Small businesses that pay their employees by the hour often have no sick leave and personal day policies. In most cases, companies in this situation experience fewer cases of abuse of sick days off because when employees do not show up for work, they do not get paid. Time clocks or official attendance ledgers are also used to let employers know exactly how many hours a particular employee works per day so that he or she can be paid accordingly. Of course, things like extended illnesses, a death in the family, or religious holidays can always force an employee to miss work.

For companies that employ salaried staff, a clear and defined policy for handling necessary sick days and personal days should be in place and followed carefully. In the case of an abuse of the system serious enough to motivate a termination, care must be taken. As Phillip M. Perry stated in *Industrial Distribution*: "If your business is small enough that you operate as the sole supervisor, you are still open to legal problems if you don't have a written policy followed to the letter. Employees who are terminated for excessive absenteeism will sue, claiming discrimination over those employees possibly the ones who are more vital to your business success who are absent just as often."

In setting this policy, it is also important to be aware of the relevant local laws in your state. For example, in February 2007 San Francisco passed a law mandating paid sick leave for all employees, including part-time employees, permanent workers, and temporary workers. Business owners must keep abreast of any such legal requirements in regards to sick leave policy by researching laws in their state or consulting with an attorney to avoid potential legal consequences.

SIMPLIFIED EMPLOYEE PENSION (SEP) PLANS

Simplified employee pension (SEP) plans also known as SEP/IRAs since they make use of individual retirement accounts are pension plans intended specifically for self-employed persons and small businesses. Created by Congress and monitored by the Internal Revenue Service (IRS), SEPs are designed to give small-business owners and employees the same ability to set aside money for retirement as traditional large corporate pension funds. SEP plans are available to all types of business entities, including proprietorships, partnerships, and corporations.

SEP plans are easy to set up and inexpensive to administer, as the employer simply makes contributions to IRAs that are established by employees. The employees then take responsibility for making investment decisions regarding their own SEP accounts. Employers thus avoid the risk and cost involved in accounting for employee retirement funds. In addition, employers have the flexibility to make large percentage contributions during good financial years, and to reduce contributions during hard times. Like other tax-deferred retirement plans, SEPs provide a tax break for employers and a valuable benefit for employees.

In many ways, SEPs can be more flexible and attractive than corporate pensions. They can even be used to supplement corporate pensions and 401(k) plans. Many people who are employed full time use SEPs as a way to save and invest more money for retirement than they might normally be able to put away under IRS rules. In fact, an article in *Forbes* magazine called SEPs a "moonlighter's delight," in that they enable full-time employees to contribute a portion of their self-employment income from consulting or freelancing outside of their regular jobs.

RULES GOVERNING SEPS

The rules governing SEPs are fairly simple but are subject to frequent changes, so annual reviews of IRS publications 560 (retirement plans for the self-employed) and 590 (IRAs) are recommended. As of 2009, SEPs could be set up using a simple form (IRS Form 5305-SEP) and unlike larger, more complicated pension plans did not require a separate trustee. As of 2009 the maximum allowable contribution per employee was 25 percent of the first $245,000 of an employee's eligible compensation, or $49,000, whichever is less. In general, eligibility is limited to employees twenty-one or older with at least 1 year of service to the company and a minimum level of compensation.

Another benefit of SEP-IRAs came into existence in 2010. As of 2010, SEP-IRAs, as well as regular IRAs and simple IRAs, can be converted to Roth IRAs with no maximum income limits. Therefore, although individuals are barred from contributing to Roth-IRAs if they make over $105,000 or $160,000 as a married couple, those individuals can contribute to a SEP-IRA and then roll the money over into a Roth-IRA for tax deferred growth. Individuals who elect to roll their SEP-IRAs or Simple-IRAs into a Roth will be taxed for the amount rolled over, but under the 2010 rules, the taxes can be paid over a 2-year period. Once the money has been rolled into the Roth-IRA, gains are not subject to taxation. Roth IRAs also have other benefits, such as no required minimum distributions.

SIMPLE IRAs. A similar program to the SEP program is the Savings Incentive Match Plan for Employees (SIMPLE) IRA. SIMPLE plans became available in January 1997 to businesses with fewer than 100 employees, replacing the discontinued Salary Reduction Simplified Employee Pension (SARSEP) plans. They are intended to provide an easy, low-cost way for small businesses and their employees to contribute jointly to tax-deferred retirement accounts. An IRA set up as a SIMPLE account requires the employer to match up to 3 percent of an employee's annual salary, up to $10,500 per year (as of 2009). Employees are also allowed to contribute up to $10,500 annually to their own accounts. In this way, a SIMPLE IRA is similar to a 401(k), but it is generally less complex and has fewer administrative requirements. Companies that establish SIMPLEs are not allowed to offer any other type of retirement plan.

OWNERS BENEFIT LESS THAN NONOWNER EMPLOYEES

A note of caution is in order. Small-business owners who want to establish a SEP or any other qualified retirement plan for themselves must also include all other

company employees who meet minimum participation standards. As an employer, the small business owner can establish retirement plans like any other business. As an employee, the small-business owner can then make contributions to the plan he or she has established in order to set aside tax-deferred funds for retirement, like any other employee. The difference is that a small-business owner must include all nonowner employees in any company-sponsored retirement plans and make equivalent contributions to their accounts. Unfortunately, this requirement has the effect of reducing the allowable contributions that the owner of a proprietorship or partnership can make on his or her own behalf.

For self-employed individuals, contributions to a retirement plan are based upon the net earnings of their business. The net earnings consist of the company's gross income less deductions for business expenses, salaries paid to nonowner employees, the employer's 50 percent of the Social Security tax, and significantly the employer's contribution to retirement plans on behalf of employees. Therefore, rather than receiving pre-tax contributions to the retirement account as a percentage of gross salary, like nonowner employees, the small-business owner receives contributions as a smaller percentage of net earnings. Employing other people thus detracts from the owner's ability to build up a sizeable before-tax retirement account of his or her own.

Still, a SEP plan offers significant advantages for self-employed persons and small-business owners. It allows a much greater annual pre-tax contribution than a standard IRA (at $5,000 or less, depending on the individual's financial status and participation in other retirement plans). In addition, individuals can contribute to their existing IRAs and 401(k)s, and still participate in a SEP plan.

SITE SELECTION

For many small businesses, business location is an essential component in its eventual success or failure. Site selection can be pivotal in all sorts of businesses, including retail, service, wholesale, and manufacturing efforts. In fact, studies conducted by the Small Business Administration (SBA) and other organizations indicate that poor location is one of the primary causes of business failure in the United States. Conversely, a good business location can be enormously beneficial to a small firm. In the retail business especially, the adage from real estate applies: location, location, location.

LOCATION NEEDS OF VARIOUS BUSINESS TYPES

Each of the above-mentioned business types retail, service, wholesale, and manufacturing have different site needs that need to be considered when settling upon a location for starting or relocating a business.

Retail Businesses. The success of retail establishments is often predicated to a large degree on their location.

Since location is so important, small business retailers often have to make significant expenditures to secure a good site on which to operate. Property owners that offer land or buildings or office space for lease or sale in already-thriving retail areas know that they can command a higher price because of the volume and quality of business that the location will bring to the company. In her article,"-How to Find the Best Retail Location," Karen E. Klein quotes a comment made by Devon Wolfe, a managing director at Pitney Bowes MapInfo, a location consultancy company: "The more mainstream your appeal, the broader your array of competition, which means that you will need to co-locate with your competitors to be a contender."

Service Businesses. Many service-oriented businesses also need to operate in "high traffic" regions, but there are exceptions to this. Most home-based business owners, for example, package their talents in service-oriented businesses (software development, freelance writing, home improvement, etc.). Others, such as pest control services or landscaping services, secure the majority of their customers online or through advertising and thus do not need to worry as much about their location. Still other service-oriented businesses, of course, rely to a great degree on their location. Dry cleaners, hair salons, and other businesses cannot afford to locate themselves on the outskirts of a business district. Many of their customers frequent their business precisely because of the convenience of their location; if that benefit dries up, so too do the customers.

Wholesale Businesses. Whereas the primary consideration for retailers and some service businesses is to locate themselves in high traffic areas hence the ubiquity of such businesses in shopping centers and malls the major location concern of wholesalers is to find a site that has good shipping and receiving facilities and close proximity to transportation routes. Zoning laws are also a consideration. Most communities maintain zoning laws that restrict where wholesalers can set up their businesses.

Manufacturing Businesses. As with wholesalers, businesses engaged in manufacturing usually have limited site location options because of local zoning laws. But manufacturers generally do not lack for options when the time comes to build or relocate a facility. Most communities have any number of sites to choose from. The key is to select the land or building that will be most beneficial to the company in the long run, taking into consideration the company's primary market, the available labor force, transportation factors, availability of raw materials, available buildings or building sites, community attitudes toward the industry, expense, and convenience of access for customers.

LOCATION OPTIONS

Small business have a number of different choices in the realm of site selection. The type of facility most often embraced by retail and many service establishments is the shopping center. The shopping center, which houses a variety of different stores (often including well-known chain stores), can take several different forms, but the best known of these is the mall. These establishments provide their tenants with large numbers of potential customers and professional marketing and maintenance services, but in return, tenants often pay high rent and additional fees (to cover maintenance costs, etc.) Many other small businesses, meanwhile, are located in smaller shopping centers that are sometimes known as strip malls or neighborhood shopping centers. These centers, which rely on a smaller customer base than their megamall cousins, are typically anchored by one or two large supermarkets or discount stores. The rest of the stores are usually small retail or service establishments of one type or another. The rent at strip malls is generally much less than it is at major malls, but of course, the level of traffic is generally not as high either. The small-business owner who wishes to establish his or her store in a shopping center must carefully weigh the financial advantages and pitfalls of each of these options before moving forward. Other retailers or service businesses prefer to set up their businesses in freestanding locations. Restaurants, for instance, often choose to set up their business in a lone building, attracted by the lower fixed rent that often accompany such arrangements.

Another facility option for the small business is the business park or office building. Indeed, many professionals (doctors, architects, attorneys) choose this option, attracted by the professional image that such trappings convey and the ability to share maintenance costs with other tenants. Some service businesses also operate from these facilities, especially if their primary clientele are other businesses.

When choosing where in the country to locate a given business or business headquarters, quality of life in the location may also play an important role. For example, a company that seeks highly skilled labor may wish to locate its headquarters in a city that can attract such labor through offering amenities such as nice weather, or may wish to be located in an area near universities in an attempt to capture young, educated potential employees. A family-owned business, on the other hand, may be more focused on setting up business in a location where the family would like to live.

OWNERSHIP VS. LEASING

Whether starting up a new business or moving an already established one, small-business owners are faced with the question of whether to lease or purchase the land or facility that they choose as the site for their company. Most small businesses operate under lease arrangements indeed, many small-business owners do not have the necessary capital to buy the facility where they will operate but some do choose to go the purchase route, swayed by the following advantages:

- Increased sense of permanence and credibility in the marketplace
- Property taxes and interest payments are tax-deductible
- Facility improvements increase the value of the business's property rather than the landlord's property

- Increased net worth through appreciation of both the business and the facility (including land and buildings)
- No forfeiture of asset at the end of term
- Ability to liquidate (lessors often have far less freedom in this area)

Of course, there are also factors associated with ownership that either convince small-business owners to stick with lease agreements or preclude ownership as a viable option.

- There is a risk that value of the land or facilities will actually go down over time because of business trends (a neighboring anchor store goes bankrupt) or regional events (a flood, massive layoffs).
- Financial risks associated with purchasing are greater and put a greater financial drain on small establishments that often have other needs (purchasing typically requires greater initial capital investment and entails higher monthly costs).
- Property can be claimed by creditors as an asset if the business goes bankrupt.

PLANNING FOR THE FUTURE

An important factor that small business owners need to consider when weighing various business location alternatives is the site's ability to address the company's future needs. It is usually easier to shrink than to expand space in the same location. Thus the growing company is wise to locate in a building or a shopping center where there is room to expand without undertaking the costs of a big move. Sometimes technological considerations enter into planning. The higher lease costs of a building located on a railroad siding may be a worthwhile anticipation of volume climbing to levels where rail service will be needed either to supply or to distribute the businesses volume or both. If relocation becomes unavoidable, it can sometimes be done in stages moving operations to new locations one at a time.

SOURCES TO CONSULT WHEN SELECTING A BUSINESS SITE

Local assistance in selecting a site for a new business can usually be found from a number of sources. These include local utilities, some of which have departments designed to provide help in this area; local Chambers of Commerce; banks and insurance agencies; real estate agents who specialize in commercial and industrial property; and state agencies. More informal networking with members of the local business community can also provide both leads and warnings about various regional properties.

SMALL BUSINESS

Most people get their definition of "small business" from personal experience in dealing with small retail stores and service organizations. Most people also have a minimum size in mind and overlook a whole category of small business, the very small operations Europeans call "micros". Additionally, many people might overlook businesses that are run solely on the Internet. However, entire enterprises that have never had a brick and mortar location have become very successful since the late 1990s and continue to grow.

Under U.S. law, quite sizeable businesses are considered "small." Definitions are typically based on the number of people employed or on sales volume, but in defining small business, there is no "one-size fits all." More true is the expression: "Different strokes for different folks," meaning that definitions are based on the economic sector in which a business operates. Small business may also be defined by a way of looking at the world; it has a cultural meaning; it is a way of life. Thus the definition has qualitative aspects the law does not care about. A quite small business may behave like a very large one because its owners have a certain view; conversely quite large corporations are sometimes still run like small businesses and exemplify the values of small business.

OFFICIAL SIZE DEFINITIONS

In most industrialized countries, small businesses are treated in special ways. They are eligible for financial programs or get favored treatment under the tax laws. For this purpose, governments publish official size standards. In the United States, such definitions are issued by the U.S. Small Business Administration's Office of Size Standards. SBA's basic definition begins with a listing of common features. According to the 2010 Small Business Administration (SBA) Web page, "Size Standards", a small business must be 1) organized for profit; 2) have a place of business in the United States; 3) make a significant contribution to the U.S. economy by paying taxes or using American products, materials, or labor; and 4) be at or below the numerical size standard for its industry. The SBA also notes that a small business can be everything from a sole proprietorship to a partnership or corporation. A 2010 update also notes, "the Small Business Act states that unless specifically authorized by statute, no Federal department or agency may prescribe a size standard for categorizing a business concern as a small business concern, unless such proposed size standard meets certain criteria and is approved by the Administrator of SBA."

U.S. Size by NAICS. According to the standards that went into effect in 2008, SBA determines size for businesses in Manufacturing, Wholesale Trade, Mining, and certain other specific industries by employment size. For others it uses revenue size, except in Banking, where asset size rules. Manufacturing enterprises with 500 and fewer employees are small businesses, although there are some industries within that sector with higher tilt-points, as discussed below; in the Wholesale Trade sector, the upper limit is 100 employees. This number is widely used as *the* definition of smallness in ordinary assessments and in eyeballing small business generally. The number is easy to remember; it is easier to get a headcount than revenue data; and Census data on employment by firm are readily available. But the "100-and-under" definition is official only for businesses in the wholesale trades.

For businesses in all other fields the definitions are based on revenue; this makes it easy for the small business to establish its own eligibility but much more difficult for analysts of small business to classify a population of companies as "small" or "large." In descending order of revenues, some of the major sectors (as summarized by SBA in 2008) are:

- Commercial Banking, $175 million in assets
- Industrial Building Construction, $33.5 million
- Software Publishers, $25
- Dredging and Surface Cleanup Activities (technically part of construction but singled out here), $20 million
- All other Special Trade Contractors, $14 million
- All other General Merchandise Stores (not including department stores, discount department stores, warehouse clubs and superstores) $11 million
- Payroll Services, $8.5 million
- Miscellaneous Crop Farming, $750,000

Businesses in these categories may *maximally* have the revenues shown and still be considered small businesses. The values thus represent upper limits.

These summaries, however, are not the detailed definitions. Those are published by the SBA in a special table organized by North American Industrial Classification System (NAICS) codes. The table lists exceptions, typically showing *larger* sizes for certain NAICS industries. To illustrate, within the Agriculture Sector, where the top is generally defined as $750,000 in revenues, Feedlots may have revenues up to $2.5 million, Chicken Egg Production up to $12.5 million, Forestry operations up to $7 million, and Logging may have 500 employees. Fishing operations top out at $4 million, and Agricultural and Forestry Support activities are $7 million except Forest Fire Suppression and Fuel Management Services where the top size is $17.5 million. The example illustrates that summary data are very general. The business owner needs to obtain his or her NAICS code and then look at the table for the precise definition for his or her operation.

The table also includes whole sectors left out of the summary such as Mining (generally 500 employees); Utilities (4 million megawatt hours a year or less); Transportation (1,500 employees for airlines, long haul rail, and pipelines; 500 for water transport (including deep sea freight, inland water freight, and coastal and Great Lakes freight transportation, among others). Also included in the table are revenues in some sectors, as of the 2008 summary, such as local general freight trucking, $25.5 million; Offices of Real Estate Agents and Brokers Finance and Insurance ($175 million in assets for Commercial Banks; $7 million in revenues for an insurance brokerage or agency); and there are others.

COMPANY DISTRIBUTION BY EMPLOYMENT

Just how big a role does small business play in U.S. commerce? In Manufacturing, 286,039 companies were active in 2006. Of these 74.2 percent had 499 or fewer employees, making nearly three-quarters of all Manufacturing firms small businesses. They employed 43.2 percent of the manufacturing workforce. In Mining, there were a total of 20,583 firms, of which 70.3 percent employed 100-499 workers, making the majority of mining firms small businesses, employing 44.2 percent of the workforce in the industry. Finally, in Wholesale Trade, there were 334,597 firms, of which 79.6 percent had 99

or fewer employees; nearly four-fifths of all wholesale trade firms in 2006.

A DIFFERENT CULTURE

Anybody who has ever worked in or run a small business will be aware of a difference in culture between "small" and "big" business. The difference arises from structural factors, of course, but equally from different values. To be sure, in specific cases a small business may have "big business" values and attitudes arising from the experience and intentions of the owners. On the whole, however, the small-business culture is marked by close and familiar contact between owners and employees; and the business as a whole is close to the outside world customers, neighbors, and suppliers. Structural factors arise because communications in a small business are easy and informal; there is much less layering; contact with the world is immediate and does not require expensive market surveys. The owners very often work within the business and are not the abstract and distant symbol of a faceless stockholder somewhere. Much more so in small businesses than in large, the enterprise has a "family" or "tribal" atmosphere, and the predominant value is continuity and survival rather than abstract concepts like profit, return, and asset appreciation. Being in close and direct contact with the environment ("belly-to-belly" as Japanese business people say), with information flow rapid and decisions easier to make and to implement, small businesses tend on the whole to be capable of rapid reaction but are also constrained by limited means.

The small business environment is both more open, free, quick, and "organic" than large structures where size alone imposes bureaucratic methods of control and slow communications through many layers of decision makers. For this reason, a highly disproportionate number of innovations arise first in small businesses, even more so in an era of Internet storefronts, and small-business owners that can in large measure run their operations from their Blackberry, iPhone, or HTC. Also, as the SBA points out, small business is the source of most new jobs: more than 75 percent of net new jobs added to the economy come from small business, primarily in the manufacturing, mining, and wholesale sectors as of 2009. When it comes to the future, one can confidently say: "Small is beautiful."

SMALL BUSINESS ADMINISTRATION

Created in 1953, the Small Business Administration (SBA) is an independent federal agency charged with aiding, counseling, and protecting the interests of American small businesses. The agency maintains a wide range of programs designed to address various aspects of this mandate. These programs, each of which seeks to assist small-business owners in one or more areas of their enterprise, are maintained in the following areas: lending and investment; surety bonds; international expansion and development; disaster assistance; federal procurement contracts; minority small business assistance; veterans' assistance; research and development; business and training; and business information and counseling. The SBA also serves as an advocate for American small businesses in government.

STRUCTURE OF THE SBA

Most SBA programs and services are implemented through Small Business Administration district offices. District offices are maintained in all fifty states, as well as Washington, D.C., and Puerto Rico (some larger states, such as California, New York, and Texas, have as many as half a dozen offices). Personnel in these offices work directly with small-business owners and various cooperating institutions to implement SBA programs.

These field offices report to regional offices of the SBA. In addition to their supervisory responsibilities, the regional headquarters are charged with educating small-business owners, lending institutions, and others on issues that affect them; fostering regional economic development; and providing the Office of Field Operations (OFO) with information on SBA programs and small-business developments at the district level. OFO is responsible for all aspects of the SBA's field operations, including communications, policy formation, and general performance. It reports directly to the SBA's chief administrator.

Collateral offices maintained by the SBA include administration; comptroller; personnel; external affairs; marketing and customer service; public communications, congressional and legislative affairs; Hearings and Appeals; Inspector General; Office of Information Resources Management (OIRM); Equal Employment Opportunity and Civil Rights Compliance; and Office of General Counsel.

Finally, the SBA maintains several departments devoted to providing advocacy services on behalf of American small-business owners. The Office of Interagency Affairs oversees enforcement of the Regulatory Flexibility Act, analyzes small-business issues, develops governmental policy options, and prepares testimony for use before various legislative and regulatory bodies. The Office of Economic Research oversees the SBA's research contracting program, and compiles and interprets various economic data on small businesses. The Office of Information and Regulatory Affairs publishes books and economic reports on small-business issues, and serves as a distributor of advocacy publications and other materials. Finally, the Office of Advocacy attempts to evaluate the effect of proposed legislation and other policy issues on small businesses. The chief counsel for advocacy acts as the primary spokesperson for the U.S. small-business community and represents its views before Congress, local governments, and other agencies. The Office of Advocacy also utilizes regional advocates who work directly with local communities and small businesses, gathering information on policies and regulations that are helping or hurting small businesses and the communities in which they operate.

SMALL BUSINESS ADMINISTRATION PROGRAMS

The SBA offers many programs in connection with lending, investment, surety bonds, international trade, disaster assistance, federal procurement, minority assistance, business training and counseling, women's business ownership, veterans' affairs,research and development, resources for planning, starting, managing, and closing a small business, and business information services.

Lending Programs. The SBA provides a number of lending options to small-business owners. The best known of these is the 7(a) Loan Guaranty, but there are many others that are widely used as well. In all of these cases, the loan is actually delivered through commercial lending institutions and other intermediaries. The SBA helps secure the loans by consenting to cover the cost of the loan should the borrower be unable to pay. Lending institutions value this added protection very highly.

The 7(a) Loan Guaranty Program, which was authorized by the passage of the Small Business Act, is primarily designed to address the long-term funding needs of small businesses by guaranteeing loans to qualified enterprises. These loans can be used for all sorts of purposes, including inventory, working capital, equipment, and real estate. Maturities are up to 10 years for working capital and up to 25 years for fixed assets. The SBA can guarantee 85 percent of loans of $150,000 or less, and 75 percent of loans more than $150,000. Loans under the 7(a) program are capped at $2 million. There are several other loan programs available through the 7(a) Loan Guaranty plan as well.

The Low Documentation Loan (LowDoc) program is a streamlined version of the 7(a) loan for businesses seeking less than $150,000. Limited to applicants with a strong credit history, LowDoc loans can be secured with a one-page application. The SBA has made a strong effort to improve response time under this plan, in large measure because it had long been criticized for the bureaucratic red tape associated with even the smallest of its loan programs.

The CAPLines program is an option designed to meet the short-term and cyclical working capital needs of small businesses. There are several different loan options available under this program, which replaced the SBA's earlier GreenLine program. Loans under CAPLines can be as much as $2 million; the SBA can guarantee up to $1 million.

The SBAExpress program is shaped to increase the capital available to small businesses seeking loans up to $350,000; a response to this application is generally given within 36 hours. Another Express program, Community Express, provides financial and technical assistance to

small-business owners in any of the agency's historically underutilized business zones (HUBZones) as well as businesses in distressed communities as identified by the Community Reinvestment Act. Likewise, the Patriot Express program offers loans to small businesses that are 51 percent (or more) owned by veterans or members of the military community.

SBA MicroLoans, meanwhile, are short-term loans of up to $35,000. Disseminated through nonprofit groups, MicroLoans are intended for the purchase of machinery and other equipment, office furniture, inventory, supplies, and working capital.

The SBA also offers several targeted lending programs for small businesses. These include the Defense Loan and Technical Assistance (DELTA) program, which provides financial assistance to defense-dependent small businesses impacted by defense cuts (loans under the DELTA plan through the 7(a) and 504 programs are usable for working capital, acquisition of assets, raw materials or inventory, capital improvements, or refinancing of current debt); prequalification pilot loan programs for women and minorities; the Export Working Capital Program (EWCP), which guarantees loans up to $2 million for qualified small businesses engaged in export transactions; the International Trade Loan (ITL), which provides long-term financing assistance up to $1.75 million to small businesses engaged in international trade or hurt by imports; and the Pollution Control Program, which gives loan guarantees to eligible small businesses proposing to design and install pollution control facilities.

The SBA also maintains a loan program known as the 504/CDC (Certified Development Companies), which makes available up to $4 million to qualified applicants. Under this system, long-term, fixed-rate financing is made available to small businesses interested in expanding or modernizing their operations through the purchase of new machinery, equipment, or real estate. DELTA loans are available through this program as well.

Another SBA loan program is the U.S. Community Adjustment and Investment Program (CAIP), created to help communities that suffered economic and workforce losses due to changing trade patterns following implementation of the North American Free Trade Agreement (NAFTA). The program utilizes both the SBA 7(a) Program and the 504 Program to offer credit and encourage business development and expansion in negatively-impacted areas. Small companies interested in pursuing CAIP assistance should contact their local CDC for more information.

The SBA relies on lending institutions and other intermediaries (such as nonprofit organizations, in the case of MicroLoans). But the SBA is careful about the banks and savings and loans companies with which it does business. The most reliable of these lending institutions are eventually designated as "preferred lenders." This status gives them increased powers of loan approval and processing (although the SBA still conducts a final review of loan applications). To become a preferred lender, an institution needs to have established a reputation for solid community lending (to small businesses and minority- and women-owned firms) and a strong history of being repaid by loan applicants.

Investment. The SBA also maintains investment programs for small businesses. Small Business Investment Companies (SBICs), for example, are SBA-licensed investment firms which armed with U.S. government-guaranteed debentures or participating securities make investments and loans to small businesses. Indeed, SBICs exist for the express purpose of funding start-up companies. They operate under extremely stringent guidelines, however, and turn down many applicants. Similar to SBICs are Minority Enterprise Small Business Investment Companies (MESBICs), which provide funding to businesses owned or operated by minorities.

The SBIC program functions as a "fund of funds," providing equity capital, long-term loans, and debt-security instruments. Hundreds of SBICs operate in a wide range of industries, with some exercising specific expertise in a particular field or stage of investment. Only small companies with net worth of $18 million or less qualify for SBIC investment assistance.

Surety Bonds. In recognition of the fact that contractors to construction projects must post surety bonds on federal construction projects valued up to $10 million, the SBA established a program wherein they guarantee bid, performance, and payment bonds for eligible small firms unable to secure surety bonds through commercial lenders. Under this program, bonds may be obtained either via prior approval, in which contractors apply through a surety bonding agent; or preferred sureties, authorized by the SBA to issue, monitor, and service bonds without prior SBA approval.

International Trade. The SBA's International Trade Loan Program is designed for small companies engaged or preparing to engage in international commerce. Under this program, the SBA guarantees up to $1.75 million for a combination of fixed asset financing and Export Working Capital Program (EWCP) assistance. The fixed-asset portion of the loan may not exceed $1.75 million, while the EWCP segment may not exceed $1.25 million. According to the SBA, the small business applicant must do the following in order to qualify: "establish that the loan will significantly expand or develop an export

market, is currently adversely affected by import competition, will upgrade equipment or facilities to improve competitive position, or must be able to provide a business plan that reasonably projects export sales sufficient to cover the loan."

The Export Express program similarly offers small businesses with lines of credit up to $250,000. This streamlined program enables businesses to get funds quickly; an answer is usually delivered within 24 hours of an application being submitted.

In addition to maintaining loan programs for small businesses engaged in international commerce, the SBA provides a number of other services to these enterprises. The Export Legal Assistance Network (ELAN), for instance, is the product of an agreement between the SBA, the Federal Bar Association, and the U.S. Department of Commerce. Under this program, trade attorneys provide free legal consultations to small business exporters.

The SBA also operates information centers called U.S. Export Assistance Centers (USEACs). As with ELAN, the USEACs are the product of an alliance between the SBA and other organizations (in USEACs' case, the Department of Commerce and the Export-Import Bank). These centers are designed to disseminate trade promotion and export financing information to small businesses engaged in international trade. The agency additionally offers a wealth of information regarding breaking in to international trade, covering such components as foreign market entry, export financing, and international transportation of goods.

Assistance Programs. The SBA makes available Physical Disaster Business Loans to businesses of any size that need to repair or replace business property to "pre-disaster" conditions. These loans, which can be used for equipment, fixtures, and inventory, are limited to $2 million and are not available to businesses which were insured for their losses. Economic Injury Disaster Loans (EIDLs), meanwhile, are targeted at businesses that have "sustained economic injury as a direct result of a disaster." These working capital loans help businesses pay ordinary and necessary operating expenses which would have been payable barring disaster. The maximum amount of an EIDL loan is also $2 million, but small-business experts note that businesses can receive no more than $2 million in combined EIDL and physical disaster business loans. An exception to this stipulation is made, however, for those places of business that qualify as major sources of employment. Under the SBA's Major Source of Employment (MSE) program, the $2 million loan limit is waived for those businesses that employ 250 or more people in an affected area.

Federal Procurement. The Small Business Administration maintains several programs designed to help small businesses secure government contracts. These include:

- Breakout Procurement Program   promotes the breakout of historically sole-source contracts for open competition with the aim of aiding small businesses and effecting government savings.
- Prime Contracting Program   designed to help small businesses interested in securing federal contracts; services include support for small business set-asides, counseling, identification of new small business sources, and "assessment of compliance with the Small Business Act through surveillance reviews."
- Subcontracting Program   designed to aid small businesses in their efforts to secure federal contracts as suppliers and subcontractors.
- Certificates of Competency   appeal process that can be used by small businesses that have been denied government contracts because of alleged lack of ability to fulfill job requirements.

Another program in this area introduced by the SBA is the HUBzone Empowerment Contracting Program. This initiative provides federal contracting opportunities for qualified small businesses located in economically distressed areas.

Minority Assistance. The SBA has several programs intended to provide support to small businesses owned and operated by minorities. Programs maintained by the SBA's Minority Enterprise Development office include 8(a) Small Disadvantaged Business Development, which arranges federal procurement opportunities for minority- and disadvantaged-owned firms, and initiatives which provide management and technical assistance to those firms. The SBA also operates an Office of Native American Affairs (ONAA), which works to provide Native American communities with business development and job creation opportunities.

Business Training and Counseling. SBA-sponsored training and counseling services are available through the following programs:

- Small Business Development Centers   provides management and technical assistance to both current and prospective small-business owners through an alliance of educators, the private sector, and federal, state, and local governments. All areas of business are covered, from market research and accounting systems to inventory control and cost-benefit analysis.
- Women's Business Centers   help women start and grow small businesses. Nearly 100 such centers work to help "level the playing field" for women entrepreneurs.

- Export Assistance Centers provide export assistance services to small businesses. Assistance is provided by the SBA, Department of Commerce, and Export-Import Bank.
- Service Corps of Retired Executives (SCORE) matches retired business executives with small businesses seeking advice on business issues. SCORE includes more than 12,400 members in hundreds of chapters around the country.

Women's Business Ownership. SBA programs specifically directed at women small-business owners include the Office of Women's Business Ownership (OWBO), which provides women with training and advice on all aspects of business ownership and management. The OWBO oversees the national network of Women's Business Centers and focuses on helping women who are economically or socially disadvantaged to start up and operate a small business.

Veterans' Affairs. The SBA maintains several programs through the Office of Veterans Business Development intended to provide information and training to veterans. These include training and transition assistance, as well as opportunities for veteran-owned companies previously reliant on the defense industry to secure other clients.

Research and Development. The Small Business Innovation Research (SBIR) program seeks to form research and development partnerships between small firms and nonprofit research institutions. It provides up to $100,000 to companies for the first phase of research, though there are stipulations attached to that figure. Phase 2 awards up to $750,000, and phase 3 sees the experiment move into the marketplace. SBIR provides financial rewards to small businesses which propose innovative ideas to problems faced by participating federal agencies. Initially established as a result of the 1982 Small Business Innovation Development Act, SBIR has been warmly received by many small companies with expertise in science and high-technology areas.

Small Business Planner. In addition to lending, investment, and other training programs, the SBA offers a number of resources that involve planning, starting, managing, and closing a small business. The agency's business plan resources cover the essentials of writing a good business plan. Start-up resources are also plentiful on the agency's Web site and include fundamental components such as buying a business or franchise, naming the business and choosing a structure, and obtaining necessary licenses and permits. Business management resources include information on managing employees, pricing products or services, and paying taxes. Last but not least, the SBA offers information on exiting a business, including selling a business, liquidating assets, and filing for bankruptcy protection.

Business Information Services A comprehensive range of business development publications is published by and made available from the SBA. Titles cover marketing, personnel, inventions, crime prevention, and a plethora of other issues. The SBA also maintains SBA Online, a computer-based electronic bulletin board of small-business information, and a toll-free answer desk for small-business owners with questions about aspects of their operation. An answer desk is open 24 hours a day, 7 days a week, but counselors are only available Monday through Friday, 9 a.m. to 5 p.m. Eastern Time. The toll-free number is (800) 8-ASK-SBA. Finally, the SBA maintains a page on the World Wide Web at www.sba.gov.

SMALL BUSINESS CONSORTIA

Business consortia are alliances of individual business enterprises. Businesses involved in these sorts of consortia are often in the same broad field or industry, though they are rarely in direct competition with one another. Instead, members usually offer products or services that are complementary to those available through other

consortium members. Unlike associations and other similar organizations, which engage in efforts to shape legislation and present a unified industry front, business consortia ally themselves for basic business functions, such as marketing. These alliances are not commonplace, but some analysts indicate that in the future, increasing numbers of small-business owners may investigate consortiums as a way of sharing common costs, increasing purchasing power, and competing with larger companies.

Business consortia usually come into being for specific reasons, such as competitive threats from a common enemy (whether another business or an unwelcome economic trend), changes in competitive structures, or deregulation. By forming a consortium, the member companies are usually admitting that, for the time being, competitive pressures are great enough to call into question their ability to survive as completely independent entities.

Participants in business consortia admit that striking such alliances can sometimes curb a firm's ability to act independently, since its words and actions will reflect on other consortia members. This can be difficult for some entrepreneurs to handle. Moreover, consortia can become crippled if their membership grows too large and unwieldy to make quick decisions, or if individual members fall victim to squabbling or worse as a result of personality conflicts, similar customer bases, or other business disputes. But proponents point out that a business consortium can provide several meaningful advantages to members as well. These include:

Increased clout. Whereas individual small businesses sometimes do not enjoy the same name recognition or respect as do larger companies, the collective bargaining and purchasing power of a consortium as well as the individual marketing efforts of members can provide individual businesses with increased recognition and stature in the community.

Savings of time and money. Joint marketing and advertising efforts save members money because they can pool their resources for better rates; they also save member businesses time because they do not have to undertake as much work themselves.

Expanded customer base. Membership in business consortia can provide participating businesses with increased exposure to new revenue streams.

Some small-business consortia have evolved along with technological advances. For instance, the University of Wisconsin-Madison E-Business Consortium (UWEBC) focuses on e-business issues facing companies. UWEBC focuses on Web and multichannel marketing, information technology, customer service, sales operations, and supply chain management. Member companies are able to tap into peer groups, member-to-member collaboration, company projects, and an extensive Web site that includes recordings of all consortia meetings. Broadband Internet advances also prompted the inception of a small-business broadband consortium by the Service Corporation of Retired Executives (SCORE) to help member businesses "increase digital literacy, Web skills, e-commerce capabilities, and online communications tools" to help small businesses operate on a more level playing field with larger competitors.

Business consortia typically focus on a particular industry segment or class of business. For instance, the Richmond Women's Business Consortium (RWBC) provides services to women-owned business and women entrepreneurs in the Richmond, Virginia, area. RWBC offers frequent networking events that bring together member organizations for the purpose of sharing information for professional development. The Business Consortium for Arts Support is similarly focused, in this case on funneling grant funding to arts organizations. Businesses and foundations make donations to the consortium, which in turn awards funding to arts groups in need. Another such consortium, the Sustainable Fashion Business Consortium, is a group of Hong Kong fashion companies that work to promote sustainable practices across the fashion supply chain. Its efforts aim to improve air and water pollution remediation, waste disposal practices, and other environmental practices utilized by member businesses.

SMALL BUSINESS DEVELOPMENT CENTERS (SBDC)

One of many programs administered by the Small Business Administration (SBA), the Small Business Development Center (SBDC) program provides management assistance to both established and prospective small-business owners. The SBA characterizes the program, which was established in 1976, as a "cooperative effort of the private sector, the educational community, and federal, state, and local governments. It enhances economic development by providing small businesses with management and technical assistance."

The SBA maintains small-business development centers in all fifty states, as well as Puerto Rico, Guam, the U.S. Virgin Islands, and the District of Columbia. Some states have more than one lead center in 2010, Texas had four, while California had six. Many of these centers have satellite service locations as well. These satellite locations are housed primarily at colleges, universities, and community colleges, but they may also be found at vocational schools, chambers of commerce, and economic development corporations.

SBDCs are typically headed up by a director and include paid staff members, but the services of volunteers qualified individuals from professional and trade associations, members of the legal, banking, and academic community, chambers of commerce representatives, and members of the Service Corps of Retired Executives are integral to most SBDCs. In addition, SBDCs commonly compensate consultants, consulting engineers, and testing laboratories for services rendered on behalf of SBDC clients.

While SBDCs are administered by the SBA, that organization is prevented by law from providing more than 50 percent of the operating funds for each state SBDC. The centers turn to state legislatures, private sector foundations and grants, state and local chambers of commerce, economic development corporations, public and private universities, vocational and technical schools, and community colleges for the remainder of their operating funds. In recent years, non-SBA sponsors have accounted for more than 50 percent of their required matching share at a number of centers.

THE SBDC PROGRAM

According to the SBA, SBDCs are designed to deliver timely and accurate counseling, training, and technical assistance in all aspects of small business management, including financial management, marketing, production and operations, organization, engineering and technical issues, personnel management, and feasibility studies. Some centers also offer assistance in such areas as venture capital formation, rural development, exporting and importing, and procurement of funding (including Small Business Innovation and Research grants), depending on the needs of their business clients and the communities in which the centers operate.

SBDCs are critically important to small-business owners in times of economic trouble. The recession of 2008 and 2009 made them indispensable to some small businesses that otherwise would have shuttered. California SBDCs, for instance, helped small-business owners in that state retain 2,400 jobs and create 3,000 new ones in 2009, despite economic turmoil. State SBDCs saw a marked rise in consulting services during that year, spending more than 82,000 hours on helping small businesses with business plans, loan applications, cashflow management, and government contracts, among other issues. Clients consequently increased sales by $118 million, according to *Economics Week*. Elsewhere throughout the country, SBDCs helped laid-off workers start new businesses for themselves. The Gannon University SBDC in Erie, Pennsylvania, started offering a 3-hour course to prospective entrepreneurs on how to start a business. The relatively low cost of the course ($25) enabled many people who were previously laid off to explore starting up their own small businesses.

SBDC assistance to small-business owners takes many forms, from counseling on legal issues to seminars on business finance to aid in putting together a business plan. Many centers also maintain extensive business libraries that contain a great deal of information of value to entrepreneurs and small-business owners.

Minorities and special interest groups are of particular concern to SBDCs. In 2010 the SBA awarded millions in grant funding to centers that assist veterans. Programs that benefited from the funding provided business ownership assistance as well as assistance to businesses dealing with key personnel who were deployed overseas. The programs also utilized multimedia tools to connect veterans through distance learning and online counseling services. Likewise, in many states with high rates of small business failure, SBDCs offer free training workshops to disadvantaged businesses. Such workshops help small-business owners sharpen their skills in marketing, management, and accounting areas that are often lacking in a struggling business.

Anyone interested in starting a small business or making improvements to an existing small business is free to make use of the SBDC program, provided that they do not have the financial resources to secure the services of a private consultant. Indeed, the SBDC centers regard their primary clientele to be businesspeople from disadvantaged socioeconomic backgrounds. The SBDC program also makes special efforts to provide assistance to women, the disabled, and military veterans. To locate the nearest SBDC, business owners may visit the Small Business Administration Web site at www.sba.gov/sbdc/.

SMALL BUSINESS INNOVATION RESEARCH (SBIR) PROGRAM

The Small Business Innovation Research Program (SBIR) is the federal government's most important research and development funding program for small businesses. It was established by the passage of the Small Business Innovation Development Act of 1982. SBIR, at the time of its passage, required by law that any federal government agency with an extramural research and development budget of more than $100 million set aside 1.25 percent of those funds for the development of high-tech small businesses. In 2010 Congress debated reauthorizing the program through 2023.

The Small Business Administration (SBA) serves as the coordinating agency for the SBIR program. It directs implementation of the program among participating agencies, reviews their progress, and reports annually to Congress on the status of the program. The SBA is also the information link to the program, collecting solicitation information from participating agencies and publishing it in quarterly pre-solicitation announcements (PSA). These announcements are the single source for the topics and anticipated release and closing dates for each federal agency's solicitations.

By 2010 eleven federal agencies participated in SBIR, bestowing research and development funds to small businesses in an array of industries. Participating agencies include the departments of Agriculture, Commerce, Defense, Education, Energy, Health and Human Services, Homeland Security, and Transportation, as well as the Environmental Protection Agency, the National Aeronautics and Space Administration (NASA), and the National Science Foundation. According to *Science* magazine, 96 percent of the total SBIR budget from all agencies comes from the departments of Defense and Energy, the National Institutes of Health, NASA, and the National Science Foundation. Furthermore, 20 percent of SBIR recipients reportedly started their companies because of a prospective SBIR award, according to U.S. Senator Mary Landrieu (D-La).

These agencies set aside seed funds to help small businesses develop innovative high-tech ideas whose commercial appeal may be some time in coming. Each year the agencies release for consideration more than 3,000 technology topics under which businesses may apply. The topics speak to specific program problems or needs and may be found in the quarterly *Pre-Solicitation Announcement (PSA)*, which is only provided online. The SBA additionally offers TECH-Net, an online database of SBIR awards that operates as a search engine for researchers, scientists, and government officials as well as small businesses looking to capitalize on potential investment opportunities.

SBIR ELIGIBILITY AND FRAMEWORK

To be eligible for SBIR funding, a small business must be U.S.-owned, independently operated, for-profit, and employ fewer than 500 people. Nonprofit organizations are not eligible for SBIR awards.

The SBIR program comprises three phases. This approach allows the government agency to invest a small amount in the beginning and then increase financial support later should the idea show promise. Once the project nears completion, funding drops off and the business must solicit capital from other sources.

Phase One The Concept Stage. In this stage, individual awards of up to $100,000 are distributed to enable businesses to conduct approximately 6 months of preliminary investigations into the feasibility of their proposed project. At this point, business owners must have a well-formed idea for an innovative product and a specific plan for how to transform it into a commercially viable form.

Phase Two The Prototype Development Phase. This phase, for which only Phase One entrepreneurs are eligible, provides additional monies (up to $750,000 over 24 months) to be used toward developing a prototype. From here, determinations are made about whether the product is a success or a failure and whether or not it is commercially viable. About 40 percent of Phase One ideas reach this second stage.

Phase Three The Commercialization Stage. In this stage, according to the SBA, "Phase Two innovation moves from the laboratory into the marketplace." No SBIR funds are used in this stage. Instead, funding must be secured from the private sector or other non-SBIR federal agency funding.

The SBIR/STTR Reauthorization Act of 2009 sought to increase award levels for the first two phases to offset inflationary effects Phase One, from $100,000 to $150,000; and Phase Two, $750,000 to $1 million. Politicking between the House and Senate pushed debate over the bill into 2010, although it received strong support from the small-business community. In addition to higher awards, the proposal sought to enable a small business that receives an award from one federal agency to receive an award from another agency for a subsequent phase, as long as the topics of the relevant awards are the same. The bill additionally endeavored to require participating agencies to issue awards for Phase Three technology. Ancillary program improvements included extending awards to small businesses operating in rural areas and directing awards toward workforce development by creating internships.

For more information on the SBIR program, business owners may contact the Small Business Administration's Office of Technology at 409 Third Street SW, Washington, DC 20416, (202) 205-6450. The SBIR Web site with program information is http://www.sbir.gov.

SMALL BUSINESS INVESTMENT COMPANIES (SBIC)

The Small Business Investment Company (SBIC) program was created in 1958 with the passage of the Small Business Investment Act. Licensed by the Small Business Administration (SBA), SBICs are privately organized and privately managed investment firms that provide venture capital to small independent businesses (defined as those with net worth of less than $18 million and average net income of less than $6 million for the prior 2 years). These loans, which are available both to new and established businesses, consist of funds borrowed (at favorable rates) from the U.S. government or from the lending institutions' own capital stock. In essence, an SBIC uses its own capital, combined with funds borrowed from investors and supported by an SBA guarantee, to make investments in qualifying small businesses. The SBIC program is designed to assure that there are institutions within the marketplace able and willing to facilitate the capital needs of a vibrant small business community. In 2009 SBICs funneled nearly $17 billion in SBA-backed and private capital.

Three different kinds of SBICs operate in the United States. Debenture SBICs provide debt or debt with equity features. These SBICs concentrate on more mature companies that can handle interest payments, therefore enabling the SBIC to meet its own interest obligations to the SBA. Participating Securities SBICs focus more on making pure equity investments but also provide debt investments. These SBICs invest "patient" equity capital in early-stage firms since interest is accrued on their SBA obligation. Finally, Specialized SBICs

(SSBICs) emphasize service to entrepreneurs who "have been denied the opportunity to own and operate a business because of social or economic disadvantage," according to the SBA. SSBICs are also called Section 301(d) SBICs and are generally lumped together under the SBIC heading.

THE SBIC ORGANIZATION

Ownership of SBICs generally takes two different forms. The majority of SBICs are relatively small, privately owned and operated firms, but many others are firms owned by commercial banks or insurance companies. For banks, establishment of an SBIC subsidiary is often an attractive proposition, because it enables them to make small business investments that would otherwise be closed to them because of U.S. banking laws and requirements. U.S. law places few restrictions on SBIC ownership. According to the SBA, "almost any person or organization with a minimum initial private capitalization of $5 million and an SBA-approved full time manager who will be in charge of the licensee's operations and who is able to serve the licensee's small business concerns, may be approved for ownership." In addition, at least 30 percent of that capital must come with sources not affiliated with fund management. The SBA's interest in encouraging SBICs is evident in the relatively hands-off regulatory environment that it has established for such enterprises. Those regulations that the SBA does enforce are concerned with ensuring the continued financial and ethical health of the SBIC program.

Obtaining an SBIC license can be a time-consuming process, often ranging from 8 months to a year. The SBA scrutinizes such factors as a team's qualifications, business plan, and fund structure as stipulated under the Small Business Investment Act. Highly successful SBICs frequently exhibit the following characteristics:

- Substantial principal investment experience
- A track record of excellent returns based on an overall evaluation of appropriate performance measures
- Evidence of strong deal flow in the proposed investment area
- Cohesive management team with history and complementary skills
- Management, operational, or technical expertise that adds value to a portfolio company
- A proven ability to manage cash flows to ensure the SBA is repaid in a timely manner

SBICs range from limited partnerships to subsidiaries of multinational corporations. Whatever their ownership situation, however, their ultimate goal is to realize a profit from their various business transactions. Some SBICs make most of their revenue from straight debt financing, with their profit coming from the differential between the cost of borrowing from the SBA and the interest rate they charge the small business borrower. Other SBICs take a more aggressive tack in seeking profits by making equity-participation loans.

According to the SBA, prospective SBICs (and SSBICs) must have a minimum private capital investment of $5 million to form (the minimum requirement for those firms wishing to utilize participating securities is $10 million). The amount of private capital that an SBIC has at its disposal is important, for the SBA limits its loan guarantees to SBICs to 300 percent of its private capital. The SBA notes, however, that an SBIC "with at least 50 percent of its 'total funds available for investment' invested or committed in 'venture capital' may receive an additional tier of leverage per dollar of private capital for total leverage of 400 percent of private capital. However, in no event may any SBIC or SSBIC draw down leverage in excess of $90 million." An SBIC that engages in leveraging is in essence borrowing additional investment funds from the U.S. Treasury. Only those SBICs that have invested the bulk of their initial private capital and are in full compliance with state and federal regulations are eligible to do this.

SBICs have several different options to choose from in providing financing to small businesses. Most SBICs provide long-term loans to qualified small businesses that need funding for needs that range from expansion of existing facilities to modernization of operations. Sometimes this loan will take the form of equity or debt securities.

OPERATING RESTRICTIONS FOR SBICS

While the SBA provides SBICs with considerable freedom to operate, they do require that these organizations adhere to certain rules. For example, SBICs are not permitted to invest in the following entities: companies with less than 51 percent of their assets and employees in the United States; passive or casual businesses; unimproved real estate; finance and investment companies; or companies seeking to purchase or improve farmland, cemeteries, or certain other stipulated types of real estate (exceptions are made for subdividers and developers, title abstract companies, and real estate agents and brokers). SBICs also are forbidden from investing in other SBICs, or in business enterprises that do not fit federal definitions of a "small business."

The SBA also has established regulations in the following areas:

- Conflict of Interest SBICs are not allowed to make business transactions with any of their associates,

which are defined as officers, directors, employees, key "control persons," and certain shareholders.

- Control the SBA has stipulated that no SBIC may exercise either direct or indirect control over the operations of any small business on a permanent basis. The SBA has, under some circumstances, permitted SBICs to assume temporary control of a business enterprise in order to protect its investment. Before doing so, however, the SBIC and the small business must submit a plan of divestiture for SBA approval.
- Overline Limitations The SBA has established investment ceilings for both SBICs and SSBICs in their dealings with individual small businesses. SBICs are not allowed to invest more than 10 percent of the sum of their private capital with any one small business multiplied by the leverage ratio that was approved at the time of licensing. The SBA does, however, occasionally grant waivers to this rule.
- Cost of Money The SBA regulates the cost of money on SBIC loans and debt securities issued by SBIC clients.
- Financing Proceeds The SBA has established regulations designed to ensure that investment funds that are used to purchase securities go directly to the small business that has offered those securities.
- Length of Financing Agreements SBA rules stipulate (in most cases) that SBIC loan agreements with small business enterprises be made for at least 5 years, and that the small business taking the loan be given adequate opportunity to fulfill its obligations ahead of schedule if it is able to do so. According to the SBA, loan and debt securities of less than 5 years' duration are permissible only on those occasions when they are necessary to protect existing financing agreements, are made in contemplation of long-term financing, or are made to finance a change in ownership.

BORROWING FROM AN SBIC

"As is true with venture capitalists in general, SBICs have divergent philosophies and operating policies," writes Art DeThomas in *Financing Your Small Business*. "Some specialize in equity financing while others provide debt financing in several different forms. This latter group of SBICs is the richest source of debt financing for small businesses outside commercial banks." Small-business owners, however, need to weigh several factors before making a loan arrangement with an SBIC.

Entrepreneurs and small-business owners seeking financing from SBICs first need to determine how many options they have. Regional SBA offices maintain information on SBICs that operate in their areas, and while they do not provide guidance in directing businesses to particular SBICs, they can give information on the industries and types of investments in which area SBICs have historically shown interest. In addition, a free directory of SBICs is available through the National Association of SBICs. A majority of SBICs focus on a particular investment stage, such as start-up, expansion, or turnaround. Others prefer to work in certain geographic areas. The SBA additionally provides an online map of SBICs organized by state on its Web site. Potential SBICs can also be identified through the Web sites of the National Association of Small Business Investment Companies and National Association of Investment Companies.

As many experts note, small businesses should narrow their search for a suitable SBIC by eliminating those that do not provide the business's desired financing route or display adequate management experience in the industry in which the business is involved. Analysts also caution small-business owners not to rush through the decision-making process. Given the latitude that SBICs have in shaping their loan policies, individual SBICs often maintain dramatically varied lending policies. Entrepreneurs and small-business owners should take the time to find the program that best meets their needs.

A company's size is also an important consideration when considering SBIC financing. An SBIC will account for a business' subsidiaries, parent companies, and affiliates when determining the size standard, according to the SBA. In addition, different industries may have alternative size standards that should be considered.

Once a prospective SBIC is identified, experts advise sharpening a business plan for presentation. The average SBIC receives hundreds of business plans each year. Finding an effective referral or introduction to a particular SBIC fund manager can greatly improve an entrepreneur's chances of being considered. Professionals such as accountants, attorneys, or industry executives can be important gateways to getting a small business noticed by an SBIC.

SMALL BUSINESS JOB PROTECTION ACT

The Small Business Job Protection Act (SBJPA), signed into law in 1996, contains a number of provisions that impact various aspects of small business operations, from retirement plans to changes in S Corporation structures. The small business community greeted many of the changes contained in the SBJPA with considerable enthusiasm, since it was widely interpreted as an act that eliminated a number of unnecessarily burdensome provisions. The act touches on a wide variety of areas relevant to small businesses, especially in the area of pensions. Changes made by the law can be found in such areas as the definition of highly compensated employees; deferred compensation arrangements; family aggregation rules; minimum pension participation rules; "safe harbor" rules for qualified cash or deferred arrangements (CODAs); notice requirements; limits on matching contributions; distributions of excess contributions; elective deferrals that may be included as compensation; early participation nondiscrimination rules; plan distributions and qualified joint and survivor annuity (QJSA) waivers; employee leasing provisions; and modification of general agreement on tariffs and trade (GATT) interest and mortality rate rules. The Small Business Administration (SBA) estimates that the act helps small businesses save around $80 million per year. Small-business consultants strongly advise business owners who wish to take full advantage of the myriad changes included within the SBJPA to consult with a tax advisor or other accounting professional.

IMPACT ON SUBCHAPTER S CORPORATIONS

Some observers estimate that the SBJPA has directly impacted as many as two million small businesses currently structured as S Corporations (corporations that choose to pass corporate income, losses, deductions, and credit on to their shareholders for federal tax purposes). For instance, the law allows S Corporations to increase shareholders from thirty-five to seventy-five, giving businesses heightened capacity to attract additional investors and capital. Another beneficial change to small-business owners concerned an expansion in the kinds of organizations that can be shareholders. Under the SBJPA, qualified pension plans are eligible to be shareholders in S Corporations. Since many pension plans are willing to invest in promising young businesses, S Corporation owners are able to turn to these entities as a source of significant capital.

The SBJPA also provides S Corporation owners with greater flexibility in structuring their businesses. Prior to the passage of the SBJPA, S Corporations could not own more than 79 percent of another company; with the new law, they may now own 100 percent of affiliated companies. Finally, business experts note that the SBJPA expands the number of allowable beneficiaries when an S Corporation puts together a small business trust.

