and even photographs can be stored in an online directory. They can be easily searched and updated at any time with minimal effort. It is suggested that a few paper copies of the employee directory and other important records be kept on hand in the event that the intranet is experiencing technical difficulties.

Organizational Charts. Online organizational charts are a useful way for employees to see the hierarchy of their company. These charts can describe who reports to whom, the specific duties of a person or department, and the structure of the organization. They can be set up in either graphic or text formats on an intranet and updated every time there is employee turnover or a change in job title or responsibilities.

DESIGNING AN INTRANET

Since individual tasks are generally a small portion of a bigger task, intranets should be organized in such a way that the related individual tasks are grouped together. These tasks can be simple or complex, but as long as they all contribute to the same overall process, employees will benefit from the easy access to information that this sort of design provides.

Intranets are useful in bringing employees from different departments together. They can even help employees of the same company who work in different locations to communicate more successfully. Through an effective design, these departments can collaborate and solve problems by using the intranet as a tool rather than relying on more traditional business ideas such as meetings and conference calls.

An intranet, like any corporate communications tool, is a reflection of the business that runs it. A company that is well organized will be able to design an intranet in such a way to best suit its needs. One benefit of intranets is that they create new forms of collaboration, which can challenge and change traditional ways of doing work and obtaining information. According to Jakob Nielson, a user advocate and former Sun Microsystems engineer, " Intranet design is maturing and reaping the rewards of continuous quality improvement for traditional features, while embracing new trends like mobile access, emergency preparedness, and user/employee-contributed content."

THE COST OF SETTING UP AND RUNNING AN INTRANET

Initially, a business that wishes to set up an intranet has to consider the following costs: 1) hardware (including the server and network adapter); 2) software and utilities; and 3) installation and maintenance. A simple intranet may be set up rather quickly if the company involved already has computers that are networked using the common TCP/IP communications protocol. To this network of computers one need only add an extra machine to act as a server. This extra machine will have to have the proper Web server software and network card installed. After everything is up and running, upgrades to the hardware will have to be made from time to time to handle increasing traffic. New software such as multimedia applications and interactive forums as well as upgrades to existing applications are all essential. The labor of employees who maintain the intranet is an ongoing cost, as are the costs to publish and archive data.

On the other hand, since intranets were designed to save time, they can usually be counted on to save money over time. According to Intranet expert Gerry McGovern, "An intranet can deliver return on investment (ROI) by either reducing the cost, or expanding the ability, to communicate. By shifting manual processes to the intranet, the cost of accessing and processing information is reduced. The intranet speedily delivers information to large numbers of people. This gives the organization a greater capacity to change."

By cutting down on routine communication, employees can refocus their efforts and perform their duties better. Employees who use the intranet to its fullest potential will discover that the benefits of e-mail, reduced paperwork, and easy access to information will increase their productivity.

Both the employee and the employer benefit in this situation. As mentioned previously, company literature that is stored and distributed online rather than through traditional paper copies also cuts down printing and distribution costs. Large companies sometimes notice a savings of tens of thousands of dollars when they post their documents online.

INTRAPRENEURSHIP

Intrapreneurs are employees who work within a business in an entrepreneurial capacity, creating innovative new products and processes for the organization. Intrapreneurship is often associated with larger companies that have taken notice of the rise in entrepreneurial activity; these firms endeavor to create an environment wherein creative employees can pursue new ways of doing things and new product ideas within the context of the corporation. But smaller firms can instill a commitment to intrapreneurship within their workforces as well. In fact, small businesses, which often originate as entrepreneurial ventures, are ideally suited to foster an intrapreneurial environment, since their owners have firsthand knowledge of the opportunities and perils that accompany new business initiatives. For larger companies, nurturing an environment of intrapreneurship is a way to recapture a dynamic spirit; for smaller companies, it can be a way of maintaining the entrepreneurial drive from which they began.

Intrapreneurship practices have developed in response to the modern world's rapidly changing marketplace. Businesses of all sizes have long had internal units dedicated to research and development and new product development. Nonetheless, the task of maintaining a creative environment in which innovative ideas may be nurtured is not an easy one and the larger the organization the more difficult that may be. As an organization grows it naturally becomes more bureaucratic and for people of a creative bent a bureaucratic environment can be stifling. Frequently, organizations lose creative people as they grow. Intrapreneuring in its current form represents the determination of employers to solve the resulting brain drain. They do so by creating the environment and incentives for entrepreneurship within their existing business operations.

Small businesses have a natural advantage in terms of establishing such an environment, although it may not come naturally even for a smaller business. Internal "incubators" are one innovative example of the trend towards intrapreneurship. In these programs, employees can use the company's resources (including their already established name and reputation, as well as management experience, financial assistance, and infrastructure) to build and promote their own new business ideas. These and similar arrangements enable companies to stem the loss of ambitious and talented employees to entrepreneurial ventures. Entrepreneurial-minded employees, meanwhile, "get the challenge and the profits of creating their own 'companies' with little of the risk they would face on their own," observed David Cuthill in *Los Angeles Business Journal.*

Haley White points out in her 2010 article for the *Daily Princetonian* that there are 150 nonprofits formed every day in the United States. She argues that the United States would be better off if there were fewer nonprofits and more intrapreneurs within existing nonprofits. "If we were to have more intrapreneurs and, by extension, fewer nonprofit organizations, we would spend less resources on operational costs and be able to focus more on making change," contends White. Indeed, is it more beneficial to start something new or to enhance an existing business? Intrapreneurship can offer the best of both worlds if it is done right and the business offers the intrapreneur enough freedom.

ORGANIZATIONAL CHARACTERISTICS THAT ENCOURAGE INTRAPRENEURSHIP

The single most important factor in establishing an "intrapreneur-friendly" organization is making sure that employees are placed in an innovative working environment. Rigid and conservative organizational structures often have a stifling effect on intrapreneurial efforts. Conservative firms are capable of operating at a high level of efficiency and profitability, but they generally do not provide an environment that is conducive to intrapreneurial

activity. Some keys to instilling an intrapreneurial environment in a business include the following:

1. Support from ownership and top management. This support should not simply consist of passive approval of innovative ways of thinking. Ideally, it should also take the form of active support, such as can be seen in mentoring relationships. Indeed, the small-business owner's own entrepreneurial experiences can be valuable to his firm's intrapreneurial employees if he makes himself available to them.
2. Recognition that the style of intrapreneurialism that is encouraged needs to be compatible with business operations and the organization's overall culture.
3. Make sure that communication systems within the company are strong so that intrapreneurs who have new ideas for products or processes can be heard.
4. Intelligent allocation of resources to pursue intrapreneurial ideas. In her 2009 article for the *Financial Post*, Cynthia Ross Pedersen discusses how this is best done. "Find the driven intrapreneur, the dream team with a vision and pull them out of your organizational machine. Give them the support they need but hold them accountable to deliver. Then let them re-energize your organization with insights, new products and a 'can do' attitude."
5. Reward intrapreneurs. All in all, intrapreneurs tend to be creative, dedicated, and talented in a variety of areas. They are thus of significant value even to companies that do not feature particularly innovative environments. Their importance is heightened, then, to firms that do rely on intrapreneurial initiatives for growth. Since they are such important resources, they should be rewarded accordingly (both in financial and emotional terms). Although intrapreneurs may not want to go into business for themselves, they still have a hunger to make use of their talents and a wish to be compensated for their contributions. If a small business is unable or unwilling to provide sufficient rewards, it should be prepared to lose that intrapreneur to another organization that can meet his or her desires for professional fulfillment.
6. Allow intrapreneurs to follow through. Intrapreneurs who think of a new approach or process deserve to be allowed to maintain their involvement on the project rather than have it be handed off to some other person or task force. Ensuring that the individual stays involved with the initiative makes sense for several important reasons. The intrapreneur's creativity and emotional investment in the project can be tremendously helpful in further developing the process or product for future use. Moreover, he or she usually possesses the most knowledge and understanding of the various issues under consideration. Most importantly, however, the small business enterprise should make sure that its talented and creative employees have continued input because not allowing them to do so can have a profoundly morale-bruising impact.

INVENTIONS AND PATENTS

A patent is a document that secures to an inventor the exclusive right to sell, make, or otherwise use his or her invention for a specified number of years. The document

details the terms under which the government has granted the inventor full possession of the invention. These terms of possession or "intellectual property right" include specifications designed to exclude all others from making, using, or selling the invention in the United States for the life of the patent. The patent also provides rightful patent holders with specific legal steps that can be taken to stop (or be compensated for) instances in which others have infringed on the patent.

Patented inventions have spawned thousands of small businesses over the years. Not all of these businesses have succeeded, of course; some were predicated on new products or designs that were fundamentally flawed, while others faded because of operational problems, economic trends, or personal frailties. But countless successful entrepreneurs have launched their businesses on the strength of a single invention, and patents continue to stand as among the most valuable assets of thousands of small-business owners across the nation.

TYPES OF PATENTS

Inventors may apply for patents on inventions in three major categories: utility patents, design patents, and plant patents.

Utility Patents. Utility patents are the most common kind of patents. They are granted to inventors who, according to the U.S. Patent and Trademark Office (PTO), invent or discover any new and useful process, machine, manufacture, or compositions of matter (mixtures of ingredients, chemical compounds), or any new and useful variations of existing products, processes, or compositions. The legal definition of "process" in this instance includes new industrial or technical methods. Utility patents are the most complex of the three kinds of patents, for they require the patent applicant to provide a full description of the invention's functional and structural features (often including detailed drawings) as well as the inventor's explanation of what he or she feels is "patentable." Inventors filing utility patents subsequently are more likely to secure legal help in making certain that all details of the patent are adequately addressed. In recent years, the greatest increase in this kind of patent application has been seen in Internet-related business methodologies and innovations. In 2008 456,321 utility patent applications were filed with the PTO, and 157,772 were issued.

Design Patents. Inventors can also obtain patents on the appearance of a product, provided that it is a new and original design. As Richard C. Levy noted in his *Inventor's Desktop Companion*, "if you've invented any new, original, and ornamental designs for an article of manufacture, a design patent may be appropriate. A design patent protects only the appearance of an article and not its structure or utilitarian features." Thomas Field, in his article, "Avoiding Patent, Trademark and Copyright Problems," pointed out that both design patents and utility patents "do more than prevent copying; they forbid the making, using or selling of an invention similar to or the same as the protected invention," even in situations where the second invention was independently created. In 2008 27,782 design patent applications were filed with the PTO, and 25,565 were issued.

Plant Patents. A plant patent is granted to anyone who invents or discovers and asexually reproduces any distinct and new variety of plant, including cultivated sports, mutants, hybrids, and newly found seedlings. The PTO does not grant plant patents, however, for tuber-propagated plants or plants found in an uncultivated state. Asexually propagated plants, noted Levy, are those that are reproduced by means other than from seeds, such as rooting of cuttings, layering, budding, grafting, and inarching. Plant patents comprise only a small minority of the total number of patents that have been bestowed by the PTO. In 2008, 1,209 plant patent applications were filed with the PTO, and 1,240 were issued.

Although millions of patents have been granted in the United States and other countries over the years, there are many things that are not eligible to receive patent protection. These include general business ideas and strategies, printed material, scientific theories, mathematical formulas, and obvious changes to existing items, although some of the above can be legally protected in other ways. Printed material, for instance, can be protected through copyrights.

FILING A PATENT

Patents are arranged according to a massive classification system encompassing more than 400 subject classes and 115,000 subject subclasses. The *Index to the U.S. Patent Classification System*, an alphabetical subject listing of these various classes and subclasses, is produced by the PTO to aid searchers of the system. "The Classifications," wrote Levy, "are to searching a patent what the card catalog is to looking for a library book. It is the only way to discover what exists in the field of prior art [prior patents]. The Classifications are a star to steer by, without which no meaningful patent search can be completed." The *Index* coupled with the *Official Gazette of the United States Patent and Trademark Office*, the *Manual of Classification*, are among the most important tools available to patent searchers.

Another important cog in the PTO's efforts to disseminate information about patents to the public is the Patent and Trademark Depository Library (PTDL), a national network of academic, research, and public libraries. Many

inventors are frequent users of often extensive PTDL resources. Also, anyone with access to the Internet can search patents and patent applications on the U.S. Patent and Trademark Office's Web site. (www. uspto.gov/).

Conducting a Patent Search. Inventors, lawyers, and patent experts all advise inventors armed with a possible new product or design to undertake a comprehensive patent search before taking any other steps. "You cannot avoid doing a search," Levy flatly stated. "The [Patent and Trademark Office] examiner will do one anyway and if your application is rejected based upon prior art (patents that have previously issued), you'll have lost the application cost not to mention the significant time and energy you invested."