CHANGES TO RETIREMENT PLANS

The SBJPA established a simplified retirement plan for small businesses that is known as the SIMPLE IRA (individual retirement account). Under these plans, which are designed for employers with 100 or fewer employees who do not maintain another employer-sponsored plan, employers and employees work together to help ensure that workers have adequate financial security when they reach retirement age. SIMPLE IRA's are available for employees who earned at least $5,000 during the last 2 calendar years and are reasonably expected to make $5,000 during the current calendar year. Under the law, employees may make elective pre-tax contributions of up to $11,500 annually, a total that has moved up at regular intervals to adjust for cost of living increases. The employer is required to make matching contributions of up to 3 percent of an employee's salary every year. The SBJPA also requires that businesses contribute at least 1 percent of all employees' compensation or be subject to significant penalties.

The law also impacts other elements of pension plans. For example, for the years 1997, 1998, and 1999, the 15 percent excise tax on excess distributions from pension plans was suspended (the excise tax was later repealed by the Taxpayer Relief Act of 1997). Moreover, the act introduced safe-harbor formulas for 401(k) salary deferral and matching contributions that eliminated requirements that employers conduct annual nondiscrimination testing. The safe-harbor formulas provide a way for employers to avoid nondiscrimination testing by adopting a plan with a relatively generous employer match one that includes a contribution of at least 4 percent of pay on behalf of all eligible employees (depending on employee contributions). Safe-harbor

matching contributions must be 100 percent vested at all times. Such contributions generally may not be distributed to employees until the earlier of when they terminate employment or reach age 59 ½." In addition, under the SBJPA, distributions from a qualified plan must begin by April of the calendar year following the later of: 1) the calendar year in which the employee reaches 70 ½ years of age, or 2) the calendar year in which the worker retires.

The SBA points out one drawback to the safe harbor clause. A business would have to declare early in the tax year whether it intends to make the necessary contributions to participate in the program. Since many small businesses do not know from one year to the next what their profit might be, many business owners feel rightly hesitant to make a financial commitment to participate in a safe harbor program.

SMALL BUSINESS/LARGE BUSINESS RELATIONSHIPS

Many small-business owners see large businesses exclusively as competitors. It is an accurate assessment for small enterprises that compete directly with larger companies. An independent record store owner, for example, will undoubtedly regard the arrival of a large chain record store as a threat. A small plastics manufacturer will similarly view larger industry firms as competition. But small businesses should recognize that large regional, national, and international companies can also be business partners, product distributors, or customers.

LARGE BUSINESSES AS PARTNERS

Business partnerships between small and large companies are on the rise. Alliances between large companies are still more prevalent, and many large firms prefer to acquire smaller enterprises, but experts contend that more large companies recognize the benefits of establishing partnerships with nimble, entrepreneurial firms. Small, growing companies can offer access to new customers, innovative products and management practices, and opportunities to share an innovative, contemporary image. This is especially true in technology, biotechnology and other industrial sectors characterized by rapid change and innovation. For instance, Sloan Security Technologies (SST), a small security technology manufacturer, was selected by Hewlett-Packard (HP) in 2010 to partner in a small business mentorship program as a result of its innovative technologies. HP provided a group of executives to mentor SST staff as it worked on its strategy to reach market success. In turn, HP was able to capitalize on SST's innovative technologies. Said chief Bryce Sloan, "HP is launching this program to a) give back to the small biz community that buys HP products and b) hopefully HP will benefit from working with small innovative partners (like us)."

Such partnerships often cross industry boundaries, as Myron Gould explains in *Direct Marketing.* "Partnerships can be formed in the profit and nonprofit sectors, in the same or different industries, within different divisions of the same company, and in similar market segments/demographics in non-competitive industries." Gould writes.

Cost efficiencies are another important byproduct of successful small business partnerships with large companies. Aircraft manufacturer Boeing was recognized for its own relationships with small businesses in its service to NASA. In order to be a NASA vendor for the International Space Station, Boeing had to do at least 19 percent of its business with small businesses. The partnerships resulted in increased cost savings.

Many observers believe that festering suspicions and stereotypes between the large- and small-business camps

about each others' motivations and abilities have begun to give way to an increasing recognition of the positives of cooperative partnerships. In *Winning Combinations: The Coming Wave of Entrepreneurial Partnerships Between Large and Small Companies* James Botkin and Jana Matthews wrote, "Both large corporations and small companies can brighten their global prospects by forming collaborative partnerships that capitalize on their complementary strengths while respecting the independence of each party."

Well-managed smaller companies can anticipate market trends, capitalize on new technologies, and use their lean structures to outpace larger companies. However, small companies are limited by certain realities that can be easily addressed by big firms. These impediments are often emphasized if the small firm hopes to establish a presence beyond its domestic borders. "Increasing globalization... makes it difficult for small entrepreneurial companies to act alone effectively," wrote Botkin and Matthews. "Their marketing and distribution channels are frequently inadequate for getting their innovative products and services to an international marketplace. The continual need of small companies for capital also limits their maneuverability. The time and attention of their entrepreneurial management is often diverted to finding and negotiating financing instead of developing markets and distribution systems."

Large firms are an obvious source of assistance, but small businesspeople tend to regard large corporations with suspicion. After all, many entrepreneurs come from corporate environments that were not necessarily characterized by adherence to any code of business ethics, and U.S. corporations have not always shown respect for small business autonomy. "But this need not be the case," wrote Botkin and Matthews. "We suggest that any partnership offer be examined critically and carefully. Entrepreneurs must learn to discriminate between corporate sharks with a bite and swallow mentality and those suitors who have a mutually beneficial arrangement in mind. It's natural to be suspicious. However, many founders of small businesses write off strategic alliances altogether, closing off what might be an increasingly important avenue of rapid growth."

Indeed, many large businesses take their small business partners seriously enough to create entire divisions dedicated to cultivating those relationships. For instance, government contractor STRATIS' small business office (SBO) helps small and minority-owned businesses compete for the IT provider's government business. The SBO is effectively a gateway between suppliers and STRATIS' operational units. When a government agency awards a project worth more than $500,000 ($1 million for construction), then the company must include a subcontracting plan that has provisions for small businesses, as stipulated under the Small Business Act. The SBO additionally offers agency-sponsored trade shows, vendor open houses, matchmaking sessions, and other opportunities that help strengthen the company's small business partnerships.

Keys to Successful Partnerships with Larger Companies. Entrepreneurs should consider a few key factors when negotiating and maintaining a partnership with a larger company.

Research. Some partnership offers sound great but can be difficult. Entrepreneurs should make sure that they undertake diligent research to assure themselves of finding the right partner. Botkin and Matthews admitted, "Not every partnership yields happy results; ill-conceived partnerships can leave your company in worse shape than before. Bad partnerships, like bad marriages, can drain resources, end up in costly litigation, and sour both partners on future relationships." Typically, however, warning signs can be identified during the research stage.

Fundamentally sound business practices. Entrepreneurs hoping to secure a partner to bankroll their R&D efforts or market their products are wasting their time if they do not have a viable business already in place. If the small company's business practices are shoddy, disorganized, or incomplete, large companies will be sure to notice.

Recognition of own responsibilities. Entrepreneurial companies need to recognize that big companies are for-profit enterprises; they expect something in return for their financial, marketing, and management help.

Monitor requirements of successful partnership. Many partnerships with larger companies require entrepreneurs to make a greater commitment to their business in order to meet the obligations of the partnership agreement. If the entrepreneur launched the business to realize greater personal wealth or establish a significant presence in a given industry, finding the desire to meet those partnership obligations should not be a problem. If, however, the entrepreneur launched a venture to stake out a lifestyle of independence and travel, that person may want to weigh the impact that the partnership could have on those aspects of his or her life.

Do not be intimidated. The trappings of the corporate world (high-rise buildings, cavernous conference rooms, legions of blue suits, etc.) can be intimidating, but small-business owners have to remember that they run viable businesses of value themselves, and they should negotiate accordingly.

Maintain independence. Autonomy is assured in this manner, so business owners should be leery of turning over too much equity in the business in exchange for financial help.

Establish clear and open lines of communication. Good communication practices are essential to all business relationships, both internal and external, and alliances with large companies are no exception.

LARGE BUSINESSES AS PRODUCT DISTRIBUTORS

Myriad small manufacturers rely on major mass merchandisers (regional, national, or international) to sell their goods. These distributors can dramatically raise a small business' fortunes in little time. But entrepreneurs seeking to establish such relationships will find that: 1) competition to secure a place on the shelves of major retail outlets is fierce; and 2) some mass merchandisers will be better suited for the small business' product than others.

Competition. The single most important factor in securing a distribution agreement with a major retailer is, of course, having a quality product. But small-business owners should attend to many other business matters every step of the way. After all, a mass merchandiser has plenty of product options; if a company stumbles at any point, many other competitors can fill space on the merchandiser's shelf. Given that reality, entrepreneurs must make sure that they have a dependable production/delivery operation in place. In addition, small-business owners should be prepared to provide prospective distributors with information on the firm's management and financial situation.

Compatibility. Entrepreneurs should concentrate their efforts on finding mass merchandisers that already sell to a demographic that will likely buy the new product. For example, an expensive home furnishing product is more likely to be compatible with an upscale retailer's offerings than a discount retailer's. Conversely, an inexpensive, commonly used product might be better suited to discount outlets.

LARGE BUSINESSES AS CUSTOMERS

Many small businesses count fellow businesses as significant or primary customers. Pleasing corporate clients is fundamentally akin to pleasing individual customers. As Richard Gerson observes in *Great Customer Service for Your Small Business*, "Much of customer service comes down to plain old common sense. Simply put, customer service involves everything you and your employees do to satisfy customers. "

However, corporate customers sometimes have different needs and priorities than do private individuals, and small businesses that do not recognize these differences are unlikely to provide appropriate service. For example, delivery deadlines are often far more important for businesses than they are for regular customers. Late delivery of a service or product could mean significant monetary loss for a corporate customer depending on that delivery to meet deadlines imposed by its own customers.

Small-business owners are painfully aware that the loss of a single corporate customer can be more harmful than the loss of a single retail consumer. Whereas businesses that serve the general public count many customers, establishments that cater to corporate clients will likely have far fewer customers. The loss of even one such client, then, can have a significant impact because of the percentage of total business that the customer represents. Finally, businesses that rely on corporate clients are more likely to encounter increased paperwork and bureaucracy to satisfy their clients' record-keeping requirements.

SMALL BUSINESS TECHNOLOGY TRANSFER (STTR) PROGRAM

The Small Business Technology Transfer (STTR) program is an initiative, coordinated and overseen by the Small Business Administration (SBA), to provide small businesses with greater access to funding in the federal innovation research and development arena. "Central to the program," notes the SBA, "is expansion of the public-private sector partnership to include the joint venture opportunities for small business and the nation's premier nonprofit research institutions. STTR's most important role is to foster the innovation necessary to meet the nation's scientific and technological challenges in the 21st century."

STTR is a parallel program to the Small Business Innovation Research (SBIR) program, and was created by Congress when it reauthorized SBIR in 1992. The STTR program is a cooperative research partnership between small business concerns and research institutions. It differs from SBIR in two ways. First, it places a greater emphasis on the potential for commercial success. This has spurred participating agencies to be more stringent in their evaluations of applicants. Secondly, it requires that universities, federal laboratories, or nonprofit research centers team with businesses to get product into the marketplace. These research partnerships between small businesses and nonprofit institutions enable participants to combine entrepreneurial initiative and creativity with the expertise, equipment, and other assets of nonprofit research laboratories.

STTR QUALIFICATIONS

In order to be considered for the STTR program, interested small businesses must meet several criteria. For instance, they must be American-owned and independently operated for-profit enterprises. In addition, the size of the company may not exceed 500 employees. There is no workforce size limit for participating nonprofit research institutions, but they must also meet certain parameters of the program. They must be principally located in the United States, and they must meet one of the following three definitions: nonprofit college or university, domestic nonprofit research organization, or federally funded research and development center.

Five federal departments and agencies the departments of Defense, Energy, and Health and Human Services, along with the National Science Foundation and the National Aeronautics and Space Administration are required by STTR rules to reserve a portion of their research and development funds for the program. As the distributors of STTR funding, they also designate those subjects suitable for additional R&D and determine whether to accept or reject STTR proposals.

These agencies make STTR awards based on the following factors: qualifications of the nonprofit research institution and its small business partner; degree of innovation; and future market potential. Small businesses that secure STTR funding are then routed through a three-phase program.

Phase One: Startup.. In this initial stage, awards of up to $100,000 are given to pay for approximately 1 year's worth of study and research into the scientific, technical, and commercial feasibility of an idea or technology.

Phase Two: Development. These awards, available to Phase One participants, reach up to $750,000 for 2 years. During this period, business/research partnerships engage in research and development work with an eye toward commercial potential.

Phase Three: Introduction to Market. During this phase, the completed project is introduced into the commercial marketplace to succeed or fail. No STTR funds support this phase. Instead, participants must secure funding from private parties or other federal agencies that do not allocate STTR monies.

Occasionally, an agency will award supplemental funding on top of the normal funding requirements for Phase One and Phase Two of the STTR program. Supplemental funding is meant to help maximize the work done between small businesses and institutional partners to commercialize a product or technology. For instance, the National Science Foundation offers Phase One supplemental funding up to $50,000 based on $100,000 of outside funding, or half the outside funding amount if less than $100,000. An applicant must have at least $40,000 in outside funding to qualify and must submit a separate proposal for the money.

Under the STTR program, a small business can keep the intellectual property rights of the products or technologies it develops alongside a institutional partner. Funding is competitive, although participating agencies have worked to streamline the process for applicants. For instance, the Department of Defense provides an online resource for potential STTR applicants that includes an overview of the program, solicitation announcements, and abstracts of successful proposals. Some agencies are willing to fast-track funding proposals they find "scientifically meritorious" and possess a high potential for commercialization. The Department of Health and Human Services offers a fast-track submission that enables small businesses to have both Phase One and Phase Two submitted and reviewed at the same time. Applicants are encouraged to remain in contact with agencies during the submission, review, and award portions of the STTR process.

More information on the STTR program can be obtained by contacting the SBA's Office of Technology in Washington, DC, or visiting the SBA's Web site at www.sba.gov.

SMALL BUSINESS-DOMINATED INDUSTRIES

The United States supports many industries that are dominated by or heavily populated with small firms. The majority of these are in the services sector, a fact that reflects the growing dominance of this sector in the overall U.S. economy. Industries that tend to be more easily entered tend to be favorable for small businesses. A need within some industries for heavy investment early on, as would be the case for somebody wishing to enter the cement manufacturing business, makes these industries less hospitable to the small business. According to the Census Bureau, industries with the greatest number of small businesses (employing 500 or fewer persons) include Healthcare and Social Assistance; Accommodation and Food Service; and Retail Trade. When it comes to industries in which the small business plays a dominant role, the U.S. Small Business Administration (SBA) reports that the fastest-growing such industries are:

1. Employment Agencies
2. Real Estate
3. Automotive Dealers and Service Stations
4. Building Materials and Garden Supplies
5. Automotive Services, Except Repair
6. Millwork, Veneer, and Plywood Manufacturing
7. Paint, Paper Hanging, and Decorating
8. Meat Markets and Freezer Provisioners
9. Retail Stores
10. Agricultural Services

These industries are expected to see continued growth over the coming years, as increasing numbers of small businesses enter the marketplace. But many analysts, citing studies conducted by the SBA's Office of Advocacy, believe that some other industries friendly to small business are poised for even greater growth. Indeed, statistics compiled by the SBA, the Department of Labor, the Bureau of Labor Statistics, and *Monthly Labor Review* indicate that high rates of growth can also be expected in such business areas as residential care, collection agencies, child day care services, travel arrangement services, equipment rental companies, accounting and bookkeeping services, public relations, and family services.

Residential Care. Residential care encompasses a variety of facilities, including those devoted to caring for emotionally disturbed adolescents and mentally retarded individuals. However, government data indicates elder care will grow the most. Analysts expect growth in assisted-living facilities which range from domiciliary care homes and personal care homes to adult congregate living facilities to drive this industry as the U.S. population ages and workers explore various elder care options. As affluent consumers purchase more long-term care insurance for their older parents, assisted living facilities stand to gain. In fact, many financial advisers suggested increasing savings for long-term care as a result of shrinking assets and rising health care costs.

"These facilities," writes Jenny McCune in *Journal of Business Strategy*, "are a bridge between traditional nursing homes, which offer round-the-clock, skilled medical care in an institutional setting, and independent retirement housing, in which residents receive no outside help. In assisted living, the elderly live as independently as possible usually in suites or cottages but also have access to meal and laundry facilities and get assistance with daily chores such as bathing and dressing." Business consultants and current participants in the industry warn, however, that while demand for these services will continue to grow in the coming years, entrance into this business area is costly.

SELECTED HIGH GROWTH INDUSTRIES FOR SMALL BUSINESS

The child-care services industry has enjoyed steady growth for a number of years, due to population increases and the growing presence of women in the business world. And as McCune notes, the popularity of child-care facilities in recent years has also been driven by the increased professionalism of the industry, as evidenced by the development of accreditation standards. The sheer demand for child-care services is expected to ensure the continued health of many businesses engaged in this area for years to come, but entrepreneurs should be aware of the hazards that lurk here as well. Business experts note that concerns about child welfare have sparked increased calls for regulation of the industry by OSHA and other government agencies, and that participants face a host of competitors. Competition to for-profit centers may include nonprofit centers sponsored by religious organizations, local Head Start programs, family members, caregivers who work in the home, and after-hours programs run by local elementary schools. Finally, professional day care centers have to grapple with liability issues, encroaching involvement of larger firms, and historically high levels of turnover both among clients and employees.

Collection Agencies. The surge in credit availability in American households has sparked a corresponding increase in demand for businesses willing to pursue collections for clients. As one industry participant tells *Journal of Business Strategy*, establishing a business in this area is attractive to some entrepreneurs "because the cost of entry is low someone can start out with a phone and a personal computer in a spare bedroom and clients generally accept smaller vendors." Another business owner in the industry observes that effective collection agencies will particularly benefit from increasing demands from clients such as credit card companies; doctors, lawyers, and other professionals; and health care firms. Moreover, many observers believe that privatization initiatives by local, state, and federal government agencies will provide collection agencies with additional business.

The strength of the economy is equally important to the health of collection agencies, especially those that collect overdue debts. In 2010 some 44 percent of the country's 15 million jobless residents were unemployed for longer than 6 months. Joblessness, and the resulting inability of people to meet financial obligations, can be an opportunity for collection agencies that work with consumers to construct plans to pay back debt, particularly for those who eventually get reemployed.

SMALL CLAIMS COURT

Small claims court is a legal court of law designed to resolve disputes involving relatively small amounts of money in an expeditious manner. Unlike other legal courts, small claims court does not operate by formal rules of evidence, and attorneys are not usually employed to plead such cases. Instead, plaintiffs and defendants appear before the court and present what evidence they have and their perspectives on the dispute. The court makes a judgment based on the evidence presented. Claims made in small claims court typically involve consumer purchases, landlord tenant relations, unpaid obligations and bills, and other types of property disputes. Small businesses occasionally go before small claims courts when the magnitude of the claim that they pursue fits the court's parameters. This form of litigation has the lowest costs. Unfortunately it is occasionally difficult to enforce the court's rulings.

CHARACTERISTICS

All fifty states and the District of Columbia have small claims courts or equivalents. In Delaware the function is performed by the Justice of the Peace, in Georgia by the

Magistrate Court, and in Mississippi by the Justice Court. In all other jurisdictions a small claims court structure exists. As the name of this institution suggests, such courts limit the size of the claims that they will adjudicate. In twenty-one states, the maximum claim permitted in 2009 to be brought is under $4,500; the highest is in Maine ($4,500) and the lowest in Kentucky ($1,500). In sixteen states the claim is fixed at no more than $5,000. In fourteen states the claim may be higher, averaging $8,875, the lowest being in Oklahoma ($6,000) and the highest in Delaware, Georgia, and Tennessee ($15,000; $25,000 in Shelby and Anderson counties, Tennessee).

HALT (Help Abolish Legal Tyranny), which describes itself as "an organization of Americans for legal reform," provides on its Web site capsule descriptions of the characteristics of small claims courts in every state. Their descriptions are offered under a nine-rubric structure: 1) applicable statutes; 2) dollar limits; 3) where to sue; 4) service (how notice of a proceeding is brought); 5) hearing date from time of filing; 6) attorneys (permitted to participate or not); 7) transfer (of the case to another court); 8) appeals available; and 9) special provisions most importantly whether or not the court will assist the successful claimant in collecting his or her judgment.

Winning a trial in small claims court does not necessarily mean a plaintiff earns the maximum payout. When a San Diego gourmet cook took an appliance maker to small claims court in 2009 over a faulty oven, he had hoped to win maximum damages of $7,500. Instead, he won $300 and an extended warranty too small a judgment, said the chef, for his time and effort. Raising limits on damages has both supporters and critics.

"These battles aren't always between a small good guy and a big bad guy. If a poor person or a struggling business lost a $20,000 judgment, it would feel a financial tsunami," wrote Michael Stetz in the *San Diego Union-Tribune*. "That's why some consumer and legal protection groups are leery of raising the limit."

Nonetheless, dollar limits have risen in recent years, making small claims court an attractive venue to small businesses for resolving disputes and collecting debts. While bill collectors and attorneys may keep up to half of a collected debt as their fee, small claims court allows a small-business owner potentially to collect 100 percent (plus additional damages in some cases). These courts are so effective that more than 60 percent of all cases filed are by businesses.

Appearing as a Plaintiff. Most small-business owners who appear in small claims court as plaintiffs do so because they are having difficulty securing payment for some product or service that they have provided to the defendant. To file a small claims action, the owner needs first to find out if he or she has a case that can even be heard in the state's court. If the size of the claim fits, the owner can check with the local county clerk's office for information on procedures for bringing suit. Again, guidelines vary from state to state, although the basic setup is consistent. The plaintiff also needs to file the claim in the jurisdiction where the defendant resides.

Once the business owner is familiar with the basic procedures, filing can proceed. This is a fairly basic document, usually only one page in length. The document briefly delineates the reasons for the suit. Also known as a summons or complaint, the document should describe the dispute; the time, date, and location that it took place; names of witnesses (if any); and desired compensation. The plaintiff should also try to name the defendant as accurately as possible when filing. The filing should name the actual corporate entity rather than, for instance, some brand name or "doing business as" designation under which the defendant operates. When the complaint has been filed, the court clerk will inform the plaintiff when the case will be tried. A filing charge is typically levied.

In the weeks leading up to the court date, the plaintiff needs to gather whatever evidence is available to bolster his or her claim, including photographs, written agreements, itemized bills and invoices, written cost estimates for service or repairs, receipts, canceled checks, and other correspondence.

Appearing as a Defendant. When a small-business owner receives notice of claim (this is usually sent by both certified and first-class mail), he or she should study the summary of the plaintiff's claims, the amount being sought, and begin preparing for the trial date (which is also included in the notification). If the copy of the claim sent by regular mail is not returned to the court as undeliverable within 21 days, it is assumed that the defendant has received the notice.

Once notified, the defendant can either settle the matter before the trial date or begin preparing for the case by gathering all favorable evidence available (itemized bills or invoices, written agreements, etc.). Untrue claims must be denied unequivocally. If the facts are true, the reasons for failing to pay must be argued with appropriate factual backing. The defendant may also make counter charges and files these in the process of answering the claim. The time frame for accomplishing all this is set by state law and will not be uniform across the nation.

RESOLVING CASES

Small claims court cases are resolved by trial, arbitration, settlement, or default judgment.

Trial. This is the method that is most familiar to most Americans. Under this arrangement, the plaintiff makes his case, the defendant offers a rebuttal, and the presiding judge makes a judgment based on the evidence presented by both sides. If either the plaintiff or the defendant is unhappy with the judge's verdict, he or she can file an appeal. This step is rarely taken, however, because of the added expense involved (filing an appeal is more expensive than filing an initial claim, and it sometimes requires soliciting the services of an attorney).

Arbitration. If both sides agree, the dispute can be resolved by way of arbitration. Arbitration is typically conducted immediately and is less formal than a trial, but no appeal from an arbitrated decision is available to either party.

Settlement. Plaintiffs and defendants also have the option of settling the case out of court prior to the trial. Out of court settlements, of course, are simply yet another commercial agreement, and if not formulated in a properly binding manner, enforceable in the courts, the settlement will be meaningless unless, of course, it takes the form of a cash payment on the spot.

Default Judgment. A default judgment also sometimes referred to as a liquidated complaint can be handed down in the event that one of the sides involved in the dispute does not appear at the scheduled trial time. In such instances, the judge is presented with the evidence provided by whichever side is present. If the person adequately proves his or her case, a default judgment for the amount claimed is entered, or (in instances wherein the plaintiff does not show up) the case may be dismissed.

COLLECTING MONEY THAT IS OWED

Winning a case in small claims court does not necessarily mean that the dispute has been wholly settled. Certainly, if the small-business owner mounts a successful defense of a claim, then he or she can return to his business secure in the knowledge that the affair is over. But if the small-business owner was a successful plaintiff, he or she still needs to make sure that the amount owed is turned over. The problem of collections, as HALT points out, is that "In most states, small claims courts can only award money damages. Small claims courts cannot issue court orders that require someone to 'cease and desist' from actions that harm others. This limitation means that many small disputes between neighbors or over contract rights cannot be dealt with in small claims court." Thus where money is at issue, the small-business person should first carefully study the applicable state law and, if it is unfavorable to collections, pursue his or her claim in regular court.

SMOKE-FREE ENVIRONMENT

The term smoke-free environment is sometimes used indiscriminately to discuss both 100 percent smoke-free areas as well as segregated and ventilated areas. A truly smoke-free environment in a business is one in which no smoking is allowed within any company building or vehicle. Depending on the company, smoking may be permitted in certain outdoor areas designated for that purpose. In other companies, the smoke-free policy prohibits smoking on *any* company property. Employees who smoke must abstain from smoking while at work or must leave company grounds to smoke. Other companies allow smoking in special rooms or areas dedicated to that purpose. For smoking areas within the building, a special and separate ventilation system must be installed in order to prevent smoke from leaking into other areas of the structure.

As of 2010, the states of Arizona, California, Colorado, Hawaii, Illinois, Iowa, Kansas, Maine, Massachusetts, Michigan, Minnesota, Montana, Nebraska, New Jersey, New Mexico, New York, Ohio, Oregon, Rhode Island, Utah, Vermont, Washington, Wisconsin, and the commonwealth of Puerto Rico all have smoke-free laws that apply to workplaces, restaurants, and bars, according to the American Nonsmokers' Rights Foundation. In addition, there are many nonsmoking cities and municipalities in states that do not have nonsmoking laws across the board. Some of these include cities in Texas, Florida, Alaska, Alabama, South Carolina, Georgia, and Kentucky. That said, as of 2010 all states with the exception of

Michigan and Vermont allow hotels and motels to allot a certain amount of rooms as smoking rooms.

With regard to smoking issues, the Centers for Disease Control and Prevention (CDC) and other health organizations are focused extensively on reducing the number of nonsmokers exposed to environmental smoke. There are specific objectives to increase the number of work sites that have smoking restrictions, and to address Environmental Tobacco Smoke (ETS) in more restrictive, clean indoor air laws. According to the CDC, the existence of smoke-free work environments will increase the likelihood that affected employees will either reduce or eliminate cigarette use, at least during the hours they are at work.

DEVELOPING AND IMPLEMENTING A SMOKE FREE WORK ENVIRONMENT

In addition to its impact on employee health and welfare, there are a number of costs associated with smoking. According to the Campaign for Tobacco-Free Kids (tobaccofreekids.org), the total annual public and private health care expenditures caused by smoking is $96 billion. This means that in the private sector, small-business owners that offer health insurance to their workers will be footing the bill for any number of smoking-related illness, including lung cancer, emphysema, and other chronic respiratory diseases.

Despite the desirability of reducing the incidence of employee smoking, the implementation of a smoke-free workplace policy needs to be considered carefully. Between the 1960s and the 1990s, the number of smokers in the United States dropped steadily. However, the number leveled off during the 1990s, despite increased numbers of smoke-free work sites. Smokers have rights too, as has been proven by litigation attempts; that said, the argument against smoking, especially where others may be involuntarily subjected to smoke, is steadily gaining recognition with many millions of proponents for nonsmoking restaurants, bars, and workplaces. Human resources director Arthur Friedson, quoted in *HR Magazine*, stated that developing a smoke-free policy rooted in "the basic respect of one co-worker to another" can be most successful, from both an ethical and a legal standpoint.

Prior to establishing a smoke-free policy, a company should investigate any existing local and state laws on smoking. Despite highly publicized trials and settlements between the federal government and tobacco companies, there is no federal oversight with respect to the institution of a smoke-free environment. *HR Magazine* quotes a figure of over 560 local governments which have enacted ordinances dealing with the rights of nonsmokers. These tend to be stricter than state laws and generally address smoking in public areas such as restaurants, grocery stores, and malls.

On the other side, a careful review of Occupational Safety and Health Administration (OSHA) regulations, protections under the Americans with Disabilities Act (ADA), and state and local law with regards to the rights of smokers and nonsmokers is also warranted. Litigation in which a smoker claims that his or her addiction to tobacco is a disability covered by state and federal laws has occurred with more frequency, although not usually successfully. However, given that any litigation, successful or not, is an enormous burden both financially and emotionally for a small business, it is important to proceed carefully. Small-business owners should work closely with their lawyers to determine applicable laws and regulations.

The most important factor in creating a smoke-free business environment is having a solid understanding of the workforce. By factoring in the needs of each employee segment, smokers and nonsmokers, and achieving some "buy-in," a small business can reduce or avoid problems down the road. From the very beginning, the involvement of individual employees (again, smokers and nonsmokers alike) in the development of a nonsmoking policy is crucial. A company should be supportive of employee efforts to stop smoking as well. Many businesses have found the investment in or reimbursement for smoking cessation programs and tools to be money well spent. Some companies even provide a monetary award to successful quitters.

Once a small business has developed its nonsmoking policy, it should provide early notice of the policy, prior to implementation. This allows employees to consider the consequences of behavior and, if need be, to make efforts to quit smoking. At this time, the company should also publicize any assistance in quitting smoking, such as a cessation program or monetary rewards. It may be more successful to implement a smoke-free policy in stages. For example, smoking might first be restricted to a designated area, then eliminated from company property entirely. However, the success of gradual implementation can vary from workplace to workplace.

Once established, a small business's smoke-free environment should also take into account new employees. While there are no laws prohibiting discrimination against smokers, questioning prospective staff as to their smoking habits is ill advised. Not hiring smokers may be defensible for an organization such as the American Cancer Society but not for most small employers. A more acceptable position is to alert candidates at the time of the interview to the small business's nonsmoking policy and its associated standards of acceptable behavior.

Finally, it is especially important for a small business to revisit its smoking policy regularly, along with other human resources policies. Local, state, and federal laws and regulations are in a constant state of flux over this

issue. It pays to review these laws regularly and in conjunction with a legal advisor. The burden of litigation over such issues is a heavy one for a small business to bear. In addition, a shifting employee population may make some changes necessary. Seeking input from employees helps to both promote and refine the policy.

EFFECTS OF A SMOKE FREE ENVIRONMENT ON CUSTOMERS

The implications of a smoke-free environment in small businesses such as restaurants, bars, and shops also extend to customers. For these types of businesses, local and state laws and regulations may also be more straightforward. Many states and municipalities already limit or eliminate smoking in the public areas of these businesses. In the state of California, for example, no smoking is permitted in any public establishment. California lawmakers alerted the public of the change 6 months prior to implementing this legislation to allow businesses time to address the issue in their workplace policies and to provide consumers with time to get used to the idea. There also may be legal issues to consider. According to an article in *Business-First Columbus*, the National Restaurant Association states that employers can be held liable if staff members become ill from secondhand smoke.

If the institution of a smoke-free environment at a small business is not tied to any governmental regulations or requirements that are already known by the general public, a small business should consider giving advance notice of the new policy to their customers. A simple posting at the door as well as personal verbal or written notice to regular clients can go a long way to ensure customers' responsiveness and compliance. Finally, in cases where customers ignore the policy, it is important to administer it courteously but consistently, even at the risk of losing those customers.

The implementation of a smoke-free environment is a complex process for any small business. By using legal counsel to wade through the maze of pertinent laws and regulations, working with employees to develop a policy, and communicating the policy regularly to both employees and customers, a small business can ensure its efforts are successful.

SOCIAL ENTREPRENEURSHIP

Social entrepreneurship refers to the use of market-driven models of business to influence fundamental changes to prevailing circumstances that are of social or environmental concern. Social entrepreneurship involves achieving a delicate balance between spreading the benefits of a venture to as many people as possible and making reasonable profitability at the same time. Income earned through social entrepreneurship is usually tied to an individual or organizational mission whereby earnings

are reinvested towards the implementation of existing and future societal needs rather than being distributed to the owners of a social enterprise.

The profitability aspect is what makes social entrepreneurship different from donor-dependent nonprofit organizations because the survival of social enterprises is usually dependent on accumulation of sustainable financial resources rather than relying on grants and donations. For example, a social enterprise that provides microfinance to small-scale business may apply extremely low interest rates so as to make the loans affordable to poor populations but still raise enough profit to support operations and revolving funds. In simple terms, therefore, social entrepreneurship involves the provision of scarce social goods or services through a blend of both social and financial returns.

Social entrepreneurship in its broadest sense is considered to be an essential driving force behind continuous innovation and socioeconomic progression. The practice provides innovative and socially responsible individuals with the opportunity to seek solutions for specific problems afflicting a society by changing or fixing systems that are not working as desired. Social entrepreneurship is usually informed by the objective to spread the benefits of an innovative, socially supportive enterprise to as many people as possible. The achievement of optimized results for social development initiatives demands the generation and application of widely acceptable and realistic ideas for solving inherent societal problems.

The entire process of social entrepreneurship often involves the introduction of improvements to existing service delivery systems, the invention of new poverty eradication approaches, and the creation of sustainable solutions to social problems. Innovation features prominently when designing, developing, and implementing new programs with unique characteristics. Social entrepreneurship can be practiced through various social institutions, disciplines, or professions such as education, microfinancing, health, agriculture, trade, manufacturing, or mass production. Some of the unique characteristics of social entrepreneurship include:

- Pioneering of change at a time of desperate need
- Responsiveness towards the specific needs of specific communities without having to shift priorities
- Scalability for gradually adjusting to the growing needs of a society as well as its own revenue and investments growth
- Active engagement of relevant stakeholders affected by social enterprise initiatives

DIFFERENCES BETWEEN SOCIAL AND BUSINESS ENTREPRENEURSHIP

Social entrepreneurship differs from business entrepreneurship with respect to the impact and distribution of the benefits of an enterprise. Basically, a social entrepreneur attempts to spread equitably the benefits of an individual or collective initiative to as many people as possible. In contrast, the benefits of a business entrepreneur are restricted to the immediate beneficiaries of the individual or individuals behind a business initiative. Moreover, the achievement of lasting fundamental changes to systems characterized by inequities is the core motivation of social entrepreneurship while business entrepreneurship is solely motivated by advancement of economic status.

Unlike the market-driven value creation that is characteristic of business entrepreneurship, value creation of social entrepreneurship is centered on systematic and lasting transformation of the societal fabric while focusing on the need of disadvantaged or marginalized populations. Nonetheless, despite the obvious differences between social entrepreneurship and business entrepreneurship, the two forms of activities share similarities in terms of orientation and design. The nexus between social entrepreneurship and business entrepreneurship is identifiable in the creation of economic growth opportunities and the pursuit of advancement through consistent innovation.

According to information contained at the *Social Enterprise* magazine Web site (www.socialenterpriselive.com), social enterprises can further be categorized either under medium-growth social enterprises or high-growth social enterprises. Medium-growth social enterprises are premised on the primary objective of providing solutions to prevailing social or environmental problems from a long-term perspective. Such social entrepreneurship initiatives rely on earned income generation strategies that span a long period of time.

High-growth social enterprises, on the other hand, are modeled along the structural foundations of venture capital investments defined by a focus on the achievement of break-even point and profit generation within a stipulated period of time, usually not exceeding 5 years. Such social entrepreneurship initiatives are designed to focus on simultaneous achievement of social and financial returns on investments over a short time span. High-growth social enterprises draw investment interests mainly from socially oriented venture funds and venture capitalists seeking opportunities to post both social and financial returns on their short-term investments.

SOCIAL ENTREPRENEURS AS AGENTS OF SOCIAL CHANGE

Social entrepreneurs are individuals committed to the search and delivery of solutions to various problems facing

society. Social entrepreneurs use both inspirational and innovative approaches designed to alleviate persistent problems that derail prosperity and development in societies. To this end, social entrepreneurs use innovation as a strategy to infiltrate societies with influential socioeconomic development ideas so as to be able to sustain and continuously expand a social enterprise through earned income.

Social entrepreneurs represent the major driving force for effecting positive change in society through the exploitation of opportunities that remain largely underestimated or underutilized. Some of the unique characteristics of social entrepreneurs include continuous dedication to innovative ideas; commitment of one's life to the transformation of societal ideals; and the ability to adopt sustained visionary and realistic approaches to social problems. To this end, a social entrepreneur should always articulate ethically correct and understandable ideas capable of eliciting massive interest and support from the majority of the local people affected by the establishment of a particular social enterprise.

There are several social entrepreneurs who are recognized and highly respected around the world for their outstanding innovative contributions towards solving many problems facing their respective societies. Muhammad Yunus, Bunker Roy, and Ann Cotton are three exemplary social entrepreneurs who achieved lasting social impacts in their respective communities.

Muhammad Yunus. Muhammad Yunus (b.1940) transformed the microfinancing industry in Bangladesh by opening up the opportunity for microloan programs for the country's poor populations. Yunus began his microloan programs in 1976 when he designed a unique model for extending small loans to people who languished in poverty due to lack of affordable financial borrowing opportunities. He founded the Grameen Bank and used it as a channel to reach out to millions of poor people in Bangladesh who lacked access to affordable credit opportunities.

Grameen Bank underwent tremendous growth over the years and its customer numbers had risen to 3.5 million in 2010. Women constitute more than 95 percent of the bank's borrowers, a situation that demonstrates its commitment to its founder's mission of helping the poor help themselves. Grameen Bank also enjoys a strong financial self-sustainability and employs more than 12,000 people.

The unique microcredit initiative of Yunus was largely motivated by the desire to reduce rampant poverty in the rural populations in Bangladesh by transforming societies through sustainable economic empowerment. Yunus was awarded a Nobel Peace Price in 2006 in recognition of his exemplary efforts, fortitude, and passion to eradicate poverty in society, and for his unique model of microcredit financing that has since been replicated all over the world.

Bunker Roy. Bunker Roy (b. 1945) scaled his innovative ideas to form the Barefoot College in Tilonia, Rajasthan, India, an informal tertiary institution that provides adult education to rural populations. Roy's ideas were premised on the need to eradicate poverty by equipping illiterate people with employable skills following his observation that many people were denied access to employment due to lack of education.

Over the years, Barefoot College was gradually transformed into a formal tertiary institution that provides training in various categories of professions such as engineering, teaching, social work, and community health. Graduates from the Barefoot College have been instrumental in integrating social change in rural communities throughout India. The installation and maintenance of solar-powered electricity systems in more than 500 villages in India is one such conspicuous achievement made by engineer graduates of the college.

Ann Cotton. British citizen Ann Cotton (b. 1950) was the central force behind the formation of the Campaign for Female Education (CAMFED) organization. Cotton founded the organization in 1993 with the guiding objective of extending sustainable educational opportunities to female African children. With a presence in countries such as Ghana, Tanzania, Zambia, and Zimbabwe, CAMFED particularly targeted young girls from poor families in rural areas who were unable to raise school fees and other educational resources.

The organization has in place a system that supports the education of girls at different stages until that point where they are trained to run small businesses so that they get to return to their communities as employable individuals and responsible leaders. As of 2010, CAMFED had successfully provided educational opportunities to approximately 700,000 female children enrolled in about 3,000 schools, particularly in countries in Sub-Saharan Africa. The organization had also trained more than 5,000 young women entrepreneurs.

Other notable social entrepreneurs who pioneered fundamental transformation of their societies include:

- American naturalist John Muir (1838 1914), who is credited with establishing the system of national parks through his advocacy of environmental conservation. Muir also contributed his efforts and ideas towards the foundation of the Sierra Club.
- Susan B. Anthony (1820 1906), whose struggle for the rights of women in the United States contributed immensely to securing women the right to vote.

- British nurse Florence Nightingale (1820 1910), who is credited with having founded the nursing profession. In addition to establishing the first nursing school, she was responsible for fighting for an improvement of service and working conditions in hospitals.
- Italian physician and educator Maria Montessori (1870 1952), who developed a unique style of leaning for schoolchildren at the early childhood stage of education, famously referred to as the Montessori Approach.
- French businessman and bureaucrat Jean Monnet (1888 1979), who was instrumental in establishing the European Coal and Steel Community (ECSC), a social enterprise organization that made an immense contribution to the post-World War II economic integration of Europe.
- Indian human rights activist Vinoba Bhave (1895 1982), who pioneered the formation of the Land Gift Movement and used the organization to champion the land ownership rights of the low-caste communities in the country. According to information contained in the Ashoka Web site, Bhave influenced the redistribution of seven million acres of lands to the poor and landless people in India.

The above examples of social entrepreneurs provide vivid pictures of what social entrepreneurship really entails. The evaluation of the impact of social entrepreneurs in a society focuses on the outreach of the benefits of a social enterprise and its financial resource sustainability. However, the need to spread social good rather than profit making should always be the guiding objective of any social enterprise.

Notably though, social entrepreneurship is not limited to particular high-profile individuals in societies. Some nonprofit organizations around the world have also been very successful social entrepreneurship agencies. Nonprofit organizations contribute to the socioeconomic well-being of societies through active involvement in the initiation, implementation, and management of programs that address the needs of disenfranchised populations. For example, Pioneer Human Services (www.pioneerhumanserv.org) is a nonprofit organization that successfully utilizes social entrepreneurship approaches to create a positive and sustainable impact on people's lives around the world.

However, a nonprofit organization can only assume the role of social entrepreneurship through the generation of income from its activities. Earned income is what enables social entrepreneurs and nonprofit organizations to achieve sustainable self-sufficiency.

FINANCIAL SELF SUFFICIENCY AND THE POTENTIAL OF EARNED INCOME

Earned income is the main source of operational and strategic capital for social enterprises. Earned income refers to payment collections for services or products rendered by a social entrepreneur or social enterprise that may be presented in the form of membership fees, subsidized interest rates, consultancy fees, rent collections, or the sale of intellectual properties, for example.

Earned income is the most preferred method employed by social entrepreneurs in the process of asserting self-sufficiency and financial sustainability of their social development initiatives. Indeed, earned income propels the mission of social enterprises without having to rely on donations or grants. In addition to leveraging the flow of funds from the private sector, earned income also enhances the management of the overall profit generation capacity of social initiatives.

Payment of subsidized fees for services rendered or tuition programs stand out as the preferred channels for generating earned income. However, social enterprises can also rely on the income potential of other entrepreneurial channels such as development and sale of unique software products, real estate, retailing and product distribution, or horticulture.

Other alternative sources of financing for social entrepreneurship include service fees or product profits from members of a target population; partnerships with governmental, nonprofit, or corporate organizations; social venture investors; venture capitalists; and angel investors.

STRATEGIES TOWARDS VALUE CREATION FOR SOCIAL ENTREPRENEURSHIP

Creation of social and economic value is the primary objective of social entrepreneurship. The objective is pursued through what is largely perceived to be business modeling for social purposes. The creation of a business for social purposes is premised on the guiding principle of achieving social good for needy populations in given localities. The need for social entrepreneurs to attain financial self-sufficiency has created increased interest in income diversification through the adoption of social purpose business models. Nonprofit organizations particularly use the social purpose business models to enhance their potential of generating earned income. The successful value creation in social entrepreneurship is dependent on several factors, including self-sustenance, value networking, and focus on the target population.

Creating Social and Economic Value through Self-Sustenance. The design and implementation of social entrepreneurship ideas is synonymous with the indefinite generation of earned income to support the perpetual

existence of a social enterprise. Self-sustenance of social enterprises relies heavily on their successful incorporation of the double bottom line principle. Double bottom line defines the ability of a social enterprise to create social value and economic value simultaneously.

The functional structures of a social enterprise should always be designed to meet the minimum recommended benchmarks for achieving perpetual financial and operational sustainability. The resource acquisition and allocation strategies that are adopted by social entrepreneurs should always reflect the potential of creating multiple and reliable streams of income. The strategic approach to resource management enables social enterprises to integrate appropriate measures for exploiting and optimizing earned income opportunities. This is achievable particularly when social entrepreneurs look inward into the potential of a social enterprise to create social and economic value simultaneously.

Sekem, a social enterprise founded by Dr. Ibrahim Abouleish (b. 1937) in Egypt, facilitated the perpetual pursuit of its mission of social, economic, and environmental development through the gradual establishment of six companies over a period of 27 years. Sekem runs different social enterprise activities such as community-based packaging and distribution of herbs and horticultural produce to manufacturing companies in Egypt. In a bid to enhance its earned income opportunities, Sekem diversified into education and cultural development. Therefore Sekem observes financial self-sufficiency through the optimization of tuition-based earned income from its educational institutions that include kindergartens, an adult training institute, and community-based medical center.

However, tracking and measurement of economic value creation of social enterprises has remained a big challenge, especially in the nonprofit sector. The persistent challenges are attributable to the lack of clear metrics for measuring the impact and performance of social business. Nonetheless, social returns on investments (SROI) can be used to derive estimations of the social and economic impacts of a social enterprise. SROI is a tool for deriving relevant nonfinancial ratios that measure the impact generated by a social investment initiative relative to the guiding mission of a social enterprise. Therefore, the impact of social entrepreneurship on the well-being of societies can be observed and quantified accordingly in terms of the success or failure of social development initiatives. The analytic details of SROI serve as a reliable reference for measuring value creation as well as eliciting social investor interest or financial support for a social enterprise.

Creating Socioeconomic Value through Networking. The creation of value networks in social enterprises aims at advancing the visionary orientation of a particular enterprise by focusing on both the internal and external resource networks. The networking aspect particularly facilitates social entrepreneurs in the process of creating value-oriented partnerships with other organizations pursuing social improvement programs. Value networking among social enterprises is the equivalent of a value chain network in the business industry. The optimization of social and economic value by social entrepreneurs involves proactive approaches in the creation of self-initiated value networks. Value networks target not only other social entrepreneurs and enterprises with related visions but also members of the society where social entrepreneurship initiatives are targeted.

One good example of a social enterprise that utilized the networking strategy right from its inception is the Escuela Polítecnica Professional in Spain. The technical training tertiary institution was established by a priest to provide technical education to local students in Mondragon, Spain, who could not afford the high costs of high-level tertiary institutions in the country. The idea of the founder to establish the Escuela Politécnica Professional as a cooperative paid off as the core mission of the educational institution became easily identifiable to the missions of other cooperative societies. Therefore, the community polytechnic was able to create a formidable network of its own in addition to enjoying the value chain network of the cooperative industry. As a result, an institution that started off as a simple social enterprise experienced fast rates of growth to become the Mondragon Corporation Cooperative. The entity diversified into other fields of social enterprises that included manufacturing and retailing and also established a global branch network consisting of thirty-eight mass production plants.

Channeling Socioeconomic Benefits to the Right Target Population. Channeling socioeconomic benefits to the right target population is essential to the implementation of a mission. In business terms, it involves the creation of a relevant customer interface through which products or services are relayed to the target market through the appropriate channels. Therefore, the creation of social and economic value by a business enterprise should subsequently be followed by the transfer of the created value to the population targeted by a particular social entrepreneurship initiative.

The effective transfer of social and economic value created by social entrepreneurship is best achieved through a strategic pursuit designed to harness gradual collaboration of the target populations right from inception of an idea. Such a participative approach enables social entrepreneurs to enhance the integration of needs of the members of the target population into the value network that defines a particular society.

Grameen Bank is one such social enterprise institution where channeling of social and economic benefits to the right target population works so well. The fact that women constituted 95 percent of the bank's 3.5 million borrowers in 2010 is a clear demonstration that the bank targets poor women in Bangladesh who require financial assistance to establish small-scale business enterprises.

USE OF THE INTERNET AS A CHANNEL FOR SOCIAL ENTREPRENEURSHIP

Globalization and the continuous advancements in information technology have taken the subject of social entrepreneurship into cyberspace. A combination of Internet and Web 2.0 tools such as blogs, e-mail groups, video conferencing, and online communities have given rise to virtual social entrepreneurship teams. Members of such virtually connected teams share ideas on how to develop appropriate and innovative solutions to various social problems experienced in different parts of the world. E-mail groups and online communities have particularly been very effective in stitching together different entrepreneurial ideas targeted at improving the social well-being of the impoverished and marginalized populations. Social entrepreneur campaigns launched by Yahoo! and by the Canadian Social Entrepreneurs are some examples of social entrepreneurship initiatives that utilize cyberspace. Other online resources on social entrepreneurship can be found at Seven Fund (www.sevenfund.org) and Ashoka (http://ashoka.org).

SOCIAL MEDIA, COLLABORATION TOOLS

Social media is a term that covers the tools used by businesses to reach customers and connect employees through online social networking. Social media strategies have only become possible in the last several years, as online technologies have grown to meet the communication demands of individuals and companies. The advance of online connections and organizations is known as Web 2.0 or, when applied to business strategy, Enterprise 2.0.

Social media involves many different tools and techniques to communicate messages, but at its heart is the social network. On an individual level, social networks like Facebook and Twitter allow people to create profiles,

connect with friends, and join groups where they can discuss common interests. Businesses use social networks in similar ways but apply them to work projects. Sometimes they use existing social networks, and sometimes they create their own applications for employees to use on secure company intranets.

Within the business, social media is used most often collaboratively, providing employees with the tools they need to access resources together and work on projects simultaneously. Another term often used is cloud computing, which describes an approach to business networks where resources are distributed as needed and applications are used by employees in one cohesive structure. Which particular social media tool is used for a collaboration depends on the business and its goals.

Forums. Forums are pages that small businesses can create to start discussions on a variety of topics and allow their customers and employees to ask questions or post comments. Once members have joined, they can view other posts, answer questions, and continue conversations that have already begun. Forums are a useful way for businesses to explain questions that are frequently asked, or explain complicated processes in detail as part of employee training. As part of the business's Web site, forums should fit in with the overall Web design but also be scalable. When a small business first begins, there may be only a few dozen employees who join as forum members, but as the business experiences growth and opens new branches, the number of members may increase beyond the abilities of the original Web structure. Forums, along with other online software, should be built to host an increasing number of members easily.

Wikis. Wikis are online resources that gather information about a number of topics. Wikis are well known for their open access: anyone can view pages and edit them to include updated information. Business wikis work in a similar manner, but they are focused on specific topics and are typically edited in two different ways. Some wikis are resources which employees can access to learn more about business policy and procedure. These wikis are usually edited by management, human resource employees, and others in charge of training. Other business wikis are used to exchange information on different projects. In this case, they are edited by members of the team. Neither type of wiki is available to the general public, since businesses keep them solely on intranets.

Life Cycle Management. Some social media tools are designed to help employees complete projects that require many steps. These tools are very common among service-oriented businesses that need detailed life cycle management applications. Employees are able to enter the program, timestamp their work, and pass many different types of documents along to other employees for questions or further work. Most applications come with the ability to tag other employees who need to look at project information or add work, including them in updates and allowing them to access necessary files. These programs tend to be more expensive and complicated than the more simple wikis or document editors.

Comprehensive applications that combine project life cycles with chat, e-mail, videoconferencing, and other features are known as groupware. Groupware is designed especially for businesses that have a high number of employees working on the same project at the same time. Everything needed for the workflow coordination and data sharing is included in groupware. Groupware applications can be either synchronous or asynchronous. Synchronous versions are real-time, updating constantly to show employees what changes are being made as they happen. Asynchronous programs usually require that a user refresh or log back into a system to see the changes.

Document Editors. Document editors are like life cycle management applications but are usually more simple. They appeal to a much wider range of businesses, including those that need to print out a frequent number of reports, letters, or invoices. Since these systems are more simple, they are often used by only a single department of larger companies, such as marketing or accounting. Employees create a document in the application, then exchange edits in a constant revision process until the document is completed. Similar tagging features allow workers to add new participants onto projects in the same way as lifecycle management programs. Most document editors are Web-based. They are accessed via third-party servers and operated on the Web instead of being downloaded onto the business's own network. These editors are often less expensive than other collaboration applications.

Conferencing. With developing technology, online conferencing can take several different forms, including video, audio, and combinations of both. A chat feature is often included in conferencing programs as well. These collaboration tools are one of the most common among businesses, popularized by inexpensive and effective tools such as Skype and Quick Connect. Employees first use these conferencing methods during their training, which can be given to many different new employees in different locations at the same time. Conferencing is used often to update experienced employees on new policy or trends.

Web Polls. Web polls are a simple tool used by businesses to gauge opinions on different aspects of company strategy. These polls are most often seen on business Web sites or social networking sites, where business marketing analysts

use them to ask for input from clients on key business decisions. When making decisions that affect employees more than customers, businesses can use these same polls and questionnaires to gauge quickly the response of a large number of employees in a short amount of time.

Social Networking. Many businesses see social networking as a personal pursuit that has no place in the business world. Many companies have developed strict policies controlling the access of social networks such as Facebook and Twitter at work, and few businesses allow employees to use these applications at all during work hours. However, social networking can also be a useful collaboration tool when used solely for business matters. Popular sites like LinkedIn allow professionals to exchange contact information to facilitate their work. Private business social networks attempt to do the same thing. They allow employees to create profiles and update microblogs with status changes showing what stage of projects they are currently on and when they have finished particular reports.

Social networks can also be used to collaborate with other businesses to increase sales and combine marketing efforts. Endorsements are easy to make with simple links over microblogs, and small businesses can exchange easy promotion with other local businesses to increase their customer base.