Patent searches can be done several ways. Some inventors choose to undertake the task themselves, often with the aid of patent software programs or by using the online database provided by the U.S. Patent and Trademark Office. Google also offers a patent search at google.com/patents. But the majority of inventors choose to secure the services of a patent attorney or a professional patent search firm. Patent attorneys typically hire professional researchers to do the actual patent search; the turnaround time with lawyers who specialize in handling such searches is usually fast, but they are also expensive because of the markup charge that attorneys impose. Other options include inventor associations, university intellectual property departments, or patent search firms. Patent search companies can be found in local yellow pages and online, but inventors need to be careful in making agreements with such firms. Some are perfectly legitimate, but others prey on unsuspecting inventors, saddling them with service contracts or other bad business arrangements. Given this reality, inventors should ask for references, evidence that the search firm has prior experience in the field in which their inventions are classified, and a signed letter of nondisclosure before agreeing to any arrangement with a search firm.

The cost of a search can vary substantially, depending on the nature of the search. As Levy remarked, "there are different charges for different assignments (for example, searching utility patents versus design patents). Electronic, chemical, biological, botanical, and medical searches are often more expensive. And, in most cases, there will be incidental charges for copies, phone and fax, online fees, and shipping and handling of your materials. This is all standard." Another fact that can influence the final cost is turnaround time. Some patent search services now offer same-day service, but at higher prices than their usual searches.

Once a patent search has been completed, the inventor can proceed accordingly. In instances where the invention is in the public domain (a patent on the invention has expired), the inventor is, according to Field, "free to manufacture and market it without concern for the patent laws. Also, even if the inventor didn't find exactly what he or she originally had in mind, a host of good and freely used ideas that are even better might have been discovered. These alone could be worth several times the price of the search in saving research and development time."

If the inventor finds that any part of his or her proposed product or design is covered by a current patent, the inventor can either drop the idea or approach the patent holder about securing a license to use it. "Infringing on a current patent exposes one to a suit for damages as well as an injunction against future use," warned Field. "Even an injunction might mean substantial costs, including the loss of current inventory, and a patent covering even a small feature of the new [product] might give rise to the need to retool. Although deliberate infringement is more serious, ignorance of others' patents is no defense."

If one or more elements of the proposed product or design appear to be new, with notable advantages over prior patents, then the inventor can submit a patent application. Inventors should be sure that they do not let their enthusiasm get the better of them in such instances. If he or she begins selling the product or design without first filing an application for patent, then he or she forfeits any possibility of securing patent rights in the United States after 1 year. In addition, the inventor loses all possible protection in most other countries.

APPLYING FOR A PATENT

Most experts counsel inventors to retain patent counsel to handle utility patents (although they are permitted to make utility patent applications themselves if they so desire). Utility patent applications are complex documents with myriad requirements, and as Levy indicated, "smart inventors use experienced patent counsel to assure that they obtain the strongest patent protection available on their inventions. There is too much at stake. Smart inventors do not rely on patent-it-yourself books." Design patent applications, however, are far less complicated, so many inventors take care of those documents themselves.

Patent Attorneys. Before making an arrangement with a patent attorney, savvy inventors take steps to ensure that they have found competent, responsible legal counsel. The first step is to make sure that the lawyer is registered with the Patent and Trademark Office. Attorneys listed with the PTO are required to have minimum academic and professional qualifications, and must pass a PTO examination.

Inventors should also make certain that their legal counsel is familiar with the field or industry in which the

invention would be used. In addition, they should do their best to insure that their attorney has all relevant information needed to make the best possible patent application. Finally, experts counsel inventors to shop around to find the best combination of price and value, and they encourage them to secure written agreements on attorney fees.

Patent Drawings. Patent experts advise inventors to secure the services of an experienced patent draftsman when the time comes to make patent drawings. "The requirements for drawings are strictly enforced," warned Levy. "Professional draftsmen will stand behind their work and guarantee revisions if requested by the PTO due to inconsistencies in the drawings.... Because the design patent is granted for the appearance of the article, the drawing in the design patent is more critical than the drawing in a utility patent. The design drawing is the disclosure of the claimed design, whereas the utility drawing is intended to provide only an exemplary illustration of some aspects of the mechanism described in the specification and claims."

Patents and the PTO. As of 2010 it generally takes the Patent and Trademark Office an average of 22 months to process patent applications and issue approved patents. Examinations of patent applications, which are undertaken in the order in which they are received, are arduous exercises, encompassing inspection of legal compliance and comprehensive searches to ensure the invention's legitimacy.

If an application is approved, then the inventor can proceed with his business plan, whether that involved launching a small business or seeking buyers for the invention. Many applications, however, are rejected when they are first submitted. Even applications for genuinely new products or designs sometimes need changes to meet PTO requirements. In instances in which the application is rejected, the inventor has limited options. The inventor can prepare a response to the examiner's stated grounds for rejection, explaining why he or she believes that the examiner erred; this is a viable step, and one which sometimes convinces examiners to reconsider. The inventor can also offer amendments to the application designed to assuage the examiner's objections.

On many occasions, however, the examiner will remain unpersuaded and will reject the inventor's claims. If this happens, the inventor can lodge appeals with the PTO commissioner and, after that, the Board of Patent Appeals and Interferences. If the application is still deemed unacceptable, and the inventor remains determined to pursue the issue, he or she can then turn to the U.S. court system. The Court of Appeals for the Federal Circuit and the U.S. District Court for the District of Columbia have both heard such cases.

Fees. Receivers of patents must pay fees to the PTO for services rendered when a patent is reviewed. In 1982 a law was passed that cut some of these fees (patent application, extension of time, revival, appeal, patent issues, statutory disclaimer, maintenance on patents) for "small entities." Small entities were held to include independent inventors, small businesses, and nonprofit organizations. In addition, all utility patents are subject to the payment of maintenance fees that must be paid to keep the patent going. These payments are made at several different points of the patent's life. Inventors need to heed this payment schedule closely, for nonpayment may result in the premature expiration of the patent (a 6-month grace period is typically provided during which the fee can be paid, albeit with a surcharge). Inventors who secure the services of a patent attorney generally do not have to worry about this scenario as much, since a competent attorney will notify them of impending maintenance fee payments.

The government's decision to retool the PTO so that it could operate without federal funding triggered significant increases in PTO fees. In 1991 Congress dramatically raised patent application fees to cover the PTO's operating costs, but by the mid-1990s this income was being redistributed to pay for other government programs or address the federal budget deficit. The PTO was subsequently forced to mull additional fee increases, which angered many members of the small-business community who felt that such increases disproportionately impacted individual inventors and entrepreneurs. However, one of the provisions of the American Inventors Protection Act of 1999 reduced certain patent fees.

In December 2004 a new Patent and Trademark Office fee schedule went into effect for the years 2005 and 2006 as part of the Consolidated Appropriations Act. Fees vary widely for different application forms and services. The range for initial patent application fees is between $50 and $300 and for each it is half the full fee for applicants that qualify as small entities. In 2010 the U.S. Senate proposed a compromise to a patent reform bill. The compromise would reduce patent fees by 50 percent for "small entities" and by 75 percent for the "new classification of micro-entities." A full list of current fees is posted on the PTO Web site.

U.S. Patents and GATT. The 1994 General Agreement on Tariffs and Trade (GATT) also brought significant changes to U.S. patent law. The biggest one changed the duration of patent protection. Prior to GATT, patents lasted for 17 years (14 years for design patents) from the date that the patent was granted. After GATT, patent terms were extended to 20 years *from the date at which the patent application was first filed.* This is a significant change, for as Levy noted, under the new arrangement, a competitor could conceivably file a long stream of fraudulent interference

objections (claims that it had developed a similar product or design at the same time) in order to delay the issuance of a patent, "thereby reducing the patent's life when it does issue."

GATT does provide some patent rules of potential advantage to small inventors. For example, it provides for the issuance of "provisional patent applications," which in effect allows inventors to file a preliminary application that establishes the date of invention. The provisional application does not replace the regular PTO application, but it gives inventors additional time to prepare for that step. Other GATT rules changed import/export rules regarding intellectual property and expanded the number of scenarios under which interference proceedings could be launched.

FILING PATENTS IN THE UNITED STATES AND ABROAD

Most experienced inventors and patent experts counsel inventors to file for a patent as soon as possible. In the United States inventors have to apply for a patent within 1 year of the time they first disclose the device or start selling it. At the conclusion of that year, a valid patent may not be obtained. Inventors should also note that a U.S. patent will not provide him or her with protection in other countries; patent applications need to be made in every country in which protection is desired. Moreover, in other countries, inventors have to apply for the patent before it is publicly disclosed.

Finally, the PTO notes that in most instances, American inventors seeking to secure a patent in another country must first get a license from the Commissioner of Patents and Trademarks. This requirement is waived, however, if the filing in the foreign country takes place more than 6 months after the U.S. filing took place.

There are two major international patent treaties that should be studied by inventors hoping to market their products abroad. The Paris Convention for the Protection of Industrial Property, which was signed by the United States and more than 170 other nations, stipulates that each signing nation provide the same rights in patents and trademarks to citizens of other participating nations that it does to its own. The Patent Cooperation Treaty, meanwhile, is a patent agreement that includes more than 140 nations.

Efforts to introduce substantial reform to the patent system have been ongoing. In 2009 the Senate Judiciary Committee introduced the Patent Reform Act of 2009 when efforts to pass a patent reform bill in the Senate were mired. The House had already passed patent reform legislation in 2007. If the House and the Senate do pass new reform, it could mean lower patent fees and changes to damages awarded for patent infringement.

INVENTORY

An inventory is the entirety of those things owned by a company and intended for resale or the raw materials and parts to be used in producing salable goods and products. Inventories are time-sensitive storage systems that can be divided into three categories. First, cycle stocks: the order

quantity or lot size received from the plant or vendor. Second, in-transit stocks: inventory in shipment from the plant or vendor or between distribution centers. Third, safety stocks: the items in inventory that serve as a buffer against forecast error and lead time variability.

Historically, there have been two basic inventory systems: the continuous review system and the periodic review system. With continuous review systems, the level of a company's inventory is monitored at all times. Under these arrangements, businesses typically track inventory until it reaches a predetermined point of "low" holdings, whereupon the company makes an order (also of a generally predetermined level) to push its holdings back up to a desirable level. Since the same amount is ordered on each occasion, continuous review systems are sometimes also referred to as event-triggered systems, fixed order size systems (FOSS), or economic order quantity systems (EOQ). Periodic review systems, on the other hand, check inventory levels at fixed intervals rather than through continuous monitoring. These periodic reviews (weekly, biweekly, or monthly checks are common) are also known as time-triggered systems, fixed order interval systems (FOIS), or economic order interval systems (EOI).

INVENTORY AND THE GROWING COMPANY

Most successful small companies find that as their economic fortunes rise, so too do the complexities of their inventory system logistics. The resulting need for increased inventory management procedures is due primarily to two factors: 1) greater volume and variety of products; and 2) increased allocation of company resources (such as physical space and financial capital) to accommodate the growth in inventory. For a small company used to ordering parts and materials in an as-needed and informal basis, the transition to a formal and documented system of purchasing and inventory management can be a significant step. It requires the creation of new job functions to identify the costs (holding, shortage) associated with inventory and to implement and manage a formal inventory system. Formal inventory systems require extensive record keeping, and on a periodic basis they must be audited by someone. In addition, this transition to a formal inventory system requires substantial coordination between different functional areas of the company. Such a transition often leads into computerization of inventory management. This can be a challenging project, particularly for companies lacking employees with appropriate backgrounds in data management.

Just-In-Time Inventory Control. Just-in-time (JIT) production is a straightforward idea that may be somewhat difficult to implement. The basic concept is that finished goods should be produced just in time for delivery, and raw materials should be delivered just in time for production. When this occurs, materials or goods never sit idle. This, in turn, means that a minimum amount of money is tied up in raw materials, semifinished goods, and finished goods. The result of a well-managed inventory system capable of supporting a just-in-time production system is sustained productivity and quality improvement with greater flexibility and delivery responsiveness. As manufacturing and distribution has become more and more efficient during the 1990s and early twenty-first century, the ideas behind JIT production are becoming a necessity more than a choice. As Hiroyuki Hirano wrote in his 2009 book *JIT Implementation Manual*, "In today's world, manufacturing industries can no longer afford to remain complacent in the belief that their chief concern is to turn out products."

SETTING AN INVENTORY STRATEGY

No single inventory strategy is effective for all businesses. When a company is faced with a need to establish or reevaluate its inventory control systems, a practice commonly known as "inventory segmenting" or "inventory partitioning" is a helpful tool. This practice is, in essence, a way of breaking down and reviewing total inventory so that a thorough assessment of each category may be made. The inventory may be broken down by product classifications, inventory stages (raw materials, intermediate inventories, finished products), sales and operations groupings, and excess inventories. Proponents of this method of study say that such categorical segmentations break the company's total inventory into much more manageable parts for analysis.

Key Considerations. Inventory management is a key factor in the successful operation of any business for which inventories are an integral part. For both large and small companies, determining whether their inventory systems are successful can be done by answering one question: Does the inventory strategy insure that the company has adequate stock for production and goods shipments while at the same time minimizing inventory costs? If the answer is yes, then the company in question is far more likely to be successful. If, however, the answer is no, then the business is operating under twin burdens that can be of considerable consequence to its ability to survive, let alone flourish.

No factor is more important in ensuring successful inventory management than regular analysis of policies, practices, and results. A useful checklist of actions for those wishing to establish and maintain an effective inventory system includes:

- Regularly reviewing product offerings, including the breadth of the product line and the impact that peripheral products have on inventory.

- Ensuring that inventory strategies are in place for each product and that they are reviewed on a regular basis.
- Reviewing transportation alternatives and their impact on inventory/warehouse capacities.
- Undertaking periodic reviews to ensure that inventory is held at the level that best meets customer needs; this applies to all levels of business, including raw materials, intermediate assembly, and finished products.
- Regularly canvassing key employees for ideas and information that may inform future inventory control plans.
- Determining what level of service (lead time, etc.) is necessary to meet the demands of customers.
- Establishing a system for effectively identifying and managing excess or obsolete inventory, and determining why these goods reached such status.
- Devising a workable system wherein "safety" inventory stocks can be reached and distributed on a timely basis when the company sees an unexpected rise in product demand.
- Calculating the impact of seasonal inventory fluctuations and incorporating them into inventory management strategies.
- Reviewing the company's forecasting mechanisms and the volatility of the marketplace, both of which can (and do) have a big impact on inventory decisions.
- Instituting a "continuous improvement" philosophy in inventory management.
- Making inventory management decisions that reflect a recognition that inventory is deeply interrelated with other areas of business operation.

To summarize, inventory management systems should be regularly reviewed from top to bottom as an essential part of the annual strategic and business planning processes.

Indeed, even cursory examinations of inventory statistics can provide business owners with valuable insights into how things are going generally. Business consultants and managers alike note that if an individual business has an inventory turnover ratio that is low in relation to the average for the industry in which it operates, this may be a sign that the business is carrying a surplus of obsolete or otherwise unsalable inventory. Conversely, if a business is experiencing unusually high inventory turnover when compared with industry or business averages, the company may be losing out on sales because of a lack of adequate stock on hand. Determining and tracking the turnover rate of all items in inventory helps in building up an inventory assessment.

INVENTORY ACCOUNTING

The way in which a company accounts for its inventory can have a visible effect on its financial statements. Inventory is a current asset on the balance sheet. One may think that inventory valuation is relatively simple. For a retailer, inventory should be valued for what it cost to acquire that inventory. When an inventory item is sold, the inventory account should be reduced (credited) and cost of goods sold should be increased (debited) for the amount paid for each inventory item. This works if a company is operating under the Specific Identification Method. That is, a company knows the cost of every individual item that is sold. This method works well when the amount of inventory a company has is limited and each inventory item is unique. Examples would include car dealerships, jewelers, and art galleries.

The Specific Identification Method, however, is cumbersome in situations where a company owns a great deal of inventory and the items within that inventory are not easily distinguished one from another. As a result, other inventory valuation methods have been developed. The best known of these are the FIFO (first-in, first-out) and LIFO (last-in, first-out) methods.

FIFO. First-in, first-out is a method of inventory accounting in which the oldest stock items in a company's inventory are assumed to have been the first items sold. Therefore, the inventory that remains is from the most recent purchases. In a period of rising prices, this accounting method yields a higher ending inventory, a lower cost of goods sold, a higher gross profit, and a higher taxable income.

The FIFO method may come the closest to matching the actual physical flow of inventory. Since FIFO assumes that the oldest inventory is always sold first, the valuation of inventory still on hand is at the most recent price. Assuming inflation, this will mean that cost of goods sold will be at its lowest possible amount. Therefore, a major advantage of FIFO is that it has the effect of maximizing net income within an inflationary environment.

LIFO. Last-in, first-out, on the other hand, is an accounting approach that assumes that the most recently acquired items are the first ones sold. Therefore, the inventory that remains is always the oldest inventory. During economic periods in which prices are rising, this inventory accounting method yields a lower ending inventory, a higher cost of goods sold, a lower gross profit, and a lower taxable income. The LIFO method is preferred by many companies because it has the effect of reducing a company's taxes,

thus increasing cash flow. However, these attributes of LIFO are only present in an inflationary environment.

The other major advantage of LIFO is that it can have an income smoothing effect. Again, assuming inflation and a company that is doing well, one would expect inventory levels to expand. Therefore, a company is purchasing inventory, but under LIFO, the majority of the cost of these purchases will be on the income statement as part of cost of goods sold. Thus, the most recent and, assuming an inflationary period, most expensive purchases will be the first items sold. As they are sold, the cost of goods sold will rise and net income will be reduced. Net income is still high, but it does not reach the levels that it would if the company used the FIFO method.

Given the important differences that exist between the various inventory accounting methods, it is important that the inventory footnote be read carefully in financial statements, for this part of the document will inform the reader of the method of inventory valuation chosen by a company. Assuming inflation, FIFO will result in higher net income during growth periods and a higher, and more realistic inventory balance. In periods of growth, LIFO will result in lower net income and lower income tax payments, thus enhancing a company's cash flow. During periods of contraction, LIFO will result in higher income levels, but it will also undervalue inventory over time.

Small-business owners weighing a switch to a LIFO inventory valuation method should note that while making the change is a relatively simple process (the company files IRS Form 970 with its tax return), switching away from LIFO is not so easy. Once a company adopts the LIFO method, it cannot switch to FIFO without securing IRS approval.

DONATING EXCESS INVENTORY

Over the years, many small (and large) businesses have gained valuable tax deductions by donating obsolete or excess inventory to charitable organizations, churches, and disaster relief efforts such as the ones launched in 2010 in response to earthquakes in Haiti and Chile. The type of deduction that can be claimed depends on the business structure of the donating company. As Joan Szabo explained in *Entrepreneur*, "If you're organized as an S corporation, a partnership, or a sole proprietorship and you donate inventory to a charity that uses the goods to assist the sick, the poor, or children, you're generally able to take a tax deduction for the cost of producing the inventory." IRS Code Section 170(e)(3) creates an enhanced deduction for C Corporations, which can take a deduction up to twice the cost of producing an item when the value is higher than the cost. In all cases, the IRS stipulates in its Publication 526 that "the contributions must be made to a qualified organization and not set aside for use by a specific person."

A number of organizations have been established for the express purpose of distributing donated inventory. Gifts in Kind International (based in Alexandria, Virginia) distributes used computers, high-tech equipment, and other donated inventory to approximately 150,000 domestic and international charities. The organization collected and distributed nearly $750 million in product donations in 2007. The Galesburg, Illinois-based National Association for the Exchange of Industrial Resources (NAEIR), meanwhile, receives donations from over 7,500 regular donors and distributes excess inventory to nearly 10,000 schools, churches, homeless shelters, and other charitable organizations. Office supplies comprise much of the NAEIR goods, but clothing, janitorial supplies, and computer equipment are also distributed. During the 2007-2008 fiscal year, NAEIR distributed $106.5 million worth of goods, and the organization estimates that as of mid-2008, it has distributed more than $2.4 billion in corporate inventory donations to American schools and nonprofit organizations since its founding in 1977.

INVENTORY CONTROL SYSTEMS

An inventory control system is a system the encompasses all aspects of managing a company's inventories: purchasing, shipping, receiving, tracking, warehousing and storage, turnover, and reordering. In different firms the activities associated with each of these areas may not be strictly contained within separate subsystems, but these functions must be performed in sequence in order to have a well-run inventory control system. Computerized inventory control systems make it possible to integrate the various functional subsystems that are a part of the inventory management into a single cohesive system.

In today's business environment, even small and mid-sized businesses have come to rely on computerized inventory management systems. Certainly, there are plenty of small retail outlets, manufacturers, and other businesses that continue to rely on manual means of inventory tracking. Indeed, for some small businesses, like convenience stores, shoe stores, or nurseries, purchase of an electronic inventory tracking system might constitute a wasteful use of financial resources. But for other firms operating in industries that feature high-volume turnover of raw materials or finished products, computerized tracking systems have emerged as a key component of business strategies aimed at increasing productivity and maintaining competitiveness. The development of powerful computer programs capable of addressing a wide variety of record keeping needs including inventory management in one integrated system have also contributed to the growing popularity of electronic inventory control options. Moreover, the spread of wireless systems and the use of barcodes has made real-time computerized inventory systems more powerful and flexible. Given such developments, it is little wonder that business experts commonly cite inventory management as a vital element that can spell the difference between success and failure in today's keenly competitive business world.

COMPUTERS AND INVENTORY

Automation can dramatically impact all phases of inventory management, including counting and monitoring of inventory items; recording and retrieval of item storage location; recording changes to inventory; and anticipating inventory needs, including inventory handling requirements. This is true even of stand-alone systems that are not integrated with other areas of the business, but many analysts indicate that productivity and hence profitability gains that are garnered through use of automated systems can be further increased when a business integrates its inventory control systems with other systems such as accounting and sales to better control inventory levels.

Inventory Control Systems. New technologies developed during the 1990s and perfected during the early twenty-first century have greatly improved the tools used to manage inventories. Powerful computer systems that are linked into networks are now able to receive information from handheld devices. The wireless handheld devices scan barcodes on inventory items and send data to a tracking database in real time. The increased efficiency of inventory systems over the past decades has made some things possible that would have been impossible in earlier times, such as the popular just-in-time manufacturing system.

One trend in the area of inventory control and management are vendor-managed inventory (VMI) systems and agreements. In a VMI system distributors and manufacturers agree to take over the inventory management for their customers. Based on daily reports sent automatically from the customer to the distributor, the distributor replenishes the customer's stocks as needed. The distributor or manufacturer sees what is selling and makes all necessary arrangements to send the customer new products or parts automatically. No phone calls or paperwork are necessary, allowing the supply chain process to remain uninterrupted.

The benefits that can accrue to both parties in a VMI arrangement are noteworthy. Both parties should experience a savings of time and labor. The customer is able to maintain fewer items in stock and can rely upon a steady flow of products or parts. The vendor or distributor benefits in two ways. First, a supplier is better able to anticipate production requirements. Second, the supplier benefits from a strong relationship with the customer, one that is more difficult to alter than a vendor-customer relationship in which such automated systems did not exist.

As with all outsourcing arrangements, there are potential drawbacks to a VMI system. The first is the partial loss of control experienced by the customer in managing his or her own inventories. Second is the problem this type of system poses for a vendor in the case of volatile sales periods. On a VMI system it is very difficult for a distributor or manufacturer to hold large inventories for one customer who is experiencing a slowdown in sales while having to ramp up for another customer who is experiencing rising demand. Both parties to a VMI agreement must weigh the pros and cons of such a system thoroughly and be sure to include in any VMI agreement prearranged methods for dealing with periods of volatile sales patterns. The popularity of VMI suggests that there are many applications in which these systems produce net benefits for both parties.

WAREHOUSE LAYOUT AND OPERATION

The trend toward automation in inventory management naturally moved into the warehouse during the 1990s. Citing various warehousing experts, Sarah Bergin wrote

in 1997 in *Transportation and Distribution* magazine that "the key to getting productivity gains from inventory management … is placing real-time intelligent information processing in the warehouse. This empowers employees to take actions that achieve immediate results. Real-time processing in the warehouse uses combinations of hardware including material handling and data collection technologies. But according to these executives, the intelligent part of the system is sophisticated software which automates and controls all aspects of warehouse operations." Even with the technological developments of the twenty-first century, this basic insight remains true. The main difference between the early 2010s and the mid-1990s is the availability of ever more sophisticated, flexible, and inexpensive tools to carry out warehouse control operations.

Another important component of good inventory management is creation and maintenance of a sensible, effective warehousing design. A well-organized, user-friendly warehouse layout can be of enormous benefit to small-business owners, especially if they are involved in processing large volumes of goods and materials. Conversely, an inefficient warehouse system can cost businesses dearly in terms of efficiency, customer service, and, ultimately, profitability.

Writing in *Transportation and Distribution* magazine in 1996, Tom Andel and Daniel A. Kind cited several steps that businesses utilizing warehouse storage systems could take to help ensure that they get the most out of their facilities. They recommended that companies utilize the following tools:

- Stock locator database. "The stock locator database required for proactive decision making will be an adjunct of the inventory file in a state-of-the-art space management system. A running record will be maintained of the stock number, lot number, and number of pallet loads in each storage location. Grid coordinates of the reserve area, including individual rack tier positions, must therefore be established, and the pallet load capacity of all storage locations must be incorporated into the database."
- Grid coordinate numbering system. Warehouse numbering system should be developed in conjunction with the storage layout, and should be user-friendly so that workers can quickly locate currently stocked items and open storage spaces alike.
- Communication systems. Again, this can be a valuable investment if the business's warehouse requirements are significant. Such facilities often utilize fork lift machinery that can be used more effectively if their operators are not required periodically to return to a central assignment area. Current technology makes it possible for the warehouse computer system to interact with terminal displays or other communications devices on the fork lifts themselves.
- Maximization of storage capacity. Warehouses that adhere to rigid "storage by incoming lot size" storage arrangements do not always make the best use of their space. Instead, businesses should settle on a strategy that eases traffic congestion and best eases problems associated with ongoing turnover in inventory.