Some examples of collaborative tools are:

1. *OfficeMedium*. OfficeMedium is a collaboration service that provides a business-specific interface for working on many different types of projects. It incorporates several different social media tools into one package, including the ability to poll employees, chat live with peers and managers, develop user profiles to share information and recognize other workers, and share calendars for projects that multiple people are working on. Clients can also be given secure links to OfficeMedium so that they can keep track of their projects. Small businesses will need to pay about $6 a month per user, and $1 a month per gigabyte of storage space. There are no mobile versions of the applications for OfficeMedium, but it is a strong option for an office-based system.
2. *Basecamp*. A Web-based collaboration tool, Basecamp allows businesses to customize the look of their application and create to-do lists or important milestones to help plan out projects. Message boards and timestamping are also available to help increase efficiency. Prices for the Basecamp software vary according to what package small businesses are interested in buying. The basic package in 2010, one of the most ideal for smaller organizations, allowed for fifteen projects to be open at the same time. It cost $24 a month with 5 GB of storage. The largest package offered unlimited projects and 75 GB for $149 a month. The developer provides a free 60-day trial download from its Web site.
3. *CubeTree*. CubeTree is designed primarily as an intranet, office-based, social networking application. Employees create a profile and input status updates to let co-workers know about coming deadlines, finished reports, or available data. Other members can then comment on the status updates in a microblogging format. Employees can also filter out status updates to just a few peers when necessary, tag co-workers for particular project updats, or control what types of updates they receive. Other tools, such as Twitter and Google Docs, can be linked into the conversation as needed. The basic download is free, with extra features costing up to $5 per user, per month.
4. *Google Wave*. Google Wave is an application designed to support ongoing conversations centering around news, projects, ideas, or data. It transmits typed letters live and integrates naturally with other Google applications, such as Gmail and Google Docs. This is a useful application for businesses that need to keep employees quickly informed concerning rapidly changing data. Documents, videos, and images can be linked directly into a Wave for immediate viewing. Whenever a new participant is tagged, he or she can scroll down to see all the information discussed earlier. Add-ons are also available to help streamline common business tasks. Google Wave was open only to invited users in the first two quarters of 2010, pending further development.
5. *Office Live Workspace*. Office Live Workspace is the Microsoft version of collaboration software. It allows users to both share documents over the internet and collaborate on projects. Multiple users can save and trade information with each other as required, and a sidebar gives real time updates showing what co-workers are uploading or working on. Document controls can be set to share screen views of a single page and decide who can view, edit, or comment on the document. Since Office Live is a Microsoft production, it works very well with Microsoft software such as Word, Excel, and PowerPoint. This application may be especially attractive to Windows-based small businesses.
6. *Zoho Writer*. Zoho Writer is a more basic collaboration tool designed almost exclusively for creating and editing documents. The basic program provides only a blank document to begin working on, but the Zoho template library allows users to choose from a variety of different document forms such as fact sheets, proposals, ads, and reports. Documents can be edited between two co-workers or shared with a

group that can work on them in real time. The application also offers offline support and synchronization for updating when users log back in. Zoho Writer is free, but users must create a writer account and sign up before they can use all elements of the application, including the ability to save Microsoft documents to the Zoho account.

7. *Hootsuite*. Hootsuite is a teamwork tool that began using Twitter as a basis for organization projects and monitoring the progress of the team as a whole. It allows small businesses to form groups in which updates from a variety of social networking sites, including Twitter and Facebook, are available. Participants can reply to all members of the group or only a select number of other people. Each account has an owner, usually the team leader, who can invite new users by tagging them. The application incorporates a news feed for information updates and an assignment function to give specific tasks to people in the group. The free application can also analyze Twitter data to spot trends and responses to business marketing techniques.
8. *Codeita*. Codeita is a cloud computing application that is designed primarily for employees who are working on coding projects for software companies. It allows different coders to work together on the same project, tracking each other's work and communicating whenever necessary. Team problem-solving features are built into the system, and it is designed to save work automatically to a server system. It also allows users to send previews of the projects they are working. This is a very useful application for small Web development businesses and similar start-ups.

SOCIAL MEDIA, COMMUNICATION TOOLS

Social media encompasses the online tools and methods used by businesses to reach customers, consumers, and other businesses in their supply chains. It is a constantly growing area of technology that embraces audio, video, and interactive materials that can be exchanged via the Internet. Social networking sites, microblogs, and online forums are all applications use in social media. The goal is to reach a large number of people in effective, personable ways, at a low cost to the business. Traditionally small businesses have been reluctant to embrace social media tools. A study by Citibank in 2009 showed that 76 percent of small-business executives had not found sites like Facebook or Twitter useful in marketing or overall strategy. That does not mean they are not trying: small business use of social media doubled between 2007 and 2009, and nearly 70 percent of small businesses make use of some aspect of social networking. The problem is in the maintenance and planning of social media initiatives, which small-business owners can struggle with more than larger companies.

All social media methods are communication tools of some sort, but several are used specifically to communicate information to the customer. Sometimes this information is simple, such as a few words that remind loyal customers about discounts and sales promotion deadlines. At other times social media communication is more complex, answering complicated questions and giving newer consumers detailed information on products or services. Which type the business uses depends on the target audience. Most small businesses should strive to balance their social media strategy by using more than one communication technique to reach people as effectively as possible.

TYPES OF COMMUNICATION TOOLS

Some of the more common social media communication tools are blogs, microblogs, content syndication blogs, short message services, podcasts, streaming videos, and instant messaging.

Blogs. Blogs are a type of social media consisting of journal-like entries, usually around 1,000 words or more. Images, video, and additional updates are often included to help people understand the scenario. If a small business has a Web site of its own on its own servers, it can incorporate a blog as a page in that Web site. If not, the Web site can sign up to one of the many blog hosting sites available. These blogs are useful when communicating important updates to customers that need more than just a few lines to explain. New customers should be able to visit business blogs and find information or news on a variety of subjects. Most blogs are archived histories that allow visitors to scroll back and review all past posts.

Microblogs. Microblog is a general name for sites that allow users to post very short updates or quick links instead of the longer journal entries. Almost all social networking sites are versions of microblogs, including the immensely popular Facebook and Twitter. Twitter is notable because it limits user entries to only 140 characters: This type of limitation defines the overall brevity of microblogs. Sometimes these short updates are difficult for businesses to use effectively, and it requires a different type of marketing approach in order to communicate information effectively to customers with only a few words and an added link or number.

Some businesses may assume that social networks and all microblogs are meant for personal use but not designed for businesses. However, both Facebook and MySpace have tools dedicated specifically for business customization, fans, and linking. There are also multiple applications designed to pull data from Twitter in order to help businesses judge the effectiveness of marketing techniques.

Content Syndication Blogs. Content syndication refers to sharing and publishing social media information across many different blogs and other Web sites. Like syndicated posts in newspapers, syndicated blogs are single entries spread across many different Web sites and sometimes even paid for by other companies. Unlike traditional articles, syndicated blog content typically takes the form of links as well as copies. Other sites link to the business blog, often in return for links to their own pages. Businesses can achieve content syndication by writing content that is interesting, timely, applicable to many situations, and has good search engine optimization (SEO). The most popular blogs are linked and reviewed by content collection sites such as Mashable. Content syndication typically occurs with general articles, not updates on business progress or sales promotions. Content is sent using RSS, or Real Site Summary, a format used to exchange and automatically update information.

SMS. SMS stands for short message service, an official name for text messaging over cell phones. As a communication tool, SMS works similarly to microblogging. The messages must be short, to the point, and include all the necessary information. Businesses are even more constrained, because they cannot link to other material or post images using SMS. This form of communication is much more personal and has a narrower target audience than other types of social media. Small businesses should always ask permission before sending employees text messages concerning deals or news. There are several Web site services that allow businesses to send e-mails as text messages for a small fee. Since this method is exclusive, small businesses can use it to offer discounts to only their most valued customers. It can also be an effective method to communicate with employees or suppliers.

Podcasting. Podcasting, derived from the technique of putting radio or news broadcasts on an iPod, is a method of making audio files available for customers or employees to download. It usually refers to only audio, but video elements can be included. Podcasting is largely informative but can also be used to repurpose other material to make it more available for customers on the go, or for those who find it easier to glean information from listening to an audio clip. Podcasts can be made available from a small business Web site or blog to give customers the chance to listen to radio interviews with owners or supporters.

Video. Except for text, streaming video is one of the most popular methods for businesses to communicate messages online. Thanks to inexpensive or free video sites like YouTube, small businesses can create their own commercials at very little cost and post them for any customers to see if they wish. Videos can be embedded into blogs or Web sites and linked between friendly contacts to help spread the message faster. Video also makes an ideal training tool for employees.

Instant Messaging. Not all businesses consider instant messaging to be a viable marketing technique, but when used properly online chatting can easily increase the value of a business product or service. Instant messaging is typically used to communicate to customers who want more knowledge about a particular service or who need help completing a specific tasks. An employee talks them through it, using the business's online chat application, answering their questions or explaining specific aspects of what the business has to offer.

ADVICE FOR SMALL BUSINESSES

Social media is a newer form of marketing, and traditional marketing techniques are not likely to be as effective when using a social media tool. Small businesses should be prepared to use different tactics and messages when communicating with consumers via online methods. While small businesses may be able to use social media applications or add features onto their existing Web site structure with little cost, maintaining social media takes more work. Banners, posters, and commercials can be created and passed along to consumers. Social media, however, focuses more on a relationship: consumers who interact with the business expect friendly answers and honest replies. Applications typically require a dedicated marketer, graphic designer, or writer to keep updates fresh and topical.

Multiple channels of communication can be achieved more easily by small businesses through repurposing. Repurposing is a common practice among businesses that use social media. It refers to using the same material in a different medium. A commercial can be made and posted on YouTube, then transferred to a podcast as a simple audio recording, then posted as dialogue text on a blog. Using this same material over again in different channels can save the business money while allowing more people to access the same message. In order to repurpose social media materials more easily, businesses should focus on simplicity and one easy theme, such as a particular sales promotion.

When creating a video, a small business should create a single hook that will interest consumers. Online, there is no reason for customers to view commercials or infomercials unless they already want to know more about a product or service. Outright selling tactics will turn consumers away, and these tactics are even more noticeable on video. It is better simply to show a customer how a product works, or what benefits a service has. The "Will it Blend? " series available on YouTube was successful because it caught consumer attention by tearing apart unusual items to demonstrate the power of Blendtec systems. Small businesses can try an advanced marketing strategy like this, or they can focus on less related material, offering consumers lifestyle or improvement advice connected with their products.

When creating audio, a small business should keep in mind that audio clips are usually designed to be downloaded. If possible, the business should offer the audio in a variety of formats or a generic MP3 format if no other option is possible. Audio clips should be short and to the point. If they are used for informative purposes, the audio clips should condense material down into only a few points that are easier to absorb. If the clip is a form of advertising, it should be professionally produced, preferably by a third party with experience in audio engineering and radio marketing.

More time can be spent with blogs than other types of social media. While blog posts can be filled with detail, they tend to veer easily off topic. The small business should create a full social media plan before creating a blog. What will be the blog's focus? How often will it be updated? Who will be hired to write it? What tone will the blog take with consumers? Rather than filling a blog with meaningless information, the small business should provide viewers with useful information and interesting facts about the current position of the company.

Microblogs cannot be used for extraneous information in the same way. Their content must be sharp and to the point, which requires a different style of writing. Most microblog sites can be used to provide links to more complete information when necessary. A small business should be prepared to spend time building an audience with microblogs, since creating a fan base is far from an immediate accomplishment. What type of information should be given depends on the microblog. Facebook is useful for generic status updates and garnering comments from fans. MySpace can be more customized to display original marketing ideas. Twitter can be used for brevity and wit, communicating sudden news with partners and consumers alike.

EXAMPLES OF MICROBLOGS

Here are some of the more common forms of microblogs.

Facebook. One of the most popular social networking sites in 2010, Facebook allows businesses to create groups, fan pages, and diagnostic tools. Fans can easily comment on status updates to let businesses know immediately what they think, and more information can always be added in the Notes feature if necessary.

Twitter.Twitter is most useful for businesses to analyze response to their marketing and follow both trends and the work of their competitors. It allows users to tag specific words and followers for more complete communication. Consumers who use Twitter are used to receiving frequent updates the moment something new occurs, so businesses should strive to maintain their Twitter accounts carefully.

LinkedIn. LinkedIn is a social networking site devoted to businesses. It allows business leaders to create profiles and make contacts with one another. Small businesses can use this application to find new opportunities or follow leads to professionals available for hire.

Digsby. Digsby is a management application that is used to combine many different social networking tools into one screen so that businesses can manage all of their accounts more easily. Chat tools are combined, e-mail accounts are linked with Digsby notifications, and social networking status updates are gathered into one spot for easier viewing. The application allows for personalization in both appearance and function.

Yammer. Yammer is a social network application designed especially for businesses. It is used mostly within the business structure to coordinate project plans or announce changes to employees. An informal group can be created on Yammer, or a business can establish an official network only for its employees.

Ning. Ning is a social network creation application that small businesses can use to create social networks about their products and services so interested consumers can join and find out more. Personal social network sites on Ning can become cluttered and unnecessary, but networks created by businesses for marketing purposes tend to be focused. Ning is most useful for small business that have high customer loyalty and goods that tend to gain a strong following.

SOCIAL MEDIA, NETWORKING

Social media is the collection of tools that businesses use to reach consumers, employees, and other companies through Web 2.0 technology. When most people hear about social media they think of social networking sites, but this is actually only a small part of the social media field. Any type of technology that allows people to communicate and exchange interests or information online is part of social media. This broad field covers audio, video, and interactive forms of multimedia.

Social media is notable for its low cost and uniquely broad audience, making social media tools ideal for small businesses to spread marketing messages or seek out contacts in their industry. However, small businesses have been slow to investigate the potential of social media sites. In 2009 Citibank surveyed 500 small businesses and found that 86 percent of them did not use social networking sites for exchanging information or offering businesses advice. These low acceptance statistics are caused in large part by lack of knowledge on how social media can be used for business networking.

The primary benefits of using social media when networking are speed and scalability. Results with social media tools can be immediate, especially during ongoing conversations. When the small business is ready, it can easily widen its searches to include other companies or professionals outside its town, state, or even country. Networking tools online allow for a much greater pool of contacts, giving small businesses access to more experience than would otherwise be possible.

REASONS FOR SOCIAL MEDIA NETWORKING

Online trade show, job fairs, and business-oriented social networks are an excellent way for employers to find new workers. As small businesses grow larger, they require more specialized employees that can handle specific marketing, accounting, or management tasks. Social networking tools

are one of the best ways to find such professionals in the modern business world.

Finding New Suppliers/Distributors. In order to cut costs, product-oriented small businesses should occasionally search for better deals with their suppliers or distributors. Social media networks like online forums and digital trade booths are methods that can be used more effectively than traditional searches. For businesses that are just starting, networking on social media sites can be an efficient way of learning more about supplier prices or finding local distributors. Online forums often compile more advice than businesses can find on word of mouth alone.

Faster Negotiations. One of the primary advantages to social media is the immediate communication that it can encourage. Social networks can be used to gain the opinions of peers or consult managers and business owners in an official context. With the aid of mobile devices such as phones or laptops, these discussions can often occur on-site when meetings with distributors or clients are taking place. Not all social network tools work well with mobile formats, but many do. If the negotiations take place online, in the form of bid or a similar process, then all discussion can occur on the Internet. As a result, the time it takes to consult on terms or respond is significantly reduced.

Closer Ties With Community. Small businesses often thrive on local contact. Social media only reinforces the local channels that these businesses depend on. Social networks like Facebook allow businesses to join town or city groups and communicate with other nearby businesses to form plans. Other networks can be even more specialized, bringing together businesses and clients with specific interests such as gardening, coffee, or nonprofit endeavors. This makes it easier to plan local events or find other businesses that are willing to collaborate. This can be more effective than the limited contact pools small businesses used to access at chamber of commerce meetings and other sponsored functions.

New Funding Opportunities. Small businesses depend on effective networking to establish new leads for funding. Raising capital can be very difficult in a local setting, and social media gives businesses the ability to reach a much larger group of potential investors or lenders willing to give small businesses loans on friendly terms. Angel investors often form groups that have a single Web site entrepreneurs can apply to for capital. Contacts with other businesses over social networks can give businesses tips about where to find loans or funding. Some network applications exist for entrepreneurs to give each other advice or link willing investors with promising businesses.

COMMON NETWORKING TOOLS

Microblogs allows users to post short, pointed status updates and then field comments from others. Some social networks are general and allow everyone to join, while others are more particular and focus on a particular location or interest. Microblogs earn their name from their brevity. They are much more concise than the journal entries on regular blogs. Twitter famously limits users to only 140 characters per post. This gives businesses only enough room for friendly comments or quick questions. Multiple other businesses or professionals can comment on one question, allowing small businesses to receive a multitude of responses at once.

Online Forums. Forums, also known as message boards, are Web sites where members can post questions or comments and respond to current questions already on the board. Forums are similar to microblogs, but instead of focusing on personal status update information, they tend to revolve around topics. Members can also give more involved answers. Forums exist for specific industry subjects and are more likely to include those who are able to respond with useful information. Small businesses can join larger organizations made up of similar businesses to access this kind of forum. Some forum memberships require applications or fees.

Specialized Networking Sites. Specialized network sites combine many different social media tools in one group. These are sites designed for business-to-business relationships, helping smaller businesses find suppliers, transporters, and investors. They often include blogs, microblogs, forums, conferences, and other social media tools to help facilitate business networking. These sites tend to be easier for small businesses to maintain than personal profiles on large networking applications. Many of these sites are also local and exist to help businesses in the area, and some are developed from existing business bureau sites.

Linking. Among businesses that regularly communicate online, linking is one of the most important networking responses used to build relations with other companies or professionals. Linking refers to digitally placing links to other blogs, sites, or profiles on the business Web site. These links can either be included in a blog as part of a conversation, or set aside as a list on the sidebar of a main Web site. These links serve two main purposes. They increase the chance that Web surfers will find the small business Web page through links to similar sites, and they form an important part of building a healthy relationship between the blogs of like-minded businesses. Linking between sites is a common and often expected form of Web-based social networking.

SOME EXAMPLES OF SOCIAL MEDIA NETWORK APPLICATIONS

The following is a list of some popular sites in use in the early 2010s.

1. **Facebook**. Facebook, along with Twitter and MySpace, is one of the most popular microblogs used by individuals and businesses alike. Facebook is useful primarily as a general networking tool, due to its widespread use across multiple countries. Small businesses can quickly join groups and win fans internationally. However, microblogs like Facebook require a significant investment of time and the right writing style in order to be effective networking tools. Time must be devoted every day to managing the business profile and responding to comments.
2. **LinkedIn**. LinkedIn is a social networking site like Facebook but is designed especially for business professional to contact one another and share valuable information. Classmates can locate one another, old business colleagues can reunite, and entrepreneurs can search for interested partners. Many professionals use LinkedIn to share their résumés and look for new positions, but the network can also be a useful tool for small-business owners as well. LinkedIn also comes with tools to manage profiles from Outlook or browse for particular topics with a dedicated toolbar.
3. **Talkbiznow**. Talkbiznow is another business networking site that revolves around business services for the owners of smaller companies. Individual users can create accounts and communicate information regarding services to other members. The application supports Webinars and voice conferencing for large meetings and text messages for smaller conversations. Service keywords are automatically tagged and highlighted so users can sort quickly through a large number of messages at a time. Business owners can create reports, or lists of potential Talkbiznow contacts for specific projects or funding.
4. **PartnerUp**. PartnerUp is a business networking Web site with several social media tools, including blogs, forums, and networks. The site is dedicated to helping small-business owners find advice and resources among their peers. Entrepreneurs can seek commercial real estate locations to open new businesses or find ideas they may be interested in participating in. Those who already own businesses can look for vendors and third-party service providers there. PartnerUp can also be a useful promotional tool, allowing marketers to spread the word about their own products or services.
5. **Qapacity**. Qapacity is a basic Web site builder service. Users create an account and then build their own Web site using several different themes and basic blog and portfolio tools. The pages created can be naturally linked with Twitter, Facebook, and other networking sites. Search engine optimization is done automatically to help clients searching for the business find it more easily. Users of Qapacity have the ability to search all other small-business owners using the same services, creating an online community. Qapacity links with Google Local and Google Maps to give networking a more local aspect.
6. **Ryze**. Ryze is a network creation site that allows business owners to contact other members with similar businesses and organize events or contracts. There are two levels to Ryze. The first consists of the home page, where users can send messages and view other member home pages. The second level lets users access specialty networks created around certain parameters, typically location, industry, or common interests.
7. **Xing**. A combination job board and networking site, Xing focuses on helping entrepreneurs make useful contacts. The site allows users to create a profile and search any posted jobs for matches, but business owners can also use the service as a directory. Over eight million contacts are available on Xing for searching, providing their location, company, and business offerings for other members. The profiles are built to focus on what services professionals over and what services they may need from other businesses to facilitate network. Xing also allows members to create groups (over 17,000 in 2010) based on topics of discussion.
8. **Entrepreneur Connect**. Entrepreneur Connect is a comprehensive Web site offering advice and networking applications for all types of entrepreneurs. The site offers regular interviews with successful entrepreneurs and articles or videos on how to succeed at certain aspects of business. Conferences and forums are promoted or sponsored by the organization, and timely discussions between members are shared with all members. There are separate groups for online, youth-oriented, female, and new entrepreneurs.

SOCIAL MEDIA, OVERVIEW

Social media is a comprehensive term used when discussing all tools that people, especially businesses, use to create an integrated online presence. These tools give businesses the ability to create and publish many different kinds of information on the Internet for the benefit of both their customers and their employees. This is one of the fastest-growing fields in small business marketing and collaboration.

Social networking is an intrinsic part of the definition for social media. Collectively, online applications that allow multiple users to exchange knowledge, personal information, and skills are known as Web 2.0, or the second phase of the Internet that embraces online gatherings of people or resources. Social networking, as a segment of the Web 2.0 concept, allows users to meet friends, express ideas, and develop interests in a variety of online applications. Social media is the method businesses use to market or complete projects on these social networking applications.

ADVANTAGES AND DISADVANTAGES

Social media is easily scalable. Large corporations can spend millions of dollars on complicated social media strategies designed to raise their brand recognition and develop various market segments. On the other end, small businesses can use social media to reach local markets with very little cost. If they are able to ship their products in a cost-effective way, small businesses can also reach specific consumers around the world to grow their customer base quickly. This provides a cost effective method of accomplishing marketing goals that would absorb hundreds of dollars using traditional media such as banners, billboards, and commercial spots. Social networking sites allow businesses with representation on those sites to reach thousands and even millions of people with only simple status updates or links to products. The effects of these marketing techniques are immediate and do not require the time it takes to send out mailers or order banners.

Businesses can also use social media for networking and distribution channels. Many online forums cater exclusively to certain industries or provide places where suppliers and distributors can meet and exchange contact information. Even more casual social sites allow small-business owners to meet likeminded entrepreneurs and trade advice, resources, or plans. As the small business grows, other social media tools can be used to create online collaboration applications for employees to work on projects together even if they cannot meet physically.

Despite its many useful qualities, working with social media does come with costs. Social media tools can be very difficult for employees to learn or use effectively, especially if their experience lies with traditional forms of media and marketing instead. Employees may need to practice before they understand how communication and media applications differ in social media settings. Social media also requires significant investment in an online business structure, including choosing a programming language, a Web site hosting service, and analytics tools to judge effectiveness. While small businesses can often hire consultants and outside Web designers to create a functional Web site, social media requires constant work to maintain correctly, so in-house skills are also needed. Some types of social networking can also expose businesses to online identity or idea theft.

POPULAR SOCIAL MEDIA TOOLS

New social media tools are being developed constantly, especially for businesses with experience in online applications. A small business does not need to choose every class of social media tool, but it should use those which apply to its target market and products or services.

1. **Microblogs**. Microblog is a general term for a social networking site that focuses on short, to-the-point status updates rather than journal entries. The most popular social networking sites, such as Facebook, MySpace, and Twitter, are different types of microblogs. These sites and others like them allow limited

notifications and links to other Web pages or images while focusing on developing contact with other users. MySpace allows a greater degree of customization than Facebook, which may be useful for a business that has graphics or music to share. Twitter is limited to only 140-character-count posts, making it ideal for telegraphing news, sharing discounts, or spreading information.

2. **Blogs**. Blogs are personal Web sites primarily in a journal-like format that can be updated by adding more posts, which tend to be around 1,000 words long. Blogs can be easily customized and linked to social networking sites to gather fans or followers. Businesses can use these blogs to offer more information and give their business a more personal feeling.
3. **Professional Networking Sites**. Professional networking sites are social networking applications that are used by business employees to make contacts. The most popular example is LinkedIn, which is designed specifically for professionals. These sites have a very similar structure to other microblogs but focus on sharing résumés or finding peers in the same industry.
4. **Online Industry Communities**. Online trade shows, business wikis, industry forums, and support sites are all examples of social media tools used by specific types of businesses, especially those interested in business-to-business selling. These tools are more in-depth than professional networking sites and allow businesses to make bids or offers, close deals, and exchange necessary information.
5. **Forums**. Forums are designed to allow any user who is a member of the forum to post questions, replies, or comments. Some forums are designed around a particular subject, while others are created by organizations to answer a variety of questions or discuss different topics. A small business can set up a forum to answer customer questions or continue dialogues as part of a larger community.
6. **Podcasts**. Podcasts, a word derived from sound files (nonmusical) downloaded onto an iPod, are a simple type of social media usually made of recorded radio broadcasts or lectures. Businesses use podcasts to spread information quickly through a company or inform customers about their products in an easy, accessible way.
7. **Analytics and Intelligence Tools**. There are many different social media tools designed specifically to examine the success of online marketing campaigns. For instance, many applications exist to search Twitter for growing trends, responses to particular subjects, and personal success on the social networking site. Google Analytics shows bloggers what searches people are using to find their blogs. Competitive intelligence tools like QuarkBase allow businesses to see what keywords competitors are using to draw customers.

DEVELOPING SOCIAL MEDIA FOR BUSINESS

Many small companies struggle with social media strategies because they do not take enough time to develop unique goals for the social media tools they are using. Thorough planning is vital to the success of any type of business social networking. Small businesses should ensure that they have comprehensive strategies in place, detailed to meet their own goals. Good marketing plans for social media endeavors focus on four C's: content, context, connections, and community. Content should be pertinent to the needs of customers but also informative. Context refers to the way the social media messages are structured and how they are used to connect customers, employees, and other companies around the small business. Together these people form a vibrant community that benefits both themselves and the business.

Another mistake common to small businesses is the belief that they can pay a project fee to a consultant or outside source to create social media tools, then maintain them with the same ease that a Web site or financial application is maintained. This is not true. In order for social networks and similar applications to be effective, they must be regularly updated by people with the skills necessary to convey sales promotions and business updates. This is a hidden cost of social media often overlooked. Writers with the ability to write for a target social audience must be used to maintain social media tools.

These writers should be equipped with the necessary knowledge to reach customers and develop business connections. Social media sites cannot be written in the same way other, more traditional advertisements are created. Those connected to social media networks expect brief and friendly posts without overt marketing techniques or pushy sales tactics. Social media tools are used to develop connections with customers and should include local information in a friendly format. Brevity and links to other pages are important.

Small businesses must also be prepared to grow their social media tools. A forum that supports a few dozen members may work well in the beginning, but can the same forum support hundreds or thousands of members as the business grows? Businesses must use technology and Web structure that supports growth, possibly rapid growth if necessary. Many microblogs automatically scale due to framework built in by their creators, but forums and wikis that are created by small businesses should have

similar capabilities. Web design consultants can offer a great deal of help when deciding scalability issues.

Many types of social media depend on winning the respect of other members. Small businesses should maintain dialogues and create ongoing conversations with customers or other organizations. This allows them to hear news through their contacts and link their brand to friendly, personable responses. Social media requires back and forth communication in order to be effective. Used properly, it can be an excellent way to receive easy feedback from customers as well as market products and services.

Employees who incorporate social marketing tools like wikis to collaborate on projects together should be trained on how to use these tools correctly. If the small business cannot train employees itself, it should hire outside consultants to do so. Employees must feel comfortable with wiki technology and have practice trading information and edits in an online work environment for in-house social media to be effective.

At the same time, employees must be trained when not to use social media. For those who must use social networking, limits should be set on how they use these tools and how much time is spent on them. Around 70 percent of all businesses in the United States have already banned employees from accessing their personal accounts on social networks. Employees who are not properly trained can waste time on social media instead of positively impacting the business.

DEVELOPING TRENDS

Social media is slowly becoming more exclusive, and this trend is expected to continue, especially for businesses. Instead of joining large social networking applications like Twitter, businesses will be able to focus on smaller sites designed for organizations and customers with particular interests. On the positive side, small businesses will get lost in the social media confusion less regularly, but on the negative side they will not be able to access as wide a consumer base.

As businesses become used to social media application, more and more analytical tools will developed, not only to judge the success of social media campaigns but also to analyze social media customers. New programs will be able to keep track of social media members, their interests, what conversations they participate in, and what products or services they may be especially interested in.

As social media tools become more and more complex, companies will need to deal with the effects they have on the work environment and business practices. Social media policies will become standard among many businesses and be written clearly into employee handbooks. Time will be taken to discuss how to represent the company correctly while using social media tools.

SOCIAL MEDIA, RICH MEDIA

The term social media refers to the collective activities, practices, and behaviors of communities of Internet users that share information, knowledge, and opinions online. Web-based applications serve as the primary vehicles for social media, enabling quick and easy transmission of content such as text, photos, video, and audio. Rich media refers to any digital interactive media that can be downloaded to a computer hard drive or embedded in a Web page, including audio, video, and animation such as Flash. Dynamic motion that occurs over time or at a user's instigation is the defining characteristic of rich media. Both social media and rich media have become instrumental components of the online experience and indispensible tools to the small-business owner.

SOCIAL MEDIA

The concept of social media combines two traditional terms to create a relatively new experience. "Social," of course, refers to a person's ability to interact with and influence others. "Media" traditionally refers to newspapers, magazines, television, and similar venues that accommodate the delivery of news and information. Together, social media is a powerful and pervasive notion that can be a boon (or potential barrier) to a small business. "Learn to live with the idea that it's nearly impossible to hide from friends, employees, customers, and others who are motivated to talk about you," write David Brake and Lon Saflo in *The Social Media Bible: Tactics, Tools & Strategies for Business Success*. "People are going

to talk and gossip and complain. This behavior is human nature, and in the new world of social media, you have virtually no control."

Social Media Benefits. From the small business perspective, social media can have a tremendously beneficial impact. Any business with a great product or service naturally wants people to talk about it. The more people are talking, the better, as positive word-of-mouth can be an enormous boost to business. A business owner may not necessarily have control over the conversation, write Brake and Saflo, but anyone with a familiar grasp of social media can take advantage of the available tools. Anyone attempting to do so should be aware of three basic rules of social media: it is all about enabling conversations; conversations cannot be controlled but can be influenced; and influence is fundamental to building economically viable relationships. "You won't have total control, but you can have considerable influence, and influence is the foundation of successful relationships with customers, employees, vendors, family, and friends," Brake and Saflo add.

Social Media Downsides. Being able to influence online conversations may be of benefit to a small business, but social media also has potential disadvantages. As already mentioned, lack of control over the conversation is a major consideration, and a certain anxiety can set in as a result of social media offerings. In an extreme example, Brake and Saflo recall an old joke in which a paranoid man refuses to attend football games because he thinks the players talk about him when they huddle. In the world of social media, the assumption is that everyone is already talking about someone (or something). As a result, Brake and Saflo urge caution in what a business owner says and does.

The latter suggestion rings true in one incident involving an employee of Starbucks. The employee, a barista in Minnesota, was fired from his job, after which he took to an employee-run blog that served as a venue for airing various grievances about the company. The former employee claimed he was fired because of his attempt to unionize employees. When he related the incident on the blog, it stirred a flurry of media coverage. Not long after news of the firing hit print and airwaves, Starbucks reinstated the employee in his old position; the company said his original dismissal had nothing to do with unionization attempts. However, as Brake and Saflo point out, his reinstatement may have been a direct result of the ensuing negative media coverage. "Is this unique to Starbucks, or is it happening other places, too?" Brake and Saflo ask. "It's happening everywhere.... What you say inside your company is never too far away from becoming a feature on someone's blog."

Types of Social Media. Social media consist of a wide range of online applications, each of which work quite differently. They all share at least one trait, however: online information exchange. "Social networking" is essentially what happens when people put social media to use. The Internet was the first such social network. Facebook, another social networking site, claimed more than 100 million registered users with more than ten billion photographs in 2010. Facebook's rival MySpace likewise boasted millions of users. The power of social networks like this cannot be overstated, particularly as it relates to the small-business owner. "The social networking site phenomenon has completely and rapidly changed the way that people interact in terms of personal and professional relationships," write Brake and Saflo. "And anytime there is a tool that millions of people in one place at one time all with common interests are clamoring to use, you, as a businessperson, need to understand and be a part of it."

To that end, Brake and Saflo offer a list of "commandments" integral to the effective use of social media:

- Thou shalt create profiles and groups. Use MySpace, Facebook, and similar social networks to create profiles with a business's unique name.
- Thou shalt use Open Social. This Google program enables users to create a social networking profile then propagate it on various networks without having to reenter the same information.
- Thou shalt participate. Visit different sites, read the conversations, then start to respond accordingly.
- Thou shalt build your own network. Start with a blog, for instance, then build the social network by using such tools as Ning or WordPress Group Platform.

The above recommendations apply to the wide variety of social media available to small businesses. Some of the most common social networks include:

- MySpace one of the more popular social networking sites online. The international Web site enables users to create their own friend networks, personal profiles, groups, photos, music, and videos. User profiles can be uniquely customized with different colors and fonts a popular feature. The site has also been embraced by record labels large and small as an effective venue for showcasing music via the MySpace music player.
- Facebook a rival to MySpace. Facebook offers features similar to MySpace, including the ability to create unique profiles and upload various types of content. Users can also create and interact in groups dedicated to particular causes or interests. Like

MySpace, Facebook has grown increasingly popular among small businesses looking to promote their products or services to a large and growing group of customers.

- LinkedIn a professional social network with 65 million international users. LinkedIn enables users to create profiles tailored to their professional occupations and link with associates and colleagues. Features include résumé functionality, job histories, professional accomplishments, and vast connections to business opportunities and potential partners. The network became especially popular during the recession of 2008 and 2009 as a resource for job opportunities in light of massive layoffs.
- Blogger a blog creation and hosting site. Blogger enables users to create blogs or "web logs" in which they can write about any topic imaginable. Users log in to the site; create "posts;" upload photos, music, and video; and then share their posts with an audience of followers who subscribe to the blog. Users can customize their blogs and even create their own domains (a specific Web URL) via Blogger. Readers can comment on specific blog posts. Blogs such as this have become an important tool for small businesses looking to discuss their products or services in an online environment.
- Twitter a real-time information network that allows users to send short news updates quickly. Like MySpace and Facebook, Twitter enables users to create unique, customizable profiles. In many ways, however, Twitter is more stripped-down than the others in that its primary feature is short information bursts, known as "tweets." This is particularly useful for businesses aiming to stay in touch with customers by providing real-time news updates about product or service offerings.
- Flickr an online photo and video sharing and management site. Flickr enables users to create unique profiles to which they can upload an unlimited number of photos and videos. Profiles can be shared with other users, who in turn can download and use photos and videos per creative commons licenses. Photos can be added via a direct Internet connection from a computer as well as through mobile devices.
- Friendster a contact management site. As the name implies, Friendster enables users to connect and stay in contact with friends all over the world. Like MySpace and Facebook, the service enables users to create profiles that list interests and occupations, as well as upload a variety of media that can be shared with other "friends."

The beauty of these social networks is that most of them link to each other. For instance, a user can set up his network so that every time he tweets from Twitter, that information shows up in his MySpace and Facebook news feeds which are viewed by his entire network of contacts.

From an entrepreneurial point of view, social media have allowed business owners the opportunity to talk about their wares without having to go through a gatekeeper. Gary Vaynerchuk, director of operations for the Wine Library and host of Wine Library TV, found this to be a key benefit when he began blogging about his business. In 2007 Vaynerchuk wanted a platform for discussing the show and his Web site, so he created a blog with a unique URL www.garyvaynerchuk.com. Initially intended as an outlet for Vaynerchuk to discuss the wine business, the blog quickly became successful and led to speaking engagements, invitations to consult companies, and other business opportunities. "What's great about social media and where the world's at now is [that] you have the ability to build much bigger brands much quicker and at much lower price points, and that's a very big change in the way business is done in America," Vaynerchuk told Brake and Saflo. "No more editor/producer telling you what you can or cannot be, or deciding whether you can speak to the American people or the people of the world actually." Vaynerchuk praised social media tools for enabling people to communicate their messages at zero cost.

Social networking is effective only if participation happens, Brake and Saflo point out. Not participating can run the risk of another user taking a name that belongs to a potential user's business to create a profile. Social media experts suggest that users first create their profiles, then listen to the conversations that are taking place, and finally respond to the conversations to engage with an audience. Like being at a party, people do not usually walk over to a group of people talking, interrupt, and tell them all about themselves (although it has happened). Unfortunately, many marketing tactics take that tack, typically with little or no success. "You first have to be at the party," write Brake and Saflo, "and then select a group, listen to them and then join in with something valuable. That's how you build community, and that's how you build trust both off line and online."

RICH MEDIA

The term rich media, also sometimes called multimedia, refers to any nontext file that incorporates audio, video, or animation. It is a useful tool for social media users since it can make their profiles and communications more attractive to an audience. The fact that rich media can be downloaded and embedded within a Web page

makes it particularly useful. Downloadable and streaming versions of rich media can be heard or viewed on different software applications such as RealPlayer, Microsoft Media Player, and Apple's QuickTime.

Rich media's defining characteristic is dynamic motion. It can occur over time or in response to a user's direct engagement. An example might be a streaming video newscast on a Web site, or a stock "ticker" that continually refreshes itself with updated stock information. Accessibility is also a key component to the effectiveness of rich media. It is most effective if it is developed with accessibility in mind and is able to run on different types of external players.

As broadband technology has made the Internet ever faster, more and more small businesses have turned to rich media to enhance their marketing communications. Not only can users view rich media on a personal computer with Internet access, mobile devices increasingly incorporate the technology. For the company that is already involved in marketing its products or services through a Web site or social media, rich media can be enormously helpful for the following reasons:

- Rich media provides marketing value. It can expand a brand, help sell a product, or explain a product or service. For instance, a virtual reality tour of a home can help a realtor provide a first look to a potential homebuyer without ever having to step through the front door. Likewise, an audio music clip can help a composer sell songs online, just as animation can help a Web designer garner new business.
- Rich media improves ease of use and the user experience on a Web site. For instance, a day care provider might utilize a Web cam to allow parents to see their children in real-time video that is password-protected, thereby offering reassurance and security.
- Rich media drives online traffic. Rich media techniques can help boost the number of visitors to a Web site, keep users on the site longer, encourage more page views, and perpetuate repeat visits.
- Rich media can be tailored to a target audience. The small-business owner who sells skateboards might create video showcasing products in use at a skate park. Similarly, an engineering firm can use rich media to create product demonstrations for potential customers, viewable right from the company's Web site.
- Rich media provides a competitive edge. Web sites that incorporate rich media are often more attractive to potential customers than sites without rich media.

Types of Rich Media. As mentioned, rich media is generally characterized by the use of audio, video, or animation. While rich media may encompass a variety of multimedia offerings, some of the most popular and useful to small businesses include:

- Streaming audio a method of delivering audio to a computer or mobile device. Streaming audio differs from other Internet audio types (such as MP3s) in one key way; it can be heard as it arrives at a computer, therefore eliminating the need to download an audio file. As the audio plays back, more data continues to arrive (or stream) to the computer. Listening to streaming audio requires a computer sound card, speakers or headphones, and the right software player (such as the aforementioned RealPlayer). Almost all software playback engines are free and easily downloaded over the Internet.
- Streaming video a method of delivering video to a computer or mobile device. Like streaming audio, streaming video allows a user to play a video as the information is streamed to the computer or mobile device. This is particularly useful to small businesses, as it is much easier to stream video from a Web site than to require users to download video files (which can take several minutes even on a high-bandwidth computer). Video streaming also requires the same software players that are used for audio streaming, including RealPlayer, QuickTime, and Media Player. One of the benefits to video streaming is the ability to conduct live events which can be streamed instantly to customers.
- Flash animation a cartoon or video animation that can be created using Adobe's Flash animation software and played on a Flash Player. Flash animation, when developed effectively, can be an attractive presence on a company Web site for potential customers. Most often, Flash content is embedded in a Web site, typically as an introductory animation file on the main landing page. It could be a 30-second introduction for a company's new product, for instance. It is important to note, however, that Flash animation code is not read by search engines. Therefore, anyone who uses Flash on a Web page should also place the navigation and content within the HTML code elsewhere on the Web page. Additionally, Flash animation can occasionally backfire. For instance, some marketers tend to overuse the technology. Having to sit through an entire Flash animation sequence can be tiresome to potential customers, who might choose to "skip intro" or navigate away from the Web site entirely. Cautious and spare use of Flash is advised.
- Widgets applications that can be embedded within a Web page, blog, or other social media to add functionality. Quizzes, games, event countdown

clocks, YouTube video playlists, and weather forecasters are among typical widgets that populate all types of social media. These are especially useful to small businesses since creating them requires no previous coding knowledge. Some businesses have even built widgets to help sell products or services and raise brand awareness.

Rich Media Considerations. Using rich media may be an attractive option for a small-business owner looking to expand his or her products or services, but a few considerations are necessary. Perhaps most importantly, an owner should determine whether the target audience will actually be able to use rich media. Young, Web-savvy customers are much more likely to have the plug-ins (software applications), know-how, and broadband speed to handle rich media applications than are older customers who might not regularly use the Internet for information purposes. In addition, doing rich media the right way will cost money. In *Web Marketing for Dummies*, Jan Zimmerman explains that Web users will know immediately if a rich media application looks terrible or does not work properly. "Good multimedia is rarely cheap," Zimmerman writes. "If you can't afford to do it right, don't do it at all."

Other important factors that should be considered prior to using rich media include; the ability to add rich media to an existing Web site at a future date; the ability to offer users an option to use Flash animation or a non-Flash version; letting viewers be able to control audio and video streaming and volumes; and whether incorporating rich media will be a justified expense (in terms of page visits, increased business, etc.). "Do not use rich media just because you can,"Zimmerman warns. "Establish a reason, an objective measure of value, and a way to measure impact on something other than your ego."

SOCIALLY RESPONSIBLE INVESTING

Socially responsible investment, also known as SRI, is an investment practice wherein people allocate their assets on the basis of their ethical or moral inclinations. Capital and investment decisions are made on the basis of one's personal beliefs. Sometimes individuals invest their money based on their own research; however, there are mutual funds and investment account firms that research "socially responsible" companies for investors. While socially responsible investing is most often linked to companies with eco-friendly and humanitarian business practices, it encompasses a wide variety of investment practices and is therefore subject to interpretation on the part of the investor.

DEFINITION OF SOCIALLY RESPONSIBLE INVESTING

Any investment made on the basis of one's personal beliefs may be deemed socially responsible. A company's business practices, political affiliations, and products may be used to determine which investments may be considered socially responsible. Most of these investments tend toward progressive companies that incorporate environmental conservation, preservation of human rights, and corporate responsibility into their business practices.

For the past couple of decades, investing in "green" companies that push toward environmental sustainability through their products and business practices has become rather popular. Other individuals or organizations choose to invest their money only in companies with a good humanitarian track record. Companies that use sweatshops, promote racism, or do not properly compensate their employees are not considered investment opportunities. Some people choose not to invest in companies in

certain regions of the world (for instance, communist countries such as China).

Entire countries have been excluded from investment lists due to their unwillingness to enforce the most basic of labor laws. Some individuals choose their investments very broadly, investing in organizations of a similar political orientation. By doing so, these individuals feel as though they are empowering the political causes they support, such as human rights or the environment. How money is invested in SRI varies widely. Mutual funds companies have sprung up over the last two to three decades that compile lists of stocks that they deem socially responsible using a variety of evaluation techniques. Individuals sometimes invest money themselves in the stock of companies that promote their belief system.

HISTORY OF SOCIALLY RESPONSIBLE INVESTING

People have been making business decisions based on their consciences for centuries, but the term "socially responsible investment" grew out of the overseas investing practices of the 1960s. When individuals began refusing to invest in South African companies (and the U.S. companies that supported them) due to the system of racial segregation known as apartheid, the SRI movement was born. Socially responsible investing has changed throughout the years to encompass much more than human rights. This is reflected in the investment firms and mutual funds holdings that have cropped up since the late 1960s.

Throughout the 1960s and 1970s, mutual funds were formed of "screened holdings," which were selected on the basis of both ethical and financial standards. The need for corporate responsibility later drove the socially responsible investment initiative as individuals became more and more concerned with the business practices of large companies.

Popularity of Socially Responsible Investing. Socially responsible investing accounts for a large portion of investment activity in the United States. It has been estimated that around one out of every seven invested dollars are wrapped up in SRI initiatives.

In the past, there has been a division between venture capitalism and socially responsible investment. Venture capitalists seek to make money by taking big financial risks, often on new technologies or innovations, in the pursuit of higher profits. Historically, venture capitalism has been a relatively cutthroat practice, with investors taking control of the businesses in which they invest and liquidating them quickly if they are not deemed profitable.

On the other hand, socially responsible investing seeks to make a profit by pouring money into organizations that are usually dedicated to making a political, social, or environmental difference. These companies will sometimes offer commercial solutions to problems with the creation of products and technologies that facilitate these goals, such as low-cost computers for third world nations or economically friendly packaging materials. Socially responsible companies might alternatively provide funding or philanthropy to organizations that promote their agenda, bolstering investor confidence.

Venture capitalism and socially responsible investment seem, at first glance, diametrically opposed to one another. However, due to technological advances, this is no longer the case. In recent years, there has been a convergence of socially responsible investment and venture capitalism. Eco-friendly products, for instance, are selling at much higher volumes than formerly, allowing individuals to capitalize on investment in such companies. These companies have a tendency to be extremely volatile and highly speculative, requiring individuals to take risks when including them in a portfolio. Picking and choosing the most promising socially responsible technology companies to invest in is nearly impossible, considering the history of environmentally friendly technologies that still have not gained wide acceptance. However, some investment firms are beginning to specialize in start-up companies pursuing environmental technology innovation. By combining private sector money with grants, such firms can maintain returns similar to those of established equity funds. The Terra Capital Fund, for instance, invests in private enterprises in South America with biodiversity benefits. The prototype carbon fund invests in companies that work toward sustainable development. The number of such funds continues to grow.

METHODS OF SOCIALLY RESPONSIBLE INVESTING

There are several different methods used by investment firms to make their list of holdings more socially responsible. The first of these, used in the 1970s and still widely popular, is known as negative screening (or exclusionary screening). Companies which use the negative screening method may weed out companies engaged in specific practices, such as arms manufacturers, tobacco and alcohol companies, and even unhealthy restaurants or food producers, from their lists of holdings.

Another method, known as qualitative screening, evaluates a company's strengths in areas that may affect investment, from employee treatment to environmental impact. As such, qualitative screening can allow an individual to assess very broadly how socially responsible a company truly is. A third type of screening evaluates companies against each other on the basis of optional initiatives like employee pay and going green. The

companies that pursue the most stringent voluntary standards are evaluated and classified as being the "best in class."

SRI has become such an important concept that investors are beginning to be concerned about the social responsibility of the holdings companies in which their funds are tied up. How these companies utilize the money of investors in their various holdings is scrutinized by investors. Not only do investors choose mutual funds firms on the basis of their holdings, they are interested in the social responsibility of the funds firms themselves. This creates the need for mutual funds companies to ensure that they are giving back a portion of their holdings to socially responsible initiatives. Some choose to funnel money back into the community in which they are based, building schools and inner-city programs. The tools that mutual funds companies use to evaluate corporations can also be used to evaluate the firms themselves.

Although these tools may satisfy many investors, others believe that only the very worst companies may be excluded from the holdings of these firms, allowing some companies with unfair business practices to end up in a mutual fund's holdings. These investors want to ensure that their investment dollars are going only to companies that they would personally support. Various avenues are available for such individuals to invest their money. Some firms create tailor-made portfolios for individuals of profitable companies that practice business according to the personal beliefs of the investor. Financial advisors can help individuals create a special portfolio that eschews corporations entirely, leaving them with a portfolio full of independent companies. Hundreds of screened mutual funds exist that help investors and companies invest their money responsibly, and each uses a slightly different methodology to determine that type of holdings that may be purchased. By tailoring investment choices to conform with personal ethics and beliefs, an investor can craft a guilt-free, profit-earning portfolio.

The need for a meaningful dialog between investors and companies has caused a move away from negative screening and toward engaging with companies to come up with solutions. Often, the result is mutually beneficial. Companies are more than happy to comply with investors' demands by making certain changes, which allows a company to foster goodwill among its base of investors, resulting in good publicity for the company. It makes sense to update outmoded business practices from a risk-management perspective, because a company thought by the public to be "socially responsible" is also viewed as having a better reputation. This creates the willingness among investors who advocate for certain causes to invest more money in the company. The result is a much more reciprocal relationship than what companies and investors once had. Fund management companies can pressure corporations whose environmental, social, or business practices could potentially cause their investments to fall into risk. Diminished shareholder value due to an increasingly informed base of investors may perhaps cause a company to reconsider its business practices. As a result, company rating systems outside of the negative, qualitative, and best-in-class screening methods have begun to be developed. Indices such as the FTSE4Good take into account multiple issues human rights, ecological impact, and shareholder relationships in order to give investors a rounded perspective on the company's commitment to social responsibility.

EFFECTS OF SOCIALLY RESPONSIBLE INVESTING

Concern over socially responsible investment is changing the way corporations function. Studies suggest that SRIs can make an impact in the way corporations operate, although such changes are rarely reflected in the price of the stock. Shareholder activists, who hold over a trillion dollars worth of investment, have filed resolutions with hundreds of companies to positively affect consumer health, the environment, and corporate business practices.

Examples abound of shareholder advocacy changing the way a company functions. During the apartheid era in South Africa, many individuals chose not to invest in companies that continued to do business in that country. Exxon, General Motors, IBM, and Goodyear were effectively forced to discontinue operations in South Africa when hundreds of millions of funds dried up from individuals who refused to invest in the companies. Another example was in the late 1990s, when General Electric's pollution of the Hudson River became news, and money was again divested from the company.

Due to the impact that a company's social practices may have on investor confidence, companies are moving forward to demonstrate their voluntary commitment to social responsibility. By doing so, they are often rewarded with consumer confidence and greater investor participation. Voluntary commitment to higher environmental standards and fair business practices became common fare for some of the world's largest companies throughout the 1990s, when oil corporations began affirming their commitment to self-imposed standards. One of the world's largest oil companies, Shell, released a statement of business practices in 1997 promising to uphold human rights as it pertained to their business. Dozens of corporations, including other oil companies and auto manufacturers, have since released public statements of business practices. While doing so has benefited socially responsible investors to a degree, companies are beginning to see some less welcome effects of their promises.

Most corporations prefer making voluntary commitments to social responsibility over broad government regulation, because they are able to make their own guidelines. However, such promises have often led to more governmental regulations. Environmental principles and human rights practices were legislated by governments worldwide in the early twenty-first century, in many cases after socially responsible investment brought such issues to the fore.

Socially responsible investment may be just as advantageous to the investor as it can for a company. In 1990 an index was created that measured the performance of socially responsible stocks. The Domini Social Index was the first of its type, and it demonstrated in its first few years of existence the advantage that socially responsible stocks may have over large corporations. In 1995 the index's returns were nearly a percentage point higher than that of the S&P 500, and in fact, its total return throughout the 1990s was higher as well. However, in 1999, sixty-seven stocks deemed socially responsible were also tracked against the S&P, and this time they underperformed the S&P. Throughout the 1990s and early years of the twenty-first century, such indices experienced a flux from one year to the next, sometimes dramatically outperforming more traditional indices and at other times underperforming them.

Nevertheless, projections indicate that over the long term, socially responsible stocks may have the upper hand. Tobacco companies, car manufacturers, and the alcohol industry are all sectors of the economy that have experienced adversity over the past couple of decades. This is reflected in the fact that at the beginning of the twenty-first century, socially responsible investors avoided such companies. Of screened portfolios, 96 percent avoided cigarette companies, and 80 percent avoided firms associated with gambling, alcohol, and defense. In contrast, socially responsible investment options are often weighted with technology, including advances in environmental sustainability and health care. As it is much easier for computer companies to comply with the environmental standards that many socially responsible investors are concerned with, technology stocks often appear in the holdings of such firms. Intel, HP, and Microsoft are three of the most commonly held stocks in SRI funds. The Ariel Fund, which favors diversity and avoids alcohol, tobacco, and firearms companies, has consistently outperformed the S&P since its inception in 1986. In a world where even the largest multinational corporations are moving toward greener, healthier, more efficient products, such investment may end up outpacing standard indices in the long term. Either way, financial return is possible in conjunction with socially responsible business investment.

EFFECTS OF SOCIALLY RESPONSIBLE INVESTING

Studies have shown that even when the market falters, socially responsible investment continues to thrive. During periods of sustained market volatility, socially screened funds have a tendency to equal or outpace the performance of funds that are unscreened. The numbers suggest that whether or not investors agree on the benefits and drawbacks of socially responsible investment, the trend is likely to continue to a point where SRI is widely considered a reasonable alternative to traditional investment. Indicators suggest that as SRI becomes more popular, and larger companies work toward satisfying the initiatives that such investors care about, companies and individuals both stand to gain. Individuals feel as though they are making money and making a difference at the same time, which encourages further investment.

Ethical investment of funds can be beneficial to businesses as well as individuals. Many businesses that promote an ethical agenda require a portion of company funds to be reinvested into companies that pursue ethical business practices. Doing so allows a company to assert its commitment to fair business practices, environmentally friendly initiatives, and humanitarian efforts. It also has a financial advantage: investing a company's funds in socially responsible companies and initiatives encourages investment in those businesses from socially conscious individuals, which results in more money for the business. Churches are among the most likely organizations to invest in socially responsible companies for different reasons. Most will refuse to support companies whose business practices are at odds with their faith, irrespective of returns. This underscores the subjectivity of socially conscious investing, which means something very different to every organization.

The business of government also benefits by socially responsible investment. A nation's political agenda can be pushed and reinforced on the basis of its international holdings. Whole governments may orient investment codes around socially responsible investment strategies in order to promote a progressive agenda. Policymakers often factor social responsibility initiatives (for example, fair treatment for female employees) into investment codes of their governments. For example, the Trade and Investment Promotion in Poland organized a trade show in Hungary in 2008 that showcased enterprises led by women. Cambodia's Better Factories initiative promoted improved labor standards. These initiatives were an attempt to encourage participation from socially responsible investors abroad.

Socially responsible investment is important for businesses that wish to create goodwill between the company and the base of investors. Allowing stockholders a

say in how the company pursues its business encourages investors to stick with a company for the long haul, which benefits both the investors and the business. Shareholders are becoming more vocal about the environmental and humanitarian environment of the company in which they have holdings. With shareholder advocacy on the increase, it is likely that socially responsible investing will become more and more popular. The number of large corporations who have moved toward more socially responsible business practices has resulted recently in increased investor activity, which benefits the global market as well as the global business climate. Governments are pressured by citizens to promote fair business and environmental sustainability, which causes the government to regulate the changes businesses are slowly beginning to make on their own. Moreover, the number of investors who care about the impact of their portfolio instead of the bottom line continues to grow.

SOLE PROPRIETORSHIP

The sole proprietorship is both the simplest and most common type of business operating in the United States today. Most businesses that are owned and operated by one person take this form; in fact, small-business owners who have sole ownership of their enterprises are automatically categorized under this business type if they do not take steps to legally establish themselves as another type of business. The essential feature of a sole proprietorship is that the law makes no distinction between the person, the sole proprietor, and the business. Virtually all of the legal and tax consequences associated with sole proprietorships flow from this basic fact.