Once again, although these recommendations were first made during the mid-1990s, they remain relevant in the early 2010s. However, one additional trend has altered the warehousing industry: outsourcing. More and more companies are choosing to outsource their warehouse functions. One survey indicated that between 1991 and 2004, the percentage of large manufacturers who used third-logistics (3PL) services increased from 38 percent to over 80 percent. This trend has enabled companies to concentrate on core business processes instead of warehousing and logistics. As Bergin wrote as early as 1997, "Third-party inventory control operations can provide companies with an array of valuable information, including analysis of products and spare parts, evaluations of their time sensitivity, and information on vendors." The benefits of 3PLs have contributed to their growth during the past two decades.

INVESTOR PRESENTATIONS

Investor presentations are an important but often overlooked aspect of entrepreneurial efforts to secure financing for their businesses. Presentations are particularly important to small-business owners hoping to raise money from private investors. Whereas institutional investors such as banks rely primarily on financial statements and business plans in making their lending decisions, private investors are more likely to be swayed by other factors, such as the owner's vision of a new product's appeal, knowledge of the marketplace, or ability to present a compelling picture of future profits for both the owner and the investor.

Poor investor presentation may close the door on potential avenues of financing, even if the entrepreneur's idea for a new business or product is a good one. "Putting together a winning presentation isn't as easy as it might seem," said David R. Evanson in *Nation's Business*. "Whatever the forum a formal dog-and-pony show before a roomful or institutional investors, a clubby luncheon with 10 to 15 wealthy individuals, or a one-on-one meeting with a venture capitalist founders ... have often shown they can shoot themselves in the foot with deadly accuracy." Entrepreneurs and small-business owners seeking expansion capital need to make certain that their presentations grab the attention of investors and inspire them.

KEYS TO SUCCESSFUL INVESTOR PRESENTATIONS

Several considerations should be kept in mind when planning a presentation to potential investors. These considerations range from tips on public speaking to recommendations on presentation content.

Tailor Presentation to Audience. Some business owners make investor presentations that are only negligibly different from presentations that they make to internal salespeople or to customers. This choice, which is often a byproduct of laziness more than anything else, can have a negative impact on the owner's chances of landing an investor. "Topics such as product features, new technology and customer service the things that matter to customers are of interest to investors only as part of an overall menu of competitive advantages that will help drive sales," wrote Evanson. Moreover, no two investors are alike; one individual may have a reputation for daring business initiatives; another may be predisposed toward (or away from) involvement in a specific industry; still another may be most interested in receiving assurances about the competence of the enterprise's management team. Entrepreneurs preparing to make a pitch toward private investors should find out as much as possible about their audience's interests and investment philosophies beforehand.

Judicious Use of Visual Aids. When intelligently utilized, visual support can be most helpful in providing context and illustrating key points. Many investor presentation experts recommend using computerized visual aids in the form of a PowerPoint (or other software) presentation. As Joseph R. Bell stated in *Finding an Angel Investor in a Day*, "Many angel groups require a PowerPoint presentation. Even if your angels don't demand this, a PowerPoint presentation will make you look focused and professional." Bell recommends keeping the presentation to a maximum of twelve slides and making sure they cover key pieces of information, including:

- Company and product: a description of product or service, the competitive advantage a company offers, the size of the market, the potential growth, and the past successes of the management team
- Specific target customers: who they are, how they will be reached, and how they will be served by the product
- The competition: its market share, and any relevant product comparisions
- Business model: product distribution, intended pricing strategies, and how customers will be reached
- Financials: income and cash flow projections, amount of investment wanted, exit strategy and potential return for investors
- Timeline: the timeline expected to reach certain milestones

Visual aids should augment the presentation, not dominate it. PowerPoint slides can be a valuable tool in a presentation, but there are a number of potential pitfalls as well. Some people place so much importance on the visual component of their presentation that they flounder in situations where they have to deviate from their script. Others cram their visual aids so full of information that viewers are unable to digest it all, which merely triggers resentment or annoyance from potential investors. Always remember: a visually interesting presentation is a very good idea, but substance should **always** trump style.

Live Demonstrations. It may be tempting for an entrepreneur to make a live demonstration or his or her product as part of the total presentation package, but demonstrations have a pretty hefty downside. This is especially true of technology products, which can end up looking hopeless because of some minor glitch. "As people with sales experience will tell you, the customer has a picture in mind of what the product is and what it's supposed to do," wrote Evanson. "Any uncontrolled situation that distorts that image is ultimately counterproductive to closing the sale." Of course, there may be situations wherein the presenter is pointedly asked for a live demonstration by a potential investor. Not granting such a request may throw prospects for financial assistance in jeopardy as well, so entrepreneurs should be prepared to make such a demonstration if it seems necessary. Finally, there are certain categories of products (generally involving simpler, nontechnological designs) that can be demonstrated with less worry for a negative outcome because of a technical glitch. Presenters must judge for themselves the potential risks of a live demonstration.

Relevance and Length. Presentations that spend excessive amounts of time on relatively unimportant points are unlikely to attract investors. Instead, presentations should remain focused on the basic information that investors are likely to want to hear, such as company background, ownership/management background, key employees, product development, market opportunities, existing competition, present and future marketing plans, and financial analysis. The authors of *Pitching Hacks: How To Pitch Startups To Investors*, recommend limiting the presentation to 20 minutes with a maximum of ten slides, though other experts recommend a maximum of twelve slides and 30 minutes for the presentation. Whereas excessively long presentations can bore investors and unduly short ones can leave investors wondering if they are being told everything, presentations of 20-30 minutes can usually provide an adequate overview and leave sufficient time to answer investor questions. Whatever rule is followed, the presentation should be focused and relevant to the audience.

Communication Abilities. The element of presentation encompasses several different areas. First of all, the presenter should ideally be able to speak in an authoritative, confident, and smooth manner. Fairly or not, public speaking ability can make a profound difference in an entrepreneur's success in securing investors for his or her business or product. "There are a number of golden rules in making a presentation and plenty of speakers break them all," observed Sue Bryant in *Marketing*. "No eye contact. No pauses. Patronizing the audience by putting text on screen and reading it out loud. Writing a speech, failing to rehearse and reading it woodenly. Fumbling with equipment and muttering: 'Now, how do I work this thing . . .'" Indeed, Bryant pointed out that excessive use of visual aids can often be traced to a presenter's discomfort with public speaking. Given the importance of a good delivery, an entrepreneur who is uncomfortable with speaking in public should consider investing in a course designed to help people with public speaking and presentation skills.

Presenters also need to make sure that the presentation itself is appropriately focused and understandable. Karen Kalish, author of *How to Give a Terrific Presentation,* stated that effective presentations have seven key organizational elements:

- Audience-grabbing opening
- Well-organized information (including examples, analogies, and anecdotes where appropriate)
- Logical transitions
- Short sentences
- Understandable language
- Good closing
- Appropriate responses to questions

Entrepreneurs are often intimately involved in the details of their products or services. This may lead to a tendency to drift off into a lengthy discussion of technical matters. The last thing that one wants is to bore prospective investors. Presenters should avoid lengthy explanations of relatively esoteric subjects. "Yes, the technical aspects of your company's product or service are important," wrote David R. Evanson and Art Beroff in *Entrepreneur*, "inasmuch as they deliver competitive advantages, open new markets or change the balance of power in an existing market but to investors, technology is not important in and of itself."

Honest Presentation. Presenting projected financial performance for a company or product is an important and delicate part of the investor presentation process. Entrepreneurs naturally want to put their prospects in a good light, but consultants warn that private investors are wary of overly optimistic numbers, and view misleading data in this area as a clear sign that they should withhold assistance. "With so many exciting opportunities in the marketplace, you've got to walk a very fine line between numbers that are exciting enough to attract investors and those that will turn them off because they're simply unrealistic," one successful business founder told *Entrepreneur*.

Question-and-Answer Sessions. Questions from investors are an inevitable part of investor presentations. Entrepreneurs who avoid answering certain questions, answer

with rambling sermons in "tech-speak," or respond in an arrogant, "know it all" fashion are unlikely to make a favorable impression on their audience.

Follow-Up. Entrepreneurs should follow up with investors within a few days of the presentation, but they should be careful not to badger him or her with multiple queries. "When raising capital, particularly from individual investors, the old rule is that yes comes fast, and no takes forever," commented Evanson and Beroff. "Still, many investors test the mettle of the business owner by seeing how long it takes him or her to follow up. If it's not forthcoming, even for reasons of perceived courtesy, many investors get turned off. On the other side of the coin, calling every day doesn't work, either."

Finally, presenters should rehearse both the presentation and various responses to anticipated questions. Entrepreneurs seeking funding from private investors are competing with many others. They need to take full advantage of the limited time afforded during an investor presentation to convince the audience that their business strategy makes sense and that their management team is capable of successfully executing the plan.

INVESTOR RELATIONS AND REPORTING

Once a privately held company issues shares of stock to the public through an initial public offering (IPO), for example it incurs a number of new responsibilities related to investor relations and reporting requirements. Also known as "going public," an IPO transforms a business from a privately owned and operated entity into one that is owned by public stockholders. An IPO is a significant stage in the growth of many businesses, as it provides them with access to the public capital market and also increases their credibility and exposure. Becoming a public entity also involves significant changes for a business, including a substantial increase in both the number and complexity of the reports the company is legally required to file.

LEGAL REPORTING REQUIREMENTS

In 1934 the Securities Act was passed. This act provided for the establishment of the Security and Exchange Commission (SEC) as the agency authorized to oversee the act's provisions. The SEC regulates all publicly traded companies. SEC reporting requirements are extensive. In addition to the periodic reports known as 8A, 10K, and 10Q, public companies must issue annual reports, quarterly reports, proxy statements, and press releases in order to keep shareholders, financial analysts, and regulatory agencies informed of their actions.

All public companies are required to file SEC documents online through the Electronic Data Gathering, Analysis, and Retrieval (EDGAR) system, which according to the SEC Web site "performs automated collection, validation, indexing, acceptance, and forwarding of submissions by companies and others who are required by law to file forms with the U.S. Securities and Exchange Commission." EDGAR forms, explanations, tutorials, and searches are available at www.sec.gov/edgar.shtml.

Form 8A. This is the main form for registering a stock issue with the SEC. It must be filed if the shares will be traded on a major stock exchange (NYSE, AMEX, or NASDAQ), if the firm will have more than 500 shareholders, or if it has more than $3 million in assets. Companies that register their stock offerings using Form 8A must also file periodic reports until they no longer meet the aforementioned requirements. These updates are an important means of communication with shareholders, who use the information in making investment decisions.

Form 10K. All public companies are required to file Form 10K annually within 90 days of end of their fiscal year. This form requires disclosure of the company's

audited financial statements, a summary of operations, a description of the overall business and its physical property, identification of any subsidiaries or affiliates, disclosure of the revenues contributed by major products or departments, and information on the number of shareholders, the management team and their salaries, and the interests of management and shareholders in certain transactions. The idea of Form 10K is to update on an annual basis the information that the company provided for its initial filing.

Form 10Q. Another SEC required form is Form 10Q. This form must be filed within 45 days of the end of each of the first three quarters in a company's fiscal year. It includes audited financial statements with management discussion as well as details of any corporate events that had a significant impact on the company.

Form 8K. Another important reporting requirement is Form 8K, which discloses major changes in corporate control or assets due to such events as mergers, acquisitions, or bankruptcy. Several other types of filings are required for specific events, such as a significant increase or decrease in the amount of outstanding stock, or distributions to shareholders in the form of stock splits or dividends. In addition, public companies are required to inform stockholders of impending meetings or votes and send out proxy statements. Finally, insider trading laws require that public companies disclose any changes in the holdings of managers or directors who own more than 10 percent of the company's stock.

EVOLUTION OF SEC REPORTING REQUIREMENTS

The Fair Disclosure Regulation, enacted in 2000, stipulates that publicly traded companies broadly and publicly disseminate information instead of distributing it selectively to certain analysts or investors only. Companies are encouraged to use several means of information dissemination including news releases, Web sites or Web casts, and press releases.

In 2002 Congress passed the Sarbanes-Oxley Act, legislation enacted in the wake of serious allegations of accounting fraud and a string of bankruptcies of very high-profile, publicly traded companies. The act established stricter reporting requirements and increased the personal responsibility that both CEOs and CFOs must take on when signing corporate reports. Meeting the requirements of this law has increased the workload for publicly traded firms and the firms that do their auditing work. In particular, Section 404 of the Sarbanes-Oxley Act requires that a company's annual report include an official write-up by management about the effectiveness of the company's internal controls. The section also requires that outside auditors attest to management's report on internal controls. An external audit is required in order to attest to the management report.

Following the financial crisis of 2008, the SEC began reviewing changes to reporting requirements in order to increase the transparency of activities related to reporting companies' risk profile. In December 2009 the SEC adopted new rules that require disclosures about risk management policies. These new rules, which became effective in 2010, require a discussion of the company's compensation policies and practices as they relate to incentives for risk-taking, and a new disclosure about the role of the company's board in overseeing risk.

BEYOND SEC REQUIREMENTS

In addition to SEC reporting requirements, public companies also face the responsibility of maintaining good investor relations. Although it is not legally required, it is nonetheless important for all companies to establish systems to deal with stockholders, financial analysts, the media, and the overall community. One of management's key responsibilities in addition to managing the business and overseeing all regulatory reporting requirements is to keep the investor's informed about company activities.

It is therefore vital that interested outsiders are presented with a complete and accurate picture of what is happening within the company. In some cases, this may entail obtaining the services of a public relations firm that specializes in investor relations. Such firms can guide newly public companies through the maze of information that they must disseminate. In addition, many smaller companies with limited resources will utilize the services of outside consultants who can help them meet their goal of providing full, accurate, and accessible information for disclosure to investors. Companies who decide to pursue this route should consider the following when selecting a consultant:

Reputation. References, qualifications, and experience of prospective investor relations firms should be closely examined.

Methodology. Consultants have different methodologies, strategies, and philosophies, and it is the small-business owner's obligation to research these variables and determine which firm is the best fit for his or her own company.

Compensation structure. Investor relations consultants maintain a wide array of compensation and billing structures. "Understand how the billing is done, how expenses are allocated, and what services the company will receive," counseled Michael Noonan in *Houston Business Journal*. "Clearly identify the terms and responsibility for each party and put the deal in writing." At the same time, companies

seeking assistance in this area need to undertake a frank appraisal of their own budgetary constraints.

IRS AUDITS

Each year, the Internal Revenue Service (IRS) conducts audits on individuals and businesses to ensure that they are in compliance with U.S. tax law. The percentage of people and businesses subject to these audits is relatively small, usually between 1 and 2 percent. For tax year 2008, the IRS audited approximately 1.5 percent of all tax returns. The rate for small businesses is slightly higher than for individuals, though in 2008, the percentage was only 2 percent.

However, audits in general have been on the rise in recent years. In 2009 the IRS performed more audits than any other year in the twenty-first century, and the IRS appears to be targeting more vigorously wealthier citizens and small businesses. In 2009 audits of people who earned $200,000 or more increased by 11 percent, and audits of those making $1 million or more increased by 30 percent. In 2009 the chance of an audit for someone who earned $1 million or more was 6.42 percent. Audits of small businesses are going up even as audits of large corporations are going down. According to a study done by the Transaction Records Access Clearinghouse at Syracuse Univeristy, "the smallest companies saw the taxman 41% more often in 2007 than in 2005, and companies with $10 million to $50 million in assets were 29% more likely to be investigated."

Many business analysts believe that smaller businesses in certain industries are at greater risk of being subjected to an audit because of historically higher levels of noncompliance in those industries, many of which are primarily composed of small firms. Home-based businesses that are characterized by cash-based transactions are particularly likely to undergo formal IRS review. Many business and tax experts, however, contend that small businesses that conduct their operations honestly and maintain good record-keeping practices should be able to weather an IRS audit without too much difficulty. Indeed, some small-business owners have been known to actually request an audit in instances where they have a dispute with the IRS over tax obligations.

When providing advice on IRS audits, tax advisors counsel small-business owners to adhere to the following guidelines:

- Be honest in business operations and in claiming deductions.
- If you prepare your own returns, be familiar with IRS rules regarding deductions and other tax matters; if not, make certain that you hire an accountant or tax advisor who is knowledgeable in these areas.
- Keep all receipts and maintain sound and thorough record-keeping practices.
- Keep expenses in line with industry norms.
- Make sure that the auditing agent is knowledgeable about the industry in which you operate.
- Be cooperative; promptly answer all communications from the IRS and make every effort to provide the auditing agent with all requested information.
- If you are unhappy with the results of an IRS audit, consider making a written appeal; the Internal Revenue Service maintains an independent division specifically designed to hear such appeals.

TAX FRAUD AND THE IRS

As the Internal Revenue Service goes about the annual routine of gathering and processing tax statements from businesses and individuals, one of the agency's principal

responsibilities is to be on the lookout for cases of potential tax evasion or fraud. Business experts cite several primary scenarios that are likely to prompt further investigation:

- Accounting irregularities, such as discrepancies between amounts reported on various financial statements.
- Inadequate record keeping, such as missing or incomplete financial records.
- Failure to report all income.
- Improper claims for deductions (such as inflated claims of business costs).
- Allocation of income to related taxpayers, especially if the recipient pays lower taxes.

Although the IRS only audits a small percentage of tax returns, there are some areas in which audits are more likely. These include:

- People who are self-employed, particularly those who take deductions for home offices.
- People with overseas bank accounts.
- People who have sold a lot of stocks.
- People who take large deductions for charitable donations.
- People who earn a lot of money. As noted above, audits of wealthy taxpayers have been rising much faster than other categories.

Financial Status Audit. One of the primary means by which the IRS conducts audits is the financial status audit. Under this form of audit, the investigating agent compares the amount of income reported against the assets and lifestyle of the taxpayer. The visibility of this type of audit has fluctuated in recent years, however. In fact, the financial status audit became a lightning rod for criticism of the IRS in the mid-1990s, when the agency announced that it intended to provide increased training in this area in order to increase its use of this type of audit. Resistance to this focus was strong and immediate. Many accountants and the Association of Independent Certified Public Accountants (AICPA) were concerned about the intrusive nature of these audits and the intention of the IRS to perform them in large numbers. The adverse reaction to the IRS decision reached a culmination in 1998, when legislators took action to curb the use of this sort of audit. The legislation written, in part, to address financial status audits is the IRS Restructuring and Reform Act of 1998. This legislation placed limits on the use of financial status audits, although it did not put an end to them.

MARKET SEGMENT SPECIALIZATION PROGRAM (MSSP)

The Market Segment Specialization Program, established in 1992, is an IRS initiative designed to conduct and analyze in-depth studies and actual audits of industries with unique business practices. MSSP Audit Technique Guides aim to improve the auditing process by creating and distributing auditor training guides on these specific industries. These guides, which were originally developed for reference use by auditors and IRS revenue agents, can also be useful to businesses preparing for IRS audits or researching their tax liability. Each of the available guides, which cover industries ranging from air charter services and architectural firms to mortuaries and gas retailers, includes an overview of industry issues, outlines of the books and records that may be maintained for tax purposes, examination techniques, industry terminology, and highlights of the prevailing business practices in that industry.

ISO 9000

ISO 9000 is a set of international standards of quality management created by the International Organization for Standardization (ISO). The ISO guidelines have become increasingly popular for large and small companies alike. In 2010 ISO standards fell under the ISO 9001:2008 revision of the original ISO 9000 specifications. Adherence is accomplished through an application

process for ISO 9000 certification in company standards for inspecting production processes, updating records, maintaining equipment, training employees and handling customer relations. "ISO is grounded on the 'conformance to specification' definition of quality," wrote Francis Buttle in the *International Journal of Quality and Reliability Management.* "The standards specify how management operations shall be conducted. ISO 9000's purpose is to ensure that suppliers design, create, and deliver products and services which meet predetermined standards; in other words, its goal is to prevent non-conformity." Used by both manufacturing and service firms, ISO 9001 standards had been adopted by 176 countries by the end of 2008.

This quality standard was first introduced in 1987 by the ISO in hopes of establishing an international definition of the essential characteristics and language of a quality system for all businesses, irrespective of industry or geographic location. Initially, it was used almost exclusively by large companies, but by the mid-1990s, increasing numbers of small and mid-sized companies had embraced ISO 9000 as well. In fact, small and moderate-sized companies account for much of the growth in ISO 9000 registration over the past several years. Revisions of the ISO standards occur periodically. In December 2003 a revised standard replaced the 1994 edition of the ISO 9000. The new standard was referred to as ISO 9001:2000. The next revised ISO standard was the ISO 9001:2008. Some will still refer to the ISO standards as the ISO 9000, but generally the 9000 number is simply a reference point for the family of standards that all fall under the umbrella of quality management guidelines set forth by the International Organization for Standardization. Revisions of the ISO standards occur periodically to meet the changing global marketplace.

THE ISO 9001:2000 STANDARDS STILL IN PLAY

While the ISO 9001:2008 is the current standard to maintain ISO certification, some of the regulations within ISO 9001:2000 are still valid as they were not updated in the 2008 revision. The ISO 9001:2000 standards include several major categories that small, medium, and large enterprises of any kind must adhere to if they want to keep their ISO certification. Some of these categories are considered "introductory" in nature while others are more complex and may take more time for a company to understand and adhere to.

The increased involvement of small and mid-sized firms in seeking ISO 9000 registration is generally attributed to several factors. Many small businesses have decided to seek ISO 9000 certification because of their corporate customers, who began to insist on it as a method of ensuring that their suppliers were paying adequate attention to quality. Other small-business owners, meanwhile, have pursued ISO 9000 certification in order to increase their chances of securing new business or simply as a means of improving the quality of their processes. "The pressure for companies to become ISO 9000-certified is absolutely increasing and will continue to increase," predicted one management consultant in an interview with *Nation's Business.* "The question many smaller companies have to ask is when, not if, they [will] get ISO 9000-registered."

ELEMENTS OF ISO 9000 QUALITY MANAGEMENT SYSTEMS

The standards of ISO 9000 detail twenty requirements for an organization's quality management system in the following areas:

- Management Responsibility
- Quality System
- Order Entry
- Design Control
- Document and Data Control
- Purchasing
- Control of Customer Supplied Products
- Product Identification and Tractability
- Process Control
- Inspection and Testing
- Control of Inspection, Measuring, and Test Equipment
- Inspection and Test Status
- Control of Nonconforming Products
- Corrective and Preventive Action
- Handling, Storage, Packaging, and Delivery
- Control of Quality Records
- Internal Quality Audits
- Training
- Servicing
- Statistical Techniques

MODELS OF ISO 9000

The ISO 9000 quality standards were broken into three model sets ISO 9001, ISO 9002, and ISO 9003. Each of these models, noted *Industrial Management* contributors Stanislav Karapetrovic, Divakar Rajamani, and Walter Willborn, "stipulate a number of requirements on which an organization's quality system can be assessed by an external party (registrar)" in accordance with the

ISO's quality system audits standard. "A quality system," they added, "involves organizational structure, processes, and documented procedures constituted towards achieving quality objectives."

In the late 2003 revision of the ISO 9000 these three standards were combined into a single ISO 9001:2000, which made ISO 9002 and 9003 obsolete. The new standard was published in 2000 and companies migrated to the new standards during the first three years of the twenty-first century. Organizations and companies that were certified under the older ISO 9000, ISO 9001, ISO 9002, and ISO 9003 systems were required to take steps to transfer or upgrade their certification to the new standard. An organization was required to demonstrate to an accredited registration body that its quality management system met the requirements of the new ISO 9001:2000.

ADVANTAGES OF ISO 9000 SYSTEM

The advantages associated with the ISO 9000 certification system are numerous, as both business analysts and business owners will attest. These benefits, which can impact nearly all corners of a company, range from increased stature to bottom-line operational savings. They include:

- Increased marketability. Nearly all observers agree that ISO 9000 registration provides businesses with markedly heightened credibility with current and prospective clients alike. Basically, it proves that the company is dedicated to providing quality to its customers, which is no small advantage whether the company is negotiating with a long-time customer or endeavoring to pry a potentially lucrative customer away from a competitor. This benefit manifests itself not only in increased customer retention, but also in increased customer acquisition and heightened ability to enter into new markets; indeed, ISO 9000 registration has been cited as being of particular value for small and mid-sized businesses hoping to establish a presence in international markets.
- Reduced operational expenses. Sometimes lost in the many discussions of ISO 9000's public relations cache is the fact that the rigorous registration process often exposes significant shortcomings in various operational areas. When these problems are brought to light, the company can take the appropriate steps to improve its processes. These improved efficiencies can help companies garner savings in both time and money. "The cost of scrap, rework, returns, and the employee time spent analyzing and troubleshooting various products are all considerably reduced by initiating the discipline of ISO 9000," confirmed Richard B. Wright in *Industrial Distribution.*
- Better management control. The ISO 9000 registration process requires so much documentation and self-assessment that many businesses that undergo its rigors cite increased understanding of the company's overall direction and processes as a significant benefit.
- Increased customer satisfaction. Since the ISO 9000 certification process almost inevitably uncovers areas in which final product quality can be improved, such efforts often bring about higher levels of customer satisfaction. In addition, by seeking and securing ISO 9000 certification, companies can provide their clients with the opportunity to tout their suppliers' dedication to quality in their own business dealings.
- Improved internal communication. The ISO 9000 certification process's emphasis on self-analysis and operations management issues encourages various internal areas or departments of companies to interact with one another in hopes of gaining a more complete understanding of the needs and desires of their internal customers.
- Improved customer service. The process of securing ISO 9000 registration often serves to refocus company priorities on pleasing its customers in all respects, including customer service areas. It also helps heighten awareness of quality issues among employees.
- Reduction of product-liability risks. Many business experts contend that companies that achieve ISO 9000 certification are less likely to be hit with product liability lawsuits because of the quality of their processes.
- Attractiveness to investors. Business consultants and small-business owners alike agree that ISO-9000 certification can be a potent tool in securing funding from venture capital firms.