ADVANTAGES OF SOLE PROPRIETORSHIP

Many aspects of sole proprietorship are attractive to entrepreneurs. Primary reasons why small-business owners choose to operate in this fashion include:

- Sole proprietors enjoy a great deal of independence and autonomy. The sole proprietor makes all the decisions. A sole proprietor decides what to sell and how to sell it, when to expand and when to pull back, when to look for financing, when to buy new equipment, when and how long to work, and when to take the day off. In some instances, sole proprietorships can benefit enormously as a result of this streamlined management structure. An entrepreneur who keeps abreast of business trends, community events, and other factors that can impact a company's fortunes may, in some cases, be able to adjust to changing business realities far more quickly than a partnership or corporation, where multiple owners and managers need to reach agreement on appropriate responses to changes in their business environment.
- Figuring taxes is fairly straightforward. Unlike other business types, sole proprietorships do not have to file separate income tax returns. In addition, FICA (Federal Insurance Contributions Act) taxes for such businesses are less than they are for partnerships or other legal operating forms. As Mike Piper notes in his 2009 book, *Surprisingly Simple: Independent Contractor, Sole Proprietor, and LLC Taxes Explained in 100 Pages or Less*, "One of the questions asked most frequently by new sole proprietors is, 'How am I taxed on money that I take out of my business?' In short, you aren't. As far as the IRS is concerned, you and your business are one in the same, Money that you move from your business checking account to your personal checking account is not taxable income. And, in turn, money that you move from your personal account to your business account is not a deduction. It's analogous to moving between two personal checking accounts the IRS doesn't care, and it will not show up on your tax return."

- Accounting is a relatively simple affair, although small-business experts encourage the owners of even the most modest business ventures to establish separate bank accounts and record-keeping practices for their enterprise. Sole proprietors can do this quite simply by establishing a "Doing Business As" (DBA) account that attaches to their personal checking or savings accounts. Such accounts can be set up at a local branch, or if the sole proprietor already has an Employer Identification Number (EIN), he or she can establish the DBA account online with many banks. This is usually easier to do if the business owner already uses online banking and billpay through his or her chosen bank.
- Business operations, too, are generally simpler in a sole proprietorship. Other forms of business often have to contend with more cumbersome or time-consuming regulatory requirements in conducting or reporting on their operations.
- Start-up costs are often modest. This is due in part to the fact that entrepreneurs who intend to establish sole proprietorships do not need to secure the services of an attorney to prepare documents required by state or federal agencies, since none are needed. In many cases, a sole proprietor may be working from his or her home, and business operations may require as little as a laptop and a cell phone with e-mail and Internet access.
- Business losses can be used to offset other income on personal tax returns. Conversely, business profits do not have to be shared with any other owners.
- Sole proprietors are not forbidden from securing and building a workforce. Indeed, many businesses that qualify as sole proprietorships (delicatessens, landscaping firms, canoe liveries, flower shops, etc.) have employees. Sole proprietors may operate a small business from their home while many contractors work for them from their homes anywhere in the world. For example, the sole proprietor of a financial transcription company may have transcriptionists in other states, or in China or India who transcribe live quarterly reports on the Internet, turn in their transcripts via e-mail, and get paid by the sole proprietor via PayPal once their work is turned in. It is the responsibility of the hired contractor to report income on his or her individual tax return; this is another benefit to the sole proprietor.

DISADVANTAGES OF SOLE PROPRIETORSHIP

While business owners who choose sole proprietorship understandably enjoy their autonomy and their freedom from the paperwork that can be considerable in other, more complicated, business types, they still need to consider the following drawbacks in the areas of liability and business financing.

"In a sole proprietorship," warned Jocelyn West Brittin in *Selecting the Legal Structure for Your Business*, "the business and the owner are one and the same. There is no separate legal entity and thus no separate legal 'person.' This means that as a sole proprietor you will have unlimited personal responsibility for your business's liabilities. For example, if your business cannot pay for its supplies, the suppliers can sue you individually. The business creditors can go against both the business's assets, including your bank account, car or house.... The reverse is also true; i.e., your personal creditors can make claims against your business's assets." Brittin does note that some states offer sole proprietors protection of their personal assets from business risks through legal designations that involve the owner's spouse or children, but such arrangements are complex, and should not be entered into without first consulting with an attorney. Business owners can also elect to purchase liability insurance for protection from lawsuits and other threats. In addition to general liability insurance, producers or sellers of goods may also want to consider securing product liability insurance. The cost of such insurance varies considerably depending on the type of business under consideration.

Raising capital for a sole proprietorship can be quite difficult as well (though many businesses that operate as sole proprietorships are of modest size and thus are not impacted by this reality). Many lenders are reluctant to provide financing to owners of sole proprietorships in large part because of fears about their ability to recover the funds should the owner die or become disabled and even those who make such loans require borrowers to provide personal guaranties on the loan. Sole proprietors who consent to such arrangements are in effect pledging their personal assets as collateral on the loan. Small-business advisors counsel clients who are considering these stipulations to proceed cautiously. If a potential lender is taking extra measures to protect itself from default, it may be an indication that the prospective borrower's business plan is viewed legitimately, perhaps as flawed or risky. In addition, even well-conceived businesses sometimes fail as a result of circumstances beyond the owner's control. An entrepreneur might, for example, establish a store that is enormously successful for its first few years of operation, only to see it suffer a dramatic downturn in performance with the arrival in town of a

much larger competitor that provides its customers with a wider variety of services and goods. Banks and other lending institutions are aware that such scenarios occur, and they plan accordingly.

SMALL BUSINESS LOANS FOR SOLE PROPRIETORS: THE ADDED DIFFICULTY

During tough times, the sole proprietor will have to be especially well bolstered, because in the end, he or she will not have the same safety nets that corporations and LLCs have. So while it is exceedingly advantageous to be able to maintain a schedule that works around their own lives, sole proprietors must take into consideration the pitfalls of financial uncertainty. One way of doing this is placing a home or other real estate in a trust that will in many cases protect it from creditors if a Chapter 7 bankruptcy is filed. If this is not possible, sole proprietors, especially those who operate in particularly unstable industries, may want to consult an attorney about filing for an LLC to protect their homes and other assets. As CEO of Walker Corporate Law Group, Scott Edward Walker, noted in his 2010 *Entrepreneur Corner* article, "The bottom line is that sole proprietorships have limited utility for entrepreneurs. If you're considering one, be sure the unlimited personal liability and lack of structure for equity issuances are things you're comfortable with. If they are, I'd definitely advise at least buying some comprehensive liability insurance from a reputable insurer to protect against lawsuits and other claims."

Continuity and Transferability. Unlike other businesses that can be passed down from generation to generation or continue to exist long after the passage of its original board of directors, sole proprietorships have a limited life. As Brittin wrote, "a sole proprietorship can exist as long as its owner is alive and desires to continue the business. When the owner dies, the sole proprietorship no longer exists. The assets and liabilities of the business become part of the owner's estate."

A sole proprietor is free to sell all or a portion of his or her business to a buyer, but any transaction that transfers ownership or turns the business into one with two or more owners puts an end to the sole proprietorship that had been in existence.

STARTING A SOLE PROPRIETORSHIP

Sole proprietorships often operate under the name of the owner of the business, but this is not a requirement. If the owner decides to select a fictitious name, however, he or she may be required to file a certificate explaining the arrangement in the region in which he or she is operating the business in question. This requirement also gives the sole proprietor legal protection, for it serves to protect them from other persons who might otherwise use the name for their own business enterprises. In addition, many states forbid business establishments from using words like "incorporated," "Co.," or "Inc." unless they actually qualify as corporations. Some cities and counties also require sole proprietorships to secure a business license before launching their business. Owners who subsequently change their business location or add new locations to their operation are often required to obtain new business licenses for those sites as well.

Many sole proprietorships also will need to obtain federal and state payroll ID numbers. These numbers are required for any businesses that will have employees or will do business with establishments that have employees. Finally, owners of sole proprietorships will, like all other business owners, have to obtain the appropriate operating licenses and certificates, if any, for the area in which they will be conducting business. Business licenses and zoning permits are among the types of licenses that are sometimes required, but for the huge numbers of sole proprietors operating Internet businesses, licensing will not be a worry so long as the goods or services are ordinary. Once these few minor licensing issues have been addressed, the sole proprietor is free to conduct business.

Once a sole proprietorship has been established and proven viable, many business owners eventually choose to incorporate. Incorporation is both more expensive and more time-consuming than sole proprietorship, but it also affords the business owner considerably more legal protection from lawsuits and other liabilities than does sole proprietorship, and it also makes it easier to secure financing for business expansion.

SPAM

Spam is a slang term that describes unsolicited commercial advertisements sent by e-mail over the Internet. Spam, which can be used as a noun or as a verb, is also known as junk e-mail or unsolicited bulk e-mail. According to Heather Newman, writing in the *Detroit Free Press*, the term comes from a skit by the Monty Python comedy troupe, in which a group of Vikings chant "spam, spam, spam, spam," to drown out all other conversation. It was adopted by early Internet users to describe annoying, unsolicited e-mail advertisements that crowd out legitimate communication. "Spam is an overwhelming fact of life for nearly every e-mail user," Newman wrote. "Some Internet webmasters say that more than half the traffic their computers handle is spam." Certainly any information technology professional knows that a huge part of setting up a small business server is protecting it with the proper software to keep it safe from spam infiltration.

THE COSTS OF SPAM

"The financial and psychological costs of spam are eroding the Internet's goodwill," Karen Rodriguez wrote in the *Phoenix Business Journal*. Spam causes problems for both e-mail users and the Internet Service Providers (ISPs) that offer access to the Internet to customers for a fee. Most e-mail users resent receiving spam messages because they fill up electronic mailboxes and are time-consuming to sort through. In addition, a large proportion of spam messages contain material that could be considered offensive or fraudulent. A survey of spam content conducted on behalf of Representative Gary Miller of California, cosponsor of proposed legislation to ban spam, found that 30 percent consisted of pornographic materials, another 30 percent consisted of get-rich-quick schemes, and the remainder included a variety of questionable business proposals and gambling opportunities.

According to a 2010 research report conducted by *Ferris Research*, the cost of spam in 2009 was $130 billion globally, of which $42 billion belonged to the United States. These numbers represent a 30 percent increase since 2007. Aside from this obviously very large loss, spam causes other costs to businesses that are extremely difficult to quantify. For example, there is the loss associated with having legitimate e-mails deleted because they fell into spam filters, and a loss in productivity time caused by searching often without success for e-mails that are lost in junk mail folders.

Companies that send out bulk e-mail defend the practice on several grounds. For example, they say that some small businesses cannot afford other forms of marketing. Sending bulk e-mail helps these businesses reach potential customers and compete with larger firms. Proponents of e-mail marketing also claim that their advertisements are a constitutionally protected form of free speech. Spammers try to justify their actions by claiming that companies should be allowed to take advantage of the online market and that people have no right to filter their mail. Clearly, consumers do have the right to control their own inboxes, but they also have the responsibility to respond accordingly by speaking up and saying they no longer wish to receive messages from this or that company or marketing firm.

But opponents of spam argue that Internet users end up paying to receive unwanted advertisements. By sending bulk e-mail to thousands of recipients, spammers create an increase in the load placed on ISP mail servers. ISPs must purchase bandwidth in order to connect their servers to the Internet. They buy bandwidth based on expected usage by their paying customers, and the cost accounts for a large percentage of their operating budgets. Spam ties up bandwidth and reduces processing speed, which causes an increase in costs for ISPs and a decrease in performance for their customers. So while it may cost a spammer only a few dollars to create and send an advertisement via e-mail, it may cost an ISP thousands of dollars to accommodate the spam. These costs are usually passed on to the ISP's customers, most of whom did not want to receive the spam in the first place.

WHICH ANTISPAM SOFTWARE IS BEST FOR BUSINESS?

In the very earliest days of the Internet, no one even considered the need for spyware, malware, or spam protection software packages. Now the question is not so much whether or not to get it, but rather, which kind to get and how all-encompassing a package a business owner may need. According to an article in *PC Magazine*, there

are a few choices, and the size of an operation and its unique individual needs will determine the best antivirus and spam-blocking protection software. *PC Magazine* writer, Neil J. Rubenking, makes a few suggestions. He notes that the securest computer in the world is the one that never connects to the Internet, but that kind of computer is an obsolete relic that has no place in the world of business.

Software options that are free can be effective, such as Avast, AVG, and some trial editions of other lower-end virus and spam protection software. However, in most cases these are not appropriate for a small business that uses a local network or server. The next group of software consists of those that fall into the "security suites" category. These are comprehensive packages that generally offer all the protections, including firewall protection (beyond system requirements), virus, rootkit, and spyware protection, as well as safeguards against malicious software and spam filtering. While the small-business owner may not have a need for loads of other applications in a protection software package, many of these comprehensive software suites do have a number of other protection services, such as secure file encryption and parental controls.

For the very serious business owner, or the business owner whose enterprise specifically focuses on a massive use of the Internet, open networks, Linux platforms, the dissemination of employee smartphones, and so on, a more comprehensive protection package will be required. For this, Rubenking recommends what he calls "mega-suites with backup." These types of protection software are very powerful, and they offer something fantastic a place online where the user's information is stored. In this way, even if a computer completely crashes from a virus, all the vital information held on that computer exists elsewhere. Depending on how much the user wants to spend, online storage can range enormously, from 2GB to 250GB and beyond. Rubenking recommends several mega-suites, among them Acronis Backup and Security 2010, CA Internet Security Suite Plus 2010, BitDefender Total Security 2010, and SOS Online Backup.

LEGISLATION TO CURB SPAM

Complaints from ISPs and Internet users have prompted several states to pass laws regulating spam. In 2003 the federal government also took action. Spam came under relatively mild regulation with the passage of the Controlling the Assault of Non-Solicited Pornography and Marketing Act, also officially called the CAN-SPAM Act of 2003 (Public Law 108-197). It took effect on January 1, 2004. The act requires that senders of unsolicited commercial e-mail label their messages, but Congress did not require a standard labeling language. Such messages are required to carry instructions on how to opt out of receiving such mail; the sender must also provide its actual physical address. Misleading headers and titles are prohibited. Congress authorized the Federal Trade Commission to establish a "do-not-mail" registry but did not require that the FTC do so. However, from 2007 onward, consumers who have e-mail accounts can place themselves on the National Do Not Mail List, which is offered as a free service from DirectMail.com. The aim of this effort is not just to eliminate the annoyance of unwanted messages; it is also an effort to prevent spam messages advertising adult products or services that could accidentally be seen by young children who are accessing a family computer. Consumers and small-business owners can also use the Privacy Rights Clearinghouse to stop spam and junk mail by visiting PrivacyRights.org.

In 2008 an update to the CAN-SPAM Act aimed to clarify some of the points of the original 2003 law. Broken down into four main categories, the FTC updated the following:

- The person in receipt of an unsolicited e-mail will never be required to pay any charges in relation to the e-mail, nor will he or she be required to offer up any personal or confidential information when he or she decides to send an "opt out" response to the sender.
- The CAN-SPAM Act was revised to make the responsible sender of the unsolicited e-mail more apparent to the recipient in an effort to ensure that the senders of spam are not breaking the rules of the act, and also to make it easier for the recipient of the e-mail to understand where he or she needs to go to opt out of the list of consumers and business owners who receive the unsolicited messages.
- The sender of spam of any kind is encouraged to include the most current, accurate physical address in some part of the body of the e-mail message. According to the FTC Web site, the address used in an unsolicited e-mail should be an "accurately-registered post office box or private mailbox established under United States Postal Service regulations to satisfy the Act's requirement that a commercial e-mail display a 'valid physical postal address'."
- The revisions made a clarification to make it understood that the term "person" to mean that it is not just individuals that must comply to the regulations outlined in the act. The idea was to dissuade solicitors from hiding behind the veil of a company or even false company name.

In effect, based on the provisions of CAN-SPAM, spam is not a computer crime unless, according to U.S. Code, Title 18, No. 1037, violation is committed "in

furtherance of any felony under the laws of the United States or of any State." However, despite its legal status, spam is a major annoyance and extracts a cost.

WAYS TO REDUCE SPAM

Strides have been made to curtail the number of spam messages that reach their intended audience. These strides appear to be the result, however, of companies spending time and money on spam filtering systems. The market for spam filtering and blocking services and software has grown rapidly and is likely to continue growing.

Other actions which can be taken to reduce the volume of incoming spam messages have to do with limiting the ways in which a person's e-mail address is exposed to the public. Spammers obtain e-mail addresses from a wide range of legal sources, including business cards, newspaper articles, Web pages, member lists, customer lists, and message postings. They even collect jokes, chain letters, and other frequently forwarded e-mail messages that have hundreds of addresses on the top. Prudent rules to follow to minimize e-mail address exposure include never replying to an e-mail message from spammers, even in order to use their "opt out" buttons; hiding the addresses of recipients if e-mail messages are forwarded to large groups of people; and not including linked e-mail addresses in the company Web site.

SPAN OF CONTROL

The concept of "span of control," also known as management ratio, refers to the number of subordinates controlled directly by a superior. It is a particularly important concept for small-business owners to understand because small businesses often get into trouble when the founder ends up with too wide a span of control. Span of control is a topic taught in management schools and widely employed in large organizations like the military, government agencies, and educational institutions. "Yet few entrepreneurs know the term or are willing to admit any limit to the number of people they directly oversee," explained Mark Hendricks in an article for *Entrepreneur* magazine. When a small-business owner's span of control becomes too large, it can limit the growth of his or her company. Even the best managers tend to lose their effectiveness when they spend all their time managing people and are unable to focus on long-term plans and competitive positioning for the business as a whole. A *Business Hub* article explains the two extremes of management control. "Too wide a span may mean that managers are overstraining themselves and that the subordinates are receiving too little guidance or control. Too narrow a span possibly will denote that managers are underutilized and that their subordinates are over controlled."

The concept of span of control was developed in the United Kingdom in 1922 by British general Sir Ian Hamilton (1853 1947). It arose from the assumption that managers have finite amounts of time, energy, and attention to devote to their jobs. In studies of British military leaders, Hamilton found that they could not effectively control more than three to six people directly. These figures have been generally accepted as the "rule of thumb" for span of control ever since. More than a decade later, A.V. Graicumas illustrated the concept of span of control mathematically. His research showed that

the number of interactions between managers and their subordinates and thus the amount of time managers spent on supervision increased geometrically as the managers' span of control became larger. While some business owners and managers accept these mathematical theories for span of control, other more progressive managers will tailor their span of control based on empirical data compiled over the life of their businesses to determine what ratio works best for their unique enterprise. After all, a small Internet business will likely need fewer managers and a less hierarchical structure, while a massive, older corporation may do best to leave its more classic span of control formula intact so long as it still serves its purpose and makes meeting the company's mission as easy as possible.

It is important to note that all managers experience a decrease in effectiveness as their span of control exceeds the optimal level. In other words, the limitations implied by span of control are not shortcomings of certain individual managers but rather of managers in general. In addition, it is important to understand that span of control refers only to direct reports, rather than to an entire corporate hierarchy. Even though a CEO may technically control hundreds of employees, his or her span of control would only include the department heads or functional managers who reported to the CEO directly. "When given enough levels of hierarchy, any manager can control any number of people albeit indirectly," Hendricks noted. "But when it comes to direct reports, the theory [of span of control] suggests entrepreneurs must respect managers' inborn limits."

Entrepreneurs and small-business owners are particularly susceptible to overextending their span of control. After all, many of these people have started a business from the ground up and are wary of losing control over its operations. They thus choose to manage lots of people directly, rather than delegating tasks to middle managers, in an effort to continue being involved in key decisions as the business grows. But this strategy can backfire, as Hendricks explained: "Extending span of control beyond the recommended limits engenders poor morale, hinders effective decision making, and may cause loss of the agility and flexibility that give many entrepreneurial firms their edge."

ORGANIZING TO OPTIMIZE MANAGERS' SPAN OF CONTROL

Establishing the optimal span of control for managers is one of the most important tasks in structuring organizations. Finding the optimal span involves balancing the relative advantages and disadvantages of retaining responsibility for decisions and delegating those decisions. In general, studies have shown that the larger the organization, the fewer people should report to the top person. Managers should also have fewer direct reports if those subordinates interact with each other frequently. In this situation, the supervisor ends up managing both his or her relationship with the subordinates and the subordinates' relationships with one another.

Over the years, business analysts and consultants have tried to come up with a magic formula for span of control. This is generally not possible in a world where businesses are extremely multifaceted, exist in a global marketplace, and have employees across many locations, even on different continents. According to an October 2009 *eNotes Business Group* submission, "An optimal/ideal span of control according to the modern authors is fifteen to twenty subordinates per manager, while according to the traditional authors the ideal number is six subordinates per manager." The article notes that a span of control depends upon many factors, such as the nature of an organization, skills and capabilities of the manager, the employee's skills and abilities, the nature of the job, and the degree of interaction required between superior and subordinates.

Some other factors affecting the optimal span of control include whether workers perform tasks of a routine nature (which might permit a broader span of control) or of great variety and complexity (which might require a narrower span of control), and whether the overall business situation is stable (which would indicate a broader span) or dynamic (which would require a narrower span). Other situations in which a broader span of control might be possible include when the manager delegates effectively; when there are staff assistants to screen interactions between the manager and subordinates; when subordinates are competent, well-trained, and able to work independently; and when subordinates' goals are well-aligned with those of other workers and the organization.

There are advantages and disadvantages to different spans of control. A narrow span of control tends to give managers close control over operations and to facilitate fast communication between managers and employees. On the other hand, a narrow span of control can also create a situation where managers are too involved in their subordinates' work, which can reduce innovation and morale among employees. A wide span of control forces managers to develop clear goals and policies, delegate tasks effectively, and select and train employees carefully. Since employees get less supervision, they tend to take on more responsibility and have higher morale with a wide span of control. On the other hand, managers with a wide span of control might become overloaded with work, have trouble making decisions, and lose control over their subordinates.

With all of these factors to consider, small-business owners might become overwhelmed with the task of

finding the optimal span of control. But Hendricks claimed that evaluating the situation and making a decision should not be too difficult. "The rule of thumb that an executive should supervise three to six people directly held up fairly well against challenges from efficiency experts, team-building zealots, technology buffs, empowerment boosters, megalomaniacs, and others determined to increase the accepted span of control," Hendricks wrote. "If the calculations are too much for you, just take a look at the amount of hours you're working. When workdays for the people at the top are twice what they are for others, span of control is out of whack."

TECHNOLOGY AND COMMON SENSE IN SPAN OF CONTROL

Span of control has evolved tremendously since the days of Sir Ian Hamilton. Interoffice instant messenger systems, Blackberry messenger services used via enterprise servers to speak to employees and managers on and off work sites, and the use of cloud computing are just a few things that have dramatically changed the landscape of management and how employees are managed. In January 2010, Ashim Gupta released his *Practical Management* article about span of control within organizations. He offers a breakdown of the most important things to consider regarding span of control in management in the twenty-first century. These important considerations are information technology (IT), additional training, and work design.

- Information technology allows for better management in span of control because it simply makes things easier. Communication is faster, information is more readily available, and management of people and projects can be done virtually, using such programs as Skype, AIM, Trillian, and Microsoft Project Manager.
- Gupta explains "more training" may seem simple enough, but it's a simple thing that can help determine span of control needs that many businesses overlook. Gupta writes, "Investing in training the employees for the current job skills and also future skills makes them more independent. Constantly involving the employees in various trainings not only increases the collective intelligence within the organization but also results in readily available resource pool in-house."
- Usually, if the manager/employee relationship allows for a little more autonomy, the nature of the relationship will be healthier. Additionally, employees who are given the room to work independently often show that they are capable, can successfully meet deadlines, and are less dependent upon upper management. This reduces the potential for conflicts, and reduces the need for overmanagement.

STAKEHOLDERS

Stakeholders are people or groups of people who have a vested interest in an entity. For a small business, a variety of players may qualify as stakeholders, including shareholders (people who own stock or equity interest in the company), employees, managers, owners, government, and local interests. Each holder's "stake" can be distinct. For a shareholder who owns a majority of a company, his or her stake would be the financial investment or stock purchased in that company. For an employee or manager, it may be job security or compensation that is tied directly to a company's financial performance. A government stakeholder may be interested in solidifying the long-term financial strength of a struggling firm, particularly one that is an important part of a community or industry.

In recent years financial experts and small-business observers have promoted the concept of "stakeholder theory," or the idea that in order to be successful, a business must create value for all its stakeholders. Management's challenge is to find how to steer stakeholder interests in the same direction. R. Edward Freeman, a

professor of business administration at the University of Virginia, noted that a company's products or services should not only be attractive to customers, but positively impact the local community and relate to what the employees excel at. For instance, consider a scenario in which the CEO of a chemical company tells a group of engineers that a plant should produce zero pollution. The engineers say that goal is unreasonable, so the CEO suggests closing the plant. A few weeks later, the engineers return to the CEO with a plan that not only eliminates pollution from the plant but saves the company money. That, argues Freeman, is how stakeholder theory ultimately produces a win. "They wouldn't accept the trade-off. They found the way to satisfy the interest of the community and the interest around the environment, and the interest of employees," Freeman wrote. "When you look for how these interests go in the same direction, you're able to create something."

TYPES OF STAKEHOLDERS

In general, stakeholders can be grouped into two main divisions: internal and external. Internal stakeholders are those people or groups that are typically involved in the daily operations of a business. In many ways they have the most crucial role as stakeholders in ensuring the effective creation and marketing of a product or service. Employees are the most common stakeholders found in the small business environment. Some companies make an employee's stakeholder status explicit upon hiring or after a probationary period. For an employee, the title of stakeholder may come with certain benefits, such as company stock, financial merit awards, or actual percentage ownership of the company. At some businesses, stakeholder status is a less explicit concept whose benefits may be less tangible but no less important. For instance, management might implore employees to be "good stakeholders" by selling more products or services to boost the company's bottom line. In this case, being a "stakeholder" has more to do with being committed to a company and improving one's own processes to help improve overall business results.

Perhaps even more so than employees, managers have a keenly vested interest as stakeholders in a company. Business success is often based on how effectively managers steer a company. In this way, management stakeholders are similar to employees in that their success may translate to such benefits as stock options and other financial awards. Managers may, however, have certain liabilities as company stakeholders. For instance, if a company's profit falls from one year to the next, so too might a CEO's potential bonus. Likewise, a company that fails can have a devastating impact on managers who claim a financial or incentive stake in that company.

To the small, family-owned business, family members can become important stakeholders. Whether it is donating capital to help finance a new company's start-up phase, serving on a company's board of directors, or simply running the company, family members are an oft-tapped source of stakeholder equity and involvement for the family-owned business.

External Stakeholders. External stakeholders have a more distant but no less critical role in a company's success. Customers are important stakeholders by virtue of how they respond to a company's products or services. Small businesses can glean important information from their clients just by listening to what they think of their offerings. Market research is one outgrowth of a desire to understand customer preferences better. Complaints and suggestions can be routed through a customer service department. Some companies even involve customers in the product development stage, including design and testing.

"The goal is to enhance timely communications between the company and its customers, and, through this process, both parties benefit," wrote Gregory Steffens for Gaebler Ventures. "Consumers receive a product that encompasses their specifications while the company earns the profit and brand equity from having a high-quality product."

Customer stakeholders can have an enormous impact on managerial decisions. For instance, an outgoing CEO who handpicks a successor should be wary of how customers might view that potential new executive. What kinds of exchanges has the successor had with customers in the past? Would customers remain loyal to the company if he or she is chosen to become its new leader? Assessing stakeholder sentiments about management changes is crucial in creating a smooth change of command, wrote Marshall Goldsmith in *Business Week*. "Ask an important question, 'Will this candidate be given a fair chance, not only by me, but also by the key stakeholders who are critical to his or her future success?' If this answer is no, and if you cannot change key stakeholder perceptions, look for another candidate."

Shareholders are another obvious type of external stakeholder. A shareholder can be anyone who owns stock in a public company or someone who has invested equity into a company for capital purposes. A shareholder does not necessarily get involved in the day-to-day operations of a business, but follows its progress by tracking company news, reading public disclosure statements such as annual reports, and closely monitoring the company's stock performance. In some cases, shareholders may also serve on a company's board of directors, thereby reviewing managerial decisions and helping to shape the course of a company's future.

Vendors are also important stakeholders to the success of a small business. Companies are well-served by seeking out suppliers that offer quality products or services at competitive prices. Vendors that step out from the rest stand to gain an important stake in that company, since they become a preferred business partner. Whether providing a product or service to that small business, the vendor is interested in growing its business relationship and therefore has a stake in the business' success. After all, a vendor can often have the power to increase or decrease a business' profit margins.

Vendor stakeholders are not just interested in signing purchase contracts, however. The most effective vendor-stakeholder relationships are the ones where vendors are involved from the start in the product design process. Noted Steffens, "Due to their expertise or knowledge regarding the supplied resource, suppliers may provide suggestions about improving a product's design and characteristics. Eventually, this cooperation could give rise to joint developments of new products that can benefit both companies."

A government agency or organization is an increasingly common source of stakeholder benefits to a company. The government often becomes a stakeholder in a company when the state of the economy or strength of public finances is inherently dependent on that company's effectiveness as a going concern. When the three largest U.S. automakers were threatened by insolvency in 2009, for instance, the federal government stepped in as a stakeholder. Poor management enhanced by recessionary pressures forced General Motors, Ford, and Chrysler to the edge of closure. At the behest of the administration of President Barack Obama, Congress approved a plan to provide billions of dollars to GM and Chrysler (Ford turned down the bailout offer and later turned a profit) to keep the automakers in business. By delivering a bridge loan to the companies, the government became a majority stakeholder in both, thereby stripping them of private status until they could function independently.

The government's role as stakeholder is a controversial one at best. Citizens' groups protest the use of taxpayer funds to save failing companies, and executives at some of the recipient firms complain of too much government meddling in their daily operations.

Community stakeholders. Local residents can also be important stakeholders in a company. Local stakeholders are not necessarily involved in the operational aspects of a business, but may have interest in the outward impacts a company might have on a community. For instance, residents might be interested in whether a business promises to hire people from the community. Locals also become stakeholders when they speak out about how a business affects their daily lives. Noise, traffic congestion, caused by a business's location, and pollution are all factors that local residents voice concern over. Even when picketing a company headquarters or going to City Hall with concerns over a business's local impacts, residents are important company stakeholders when it comes to a business's future prospects in a community.

STAKEHOLDERS AND SMALL BUSINESS BENEFITS

Once stakeholders are identified, managing them becomes the main task at hand. A small-business owner should contemplate how his or her employees see themselves in the value-creation process. Or, perhaps, a small business owner might focus on what one critic has to say about the company's product. Starting with one stakeholder is a good first step in understanding how all stakeholders are connected to a company. A number of resources are available to small businesses for determining and managing stakeholder needs and expectations. Stakeholder expectation analysis worksheets are helpful in identifying specifics related to what every stakeholder expects as well as criteria for effectively managing those relationships.

Much of the literature surrounding stakeholders deals primarily with large businesses, although some experts contend it is equally, if not more, important for small businesses. Small businesses are no less committed to creating value for their stakeholders, notes Freeman. At some point, a small business will either make its own products or hire suppliers to do so. Customers will eventually want to buy those products. The business will start to be an important part of its community. All these various stakeholders require a business owner's attention, Freeman contends, and with the proliferation of communications technology, stakeholders have immediate contact with a business. Thus, managing their interests can help pave the way toward a vibrant business.

STANDARD MILEAGE RATE

The standard mileage rate (SMR), also known as mileage per diem, is the amount per mile that the Internal Revenue Service (IRS) allows small businesses and self-employed persons to use to calculate their vehicle expenses for tax deduction purposes. Businesses that choose to use the standard mileage rate do so because it is easier to use than the actual costs method, which requires keeping complete records of expenses like gasoline, maintenance, tires, insurance, and license and registration fees. The standard mileage rate for business can be used for all mileage accumulated for work-related trips. Normal commuting between home and work does not qualify for this type of deduction.

The standard mileage rate is determined by the IRS and is routinely adjusted, but not more often than once a year. As of January 1, 2010, the standard mileage rate was set to 50 cents per mile for the year. In unique circumstances, the IRS will make midyear changes, such as in the late summer of 2005 when the standard mileage rate was increased in an attempt to allow for a summer of devastating hurricanes, the loss of oil-refining capacity in the Gulf of Mexico, and the subsequent rise in gas prices. The IRS explained the adjustment this way: "In September, the IRS made a special one-time adjustment for the last four months of 2005, raising the rate for business miles to 48.5 cents per mile in response to a sharp increase in gas prices, which topped $3 a gallon." The 2006 rate was lowered following stabilization in gas prices. In 2008 a mid-year change to the SMR was made to balance out another sharp increase in gas prices; by 2009 the SMR was 55 cents per mile, five cents higher than the following year in which gas prices settled down for the most part, at least compared to the fluctuations of the previous 5 years or so.

A different rate is set by the IRS for miles driven "for medical or moving purposes" and those driven "in service of charitable organizations." The 2010 standard mileage rates per mile driven for these two categories were 24 cents and 14 cents, respectively.

The standard mileage rate can be used for vehicles that a business owns. In addition, the IRS decided in 1998 that the SMR can also be used for leased vehicles, provided that one uses the standard mileage rate for the duration of the lease (or the balance of the lease if it began before 1998).

RESTRICTIONS ASSOCIATED WITH THE STANDARD MILEAGE RATE

While the standard mileage rate is quite practical, it may not be used in several situations. One instance would include taxis and other vehicles for hire that charge for mileage in the first place. Also, if a fleet-type business is using more than one vehicle at the same time, it cannot use the standard mileage rate, although it can use it if it owns two or more vehicles that are not being used concurrently. Rural mail carriers that already receive a qualified reimbursement are also not eligible for the standard mileage rate.

In addition, small businesses that decide to use the standard mileage rate for a vehicle must do so in the first year that the vehicle is placed into service. In later years, a business can switch to the actual cost method if it so desires. However, a straight-line method of depreciation, which yields a smaller deduction, must be used in all subsequent years for vehicles that initially used the standard mileage rate.

The standard mileage rate already has vehicle depreciation built into it, meaning that one cannot claim additional depreciation when using this form of deduction. Also, businesses that sell a car that has used the standard mileage rate will have to figure out whether any taxable gains were made on the sale and adjust the tax basis of the vehicle for each year the SMR was applied. Finally, the standard mileage rate and the 'actual costs' method cannot be used at the same time.

STANDARD MILEAGE AND THE SMALL BUSINESS OWNER

Some small-business owners may be exceedingly aware of SMR because they deal with it every day couriers, delivery persons, truckers, and moving companies, for example. But many other small-business owners forget or disregard their mileage, thinking it will not make that much difference. This is quite often untrue and means a loss at the end of the day. For example, an IT professional with clients all over a given city may not be clocking his or her mileage between one office to the next, yet extensive traveling, no matter what the industry, means mileage, which means tax deductions. Whether the business owner is a pastry chef working from his or her own kitchen, or a Web entrepreneur, once behind the wheel for business purposes, miles should be clocked and accounted for.

Stephen Fishman noted in his 2009 book, *Home Business Tax Deductions: Keep What You Earn*, "If your home office is your principal place of business, you can deduct the cost of traveling from your home to other work locations for your business. For example, you can deduct the cost of driving to perform work at a client's or customer's office. The value of this deduction often exceeds the value of the home business deduction itself. If you don't have a home office, these costs are not deductible." Fishman also noted that there are common misconceptions about what should be considered mileage versus what actually is, and what business owners know about mileage can be surprisingly little. For example, if a business owner has a friend or relative who does not work for the company deliver something to a client's house, the miles traveled are deductible for tax purposes. Conversely, however, those who are employed may not use mileage as a tax deduction when it accounts for commuting to and from an office. For this reason, while it may not seem to make sense to some, becoming a contractor and working from home can not only save money, it also means that any traveling done will be deductible, unlike those long treks to and from an office where one is a W-2 employee.

OTHER SMALL BUSINESS SMR CONCERNS

Sole proprietors and microbusinesses are not the only ones that should be using the SMR to determine deductions and costs. Other small businesses need to stay current on IRS mileage valuation because it will determine their own bottom line, how much they opt to pay employees or contractors, and how they will record the mileage for one vehicle or a fleet that is used to run the business. (Although standard mileage rates will only apply to companies whose fleets do not run concurrently, other deductions will apply.) As Sheppard Mullin comments in his January 2010 post on *Labor Employment Law Blog*, "Even if employers supply their own vehicles, they can apply this rate to calculate the allowable deduction for the business use of a vehicle for Federal income tax purposes." So, whether the business uses company cars, vans for deliveries, or even trucks for a nonprofit endeavor, there are deductions for nearly any venture that uses motor vehicles in any way.

Small-business owners should make an effort to stay on top of the standard mileage rates for any given year. Generally, the rates will stay the same in a given federal fiscal year, but if gas prices spike in one direction or another, the savvy entrepreneur will check the IRS Web site for press releases about any changes in SMR.

STOCKS

Securities issued by a corporation are classified as debt, equity, or some hybrid of these two forms. Debt usually takes the form of a loan and must be repaid; equity usually takes the form of an ownership claim upon the corporation. The two main types of equity claims are common stock and preferred stock, although there are also related claims, such as rights, warrants, and convertible securities. Growing companies, which tend to lack the assets necessary to secure debt, often decide to issue equity securities. Although issuing common stock can be traumatic for a small business because it can be costly, and because it causes a dramatic redistribution of ownership and control it can also provide a solid foundation upon which to build a company. Preferred stock offers holders priority in receiving dividends and in claiming assets in the event of business liquidation, but it also lacks the voting rights afforded to common stockholders. Many venture capitalists require convertible preferred stock which can be converted to common stock at some time in the future at a favorable price as incentive to invest in start-up ventures. In addition, common stocks represent stock option benefits for those employed by a company. As Joshua Rosenbaum and Joshua Pearl wrote in their 2008 book, *Investment Banking: Valuation, Leveraged Buyouts, and Mergers and Acquisitions*, "Stock options are granted to employees as a form of non-cash compensation. They provide the right to buy (call) shares of the company's common stock at a set price ('exercise' or lsquo;strike' price) during a given time period."

COMMON STOCK

A share of common stock is quite literally a share in the business, a partial claim to ownership of the firm. Owning a share of common stock provides a number of rights and privileges. These include sharing in the income of the firm, exercising a voice in the management of the firm, and holding a claim on the assets of the firm.

Dividends. Sharing in the income of the firm is generally in the form of a cash dividend. The firm is not obligated to pay dividends, which must be declared by the board of directors.

For widely held, publicly traded firms, there are a number of indications that shareholders and investors like dividends and dividend increases. In these contexts, dividends are taken as a signal that the firm is financially healthy. A decrease in dividends would indicate inability to maintain the level of dividends, signaling a decline in prospects. An increase would signal an improvement in prospects. The signal from a dividend decrease is strong because management will wish to give only positive signals by at least maintaining the dividend, making cuts only when absolutely necessary. The signal from a dividend increase is also strong because management would be hesitant to increase dividends unless they could be maintained. The signaling nature of dividends is supported by cases in which the dividend is maintained in the face of declining earnings, sometimes even using borrowed funds. It is also supported by the occurrence of "extraordinary" or one-time-only dividends, a label by which management attempts to avoid increasing expectations.

This signaling approach is not applicable to closely held firms. In this situation, communication between management and shareholders is more direct, and signals are not required. When owners are also the managers, sharing in earnings may take the indirect form of salaries and fringe benefits. In fact, shareholders in closely held firms may prefer that dividends be reinvested, even in relatively low return projects, as a form of tax protection. The investment is on a pretax (before personal tax) basis for the investor, avoiding immediate double taxation and converting the income to capital gains that will be paid at a later date.

Dividends are declared for stockholders at a particular date, called the date of record. Since stock transactions ordinarily take 5 business days for completion, the stock goes "ex-dividend" 4 days before the date of record, unless special arrangement is made for immediate delivery. Since the dividend removes funds from the firm, it can be expected that the per share price will decrease by the amount of the dividend on the ex-dividend date.

Control. The corporate form allows the separation of management and ownership, with the manager serving as the agent of the owner. Separation raises the problem of control, or what is termed the agency problem. Stockholders have only indirect control by voting for the directors. The directors in turn choose management and are responsible for monitoring and controlling management's conduct. In fact, the stockholders' ability to influence the conduct of the firm may be quite small, and management may have virtually total control within very broad limits.

Voting for the directors takes either of two forms. The first form is majority voting. In this form, each stockholder receives votes for each open position according to the number of shares held, and may cast those votes only for candidates for that position. The winning candidate is the candidate receiving a majority of the votes cast. The second form is called cumulative voting. In this form, stockholders again receive votes for each open position according to the number of shares held, but may apportion the votes among the positions and candidates as desired. The candidates receiving the most votes are elected.

Excluding minority stockholders from representation on the board is more difficult under cumulative voting. For example, if there are four directors to be elected and one million shares eligible to vote at one vote per share, a stockholder with 500,001 shares would control the election. Under majority voting a dissident stockholder with 200,001 shares could cast only 200,001 votes apiece for candidates for each of the four positions, which would not be sufficient to ensure representation on the board. Under cumulative voting, a dissident stockholder with a minimum of 200,001 shares could be sure of representation by electing one candidate of choice, casting a cumulative 800,004 votes for that candidate. The remaining 799,999 shares could be sure of electing three chosen candidates but could not command sufficient votes to exceed the cumulative dissident vote four times.

Although the board of directors is supposedly independent of management, the degree of independence is sometimes small. Typically, some members of the board are "insiders" drawn from management, while others are "outside" directors. Outside directors may not be completely independent of management for several reasons. One reason is that few shareholders can afford the time and expense to attend the annual meetings, so that voting is done through the mail, or via e-mail, or by virtual meetings using Skpe, Vonage, or Microsoft Meeting. This usually takes the form of a "proxy," giving management the power to vote for the shareholder, as instructed. While the shareholder may instruct management on how to vote, the choices may be few and are controlled by management. Management will tend to nominate safe candidates for directorship who will not be likely to challenge the status quo. As a result, directorship is at times an honor or sinecure, treated as having few real obligations.

Dissidents may mount opposition and seek the proxy votes, but such opposition is liable to face legal challenges and must overcome both psychological barriers and shareholder apathy. Many shareholders either do not vote or routinely vote for existing management. Further, dissidents must spend their own money, while management has the resources of the firm at its disposal.

In addition to controlling the proxy system, managements have instituted a number of other defensive mechanisms in the face of takeover threats. It is not unusual to find several ''classes'' of stock with different voting power, with some classes having no voting power at all. A number of firms have changed from cumulative to majority voting. Staggered boards, in which only a portion of the board terms expire in a given year, and supermajority voting policies have also been used. Takeover defenses include the golden parachute, or extremely generous severance compensation in the face of a takeover, and the poison pill, an action that is triggered by a takeover and has the effect of reducing the value of the firm.

Residual Ownership. The common stockholder has a claim on the assets of the firm. This is an undifferentiated or general claim, which does not apply to any specific asset. The claim cannot be exercised except at the breakup of the firm. The firm may be dissolved by a vote of the stockholders, or by bankruptcy. In either case, there is a well-defined priority in which the liabilities of the firm will be met. The common stockholders have the lowest priority and receive a distribution only if prior claims are paid in full. For this reason the common stockholder is referred to as the residual owner of the firm.

Preemptive Right. The corporate charter will often provide common stockholders with the right to maintain their proportional ownership in the firm, called the preemptive right. For example, if a stockholder owns 10 percent of the stock outstanding, and 100,000 new shares are to be issued, the stockholder has the right to purchase 10,000 shares (10 percent) of the new issue. This preemptive right can be honored in a rights offering. In a rights offering, each stockholder receives one right for each share held. Buying shares or subscribing to the issue then requires the surrender of a set number of rights, as well as payment of the offering price. The offering is often underpriced in order to assure its success. The rights are then valuable because possession of the rights allows subscription to the underpriced issue. The rights can be transferred and are often traded.

A rights offering may be attractive to management because the stockholders, who thought enough of the firm to buy its stock, are a pre-sold group. The value of the preemptive right to the common stockholders, however, is questionable. The preemptive right of proportional ownership is important only if proportional control is important to the stockholder. The stockholder may be quite willing to waive the preemptive right. If the funds are used properly, the price of the stock will increase, and all stockholders will benefit. Without buying part of the new issue, the stockholder may have a smaller proportional share, but the share will be worth more. While rights are usually valuable, this value arises from underpricing of the issue rather than from an inherent value of rights. The value of the rights ultimately depends on the use of the funds and whether or not the market views that use as valuable.

Valuation. In investment practice, decisions are more often expressed and made in terms of the comparative expected rates of return rather than on price. A number of models and techniques are used for valuation. A common approach to valuation of common stock is present value. This approach is based on an estimate of the future cash dividends. The present value is then the amount which, if invested at the required rate of return on the stock, could exactly recreate the estimated dividends. This required rate of return can be estimated from models such as the capital asset pricing model (CAPM), using the systematic risk of the stock, or from the estimated rate of return on stocks of similar risk. Another common approach is based on the price-earnings ratios, or P/E. In this approach, the estimated earnings of the firm are multiplied by the appropriate P/E to obtain the estimated price. This approach can be shown to be a special case of present value analysis, with restrictive assumptions. Since various models and minor differences in assumptions can produce widely different results, valuation is best applied as a comparative analysis.

In some cases, such as estate valuation, the dollar value of the stock must be estimated for legal purposes. For assets that are widely publicly traded, the market price is generally taken as an objective estimate of asset value for legal purposes, since this is sale value of the stock. For stock that is not widely traded, valuation is based on models such as present value, combined with a comparison with similar publicly traded stock. Often, however, a number of discounts are applied for various reasons. It is widely accepted that, compared to publicly traded stock, stock that is not publicly traded should be valued at a discount because of a lack of liquidity. This discount may be 60 percent or more. Another discount is applied for a minority position in a closely held stock or a family firm, since the minority position would have no control. This discount does not apply if the value is estimated from the value of publicly traded stock, because the market price of a stock is traded already at the price of a minority position. There is an inverse effect for publicly traded stock in the form of a control

premium. A large block of stock which would give control of the firm might be priced above market.

Finally, it should be noted that the accounting book value is only rarely more than tangentially relevant to market value. This is due to the use of accounting assumptions such as historic cost. While accounting information may be useful in a careful valuation study, accounting definitions of value differ sharply from economic value.

PREFERRED STOCK

Preferred stock is sometimes called a hybrid, since it has some of the properties of equity and some of the properties of debt. Like debt, the cash flows to be received are specified in advance. Unlike debt, these specified flows are in the form of promises rather than of legal obligations. It is not unusual for firms to have several issues of preferred stock outstanding, with differing characteristics. Other differences arise in the areas of control and claims on assets.

Dividends. Because the specified payments on preferred stock are not obligations, they are referred to as dividends. Preferred dividends are not tax-deductible expenses for the firm, and consequently the cost to the firm of raising capital from this source is higher than for debt. The firm is unlikely to skip or fail to declare the dividend, however, for several reasons. One of the reasons is that the dividends are typically (but not always) cumulative. Any skipped dividend remains due and payable by the firm, although no interest is due. One source of the preferred designation is that all preferred dividends in arrears must be paid before any dividend can be paid to common stockholders (although bond payments have priority over all dividends). Failure to declare preferred dividends may also trigger restrictive conditions of the issue. A very important consideration is that, just as for common dividends, preferred dividends are a signal to stockholders, both actual and potential. A skipped preferred dividend would indicate that common dividends will also be skipped, and would be a very negative signal that the firm was encountering problems. This would also close off access to most lenders.

There is also a form of preferred stock, called participating preferred stock, in which there may be a share in earnings above the specified dividends. Such participation would typically only occur if earnings or common dividends rose over some threshold, and might be limited in other ways. A more recent innovation is adjustable-rate preferred stock, with a variable dividend based on prevailing interest rates.

Control. Under normal circumstances, preferred stockholders do not have any voting power. As a result, they have little control over or direct influence on the conduct of the firm. Some minimal control would be provided by the indenture under which the stock was issued, and would be exercised passively that is, the trustees for the issue would be responsible for assuring that all conditions were observed. In some circumstances, the conditions of the issue could result in increased control on the part of the preferred stockholders. For instance, it is not unusual for the preferred stockholders to be given voting rights if more than a specified number of preferred dividends are skipped. Other provisions may restrict the payment of common dividends if certain conditions are not met. Preferred stockholders also may have a preemptive right.

Claim on Assets and Other Features. Another source of the preferred designation is that preferred stock has a prior claim on assets over that of common stock. The claim of bondholders is prior to that of the preferred stockholders. Although preferred stock typically has no maturity date, there is often some provision for retirement. One such provision is the call provision, under which the firm may buy back or recall the stock at a stated price. This price may vary over time, normally dropping as time passes. Another provision is the sinking fund, under which the firm will recall and retire a set number of shares each year. Alternately, the firm may repurchase the shares for retirement on the open market, and would prefer to do so if the market price of the preferred is below the call price. Preferred stock is sometimes convertible, meaning that it can be exchanged for common stock at the discretion of the holder. The conversion takes place at a set rate, but this rate may vary over time.

Valuation. The par value of a preferred stock is not related to market value, except that it is often used to define the dividend. Since the cash flow of dividends to preferred stockholders is specified, valuation of preferred stock is much simpler than for common stock. The valuation techniques are actually similar to those used for bonds, drawing heavily on the present value concept. The required rate of return on preferred stock is closely correlated with interest rates, but is above that of bonds because the bond payments are contractual obligations. As a result, preferred stock prices fluctuate with interest rates. The introduction of adjustable-rate preferred stock is an attempt to reduce this price sensitivity to interest rates.

Valuation is an ever-evolving practice. Rosenbaum and Pearl comment that "In the aftermath of the subprime mortgage crisis and ensuing credit crunch, the world of finance is returning to the fundamentals of valuation and critical due diligence for mergers & acquisitions (M&A), capital markets, and investment opportunities. This involves the use of more realistic assumptions governing approach to risk as well as a wide range of valuation drivers, such as expected financial performance,

discount rates, multiples, leverage levels, and financial terms.'' As the first decade of the twenty-first century came to a close, there were signs that the global economy was recovering from the recession that began in 2008, and the return to more traditional forms of valuation was a welcome sign of a return to financial stability.

FOREIGN STOCK

Purchases of foreign stock have greatly increased in recent years. One motivation behind this increase is that national economies are not perfectly correlated, so that greater diversification is possible than with a purely domestic portfolio. Another reason is that a number of foreign economies are growing, or are expected to grow, rapidly. Additionally, a number of developing countries have consciously promoted the development of secondary markets as an aid to economic development. Finally, developments in communications and an increasing familiarity with international affairs and opportunities has reduced the hesitance of investors to venture into what once was unfamiliar territory.

Foreign investment is not without problems, though international communication has become less expensive and even comparable to domestic communication. This is due to the advent of services such as Skype, Vonage, and other Internet portals and programs that allow business owners, managers, employees, partners, clients, and shareholders to talk to one another for free or next to nothing. Files and links can be shared for free, and when business associates and clients are not able to interface on live Internet discussions, they can text or Tweet one another to keep up to date on any changes in stocks or other pertinent business matters. Social and business customs often vary greatly between countries, so it is important for businesspersons to research and understand the customs of various business cultures before engaging.

Trading practices on some foreign exchanges are different than in the United States. Accounting differs not only in procedures, but often in degree of information disclosed. Although double taxation is generally avoided by international treaties, procedures are cumbersome. Political instability can be a consideration, particularly in developing countries. Finally, the investor faces exchange rate risk. A handsome gain in a foreign currency can be diminished, or even turned into a loss, by shifting exchange rates. These difficulties are felt less by professional managers of large institutions, and much of the foreign investment is through this channel.

An alternative vehicle for foreign investing is the American Depositary Receipt (ADR). This is simply a certificate of ownership of foreign stock that is deposited with a U.S. trustee. The depository institution also exchanges and distributes any dividends, and provides other administrative chores. ADRs are appealing to individual investors. It has also been suggested that the benefits of international investing can be obtained by investing in international firms.

INVESTMENT CHARACTERISTICS

Stocks are diverse in nature and can be classified many ways for investment purposes. For example, stocks can be classified according to the level of risk. Risky stocks are sometimes referred to as aggressive or speculative. They may also be growth stocks, which are expected to experience high rates of growth in size and earnings. If risk is measured by the beta (systematic or nondiversifiable risk), then the term applies to a stock with a beta greater than one. These stocks are quite sensitive to economic cycles, and are also called cyclical. Contrasted are the blue-chip stocks high-quality stocks of major firms that have long and stable records of earnings and dividends. Stocks with low risk, or a beta of less than one, are referred to as defensive. One form of investment strategy, called timing, is to switch among cyclical and defensive stocks according to expected evolution of the economic cycle. This strategy is sometimes refined to movement among various types of stock or sectors of the economy. Another stock category is income stocks stocks that have a long and stable record of comparatively high dividends.

Common stock has been suggested as a hedge against inflation. This suggestion arises from two lines of thought. The first is that stocks ultimately are claims to real assets and productivity, and the prices of such claims should rise with inflation. The second line of thought is that the total returns to common stock are high enough to overcome inflation. While this is apparently true over longer periods, it has not held true over shorter periods.

Preferred stock is generally not considered a desirable investment for individuals. While the junior position of preferred stockholders as compared to bondholders indicates that the required rate of return on preferred will be above that of bonds, observation indicates that the yield on bonds has generally been above that of preferred stock of similar quality. The reason for this is a provision of the tax codes that 70 percent of the preferred dividends received by a corporation are tax exempt. This provision is intended to avoid double taxation. Because of the tax exemption, the effective after-tax yield on preferred stock is higher for corporations, and buying of preferred stock by corporations drives the yields down. The resulting realized return for individuals, who cannot take advantage of this tax treatment, would generally be below acceptable levels.

STRATEGY

Strategy refers to a general plan or an approach shaping a business. It has spread from broad concepts of corporate planning to such matters as marketing, advertising, human resources, accounts receivable collections, and to nearly every function and style of business.

Analysis of strategy deconstructs the concept into its visible inputs, such as the needs of the market, products that can meet the need, their differentiation from competing products, alternative means of production, and marketing techniques to reach the consumer.

DEFINITIONS AND EXAMPLES

A strategy is a broad and general approach to an enterprise in which certain structural elements are determined in advance and courses of action have been selected from among others in order to *differentiate* the enterprise. Strategies focus on reaching company goals and differentiating businesses from their competition.

A strategy is thus characterized by choices and decisions concerning future action at a level of generality which permits flexible implementation. A strategy is more specific than a policy but more general than a plan.

A classical example of corporate strategy was that developed by Alfred P. Sloan (1875 1966) for General Motors after he became its president in 1923. Sloan introduced annual styling changes, launching planned obsolescence as a motivator for replacing the car, and organized the different car lines based on pricing. The strategy worked very well for its time and was widely imitated, but it was also a high-cost strategy that required significant investment of money and time annually. As businesses developed further, focus on low-cost strategies that saved money while also furthering business goals became more common.