DISADVANTAGES OF ISO 9000 SYSTEM

Despite the many advantages associated with ISO 9000, however, business owners and consultants caution companies to research the rigorous certification process before committing resources to it. Following is a list of potential hurdles for entrepreneurs to study before committing to an initiative to gain ISO 9000 certification:

- Owners and managers do not have an adequate understanding of the ISO 9000 certification process or of the quality standards themselves. Some business owners have been known to direct their company's resources toward ISO 9000 registration, only to find

that their incomplete understanding of the process and its requirements results in wasted time and effort.

- Funding for establishing the quality system is inadequate. Critics of ISO 9000 contend that achieving certification can be a very costly process, especially for smaller firms.
- Heavy emphasis on documentation. The ISO 9000 certification process relies heavily on documentation of internal operating procedures in many areas, and as Meyer stated, "many say ISO's exacting documentation requirements gobble up time. Indeed, there are horror stories about companies losing substantial business because a documentation obsession redirected their priorities." According to *Nation's Business.* Small-business owners need to find an appropriate balance between ISO documentation requirements and attending to the fundamental business of running a company: "Strike a balance among obsessively writing down every employee's task, offering training for the work, and letting common sense dictate how a task is to be performed."
- Length of the process. Business executives and owners familiar with the ISO 9000 registration process warn that it takes many months to complete.

ISO 9001:2008 INTERNAL AUDIT STANDARDS

In the ISO 9001:2008 revision of ISO 9001 standards, regulations and how well they are enforced involves the practice of internal audits. According to the 2009 book *ISO 9001:2008 Internal Audits Made Easy* by Anne W. Phillips, internal auditors should practice their trade just as an external auditor would. Acting in a less rigid manner can lead to a relaxed practice of ISO standards which will only cause problems if an external auditor comes along. To keep ISO certification, internal auditors must not be lenient when observing and reporting about how well the ISO standards are being practiced within a firm.

Phillips wrote, "&internal auditors implement a practical internal audit process that meets the requirements of ISO 9001:2008 while adding significant, measureable value to the organization's bottom line." Essentially, the job of an ISO internal auditor is not unlike the job of a financial auditor. The role includes making sure that best practices are being followed, that the regulations are being followed, and that every effort is being made to ensure employee performance is above board.

ISO 9004:2009

According to the American Society for Quality (ASQ), the next generation ISO standard, 9004:2009, is a set of guidelines to help sustain the overall productivity and success of a small, medium, or large business. ASQ notes that in terms of quality management techniques and procedures, ISO 9004:2009 has a broader spectrum of methods and regulations to maintain and improve a company's performance. According to the 2009 book *ISO 9000 Quality Systems Handbook*, by David Hoyle, ISO 9004:2009 is the evolution of the ISO 9000 family of procedures and standards. 9004:2009 focuses more on the process of quality management than the individual procedures that make it possible. Hoyle notes, "ISO 9004:2009 goes further and creates a cycle of sustained success, driven from a mission and vision that is influenced by stakeholder needs and expectations through an extended system of managed processes to produce results that satisfy all stakeholders."

The constant revision and updating of ISO standards is essential to the continued success of small businesses that value ISO certification. Customer satisfaction is the desired result of quality management. ISO 9004:2009 is the natural progression in ISO standards that make product improvement and internal business procedures continue to measure up to the goal of customer satisfaction.

SELECTING A LEADER FOR THE ISO 9000 REGISTRATION PROCESS

ISO 9000 experts and businesses that have gone through the rigorous process of certification agree that businesses that appoint someone to guide the process are much more likely to be able to undergo the process in a healthy, productive manner than are firms that have murky reporting relationships. Hiring an outside consultant is one option for businesses. "An ISO 9000 advisor could give you a rough sketch of the registration process and help you get started," stated *Nation's Business.* "Or the consultant could counsel you through the entire process, writing the company's quality policy statement and even specific operating procedures." In addition, firms should hire an ISO-9000 registrar with a background in their industry, legitimacy with international customers, and knowledge of small business issues.

Some small firms choose to appoint an employee as their ISO 9000 representative rather than hire an outside consultant. Many companies have done this successfully, but small-business owners should take great care in making this decision. "The ISO 9000 representative [should be] a person who encompasses a genuine and passionate commitment to quality and success, knowledge of processes and systems within the company, and power to influence employees at all levels," wrote Karapetrovic, Rajamani, and Willborn. "He should be familiar with the standards. If this is not the case, there are ample training opportunities available to acquire sufficient expertise." It may also be

beneficial for this person to have education in the field of quality management and best practices.

For more information on ISO 9000 registration, small-business owners can contact several organizations. One organization that offers help with ISO 9000 registrations is the American Society for Quality, located at 600 North Plankinton Avenue, Milwaukee, WI 53203. They can be reached by telephone at 800-248-1946, and online at www.asq.org. Another such organization is the American National Standards Institute, located at 1819 L Street, NW, Washington DC 20036. They can be reached by phone at 202-293-8020, and online at www.ansi.org. Business owners can stay updated on ISO news and changes in standards by visiting www.iso.org and clicking on the "News and Media" tab.

JOB DESCRIPTION

A job description is the official written account of an employment position. It is a structured and factual statement of a job's functions and objectives, and should give the boundaries of the position holder's authority. This account usually lists the typical tasks to be performed by the position holder, the training, education, and experience required to do the work, and it includes a description of the essential functions to be performed. Job descriptions also include information about salary ranges and any benefits that are offered to employees in the position. In many cases, a job description also outlines how the position fits into a larger organizational whole. The term "job specification" is often used as a synonym for job description.

Recruiters, online headhunters such as Creative Circle, and personnel managers rely on clear and concise job descriptions to streamline the application and interviewing process and to judge work performance after a person has been hired. Job descriptions and specifications usually include, in addition to the basic items listed above, details about:

- The position's travel obligations, including national, international, and any telecommuting
- Normal work schedule, including any potential flex time arrangements or work from virtual office
- Physical location where duties will be carried out, including a brick-and-mortar main office, home office, or mobile office
- Union status, if any
- Supervisory relationships
- Bonuses that may be earned and how they may be earned

In essence, effective job descriptions let employees know what is expected of them. If a person is to perform her assigned task, she needs to know what it is, how to do it, and how to measure the results. All of these directives should be discernable from the job description.

Job descriptions can be useful in organizing and assessing the work being done at all levels of an organization. They are not useful only in the recruiting process. As the authors of a Chartered Management Institute article explain, apart from giving the job holder and immediate line manager a clear overall view of a position, job descriptions can serve as the basis upon which to carry out performance appraisals and job evaluations. They can also help to identify any duplication or absence of particular functions or activities within an organization.

JOB DESCRIPTIONS AND COMPANY CULTURE

The level of detail utilized in the creation of job descriptions and the monitoring of employee execution of the duties articulated therein can vary tremendously from organization to organization. A multinational corporation, for example, may have job descriptions that are far more formal and detailed in their contents than those used by a small local business. Companies in different industries tend to approach the issue of job descriptions differently as well (tool and die manufacturers, for example, are more likely to institute job definitions for various positions than are fishing charter

services). And, finally, some business owners and management teams simply institute and nourish different company cultures that may have dramatically different conceptions of job descriptions and their utility. For example, companies that operate in a flexible working environment, one in which employee roles are fluid and expectations change, may find the quest to define various job parameters to be daunting. The essence of the problem is how to reconcile clear directives with flexible work systems. One approach to solving this problem is for a manager to write a theoretical job description for how he or she sees the work being done. Then, those involved in actually doing this work can edit the description as needed in order to fine tune the description to the realities of the work environment.

In a company setting where job descriptions are not available, disaster can be the result. Employees may be overlapping efforts without knowing it, or conversely, important tasks may be overlooked because one employee thought it was the job of another employee. In a global market structure in which contractors are often working from home, a business owner or manager must give workers precise definitions of what their tasks and responsibilities include.

Even though they are important, job descriptions are often thought of as necessary for only the lower-level people within the organization. Managerial positions usually come with what are called 'mission statements' and while this sounds very good, mission statements made a very poor gauge against which to measure anything because they tend to be abstract definitions of what the overall company goal is rather than a list of executable steps or responsibilities. Most human resource experts suggest that all positions within a company should include a job description. These documents can help business enterprises maintain their focus at all job levels, including top management and ownership positions. Owners of family establishments or very small business enterprises, meanwhile, may simply decide that formal job descriptions are unnecessary. Ultimately, each small-business owner needs to consider the unique aspects of his or her own business situation when deciding how to define and monitor the responsibilities of each work position.

JOB DESCRIPTIONS AND PERFORMANCE APPRAISALS

The many advantages of having formal job descriptions for all positions within a company should not blind business owners to the need for consistency between what is stated in a job description and what is stated in the personnel policies of the company. The existence, for example, in a job description of details about how overtime pay will be handled must mirror the overtime descriptions in the personnel policy if a company is to avoid the potential for legal troubles.

Performance Reviews. Annual or semiannual performance reviews are fixtures in most establishments, and they are useful to both employee and employer for many reasons. But employers should know that they can also run into trouble if they give employees poor marks for their work on tasks that are not delineated in their official job description. A company may be at legal risk if it holds employees responsible for work that has not been defined in writing. This problem is most likely to crop up in situations where a reorganization or attrition has prompted a reallocation of responsibilities within the organization. Of course, bestowing praise on an individual who takes on responsibilities not mentioned within his or her job description is unlikely to have unwanted repercussions. The key is to avoid linking negative outcomes (such as discipline or denial of a raise) to duties that are not included on the job description or to unduly focus on those duties at the expense of those responsibilities that are specifically mentioned.

According to the 2010 article, *Why Managers Delay Employee Appraisal*, by Reylito Elbo, "The annual performance appraisal is a universal issue found in many organizational calendars. Line managers often consider it a stressful and an unwelcome task. That's why they respond with the bad habit of procrastination, if not avoidance." This is especially an issue in small to medium-sized businesses where rules and regulations surrounding the employee review process may be very lax or not delineated at all. Elbo added that software programs that make the employee evaluation process easier are simply not applied as often as they could be. Therefore, an appraisal of an employee that could take just a few minutes out of a manager's day becomes a disorganized and not properly thought out process. Managers and business owners often view performance reviews as their last priority. Hesitating or putting off employee evaluations can cause a great deal of frustration for employees who know they deserve an evaluation and also a raise in compensation.

Overtime. As most employers are aware, federal law differentiates between employees who are owed overtime pay (nonexempt employees) and those who are not owed overtime pay (exempt employees). Exempt positions are excluded from minimum wage, overtime regulations, and other rights and protections afforded under the provisions of the Fair Labor Standards Act (FLSA). Employers must pay a salary rather than an hourly wage for a position for it to be exempt. Nonexempt positions are those that are not exempt from FLSA requirements. Employees who fall within this category must be paid at least the federal minimum wage for each hour worked and are paid overtime pay of not less than one and a half times their hourly rate for any hours worked beyond 40 each week.

What many employers do not know is that overtime liability can be linked to an employee's duties *as they are described in his or her job description*, not according to what tasks the employee actually performs. For example, suppose an owner decides that one of her managers' should occupy

an office closer to the production department. If that manager comes in to pack or move boxes over the weekend, the employer may be liable for overtime even if the employee is exempt because packing and moving are not part of the employee's usual job activities. This principle applies to any tasks not normally performed by the employee, or to tasks that are not directly related to his or her normal job. The important issue to consider is not whether the activity is a one-time event, but whether the task relates to the employee's usual job duties.

Employee Dismissals. Small-business owners who decide to terminate an employee for poor performance have to make sure that they are doing so because of their dissatisfaction with the employee's work on tasks that are discussed in the job description. Otherwise, the employee may have some legal basis upon which to challenge the dismissal.

While dismissals in the workplace will never be a thing of the past, Paul Falcone, in his 2010 book *101 Sample Write-Ups for Documenting Employee Performance Problems: A Guide to Progressive Discipline & Termination*, advocates a new type of employee-employer relationship that might reduce the need for dismissals. Noting that traditional ideas of discipline are mostly negative and one-sided, Falcone introduces the idea of progressive discipline. He writes, "Progressive discipline is a means of communicating problem issues directly and in a timely fashion so that employees can involve themselves in the problem-solving process. However, proper communication both verbal and written is difficult to accomplish without a framework for structuring your thoughts and sharing your suggestions with your employees." To solve the problem, Falcone discusses a number of frameworks that help open employer-to-employee discussions that are mutually beneficial. Everything from absenteeism to drug use, violations in dress code, tardiness, co-worker tensions, and a number of other topics can be broached in a more positive manner. Falcone and other experts in management contend that a positive approach goes much further with workers than the tired finger-wagging of generations past.

USING AND MAINTAINING JOB DESCRIPTIONS

Job descriptions can be valuable business resources when used correctly. But many companies do not take full advantage of these documents, either because they are ignorant of their possibilities or because of company-wide perceptions that they are of limited use. There are several factors that can limit the effectiveness of these documents:

- Managers unfamiliar with the purpose and usage of job descriptions.
- Vague, inaccurate, outdated, or incomplete job descriptions.
- Managers not motivated to utilize job descriptions.
- Job descriptions arranged in a format that is not standardized or friendly to managers or employees.
- Job in question "escapes definition" because of fluidity, variety of tasks.