Conventional management wisdom states that businesses must have a strategy in order to succeed. It is closer to the truth to say that all businesses by definition have a strategy; it may or may not be consciously crafted, especially for smaller, more informal businesses. The manner in which a company is organized and run is the expression of its strategy. Consciously formulated strategies are superior to informal approaches only if the planning is insightful, well done, and adapted to the circumstances. A good strategy will incorporate long-term goals, customer reactions, and accurate financial data.

STRATEGIZING: BIG AND SMALL

Strategy formulation as a discipline is much more common in large corporations than in small business. In small business strategizing tends to be confined to the owner, or possibly a small circle of trusted associates, while in large companies overall strategy is developed by executives, while operating divisions of the company will create their own strategies for their individual goals. In a company principally interested in short-term returns, for instance, individual strategies reliant on capital investments over longer periods will fare more poorly than highly leveraged approaches. In well-run large corporations, top management will make the effort to formulate different broad strategies for lower elements based on realities in the market and not permit vague concepts to preempt appropriate responses.

BUSINESS STRATEGY LEVELS

There are three primary levels of strategy that organizations are separated into for ease of clarification: corporate, business, and operational. While each of these levels of strategy focus on the same goals and missions, they have different purposes and oversee different facets of the business. Small businesses are more likely to use a business level strategy primarily, but they will also need a

corporate level strategy when expanding into new areas or additional centers of operation.

Corporate Level. Corporate strategy refers to the management of the company as a whole. Most of this management pertains to the business units of the company, the different departments or sections of the business, and how they work together. Corporate strategy seeks to raise not only the value of the entire company, but also of the individual units. Any major changes, such as the introduction of new products or pursuit of a new consumer demographic, originate at the corporate level. These strategies also take into account shareholders and how to increase shareholder value. Strategies at the corporate level both trickle down to lower managers and are in turned influenced by the attitudes and opinions of the majority of employees.

Business Level. At this level the business interacts with its customers , suppliers, distributors, and competitors. Business strategies are positioning strategies: they deal with presenting a product or service to consumers. Most marketing strategies fall into this category, including company-wide branding projects and company identity projects. Anything that directly increases the real or perceived value of an existing project is a business strategy.

Operational Level. Operational strategies govern most of the work that takes place in the business. The decisions made at the corporate and business levels are carried out at the operational level, as services are rendered and goods are produced, stocked, and sold. In a small business operational strategies are usually created and overseen by the owner, while larger companies separate operational strategies with layers of management. While business operations are more direct than the plans used at other levels, there is also more room for improvement in efficiency and technology.

COMMON SMALL BUSINESS STRATEGIES

There are several different popular strategies that small businesses are likely to use as they try to grow their customer base and maintain their productivity. One of the most common is the cost leadership strategy, when the business aims to offer lower prices for the best products in its market. The customer base is grown by using low prices, which can be offered due to company efficiency. Focused low- cost strategies are similar, but instead of competing to offer the lowest price in a wide market, the business instead selects a smaller market niche that it can appeal to, such as schools or cafés.

Differentiation strategies, on the other hand, pursue perceived product value rather than lower prices. These strategies use innovative additions to products and marketing plans to set their product apart in the minds of consumers. Focused differentiation strategies are similar but apply only to a certain segment of the market; they are often easy to accomplish for small businesses that can differentiate locally by offering local services, knowledge, and availability. Integrated strategies use a combination of low costs and differentiation to appeal to consumers on a variety of levels.

STRATEGY, GENERIC

Generic strategies refer to long-term-oriented plans that firms adopt with the ultimate objective of gaining competitive advantage in a given industry, market segment,

or product line. Generic strategies are classified into three main forms of organizational strategic approaches that include cost minimization, product differentiation, and focused strategy. Michael Porter is credited for being the brainchild behind the conceptualization of the generic strategies. Porter laid out the foundation of generic strategies in a 1985 book publication titled *Competitive Advantage: Creating and Sustaining Superior performance.* The applicability of the generic strategies across the board, in different product and service sectors as well as all kinds of organizations irrespective of their sizes or structures, is what makes them valuable in the pursuit of competitive advantage.

COST MINIMIZATION

Cost minimization is a process through which a firm seeks to offer products or services at reduced prices through the reduction of the cost of key production inputs. Cost minimization strategy primarily serves the purpose of stimulating demand, winning and retaining customer loyalty, and expanding the market share of a firm or product. Cost minimization is usually adopted in situations where a product lacks adequate competitive advantage or alternatively, in situations where high volumes of production are bound to achieve pricing advantages associated with economies of scale. For small businesses, however, the pursuit of economies of scale may be elusive because of resource and production constraints. Therefore, small business enterprises may pursue cost minimization strategies with the overriding objective of creating adequate competitive advantage for a product, service, or firm as a whole.

Cost minimization strategy is widely applicable to small business enterprises because of its suitability to situations where a firm is yet to establish clear strategies for competitive advantage or when products or services can be produced cheaply and sold cheaply through economies of scale. However, cost minimization is not limited to the aspect of extending the advantages of low costs of production to customers. Business enterprises which seek to benefit from cost minimization should also set the appropriate targets for assuming cost leadership in a particular industry or product line.

Different business enterprises apply different cost reduction strategies such as *kaizen* and just-in-time (JIT). *Kaizen* is a Japanese production strategy that emphasizes on continuous improvement on work processes aimed at eliminating waste and achieving efficiency. JIT, on the other hand, is a resource management strategy that emphasizes the acquisition of capital or material resources only when they are required so as to cut down on storage and inventory costs. JIT asserts planning and control in the production of orders by limiting production on specific customer orders and prevailing conditions of market demand so as to eliminate unnecessary inventory processes. Theoretically, JIT practices effectively result in cost-effective utilization of financial and production resources by matching production inputs against targeted outputs. The adoption of such production processes and material management strategies enable business enterprises to cut down immensely on operational costs.

The airline industry provides one of the best examples of cost minimization strategies that are used by competing firms to expand their market share and gain competitive edge. An article titled "Porter's Generic Strategies: Choosing Your Route to Competitive Advantage," published at www.minds.com, identifies the "no frills airlines" as one such example of cost-cutting measures that have seen small airline operators gain a competitive edge over the large and more luxurious airlines. Small airline companies such as JetBlu and Ryanair minimize their operations costs so as to extend lower prices to their customers. Basically, the airlines cut down on costs by operating without luxurious onboard facilities and concentrating on a limited number of routes. By doing this they optimize expansion of market share through cheaper prices compared to services offered by larger, luxurious airlines. The cost minimization strategies have seen the small airline companies achieve sustainable competitive edge over their more established rivals in the industry.

Small business enterprises can achieve more meaningful cost minimization objectives through necessary facilitation that include:

- Adequate capital investment in technological tools for enhancing operational capacity
- Logistical efficiency
- Sustainable sources of operational resources such as human resources and capital facilities

Infrastructure, information communication, service equipment, and transportation are the main technological aspects relevant to the cost minimization strategies of a business enterprise.

PRODUCT DIFFERENTIATION

The desire of an entrepreneurial firm to satisfy the varying needs of a target market for given products or services can best be achieved through the development of product varieties that are uniquely identifiable to the firm. As such, the uniqueness aspect of product differentiation ultimately employs a comparative approach whereby the products or services provided by a firm must be of high quality and bear unique functionality characteristics compared to products or services offered by other competitors in the industry.

The successful implementation of product differentiation strategy in small business enterprises requires business entrepreneurs to perform consistent market research and pursue sustained product innovations. The products and services delivered must be of high quality, and frequent marketing and advertising should be undertaken to promote awareness about the uniqueness of a product's features on functionalities.

Mercedes Benz is a good example of a brand that enjoys a strong customer loyalty and competitive advantages that ultimately place the company above its competitors. The company not only capitalizes on product differentiation through production of different models (classes) of the Mercedes Benz brand, but also goes ahead to create information-technology-oriented channels for the different categories of its target customers. Mercedes Benz has particularly been successful in taking advantage of service line descriptions, customer base, customer care, cost control, and partnerships. The differentiation strategy used to market Mercedes Benz is applicable across the industry in large, medium scale, and small business enterprises.

FOCUS STRATEGY

Focus strategy is the third pillar of Porter's generic strategies. Focus strategy involves the concentration of a firm's performance objectives on particular segments of the target market or product portfolio. As such, the exceptional strategic pursuits of a firm's objectives are harnessed to gain a competitive edge in terms of cost containment and product characteristics.

Focus strategy is particularly applied in situations that present difficulties in achieving a hybrid between product differentiation and cost leadership strategies. Therefore, a business organization can choose either focus on product differentiation or cost reduction but not both at the same time. The focus strategy demands the narrowing down of a firm's business perspectives to suit the unique needs of a particular product or market segment in the most unique fashion so as to gain sustainable advantage over other competitors.

The focus strategy usually portends the effect of gaining access to targeted market segments with very little competition in terms of pricing or product characteristics. For example, a decision to focus on cost reduction may be influenced by the need to lower costs of production so as to distribute its products or services at lower rates than those of existing or potential competitors. Similarly, focus on the production of a particular product with unique characteristics and functional capabilities may enable a firm to dominate a particular market because of the product's unique attributes in regard to customer preferences.

CHOOSING APPROPRIATE GENERIC STRATEGY

The choice of a generic strategy may vary with the size, resource base, nature, objectives, or operational structure of a business enterprise. Although Porter recommended the application of one particular generic strategy at a time, business experience over time has demonstrated that the three generic strategies are not mutually exclusive and can be combined according to the prevailing needs of a business enterprise. For example, a business enterprise can adopt product differentiation and focus strategy concurrently. However, the recommended guidelines for choosing independent or appropriate combinations of the generic strategies include:

1. Strengths, weaknesses, opportunities, and threats (SWOT) analysis;
2. Porter'sfive forces analysis; and
3. comparison of the SWOT and five forces analyses.

SWOT analysis evaluates the internal capabilities of a business relative to the key factors of strengths, weaknesses, opportunities, and threats relative to the prevailing business environment and operational factors. Five forces analysis, on the other hand, provides a candid picture of the prevailing trends in a particular industry, with emphasis on the threats of substitute products, threats of new entrants, power of suppliers, power of buyers, and rivalry for market share.

STRATEGY, PORTFOLIO MODEL

Portfolio modeling is the process of allocating resources among various business or organization units relative to the significance of each business unit in the operations and activities of an organization. The conceptual framework of the portfolio model forms the basis through which business enterprises set long-range plans for development of a new range of products or services. Done correctly, portfolio modeling optimizes value, maximizes profits, supports enterprise strategies, and facilitates balancing of competing priorities in organizational structure.

The conceptual framework of the portfolio model is applicable to different types of organizations and particularly so in commercial and investment businesses organizations. Commercial portfolios are synonymous with small, medium scale, and large business organizations which pursue multiple projects for which relevant portfolios must be created to achieve conformity among different projects undertaken by various business units of the business organization. An investment portfolio, on the other hand, involves the apportionment of financial resources to different long-term sources of income either at the individual level or through representative organizations. Investment portfolios seek to maximize income generation through the selection of the most profitable long-term investment opportunities.

Portfolio modelling is closely related to research and development initiatives that lay the foundation of the breakdown of organizational future operational structures and plans, with emphasis on the number of business units or constitution of product lines. The management of a portfolio model is applicable at the organizational level, business unit level, or product level. Product level portfolio management may further target a given market segment or particular product line. Product portfolio management is widely applied in the development of new product lines or projects. A company can set up an independent project team to deal exclusively with the development of new product portfolios which are capable of advancing the company's long-term product and service production plans.

The different parameters of the portfolio model are analyzed, tested, and implemented through a logical sequence that involves:

1. the creation and analysis of market, production, and distribution strategies for a given group of products or services;
2. evaluation of resource availability to establish if the accessible financial resources can adequately match and balance against a targeted portfolio size;
3. assessment of the short-term and long-term profit projections, investment options, and risk levels for each product that is part of a production portfolio.

PHASES OF PORTFOLIO MANAGEMENT MODEL

In his article titled "UPMM A Full Model for Portfolio Management," Stanislaw Gasik identified the key pillars of portfolio management process as components proposing, identification, evaluation and selection, and creation. According to Gasik, the components proposing phase involves the creation of proposals for different components of either commercial or investment portfolios. The identification phase involves detailed analysis of components that can potentially be included in a portfolio relative to the prevailing strategic plans of an organization. The evaluation and selection phase involves a consolidation process of the identified and defined sets of portfolio components to be implemented by the company in accordance with the organizational strategic priorities. The creation phase provides the opportunity for creating the selected sets of portfolio components for either strategic goals that already have components or those which are yet to be identified with any components.

DECISION MAKING PROCESS FOR THE PORTFOLIO MANAGEMENT MODEL

The processes of making decisions and weighting of strategic objectives for portfolio management may vary from one business enterprise to another. Indeed, the portfolio model provides business enterprises with the opportunity to develop unique industry-specific operational strategies that can enhance the competitive edge of a business in the long term. However, the strategic goals of a business enterprise must always be balanced against all likely opposing forces. Some of the challenges that business enterprises encounter when attempting to achieve a balance among different competing forces in portfolio modelling processes include:

- The measure of projected profits versus associated risks
- Creation of new product portfolios versus improvement of existing product portfolios

- Short-term implications of a product portfolio versus its long term implications
- The dilemma between creating a portfolio that will target a given market segment or one that targets a particular product line

The magnitude of the challenges and dilemmas presented by the different competing factors that characterize organizational or business portfolio analysis require the application of different portfolio management techniques so as to derive appropriate portfolio management decisions. Mathematical methods, visuals techniques, and scoring methods are some of the widely used tools and techniques in portfolio management techniques.

Mathematical Methods. Mathematical methods are also referred to as heuristic models and are used to analyze the profits and financial optimality returns of a given product or project portfolio. As such, a business organization seeks to determine the lowest and highest levels of profits that can possibly be earned by the organization as a whole or by its selected business units, products, or services in a given time span with reference to both the short-term and long-term projections. The process enables the business to set resource allocation priorities to the different business units or service and product lines. However, the mathematical portfolio management technique is considered to be too rigid and thus incapable of aligning a given portfolio against an organization's overall strategic objectives.

Scoring Methods. The scoring portfolio management technique involves the weighting of the different business operational measures, options, and alternatives to determine the levels of requirements for investment, profit projections, risk susceptibility, and strategic relevance of each or a combination of the portfolio alternatives at hand. The scoring method is a very significant tool in the process of ensuring that a business organization adopts the best portfolio management decisions as possible that are capable of creating and sustaining a competitive edge for the business in the long term. However, the scoring method is characterised by numerous weaknesses, key among them being the inability of the method to achieve optimization of a product or service mix, as well as the susceptibility of the method to overemphasize the financial aspects of business operations. Indeed, appropriate portfolio management techniques should always take into account other organizational operational parameters such as human resources, environmental factors, legal factors, and political factors.

Visual Techniques. Visual techniques in portfolio management processes involve the use of graphical tools and aids such as maps, graphs, and pictures to develop a nexus of relationship among different organizational, business, or product parameters. The visual illustrations are used to determine the balance among different competing factors of a portfolio, particularly so in situations where two different factors are in direct competition with each other. Such directly competing factors may include the measure of projected profits versus associated risks; creation of new product portfolios versus improvement of existing product portfolios; short-term implications of a product portfolio versus its long-term implications; and the dilemma between creating a portfolio that will target a given market segment or one that targets a particular product line.

As such, the visual portfolio management techniques are designed to ensure the achievement of balance between competing portfolio factors so as to ensure all probabilistic factors are proportional to each other. For example, the visual techniques can be used to ensure that a very profitable portfolio is not too risky at the same time. However, visual techniques for portfolio management lack the ability to set clear prioritization mechanisms for different components of a portfolio.

APPLICATION BASICS OF THE PORTFOLIO MODEL

So far, it is evident that the three portfolio management techniques cannot achieve optimized results when applied independently. As such, small business entrepreneurs can achieve strategic optimization of the portfolio model by mixing and blending the three different techniques to suit the strategic projections of the business enterprise at a given time. The management process of the portfolio model largely relies on the overall business plans and involves the definition of the total input of organizational human and capital resources, sales projections for new product development, and research and development investment estimations.

STRATEGY, STRUCTURE-CONDUCT-PERFORMANCE MODEL

The structure-conduct-performance model is a conceptual model which promulgates the idea that the performance of a firm is highly dependent on the conduct of the firm relative to the basic structures of the firm with reference to the activities of suppliers, trends of buyers, and entry barriers that characterize a particular industry. Strategic management is viewed to be more or less the procedural pursuit of organizational objectives, a definition that is in tandem with the basic structure-conduct-performance model that is meant to enhance service- and process-oriented functionalities in business organizations. The basic tenets of structure-conduct-performance model are founded on the efficiency and monitoring perspective defined by the formulation of operational objectives, development plans for achieving set business objectives, and resource allocation for resource acquisition.

The development of corporate or business strategies is heavily reliant on the operational capabilities of a business organization relative to identifiable strengths and weaknesses that characterize the organization's internal and external environment. Competitor analysis also enables a business enterprise to craft clear strategic goals designed to achieve a competitive edge for the business. To this end, the value chain alignment of a business organization is tailored accordingly to reflect the prevailing market conditions but also to build advantageous competitive advantages capable of outlasting any future strategic maneuvers of persistent competitors in a given industry, target market, or product line.

To this end, the need to nurture the participation of stakeholders in organizational decision-making processes, the creation of contractual relationships between a firm and its stakeholders, and the infusion of terms of trust and ethical approaches to long-term business plans stand out as the most conspicuous strategic issues that concern the conduct of business activities. Needless to say, business entrepreneurs must always undertake careful collection and consideration of adequate information at all levels of decision-making processes to ensure an informed approach in protecting and advancing the best interests of the business enterprise.

Organizational value chain modeling has at its core the alignment of organizational operational and resource capacity to the overall strategic objectives. The creation of marketing mix, customer relations management networks, and human resources capacity, as well as product and service distribution strategies, are substantially pinned to the financial flexibility and budgetary capacity of a business organization. Indeed, it is from this perspective that the logical concepts that underpin the strategic preferences of an organization have been identified in the structure-conduct-performance model.

APPROACHES TO STRUCTURE CONDUCT PERFORMANCE MODEL

Structuralist approach and reconstructionist approach are the two main types of strategic approaches to structure-conduct-performance model. The two approaches provide clear demonstration of the relationship between structure and strategy.

Structuralist Approach. The structuralist approach is based on the premise that organizational strategy is usually shaped by structure. As such, the strategic pursuits in business organizations are subject to internal and external environmental aspects of the organizations, with particular reference to the operational parameters of the organizations such as threats of competitors, entry barriers to a particular industry, power of buyers, or rivalry among competitors. All these factors are based on a Porter's five forces analysis which defines the competitive status of a particular industry at a given time. (Five forces analysis was developed by Michael Porter of Harvard Business School in 1979.) To this end, firms seek to exploit the inherent conditions in both the external and internal environments that characterize their operations so as to harness efficiency, expand business opportunities, and achieve competitive advantage in a particular industry. Various business organizations such as IBM, Apple Inc., and Microsoft Corporation are good examples of companies whose strategies have shaped the structure of the respective industries in which they operate, and they serve as good models for application in small business enterprises.

Reconstructionist Approach. Unlike the structuralist approach, the reconstructionist approach is premised on the assumptions that the environmental competitiveness of an industry does not absolutely determine the performance of a business organization. Simply put, the approach assumes that organizational structure can be shaped by preferred and adopted strategy. The implications of the environment to the performance factors are perceived to be secondary to internally initiated operational and strategic initiatives. To this end, the reconstructionist strategy is largely synonymous with the blue ocean strategy framework, which promulgates the view that business organizations can achieve systematic reconstruction of their respective industry categories and ultimately achieve favorable systematic reversal of the dependency sequence that is characteristic of the structuralist approach. Blue ocean strategy is themed on the concept that the landscape of economic development can be shaped by the individual actions of different participants. However, the concept of reconstructionist approach goes beyond the mere adoption of strategy to structure to incorporate the alignment of the strategies of the business organization to the performance metrics that are sustainable.

CHOOSING APPROPRIATE APPROACHES

According to Chan Kim and Renee Mauborgne, the determination of the right strategic approaches relative to the structure-conduct-performance model is subject to three key organizational factors that include:

1. the prevailing operation structures in an organization;
2. the capacity and capabilities of the organization's resources;
3. the strategic orientation of the organization.

For example, the structuralist approach is preferable in conditions where the structures of the conditions in the market are favorably attractive and a business organization has the capacity to harness good returns through the competitive advantage provided by resource capacity and operational capabilities.

The reconstructionist approach, on the other hand, is best suited for situations where potential created by prevailing structural conditions in a business enterprise are favorable but the resource capabilities of the organization are inadequate to launch a meaningful challenge against the more established players in the industry. The reconstructionist approach can be very helpful for small business enterprises seeking to gain a competitive edge in markets characterized by intense competition.

The perspective of strategic orientation and mind set of the business organization comes into play when the organization lacks a clear position on the potential of its resource capacity and capabilities in the pursuit of competitive advantage. All in all, the core objectives of a business enterprise should always be underlined by the drive to optimize returns through the adoption and implementation of strategies that leverage the key strengths of the organization.

SUBCONTRACTING

Strictly speaking, "subcontracting" is practiced only by a contractor, namely an individual or a company working for another entity under a contractual agreement. If the contractor then hires out some of the work to yet another organization, it is said to have subcontracted the work out. Subcontracting is most common in the construction industry: builders often subcontract plumbing, electrical work, drywalling, painting, and other tasks. But many other types of business engage in contract work as well, including Web developers, IT professionals, communications contractors, writers, and government contractors of all kinds. The whole industry that supplies the U.S. Department of Defense typically operates under contract and uses many subcontractors in turn.

In recent times the term has come to be used in a more general sense to refer to any kind of work contracted or "farmed" out. Outsourcing tasks and functions has become a common tactic used to lower costs. Companies that operate on their own behalf selling goods and services to the public may also engage in contracting or "subbing" some of the work. In such cases no contract is in existence, hence the prefix "sub" is unnecessary; it is often used anyway and thus the commonly used abbreviation, "subbing." In the discussion that follows both kinds of contract relationship will be included, thus also the use of independent contractors and freelancers. Professionals in the technology and Internet industries were a growing sector of subcontractors by the end of the first decade of the twenty-first century, changing perceptions of what it meant to be a subcontractor or freelancer.

WHY CONTRACTORS ARE USED

Contracting and subcontracting are institutional expressions of the division of labor or of specialization. Such forms are used for the simple reason that they cost less than providing the service in-house. Certain types of work require specialized and often expensive tooling and skills not required in a company on a daily basis; to provide such services in-house would not be cost-effective. By specializing in a particular function, equipping it and staffing it to serve a large clientele, service organizations can achieve scale effects simply not available to the ordinary business. An example of this is payroll services under which a small firm can contract out its payroll administration to a company for a small fee; the company gets excellent service, guaranteed conformity to tax law, and saves money. Saving money is also at the root of the more questionable practice of laying off people and then hiring them back as "independent contractors" at fees that cost less than their previous salaries, payroll tax, plus fringes. Such forms are frowned upon by government and are sustained only so long as the supply

of such labor exceeds the demand. The chief disadvantages of using contractors are diminished control over the function and less ability to predict its future costs.

CONTRACTORS VS. EMPLOYEES

A contractor who behaves and is treated like an employee *is* an employee from the viewpoint of the Internal Revenue Service (IRS). The IRS applies a multipart test in order to determine whether a certain worker should be classified as an employee or an independent contractor. The main issue underpinning the test is who sets the work rules: employees must follow rules set by their bosses; independent contractors set their own rules. An individual who sets his or her own hours, receives payment by the job, and divides his or her time between work for several different employers would typically be classified as an independent contractor. Other criteria involve who provides the tools and materials needed to complete the work. An individual who works at an employer's facility and uses the employer's equipment may be considered an employee unless the individual is providing software consulting, for instance; one who works at a separate location and provides his or her own equipment would be classified as an independent contractor. Finally, an independent contractor usually pays his or her own business expenses and takes the risk of not receiving payment when work is not completed in accordance with a contract; an employee is usually reimbursed for business-related expenses by the employer and receives a paycheck whether his or her work is completed or not.

A small business may be on either side of this equation: providing contractual services or purchasing such services. As a seller, the business must retain its independence; as a buyer, the business must avoid directing the contractor in such detail as to qualify him or her as an employee. Problems often arise when the seller *wishes* to be a contractor, has chosen that path willingly, but is using the buyer as his or her first customer, having worked there many years. In such cases, the old relationship may be habitual.

BEING A SUBCONTRACTOR

Those who have an interest in becoming subcontractors should not romanticize the notion. According to a 2010 report released by the *Commerce Centre*, a British Columbia-based government publication, becoming a contractor means doing homework first. The Commerce Centre recommends reviewing both past and present opportunities for bidding in a given industry to get a feel for what is to be expected and what a subcontractor can count on in terms of return on investment. Subcontractors should sign up for e-mail alerts for new jobs that they can bid on. Those who wish to become successful subcontractors will stay well-prepared this is done by staying abreast of changes in the industry in which they operate, and keeping up with any legal documentation or changes in industry regulations found on regulatory Web sites. The Commerce Centre also recommends that subcontractors add themselves to business registries where they can be found by companies that are looking for bidders on various projects. Various online databases offer this as a free service to subcontractors.

A potential pitfall of being a subcontractor is pricing during bidding. Some subcontractors especially those new to the practice of bidding will put together ragtag bids that can either cost them the chance at the work or put them in a position where the project actually costs them more than what they priced the bid out for. During the bidding process, both the business seeking the subcontractor and the subcontractor must be pragmatic. John Edward Murphy explains in his 2009 book, *Guide to Contract Pricing*, "Sometimes, the estimator, needing something to put on the purchase request, may make an outright guess, which is obviously a good basis for price comparison." Murphy's assessment is a good one, and too often contractors will fall into the trap of wanting the job so badly that they submit a half-baked bid in an effort to have the first shot, or because they think that the company looking for the contractor will simply look at bids based on price and nothing else. Truth be told, many companies are much more interested in a properly researched bid that accounts for all the aspects of the project, not a slapdash document with no line-by-line breakdown of the cost. Companies looking for contractors for a given project want to know where their money is going. If they can see that a bid is put together well and offers proper explanation of the overall cost, they will be more likely to offer the bidder the job.

WORKING WITH SUBS AND CONTRACTORS

Small-business owners may be highly experienced in using subcontractors because subs are a natural part of their industry as in construction. In cases where a large company provides a service, such as a payroll firm, the relationship is again clear and unambiguous as is, for instance, working with outside accountants in business for themselves. Nor are problems likely to arise when surges in business must be accommodated by hiring temporary workers from a temp firm. In yet other cases, such as buying advertising services, the relationship is traditional and not viewed as contracting out a service even when the relationship is ongoing rather than a one-time situation. Most companies working with ad agencies also have an internal advertising manager. Problems for the small business arise when it works with independent contractors,

usually individuals, who carry out tasks that either have been or could be done in-house. Problems also arise when the business works in such close partnership with a contractor that interactions between the contractor's employees (and executives) and the company's own staff arise.

The skilled small-business owner will, of course, avoid any contracting arrangements that may be seen by his or her own people as exploitive. The owner who makes use of people down on their luck in order to avoid having to pay their payroll taxes, for example, will likely pay a high price for this in another form: eroding morale and key people quitting to seek their fortunes elsewhere. But it is sometimes difficult to hire talented individuals because they do not wish to work for the company as employees. If that is the case, the company's own employees should be informed of the fact.

SUBSTANCE ABUSE

Substance abuse in the workplace is a subject of concern to many small-business owners, to one degree or another. Oftentimes the issue is a sensitive one to confront, but business owners and researchers alike agree that if left unchecked, substance abuse has the capacity to cripple or destroy a company.

IMPACT IN THE WORKPLACE

Substance abuse is a hard problem to eradicate in any business setting, but it can be particularly difficult to address in small business settings. After all, many small-business owners develop close or at least friendly relationships with their employees because they often work together on projects and share smaller work areas. "Because many small business owners have one-on-one relationships with each employee, dealing with an employee who is addicted to alcohol or drugs is a personal as well as a personnel problem," wrote Barbara Mooney in *Crain's Cleveland Business.* On the small business scale, confrontation can be explosive. What would be the job of many people or even a whole department in a larger company may be the responsibility of one person if this person is made to feel uncomfortable or cornered, the result may be destructive action against the company. The disgruntled employee with an addiction may have a skewed perception of the situation, causing him or her to defame or slander the business name or the names of executives or the business owner.

Substance abuse experts and business researchers alike warn that substance abuse problems are not the sort of problems that tend to go away by themselves. Rather, they often continue to grow and fester, further strangulating the business's productivity and profitability. Indeed, substance abuse often ends up being a tremendous drain on a company's fiscal well-being. This drain takes many forms, including decreased productivity, increased absences, rising numbers of accidents, use of sick leave, and jumps in workers' compensation claims. Indeed, *HR Focus* reported in 1997 that "alcohol and drug abusers are absent from work two-and-a-half times more frequently than nonusers; they use three times the amount of sick leave as nonusers; their worker's compensation claims are five times higher; and they are generally less productive." This latter factor what *HR Focus* termed "the less dramatic, day-to-day financial losses that accrue in a company when its workers are impaired and performing below potential" can be particularly deadly to a business precisely because its impact is so hard to detect and quantify.

In April 2009, Emily Holbrook of *Risk Management* magazine reported that productivity losses caused by employees accounted for $197 billion. Of this amount, Holbrook reports, a major cause of losses was the abuse of substances in the workplace. "What this means is that more than likely, one or more of your employees or coworkers is lacking in productivity due to the fact that they are currently under the influence or recovering from being under the influence the night before (just hours before arriving to work). This, as one might assume, can have an enormous impact on workers comp costs as

employees with drug abuse problems are four times more likely to have an on-the-job injury."

Substance abuse problems also open companies up to greater legal liability. According to *Occupational Medicine*, studies indicate that: 1) alcohol and drug abusers are two to four times as likely to have an accident as people who do not use drugs and alcohol; and 2) substance abusers can be linked to approximately 40 percent of American industrial fatalities. Moreover, business consultant Tim Plant indicated to *HR Focus* that drug- or alcohol-addled employees can also wreak harm on people and places outside the company: "When drivers come to work under the influence of drugs or alcohol," he said, "accidents could happen, causing the disruption of deliveries or other activities. Vehicles could be damaged; people could be hurt or killed. These have an immediate impact on the bottom line for a small- or medium-sized company."

Finally, in situations where a partner or owner of the business is the one with the substance abuse problem, the very life of the company is often jeopardized. Such people obviously wield a tremendous amount of influence over a company, and if their ability to make reasonable, intelligent decisions in a timely manner is compromised, the financial health of the company will likely deteriorate as well.

CHARACTERISTICS OF SUBSTANCE ABUSERS

Substance abuse experts and business owners who have been forced to deal with drug or alcohol abusers in their workplace cited a variety of warning signs that owners and managers should look for if they suspect a problem:

- Increased absenteeism and tardiness, especially immediately before and after weekends and holidays
- Deteriorating work performance, as manifested in big changes in work quality or productivity
- Frequent colds, flus, headaches, and other ailments
- High rates of mishaps, both on and off the job
- Unusually high medical claims
- Excessive mood swings, which may manifest themselves in immoderate levels of talking, anxiety, or moodiness
- Overreactions to criticism, both real or imagined
- Avoidance of supervisors
- Deterioration in physical appearance or grooming
- Financial problems

Researchers also note that certain industries and business dynamics seem especially prone to substance abuse problems. One substance abuse counselor flatly told Barbara Mooney of *Crain's Cleveland Business* that the extent of substance abuse problems in small businesses often depends on the makeup of its work force: "It's a problem prevalent among employers who hire a lot of entry-level people in industries with high turnover rates and high stress levels." Such conditions can be found in some retail establishments and especially in the restaurant industry, where late working hours, proximity to liquor, and demographic characteristics (prevalently young and single) provide a fertile atmosphere for substance abuse. Family-owned businesses are also cited as being particularly vulnerable to substance abuse problems, in part because family members may have a more difficult time being objective about a relative's work performance.

POLICIES AND STRATEGIES TO CURB SUBSTANCE ABUSE

Although tackling the problem of substance abuse can be a daunting one for small business enterprises, substance abuse experts and business researchers note that affected businesses can utilize a variety of steps that have a track record of effectiveness in curbing workplace drug and alcohol abuse.

One of the most commonly practiced policies employed by businesses of all sizes is random drug testing, wherein employees (and prospective employees) are required to submit to scientific tests to determine whether they have been using illegal drugs. Many experts cite the growing popularity of such policies for the apparent downturn in workplace substance abuse incidents in recent years. Drug testing remains controversial, however, as opponents argue that it violates individual privacy rights and sometimes hurts employee morale.

Small-business owners should also make an effort to enlist the support of employees in establishing a drug-free workplace. "Everyone . . . has an interest in securing a safe workplace and making sure that colleagues pull their loads," commented *HR Focus*. "One of the most effective ways to fight substance abuse is for employees to unite against it," concurred W. H. Weiss in *Supervisor's Standard Reference Handbook*. "Supervisors can spur such a move by making it clear to their people that alcohol or drug use on the job is absolutely unacceptable."

Business owners should consider providing an employee assistance program (EAP) for its workers. "Adopting an employee assistance program is viewed favorably by both management and employees," wrote Gregory M. Lousig-Nont and and Paul M. Leckinger. "Under such a policy, the company agrees to assist employees who have a substance abuse problem. Assistance generally comes in the form of granting the employee sick leave and paying for a rehabilitation program, and a promise by the company that there will

be no retribution against the employee." The responsibility for initiating enrollment in such programs, however, rests with the employee. If management discovers that a worker who has not pursued help through an EAP has a substance abuse problem, he or she may face termination. Employee assistance programs have been hailed by substance abuse experts and businesspeople alike as an effective tool in curbing workplace drug and alcohol abuse, and proponents point out that the cost of such programs is usually far less than the costs that often accrue when a substance-abusing employee is not dealt with.

Finally, when confronted with evidence of workplace substance abuse, managers and owners of small companies are urged to intervene immediately and determine whether a problem exists. If a problem is found, then the business needs to document the performance of the employee. This will offer the company a greater measure of legal protection in case it needs to fire the employee or the employee's performance spurs legal claims from outside parties.

SUCCESSION PLANS

A succession plan is a written document that provides for the continued operation of a business in the event that the owner or a key member of the management team leaves the company, is terminated, becomes incapacitated, retires, or dies. It details the changes that will take place as leadership is transferred from one generation to the next, or from one partner to another. In the case of small businesses, succession plans are often known as continuity plans, since without them the businesses may cease to exist. Succession plans can provide a number of important benefits for companies that develop them. For example, a succession plan may help a business retain key employees, reduce its tax burden, and maintain the value of its stock and assets during a management or ownership transition. Succession plans may also prove valuable in allowing a business owner to retire in comfort and continue to provide for family members who may be involved with the company.

Despite the many benefits of having a succession plan in place, many companies especially small businesses neglect to develop one. This oversight may occur because the business owner does not want to confront his or her own mortality, is reluctant to choose a successor, or does not have many interests beyond the business. A business owner may verbally voice his or her wishes for change after retirement or in the event of an untimely death, but unless these wishes are in writing, the rights to the business and the decision as to whom will be in charge may be up to the judge in probate court.

Succession and the planning it entails can be much like planning one's own funeral. Perhaps in part because of this discomfort of the process, the transfer of power from the first to the second generation seldom happens while the founder is alive and active in the business. Yet it is one that must be prepared for if the business owner hopes to avoid having hard-earned assets go to unwanted individuals and institutions. Unfortunately, this can happen quite easily, and if business assets are held within revocable or irrevocable trusts, the trustee will call the shots and while this person is supposed to honor the wished of the deceased business owner, there exists the possibility that he or she will not. This means generational trusts may be a good idea for those who wish to

pass a family business on to a son or daughter. A generational trust that holds the assets of the business will also keep both hard and soft assets safe from creditors in many cases. When a final will and testament is coupled with a generational or other type of trust, the chances of who will get what according to the wishes of the older generation are much better. Without this legal protection as part of a succession plan, probate judges and trustees can change the outcome drastically.

PREPARING FOR SUCCESSION

Experts claim that the succession planning process should ideally begin when the business owner is between the ages of forty-five and fifty if he or she plans to retire at sixty-five. Since succession can be an emotionally charged issue, sometimes the assistance of outside advisors and mediators is required. Developing a succession plan can take more than 2 years, and implementing it can take up to 10 years. The plan must be carefully structured to fit the company's specific situation and goals. In his 2010 book *Effective Succession Planning: Ensuring Leadership Continuity and Building Talent from Within*, William J. Rothwell discussed succession planning methods and strategies, noting the importance of taking steps to draft the most effective succession plan. Rothwell wrote, "Important steps in the process are (1) determining the organization's purpose, goals, and objectives; (2) scanning the external environment to identify future threats and opportunities; (3) appraising the organization's present strengths and weaknesses." When completed, the succession plan should be reviewed by the company's lawyer, accountant, and bank.

One of the main reasons business owners should take the time to create a successful continuity plan is that it is one of the few ways for most to assure themselves a way out of the business with assets enough for retirement. To do this, the business owner has a few basic options: sell the company to employees, family members, or an outsider; retain ownership of the company but hire new management; or liquidate the business. An Employee Stock Ownership Plan, or ESOP, can be a useful tool for the owner of a corporation who is nearing retirement age. The owner can sell his or her stake in the company to the ESOP in order to gain tax advantages and provide for the continuation of the business. If, after the stock purchase, the ESOP holds over 30 percent of the company's shares, then the owner can defer capital-gains taxes by investing the proceeds in a Qualified Replacement Property (QRP). QRPs can include stocks, bonds, and certain retirement accounts. The income stream generated by the QRP can help provide the business owner with income during retirement.

In *Family Business Succession: The Final Test of Greatness*, Craig E. Aronoff, Stephen L. McClure, and John L. Ward outline a number of steps companies should follow in preparing for succession. These steps include:

1. Establishing a formal policy regarding family participation in the business
2. Providing solid work experience, including forward-thinking cross-training for all employees, to ensure that succession is based on performance rather than heredity
3. Creating a family mission statement based on the members' beliefs and goals for the business
4. Designing a leadership development plan with specific job requirements for the successor
5. Developing a strategic plan for the business, including management, marketing, online presence, and who will be responsible for each of these aspects
6. Making plans for the preceding generation's financial security
7. Identifying a successor or determining the selection process
8. Setting up a succession transition team to keep decision makers informed about their role in the changes
9. Completing the transfer of ownership and control

Succession should be viewed as a process rather than as an event. There are four main stages in the succession process: initiation, selection, education, and transition. In the initiation phase, possible successors learn about the family business. It is important for the business owners to speak openly about the business, in a positive but realistic manner, in order to transmit information about the company's values, culture, and future direction to the next generation.

The selection phase involves designating a successor among the candidates for the job. Because rivalry often develops between possible successors who, in the case of a family business, are likely to be siblings this can be the most difficult stage of the process. For this reason, many business owners either avoid the issue outright or indirectly through the naming of multiple successors or make the selection on the basis of age, gender, or other factors other than merit. A wiser course would be to develop specific objectives and goals for the next generation of management, including a detailed job description for the successor. Then a candidate can be chosen who best meets the qualifications. This strategy helps reduce the emotional aspect from the selection process, and may help the business owners feel more comfortable with their selection. The decision about when to announce the successor and the schedule for succession

depend upon the business, but an early announcement can help reassure employees and customers and enable other key employees to make alternative career plans as needed.

Once a potential successor has been selected, the company then enters the training phase. Ideally, a program is developed through which the successor can meet goals and gradually increase his or her level of responsibility. The owner may want to take a number of planned absences so that the successor has a chance to run the business for limited periods of time. The training phase also provides the business owner with an opportunity to evaluate the successor's decision-making processes, leadership abilities, interpersonal skills, and performance under pressure. It is also important for the successor to be introduced to the business owner's outside network during this time, including customers, bankers, IT professionals and other contractors, Web developers, marketers, Internet and wireless suppliers, and business associates.

The final stage in the process occurs when the business owner retires and the successor formally makes the transition to his or her new leadership role. This transition can be made as smooth as possible for the company by publicly committing to the succession plan, having the departing executive leave in a timely manner, and eliminating his or her involvement in the company's daily activities completely. In order to make the transition as painless as possible for himself or herself, the business owner should also be sure to have a sound financial plan for retirement and to engage in relationships and activities outside of the business.

It is a well-known fact that many business owners have a very hard time leaving the company altogether. It is not uncommon to see the small-business owner well into his or her seventies or even eighties still making the trek to the office, if only once in a while. This scenario can be both good and bad the should-be retired business owner can lend some advice or lead the younger generation through a tough process. Conversely, the older business owner may overshadow the authority of the younger generation, causing workers not to take the new boss very seriously. Marshall Goldsmith makes a point about CEOs and business owners who do not have an interest in what he calls "traditional retirement." In his 2009 book, *Succession: Are You Ready?* Goldsmith writes, "Make peace with your loss of status in advance. Learn to enjoy the process of others' striving to get ahead. If you cannot make peace with losing status, don't retire!"

SUPPLIER RELATIONS

Good purchasing practices are an integral part of small business success, and few factors are as vital in ensuring sound purchasing methodologies as the selection of quality suppliers. Indeed, finding good suppliers and maintaining solid relations with them can be an invaluable tool in the quest for business success and expansion. In fact, a business can only be as good as are the suppliers with whom it works. Suppliers provide the materials a company uses to produce its own goods and services. Suppliers provide the transportation of those materials. Suppliers provide a company with the services it uses in providing goods and service to its customer. Without a solid relationship with its suppliers, a company cannot offer its own customers a consistently high-quality product or service. Small-business owners may be surprised to find that the demographic they serve is often more educated than ever before about where they purchase goods and services. It is important for the business owner and managers to know their potential clientele well enough to know if they have objections to manufacturing in China,

communications from India, or will research enough to know whether suppliers' workers have ever struggled with layoffs or maintaining fair wages.

For many procurement organizations, suppliers have become an important factor in their planning. Suppliers are often a procurement organization's secret competitive weapon, their hidden resource, their competitive edge. These competitive gains can manifest themselves in a wide range of areas, from better prices and delivery times to increased opportunities to consider and implement innovative practices. Such improvements will not be realized without meaningful leadership from business owners and executives. Leading companies develop tailored supply strategies that are directly linked to their corporate strategies. These leaders emphasize shareholder-value creation, revenue growth, and cost competitiveness, and establish specific programs with their key suppliers in order to ensure that these priorities are addressed. Whenever possible, business leaders use suppliers to maximize their own product competitiveness, going beyond the narrow focus of cost reduction.

SUPPLY CHAINS AND PARTNERSHIPS

Countless management experts and analysts have touted the benefits that businesses of all sizes can realize by establishing "partnerships" with their suppliers. Under such a plan, which is also sometimes referred to as "supply chain management," distribution channels are set up across organizations so that all the members of the channel, from suppliers to end users, coordinate their business activities and processes to minimize their total costs and maximize their effectiveness in the marketplace. But while this trend has become more prevalent in today's business environment, it is still practiced in only spotty fashion in some industries. Common impediments to establishing true business partnerships with suppliers include attachment of greater importance to other initiatives; comfortable relationships with existing suppliers; dearth of cross-business unit cooperation; doubts about the benefits of instituting such practices; lack of cross-functional cooperation; poor monitoring and control systems; inexperience at managing improvement programs; and distrust of suppliers. Companies that feature many of these characteristics typically cling to old competitive bidding practices that center on perfectly legitimate concerns about price, but at the exclusion of all else.

In his 2010 book, *Strategic Sourcing Suppliers Are from Mars, Customers Are from Venus*, Murillo Xavier explains how cost reduction does not have to create disadvantages such as lower product quality or poor delivery of goods. In what Xavier calls "Strategic Sourcing," companies who manage suppliers intelligently can reap massive benefits. Xavier writes, "In many cases, a simple 10% reduction in outside purchasing cost can increase the profitability of the company from 20% to 60%. In fact, some companies re-evaluated their suppliers and achieved savings of more than 40% by using regional suppliers instead of national ones." Not only does this aspect of strategic sourcing save money and time, it can also inject more money into a local community because it makes use of suppliers in a business's own backyard rather than exporting it to larger, often faceless suppliers. Working with regional suppliers often engenders a better and more open line of communication small businesses and regional suppliers may face many of the same challenges and can work together to minimize the negative impacts of such adversities.

Still, many businesses miss out on the many benefits that can accrue when effective partnering initiatives are established with suppliers. Suppliers can be an important source of information on ways in which both small and large businesses can improve performance and productivity. Five general categories exist in which supplier involvement can help buyers compete in the marketplace:

1. Improvement of products through contributions to product design, technology, or ideas for producing new products. In most such instances, suppliers help buyers by pointing out ways in which designs can be improved or more desirable materials can be used.
2. Improvements in product quality. In addition to providing design recommendations that result in improved products, suppliers are often sources of suggestions that allow buyers to hold consistent tolerances in production.
3. Improvements in "speed to market." Some of the most significant contributions in this area came from suppliers to original equipment manufacturers.
4. Reductions in total product cost, either through streamlining of work processes (inventory management, new product design, scheduling, etc.) or replacement of costly components with less expensive but still effective ones.
5. Improvements in customer satisfaction. This can be in the form of better communication as simple as an e-mail relaying that an order was received, or offering member sign-in for returning businesses or individual clients from the company Web site. In this way clients can check on their order history, track an order, and view and print invoices for accounting and tax purposes.

Analysts indicate that suppliers receive some benefits in the emerging purchasing dynamic as well. Reduced paperwork, lower overhead, faster payment, long-term

agreements that lead to more accurate business forecasts, access to new designs, and input into future materials and product needs have all been cited as gains. Other observers, meanwhile, point out that some buyer-supplier relationships have become so close that suppliers have opened offices on the site of the buyer, an arrangement that can conceivably result in even greater improvements in productivity and savings. Such is the case with suppliers of Wal-Mart many of Wal-Mart's suppliers are able to lower their cost and offer expedited service to Wal-Mart by operating an office or warehouse from Bentonville, Arkansas, where Wal-Mart'headquarters are. Being able to serve Wal-Mart more quickly than competitors is extremely important for a supplier. As the world's largest retailer, Wal-Mart controls the bottom line for thousands of merchandisers and suppliers, many of which would go out of business or struggle if they were to lose their relationship with Wal-Mart.

Of course, companies are not going to form such "partnerships" with all of their suppliers. Some form of the traditional purchasing process involving bidding and standard purchase orders and invoices will continue to exist at almost every company, and especially at smaller companies that do not have the financial clout to pressure suppliers for price or delivery concessions.

But many management consultants and business experts contend that even those businesses that are not ideally positioned to create partnerships with suppliers can benefit from the establishment of effective supply chain management practices. Buyer-seller alliances unleash a capacity for innovation that far outweighs the short-term cost savings offered by arm's-length competitive bidding. Businesses should explain their overarching needs to several dedicated suppliers and open lines of communication with them rather than simply defining their requirements and waiting for a flurry of bids that are primarily or exclusively concerned with submitting the lowest bid.

Potential Drawbacks of Supplier Partnerships. Establishing close relationships with suppliers, though, means that buyers have to conduct the necessary research to make sure that they select the right companies. Purchasers need to know a great deal more about suppliers' capabilities than they did when everything depended on a bid/buy relationship. Today's emphasis on partnerships is contingent on suppliers who can become part of a whole supply system. In fact, major suppliers need to be critically screened and evaluated before they are brought into any supply chain system. Thriving small and mid-sized businesses that are already well-established will be better able to take on such tasks than will fledgling businesses, but even start-ups should take the time to learn more about their suppliers than their prices. Even then, small-business owners and managers should be careful not to marry themselves to a specific supplier. If a better supplier comes along, the business could lower its cost, offer better quality products, or speed up transport.

Of course, desired supplier traits vary somewhat depending on who is being surveyed. For example, design engineers tend to place the most weight on product quality when analyzing suppliers, while purchasing professionals place greater importance on cost considerations in conjunction with product quality. Criteria to be evaluated will also vary depending on product category. The objective of all evaluations is the same: To compare all potential suppliers in a market segment to determine the one best qualified partner with whom to work. The evaluation of potential suppliers should include an assessment about whether the supplier is suited to assist the purchaser to meet its prime business objectives. Typical the objectives to which the supplier should provide assistance include inventory reduction, quality improvement, elimination of paperwork, and improved handling of incoming goods.

Companies that do not do the necessary legwork, on the other hand, may find themselves linked to a poor or untrustworthy supplier that can erode a business's financial fortunes and industry/community reputation in a remarkably short span of time. Poor supplier performance is not the only risk a purchaser faces in situations where it has linked with a bad supplier. Another potential threat that arises when partnering with suppliers is the loss of trade secrets to competitors. Additionally, a supplier may venture out on its own once it has acquired new abilities and may in fact become a competitor. A company that abdicates too much to its suppliers may weaken itself. All of these risks are especially great in fast-moving, knowledge-intensive industries, which are precisely those for which integrated supply chains may be of particular usefulness. Given these potential pitfalls, businesses seeking to establish partnerships with suppliers are urged to proceed with caution.

EVALUATING SUPPLIERS

Whether searching out new suppliers or benchmarking the performance of current suppliers, businesses are urged to consider the following when evaluating their options:

- Commitment to quality Not surprisingly, product quality is regarded as an essential factor in selecting a supplier. Specifics in this realm include the suppliers' statistical process control methods, its QS-9000 registration, its approaches to problem solving and preventive maintenance, and its methods of equipment calibration.

- Cost-competitive Competitive pricing is another huge factor, especially for businesses that are smaller or experiencing financial difficulties.
- Communication Suppliers that do not maintain a policy of open communication or even worse, actively practice deception should be avoided at all costs. The frustrations of dealing with such companies can sometimes assume debilitating dimensions. Moreover, constant exposure to such tactics can have a corrosive effect on internal staff.
- Timely service Businesses' strategies are predicated on schedules, which in turn are based on receiving shipments at agreed-upon times. When those shipments slip, business strategies suffer. The blow can be particularly severe if the supplier is negligent or late in reporting the problem.
- Flexibility and Special Services Many purchasers express appreciation for suppliers that take extra measures to satisfy their customers. These "perks" can range from after-hours accessibility to training or inventory support.
- Market knowledge Suppliers with extensive knowledge of market conditions and mastery of contemporary issues impacting a business can be immensely valuable in helping small companies chart a course to sustained financial success.
- Production Capabilities The supplier's capacity for program management and production should be considered, including its ability to integrate design and manufacturing functions, its approach to design changes, and its program measurement features.
- Financial Stability Businesses that allocate large sums for purchasing materials often prefer to make long-term deals with suppliers that are financially stable. Such arrangements not only convey security, but they allow companies to learn about one another and gain a fuller understanding of each business's needs, desires, operating practices, and future objectives.
- Logistics/Location Supplier capabilities in this area include transportation capacity, sourcing capabilities, and 'just-in-time' performance.
- Inventory Evaluation of this consideration is dependent somewhat on the supplier's business. If the supplier is a distributor, the emphasis will be on how well his inventory is set up to avoid stockouts. With a manufacturer, emphasis has to be on inventory accessibility. If the supplier has a just-in-time program with 24-hour assured delivery, it is in better condition than the manufacturer with a lot of raw material inventory and an 8-week lead-time for raw material.
- Ability to provide technical assistance Suppliers with top research and development capacities can be quite valuable to buyers, providing them with significant savings in both price and quality.

OTHER KEYS TO SUCCESSFUL SUPPLIER RELATIONSHIPS

Of the most important aspects of supplier relationships, communication is paramount. In his 2009 book, *Enterprise Supply Chain Management: Integrating Best in Class Processes*, Vivek Sehgal explains the value of communication and how it has changed with the advent of so many kinds of electronic communications and other technologies. "Most business transactions these days are exchanged using standard industry formats automatically between the buyer and supplier computer systems." Almost all communication in the business world is via e-mail or other automated message systems. While this has done a great deal to expedite services and the speed with which clients can receive what they need from suppliers, it can be quite impersonal and does not always lend itself to the kind of communication that suppliers and small businesses enjoyed in decades past. It is important for both suppliers and small-business owners to interface on some more personal level at least every once in a while.

A common lament of suppliers is that buyer organizations all too often have unrealistic expectations about the supplier's ability to anticipate buyer needs. As one purchasing executive admitted to *Purchasing*, "In new technology areas we have great difficulty getting the users in our own company to define what they want. Most have an attitude of 'I'll know it when I see it.' And many of these users keep changing their minds."

Honesty on both sides is another important quality in effective buyer-supplier relations. Small-business owners hate being misled by their suppliers, yet they are often less than above-board in their own communications with suppliers. This is most common when the business is grappling with past-due payments, but entrepreneurs should avoid subterfuge and be upfront with suppliers about their situations. "Instead of lying and saying the check's in the mail, tell suppliers what's happening and what you propose to do about it," one small-business owner told *Nation's Business*. "If you have a note that's due, you call them, instead of waiting for them to call you. They appreciate that. Business people are afraid to make that phone call; they want to make it all sound rosy. But . . . if you owe them, suppliers are eager to find a way to work with you."

SUPPLY AND DEMAND

Supply and demand is a fundamental factor in shaping the character of the marketplace, for it is understood as the principal determinant in establishing the cost of goods and services. The availability, or "supply," of goods or services is a key consideration in determining the price at which those goods or services can be obtained. For example, a landscaping company with little competition that operates in an area of high demand for such services will in all likelihood be able to command a higher price than will a business operating in a highly competitive environment. But availability is only one-half of the equation that determines pricing structures in the marketplace. The other half is "demand." A company may be able to produce huge quantities of a product at low cost, but if there is little or no demand for that product in the marketplace, the company will be forced to sell units at a very low price. Conversely, if the marketplace proves receptive to the product that is being sold, the company can establish a higher unit price. "Supply" and "demand," then, are closely intertwined economic concepts; indeed, the law of supply and demand is often cited as among the most fundamental in all of economics.

FACTORS IMPACTING SUPPLY AND DEMAND

When using the term "demand" most people think the word means a certain volume of spending, as when news reports say that the demand for cars has fallen off or the demand for paper is high. But that is not what economists mean when using the term. For economists, demand means not just how much consumers are spending for a given item, but how much consumers are spending for that item *at its price*, and how much consumers would spend *if its price changed.* Price in fact is so important to demand that economists refer to the relationship as "the law of demand." This law posits that price can directly affect demand. When the cost of a product (or service) increases, consumers tend to use less of that product. When prices for a product or service drop, customers may purchase more of that product or service because they can afford to buy more of it. Governments use this law sometimes to bolster an economy or industry that is in jeopardy. For example, during the economic downturn of 2008 and 2009, the housing market in the United States suffered. As fewer people had jobs and good income, the demand for homes fell, even though the cost of housing fell as well. In order to boost the housing market and therefore the economy at large, the U.S. government offered a number of incentives to buyers, including $12.6 billion in homebuyer tax credits. These incentives were designed to make housing more affordable and therefore to raise demand for housing. Some economists estimated that these incentives accounted for up to 25 percent of housing demand while they were in effect.

The demand for products and services is predicated on a number of factors. The most important of these are the tastes, customs, and preferences of the target market, the consumer's income level, the quality of the goods or

services being offered, and the availability of competitors' goods or services. All of these elements are vital in determining the price that a business can command for its products or services, whether the business in question is a hair salon, a graphic arts firm, or a cabinet manufacturer.

The supply of goods and services in the marketplace is predicated on several factors as well, including production capacity, production costs (including wages, interest charges, and raw materials costs), and the number of other businesses engaged in providing the goods or services in question. Of course, some factors that are integral in determining supply in one area may be inconsequential in another. Weather, for example, is an important factor in determining the supplies of wheat, oranges, cherries, and myriad other agricultural products. Yet weather rarely impacts the operations of businesses such as bookstores or auto supply stores, except under the most exceptional of circumstances.

"When we are willing and able to buy more, we say that demand rises, and everyone knows that the effect of rising demand is to lift prices," summarized Robert Heilbroner and Lester Thurow in their book *Economics Explained: Everything You Need to Know About How the Economy Works and Where It's Going*. "Of course the mechanism works in reverse. If incomes fall, so does demand, and so does price." When the economy suffers, as it did in 2008 and 2009, for example, this affects supply and demand. Unlike the weather, a factor which only affects some businesses, economic stability and strength can affect supply and demand across industries. Heilbroner and Thurow point out that supply can also dwindle as a result of other business conditions, such as a rise in production costs for the producer or changes in regulatory or tax policies. "And of course both supply and demand can change at the same time, and often do," added Heilbroner and Thurow. "The outcome can be higher or lower prices, or even unchanged prices, depending on how the new balance of market forces works out."

EVALUATING SUPPLY AND DEMAND

Economists analyze the effect of supply and demand on a product, service, or industry by graphing the price, demand, and supply of a product or service on charts which show the demand curve and the supply curve of a product or service. These curves show changes in price, demand, and supply over time. As N. Gregory Mankiw noted in his 2009 book, *Principles of Economics*, this way of analyzing demand and supply is somewhat artificial as it assumes that all other factors (except price) affecting supply and demand remain constant.

Nevertheless, the demand curve and supply curve are important in noting and even predicting overall trends. Also, when supply and demand curves are graphed together for the same goods and services, economists can determine the equilibrium price of a product or service. The equilibrium price is the price at which the supply curve and the demand curve intersect, and it represents the price at which the amount of a product or service supplied is in balance with demand for that product or service.

SUPPLY AND DEMAND ELASTICITY

The demand for goods depends on the price for those goods, as well as on consumer income and on the prices of other goods. Similarly, supply depends on price, as well as on variables that affect production cost. How much the supply and demand will rise or fall is often difficult to predict. This measurement of a product or service's responsiveness to market changes is known as elasticity. Elasticity is a measure of the responsiveness of one economic variable to another. For example, price elasticity is the relationship between a change in the supply of a good and the demand for that good. Economists are often interested in the price elasticity of demand, which measures the response of the quantity of an item purchased to a change in the item's price. A good or service is considered to be highly elastic if a slight change in price leads to a sharp change in demand for the product or service. Products and services that are highly elastic are usually more discretionary in nature readily available in the market and something that a consumer may not necessarily need in his or her daily life. On the other hand, an inelastic good or service is one for which changes in price result in only modest changes in demand. These goods and services tend to be necessities.

The quality and degree of marketplace reaction to price changes depend on several factors. These include: 1) the presence or absence of alternative sources for the product or service in question; 2) the time available to customers to investigate alternatives; 3) the size of the investment made by the purchaser. Elasticity, then, is an important factor for small-business owners to consider when entertaining thoughts about changing the prices of the goods or services that they offer.

SUSTAINABLE BUSINESS PRACTICES

Sustainable business practices are the process by which a company aligns its activities with a concern for the natural environment and the communities in which the company operates. Sustainable business practices surged in popularity in the late twentieth and early twenty-first centuries, and the term now covers a wide variety of areas: incorporating clean and green energy practices; taking into account a "triple bottom line" to include social and environmental responsibility as well as profit; and being accountable to stakeholders, not just shareholders.

The growing popularity of sustainable business practices can be attributed to a society increasingly concerned with social and environmental issues. As consumers, these concerned citizens are using their buying power to reward companies with sustainable business practices and punish those seen as polluters or exploiters. Sustainability has become a marketing tool used to differentiate a company from its competitors. Competitive companies use sustainable business practices to become more efficient, cut costs, and create new business models that focus on "doing well by doing good."

A NEW BUSINESS REALITY

Many people no longer see business as merely providing jobs and goods or services. Instead there is a growing expectation that companies should act ethically and contribute more than jobs to society even if that means reduced profits to shareholders. A 2008 survey of graduating MBAs at eleven top business schools, conducted by the Stanford University Graduate School of Business, showed that corporate social responsibility ranked high when these graduates searched for employers.

Management literature of the first decade of the twenty-first century, as well as sustainability consultants, offer plentiful advice on how companies can benefit financially from anticipating and responding to society's demands for businesses that contribute to society. In May 2010 the *Harvard Business Review* called sustainability a "business megatrend." As a megatrend, sustainability is creating new business opportunities and endangering the profitability of companies that do not react or adapt. In the article "The Sustainability Imperative: Lessons for Leaders from Previous Game-Changing Megatrends," David Lubin and Daniel Esty explain why sustainability has developed into a megatrend over the past few years: "Globalized workforces and supply chains have created environmental pressures and attendant business liabilities. The rise of new world powers, notably China and India, has intensified competition for natural resources (especially oil) and added a geopolitical dimension to sustainability. 'Externalities' such as carbon dioxide emissions and water use are fast becoming material meaning that investors consider them central to a firm's performance and stakeholders expect companies to share information about them. These forces are magnified by escalating public and governmental concern about climate change, industrial pollution, food safety, and natural resource depletion, among other issues."

However, those same global factors can make sustainable business practices feel like a luxury when companies face competitors based in countries where sustainability is not practiced. In their 2009 *Harvard Business Review* article, "Why Sustainability Is Now the Key Driver of Innovation," Ram Nidumolu, C. K. Prahalad, and M. R. Rangaswami address this issue: "Suppliers can't provide green inputs or transparency; sustainable manufacturing will demand new equipment and processes; and customers will not pay more for eco-friendly products during a recession. That's why most executives treat the need to become sustainable as a corporate social responsibility, divorced from business objectives." However, when the authors researched sustainability initiatives at thirty large companies over time, they found that sustainability spurred technological and organizational innovation that brought both immediate financial benefits (from a reduction of resources used) and long-term gain from better products or new lines of business.

The twenty-first century witnessed the rise of companies that innovated around sustainable business practices by creating new products or businesses models and achieved popularity and profits. In fact, some of the more successful companies begun in the late twentieth century, like Ben and Jerry's, Burt's Bees, and Tom's of Maine, were bought by multinational companies to improve their image and add revenue from a fast-growing consumer segment. Other companies stand above their competitors because sustainable business practices permeate every action of the company. A few examples of such

successful companies in 2010 included Timberland and Whole Food's.

TRIPLE BOTTOM LINE

The theory of the triple bottom line (TBL) is that companies need to focus on more than just profits. Rather, companies are a part of the society in which they operate and need to add benefit to that society. In addition to supplying jobs and goods or services, TBL advocates that companies also need to pursue environmental quality and social justice. This triple bottom line of people, planet, and profit was popularized by John Elkington in his 1998 book *Cannibals with Forks: Triple Bottom Line of 21st Century Business.* Elkington wrote that "key markets are on the verge of rapid change, driven by new environmental standards and related customer requirements. As a result, new lines are being drawn alongside the old profit and loss statements."

Triple bottom line proposes that a company's primary responsibility is to stakeholders anyone linked, directly or indirectly to the company's actions rather than to shareholders. According to the TBL theory, companies' primary purpose should be to increase social and environmental welfare, rather than to maximize profits and increase shareholder value.

A TBL company looks to reduce its impact on the environment by consuming less energy and nonrenewable resources and reducing waste. TBL manufacturers take a "cradle to grave" approach, examining a product's life cycle from raw materials to distribution and disposal and implementing changes to reduce the environmental impact of each of these steps. Almost by default, TBL excludes companies producing "dirty" products like oil, gas, chemicals, weapons, or products containing dangerous components. TBL also advocates that a company treat people well, whether they are employees, suppliers, or members of the community where the business is based.

CORPORATE SOCIAL RESPONSIBILITY

A theory similar to a triple bottom line and also popular is corporate social responsibility (CSR), which integrates triple bottom line actions into a company's business model. A business practicing CSR strives to improve its treatment of employees, its use of natural resources, and its contributions to society. CSR efforts range from energy efficiency to waste reduction to donating money and employee time to community causes. By the early 2010s CSR had been widely adopted by many firms.

Both TBL and CSR are voluntary systems, but with so many companies publicizing their efforts in these areas, a company without a CSR or TBL policy may lose market share. In a 2009 survey by the Conference Board, 48 percent of 158 companies surveyed said brand visibility and awareness were increasingly important components of their CSR. The relationship between giving and corporate sustainability goals was important to 46 percent of respondents. Publicly traded companies include their CSR efforts in annual reports while businesses large and small publicize their CSR activities on their company Web sites. Incorporating corporate social responsibility and achieving a triple bottom line have become buzzwords for companies both large and small.

CORPORATE GOODWILL

A common CSR component is donations to nonprofit organizations. In the first decade of the twenty-first century, those donations funded arts and culture initiatives, event sponsorships, and other highly visible areas. During the recession of 2008 and 2009, companies began focusing on CSR investments that produced more return for the dollar invested, such as partnering with nonprofits whose programs fit the companies' areas of activity. The 2009 Conference Board survey found that 45 percent had cut 2009 giving budgets and 16 percent of companies were considering budget cuts. Companies also increased time available to employees for volunteering instead of giving direct donations. Such initiatives are ways companies can motivate and retain employees rather than compensating them directly with raises or bonuses.

CRITICISM OF CSR AND TBL

Critics of CSR come from both the political right and left and even share some common concerns. Free market activists argue that top management should not waste company resources and shareholder value by donating large sums to charity and other CSR largesse. Shareholders have invested their money in the company for a return on that money comparable to the risk, and the company's primary goal is to provide a return on that investment. These critics contend that the social benefits touted by CSR are natural byproducts of a thriving company. These benefits include jobs and employee benefits, better communities, and reinvestment into the environment to ensure future manufacturing resources. Some critics from the left agree that is not the main responsibility of businesses to solve social and environmental problems. They contend that it is the government and civil society that are responsible for tackling these problems.

Another criticism is that companies self-reported the impact of their CSR efforts, which can mean that CSR is little more than a public relations exercise and can even detract from the real need to address environmental or social issues. Finally, the business case for companies to engage in elaborate CSR campaigns is not always clear. In his book *The Market for Virtue: The Potential And Limits of Corporate Social Responsibility*, David Vogel argues that

"although CSR may provide benefit to some firms in some areas by protecting and improving their reputation, for example, or by helping them attract, motivate, and retain employees these benefits are often elusive and rarely affect their financial performance."

ENVIRONMENTAL SUSTAINABILITY AND ENERGY EFFICIENCY

Environmental issues are at the forefront of the public consciousness in the twenty-first century, and issues such as climate change, global warming, and clean energy have moved mainstream. University researchers, entrepreneurs, and investors are looking for new ways to make clean energy, improve auto efficiency, and reduce manufacturing waste, among many areas. Venture capital firms have ramped up their investments in clean technology, with $9 billion invested in 2008. Private sector investment in clean technology has been estimated at over $200 billion, and over $400 billion of worldwide funds have been earmarked for clean tech and sustainability programs as of 2010, according to Lubin and Esty.

Efforts toward environmental sustainability and energy efficiency can have immediate cost savings, as well as positive marketing potential, and most companies include these areas as the cornerstone of their CSR efforts. In the recession of 2008 and 2009, companies cut budgets for corporate social responsibility because it was not seen as a business necessity when money was tight. However, companies did not turn away from sustainable business practices completely, instead investing more money in energy and efficiency.

Small business owners looking for a marketing edge, or to save money on energy or resource consumption, should conduct a thorough review of their company's environmentally sustainable business practices. Each business function should be reviewed in the search for areas to improve. "Companies develop sustainable operations by analyzing each link in the value chain. First they make changes in obvious areas, such as supply chains, and then they move to less obvious suspects, such as returned products," wrote Nidumolu, Prahalad, and Rangaswami in their 2009 article.

Though sustainable business practices may carry a longer payback period or return on investment than is typical, the growing trend requires that companies invest in sustainability to stay competitive. Some of the common improvements are those that will bring short-term cost savings, like reducing waste and energy consumption, increasing recycling, and streamlining processes to reduce the amount of energy consumed while being more efficient as a company. Projects with a long-range payback are being undertaken for marketing and future returns, such as increasing safeguards against environmental harm and the potential for litigation and fines, or installing solar panels and other alternative energy production.

Companies can introduce environmentally sustainable business practices slowly as they look at each area of the business. Both the articles by Nidumolu, Prahalad, and Rangaswami, and by Lubin and Esty, suggest distinct stages, which, if done right, save the company money while increasing its competitive advantage. "The initial aim is usually to create a better image, but most corporations end up reducing costs or creating new businesses as well," wrote Nidumolu, Prahalad, and Rangaswami.

Here are some advantages sustainable business practice can bring to a company.

1. Outperform competitors on regulatory compliance and environment-related cost and risk management. There are basic environmental regulations that every company must follow. Businesses operating globally need to comply with different regulations in each county. Competitive companies choose to apply the most stringent rule across all markets. This makes the company more likely to innovate when faced with stricter regulation than competitors. In addition to merely complying with environmental regulations, companies look to reduce the pollution they produce or implement more stringent safeguards against environmental damage. Through this process, they become more proactive about environmental issues.
2. Innovate and redesign products, processes, and systems to improve risk management and lower the use of natural resources. Once regulatory compliance is met and exceeded, companies should focus on reducing the consumption of nonrenewable resources such as coal, petroleum, and natural gas along with renewable resources such as water, timber, and paper.
3. Continue the drive toward efficiency from manufacturing facilities and offices to the value chain. Companies work with suppliers and retailers to develop environmentally friendly raw materials and components and reduce waste.
4. Leverage sustainability innovations to develop new revenue streams and ways to make money.
5. Create new business models and ways to differentiate from the competition through repositioning the entire company. The companies that use the megatrend of sustainability to their advantage are those that find new ways to make money.

ISO 14000 STANDARDS

The ISO 14000 series is a set of environmental management standards developed by the International Organization for Standardization (ISO). The ISO is a nongovernmental

network of the national standards institutes of 161 countries and is the largest developer of international standards.

According to the ISO Web site, a business of any size or type can use this management tool to identify and control the environmental impact of its business activities, continuously improve environmental performance, and set and achieve environmental objectives and targets. ISO claims that enacting the ISO 14000 series brings companies economic as well as environmental benefits, including reduced raw material use, reduced energy consumption, improved process efficiency, reduced waste generation and disposal costs, utilization of recoverable resources, and a more positive image among customers, regulators, and the general public.

The most common guideline from the series is ISO 14001:2004, which outlines the requirements for an environmental management system. In order to fulfill the requirements, businesses need to collect objective evidence that can be audited to demonstrate that the environmental management system is effective and conforming to the standard. Once implemented, ISO 14001:2004 can provide management the assurance that the company is in control of the processes and activities that impact the environment. The guidelines enable businesses to go beyond merely avoiding pollution that could result in fines or bad press. Instead, it provides managers with the tools to be proactive and surpass current environmental legislation while providing the company a return on investment for its environmental sustainability activities. Employees will know that they are working for a company that is taking steps to be environmentally responsible. Customers, the community, and the government may be more reassured that the company is complying with all environmental regulations and more inclined to believe a company's CSR claims.

Small businesses may wonder if they have the resources to implement such a system. Benefits to small businesses, claims the ISO, include cost savings; risk management to reduce legal, financial, and reputation-related environmental liabilities; marketing opportunities; and engagement of the community.

A related standard, ISO 14004:2004, provides more general guidelines on the elements of an environmental management system, its implementation, and the main issues involved. ISO announced publication in 2010 of ISO 26000, a guidance standard on corporate social responsibility. The CSR standard is voluntary, does not include requirements, and will not provide a certification if all standard components are achieved. The guidance standard will be published in 2010 as ISO 26000. The ISO sells access to these standards and its publications online at its Web site: www.iso.org.

IMPLEMENTING SUSTAINABLE BUSINESS PRACTICES FOR SMALL BUSINESSES

The easiest and most cost-effective way for a company to implement sustainable business practices is to reduce the amount of energy and resources the business consumes. Even the smallest company can review each step of how goods are made or services delivered to identify ways to reduce waste and energy consumption and costs. Waste prevention can be as simple as implementing double-sided printing and storing documents digitally instead of printing them. Soliciting ideas from employees can often generate innovative cost savings through sustainability measures that management may not have thought of. In fact, employee participation in sustainability efforts is seen as an inexpensive way to jumpstart the initiative, contribute to employee morale, and create easy successes to move the process forward.

In order to start implementing sustainable business practices, small businesses should contact their local utility company, many of which offer free energy audits to pinpoint where energy is being wasted. Energy Star, the U.S. governmental rating system for energy efficiency, offers online resources on commercial building energy management and high-efficiency products at its Web site: www.energystar.gov. The U.S. Environmental Energy Technologies Division maintains a listing of energy efficiency resources for businesses and homeowners at: http://eetd.lbl.gov/einfo-links.html

SUSTAINABLE GROWTH

In simple terms and with reference to a business, sustainable growth is the realistically attainable growth that a company could maintain without running into problems. A business that grows too quickly may find it difficult to fund the growth. A business that grows too slowly or not at all may stagnate.

In the first decade of the twenty-first century, sustainable growth has sometimes been used to refer to company growth using sustainable resources or company growth which does not harm the environment unduly. This is not usually considered by economists to be a strictly correct use of the term but it is often used in this manner.

Economically speaking, finding the optimum growth rate is the goal. A sustainable growth rate (SGR) is the maximum growth rate that a company can sustain without having to increase financial leverage. In essence, finding a company's sustainable growth rate answers the question: how much can this company grow before it must borrow money? According to William Lasher's 2008 book, *Practical Financial Management*, a company's sustainable growth rate provides a theoretical snapshot of the business's current strength. Lasher also noted that while a company's sustainable growth rate suggests a point at which a company will be able to grow without taking on new debt, in actual fact companies may still need to borrow money in order to maintain their debt-equity ratio.

The models used to calculate sustainable growth assume that the business wants to: 1) maintain a target capital structure without issuing new equity; 2) maintain a target dividend payment ratio; and 3) increase sales as rapidly as market conditions allow. Since the asset to beginning of period equity ratio is constant, and the firm's only source of new equity is retained earnings, sales and assets cannot grow any faster than the retained earnings plus the additional debt that the retained earnings can support. The sustainable growth rate is consistent with the observed evidence that most corporations are reluctant to issue new equity. If, however, the firm is willing to issue additional equity, there is in principle no financial constraint on its growth rate. Indeed, the sustainable growth rate formula is directly predicated on return on equity.

To calculate the sustainable growth rate for a company, one must know how profitable the company is, based on a measure of its return on equity (ROE). One must also know what percentage of a company's earnings per share it pays out in dividends, which is called the dividend-payout ratio. With these figures one can multiply the company's ROE by its plowback ratio, which is equal to 1 minus the dividend-payout ratio. Sustainable growth rate = ROE $\times$ (1 - dividend-payout ratio). Just as the break-even point for a business is the "floor" for minimum sales required to cover operating expenses, the SGR is an estimate of the "ceiling" for maximum sales growth that can be achieved without exhausting operating cash flows. The SGR can be thought of as a growth break-even point.

THE CHALLENGE OF ATTAINING SUSTAINABLE GROWTH

Creation of sustainable growth is a prime concern of small-business owners and big corporate executives alike. For small businesses, however, sustainable growth can be even more important. While larger companies may be able to absorb costs temporarily or borrow money in order to cope with too-rapid growth, smaller businesses may not have these options. Also, smaller businesses must pursue sustainable growth in order to remain competitive; growth which is too modest can make a smaller business compete poorly and therefore fare badly.

For both small and large businesses, however, achieving sustainable growth is no easy task, given rapidly changing political, economic, competitive, and consumer trends. Each of these trends presents unique challenges to business leaders searching for the elusive grail of sustainable growth. Customer expectations, for example, have changed considerably over the last few generations. In addition, competition is keen in nearly all industries, which have seen unprecedented breakdowns in the barriers that formerly separated them.

According to Darren D. Lee, Robert W. Faff, and Kim Langfield-Smith, authors of a 2009 study of sustainable growth, company concerns regarding sustainable growth are also influenced by tightened regulations and heightened surveillance of sustainable growth. Following a number of scandals and business corruption cases in the first decade of the twenty-first century, companies are being held more responsible for their business decisions, and this includes decisions regarding growth. According to Lee, Faff, and Langfield-Smith, many companies have sustainability divisions to improve sustainability reporting, including reporting of efforts made by companies engaged actively in growth. Companies committed to sustainable growth are in effect committed to growing at a responsible pace, one that will not create grounds for problems. Investors and shareholders are increasingly interested in seeing evidence of

company commitment to reasonable or sustainable growth, according to the 2009 study.

According to some economists, sustainable growth begins with a change in mindset. In order for a company to pursue sustainable growth, the company must first shift its focus from the idea of economic growth at any cost to the idea of balanced growth. The growth challenge is articulated differently by different companies and within different industries. For some, developing and launching new products and services to meet the evolving needs of their customers is the issue. For others, capitalizing on global opportunities is key. Some companies look to new business areas that will represent the next major thrust for their business. For a few companies, all of these strategic efforts are simultaneously used, along with ongoing efforts to rebuild organizational capabilities.

Economists and business researchers contend that achieving sustainable growth is not possible without paying heed to twin cornerstones: growth strategy and growth capability. Companies that pay inadequate attention to one aspect or the other are doomed to failure in their efforts to establish practices of *sustainable* growth (though short-term gains may be realized). After all, if a company has an excellent growth strategy in place, but has not put the necessary infrastructure in place to execute that strategy, long-term growth is impossible. The reverse is true as well; a good infrastructure with no growth strategy in place will make sustained growth difficult to achieve.

USING THE SUSTAINABLE GROWTH RATE

The concept of sustainable growth can be helpful for planning healthy corporate growth. This concept forces managers to consider the financial consequences of sales increases and to set sales growth goals that are consistent with the operating and financial policies of the firm. Often, a conflict can arise if growth objectives are not consistent with the value of the organization's sustainable growth.

According to economists, if a company's sales expand at any rate other than the sustainable rate, one or more of the basic business ratios must change. If a company's actual growth rate temporarily exceeds its sustainable rate, the required cash can likely be borrowed. When actual growth exceeds sustainable growth for longer periods, management must formulate a financial strategy from among the following options: 1) sell new equity; 2) permanently increase financial leverage (i.e., take on more debt); 3) reduce dividends; 4) increase the profit margin; or 5) decrease the percentage of total assets to sales.

In practice, companies are often reluctant to undertake these measures. Firms dislike issuing equity because of high issue costs, possible dilution of earnings per share, and the unreliable nature of equity funding on terms favorable to the issuer. A firm can only increase financial leverage if there are assets that can be pledged and if its debt-to-equity ratio is reasonable in relation to its industry. The reduction of dividends typically has a negative impact on the company's stock price. Companies can attempt to liquidate marginal operations, increase prices, or enhance manufacturing and distribution efficiencies to improve the profit margin. In addition, firms can source more activities from outside vendors or rent production facilities and equipment, which has the effect of improving the asset turnover ratio. Increasing the profit margin is difficult, however, and large sustainable increases may not be possible. Therefore, it is possible for a firm to grow too rapidly, which in turn can result in reduced liquidity and the unwanted depletion of financial resources.

The sustainable growth model is particularly helpful in situations in which a borrower requests additional financing. The need for additional loans creates a potentially risky situation of too much debt and too little equity. Either additional equity must be raised or the borrower will have to reduce the rate of expansion to a level that can be sustained without an increase in financial leverage.

Mature firms often have actual growth rates that are less than the sustainable growth rate. In these cases, management's principal objective is finding productive uses for the cash flows that exist in excess of their needs. Options available to business owners and executives in such cases include returning the money to shareholders through increased dividends or common stock repurchases, reducing the firm's debt load or increasing possession of lower-earning liquid assets. Note that these actions serve to decrease the sustainable growth rate. Alternatively, these firms can attempt to enhance their actual growth rates through the acquisition of rapidly growing companies.

Growth can come from two sources: increased volume and inflation. The inflationary increase in assets must be financed as though it were real growth. Inflation increases the amount of external financing required and increases the debt-to-equity ratio when this ratio is measured on a historical cost basis. Thus, if creditors require that a firm's historical debt-to-equity ratio stay constant, inflation lowers the firm's sustainable growth rate.

SYNDICATED LOANS

Syndicated loans are large loans made by two or more lenders and administered by a common agent using similar terms and conditions and common documentation. Most loan syndications take the form of a direct-lender relationship, in which the lead lender is the agent for the other lenders in the origination and administration of the loan, and the other lending banks are signatories to the loan agreement. In the last several years the popularity of this type of loan has exploded.

In the 1970s and early 1980s, syndicated loans were mainly organized for governments, especially those in the developing word. By the mid-1980s, however, syndicated loans were increasingly used for larger businesses and eventually started to be used by medium companies as well. Between the mid-1980s and the middle of the first decade of the twenty-first century, syndicated loans grew rapidly in size, importance, and popularity. For large and medium-sized companies, they became a viable way to raise funds. In 2006 the U.S. saw $1.5 trillion in syndicated loans, as reported by Loan Pricing Corp. (LPC). In 2009 issues of new syndicated loans for large and medium companies reached their lowest point in two decades. According to the 2009 book, *Introduction to Corporate Finance*, by William L. Megginson and Scott B. Smart, by 2008 syndicated loans were a $2.5 trillion per year business, with about two out of every three U.S. syndicated loans going to corporate businesses. By early 2010 many individual lenders offering standard loans tightened eligibility requirements. Medium-sized companies were also getting fewer syndicated loans. In fact, according to a 2010 article in the *Economist*, the syndicated lending market catering to medium-sized companies was working at less than half of peak levels in early 2010. In many cases, companies looking for loans in early 2010 already had large debt loads and were plagued by poor sales as well, leading to problems securing loans.

Most successful small companies that have evolved to the point where they are straining at the boundaries of that "small" designation have always dealt with one or a few individual banks, negotiating individual loans and lines of credit separately with each institution. The next financing step, however, may be to consolidate banking activity through one syndicated facility. While business owners and executives are sometimes loath to run the risk of alienating banks with which they have long done business, the simple reality is that companies can outgrow their traditional banks. As they grow, such companies may need access to more capital than can be handled comfortably by a single bank. An expanded bank group may be needed to fund their continued growth.

Of course, businesses can always choose simply to increase their stable of lending institutions, but this has several drawbacks. Managing multiple bank relationships is a time-consuming job. Each bank must be provided a lot of information about a potential borrower and how its financial activities are conducted. A comfort level must be established on both sides of the transaction, which requires time and effort. Negotiating a document with a single bank can take days. To negotiate documents with four to five banks separately is a much bigger job. Staggered maturities must be monitored and orchestrated. Multiple lines of credit require an intercreditor agreement among the banks, which takes additional time to negotiate.

Given these obstacles, business owners and executives often express interest in syndicated loans, which offer consolidation of effort and the possibility of making new banking contacts. Lenders support their use as well. Lenders tend to favor syndications because these arrangements permit them to make more loans, while limiting individual exposures and spreading the lenders' risk within portfolios more widely. In addition, lenders like the fact that administration of syndicated loans is extremely efficient, with the agent managing much of the process on behalf of the participants.

Syndicated loans hinge on the creation of an alliance of smaller banking institutions that, by joining forces, are able to meet the credit needs of the borrower. This creation is spurred by selection of an agent or arranger who manages the account. In consultation with the borrower, the agent will assemble a group of banks to form a syndicate. Each member of the syndicate then lends a portion of the total loan amount. Such a syndicated loan is normally signed 6 to 8 weeks after the mandate has been awarded, and after signing, the borrower can begin to draw down funds.

Borrowers taking out syndicated loans pay up-front fees and annual charges to the participating banks, with interest accruing (on a quarterly, monthly, or semiannual

basis) from the initial draw-down date. Nonetheless, on large loans that would otherwise be handled by several different lending institutions under separate loan agreements, syndicated loans can still be more cost-effective. This cost saving increases as the amount required rises.

Although syndicated loans can be used for any financial needs a business has, they are often used for project finance and for Eurocurrency lending. Eurocurrency lending involves syndicates of international banks that offer very large sum loans to corporations and other banks. These types of loans are often $500 million or larger, and many loans exceed $1 billion, according to Megginson and Smart. Project finance (PF) loans are syndicated loans offered to stand-alone companies for a single, large project such as building a toll bridge that requires up-front cash but will eventually generate revenue. These syndicated loans are unique because they are secured by the cash revenue and assets of the project they are used for, not by the assets of the creditors.

OTHER ADVANTAGES OF SYNDICATED LOANS

Economists and syndicate executives contend that there are other, less obvious advantages of syndicated loans. These benefits include:

- Flexibility in structure and pricing. Borrowers have a variety of options in shaping their syndicated loan, including multicurrency options, risk management techniques, and prepayment rights without penalty.
- Syndicated facilities bring businesses the best prices in aggregate and spare companies the time and effort of negotiating individually with each bank.
- Loan terms can be abbreviated.
- Increased feedback. Syndicate banks sometimes are willing to share perspectives on business issues with the agent that they would be reluctant to share with the borrowing business.
- Syndicated loans bring the borrower greater visibility in the open market.

In addition, syndicate loans for very large corporations have some additional advantages. In many cases, syndicated loans for very large corporations can be arranged very quickly. According to Megginson and Smart, many large corporations enjoy remarkably flexible syndicated loans. Lenders will often offer such loans as floating-rate credits, often initially in the form of lines of credit, so that corporations can access funds quickly and easily. After 4 to 6 years, the loans are usually converted into more traditional loan structures, with a fixed rate and a schedule of repayment. This structure makes it especially convenient for larger corporations to organize acquisitions agreements.

SYNDICATE FORMATION

A borrower's ability to secure a syndicated loan, though, is predicated on its ability to spur the creation of a syndicate in the first place. No two syndications are identical. The lending environment changes every day. Many intangibles influence the structure and pricing of credit. These include the experience and depth of a borrowing company's management team; trends in the industry and market in which the borrower is active; and financial trends within a company.

The first thing the company has to do is select an agent to facilitate communications and transactions between the borrower and the banking institutions that will form the syndicate. The first place to look for an agent is among existing contacts. The agent is often, though need not be, the largest participant in the syndication. The agent must, however, have sufficient capital strength to be the anchor of the credit. Because it is important for a borrower to feel comfortable with the agent, and vice versa, working with an institution with whom one has a solid history often works best.

Once an agent has been selected, the process of finding willing banks is undertaken. This phase of the process can vary considerably in terms of complexity. Some agents gauge the interest level of other lenders by simply sending them necessary financial information on the borrower and the intended shape and size of the syndicate group, as well as data on borrower operations, background, management, and marketing. In other cases, however, this process can be more complex, involving extensive due diligence, the preparation of a complete syndication offering memorandum (including financial projections), and a formal bank presentation.

By and large, the length of time necessary to form a bank group is roughly equivalent to the complexity of the proposed deal. Creation of a syndicate can take place over the course of a few weeks or a few months. Analysts note, however, that the length of time necessary to conclude the deal is usually less if the banks are already familiar with the borrower's operations. Once the membership of the group has been determined, the relationship quickly assumes the character that the borrowing business would expect when dealing with a single lending institution. Participating banks will still call on the borrower if need be but these interactions will be infrequent. The agent or arranger will be the primary contact for the borrower.

Indeed, the agent's responsibilities are many and varied. The agent is charged with administering the syndicated facility itself, as well as all borrowings, repayments, interest settlements, and fee payments. A chief component of the administration function is to make sure that communications between the lending institutions and the borrower remain open so that both sides

remain informed about changing business and market realities. In return for providing these services, the agent is compensated with an annual fee.

T

TARGET MARKETS

A target market is a group of customers with similar needs that forms the focus of a company's marketing efforts. Similarly, target marketing involves tailoring the company's marketing efforts to appeal to a specific group of customers. Selecting target markets is part of the process of market segmentation dividing an overall market into key customer subsets or segments, whose members share similar demographic characteristics and needs. Demographic characteristics that are analyzed for target marketing purposes include age, income, geographic origins and current location, ethnicity, marital status, education, interests, level of discretionary income, net worth, home ownership, and a host of other factors. A company wishing to focus its efforts on a well-defined market segment can select from among these characteristics the particular segments it wishes to target. For a small company, the act of identifying a target market and then working to satisfy the needs of that market is a sound basis upon which to build the business. For any company, making the most of marketing expenditures means getting the message to the intended audience focusing the marketing effort in such a way that it reaches and appeals precisely to the audience being targeted.

Target marketing can be a particularly valuable tool for small businesses, which often lack the resources to appeal to large aggregate markets or to maintain a wide range of differentiated products for varied markets. Target marketing allows a small business to develop a product and a marketing mix that fit a relatively homogenous part of the total market. By focusing its resources on a specific customer base in this way, a small business may be able to carve out a market niche that it can serve better than its larger competitors.

Identifying specific target markets and then delivering products and promotions that ultimately maximize the profit potential of those targeted markets is the primary function of marketing management for many smaller companies. For instance, a manufacturer of fishing equipment would not randomly market its product to the entire U.S. population. Instead, it would conduct market research, using such tools as demographic reports, market surveys, and trade shows, to determine which customers would be most likely to purchase what it offers. It could then spend its limited resources in an effort to persuade members of its target group(s) to buy. Advertisements and promotions could be tailored for each segment of the target market.

There are infinite ways to address the wants and needs of a target market. For example, product packaging can be designed in different sizes and colors, or the product itself can be altered to appeal to different personality types or age groups. Producers can also change the warranty or durability of the good or provide different levels of follow-up service. Other influences, such as distribution and sales methods, licensing strategies, and advertising media, also play an important role. It is the responsibility of the marketing manager to take all of these factors into account and to devise a cohesive marketing program that will appeal to the target customer.

Small business enterprises are also encouraged to examine their marketing efforts continually to make sure that they keep pace with changing business realities. For example, business start-ups typically accept any kind of legitimate business in order to pay the bills and establish

themselves as a viable entity. But long after the start-up has blossomed into a solid member of the local business community, it may continue to rely on these early accounts rather than casting its net for more promising clients. "Are you happy with the makeup of your customer base and the nature of the work you do now?" asked Kim Gordon in *Entrepreneur*. "Altering the types of accounts you serve, their size, location or other criteria can have a big impact on your bottom line.... Instead of letting your current customer base define you, use target marketing to determine who your next customers or clients should be." The process of redefining ideal clients and customers can be painstaking and time-consuming, for creating profiles of a new target audience necessitates extensive research into ideal prospects and the marketing measures that will be most effective in reaching them. But for many small business owners, the effort is worthwhile. "By targeting your ideal prospects, you'll avoid detours and grow your business in all the right directions," wrote Gordon. "Soon you'll have the kind of company that matches your vision and grows increasingly profitable over time."

While in many cases a company selects its own target market based on its product or service, sometimes larger economic or demographic forces can also have an impact on which markets it makes sense to target. For example, in a 2009 article, author Robert P. Singh noted that 12.5 percent of the U.S. population (or one in eight Americans) are over the age of sixty-five. It is predicted that by 2030 about one in five members of the population will be elderly, pushing many companies to focus on this target market. In addition to defining which target markets and clients a small business wishes to work with, therefore, it is also a good idea to consider larger demographic trends when selecting a target market.

One trend in target marketing in the first decade of the twenty-first century is online target marketing. Online marketing is unique because it allows marketers to target customers and clients more effectively. With print advertising, marketers can try to target specific audiences by printing circulars or ads that target a specific geographic area or a specific publication's demographic. Online marketing, however, allows for very specific targeting. Many companies use pay-per-click (PPC) advertising, which targets users who are looking up specific terms in search engines. Marketing companies use cookies in order to track customers' online preferences in order to target ads better. Marketers can target ads, for example, at customers who have recently been running online searches for specific products, services, or keywords. This ensures that online ads reflect the actual recent interests of users.

Social networking is providing marketers another avenue for targeted marketing. According to a 2010 article by Michael A. Stelzner, 88 percent of marketers make use of Twitter, another 70 percent use blogs, and 78 percent use LinkedIn. Social networking allows marketers to target specific customers by directly linking to groups and customers of interest. For example, a company offering fishing services can link directly to fishing associations or clubs using blogs or social networking sites. All the members of those clubs and associations will then see the comments or content left by the fishing services company.

TARIFFS

A tariff is a tax or duty imposed by one nation on the imported goods or services of another nation. Tariffs are a political tool that have been used throughout history to control the amount of imports that flow into a country and to determine which nations will be granted the most

favorable trading conditions. High tariffs create protectionism, shielding a domestic industry's products against foreign competition. High tariffs usually reduce the importation of a given product because the high tariff leads to a high price for the customers of that product.

There are two basic types of tariffs imposed by governments on imported goods. First is the *ad valorem* tax, which is a percentage of the value of the item. The second is a *specific tariff,* which is a tax levied based on a set fee per number of items or by weight.

Tariffs are generally imposed for one of four reasons:

- To protect newly established domestic industries from foreign competition.
- To protect aging and inefficient domestic industries from foreign competition.
- To protect domestic producers from "dumping" by foreign companies or governments. Dumping occurs when a foreign company charges a price in the domestic market which is below its own cost or under the cost for which it sells the item in its own domestic market.
- To raise revenue. Many developing nations use tariffs as a way of raising revenue. For example, a tariff on oil imposed by the government of a company that has no domestic oil reserves may be a way to raise a steady flow of revenue.

Since the early 1990s, the trend has been decreased tariffs on a global scale, as evidenced by the passage of well-known treaties such as the General Agreement on Tariffs and Trade (GATT) and the North American Free Trade Agreement (NAFTA), as well as the lowering of trade barriers in the European Union, reducing or even abolishing tariffs. These changes reflect the conviction among some politicians and economists that lower tariffs spur growth and reduce prices generally. However, with an economic downturn in 2008 and 2009, some tariffs were raised again. For example, the United States and China were embroiled in early 2010 in a number of tariff disputes affecting the import and export of steel pipes, chicken, movies, and books, among other products. Critics of the administration of President Barack Obama have alleged that it has raised tariffs or blocked trade between the United States and Brazil, Mexico, and China, leading to retaliatory high tariffs from those countries. However, in 2010 President Obama also expressed a commitment to the National Export Initiative, which would see exports from the United States to other countries double through 2015. Historically in the United States, the Democratic Party has been more closely associated with protective tariffs than the Republican Party.

Opponents of tariffs argue that tariffs hurt both (or all) countries involved, those that impose the tariff and those whose products are the target of the tariffs. For the country whose products are the target of tariffs, costs of production and sale prices rise and for most this leads to fewer exports and fewer sales. A decline in business leads to fewer jobs and spreads the slowdown in economic activity.

The argument that tariffs actually harm the country that imposes them is somewhat more complex. Although tariffs may initially be a boon to domestic producers who are faced with reduced competition as a result of the tariffs, the reduced competition then allows prices to rise. The sales of domestic producers should rise, all else being equal. The increased production and higher price lead to domestic increases in employment and consumer spending. The tariffs also increase government revenues that can be used to the benefit of the economy.

All of this sounds positive. However, tariff opponents argue that the costs of tariffs cannot be ignored. These costs come when the price of the goods on which the tariffs were imposed has increased, the consumer is forced either to buy less of these goods or of some other goods. The price increase can be thought of as a reduction in consumer income. Since consumers are purchasing less, domestic producers in other industries are selling less, causing a decline in the economy.

There are also other, more tangible problems with tariffs. Critics who oppose tariffs point out that in some cases, tariffs are imposed to help domestic special interest groups, unions, and lobbyists, sometimes to the detriment of smaller businesses or customers. Further, critics argue, countries that levy high tariffs and practice what is known as "trade protectionism" prevent specialization in specific industries and halt larger economic growth.

Despite these arguments that tariffs are eventually harmful to all parties in a trade relationship, they have been used by all nations from time to time. Most developing countries use tariffs to try and protect their fledgling industries or industries they feel the nation needs domestically in order to remain independent. The United States used tariffs extensively throughout its early years as a nation and continues to do so today when the political will exists. Even proponents of free trade sometimes determine that tariffs may serve a useful purpose. In April 2010, the U.S. Commerce Department agreed to raise tariffs on Chinese oil well pipes to 30 percent for some companies and 99 percent for others after it was determined that China might have been violating fair trade laws by exporting pipes into the United States at below cost. In instances such as these, tariffs can be used to control or halt trade practices that place a domestic manufacturer at a disadvantage.

The United States and other countries have signed a number of international trade agreements which define

how countries can establish tariffs. These regulations ensure that countries do not levy unfair tariffs and allow disgruntled nations to protest tariffs imposed by other nations. The laws and rules regarding tariffs under these agreements also ensure that each participating nation follows a due process when raising or levying tariffs. After World War II, the United States was part of the General Agreement on Tariffs and Trade (GATT). Since then, U.S. tariffs and trade as well as the tariffs and trade of other nations have been regulated by the World Trade Organization (WTO). In the United States, the House of Representatives and the Senate determine what goods have tariffs placed upon them and what the rate of tariffs will be.

How companies are impacted by tariffs differs from company to company based on a number of factors proximity of industry sector to the tariff imposed, how directly the company's inputs and outputs are touched by the tariff, whether or not the company is involved in exporting or importing, and other factors. Businesses that do most of their business within a domestic market may benefit from the imposition of tariffs on competitive products. If, however, the material inputs to the products of a business are the targets of tariffs, then the business may well be harmed by rising prices on its material inputs. In another possible scenario, a business that is involved with exporting may be harmed if it sees the imposition of a tariff on products similar to those it exports, and retaliatory tariffs are imposed by other nations on the products it exports. As these examples show, the impact of tariffs on one business may be very different from those experienced by another business, and the impacts differ based on characteristic other than the size of the businesses.

Exporters are usually well aware of the potential harm that may befall them if tariffs are unexpectedly imposed on their products, and for that reason they usually include a disclaimer of responsibility for such tariffs that are imposed after a purchase agreement is signed. Such clauses to a purchase agreement usually state something like: "Prices quoted do not include (and Customer agrees to pay) taxes, tariffs, duties, or fees of any kind which may be levied or imposed on either party by federal, state, municipal, or other governmental authorities in connection with the sale or delivery of the product." The key is to protect the business from liability for potential unpredictable and potentially arbitrary government actions.

NONTARIFF BARRIERS

Worth noting is the fact that nontariff barriers are also used quite frequently by nations of all sizes in their attempt to bolster their own economies and protect domestic interests. The Small Business Administration defines nontariff barriers as "laws or regulations that a country enacts to protect domestic industries against foreign competition. Such nontariff barriers may include subsidies for domestic goods, import quotas or regulations on import quality."

TAX-DEDUCTIBLE BUSINESS EXPENSES

Tax-deductible expenses are almost any "ordinary, necessary, and reasonable" expenses that help to earn business income. Deductible expenses are those that can be subtracted from a company's income before it is subject to taxation. When it comes to what exactly is meant by ordinary, necessary, and reasonable expenses, the Internal Revenue Service (IRS) has defined these as any expenses that are "helpful and appropriate" for a business. The standard business deductions which include general and administrative expenses, business-related travel and entertainment, automobile expenses, and employee

benefits are outlined in Section 162 of the Internal Revenue Code. Some expenses are considered "current" and are deducted in the year that they are paid, while others are considered "capitalized" and must be spread out or depreciated over time. There are a few business expenses that are specifically prohibited by law from being deductible, even though they may be used by the business to earn income. These include such things as a bribe paid to a public official, traffic tickets, the clothes one wears for work unless they are a required uniform, and expenditures deemed to be unreasonably large (like a corporate jet for a small retail business to use in visiting a few suppliers).

It is important to note that tax deductions change virtually every tax season, often as a result of economic changes, making it important to check the latest rules and regulations. For example, when Congress passed the American Recovery and Reinvestment Act of 2009, a number of new tax deductions were allowed for small businesses. For example, under IRC 168(k), the first-year bonus depreciation of 50 percent was extended. Also, employers who hired unemployed veterans or " disconnected youth" in 2009 or 2010 became eligible for a work opportunity tax credit under IRS section 51(d)(14). A tax credit for new markets (IRS section 45D) was increased to $5 million in 2008 and 2009.

Good management of a business must include efficient management of the company's tax liabilities, maximizing the deductions and minimizing the obligations within the boundaries of the law. Taking advantage of allowable tax deductions can benefit small-business owners in many ways. "Knowing how to maximize your deductible business expenses lowers your taxable profit," noted Frederick W. Dailey in his book, *Tax Savvy for Small Business.* "To boot, you may enjoy a personal benefit from a business expenditure a nice car to drive, a combination business trip/vacation and a retirement savings plan if you follow the myriad of tax rules." Solid record keeping is vital for small businesses that hope to claim their allowable tax credits and deductions. After all, deductions can be disallowed for even legitimate business expenditures if those expenditures are not adequately supported by business records. Some of the major categories of tax-deductible business expenses are described below.

GENERAL AND ADMINISTRATIVE EXPENSES

All of the basic expenses necessary to run a business are generally tax deductible, including office rent, salaries, equipment and supplies, telephone and utility costs, legal and accounting services, professional dues, and subscriptions to business publications. Education expenses are deductible if they are necessary to improve or maintain the skills involved in one's present employment or are required by an employer. However, education costs cannot be deducted when they are incurred in order to qualify for a different job. Some other miscellaneous expenses that may be deductible in this category include computer software, charitable contributions, repairs and improvements to business property, bank service charges, consultant fees, postage, and online services.

In most cases, general and administrative business expenses are deductible in the year in which they are incurred. An exception applies to the costs of starting a business, costs that may be incurred prior to beginning operations. These expenses must be capitalized over 5 years, which may seem strange since they are deductible immediately once the business is open. Depreciating the costs of starting a business might be preferable if the business is expected to show a loss for the first year or two. Otherwise, it may be possible to avoid the need to capitalize these expenses by delaying payment on invoices until the business opens or by doing a trivial amount of business during the start-up period.

Home Office Deduction. The use of part of a home as a business office may enable an individual to qualify for significant tax deductions. The "home office deduction" allows individuals who meet certain criteria to deduct a portion of mortgage interest or rent, depreciation of the space used as an office, utility bills, home insurance costs, and cleaning, repairs, and security costs from their federal income taxes. Although the IRS has established strict regulations about who qualifies for the deduction, many people claim the deduction each year. The savings that this deduction enables can be considerable, as much as $3,000 annually for a sole proprietor living in a home valued at $150,000.

Home office operators may claim a deduction for those offices on IRS Form 8829 (Expenses for Business Use of Your Home), which is filed along with Schedule C (Profit or Loss From Your Business). There are restrictions, however, which are covered in IRS Publication 587 (*Business Use of Your Home*).

In general, a home office deduction is allowed if the home office meets at least one of three criteria: 1) the home office is the principal place of business; 2) the home office is the place where the business owner meets with clients and customers as part of the normal business day; or 3) the place of business is a separate structure on the property but is not attached to the house or residence. Changes in 1997 expanded the definition of "principal place of business" to include a place that is used by the taxpayer for administrative or management activities of the business, provided there is no other fixed location where these activities take place.

The deduction is figured on the size of the home office as a percentage of the total house or residence. For

example, if the total house size is 2,400 square feet and the home office is 240 square feet, 10 percent of the total house is considered used for business. That would allow the business owner to deduct 10 percent of the household's costs for electricity, real estate taxes, mortgage interest, insurance, and repairs as business expenses. The total amount of the deduction is limited to the gross income derived from the business activity, less other business expenses. In other words, the home office deduction cannot be used to make an otherwise profitable business show a loss.

AUTOMOBILE EXPENSES

Most people have occasion to drive a car while conducting business. Business-related automobile mileage is tax deductible, with the exception of commuting to and from work. Any other mileage from the place of business to another location can be considered a business expense as long as the travel was made for business purposes. The IRS allows the mileage deduction to be calculated using two different approaches. The straight-mileage approach multiplies the cents-per-mile allowed by the IRS (¢55 in 2009) by the number of miles attributable to business use of the automobile. For example, a small-business owner who drove 1,000 miles at ¢55 per mile would gain a deduction of $550. In addition to this, in 2009 the IRS permitted parking fees, tolls, and reasonable related expenses to be added to this amount.

In contrast, the actual-expense approach adds up all the costs of operating the car for a year, such as gasoline, insurance, maintenance, and depreciation, and multiplies that total by the percentage of the annual mileage that was attributable to business purposes. For example, a small-business owner who paid a total of $3,000 in operating costs and drove a total of 15,000 miles, only 1,500 of which were business-related, would gain a deduction of $3,000 × .10 or $300. Businesses are required to use the actual-expense approach under certain circumstances if the vehicle is leased, if more than one vehicle is used for the business, or if the approach was used for that vehicle during its first year of service but otherwise can choose the approach that yields the larger deduction. Small businesses that use a vehicle for both personal and business use may wish to base deductions based on the percentage of total costs of a car used for business use. In either case, it is necessary to maintain an accurate log of business mileage and associated automobile expenses.

ENTERTAINMENT AND TRAVEL

Reasonable travel and entertainment costs are tax deductible if they are: 1) directly related to business, meaning that business took place or was discussed during the entertainment; or 2) associated with business, meaning that business took place or was discussed immediately before or after the entertainment (i.e., a small-business owner took a client out to dinner or to a sporting event following a meeting). Because they include a personal element, only 50 percent of meals and entertainment expenses are deductible as business expenses. Business-related travel, however, is fully deductible.

Careful records are necessary to substantiate the deductions. For business-related meals and entertainment, these records should include the amount, place, date, reason for entertainment, nature of business discussion, and name and occupation of the person being entertained. It is not necessary to retain receipts for expenditures less than $75, although a person does need to keep documentation of all these smaller expenses, so keeping the receipts is still advisable. Tax advisors also recommend people keep the receipts of meals eaten alone if they are eaten as part of an overnight business trip. In these cases, the cost of the meal is deductible.

Keep in mind that lack of adequate documentation or receipts may allow the IRS to disallow certain deductions. Also, not having adequate documentation could create problems in the event of an audit. Entertainment that is done within the home is also deductible in some cases. Company parties that involve all employees are 100 percent deductible, although they must be infrequent and not overly extravagant. In addition, gifts to clients and customers are deductible to a maximum of $25 per year, or $400 if the business name is imprinted on them.

The costs of reasonable and necessary business travel including meetings with clients and suppliers as well as conferences and seminars intended to expand a business person's expertise are fully deductible as business expenses. The costs that can be deducted include airfare, bus or train fare, car rental, taxi fare, hotels and meals, and incidentals such as tips and dry cleaning expenses. Restrictions apply to travel in foreign countries or on cruise ships. In addition, travel to investment-related seminars are not deductible, though the cost of the seminars may be. The IRS also permits deductions for relocation costs undertaken for employment. If a small business needs to relocate, these expenses may provide a tax deduction. A variety of rules apply to deducting business travel expenses, so it is necessary to review them in detail or enlist the help of a tax professional.

In addition to disallowing any deductions that are not adequately supported by receipts or other documentation, it is possible for the IRS to disallow any deduction that it deems unreasonable or "lavish or extravagant." However, the IRS does not carefully define what it does and does not consider extravagant and lavish. This has led to some unusual judgments in tax court, such as deductions involving cat food and personal jets. At the same time, the lack of a detailed definition has some small-business owners fearing to declare any entertainment expenses, for fear that they will be deemed unreasonable. When considering

whether an expense should be deducted, small-business owners should consider their income or profit levels. In general, the higher the level, the larger the acceptable expenses allowed, as there is a reasonable expectation that such a business will need to impress. In general, more direct expenses, such as advertising or wooing new clients, are seen as reasonable costs. Keep in mind, too, that certain business expenses are more difficult to prove than others. A business meeting with a client at a local restaurant is usually seen as reasonable. A trip abroad or a fishing trip with a client will be more difficult to prove. For more challenging deductions, the business owner should keep careful logs of what was discussed that related to business and keep track of how much total business talk or activity occurred during an event. Business meeting minutes, notes, and reports can all be used as evidence in these situations.

DEPRECIATION

According to Section 179 of the Internal Revenue Code, small-business owners can write off the first $18,000 of equipment purchased for business use each year during the year in which it was purchased. In many cases, it makes sense to take advantage of this tax break immediately, particularly if purchases will be fairly regular from year to year. If the item is a one-time purchase or if the total amount spent is greater than the limit, however, the business owner may wish to depreciate the cost over future time periods. Depreciation is a tax-deductible business expense.

Depreciation for tax purposes is determined by an IRS formula and has nothing to do with the actual value of equipment at year end. Instead, the amount claimed as depreciation is designed to spread the cost of the equipment over time and maximize the annual tax deductions associated with it. Most companies use a straight-line depreciation method for their financial statements, because the even amounts approximate the rate at which the equipment is used up and will need to be replaced. However, they tend to use accelerated depreciation methods for tax purposes in order to deduct a larger portion of the equipment's cost sooner. The IRS applies different "life spans" to different types of equipment for the purposes of depreciation. For example, it applies a 5-year life to telecommunications equipment and automobiles, and a 7-year life to computers and office equipment like desks, chairs, and fixtures. As of 2010, new tax credits were available to some businesses for accelerated depreciation of capital investments as well.

In 2009 and 2010, when many businesses were running at a loss, there was an increased interest in declaring losses as deductions. The American Recovery and Reinvestment Act of 2009 changed the rules for these deductions, but in general the rules stipulate that if the expenses of running a business were larger than the profits earned during a year, a business can claim net operating loss (NOL) as a deduction. In some cases, a business can even spread out the losses over a few tax years. The rules governing this deduction are strict, and most small businesses are advised to seek professional help before seeking a deduction for net operating losses.

EMPLOYEE BENEFITS

The cost of providing employees with a wide variety of fringe benefits is considered a tax-deductible business expense for employers. Most of these benefits are not considered income for employees, so they receive a tax break as well. Certain types of benefits particularly retirement and pension plans are also deductible for self-employed persons and small-business owners. However, it is important to keep up with the rapidly changing tax laws regarding these matters. Some of the types of employee benefits that may be considered tax-deductible business expenses include retirement plans, health insurance, disability and life insurance, company cars, membership in clubs and athletic facilities, dependent care assistance, education assistance, employee discounts, and business meals, travel, and lodging.