Entrepreneurs and managers, then, need to attend to all of these potential pitfalls when creating job descriptions for their workforce. In addition, human resource management experts hasten to point out that job descriptions are only effective if they are subject to continuous review and revision.

1. Continuous updating. Each employee's job description should be amended as his or her duties change. One commonly overlooked aspect of this requirement is that employers should react quickly when an employee quits or is terminated. In such instances, each task formerly carried out by the ex-employee should be formally reassigned in writing to another person's job description.
2. Proper classification. Employers who remain cognizant of job descriptions and classifications when assigning various tasks are far less likely to get tripped up on overtime hassles than businesses that are careless about such issues.
3. Communication. In addition to regularly scheduled performance reviews, employers should make sure that employees who find their duties and responsibilities undergoing change have the opportunity to ask questions and even raise objections.

JOB SHARING

Job sharing is a flexible work option in which two or possibly more employees share a single job. For example, one person may work in a certain position Monday and Tuesday, and a second person may occupy that same position Thursday and Friday. The two people may both work on Wednesday and use that time to update each other on the current status of the various projects on which they collaborate. A variety of other arrangements are possible as well. Job sharing is particularly popular among employers when overhead is high or when part-time workers are desirable because they do not require benefits. Job sharing can also be an alternative to laying employees off when consumer activity drops due to economic downturn, such as what happened in the United States in 2008 and 2009.

Job sharing is a somewhat controversial alternative to telecommuting, flexible working hours, compressed work weeks, and other arrangements used by businesses to offer their employees more flexibility in terms of work schedules without increasing costs and while maintaining productivity. Job sharing is an option for employees who wish to work somewhat shorter hours. In many cases, a job sharing position does require that the individuals involved are willing to be contacted during the work week even on days they do not work so that questions may be answered and the coordination between the two or more individuals sharing a position is maximized. While this would have been more difficult in decades past, with the advent of handheld devices that offer e-mail availability and the option to text co-workers and clients easily, job sharing may be the best alternative for many working professionals who need a flexible work option.

Job sharing offers small businesses a chance to retain valued employees who are either approaching retirement or starting families and would consider leaving if more flexible options were not made available. Job sharing can also help eliminate the need to train new employees if a valued employee were to leave the company. Job sharing can seem intimidating to managers, who may fear that it could lead to confusion, more paperwork, and a host of other hassles. If a proper plan is in place and each job sharer is held accountable for his or her duties, however, these issues can be avoided.

PLANNING A JOB SHARING POSITION

In order for a job-sharing program to succeed, a solid plan must be put in place to ensure that the work gets done properly. Managers must pay close attention to how the system is working. Solid communication between work partners and management, as well as other employees who are not in the job-sharing program, is a must. Done properly, job sharing can lead to a high level of productivity, perhaps even higher than the level contributed by a single, traditional employee.

The first step in implementing a job-sharing program is to decide whether the job can be shared and if there are likely candidates to share it. Most often, these candidates already exist within the company, although potential job sharers can be recruited from the outside workforce. Jobs with clearly defined individual tasks are the best to consider for job sharing. More complex jobs are less suitable for a job-sharing arrangement. Above all, management has to be committed to the job-sharing program, as do the employees who are participating in it.

Several specific issues should be dealt with in advance of starting a job-sharing program. These include:

- Clarifying how the salary for a position will be divided between the job sharers and how the hours will be covered.
- Determining how vacation and sick days will be divided between the participants.
- Establishing a division of employment benefits that provide both parties some coverage but does not cost the company twice what it would bear for a single employee. Many small businesses accomplish this by offering flex insurance or child care plans in which employees also have a stake in the kind of investment they make with regard to their own benefits.
- Ironing out the details about who will have responsibility for what elements of the work.
- Defining how employment evaluation will be handled in advance so that the job sharers know how much of their evaluation will be based on the work product of the other job sharer. If the business owner or manager is using employee evaluation software, he or she will need to make sure that the program is set up to understand which employees share jobs and how parameters might be different for them.

Because of the need to work very closely with one another, job sharers should have a hand in deciding with whom they wish to share a job. According to the Managing

Benefits Plans article, "Job Sharing: One Way to Hold on to Valued Employees," "Job sharers should find their own partners. It is up to the prospective job sharer, not the employer, to find a coworker who wants to share a job." The article goes on to explain that employers will need to be involved in this decision so that they can make sure that the job partners are at the same career level and are compatible. Finally, the job-sharing situation must benefit the company as well as the employees involved.

JOB SHARING AND EMPLOYEES

It is important to find partners in a job-sharing position that have work styles, habits, preferences, quality standards, and communications skills that are compatible and closely matched. Many times, it can be advantageous if the employees select their own partners to ensure that these conditions are met. Most often it is important for employers to find job-sharing partners with comparable skill levels, but there are still possible benefits if they do not. For instance, a more experienced worker can train an up-and-coming employee in a job-sharing situation. When this happens, the employer can cut back on the time and money it would normally take to train the new employee, while also paying him or her a lower salary than the veteran worker during this time.

Employees who participate in job sharing divide their responsibilities in several different ways. They can share the job evenly or separate it into individual tasks that better suit each individual. If the job has unrelated tasks, those can also be divided. The work week can be split in half and shifts can be alternated so one employee works 3 days one week and 2 days the next. Job sharing employees must be able to coordinate their schedules to make sure someone is always on the job when they are required to be. If time of day is not important to the workload, job sharing may be best divided with people who have the number of hours to work that best match one another, rather than by a given Monday through Friday, 9 to 5 schedule. This also works well for global companies who may be offering job sharing from one time zone to another.

THE ADVANTAGES OF JOB SHARING

The job-sharing arrangement allows employees to work part-time in order to spend more time with their families, attend school, or pursue other personal interests. New mothers find that it is a way to continue their careers while not having to deal with the stress and guilt that comes with putting their child in full-time day care. Experienced senior workers who wish to cut back a bit while still continuing their careers also benefit from job sharing, as do employees who wish to pursue more than one career opportunity at the same time. In addition, job-sharing employees often find that this type of arrangement helps them to cut down on work-related stress and burnout.

Despite its often intimidating nature and the possibility for confusion, job sharing can also be advantageous and desirable to small-business owners and managers. First, there is the simple theory that two or more individual employees can bring a greater variety of abilities to the job than a single employee can. In some instances, job sharing can also lead to extended work days and therefore more productivity without having to pay employees overtime. Employers can also ask job sharers to work more during busy times, therefore eliminating the hassles of having to hire and train temporary employees.

Keeping employees happy can be as much for the company as it is for the employee. In the "Benefits to Organizations," portion of the *Catalyst.org* survey update of 2009, "66% of employees at organizations with high levels of flexibility report high levels of job engagement and commitment, compared to 56% of employees at organizations with low levels of flexibility," and, "67% of employees at organizations with high levels of flexibility report high levels of job satisfaction, compared to 23% of employees at organizations with low levels."

HOW TO KEEP A SHARED JOB RUNNING SMOOTHLY

Employees who share a job have an arsenal of resources at their disposal to communicate with each other and ensure that the job is getting done. These resources include e-mail, phone, text, Twitter, iReport, instant messaging, faxes, checklists, daily logs, and online spreadsheets.

It is probably in the best interest of small-business owners to conduct performance reviews of employees involved in a job-sharing program to ensure that things are going smoothly. These reviews can either be individual evaluations of each worker or take the form of a team review. If one person is carrying the weight of the team and the other is not doing his or her fair share, it is up to management to decide if this is just an isolated problem with that particular team or if the job-sharing program is just not a successful one for their business.

If a meeting that is pertinent to the job comes up, the employees and management must decide if both employees should attend or just one. It often helps if the job-sharing employees who work on the same days are able to overlap their schedules in order to interact and keep things running as smoothly as possible.

Benefits for employees who participate in job sharing can be handled in a variety of different ways. Full or partial benefits can be given to the job sharer according to the specific situation. Benefits such as insurance and pension plans are easier to negotiate and are often prorated. Vacation time, personal and sick days, and even salary can also be prorated to the amount of time each employee spends on the job. As stated above, these issues

should all be decided upon and agreed to by all parties before the job-sharing program is implemented. A guide or formal contract is suggested to make sure everyone involved understands these issues. Usually job sharing results in a slight increase in benefit costs, mainly in covered statutory benefits like Social Security and employment taxes. Small-business owners must decide if the assumed increase in productivity is enough to offset these costs. Since job sharers work fewer hours then do typical employees, overtime pay is rarely an issue in these types of situations.

JOB SHOP

A job shop is a type of manufacturing process in which small batches of a variety of custom products are made. In the job shop process flow, most of the products produced require a unique set-up and sequencing of process steps. Job shops are usually businesses that perform custom parts manufacturing for other businesses. However, examples of job shops include a wide range of businesses a machine tool shop, a machining center, a paint shop, a commercial printing shop, and other manufacturers that make custom products in small lot sizes. These businesses deal in customization and relatively small production runs, not volume and standardization. Because the volume is low, a high premium is placed on quality, which often means qualified personnel and sophisticated technology.

CHARACTERISTICS OF A JOB SHOP

Characteristics of a job shop include layout, routing, employees, information, and scheduling.

Layout. In the job shop, similar equipment or functions are grouped together, such as all drill presses in one area and grinding machines in another in a process layout. The layout is designed to minimize material handling, cost, and work in process inventories. Job shops use general purpose equipment rather than specialty, dedicated product-specific equipment. Digital numerically controlled equipment is often used to give job shops the flexibility to change set-ups on the various machines very quickly. Because economies of scale are usually not a part of a job shop's competitive edge, they compete on factors other than price. They compete on quality, speed of product delivery, customization, and new product introduction.

Routing. When an order arrives in the job shop, the part being worked on travels throughout the various areas according to a sequence of operations. Not all jobs will use every machine in the plant. Jobs often travel in a jumbled routing and may return to the same machine for processing several times. This type of layout is also seen in services like department stores or hospitals, where areas are dedicated to one particular product (men's clothing) or one type of service (maternity ward).

Employees. Employees in a job shop are typically highly skilled craft employees who can operate several different classes of machinery. These workers are paid higher wages for their skill levels. Due to their high skill level, job shop employees need less supervision. Workers may be paid a standard hourly wage or by an incentive system. The role of management is to bid on jobs and to establish prices for customer orders. The key activity in a job shop is processing information.

Information. Information is the most critical aspect of a job shop. Information is needed to quote a price, bid on a job, route an order through the shop, and specify the exact work to be done. Information begins with quoting, then a job sheet and blueprint are prepared before the job is released to the floor. Once on the production floor, employees complete job sheets and time cards for labor cost calculations and to update records for quoting future jobs when variances are present. Unless the job shop is very traditional, much of this work is now done on computers using specific software, and the computers across the job shop are on a local area network that allows the disparate pieces of information to come together to estimate a cost, timeframe, or other variables.

While it is often easy to bid on jobs the shop has manufactured before, new jobs require accurate costing of labor, materials, and equipment as well as accurate assigning of overhead to the job. Tickets follow each job through the shop, often electronically through the computer network, where time and activities are recorded. Because the job shop makes specialty, custom items, it competes on quality and customer service and not on price. The job shop has little if any raw materials inventory because customers bring in the parts and materials to be worked on. The job shop has work-in-process inventory while jobs are being completed, but typically the customer is waiting on the order and expects prompt delivery, so there is no finished goods inventory in this make-to-order environment. Some job shops, like many small businesses, thrive on managing cash flow. They may work on small jobs to complete them by the end of the month so they can bill customers for the work.

Scheduling. A job is characterized by its route, its processing requirements, and its priority. In a job shop the mix of products is a key issue in deciding how and when to schedule jobs. Jobs may not be completed based on their arrival pattern in order to minimize costly machine set-ups and changeovers. Work may also be scheduled based on processing time, from shortest to longest.

Kenneth Baker writes in his 2009 book, *Principles of Sequencing and Scheduling*, "The performance objective of 'meeting job due dates' is one of the scheduling criteria most frequently encountered in practical problems. While meeting due dates is only a qualitative goal, it usually implies that time-dependent penalties are assessed on late jobs but that no benefits derive from completing jobs early." When it comes to a job shop, the work is much more qualitative than quantitative. Nonetheless, there is an expected level of productivity, and if an item becomes so highly specialized that returns diminish due to tardiness, and more is invested than made on return, it may be time to make a decision about that particular product.

JOB SHOP SOFTWARE

Few things have revolutionized the specialized world of job shops like jobbing software. Also called "production control software," job shop software is made by a number of software companies, including JobMaster, Exact JobBOSS, AyaNova, Shop Tech, Epicor, and Exact Software. Job shop software is extremely competitive, and there are many makers of software packages that help the job shop workers do everything from quote a price for production based on raw materials and labor costs, create a sales order with the click of a mouse (or even remotely with an iPhone app), create procedural steps for a new job to be integrated into the shop, and more.

The software for job shops has ramped up the need for a higher degree of education and expert-level experience with computers and complex programming. Conversely, however, it has made life in the job shop easier, more productive, and simpler for the small-business owner to manage. Job shop software gives floor managers and employees in highly specialized fields unique abilities to complete their jobs. Other actions are embedded in most of these software systems that make day-to-day activities simple as well, including weighing and measuring inventory for shipping and printing labels, and creating and implementing checklists for quality control.

The very design and layout of the job shop suggests high-level specialization in most cases, and so it is important that the software chosen meets the unique needs of the small business enterprise. There are many opinions, and for some, it may take testing a few programs to see which one works best. In her 2010 article, "Guide to Job Shop Software," Lori Carver discusses the important factors in deciding on job shop software. She writes, "Many software systems will contain information that you do not need so do not pay for options that do not work for you. Select a software system that will grow with your company. Alternatively, upgrading your present software with new functions may be the best option if you have a system that is already working for you." Carver also notes the importance of solid customer support as part of what the business owner pays for.

JOINT VENTURES

A joint venture is a business enterprise undertaken by two or more persons or organizations to share the expense and (hopefully) profit of a particular business project. A joint venture is

not a business organization in the sense of a proprietorship, partnership, or corporation. It is an agreement between parties for a particular purpose and usually a defined timeframe. Joint ventures may be very informal, such as a handshake and an agreement for two firms to share a booth at a trade show. Other arrangements may be extremely complex, such as a consortium of major electronics firms joining to develop new microchips. The key factor in a joint venture partnership is its single, definable objective. Creative small-business owners have been able to use this business strategy to good advantage over the years, although the practice remains one primarily associated with larger corporations.

Most joint ventures are formed for the ultimate purpose of saving money. This is as true of small neighborhood stores that agree to advertise jointly in the weekly paper as it is of international oil companies that agree to work together for purposes of oil and gas exploration or extraction. Joint ventures are attractive because they enable companies to share both risks and costs.

LEGAL STRUCTURE OF JOINT VENTURES

Joint ventures are governed entirely by the legal agreements that brought them into existence.

Some joint venture partners may wish to formalize the venture by creating a new joint venture company. Joint venture companies can be very flexible entities in which partners each own shares and agree on how they will be managed. More common are joint venture agreements that do not include the formation of a new entity, though when they do, it is increasingly popular for them to be set up as limited liability corporations (LLCs). Instead, the venture is operated through the existing legal status of the venture partners, or co-venturers. Since the joint venture is not a legal entity, it does not enter into contracts, hire employees, or have its own tax liabilities. These activities and obligations are handled through the coventurers directly and are governed by contract law. Corporate law, partnership law, and the law of sole proprietorship do not govern joint ventures. Finally, since the venture ends at the conclusion of a specific project, there is no need to address issues of continuity of life and free transferability, unless a joint venture company has been created.

WHY JOINT VENTURES FAIL

Many small-business consultants counsel clients to approach joint ventures cautiously. They acknowledge that such partnerships can be most valuable in nourishing a company's growth and stability, but also point out that smaller businesses usually have far less margin for error than do multinational corporations, or even mid-sized companies. Some experts recommend that business owners considering a joint venture with another establishment (or establishments) launch a small joint venture first. Such small projects allow companies to test the relationship without committing large amounts of money, or more importantly, time. This is especially true when companies with different structures, corporate cultures, and strategic plans work together. These sorts of differences often make it difficult to work together smoothly, so going through a period of "courtship" before committing to the marriage is usually a wise move.

In addition to a period of courtship, a small business should investigate the prospective partner thoroughly, including interviewing prior joint venture partners, suppliers, and customers. This is especially true for a small company considering a joint venture agreement with a larger firm. Joint ventures can benefit all parties to the agreement greatly, and often do. But when they go wrong, the pattern is often a familiar one, explains Gabriel Berg, a partner in the New York City Law firm of Berg & Androphy, a firm that handles many claims of idea theft. Berg is quoted in an *Entrepreneur* article that highlights difficulties that often arise when a small firm wishing to market or advance a new product idea enters or attempts to enter a joint venture agreement with a large corporation.

Berg outlines the pattern she has seen in countless lawsuits arising from failed joint ventures. Early on, the small company will try to protect itself through the use of nondisclosure agreements and by withholding key information. Over time it may feel pressure to share proprietary information too early in the process because it needs the larger company's resources capital or market distribution network. By divulging this information too early and before contracts exist to strictly define the terms under which the parties will develop the joint venture project, the small firm puts itself in a vulnerable position. "It's easy to think nondisclosure agreements are enough, but most leave room for either party to claim that nothing new has been invented....[and] both sides have room to come back later and say, 'Oh, we always knew how to do that.'"

People sitting down to discuss a joint venture partnership are usually in an optimistic mood and want to trust their potential partners. So far so good. However, if the optimism causes the partners to proceed before their relationship is thoroughly documented in the form of contracts, then trouble may follow. It is crucial that contracts exist that clearly define how the costs and benefits of the joint venture will be shared by each partner. Otherwise, a small-business owner may wake up to the nightmare scenario described by Berg: "A large company calls, promising the moon, and you end up out of business, watching your ideas go to market without you." Lawsuits are very costly and they take time. Although many small firms may win lawsuits resulting from failed joint ventures they are often described as hollow victories because they cost so much to litigate and often cause the company to fail in the process. It is, of course, far better to avoid such litigation if at all possible.

Managing a joint venture partnership is another area that often causes friction in the partnership. The managers of one company may be more adept or decisive with their decision making than their counterparts at the other company. This can lead to tension and a lack of cooperation. Projects are made more difficult if they lack a well-defined decision-making process that is predicated on mutually recognized goals and strategies.

BENEFITS OF JOINT VENTURES

Among the most significant benefits derived from joint ventures is that parties to the venture save money and reduce their risks through capital and resource sharing. Joint ventures also give smaller companies the chance to work with larger ones to develop, manufacture, and market new products. In this kind of joint venture, two or more smaller businesses help one another out. Small Internet businesses are the mini-marts of the twenty-first century, and that is why one mini-mart selling shoes may support another mini-mart selling sunglasses.

Joint ventures also give companies of all sizes the opportunity to increase sales, gain access to wider markets, and enhance technological capabilities through research and development underwritten by more than one party. Until relatively recently, U.S. companies were often reluctant to engage in research and development partnerships, and government agencies tried not to become involved in business development. However, with the emergence of countries that feature technologically advanced industries (such as electronics or computer microchips) supported extensively by government funding, U.S. companies have become more willing to participate in joint ventures in these areas. In addition, both federal and state agencies have become more generous with their financial support in these areas. Government's increased involvement in the private business environment has created more opportunities for companies to engage in domestic and international joint ventures.

HOW TO END A JOINT VENTURE

There are times when a joint venture just may not be in every business owner's interest anymore. If it is not working, there are ways to end it on a healthy note. Likewise, there are things that can be done ahead of time (kind of like a prenuptial agreement) that will make the split easier and safer for all parties. In his March 2010 article, "How to End a Joint Venture," Christian Fea writes, "Even if you and your JV partner drew up an exceptional JV agreement and included an exit clause and strategy, there will most likely be some issues that need to be resolved. A good plan in the beginning can help your exit be more smooth and painless, but continue your dissolution with a positive attitude and business-like manner so that your closing negotiations will come to a friendly conclusion. Working to keep trust between you and your JV partner can go a long way to continuing good relations with others in your business community."

If a separate entity was created for the venture, it will likely hold certain property and assets. Either party will have the option to buy out the other out, so establishing at the beginning how this will work out might behoove all parties so there are no misconceptions or sad surprises.

An especially important aspect of the predrawn plan is any intellectual property. Any ideas that one business owner came in with should be written down and dated, preferably in the form of something indisputably dated, like an e-mail with the information in the body or in the form of an attachment with a "date last modified" in the document properties. In addition to any intellectual property notated as belonging to one party before the joint venture is created, any intellectual property that was created during the venture should either be in the name of one business owner or the other. Deciding who should own intellectual property created during the lifespan of the joint venture is something that should be done on day one, not midstream or after-the-fact.

K

KEOGH PLAN

A Keogh Plan is an employer-funded, tax-deferred retirement plan designed for unincorporated businesses or self-employed persons, including those who earn only part of their income from self-employment. Covered under Section 401(c) of the tax code, Keogh plans are named after Eugene Keogh, the congressman who first came up with the idea. Keogh plans feature relatively high allowable contributions $49,000 annually as of 2010 which makes them popular among sole proprietors and small businesses with high incomes. Keoghs can be more costly to set up and administer than similar retirement programs, such as Simplified Employee Pension (SEP) plans, because they require annual preparation and filing of IRS Form 5500 or Form 5500-EZ. One of these two forms must be filed with the Employee Benefits Security Administration of the U.S. Department of Labor. This document can be complicated and usually requires a small-business person to obtain the services of an accountant or financial advisor. In some cases, an attorney may also be required. The small-business owner should be aware that financial information becomes available to the public under Keogh Plans. As with nearly any retirement plan that exists today, a Keogh can be negatively impacted by downturns in the economy and stock market.

That said, the simplicity of setting up an SEP may give self-employed persons the idea that they can set them up on their own when in fact, the advisement of a tax or financial analyst (with a background in small business financials) is most likely the wiser step to take. "Guesstimating" the right choice when it comes to large sums of money especially if that money is invested in an unstable marketplace is probably a poor choice for the high net-worth entrepreneur or other small-business owner.

There are many proponents of Keogh plans who feel that they are a great way for American small-business persons to save for themselves in times when the economy is uncertain. In her 2010 edition of *How to Invest $50-$5,000,* Nancy Dunnan wrote, "If you are self-employed, either part-time or full-time, you should take advantage of the tax benefits offered by a Keogh plan. Keoghs are available to self-employed individuals or partners, including sole proprietors who file Schedule C or a partnership whose members file Schedule E." Dunnan later added, "Even if you have a 401(k) or other qualified pension plan for your salaried income, you can still have a Keogh in which to shelter that portion of your income that comes from being self-employed. Don't miss the opportunity!" Dunnan noted that IRAs, 401(k)s, and Keoghs should all be considered for small-business owners, contractors, or sole proprietors; all should retain the counsel of professional accountants or financial experts to decide which plan or which combination of plans is best suited to his or her unique needs.

As is the case with other common types of retirement programs, Keogh contributions made on employees' behalf are tax-deductible for the employer, and the funds are allowed to grow tax-deferred until the employee withdraws them upon retirement. The funds held in a Keogh may be invested in certificates of deposit, mutual funds, stocks, bonds, annuities, or some combination thereof. Withdrawals are not permitted until after the employee has reached age 59 ½, or else the amount withdrawn is subject to a 10 percent penalty in addition to regular income taxes. Usually only the employer may contribute to a Keogh plan. In addition, the employer can establish a vesting schedule

through which employees gradually gain full rights to the funds in their accounts over a number of years. Keogh accounts must be opened by December 31 in order to qualify for tax deductions in a given year, but funds can be contributed until the company's tax deadline.

TYPES OF KEOGH PLANS

A December 2008 article, "Self-Employed Retirement Plans: Keogh Plan," describes two types of defined Keoghs: a money purchase plan and a profit sharing plan, The author of the article, Ryan Guina, noted, "A Money Purchase Plan requires mandatory annual contributions. The plan will state that 10% of compensation (or net profit from the business for the owner-employee) will be contributed each year. As long as the business shows a profit a contribution must be made for the owner-employee." Guina added, "With a Profit Sharing Plan the annual contributions are discretionary. The business owner can decide each year if he/she will make a contribution. The plan could say that 10% of compensation will be contributed if the company so decides. Most Keogh Plans contain both Money Purchase and Profit Sharing components, with a separate account for each component."

Although Keoghs give small-business owners valuable tax deductions and enable them to provide a valuable benefit to their employees, the plans also have some stipulations that may make them more attractive to some and less attractive to others . Business owners who employ other people are required to fund a retirement program for non-owner employees if they establish one for themselves. But because the owner's contributions to his or her own plan are based upon the net income of the business from which self-employment taxes and contributions to employees' retirement accounts have already been deducted the owner's allowable contributions are reduced. This may seem unfair to many small-business owners who also employ others, but for those who are loyal employees for long enough to qualify for a retirement savings plan of any kind, it may seem the right choice. After all, if these same workers were employed by a large corporation, they would quite likely receive a retirement plan of some kind. Many large corporations will profit share into retirement accounts or match (up to a certain percentage) what an employee puts into his or her 401(k).

WHAT TO CONSIDER WHEN CONSIDERING A KEOGH PLAN

According to a 2010 article on Lawyers.com, there are some important questions a small-business owner should ask his or her lawyer or financial professional before deciding on a Keogh plan. Lawyers.com recommends asking: 1) If I or my family experiences an emergency, will I be able to withdraw money from my Keogh?; 2) Are there real, tangible benefits to making a nondeductible contribution to my Keogh?; and 3) What kinds of restrictions, if any, are there on borrowing from my Keogh? In addition to these smart questions for an attorney or CPA, entrepreneurs may also want to ask if there are differences in how the answers to these questions may change depending on what type of Keogh is established.