Retirement and Pension Plans. Small-business owners have a wide variety of retirement plans from which to choose in order to gain tax advantages. In most cases, employer contributions are tax-deductible business expenses, and the money is allowed to grow tax-deferred until employees reach retirement age, at which point, it is assumed, they will be in a lower tax bracket than during their working years. The most important thing to remember is that small-business owners who wants to establish a qualified plan for themselves must also include all other company employees who meet minimum participation standards. As an employer, the small-business owner can establish retirement plans like any other business. As an employee, the small-business owner can then make contributions to the plan he or she has established in order to set aside tax-deferred funds for retirement, like any other employee. The difference is that a small-business owner must include all nonowner employees in any company-sponsored qualified retirement plans and make equivalent contributions to their accounts.

For self-employed individuals, contributions to a retirement plan are based upon the net earnings of their business. The net earnings consist of the company's gross income less deductions for business expenses, salaries paid to nonowner employees, the employer's 50 percent of the Social Security tax, and significantly the employer's contribution to retirement plans on behalf of employees. Therefore, rather than receiving pre-tax contributions to the retirement account as a percentage of gross salary, like nonowner employees, the small-business owner receives contributions as a smaller percentage of net earnings. Employing other people thus detracts from the owner's ability to build up a sizeable before-tax retirement account

of his or her own. For this reason, some experts recommend that the owners of proprietorships and partnerships who sponsor plans for their employees supplement their own retirement funds through a personal after-tax savings plan.

Nevertheless, many small businesses sponsor retirement plans in order to gain tax advantages and increase the loyalty of employees. A number of different types of plans are available. In nearly every case, withdrawals made before the age of 59 ½ are subject to an IRS penalty in addition to ordinary income tax. The plans differ in terms of administrative costs, eligibility requirements, employee participation, degree of discretion in making contributions, and amount of allowable contributions.

Tax Professionals. There are a number of tax professionals who can help businesses with tax deductions. Tax attorneys, accountants, and tax advisors can help businesses with long-term financial and tax planning and can help businesses understand the latest tax regulations and rules. In many cases, professional help can also assist small businesses in maximizing possible tax deductions. In 2010, for example, new tax credits include possible deductions for job creation and energy refitting. Tax professionals can help businesses understand and secure these new deductions.

TAX PLANNING

Tax planning involves conceiving of and implementing various strategies in order to minimize the amount of taxes paid for a given period. For a small business, minimizing the tax liability can provide more money for expenses, investment, or growth. In this way, tax planning can be a source of working capital. Two basic rules apply to tax planning. First, a small business should never incur additional expenses only to gain a tax deduction. While purchasing necessary equipment prior to the end of the tax year can be a valuable tax planning strategy, making unnecessary purchases is not recommended. Second, a small business should always attempt to defer taxes when possible. Deferring taxes enables the business to use that money interest-free, and sometimes even earn interest on it, until the next time taxes are due.

Experts recommend that entrepreneurs and small-business owners conduct formal tax planning sessions in the middle of each tax year. This approach will give them time to apply their strategies to the current year as well as allow them to get a jump on the following year. It is important for small-business owners to maintain a personal awareness of tax planning issues in order to save money. While accountants and tax advisors can help provide advice and information about current tax laws, businesses are responsible for ensuring that their taxes are correctly filed. Even if they employ a professional bookkeeper or accountant, small-business owners should keep careful tabs on their own tax preparation in order to take advantage of all possible opportunities for deductions and tax savings. Whether or not an entrepreneur enlists the aid of an outside expert, he or she should understand the basic provisions of the tax code.

GENERAL AREAS OF TAX PLANNING

There are several general areas of tax planning that apply to all sorts of small businesses. These areas include the choice of accounting and inventory-valuation methods, the timing of equipment purchases, the spreading of business

income among family members, and the selection of tax-favored benefit plans and investments. There are also some areas of tax planning that are specific to certain business forms sole proprietorships, partnerships, C corporations, and S corporations. Some of the general tax planning strategies are described below.

Accounting Methods. Accounting methods refer to the basic rules and guidelines under which businesses keep their financial records and prepare their financial reports. There are two main accounting methods used for record keeping: the cash basis and the accrual basis. Small-business owners must decide which method to use depending on the legal form of the business, its sales volume, whether it extends credit to customers, and the tax requirements set forth by the Internal Revenue Service (IRS). The choice of accounting method is an issue in tax planning, as it can affect the amount of taxes owed by a small business in a given year.

Accounting records prepared using the cash basis recognize income and expenses according to real-time cash flow. Income is recorded upon receipt of funds, rather than based upon when it is actually earned, and expenses are recorded as they are paid, rather than as they are actually incurred. Under this accounting method, therefore, it is possible to defer taxable income by delaying billing so that payment is not received in the current year. Likewise, it is possible to accelerate expenses by paying them as soon as the bills are received, in advance of the due date. The cash method is simpler than the accrual method, it provides a more accurate picture of cash flow, and income is not subject to taxation until the money is actually received. According to Barbara Weltman's 2009 book *JK Lasser's Small Business Taxes 2009: Your Complete Guide to a Better Bottom Line*, as personal income tax rates have declined, income deferral has been an attractive prospect for some small businesses. Using a cash basis can be especially beneficial for small businesses and one-person businesses or self- employed individuals, as this method allows a business greater control over end-of-year income and therefore tax rates and tax payments.

In contrast, the accrual basis makes a greater effort to recognize income and expenses in the period to which they apply, regardless of whether or not money has changed hands. Under this system, revenue is recorded when it is earned, rather than when payment is received, and expenses recorded when they are incurred, rather than when payment is made. The main advantage of the accrual method is that it provides a more accurate picture of how a business is performing over the long term than the cash method. The main disadvantages are that it is more complex than the cash basis, and that income taxes may be owed on revenue before payment is actually received. However, the accrual basis may yield favorable tax results for companies that have few receivables and large current liabilities.

Under generally accepted accounting principles (GAAP), the accrual basis of accounting is required for all businesses that handle inventory, from small retailers to large manufacturers. It is also required for corporations and partnerships that have gross sales over $5 million per year, though there are exceptions for farming businesses and qualified personal service corporations, such as doctors, lawyers, accountants, and consultants. Other businesses generally can decide which accounting method to use based on the relative tax savings it provides.

Inventory Valuation Methods. The method a small business chooses for inventory valuation can also lead to substantial tax savings. Inventory valuation is important because businesses are required to reduce the amount they deduct for inventory purchases over the course of a year by the amount remaining in inventory at the end of the year. For example, a business that purchased $10,000 in inventory during the year but had $6,000 remaining in inventory at the end of the year could only count $4,000 as an expense for inventory purchases, even though the actual cash outlay was much larger. Valuing the remaining inventory differently could increase the amount deducted from income and thus reduce the amount of tax owed by the business.

The tax law provides two possible methods for inventory valuation: the first-in, first-out method (FIFO); and the last-in, first-out method (LIFO). As the names suggest, these inventory methods differ in the assumption they make about the way items are sold from inventory. FIFO assumes that the items purchased the earliest are the first to be removed from inventory, while LIFO assumes that the items purchased most recently are the first to be removed from inventory. In this way, FIFO values the remaining inventory at the most current cost, while LIFO values the remaining inventory at the earliest cost paid that year.

LIFO is generally the preferred inventory valuation method during times of rising costs. It places a lower value on the remaining inventory and a higher value on the cost of goods sold, thus reducing income and taxes. On the other hand, FIFO is generally preferred during periods of deflation or in industries where inventory can tend to lose its value rapidly, such as high technology. Companies are allowed to file IRS Form 970 and switch from FIFO to LIFO at any time to take advantage of tax savings. However, they must then either wait 10 years or get permission from the IRS to switch back to FIFO.

Equipment Purchases. In 2009 IRS section 179 allowed small businesses to deduct up to $250,000 of business property costs, including equipment costs, furnishings, vehicles, machinery, and other property used for business purposes. Any purchases above this amount must be depreciated over several future tax periods. It is often advantageous for small businesses to use this tax incentive to increase their deductions for business expenses, thus

reducing their taxable income and their tax liability. Necessary equipment purchases up to the limit can be timed at year end and still be fully deductible for the year. This tax incentive also applies to personal property put into service for business use.

Wages Paid to Family Members. Self-employed persons can also reduce their tax burden by paying wages to a spouse or to dependent children. Wages paid to children under the age of eighteen are not subject to the Federal Insurance Contributions Act or FICA (Social Security and Medicare) taxes in cases of sole proprietorships or partnerships. Employers are expected to withhold 6.2 percent of wages for Social Security taxes as of 2009 and 1.45 percent of wages for Medicare taxes. Employers are also required to match the amount contributed by every employee, so that the total FICA contribution is 12.4 percent for Social Security and 2.9 percent for Medicare. Self-employed persons are required to pay both the employer and employee portions of the FICA tax.

But the FICA taxes are waived when the employee is a dependent child of the small-business owner, saving the child and the parent 12.4 and 2.9 percent each. In addition, the child's wages are still considered a tax-deductible business expense for the parent thus reducing the parent's taxable income. Although the child must pay normal income taxes on the wages he or she receives, it is likely to be at a lower tax rate than the parent pays. Some business owners are able further to reduce their tax burden by paying wages to their spouse. If these wages bring the business owner's net income below the threshold for FICA taxes ($106, 800 in 2010) then they may reduce the self-employment tax owed by the business owner. It is important to note, however, that the child or spouse must actually work for the business and that the wages must be reasonable for the work performed.

Benefits Plans and Investments. Tax planning also applies to various types of employee benefits that can provide a business with tax deductions, such as contributions to life insurance, health insurance, or retirement plans. As an added bonus, many such benefit programs are not considered taxable income for employees. Finally, tax planning applies to various types of investments that can shift tax liability to future periods, such as treasury bills, bank certificates, savings bonds, and deferred annuities. Companies can avoid paying taxes during the current period for income that is reinvested in such tax-deferred instruments.

TAX PLANNING FOR DIFFERENT BUSINESS FORMS

Selection of the form of organization that one uses for a company has a considerable impact on the rate at which tax liabilities accrue. Many aspects of tax planning are specific to certain business forms; some of these are discussed below.

Sole Proprietorships and Partnerships. Tax planning for sole proprietorships and partnerships is in many ways similar to tax planning for individuals. This is because the owners of businesses organized as sole proprietors and partnerships pay personal income tax rather than business income tax. These small-business owners file an informational return for their business with the IRS, and then report any income taken from the business for personal use on their own personal tax return. No special taxes are imposed except for the self-employment tax, which requires all self-employed persons to pay both the employer and employee portions of the FICA tax, for a total of 12.4 percent for Social Security taxes and 2.9 percent for Medicare taxes.

Since they do not receive an ordinary salary, the owners of sole proprietorships and partnerships are not required to withhold income taxes for themselves. Instead, they are required to estimate their total tax liability and remit it to the IRS in quarterly installments, using Form 1040 ES. Most sole proprietors must also file Schedule C or C-EZ, Profit or Loss from Business, while farmers may be required to file Schedule F, Profit or Loss from Farming. This is in addition to Form 1040 ES. It is important that the amount of tax paid in quarterly installments equal either the total amount owed during the previous year or 90 percent of their total current tax liability. Otherwise, the IRS may charge interest and impose a stiff penalty for underpayment of estimated taxes.

Since the IRS calculates the amount owed quarterly, a large lump-sum payment in the fourth quarter will not enable a taxpayer to escape penalties. On the other hand, a significant increase in withholding in the fourth quarter may help, because tax that is withheld by an employer is considered to be paid evenly throughout the year no matter when it was withheld. This leads to a possible tax planning strategy for a self-employed person who falls behind in his or her estimated tax payments. By having an employed spouse increase his or her withholding, the self-employed person can make up for the deficiency and avoid a penalty. The IRS has also been known to waive underpayment penalties for people in special circumstances. For example, they might waive the penalty for newly self-employed taxpayers who underpay their income taxes because they are making estimated tax payments for the first time.

Another possible tax planning strategy applies to partnerships that anticipate a loss. At the end of each tax year, partnerships file the informational Form 1065 (Partnership Statement of Income) with the IRS, and then report the amount of income that accrued to each partner on Schedule K1. This income can be divided in any number of ways, depending on the nature of the partnership agreement. In this way, it is possible to pass all of a partnership's early losses to one partner in order to maximize his or her tax advantages.

Limited Liability Companies (LLCs). LLCs offer similar liability protection as corporations, but also offer pass-through tax benefits as well as less regulation of management. This allows the LLC to enjoy some tax benefits while also having the flexibility to institute a good tax plan. LLCs have members rather than shareholders. In some cases, LLCs have only one member or owner. In other cases, they can have corporations, companies, individuals, foreign parties, and other LLCs as members. Insurance companies, banks, and a few other types of businesses are not allowed to be LLCs. In some cases, small businesses considering corporation status may want to consider LLC status. It offers some tax benefits as well as protection against liability issues but with more flexibility, while allowing business partners to retain more control.

C Corporations. Since a corporation is more complex as a business form than partnerships or sole proprietorships, and since it is subject to more complex regulations and rules, careful tax planning is more important for corporations. Also, tax planning strategies for C corporations are different from those used for sole proprietorships and partnerships because profits earned by C corporations accrue to the corporation rather than to the individual owners, or shareholders. A corporation is a separate, taxable entity under the law, and different corporate tax rates apply based on the amount of net income received. As of 2010 the corporate tax rates were 15 percent on income up to $50,000, 25 percent on income between $50,001 and $75,000, 34 percent on income between $75,001 and $100,000, 39 percent on income between $100,001 and $335,000, 34 percent on income between $335,001 and $10 million, 35 percent on income between $10 million and $15 million, 38 percent on income between $15 million and $18,333,333, and 35 percent on all income over $18,333,334. Businesses involved in manufacturing are charged a top tax rate of 32 percent. Personal service corporations, like medical and law practices, pay a flat rate of 35 percent. In addition to the basic corporate tax, corporations may be subject to several special taxes. Corporations are taxed at several levels. Most corporations need to pay state taxes as well as federal taxes. In addition, shareholders earning dividends from a corporation need to declare this on personal tax returns. If shareholders are also employees, the shareholders must pay personal income tax on their personal salary. In this case, the employee and the C corporation each pay half of the FICA taxes. The corporation can deduct its contributions.

Corporations must prepare an annual corporate tax return on either a calendar-year basis (the tax year ends December 31, and taxes must be filed by March 15) or a fiscal-year basis (the tax year ends whenever the officers determine). C corporations need to file Form 1120 or 1120-A, U.S. Corporation Income Tax Return. Most Subchapter S corporations, as well as C corporations that derive most of their income from the personal services of shareholders, are required to use the calendar-year basis for tax purposes. Most other corporations can choose whichever basis provides them with the most tax benefits. Using a fiscal-year basis to stagger the corporate tax year and the personal one can provide several advantages. For example, many corporations choose to end their fiscal year on January 31 and give their shareholder/employees bonuses at that time. The bonuses are still tax deductible for the corporation, while the individual shareholders enjoy use of that money without owing taxes on it until April 15 of the following year.

Both the owners and employees of C corporations receive salaries for their work, and the corporation must withhold taxes on the wages paid. All such salaries are tax deductible for the corporations, as are fringe benefits supplied to employees. Many smaller corporations can arrange to pay out all corporate income in salaries and benefits, leaving no income subject to the corporate income tax. Of course, the individual shareholder/employees are required to pay personal income taxes. Still, corporations can use tax planning strategies to defer or accrue income between the corporation and individuals in order to pay taxes in the lowest possible tax bracket. The one major disadvantage to corporate taxation is that corporate income is subject to corporate taxes, and then income distributions to shareholders in the form of dividends are also taxable for the shareholders. This situation is known as "double taxation."

S Corporations. Subchapter S corporations avoid the problem of double taxation by passing their earnings (or losses) through directly to shareholders, without having to pay dividends. Experts note that it is often preferable for tax planning purposes to begin a new business as an S corporation rather than a C corporation. Many businesses show a loss for a year or more when they first begin operations. At the same time, individual owners often cash out investments and sell assets in order to accumulate the funds needed to start the business. The owners would have to pay tax on this income unless the corporate losses were passed through to offset it.

Another tax planning strategy available to shareholder/employees of S corporations involves keeping FICA taxes low by setting modest salaries for themselves, below the Social Security base. S corporation shareholder/employees are only required to pay FICA taxes on the income that they receive as salaries, not on income that they receive as dividends or on earnings that are retained in the corporation. It is important to note, however, that unreasonably low salaries may be challenged by the IRS.

TAX PREPARATION SOFTWARE

Faced with a tax code which inevitably changes from year to year, many small-business owners choose to use one of the many tax preparation software packages which are now widely available. These packages are available for computers running any of the more popular operating systems and most use a spreadsheet format.

The advantages to using tax preparation software are many. First, they result in more complete and accurate returns. The typical paper tax return has an error rate of 20 percent. Because of built-in math calculators and other automatic checks, electronic tax preparation reduces this error rate to less than 1 percent. Tax preparation software packages may also steer the taxpayer toward greater savings or little-known deductions, paying for themselves with the returns they yield. But even if no direct tax savings are realized, many analysts believe that use of the software saves many business owners a considerable amount of time, thus freeing them to use their talents in other business areas.

Purchasing the software to prepare tax returns, no matter which package is purchased, will undoubtedly be less expensive than hiring an accountant. Of course, a CPA can be creative and intuitive about individual circumstances in a way that a computer program can not. But unless the finances for the year are extremely complicated, the best of these software programs should be sufficient to meet the requirements of most small enterprises. Of course, the old adage "garbage in, garbage out" applies here. A small-business owner who is not comfortable with accounting and finance may choose to enlist the aid of an accountant even if the software option seems alluring. Some entrepreneurs prepare the taxes themselves and then have an accountant review and sign off on the results. Using an accountant may also be comforting for some because in the event of an audit, the small-business owner will not have to face the IRS without the expert knowledge of the CPA who originally prepared the tax return.

COMPONENTS OF THE PACKAGES

All of the software packages have more than one option for entering data into the IRS-accepted forms. The user can always opt for the simple method of entering figures into the forms without assistance from the program, using the software mainly to double-check figures and calculate final amounts. All of the software packages also have an interview function, which asks easily understandable questions to which the user responds by clicking yes or no boxes. This function specifies which schedules are required by the IRS, and which sections of the basic 1040 and schedules can be bypassed. Depending on the program, there may be a third route a "fast track" interview, through which the user can select specific parts of the interview to fill out, speeding up the process and avoiding the sections which are not pertinent to the case at hand.

Many of the programs also have importing features, which allow the user to pull data from other programs directly into the tax preparation. Generally, these work primarily with Quicken and QuickBooks. If the small-business owner already uses one of these applications to calculate tax-related expenses, it is relatively quick and easy to transfer information, cutting down on duplicated work. Almost all of the packages also allow the user to import last year's tax information, provided it was prepared with the same package.

Filing. When it comes to methods of filing, most of the packages provide several options for the user to choose between. The forms can be filled out electronically and then printed and mailed to the IRS to be processed in a paper version. Some of the packages offer the abbreviated Form 1040PC, which is also submitted as a hard copy, and some of the packages allow the user to file electronically, although most charge an additional fee for this option (around $10).

Features and Help. All of the software packages automatically check for mathematical mistakes and warn of possible errors when questionable data is entered into a field. Most of the programs can offer advice some from

specific tax experts about how to maximize the return and minimize taxes paid. Some of the programs offer complete IRS tax guides which can be directly accessed, and some offer only abbreviated versions of this information. Another feature often offered in these tax preparation software packages is one that can alert the user to potential audit flags resulting from data entered. Several packages offer a review option after the forms are completed; this option can provide advice on what to do differently to pay lower taxes the next time around. Some software even prompts users for common deduction information, alerting taxpayers to possible deductions.

Most software packages include the option to do state tax preparation in addition to the federal forms. Since some packages do not cover all fifty states, it is important when buying the software to be sure that it includes the forms necessary for the state in which one is operating. The state return supplement may be included in the original price or may be priced separately. Prices for the packages range from around $20 to more than $75, plus state supplements and filing fees.

E FILING.

One of the most recent trends in tax software since 2007 has been the rise of e-filing or electronic filing software options. These software options allow companies (and individuals) to file their taxes online and send their returns online. Not only is this a more environmentally friendly way of filing taxes, but it is faster and requires no trip to the post office. Electronic filing also has a reduced error rate, thanks to the fact that the electronic forms do not require anyone to decipher handwriting. Taxpayers and companies who choose electronic filing get a quick response acknowledging their filing, and when taxpayers choose direct deposit, returns can be processed much more quickly with electronic filing. Online filing makes it easier for the small business to make online payments of taxes and to keep track of amounts owing. Anyone deciding to use electronic filing with a business return, however, should be aware that the IRS demands that all software offering e-filing pass Modernized e-File Assurance Testing (ATS). It is essential to make sure that the software chosen has been approved by the IRS in this way.

In early 2010 the IRS partnered with twenty software companies (joined in the Free File Alliance LLC) to create Free File, an online e-software option available for free from the IRS website. Unlike other software, Free File offers many free features, including free electronic filing. The IRS estimates that 70 percent of taxpayers are eligible for Free File.

DECIDING WHICH PACKAGE TO USE

Choosing a package will depend on how complicated the company's tax return is likely to be. A few of the products can manage even very complicated scenarios, while the few at the bottom of the price range tend to be better for simple personal tax returns. For the small-business owner, who may be dealing with self-employment taxes, home-work environments, and partnerships, it is probably worthwhile to purchase one of the more detailed programs. As of 2009 the two most popular tax software packages, according to at least one survey, were UltraTax CS by Thomson Reuters and Drake Software.

It is important to find tax prepration software that is easy to update each year, since tax rules change often. Good customer support and ease of use are also important features. Many office supply and computer stores have displays of tax software that let customers "try before you buy" and many software vendors allow a test or sample online before purchase. This can be more useful than reading reviews in determining whether a product is a good match.

TAX RETURNS

Tax returns include all the required paperwork that accompanies the remittance of taxes to the appropriate government agencies, the largest of these being the Internal Revenue Service (IRS). The IRS had 1,134 forms and files available for download from its Web site in 2010 . Each form applies to a different situation or purpose. For example, Form 1065 details the income received by a business operating as a partnership, and Form 8826 relates to expenses claimed for business use of a home. Perhaps the most familiar type of tax form is the annual personal tax return, Form 1040, that must be completed by millions of taxpayers each year. Increasingly, electronic tax returns or returns filed online are becoming increasingly popular. According to Barbara Weltman's book *JK Lasser's Small Business Taxes 2010: Your Complete Guide to a Better Bottom Line*, approximately two million tax returns filed by partnerships and corporations in 2008 were filed electronically.

Considering that the laws have undergone no fewer than nine major revisions in the past two decades, as well as numerous minor changes, it is no wonder that tax return preparation can be exceedingly difficult and time consuming for small-business owners. Since the average small-business person can ill afford to call a tax pro with every question, time will be necessary to make one's way through the maze of tax forms and instructions. Fortunately, a great deal of information is available to help in this task. Sources include IRS publications and help lines, self-help tax preparation guides and software, trade associations, periodicals, and online services.

It is important for small-business owners to maintain a personal awareness of tax-related issues in order to save money. Even if they employ a professional bookkeeper or accountant, small-business owners should keep careful tabs on their own tax preparation in order to take advantage of all possible opportunities for deductions and tax savings. Whether or not small-business owners enlist the aid of an outside accountant, they should understand the basic provisions of the tax code and not blindly allow someone else to take complete charge of their taxpaying responsibilities. Knowledge of tax structures and provisions can have a powerful impact on the potential for maximizing profits. Knowing what the tax law has to offer can provide a company with an advantage over competitors who do not use tax planning efficiently.

COMMON BUSINESS TAX FORMS AND FILING DEADLINES

Small businesses that employ persons other than the owner or partners are required to withhold payroll taxes from the wages paid to employees, remit these taxes to the IRS, and make regularly scheduled reports to the IRS about the amount of payroll taxes owed and paid. Payroll taxes include regular income taxes, FICA (Social Security and Medicare) taxes, and FUTA (federal unemployment) taxes. In addition to withholding payroll taxes for employees, employers must remit these taxes to the IRS in a timely manner. The regular income taxes and the portion of the FICA taxes that are withheld from employees' wages each pay period must be remitted to the IRS monthly (or quarterly if the amount is low), along with a Federal Tax Deposit Coupon (Form 8109-B).

Employers must also file four different reports regarding payroll taxes. The first report, Form 941, is the Employer's Quarterly Federal Tax Return. This report details the number of employees the business had, the amount of wages they were paid, and the amount of taxes that were withheld for the quarter. The other three reports are filed annually. Form W-2 the Annual Statement of Taxes Withheld must be sent to each employee before January 31 of the following year. It details how much each employee received in wages and how much was withheld for taxes over the course of the year. Copies of the W-2 forms for all employees also must be sent to the Social Security Administration. The third payroll tax report, Form W-3, must be sent to the IRS by February 28 of the following year. It provides a formal reconciliation of the quarterly tax payments made on Form 941 and the annual totals reported on Form W-2 for all employees. In addition, employers will generally need to file Form 944, Employer's Annual Federal Tax Return. The final report is the Federal Unemployment Tax Return, Form 940, which outlines the total FUTA taxes owed and paid for the year.

Employment returns, such as Form 940, Form 941, and Form 944, do not have to be filed electronically, but they can be filed this way with authorization from the IRS. Many businesses can gain some additional advantages from filing these forms electronically. Generally, employers can save time and reduce errors by filing these returns electrically. The IRS needs a letter of application from a business in order to grant the required authorization, according to Weltman.

Independent contractors to whom a business pays more than $600 during the tax year must be sent a Form 1099 by the business no later than January 31 of the following year. This form is like a W-2 form for non-employees. Like the W-2 form, it has a related summary form that must be sent to the IRS along with copies of all 1099 forms no later than February 28. This summary report is IRS Form 1096. As of 2008, self-employed workers who make $5,000 or less can file the simpler schedule C-EZ. In general, sole proprietorships file either schedule C-EZ or Form 1040 by April 15.

Since they do not receive an ordinary salary, the owners of sole proprietorships and partnerships are not

required to withhold income taxes for themselves. Instead, they are required to estimate their total tax liability and remit it to the IRS in quarterly installments, using Form 1040 ES. It is important that the amount of tax paid in quarterly installments equal either the total amount owed during the previous year or 90 percent of their total current tax liability. Otherwise, the IRS may charge interest and impose a stiff penalty for underpayment of estimated taxes. At the end of the tax year, the income for sole proprietorships is simply reported on the personal tax return of the business owner. Partnerships must file the informational Form 1065 (Partnership Statement of Income) with the IRS, and then report the amount of income that accrued to each partner on Schedule K1.

Corporations must prepare an annual corporate tax return on either a calendar-year basis (the tax year ends December 31, and taxes must be filed by March 15) or a fiscal-year basis (the tax year ends whenever the officers determine). Most Subchapter S corporations, as well as C corporations that derive most of their income from the personal services of shareholders, are required to use the calendar-year basis for tax purposes. Most other corporations can choose whichever basis provides them with the most tax benefits. At the end of their tax year, corporations file either Form 1120, the U.S. Corporate Income Tax Return, or the shorter Form 1120A. If they expect to owe taxes, corporations are required to make quarterly estimated payments, like other businesses.

If a company cannot pay taxes or file a return on time, it is important that the business apply for a return extension from the IRS. If a company cannot file on time, the IRS will usually grant a 6-month extension or a 5-month extension for partnerships. To qualify, businesses must apply by the date their tax returns are due. In the case of a natural disaster or some other large-scale catastrophe, the IRS will sometimes issue a blanket extension, allowing all businesses in an affected area to file late. It is always important to secure extensions rather than avoid filing, as this helps prevent penalties.

TAX WITHHOLDING

Tax withholding refers to the portion of an employee's gross wages that is retained by an employer for remittance to the Internal Revenue Service (IRS). Two main types of taxes are typically withheld regular income taxes and Federal Insurance Contribution Act (FICA) taxes, which include contributions to the federal Social Security and Medicare programs. Many states and some cities and municipalities also apply taxes, and in some cases these taxes too must be withheld by employers. Taxes withheld from an employee's paycheck are paid to the IRS in the employee's name. Although tax withholdings are most commonly discussed in relation to income tax, tax may also be withheld in other situations. For example, lottery or gambling winnings usually have taxes withheld. Bonuses, pensions, and commissions may also be subject to tax withholding.

At the federal tax level, the two types of taxes that employers are required to withhold are amounts for regular income taxes and a set percentage of gross pay for FICA taxes.

Income Tax Withholding. Federal Income Tax Withholding (FITW) is the amount employers deduct from employee paychecks for federal income taxes. Although employers deduct this amount, however, employees remain fully responsible for paying their income taxes. Employers receive no deductions for FITW. In addition to FITW, employers are generally responsible for withholding some state taxes from employee paychecks as well. As of 2009 employers in all states must withhold the unemployment compensation taxes for their state. Most states also require employers to withhold state income tax. Only in Florida, Texas, Alaska, Nevada, South Dakota, Washington, and Wyoming were employers exempt from this rule as of 2009. A few states Califonia, New Jersey, New York, Hawaii, and Rhode Island require withholding of state disability taxes. In Hawaii, New Jersey, and New York, employers must also contribute to the state disability taxes themselves.

The amount that is withheld from an employee's paycheck in order to pay income taxes is determined based on the person's income level and the number of exemptions

that the person claims. Withholding is usually done in standard amounts based on formulas provided by the IRS. Employees can adjust their income tax withholding by filing Form W-4 with their employer and designating the number of withholding allowances they wish to claim. Employees decide upon the number of withholding allowances they wish to claim based on their expected tax liability, which depends on their filing status, family circumstances, other sources of income, and available deductions or tax credits. It is not advisable to overpay taxes even though the extra amount is eventually refunded to the taxpayer because it is like giving the government an interest-free loan. At the same time, it is not advisable to underpay taxes because it may be difficult to come up with a lump-sum payment when it is due on April 15. In addition, a taxpayer who underpays his or her income taxes by more than 10 percent may face a penalty and have to pay the government interest on the funds owed.

There are other reasons why a taxpayer may wish to submit Form W-4 to adjust tax withholdings. If an employee gets a new job or takes on a second job, for example, a new Form W-4 will need to be submitted to adjust withholdings. Also, if an employee gets married or divorced, this will affect the employee's tax status, and a new Form W-4 will be needed. The IRS recommends that employees submit a new Form W-4 within 10 days of an event that affects tax status.

Unfortunately, the IRS guidelines for withholding can cause problems with overpayment or underpayment of taxes even in simple cases. For example, a single taxpayer with no dependents and only one source of income would be instructed to claim two withholding allowances to best approximate the total tax owed. But this strategy may cause the taxpayer in question to owe around $200 on April 15. Similarly, a married couple with one income would be instructed to claim three withholding allowances, but this would cause a balance due for the year of nearly $400. Because the IRS guidelines are general, some small underpayment or overpayment is likely even if the number of withholding allowances or exemptions is chosen with care. However, the IRS does provide Publication 919 to give some guidance as to withholding. This is a good place to start if someone is trying to determine how much to have withheld from his or her taxes.

Since tax withholding rules are complex, errors can occur. If the withholding error is discovered during the same tax year the withholding affects, the employee can usually simply make the correction. As of 2009 the Adjusted Employer's Quarterly Federal Tax Return or Claim for Refund (Form 941-X) is used for this purpose, and according to IRS section 6205 this sort of adjustment usually does not require penalty payments. If an employer underpays FICA taxes on behalf of an employee and only discovers the error after the tax year is over, the employer must submit a corrected Form W-2 to the Social Security Administration and the employee.

There is another factor that needs to be considered when an employee decides about the number of exemptions to choose, and thus a tax withholding level. Many people supplement their regular employment income with interest, dividends, capital gains, rental property, or self-employment income. In many cases, this means that regular withholding from employment income based on the IRS formulas is not enough to cover the taxes owed. In a situation in which an employee anticipates income from other sources, he or she may choose to maximize the amount withheld by the employer so that the taxes withheld will help to pay for tax obligations arising from another source of income.

Taxpayers are required to pay at least 90 percent of their total tax liability in installments prior to April 15. If they do not, they may be subject to a penalty. However, the penalty is waived for taxpayers who pay at least as much in total taxes as they had owed the previous year, or for whom the amount underpaid is less than $500. Since the IRS calculates the amount owed quarterly, a large lump-sum payment in the fourth quarter will not enable a taxpayer to escape penalties. On the other hand, a significant increase in withholding in the fourth quarter may help, because tax that is withheld by an employer is considered to be paid evenly throughout the year no matter when it was withheld. For this reason, taxpayers who see a significant underpayment problem looming should have additional taxes withheld by their employers. An employee may request that his or her employer withhold and send to the IRS as large a percentage of his or her gross income as desired. So, for example, if a person who does Web site design work as a supplement to her regular job receives a large Web design project late in the tax year, she may ask her employer to increase her income tax withholding to 50 percent for the remainder of the year in order to try and make up for the unexpected rise in income tax liability for that year. To avoid a penalty, the total tax withheld must reach 90 percent of what will be owed in the current year or 100 percent of what was owed in the previous year.

This strategy can also work for a self-employed person who falls behind in his or her estimated tax payments. By having an employed spouse increase his or her withholding, the self-employed person can make up for the deficiency and avoid a penalty. The IRS has also been known to waive underpayment penalties for people in special circumstances. For example, they might waive the penalty for newly self-employed taxpayers who underpay their income taxes because they are making estimated tax payments for the first time.

FICA Tax Withholding. The second type of federal tax which employers are required to withhold from their employees' payroll checks is the Federal Insurance Contribution Act (FICA) tax. The FICA tax includes contributions to two federal programs, Social Security and Medicare. The tax rate for FICA taxes does not often change, but the earnings on which those taxes are applied changes from year to year. In 2009 employers withheld 6.2 percent of wages for Social Security taxes and 1.45 percent for Medicare taxes. In 2010 the wage base limit for Social Security taxes was $106,800, but there was no wage limit for Medicare, so all income amounts are subject to this tax. Employers are also required to match the FICA amount withheld for every employee, so that the total FICA contribution is 15.3 percent on the first $106,800 earned. Self-employed persons are required to pay both the employer and employee portions of the FICA tax.

TECHNOLOGY DIFFUSION

Technology diffusion involves the dissemination of technical information and expertise to a user or group of users. It measures to what extent a technology has been adopted by a market. The technology may be "hard," such as computers and machine tools, or "soft," such as manufacturing improvements and training methods. Technology diffusion can occur in products and processes and generally precedes technology adoption.

Technology diffusion differs from technological innovation in that it does not necessarily involve new or advanced technology, even if the technology is new to the user. It also differs from technology maturity, which measures a technology's progression versus a physical limit. Diffused technologies can be acquired from vendors, customers, consultants, and peer firms. Public technology centers, government laboratories, and universities are also sources of diffused technology. Technology diffusion additionally can occur through the transfer of skilled labor; activities undertaken by professional organizations and the scientific press; multiple forms of informal knowledge trading; and reverse engineering.

The rate at which a technology diffuses varies greatly due to many factors; some of these factors are cost, ease of use, and the willingness of the technological innovators to spread their idea. NASA, for instance, is required by law to share its innovations as widely as possible. Devices that the agency created to monitor astronauts' health in space are now used in hospitals to keep track of patient health. A different example is NASA' adoption of Tang, a powdered drink developed by General Foods in 1957, as a result of astronaut John Glenn's eating experiments in orbit.

In his book on the topic, *Diffusion of Innovations*, sociologist Everett Rogers illuminates four elements of technology diffusion: innovation, communication channels, time, and the social system.

Innovation. Rogers describes innovation as "an idea, practice, or object that is perceived as new by an individual or other unit of adoption." Whether it is actually new matters little; a user's perception that a technology is new will influence how he or she reacts to it. An innovation's newness does not necessarily have to involve new knowledge. As Rogers notes, someone may know about an innovation for a length of time before developing an opinion about it. "Newness," therefore, can be characterized by knowledge as well as persuasion and a decision to adopt an innovation.

Innovation can be further broken down into specific characteristics that help explain its adoption rate. Technologies like DVDs and smart phones may take only a few years to achieve widespread adoption, yet other practices like using seatbelts require decades. To assume that all

innovations can be judged using the same analysis is a gross oversimplification, Rogers writes. The following key characteristics help to explain the speed at which innovations may be adopted:

- Relative advantage   the degree to which innovation is perceived as better than the idea it supersedes. Whether an innovation has sufficient objective advantage matters much less than whether someone perceives the innovation as advantageous. If perceived relative advantage is high, it is likely the rate of adoption for an innovation would be rapid.
- Compatibility   the extent to which an innovation is viewed as meeting values, experiences, and needs of potential adopters. An innovation that is inconsistent with the values of a social system will have a harder time finding widespread and rapid adoption.
- Complexity   the relative difficulty in understanding or using an innovation. Innovations that are easy to understand are prone to faster adoption in a social system.
- Trialability   whether an innovation can be experimented with. If new ideas can be tried out on a limited basis, they will generally be adopted more quickly.
- Observability   the level of visibility of an innovation's results to other people. If people can see such results, they are more likely to adopt.

Communication Channels. Diffusion is a type of communication that relates something new to the recipient. The communication encompasses the idea, a person with knowledge of or experience with the idea, a second person who does not have experience with that idea, and a communication channel that connects the two. Mass media is the most efficient method for transferring an innovation to an audience, explains Rogers. However, interpersonal relationships can also be effective at persuading someone of the value of an innovation. This typically involves a face-to-face exchange between two individuals or groups of people. People primarily depend on others' experience when making up their own minds about an innovation. This, Rogers adds, suggests that diffusion of technologies consists of modeling and imitation by potential adopters of people who have already adopted the technology.

Time. Time impacts technology diffusion in several ways. It is most evident between the moment a potential adopter learns of a new innovation and when he or she decides whether to adopt that technology. Time is also involved in how early or late an adopter accepts an innovation compared to other adopters within a system. Finally, time comes into play in the rate of adoption, typically measured as the number of members who adopt an innovation within a given period. This element can be further deconstructed to examine time's impact on the diffusion of technologies:

- Innovation-Decision Process   the time that passes between first knowledge of an innovation to adoption (or rejection). Rogers explains that five main steps are involved in this process: knowledge, persuasion, decision, implementation, and confirmation. "The innovation-decision process involves time in the sense that the five steps usually occur in a time-ordered sequence," writes Rogers. "Exceptions to the usual sequence of these five stages may occur for some individuals under some conditions, such as when the decision stage precedes the persuasion stage (perhaps an individual was ordered to adopt by some authority figure)."
- Innovativeness   the extent to which an adopter of an innovation takes action relatively earlier than other members of a system. Diffusion research shows that members within different adopter categories typically have much in common. Adopter categories are generally characterized as: 1) innovators; 2) early adopters; 3) early majority; 4) late majority; and 5) laggards. For instance, most members of the late majority category may likely share such characteristics as low socioeconomic status, rare use of mass media channels, and low incidence of new idea learning via interpersonal relationships.
- Rate of Adoption   the speed in which an innovation is adopted by members of a social system. "When the number of individuals adopting a new idea is plotted on a cumulative frequency basis over time, the resulting distribution is an S-shaped curve," explains Rogers. "At first, only a few individuals adopt the innovation in each time period (a year or a month, for example); these are the innovators." Rogers adds that as more individuals adopt in each succeeding time period, the diffusion curve begins to rise. At some point, the trajectory of diffusion once again flattens out as fewer individuals who have yet to adopt the innovation remain.

Such S-shaped curves are the hallmark of most innovations, Rogers contends. An S-curve can change slightly from innovation to innovation, however. For instance, a new idea that diffuses rapidly will boast a steep S-curve. Conversely, an innovation with a slow rate of adoption will result in an S-curve that slopes more gradually. Using S-curves, diffusion researchers examine why some innovations have a rapid rate of adoption while others do not.

Social System. A social system consists of related entities that work together toward a common goal. Entities may

be individuals, groups of people, organizations, and even subsystems. Technology diffusion occurs within a social system, and that system's structure can influence an idea's diffusion in different ways. Other social system factors play a role in impacting diffusion, including norms, opinion leaders, change agents, types of innovation-decisions, and the consequences of innovation.

Together, all four elements work to create the process of diffusion, summarizes Rogers. Diffused technologies have gained increasing importance in the realm of small business. Different small businesses use technology in different ways. Some may boast strong technological development capabilities, although most arguably use technology with a varied range of internal skills. Still others may be completely indifferent to technology, particularly those engaged in craft or labor-intensive industries.

DIFFUSION AND TECHNOLOGY MANAGEMENT

Technology diffusion is a key component of many firms' larger technology management strategies. Technology management is a set of management disciplines that enable a firm to handle its available technology to capitalize on competitive advantages. It includes planning, design, optimization, and the operation and control of tech products, process, and services.

Measuring diffused technologies, therefore, can help a business gain important insight into how best to maximize its overall technology management. Technology diffusion measurements can be expressed in percentages. The Fisher-Pry equation is the standard method for measuring technology diffusion over time. Fisher-Pry essentially identifies two characteristics: 1) the midpoint in time at which 50 percent adoption of a technology was achieved in a market; and 2) a relative quantification of the rate that the technology was adopted. S-curves are an important part of the Fisher-Pry equation and help portray new technology as it moves from concept to production to maturity and finally to market saturation.

TELEMARKETING

Telemarketing is the process of using the telephone to generate leads, make sales, or gather marketing information. Telemarketing can be either inbound or outbound in scope. Inbound telemarketing consists of handling incoming telephone calls often generated by broadcast advertising, direct mail, or catalogs and taking orders for a wide range of products. Representatives working in this type of telemarketing program normally do not need as much training as outbound representatives because the customer already has shown an interest by calling in.

Outbound telemarketing can be aimed directly at the end consumer for example, a home repair business may call people in its community to search for prospects or can be part of a business-to-business marketing program. Representatives working on this side of the industry generally require more training and product knowledge, as more actual selling is involved than with inbound operations.

For a long time, outbound telemarketing was a particularly valuable tool for small businesses, in that it saved time and money as compared to personal selling but offered many of the same benefits in terms of direct contact with customers. In fact, experts estimate that the cost of closing a sale through telemarketing is less than one-fifth of what it would cost to send a salesperson to make a sale in person. Telemarketing was especially useful when the customers for a small business's products or services were located in hard-to-reach places, or when many prospects had to be be contacted in order to find one interested in making a purchase. Changes to telemarketing law, however, have made it much less advantageous for businesses to reach potential customers through telemarketing.

FEDERAL DO NOT CALL LIST

In 2003 the popular uproar against telemarketing calls grew so loud that legislators in Washington took notice and took action. Following the lead of several states, federal legislators passed a law in 2003 that made it possible for people to register to have their home phones included on a do-not-call list and by so doing "opt-out of telemarketing." The law is the Do-Not-Call Registry Act

of 2003. This act authorized the Federal Trade Commission (FTC), under sections of the Telemarketing and Consumer Fraud and Abuse Prevention Act, to implement and enforce a do-not-call registry to be established and run by the commission. The registry is nationwide in scope, applies to all telemarketers (with some exceptions), and covers both interstate and intrastate telemarketing calls. Commercial telemarketers are not allowed to call a number that is on the registry, subject to certain exceptions.

Organizations not covered by the law include nonprofit organizations, political campaigns, and companies that have an existing business relationship with a call recipient. The goal is to eliminate cold calls for all those who chose to "opt-out" of telemarketing; it is not designed to keep companies from calling their customers for repeat sales. As early as 2005, just 2 years after the law was passed, the FTC reported having close to 65 million numbers in the do-not-call registry with an additional 150,000 added monthly. Under the law, telemarketers are required to purchase a copy of the list for the area codes they wish to call and then remove from their call lists all numbers that appear on the FTC list. Those companies that fail to comply with this law face the imposition of heavy fines. In late 2005 the largest fine to-date was imposed on the satellite television company, DirectTV. The fine charged DirectTV was $5.3 million. The underlying complaint named as defendants DirectTV, five firms that telemarketed on its behalf and six principals of those telemarketing firms. "This multimillion-dollar penalty drives home a simple point: Sellers are on the hook for calls placed on their behalf," said FTC chairman Deborah Platt Majoras in an article in the magazine *Brandweek.* In 2008 Wachovia was also hit hard, agreeing to pay a settlement of up to $144 million as a result of its telemarketing practices. The complaint had alleged that Wachovia provided its clients' bank account information to telemarketers who used the information to sell discount travel and grocery vouchers.

Although solid numbers are hard to find, one commonly accepted estimate is that the do-not-call regulation had cut the number of telemarketing calls by half during the first 2 years in effect. Telemarketing firms report seeing their lists cut by 35 to 55 percent.

In 2008 another new law was passed to restrict the telemarketing industry. The law was an amendment to the FTC's Telemarketing Sales Rule and dealt with automated or "robo-calls" wherein a prerecorded sales presentation is presented to individuals when they answer the telephone. The amendment involved two phases of change. First, by 2009, all companies were required to add an opt-out option to "robo-calls." Second, by September 2009, companies were forbidden from making any such calls without prior and express written permission of the consumer. This rule also eliminated the established relationship exception in the Do-Not-Call act, so a company cannot place an automated call with a sales message to any customers, even those whom they have worked with in the past, without express permission to do so. This has greatly curtailed the practice of automated sales calls.

The industry has since adjusted to the new reality that has been created by the do-not-call registry, creating ways in which to generate new telephone lists that include potential clients that are not on the do-not-call list or clients who by virtue of signing up for a sweepstakes event have created for themselves a "relationship" with the seller. Companies with whom a person has done business or with whom a person has signed up for a drawing are allowed to call that individual whether or not his or her phone number is on the do-not-call list. Consequently, companies that use telemarketing have turned to online information request forms, online sweepstakes, and other forms of online advertising to create calling lists of customers who have expressed an interest.

Internet marketing has also allowed companies to reach out to customers in other ways, in addition to telemarketing. Companies can keep up with customers through e-mail mailing lists and newsletters. Special offers or deals can be sent to customers via e-mail or posted on social networking Web sites such as Twitter and Facebook, allowing the companies to reach a wider range of customers who it can no longer access via telephone.

Although much reduced, telemarketing is still an option for some types of businesses. In particular, business-to-business telemarketing is still a useful tool within a larger marketing strategy for companies that sell to other companies.

Selling. Telemarketing can either supplement or replace face-to-face selling to existing accounts. It can complement the field sales effort by reaching new customer bases or geographic markets at relatively low cost. It can also be used to sell goods and services independently, with no field sales force in place. This method often is used for repetitive supply purchases or readily identifiable products, though it can be effectively applied to other products as well.

The inside sales force can be used to replace direct contact for marginally profitable customers. A general rule of thumb in business says that 20 percent of customers account for 80 percent of sales, so conversely the remaining 80 percent of customers generate just 20 percent of sales. But businesses must keep in mind that marginal does not necessarily mean unprofitable. And the existing customer base is perhaps the most important asset in any business; increases in sales most often come from current accounts, and it generally is less costly to maintain current customers than to search out new business, particularly

with the reduction of access resulting from the FTC do-not-call list. Telemarketers can give these reliable customers the attention they deserve. The reps can phone as often as needed, determine the customers' purchasing cycles, and contact them at appropriate reorder times.

Lead Generation. Through telemarketing or through Internet inquiry forms and newsletters, a company can compile and update lists of customer prospect leads and then go through these lists searching for sales leads. Telemarketing can screen the leads and qualify them according to priority, passing the best leads to the field sales force for immediate action. The inside sales force also can identify the decision maker with the buying power and set up appointments for the outside sales force.

Improving Customer Service. Studies show it costs five times more to win over a new customer than to keep an existing one. By using telemarketing as a main facet of customer service, companies can go a long way toward keeping customers happy.

In addition, when used in conjunction with current computer technology, a telemarketing program can be analyzed in terms of costs and benefits, using quantitative data on the number of contacts, number of presentations, total sales, cost per sale, and income per sale.

ESTABLISHING A SUCCESSFUL PROGRAM

Not all telemarketing programs are successful. Improper execution, unrealistic goals over a short time period, oversimplification, and lack of top management support have caused the ultimate failure of more telephone sales programs than can be imagined. Like any marketing strategy, telemarketing takes time to plan and develop. It takes time to gain confidence in the message, to identify weak areas, and to predict bottom-line results. Some of the most common telemarketing mistakes include not giving it a total commitment; not utilizing the proper expertise; failing to develop a proper database; improper human resource planning; lack of proper scripts and call guides; lack of quality control; and failing to understand the synergy with other direct marketing disciplines. To create a successful telemarketing program, management must understand and agree to the necessary personnel and financial resources, as well as devote adequate time for program development and testing. Telemarketing and related direct marketing techniques can produce solid sales. But they need a chance to develop and demonstrate that success. Very simply, it takes time.

Experts agree that companies must be careful in forming telemarketing goals and objectives. Some of the most important factors for success include developing a complete marketing plan with built-in criteria for accounting and analysis; writing scripts, sales outlines, and presentations to be performed; establishing training and hiring procedures for both supervisors and sales personnel; analyzing and evaluating campaigns, personnel, and cost effectiveness; having support and commitment from management for the telemarketing's role in the overall marketing effort; establishing reachable goals; and placing a continuous emphasis on follow-up.

For compensation, most companies use a combination of salary, commission, and bonuses. Studies indicate that incentives generally aid in sales success, but it is important to link the inducements to the performance desired, be it total sales, calls completed, or presentations given. Some form of quotas are also commonly used so that sales reps know what is expected of them. Firms should be reasonable in setting quotas. If the goals are too high, the reps will become frustrated, leading to morale and worker retention problems. Conversely, low quotas can create an environment in which effort is lacking, especially if the compensation package in place is heavily weighted toward base salary.

Telemarketing positions typically show high levels of turnover, in large measure because the majority of interactions with potential customers end in rejection. Working shorter shifts or using computers to prescreen customers can help reduce the amount of rejection telemarketers experience. Training is another important factor. If the individuals that comprise the telemarketing staff are trained to be specific, control the time and pace of conversation, ask questions and listen without interrupting or rushing the customer's response, and respond to objections or concerns in a positive manner, they will experience greater levels of success and hence, a more positive outlook on their duties.

TEMPORARY EMPLOYMENT SERVICES

Temporary employment services (often referred to as temporary employment agencies or firms) offer client companies the services of temporary employees who possess specific skills. This arrangement can provide a client company with needed help during peak demand periods, staffing shortages, or the vacations of regular employees, without requiring the time, expense, and long-term commitment of hiring a new employee. Temporary employment firms typically undertake hiring and firing decisions, issue paychecks, withhold payroll taxes, and make contributions for unemployment insurance, workers' compensation, and Social Security for the employees serving in their client's places of business. Client companies simply describe their staffing needs and time frame, then pay a set hourly rate to the temporary employment agency for the services of a "temp." The business scenarios in which temporary staff can be useful are virtually endless, noted *Arkansas Business.* "A large staffing service can bring in any number of temporaries to work days, nights, weekends, or holidays and not just to perform low-skill tasks. Specialized temporary services can routinely handle specific, time-sensitive and highly skilled projects. In fact, very often temporary workers are so qualified, employers end up adding them to the full-time staff, saving the high cost of hiring and training. Additionally, a temporary employee allows you to judge whether you need a full-time person for a particular job or if ongoing temporaries can complete the tasks."

The use of temporary employment grew rapidly in the 1980s and early 1990s during the trend toward business downsizing and restructuring, in which many companies reduced the size of their core workforces. Companies began to substitute temporary for permanent employees for cost savings in payroll administration and fringe benefits, and to gain greater flexibility in the face of changing business conditions. After a slowdown in 2000 because of the bursting of the tech bubble and in 2001 because of an economic recession, "the temp industry began thriving again, placing day laborers, secretaries, accountants and engineers in projects that last from a few days to six months or more," according to H. Lee Murphy writing in *Crain's Chicago Business.* Furthermore, following the recession in 2008 and 2009, temp agencies reported better than average earnings in 2010, and the growth of the temporary job market was outpacing the growth of the permanent job market. Although in the past, most temporary employment services specialized in providing general secretarial and clerical help to client companies, this has been changing. Use of temporary workers has expanded in the manufacturing sector coinciding with the advent of "just-in-time" production systems and in professional occupations, such as accounting, law, and engineering.

Another effect of the 2008 and 2009 recession was that workers reportedly flooded temp agencies when they were unable to find full-time jobs. Aaron Brooks, the managing director of Mergis Group, an employment agency in Chicago, reported that while the agency used to have to recruit people with advanced degrees, more candidates with MBAs and CPAs were seeking positions from his office.

Changes in the nature of the work force such as an increase in the number of working mothers have contributed to the popularity of temporary employment arrangements. Part-time workers who are employed as "temps" enjoy a great deal of flexibility in setting schedules and choosing assignments. For example, a mother with young children in school might opt to work fairly consistently during the school year, but not at all during the summer months. Some professional workers use temporary assignments as a way to add variety to their jobs, while recent college graduates might view temp work as a stepping stone to permanent employment. But even though temporary employment offers advantages for some workers, many others who have been laid off or are unable to find permanent positions work as temps out of necessity rather than preference.

The economic and demographic forces that have stimulated growth in the temporary staffing industry as an alternative to hiring permanent employees are not likely to change in the near future. These forces include the shift from production of goods to processing of information; employer reluctance to add permanent staff in the face of economic uncertainty and volatility; technological changes that require special expertise to deploy and operate; a desire to avoid seemingly ever more expensive benefit packages, and the availability of capable individuals who either must or prefer to enter the temporary labor market.

Nonetheless, there are potential drawbacks associated with going the "temp service" route that must be weighed. One factor commonly cited is the greater allocation of time and resources to training that may be necessary if a company receives several different temp workers in succession for one job. Another criticism that is sometimes raised in conjunction with reliance on temp services is that some temporary staffers do not feel a connection to the company for which they are working, which can have a deleterious impact on effort and effectiveness. Companies can do much to address these potential problem areas, however, by establishing and maintaining a program that continually monitors and reviews the contributions of temp workers.

CHOOSING A TEMPORARY SERVICE

Temporary employment services are a particularly attractive option for small businesses, which often need help on a limited basis but lack the resources to recruit, screen, and pay new, full-time employees. A small business considering the services of a temporary employment agency should first consider several factors:

Gauge need. Business owners should examine production schedules, composition of employee benefits (number of sick days and vacation days, etc.), and seasonal workloads when weighing whether to pursue temporary staff. Shortcomings in specific areas of business knowledge should be factored in as well. Another key factor that should be weighed is less quantifiable but even more important: quality of customer service. "Check the quality of the work not just during the times when employees are covering for another worker, but on a regular basis," wrote Don Owens in *Sacramento Business Journal.* "Judge the way employees react when asked to do more from each other and from managers. Most importantly, look at how employees treat people outside the company from the vendors and suppliers to the customers themselves. Are they harried, short and tense?" If so, temporary additions to the workforce may be in order.

Put an effective screening process in place. It is important to understand the temporary services firm's screening process for temporary employees. Though minimal screening is acceptable for low-level jobs, the process should include more sophisticated screening methods such as personal interviews, computer testing, or psychological evaluations for positions requiring specialized skills. Existing employee job descriptions can be used to determine temp staffers' suitability for jobs and to measure their performance once they have begun work.

Evaluate potential temporary staffing services. Experts urge business owners to seek out recommendations for temp services from other members of the business community. Once business owners have targeted specific services for consideration, they should conduct extensive interviews with management to explain their company's needs and determine their ability to meet those needs. "The natural inclination is to look for the lowest rate," observed *Arkansas Business.* "Yet quality of service is just as important. . . . A firm that carefully screens and evaluates the skills of all its temporaries will provide you with workers who do the job right the first time."

Establish partnership with the temp service. The temporary services firm your company selects should be able to evaluate the client company's project requirements, time frame, budget, and working environment, and provide temporary employee who have the appropriate skills, availability, and personality to meet its client's needs. Ideally, the temp services firm should be flexible in accepting last-minute requests for temps or in changing temps in the middle of a project if the first one does not work out. Payment rates should be negotiable, based on the skill level required and the quantity of work.

Make the workplace one in which temporary workers can succeed. Companies should make sure that temporary workers are made to feel welcome upon arrival, and that they receive solid training. They should not be abandoned to "sink or swim" on their own.

Monitor temporary staffing initiatives. Put programs in place to monitor and review temp staff performance and determine the impact of the temp service on bottom-line financial performance and customer service.

TESTING LABORATORIES

Testing laboratories are utilized by all manner of businesses to provide objective analytical data on the quality of a product or a process. Some companies look to testing labs for product certification, which can be a significant marketing tool, while others use testing labs to analyze the results of employee drug tests. Still other companies secure the services of environmental testing laboratories to check on water and soil quality before making a major land or facility purchase. Whatever the reason, the services offered by testing laboratories are often of great usefulness to businesses in a wide range of industry sectors.

The number and size of testing laboratories operating in the United States and many other industrialized nations has increased significantly over the last few decades. There are myriad reasons for this growth, but observers generally point to the rise in product testing for the bulk of the increase. For example, in 2007, following a toy recall of 1.5 million toys tainted with lead paint, testing labs were flooded with toys, forcing them to increase their staffs, move testing agents from other fields, and work overtime. These widespread product recalls and problems can create high demand for increased independent testing as companies struggle to protect and maintain their brand reputations and to avoid potential litigation. The recall of a certain type of product can thus essentially serve as a wake-up call, spurring others within the industry to turn to these outside testing labs.

While experts agree that these product analysis factors have had a significant impact, several other trends have also been cited as key to the increased reliance on external testing labs. The rising expense of product liability insurance, for instance, has led many companies to utilize testing labs to check out new or "improved" products prior to general release. Small to mid-sized companies often look to independent labs to serve as their quality control department. Testing laboratories have assumed this role with smaller companies in large measure because of the expense of maintaining comparable facilities in-house. Still, many big firms use them as well in order to secure independent results in areas of quality control and failure analysis.

It should be noted, however, that testing laboratories generally limit themselves to one specific testing area. For example, a company that conducts analysis of employee drug tests will rarely offer services in the realm of environmental analysis; similarly, a company that conducts tests on soil or water will not be of use to a small-business owner who is seeking product quality testing services.

ADVANTAGES OF USING A TESTING LABORATORY

Business analysts, laboratory managers, and business owners for both large and small organizations agree that there are several significant advantages associated with utilizing the services of an independent testing lab. Three primary reasons that businesses choose off-site independent laboratories are: objectivity, economic considerations, and safety.

Objectivity. The independent, off-site testing laboratory focuses on its testing procedures to ensure accurate results. Companies often use the terms "third-party testing" or "tested by an independent laboratory" in advertising claims that guarantee that their test results are objective and free from the influence, guidance or control of interested parties. The independent laboratory exists for only one purpose: to provide objective, analytical data on the quality of a product or process. Testing laboratories invests considerable time, money and effort to ensure this objectivity. In keeping with this agenda, testing labs usually keep copious documentation on the internal processes that they follow to ensure objectivity and accuracy. Such information usually includes requirements for training of personnel, especially analysts; maintenance and calibration of equipment; standardization and adoption of analytical methods; verification of results; sample recovery and handling procedures; quality control measurement procedures; internal and external proficiency programs and certifications; and accreditations.

Some private labs, unfortunately, fall short of the quality and objectivity standards that one would hope for. In 2008 the Food and Drug Administration (FDA) subpoenaed ten laboratories that tested food following an outbreak of salmonella linked to tomatoes. The FDA discovered that it was routine for private labs to retest food until a clean and positive result was obtained. FDA investigators also believed that the labs disregarded data that showed the food was unsafe or did not meet FDA standards. While using a lab that provides favorable test results may seem more economically advantageous at the time, in the long run this could make a company liable for potentially expensive lawsuits.

Economic Considerations. Economics play a central role in the decision to utilize an outside testing laboratory to conduct quality and safety tests. This is especially true for small firms. Indeed, small-business owners engaged in establishing or fortifying their enterprises will likely have a host of things on which they will want to spend their money, from new equipment to new advertising campaigns to workforce or facility expansion. These businesses may well be better off financially by securing the services of an outside entity, despite the expense involved there, rather than setting up internal testing facilities. Moreover, many

businesses that decide to establish internal testing facilities do so without fully factoring in the ancillary costs associated with such activity. Running a testing laboratory includes many costs that may be overlooked in an initial analysis of the undertaking. These include corporate or upper management salaries and benefits; liability insurance; additional professional services (legal or accounting); and finally the opportunity cost associated with investing the funds necessary for such an undertaking in a more profit-making activities.

Safety. Many companies engaged in producing potentially hazardous materials prefer to utilize an outside testing firm to minimize the danger of in-house exposure to hazardous agents.

CHOOSING A TESTING LABORATORY

There are many criteria to consider when selecting a testing laboratory. These criteria will be shaped to some degree by the situation of the company making the selection; for example, a smaller company that needs only limited testing done may well make its selection exclusively on the basis of price and quality. But for many companies of varying sizes, several other factors are usually considered as well. It is important to take as much care in selecting a laboratory as one might in selecting a financial advisor   the accuracy of the results may affect decisions worth thousands or even millions of dollars.

There are several basic criteria upon which testing laboratories should be selected:

- Quality and accuracy of testing
- Turnaround time
- Nature of analysis services provided
- Additional services
- Cost
- Certification/accreditation

Quality. This is the most vital consideration in judging any testing lab. Small-business owners should look for labs that maintain and adhere to documented quality control programs. A good laboratory should be eager to discuss its quality control program with potential clients. It should have a quality assurance manager whose sole responsibility is the implementation of quality control programs and the monitoring of the same. Those quality control programs should also perform multipoint calibrations; analyze control standards; use analytical methods in testing; test for inadvertent skewing of results; and test for reproducible results.

Turnaround. The amount of time necessary to get results on tests from independent labs depends to a large extent on the area in which the labs are involved. Product testing labs, for example, typically take months to complete their tests, and environmental analyses take longer than do medical or clinical tests. Still, most environmental tests can be completed in a week or two, and some environmental, clinical, or medical labs are able to speed up analyses in exchange for additional compensation.

Expense. Cost is always a concern, especially for smaller businesses with more modest financial resources. But small-business owners should make sure that they fully understand the extent of the testing and other services that they are receiving before signing an agreement.

Certification. All testing laboratory candidates should be asked to provide prospective clients with documentation as to the certifications and accreditations the lab carries. Certification requirements differs from state to state and from application to application. This is one reason why testing labs often specialize in one or two areas of expertise. For the client, the consequences of a poorly produced testing result may range from worthless data to the potentially staggering costs associated with correcting for actions taken based on incorrect data.

Companies preparing a product for testing and certification should make arrangements with a reliable testing laboratory early in the process, so that all procedural issues can be addressed in advance and so both sides are on the same page regarding such issues as timeline and necessary information exchange. "Communication is probably the most important aspect of dealing with an outside certification agency," stated one executive in *Appliance Manufacturer*.

TIME MANAGEMENT

Time management is a broad term used to describe the ways in which tools and processes are employed to increase efficiency and productivity. Most individuals practice some form of time management every day in their personal lives. Getting the kids off to school or showing up to work on time requires at least some organized approach to allocating the use of time. In the business world, effective time management is vital to ensure smooth operations and long-term success. Without it, companies would have a difficult time fulfilling commitments on deadline and convincing customers of their professionalism. The importance of these two factors cannot be overlooked when one considers that happy customers are often repeat customers, and repeat customers are an essential building block for most businesses.

The typical American spends an average of 7.6 hours at work each workday, according to the U.S. Bureau of Labor Statistics's 2008 American Time Use Survey. Optimizing those hours is advantageous for both the worker and the business, helping to foster personal and professional satisfaction and success. It is the company's responsibility, therefore, to ensure that personnel are given the information and resources to help them avoid procrastination and inefficient use of time. The same concept applies whether the staff size equals 100 or just one (i.e., the business owner).

TIME MANAGEMENT STRATEGIES

There are several simple tactics that can be applied to help manage the use of workplace hours. Foremost is planning. Business owners and managers can start by creating a basic to-do list each day that outlines and prioritizes the tasks for completion; the most pressing tasks should be placed at the top and longer-term projects at the bottom. Scheduled telephone calls, meetings, and required daily activities, such as filing and work breaks, should also be included on the list. Once the day's tasks are identified, blocks of time can be slated to complete them. Tasks do not need to be completed in the order they appear on the list; alternating between easy and difficult or fun and monotonous responsibilities may help keep momentum going throughout the day. Having a daily schedule even a loose one gives individuals a clear path to follow during their day rather than wasting time mulling over what needs to be done and what should be done next. If employees discover some unexpected spare time, they can take the opportunity to complete tasks that may help ease potential burdens down the road, such as organizing their workspace or preparing notes for a meeting.

Some other tips for effective time management include accepting the fact that only so much can be completed during a given workday, even when burning the late-night oil, and that the project slate likely will not be wiped clean by quitting time. It is also important to learn how to delegate; everyone needs help some time. For many small-business owners it is difficult to hand over responsibilities to others, but they are not doing the business any favors by over-extending themselves. Writer Danielle Kubus claims that business owners and managers should practice the "80/20 rule," which dictates that 80 percent of one's success comes from 20 percent of one's efforts. She says small-business leaders must figure out where their most profitable 20 percent is and spend the majority of their time focused on those responsibilities.

Business owners can help their employees practice effective time management. To start, employees must be made aware of the link between efficient time use and business success. Practices that support the idea must be infused into every aspect of the operation. For instance, in addition to leading by example, managers should set reasonable deadlines and workloads for their staff and offer incentives and rewards for timely achievements. It is also essential that the business provides employees with the tools necessary to complete the tasks at hand. Think about an accountant without a calculator or a hair stylist without scissors.

VIRTUAL ASSISTANTS

There are several time management tools available to support small businesses, ranging from Enterprise Resource Planning systems to online skills seminars. One resource increasingly being utilized by small-business owners is the virtual assistant. The assistant is typically a prescreened, qualified administrative professional who works remotely via electronic technologies to complete organizational tasks for the business. Virtual assistants can help small-business owners with tasks as varied as Web site design and maintenance, travel reservations, customer service, database management, billing, and marketing services, depending on their background and skills set. Outsourcing these tasks frees the small-business owner to focus on more strategic initiatives aimed at improving and growing the business.

As with any working partnership, it is important to find the right person for the job. Referrals from business associates or colleagues, as well as networking via social media forums like LinkedIn, Twitter, and Facebook, can help small-business owners find appropriate virtual assistant candidates. Once a group of qualified individuals has been identified, phone interviews and skills tests can narrow the field until the desired candidate is selected.

If time management and its impact on the business is neglected, it could greatly hamper the company's financial and personnel resources, its business reputation, and its ultimate success. Proper planning and conscientious time management practices can help build a foundation for accomplishment and development.

TOLL-FREE TELEPHONE NUMBERS

Toll-free telephone numbers are a staple of business efforts to garner new customers and retain existing ones. By utilizing toll-free phone numbers, businesses provide clients and others with a means of communicating with them at no charge; instead, the business that maintains the toll-free line pays all costs associated with the line including incoming calls.

At one time, toll-free telephone numbers were a novelty. Since their inception in 1967, however, the U.S. economy has become increasingly service-based and competitive, creating an environment in which toll-free numbers have come to be expected by customers seeking to make purchases of all kinds of goods and services. But the popularity of toll-free numbers has created a growing shortage of the numbers in recent years. Indeed, reports indicate that the mid-1990s saw the same number of new toll-free numbers introduced as were assigned during the first two and a half decades of toll-free usage. This increase can be attributed both to improved technologies, which gave rise to the usage of pagers, modems, and cellular phones (many of which have 800 numbers); the ease in obtaining toll-free telephone numbers through promotional packages; 800 number portability from carrier to carrier; and the growth in use of "vanity" numbers (i.e., 800-HOLIDAY). Another key factor in the explosion of toll-free numbers was an FCC ruling that took effect in 1993, granting companies ownership of their toll-free numbers. "Before that time, a company with an 800 number that wanted to change from AT&T to Sprint for long-distance had to have its number deleted from the AT&T database, then see if Sprint had the same toll-free number available, which was unlikely," wrote *Telephony*'s Phil Britt. "So rather than change toll-free numbers, the company would stay with its original long-distance carrier. After the ruling took effect, the toll-free numbers were maintained . . . on a centralized database rather than on separate databases by each of the long-distance companies . . . . That meant lower cost and keener competition."

The popularity and demand for toll-free numbers resulted in the 800 prefix running out. New toll-free telephone numbers were assigned by the Federal Communications Commission (FCC) and now include the original 800 prefix, as well as 888 and 877 (since 1995), 866 (since 1997), and 855 (since 2000). For future use are 844, 833, and 822, which have all been reserved but have yet to be activated as of early 2010.

Today, companies can set up toll-free numbers with relatively little difficulty or expense. Sites such as www.get800today.com allow a business to get a toll-free number almost instantly. Businesses pay a $25 activation fee and enter a phone number to have incoming toll-free calls forwarded to them. A standard home or phone service can thus become toll free. The site also offers prepayment in the amount of the business owners' choice,.

ADVANTAGES OF TOLL FREE NUMBERS

Toll-free service offers several advantages to small-business owners that traditional toll phone service cannot provide. First and foremost, a toll-free telephone number makes a company more accessible to clients, customers, employees, and business associates. It enhances a business's image as a successful, professional company, and many experts contend that it shows clients that customer service is an important component of the business's operating philosophy. Additionally, toll-free service can help lower business costs if a company is currently accepting collect calls or is finding it expensive to keep

in touch with the home office while on the road. Lastly, toll-free service usually details incoming calls on the statement, with names and numbers allowing easier customer tracking.

Obtaining a toll-free number is a relatively simple process. Consumers can simply request one from their local or long-distance phone company. The cost of securing and maintaining a toll-free line will vary depending on geographic region and the amount of calls that are transmitted through the line. Some small-business owners who request vanity toll-free numbers have reported tremendous success with them, but other experts counsel small-business owners to avoid vanity numbers altogether, saying that customers may become frustrated by being forced to hunt and peck their way through a toll-free number that is made up of letters rather than numbers. Firms that do choose to secure a vanity number can eliminate much of this frustration by advertising both the spelled-out and numeric versions of the number.

TOTAL PREVENTIVE MAINTENANCE

Total Preventive Maintenance (TPM) is an approach that places the responsibility for routine maintenance on the workers who operate the machinery, rather then employing separate maintenance personnel for that function. Used in many Japanese companies, TPM gives employees a sense of responsibility and awareness of the equipment they use. It has the side benefit of reducing the abuse and misuse of the equipment as operators who are also in charge of the maintenance of equipment are more careful about using it.

The term *maintenance* is used to describe the various efforts businesses make toward keeping their facilities and equipment in good working order. It encompasses both breakdown maintenance a policy that involves dealing with problems as they occur and attempting to reduce their impact on operations and preventive maintenance a policy that involves using such measures as inspecting, cleaning, adjusting, and replacing worn parts to prevent breakdowns from occurring in the first place.

Four basic categories of maintenance are generally identified:

1. preventive maintenance, which involves scheduled and regular inspections;
2. minor corrective maintenance, which involves replacing small parts;
3. major corrective maintenance, which is unexpected maintenance that requires repairs that cost between 6 and 50 percent of the value of the equipment; and
4. predictive maintenance, which is maintenance done in order to head off major problems that are predicted to occur.

Making the most of maintenance dollars means intelligent planning and good implementation. Preventive maintenance is performed periodically in order to reduce the incidence of equipment failure and the costs associated with it. These costs include disrupted production schedules, idled workers, loss of output, and damage to products or other equipment. Preventive maintenance can be scheduled to avoid interfering with production. Common methods of planning preventive maintenance are based on the passage of time, on the amount of usage the equipment receives, and on an as-needed basis when problems are uncovered through inspections. Ideally, preventive maintenance will take place just before failure occurs in order to maximize the time that equipment is in use between scheduled maintenance activities.

The goal for production managers is to find a balance between preventive maintenance and breakdown maintenance that will minimize the company's overall maintenance costs. Those in charge of the TPM must balance these two factors in order to minimize their combined cost. If maintenance work is done only in a reactive manner, after breakdown occurs, repair costs are very high. Furthermore, hidden costs, such as lost production and the cost of wages while equipment is not in service, must be factored in. So must the cost of injuries or damage to other equipment and facilities or to other units in production. All of the costs associated with these side effects can by minimized by TPM. There is, however, a point at which the cost of preventive maintenance exceeds the benefit.

The decision of how much maintenance to perform involves the age and condition of the equipment, the complexity of technology used, the type of production process, and other factors. For example, managers would tend to perform more preventive maintenance on older machines because new ones have only a slight risk of breakdown and need less work to stay in good condition. It is also important to perform routine maintenance prior to beginning a particularly large or important production run.

In TPM, production employees are trained in both operating procedures and routine maintenance of equipment. They perform regular inspections of the machinery they operate and replace parts that have become worn through use before they fail. The approach is often considered a more holistic approach to maintenance. Since the production employees spend so much time working with the equipment, they are likely to pick up small signals that a machine is in need of maintenance. Among the main benefits of TPM is that employees gain a more complete understanding of the functioning of the system. TPM also gives them increased input into their own productivity and the quality of their work.

The aim of TPM is to avoid deterioration of assets, and to avoid consequences such as late shipments or poor product quality that can result when sudden and unexpected maintenance is required. Experts suggest that while TPM can be implemented as a stand-alone policy, it is most effective when part of a lean business strategy designed to reduce waste and improve overall performance.

TOTAL QUALITY MANAGEMENT (TQM)

Total Quality Management (TQM) refers to management methods used to enhance quality and productivity in business organizations. TQM is a comprehensive management approach that works horizontally across an organization, involving all departments and employees and extending backward and forward to include both suppliers and clients/customers.

TQM is only one of many acronyms used to label management systems that focus on quality. Other acronyms include CQI (continuous quality improvement), SQC (statistical quality control), QFD (quality function deployment), QIDW (quality in daily work), and TQC (total quality control). Like many of these other systems, TQM provides a framework for implementing effective quality and productivity initiatives that can increase the profitability and competitiveness of organizations. In 2010 an increased focus on corporate responsibility and sustainability also gave rise to a new acronym: CR. While some have likened corporate responsibility, or CR, to TQM, others believe this new focus represents a new era and a professional revolution.

ORIGINS

TQM, in the form of statistical quality control, was invented by the statistician Walter A. Shewhart (1891 1967). It was initially implemented at Western Electric Company, in the form developed by management consultant Joseph Juran (1904 2008) who had worked there with the method. TQM was demonstrated on a grand scale by Japanese industry through the intervention of W. Edwards Deming (1900 1993) who, in consequence, and thanks to his missionary labors in the United States and across the world, has come to be viewed as the "father" of quality control, quality circles, and the quality movement generally.

Walter Shewhart, then working at Bell Telephone Laboratories, first devised a statistical control chart in 1923; it is still named after him. He published his method in 1931 as *Economic Control of Quality of Manufactured Product.* The method was first introduced at Western Electric Company's Hawthorn plant in 1926. Joseph Juran was one of the people trained in the technique. In 1928 he wrote a pamphlet titled *Statistical Methods Applied to Manufacturing Problems.* This pamphlet was later incorporated into the *AT&T Statistical Quality Control Handbook.* In 1951 Juran published his very influential *Quality Control Handbook*

W. Edwards Deming, trained as a mathematician and statistician, went to Japan at the behest of the U.S. State Department to help Japan in the preparation of the 1951 Japanese Census. The Japanese were already aware

of Shewhart's methods of statistical quality control. They invited Deming to lecture on the subject. A series of lectures took place in 1950 under the auspices of the Japanese Union of Scientists and Engineers (JUSE). Deming had developed a critical view of production methods in the United States during World War II, particularly methods of quality control. Management and engineers controlled the process; line workers played a small role. In his lectures on SQC Deming promoted his own ideas along with the technique, namely a much greater involvement of the ordinary worker in the quality process and the application of the new statistical tools. He found Japanese executives receptive to his ideas. Japan began a process of implementing what came to be known as TQM. They also invited Juran to lecture in 1954; Juran was also enthusiastically received.

Japanese application of the method had significant and undeniable results, manifesting as dramatic increases in Japanese product quality and Japanese success in exports. This led to the spread of the quality movement across the world. In the late 1970s and 1980s, U.S. producers scrambled to adopt quality and productivity techniques that might restore their competitiveness. Deming's approach to quality control came to be recognized in the United States, and Deming himself became a sought-after lecturer and author. Total Quality Management, the phrase applied to quality initiatives proffered by Deming and other management gurus, became a staple of American enterprise by the late 1980s. But while the quality movement has continued to evolve beyond its beginnings, many of Deming's particular emphases, particularly those associated with management principles and employee relations, were not adopted in Deming's sense but continued as changing fads, including, for example, the movement to "empower" employees and to make "teams" central to all activities.

While enthusiasm for TQM has ebbed since the 1990s, many still believe that the central tenet of employee empowerment can be a factor that leads to positive social change. Author Gretchen Spreitzer, a University of Michigan's Ross School of Business professor, believes that TQM principles are one of the keys to improving society. Spreitzer conducted surveys in sixty-five countries and found a clear link between employee workplace empowerment and the quality of civic life. Spreitzer hypothesizes that happy employees are better citizens and that employees trained in TQM can apply the principles or resourcefulness and engagement to improve their societies. Although Spreitzer's research is preliminary, she writes that, the "sense of collective agency gained by community members working together to solve business problems has spilled over into civic matters as well... [resulting in] strategic plans for sectors such as agriculture, education, ecotourism, and handicrafts."

TQM PRINCIPLES

Different consultants and schools of thought emphasize different aspects of TQM as it has developed over time. These aspects may be technical, operational, or social/managerial.

The basic elements of TQM, as expounded by the American Society for Quality Control, are 1) policy, planning, and administration; 2) product design and design change control; 3) control of purchased material; 4) production quality control; 5) user contact and field performance; 6) corrective action; and 7) employee selection, training, and motivation.

The real root of the quality movement, the "invention" on which it really rests, is statistical quality control. SQC is retained in TQM in the fourth element, above, "production quality control." It may also be reflected in the third element, "control of purchased material," because SQC may be imposed on vendors by contract.

In a nutshell, this core method requires that quality standards are first set by establishing measurements for a particular item and thus defining what constitutes quality. The measurements may be dimensions, chemical composition, reflectivity in effect any measurable feature of the object. Test runs are made to establish divergences from a base measurement (up or down) which are still acceptable. This "band" of acceptable outcomes is then recorded on one or several Shewhart charts. Quality control then begins during the production process itself. Samples are continuously taken and immediately measured, the measurements recorded on the chart(s). If measurements begin to fall outside the band or show an undesirable trend (up or down), the process is stopped and production discontinued until the causes of divergence are found and corrected. Thus SQC, as distinct from TQM, is based on continuous sampling and measurement against a standard and immediate corrective action if measurements deviate from an acceptable range.

TQM is SQC plus all the other elements. Deming saw all of the elements as vital in achieving TQM. In his book *Out of the Crisis*, first published in 1982, he contended that companies needed to create an overarching business environment that emphasized improvement of products and services over short-term financial goals a common strategy of Japanese business. He argued that if management adhered to such a philosophy, various aspects of business ranging from training to system improvement to manager-worker relationships would become far healthier and, ultimately, more profitable. But while Deming was contemptuous of companies that based their business decisions on numbers that emphasized quantity over quality, he firmly believed that a well-conceived system of statistical process control could be an invaluable TQM tool. Only through the use of statistics, Deming argued, can managers know exactly what their problems are, learn

how to fix them, and gauge the company's progress in achieving quality and other organizational objectives.

MAKING TQM WORK

In the modern context TQM is thought to require participative management; continuous process improvement; and the utilization of teams. Participative management refers to the intimate involvement of all members of a company in the management process, thus deemphasizing traditional top-down management methods. In other words, managers set policies and make key decisions only with the input and guidance of the subordinates who will have to implement and adhere to the directives. This technique improves upper management's grasp of operations and, more importantly, is an important motivator for workers who begin to feel like they have control and ownership of the process in which they participate.

Continuous process improvement, the second characteristic, entails the recognition of small, incremental gains toward the goal of total quality. Large gains are accomplished by small, sustainable improvements over a long term. This concept necessitates a long-term approach by managers and the willingness to invest in the present for benefits that manifest themselves in the future. A corollary of continuous improvement is that workers and managers develop an appreciation for, and confidence in, TQM over a period of time.

Teamwork, the third necessary ingredient for TQM, involves the organization of cross-functional teams within the company. This multidisciplinary team approach helps workers to share knowledge, identify problems and opportunities, derive a comprehensive understanding of their role in the overall process, and align their work goals with those of the organization. The modern "team" was once the "quality circle," a type of unit promoted by Deming.

For best results TQM requires a long-term, cooperative, planned, holistic approach to business, what some have dubbed a "market share" rather than a "profitability" approach. Thus a company strives to control its market by gaining and holding market share through continuous cost and quality improvements and will shave profits to achieve control. The profitability approach, on the other hand, emphasizes short-term stockholder returns and the higher the better. TQM thus suits Japanese corporate culture better than U.S. corporate culture. In the corporate environment of the United States, the short-term is very important; quarterly results are closely watched and impact the value of stocks; for this reason financial incentives are used to achieve short-term results and to reward managers at all levels. Managers are therefore much more empowered than employees despite attempts to change the corporate culture. For these reasons, possibly, TQM has undergone various changes in emphasis so that different implementations of it are sometimes unrecognizable as the same thing. In fact, the quality movement in the United States has moved on to other things: the lean corporation (based on just-in-time sourcing), Six Sigma (a quality measure and related programs of achieving it), and other techniques.

PRACTICING TQM

As evident from all of the foregoing, TQM, while emphasizing "quality" in its name, is really a philosophy of management. Quality and price are central in this philosophy because they are seen as effective methods of gaining the customer's attention and holding consumer loyalty. A somewhat discriminating public is thus part of the equation. In an environment where only price matters and consumers meekly put up with the successive removal of services or features in order to get products as cheaply as possible, the strategy will be less successful. Not surprisingly, in the auto sector, where the investment is large and failure can be very costly, the Japanese have made great gains in market share; but trends in other sectors in retailing, for instance, where labor is imposed on customers through self-service stratagems a quality orientation seems less obviously rewarding.

For these reasons, the small business looking at an approach to business ideal for its own environment may well adapt TQM if it can see that its clientele will reward this approach. The technique can be applied in service and retail settings as readily as in manufacturing, although measurement of quality will be achieved differently. TQM may, indeed, be a good way for a small business, surrounded by "Big Box" outlets, to reach precisely that small segment of the consuming public that, like the business itself, appreciates a high level of service and high-quality products delivered at the most reasonable prices possible.

TRADE SECRETS

A trade secret generally constitutes any confidential business information that gives a company its competitive advantage. It may refer to a company's "secret sauce," unique sales and advertising strategies, distribution approaches, cost structure, production plans and processes, market research, customer and client lists, or any other specialized element involved with the functioning of the business. Unauthorized disclosure or use of a company's proprietary information ranging from outright espionage to breach of confidence by a former employee is widely considered to be a violation of the trade secret and an unfair business practice. Trade secret violations are subject to legal consequences in most states under provisions of the Uniform Trade Securities Act as amended in 1985 and internationally under the federal Economic Espionage Act of 1996.

Two key factors must be present before the trade secret label can be applied to the secret formula, template, device, concept, strategy, program, or process. First, the secret must provide the owner of the information with a competitive marketplace advantage. In other words, it must have commercial value. Second, the secret must be treated in a manner that can be reasonably expected to prevent both the public and business competitors from learning about it, barring foul play. It is this second stipulation that sets trade secrecy apart from intellectual property. Essentially, intellectual property such as copyrights and trademarks must be registered with the U.S. government in order to receive protection under the law. However, the mere act of maintaining confidentiality provides legal protection to trade secrets. The protection lasts as long as the secret remains confidential. The Coca-Cola Company has kept its coveted soft-drink formula a protected trade secret for more than a century.

PROTECTING TRADE SECRETS

Keeping a secret for 100 years is quite an accomplishment, but it is not an exclusive perk of the big and powerful. Small businesses can position themselves for similar closed-mouth success simply by taking a few prudent measures.

1. Determine what information is confidential and clearly communicate that to all employees. It is imperative that each individual understands precisely what company information is not allowed beyond the water cooler, or in some cases beyond his or her own desk. Actually labeling documents as confidential will help.
2. Train new employees about confidentiality expectations. Make sure that all new hires are made aware of confidentiality issues and the company's expectations by incorporating those topics into job orientation and training.
3. Ensure that all employees and relevant business partners sign a nondisclosure agreement. This document is a legal form outlining which company information is to be kept confidential. Signatories acknowledge that they are aware of the information's value and that they are legally bound to adhere to confidentially rules.
4. Limit access to confidential information. Employees should have access only to trade secrets that are vital to the function of their position. Employees in-the-know should be instructed not to share the information with other employees who do not have the same authorized access.
5. Keep the print and electronic paper trail well protected. Just one errant e-mail could have devastating consequences. Protect all electronic files with a creative password, and change it frequently. Shred all paper files that are no longer needed and keep current copies locked behind closed doors.
6. Debrief employees who are leaving during exit interviews. These interviews provide a final opportunity to remind employees about their obligation to continue to keep the company's trade secrets confidential even beyond the active period of employment.
7. Regularly review security systems. Annual assessments should be made to evaluate whether business security systems for both brick-and-mortar protections such as building access and evacuation procedures as well as data safety like hard drive backup and document destruction policies are continuing adequately to guard the organization's trade secrets.

TRADE SECRET VIOLATIONS

In the event of a trade secret infringement, the business owner has the right to take legal action. The owner may request that the applicable court issue an injunction against the party or parties involved in order to prevent further disclosure or use of the confidential information. The business owner is also within his or her legal rights to seek

damages for any economic injury occurring as a result of the trade secret theft. To triumph in a trade secret violation lawsuit, the business owner must demonstrate that: 1) the information asserted to be confidential has a direct link to a competitive advantage; 2) the information is truly maintained in secrecy by the company; and 3) the information was improperly acquired, disclosed, or used by the defendant.

As with most things in business and life, there is an exception. A business owner cannot seek legal action against people or organizations that discover the trade secret on their own without violating contracts or laws protecting the secret. One of the most common ways for this situation to occur is when one company's product is legally obtained (typically through purchase) by a competing organization. The competitor then takes the rival product apart to figure out precisely what is in it and exactly how it works. No matter how dedicated the effort however, successful reverse engineering cannot always be achieved. No one as yet has managed to decipher Coca-Cola's magic.

Small-business owners can go a long way toward protecting their vital trade secrets by establishing a comprehensive trade secrets policy, by communicating that policy effectively to employees and business partners, and by enforcing that policy on a daily basis. Essentially, the best advice is to lead by example and practice what is preached every day.

TRADEMARKS

A trademark is a word, phrase, symbol or design or a combination of these adopted and used by a manufacturer or merchant to identify its goods and distinguish them from those manufactured or sold by its competitors. The symbol used to identify a trademarked product are the letters TM presented in upper case, superscript TM. In recent years, colors (such as John Deere green), sounds (such as the National Broadcasting Company's use of distinctive chimes), and scents have also been registered as trademarks. Service marks, meanwhile, are identical to trademarks except that they identify and distinguish the source of a *service* rather than a product. The term "trademark," however, is commonly utilized to refer to both trademarks and service marks.

Whereas exclusive rights to other items of intellectual property such as copyrights and patents eventually expire, trademark rights can last indefinitely, provided the owner of the mark continues to use it to identify its goods or services. The initial term for a federal trademark registration is 10 years, but the owner has the option to renew for additional 10-year terms. The Patent and Trademark Office (PTO), however, has stipulated that between the 5th and 6th years of the initial registration term, the registrant must file an affidavit confirming the need to keep the registration alive. If no affidavit is filed, the registration is canceled, and other companies can pursue the mark for their own use if they so desire.

OTHER TYPES OF TRADEMARKS

In addition to trademarks and service marks, there are two other kinds of marks that generally fit under the generic "trademark" umbrella: certification marks and collective marks.

Certification Mark. A certification mark is a mark used in connection with products or services in order to certify the region of origin of those products and services, or to certify some other characteristic of those products and services. Other characteristics may be: 1) the origin of the materials used to make a product; 2) the procedures used to assure the quality of the product or service; or 3) the union membership of those involved in the manufacture of a product or service. Examples of certification marks include the UL symbol of Underwriters Laboratories (for quality), "Made in the U.S.A." designations (for place of origin), and the Motion Picture Association of America's movie ratings (for service).

Collective Mark. Collective marks are trademarks or service marks used by members of an association, cooperative, or other group. Organizations as diverse as the National Rifle Association, the Big Ten Athletic Conference, and the Sierra Club all utilize collective marks.

TRADEMARK RIGHTS

Trademark rights to an identifying word, phrase, symbol, design, sound, or color can be secured either by actually using the mark in commerce or by registering the mark

with the Trademark Office, a division of the Patent and Trademark Office (PTO). "Federal registration [with the PTO] is not required to establish rights in a mark, nor is it required to begin use of a mark," noted the PTO in its booklet, *Basic Facts About Registering a Trademark*. "However, federal registration can secure benefits beyond the rights acquired by merely using a mark. For example, the owner of a federal registration is presumed to be the owner of the mark for the goods and services specified in the registration, and to be entitled to use the mark nationwide." In addition, owners of federal registration for a trademark often enjoy an advantage if legal disputes over use of a trademark arise.

The "Right to Register." According to the Patent and Trademark Office, the ultimate right to register a trademark generally belongs to the first party whether it is a small business or a large corporation to use a trademark "in commerce" or file a trademark application with the PTO.("Commerce" in this situation means commerce regulated by the U.S. Congress, i.e., interstate commerce or commerce between the United States and another nation; use of a trademark in purely local commerce within a state does not qualify as "use in commerce.")

The "Right to Use." As the PTO itself admitted in its *Basic Facts About Registering a Trademark*, "the right to use a mark can be more complicated to determine. This is particularly true when two parties have begun use of the same or similar marks without knowledge of one another and neither has a federal registration. Only a court can render a decision about the right to use, such as issuing an injunction or awarding damages for infringement." As indicated above, possession of federal registration can be a valuable weapon if a court fight erupts over use of a disputed trademark.

Small businesses should beware of a "trademark troll," a perjorative term for those who register the name of existing businesses as trademarks and then demand money to either lease or sell the name back to the business. Trademark trolls can also register a long list of words and phrases and then attempt to sell these trademarked terms to businesses that wish to use the phrase. Trademark trolls exist in the United States and target both large and small companies; in fact, one trademark troll attempted to register the name Google. Such trolls also exist internationally: for example, one such troll targeted two juice companies in Scotland Juiceling and Juiced Up after trademarking their brand names, in order to demand money for the existing business to continue using the name. As such, business owners may want to consider trademarking their business name early before they become a target of such unscrupulous individuals.

TRADEMARK SEARCHES

A small-business owner who has come up with a trademark that he or she wishes to use may want to conduct a trademark search before going to the trouble and expense of sending an application to the PTO. Infringing on another's marks can often happen unintentionally, without copying the marks outright or even being in direct competition with their owner. All that is necessary is to use the same mark or a similar mark in a way that may cause consumers some confusion as to the source or sponsorship of the goods or services. A trademark search can uncover whether the mark (or a similar one) has already been registered with the PTO.

APPLICATIONS FOR FEDERAL REGISTRATION

There are two primary ways in which a U.S. applicant can apply to register his or her trademark with the PTO, depending on whether or not the mark has already been used in commerce. An applicant who has already begun using the trademark in commerce may file with the PTO based on that use. This is commonly known as a "Use" application. If an applicant has not yet used the trademark in question in commerce, but has an honest intention to do so, he or she may file an "Intent-to-Use" application with the PTO. A third option, which can only be used by applicants from outside the United States, allows the applicant to file in the United States based on an application or registration made in another country.

Applications for federal registration should include the following:

- PTO Form 1478 This application, also known as "Trademark/Service Mark Application, Principal Register, with Declaration," should be carefully completed and fully signed.
- Drawing of the mark This drawing must be included on a separate piece of paper; the specifications for the drawing and the paper itself are quite extensive, so the applicant should make sure that the drawing adheres to all guidelines. If a separate drawing page is not included, then the application will be returned to the applicant without a filing date.
- Filing fee For current information on the application filing fee for trademarks, applicants should call the Patent and Trademark Office or consult its Web site "Intent-to-Use" applications are more expensive. If the full amount of the fee is not included in the application, then the application will not be considered. Fees are not refundable, even in instances where trademark ownership applications are turned down.

- Specimens These are actual samples of how the mark is actually used or will be used in commerce. For products, examples of acceptable specimens are tags or labels attached to the goods, to the containers in which those goods are packaged, to displays associated with the goods, or to photographs of the goods showing use of the mark on the goods themselves. For services, examples of acceptable specimens include signs, brochures about the services, advertisements for the services, business cards or stationery showing the mark in connection with the services, or photographs which show the mark as it is used either in the rendering or advertising of the services. Each application must include three specimens, but they do not necessarily have to be of three different uses.

PTO Acceptance and Rejection. The federal registration of trademarks is governed by the Trademark Act of 1946 (and amendments thereof), the Trademark Rules, 37 C.F.R. Part 2, and the Trademark Manual of Examining Procedure. When the PTO receives an application for trademark registration, it checks the application in accordance with the above-mentioned guidelines. First, the PTO reviews it to see if it meets the minimum requirements for receiving a filing date. If it meets those requirements, the PTO assigns it a serial number and sends the applicant a notification of receipt. If the minimum requirements are not met, the entire application (including the filing fee) is returned to the applicant.

Applications that pass this first stage are then reviewed by an examining attorney at the PTO, who determines if there are any reasons why the mark cannot be registered. A mark may be turned down for any of the following reasons:

- The mark too closely resembles a mark already registered in the PTO.
- The mark's capacity for causing confusion among relevant consumers with goods or services associated with other parties.
- The mark includes a name, portrait, or signature identifying a particular living individual except by his written consent, or the name, signature, or portrait of a deceased president of the United States during the life of his wife, except in instances where the widow has given her written consent to such use.
- The mark includes the flag or coat of arms or other insignia of the United States or any of its states or municipalities, or of any foreign nation, or any simulation thereof.
- The mark has immoral, deceptive, or scandalous connotations.
- The mark disparages or falsely suggests a connection with persons (living or dead), institutions, beliefs, or national symbols.
- The mark brings such persons, institutions, beliefs, or national symbols into contempt or disrepute.

Objections raised during this stage of the review are sent to the applicant. Remedies that might make the mark acceptable are sometimes suggested in these letters as well. The application will be deemed abandoned if the applicant does not respond within 6 months of the mailing date of that letter. In cases in which the applicant's response does not sway the PTO examiner to give approval for the mark, the applicant can turn to the PTO's Trademark Trial and Appeal Board.

If there are no objections, or if the applicant overcomes all objections, the examining attorney will approve the mark for publication in the *Official Gazette*, a weekly publication of the PTO. At this point, anyone who believes he or she may be damaged by the registration of the mark has 30 days from the date of publication to file an opposition to registration. An opposition is similar to a formal proceeding in the federal courts, but it is held before the Trademark Trial and Appeal Board. If no opposition is filed, the application enters the next stage of the registration process.

If the application is approved and no opposition is filed, applicants may have a little or a lot to do, depending on their situation. For applicants who filed "Use" applications, most of the work is over. The PTO will register the trademark and issue a registration certificate a few months after the date the mark was published in the *Gazette*. Applicants who filed based on their intent to use the trademark down the line, though, need to attend to several matters to make sure that their rights do not slip away. In situations where it has approved an "Intent-to-Use" application, the PTO issues a Notice of Allowance approximately 12 weeks after the mark was published. After receiving the Notice, the applicant has 6 months in which either to use the trademark in commerce and submit documentation of that use or request a 6-month extension. If the documentation of use called the Statement of Use is filed and approved, then the PTO will issue the registration certificate for the trademark.

Even if the PTO grants an applicant a trademark registration, business experts warn that such registration only provides protection to the owner in the United States and its territories. "If the owner of a mark wishes to protect a mark in other countries, the owner must seek protection in each country separately under the relevant laws," warned the PTO in its *Basic Facts About Registering a Trademark*. "The PTO cannot provide information or advice concerning protection in other countries."

Business owners should also be aware of additional restrictions imposed within individual states. For example, Utah aimed to pass a Trademark Protection Act banning advertisers from using trademarked terms in advertisements to Utah users (i.e., from a Coke ad using the trademarked name Pepsi). Search engines argued that Utah law was inconsistent with U.S. trademark law, and Utah amended the act slightly, permitting comparative advertisements.

TRAINING AND DEVELOPMENT

Training and development describes the formal, ongoing efforts that are made within organizations to improve the performance and self-fulfillment of their employees through a variety of educational methods and programs. In the modern workplace, these efforts have taken on a broad range of applications from instruction in highly specific job skills to long-term professional development. In recent years, training and development has emerged as a formal business function, an integral element of strategy, and a recognized profession with distinct theories and methodologies. More and more companies of all sizes have embraced "continual learning" and other aspects of training and development as a means of promoting employee growth and acquiring a highly skilled work force. In fact, the quality of employees and the continual improvement of their skills and productivity through training, are now widely recognized as vital factors in ensuring the long-term success and profitability of small businesses. "Create a corporate culture that supports continual learning," counseled Charlene Marmer Solomon in *Workforce.* "Employees today must have access to continual training of all types just to keep up . . . . If you don't actively stride against the momentum of skills deficiency, you lose ground. If your workers stand still, your firm will lose the competency race."

For the most part, the terms "training" and "development" are used together to describe the overall improvement and education of an organization's employees. However, while closely related, there are important differences between the terms that center around the scope of the application. In general, training programs have very specific and quantifiable goals, like operating a particular piece of machinery, understanding a specific process, or performing certain procedures with great precision. Developmental programs, on the other hand, concentrate on broader skills that are applicable to a wider variety of situations, such as decision making, leadership skills, and goal setting.

TRAINING IN SMALL BUSINESSES

Implementation of formal training and development programs offers several potential advantages to small businesses. For example, training helps companies create pools of qualified replacements for employees who may leave or be promoted to positions of greater responsibility. It also helps ensure that companies will have the human resources needed to support business growth and expansion. Furthermore, training can enable a small business to make use of advanced technology and to adapt to a rapidly changing competitive environment. Finally, training can improve employees' efficiency and motivation, leading to gains in both productivity and job satisfaction. According to the U.S. Small Business Administration (SBA), small businesses stand to receive a variety of benefits from effective training and development of employees, including reduced turnover, a decreased need for supervision, increased efficiency, and improved employee morale. All of these benefits are likely to contribute directly to a small business's fundamental financial health and vitality

Effective training and development begins with the overall strategy and objectives of the small business. The entire training process should be planned in advance with specific company goals in mind. In developing a training strategy, it may be helpful to assess the company's customers

and competitors, strengths and weaknesses, and any relevant industry or societal trends. The next step is to use this information to identify where training is needed by the organization as a whole or by individual employees. It may also be helpful to conduct an internal audit to find general areas that might benefit from training, or to complete a skills inventory to determine the types of skills employees possess and the types they may need in the future. Each different job within the company should be broken down on a task-by-task basis in order to help determine the content of the training program.

The training program should relate not only to the specific needs identified through the company and individual assessments, but also to the overall goals of the company. The objectives of the training should be clearly outlined, specifying what behaviors or skills will be affected and how they relate to the strategic mission of the company. In addition, the objectives should include several intermediate steps or milestones in order to motivate the trainees and allow the company to evaluate their progress. Since training employees is expensive, a small business needs to give careful consideration to the question of which employees to train. This decision should be based on the ability of the employee to learn the material and the likelihood that they will be motivated by the training experience. If the chosen employees fail to benefit from the training program or leave the company soon after receiving training, the small business has wasted its limited training funds.

The design of training programs is the core activity of the training and development function. In recent years, the development of training programs has evolved into a profession that utilizes systematic models, methods, and processes of instructional systems design (ISD). ISD describes the systematic design and development of instructional methods and materials to facilitate the process of training and development and ensure that training programs are necessary, valid, and effective. The instructional design process includes the collection of data on the tasks or skills to be learned or improved, the analysis of these skills and tasks, the development of methods and materials, delivery of the program, and finally the evaluation of the training's effectiveness.

Small businesses tend to use two general types of training methods, on-the-job techniques and off-the-job techniques. On-the-job training describes a variety of methods that are applied while employees are actually performing their jobs. These methods might include orientations, coaching, apprenticeships, internships, job instruction training, and job rotation. The main advantages of on-the-job techniques is that they are highly practical, and employees do not lose working time while they are learning. Off-the-job training, on the other hand, describes a number of training methods that are delivered to employees outside of the regular work environment, though often during working hours. These techniques might include lectures, conferences, case studies, role playing, simulations, film or television presentations, programmed instruction, or special study.

On-the-job training tends to be the responsibility of supervisors, human resources professionals, or more experienced co-workers. Consequently, it is important for small businesses to educate their seasoned employees in training techniques. In contrast, off-the-job tends to be handled by outside instructors or sources, such as consultants, chambers of commerce, technical and vocational schools, or continuing education programs. Although outside sources are usually better informed as to effective training techniques than company supervisors, they may have a limited knowledge of the company's products and competitive situation. Another drawback to off-the-job training programs is their cost. These programs can run into the multi-thousand-dollar per participant level, a cost that may make them prohibitive for many small businesses.

Actual administration of the training program involves choosing an appropriate location, providing necessary equipment, and arranging a convenient time. Such operational details, while seemingly minor components of an overall training effort, can have a significant effect on the success of a program. In addition, the training program should be evaluated at regular intervals while it is going on. Employees' skills should be compared to the predetermined goals or milestones of the training program, and any necessary adjustments should be made immediately. This ongoing evaluation process will help ensure that the training program successfully meets its expectations.

COMMON TRAINING METHODS

While new techniques are under continuous development, several common training methods have proven highly effective. Good continuous learning and development initiatives often feature a combination of several different methods that, blended together, produce one effective training program.

Orientations. Orientation training is vital in ensuring the success of new employees. Whether the training is conducted through an employee handbook, a lecture, or a one-on-one meeting with a supervisor, newcomers should receive information on the company's history and strategic position, the key people in authority at the company, the structure of their department and how it contributes to the mission of the company, and the company's employment policies, rules, and regulations.

Lectures A verbal method of presenting information, lectures are particularly useful in situations when the goal is to impart the same information to a large number of people at one time. Since they eliminate the need for individual training, lectures are among the most cost-effective training methods. But the lecture method does have some drawbacks. Since lectures primarily involve one-way communication, they may not provide the most interesting or effective training. In addition, it may be difficult for the trainer to gauge the level of understanding of the material within a large group.

Case Study. The case method is a nondirected method of study whereby students are provided with practical case reports to analyze. The case report includes a thorough description of a simulated or real-life situation. By analyzing the problems presented in the case report and developing possible solutions, students can be encouraged to think independently, as opposed to relying upon the direction of an instructor. Independent case analysis can be supplemented with open discussion with a group. The main benefit of the case method is its use of real-life situations. The multiplicity of problems and possible solutions provide the student with a practical learning experience rather than a collection of abstract knowledge and theories that may be difficult to apply to practical situations.

Role Playing. In role playing, students assume a role outside of themselves and play out that role within a group. A facilitator creates a scenario that is to be acted out by the participants under the guidance of the facilitator. While the situation might be contrived, the interpersonal relations are genuine. Furthermore, participants receive immediate feedback from the facilitator and the scenario itself, allowing better understanding of their own behavior. This training method is cost effective and is often applied to marketing and management training.

Simulations. Games and simulations are structured competitions and operational models that emulate real-life scenarios. The benefits of games and simulations include the improvement of problem-solving and decision-making skills, a greater understanding of the organizational whole, the ability to study actual problems, and the power to capture the student's interest.

Computer-Based Training. Computer-based training (CBT) involves the use of computers and computer-based instructional materials as the primary medium of instruction. Computer-based training programs are designed to structure and present instructional materials and to facilitate the learning process for the student. A main benefit of CBT is that it allows employees to learn at their own pace, during convenient times. Primary uses of CBT include instruction in computer hardware, software, and operational equipment. The last is of particular importance because CBT can provide the student with a simulated experience of operating a particular piece of equipment or machinery while eliminating the risk of damage to costly equipment by a trainee or even a novice user. At the same time, the actual equipment's operational use is maximized because it need not be utilized as a training tool. The use of computer-based training enables a small business to reduce training costs while improving the effectiveness of the training. Costs are reduced through a reduction in travel, training time, downtime for operational hardware, equipment damage, and instructors. Effectiveness is improved through standardization and individualization.

Web-based training (WBT) is an increasingly popular form of CBT. The greatly expanding number of organizations with Internet access through high-speed connections has made this form of CBT possible. By providing the training material on a Web page that is accessible through any Internet browser, CBT is within reach of any company with access to the Web. The terms "online courses" and "Web-based instruction" are sometimes used interchangeably with WBT.

Some companies are also attempting to combine Web-based training with face-to-face training through the use of avatars. Avatars have long been used in online games to allow users to create a visual representation of themselves within the online world. The *Wall Street Journal* reported that companies are embracing this concept, making use of avatars to add a more human element to online or Web-based training. "We have definitely saved money [and] have had an increase in productivity," noted Robert Koehler, interactive-technology director in Chicago at SBC Communications Inc., which used Pulse Entertainment Inc.'s avatar technology in its training courses.

Self-Instruction. Self-instruction describes a training method in which the students assume primary responsibility for their own learning. Unlike instructor- or facilitator-led instruction, students retain a greater degree of control regarding topics, the sequence of learning, and the pace of learning. Depending on the structure of the instructional materials, students can achieve a higher degree of customized learning. Forms of self-instruction include programmed learning, individualized instruction, personalized systems of instruction, learner-controlled instruction, and correspondence study. Benefits include a strong support system, immediate feedback, and systematization.

Audiovisual Training. Audiovisual training methods include television, films, and videotapes. Like case studies, role playing, and simulations, they can be used to expose employees to "real world" situations in a time- and cost-effective manner. The main drawback of audiovisual training

methods is that they cannot be customized for a particular audience, and they do not allow participants to ask questions or interact during the presentation of material.

Team-Building Exercises. Team building is the active creation and maintenance of effective work groups with similar goals and objectives. Not to be confused with the informal, ad hoc formation and use of teams in the workplace, team building is a formal process of building work teams and formulating their objectives and goals, usually facilitated by a third-party consultant. Team building is commonly initiated to combat poor group dynamics, labor-management relations, quality, or productivity. By recognizing the problems and difficulties associated with the creation and development of work teams, team building provides a structured, guided process whose benefits include a greater ability to manage complex projects and processes, flexibility to respond to changing situations, and greater motivation among team members. Team building may include a broad range of different training methods, from outdoor immersion exercises to brainstorming sessions. The main drawback to formal team building is the cost of using outside experts and taking a group of people away from their work during the training program.

Apprenticeships and Internships. Apprenticeships are a form of on-the-job training in which the trainee works with a more experienced employee for a period of time, learning a group of related skills that will eventually qualify the trainee to perform a new job or function. Apprenticeships are often used in production-oriented positions. Internships are a form of apprenticeship that combines on-the-job training under a more experienced employee with classroom learning.

Job Rotation. Another type of experience-based training is job rotation, in which employees move through a series of jobs in order to gain a broad understanding of the requirements of each. Job rotation may be particularly useful in small businesses, which may feature less role specialization than is typically seen in larger organizations.

APPLICATIONS OF TRAINING PROGRAMS

While the applications of training and development are as various as the functions and skills required by an organization, several common training applications can be distinguished, including technical training, sales training, clerical training, computer training, communications training, organizational development, career development, supervisory development, and management development.

Technical training describes a broad range of training programs varying greatly in application and difficulty. Technical training utilizes common training methods for instruction of technical concepts, factual information, and procedures, as well as technical processes and principles.

Sales training concentrates on the education and training of individuals to communicate with customers in a persuasive manner. Sales training can enhance the employee's knowledge of the organization's products, improve his or her selling skills, instill positive attitudes, and increase the employee's self-confidence. Employees are taught to distinguish the needs and wants of the customer and to persuasively communicate the message that the company's products or services can effectively satisfy them.

Clerical training concentrates on the training of clerical and administrative support staffs, which have taken on an expanded role in recent years. With the increasing reliance on computers and computer applications, clerical training must be careful to distinguish basic skills from the ever-changing computer applications used to support these skills. Clerical training increasingly must instill improved decision-making skills in these employees as they take on expanded roles and responsibilities.

Computer training teaches the effective use of the computer and its software applications. Computer training often must address the basic fear of technology that most employees face and identify and minimize any resistance to change that might emerge. Furthermore, computer training must anticipate and overcome the long and steep learning curves that many employees will experience. To do so, such training is usually offered in longer, uninterrupted modules to allow for greater concentration, and structured training is supplemented by hands-on practice. This area of training is commonly cited as vital to the fortunes of most companies, large and small, operating in today's technologically advanced economy.

Communications training concentrates on the improvement of interpersonal communication skills, including writing, oral presentation, listening, and reading. In order to be successful, any form of communications training should be focused on the basic improvement of skills and not just on stylistic considerations. Furthermore, the training should serve to build on present skills rather than rebuilding from the ground up. Communications training can be taught separately or can be effectively integrated into other types of training, since it is fundamentally related to other disciplines.

Organizational development (OD) refers to the use of knowledge and techniques from the behavioral sciences to analyze an existing organizational structure and implement changes in order to improve organizational effectiveness. OD is useful in such varied areas as the

alignment of employee goals with those of the organization, communications, team functioning, and decision making. In short, it is a development process with an organizational focus to achieve the same goals as other training and development activities aimed at individuals. OD practitioners commonly practice what has been termed "action research" to effect an orderly change which has been carefully planned to minimize the occurrence of unpredicted or unforeseen events. Action research refers to a systematic analysis of an organization to acquire a better understanding of the nature of problems and forces within it.

Career development refers to the formal progression of an employee's position within an organization by providing a long-term development strategy and designing training programs to achieve this strategy as well as individual goals. Career development represents a growing concern for employee welfare and their long-term needs. For the individual, it involves the description of career goals, the assessment of necessary action, and the choice and implementation of necessary steps. For the organization, career development represents the systematic development and improvement of employees. To remain effective, career development programs must allow individuals to articulate their desires. At the same time, the organization strives to meet those stated needs as much as possible by consistently following through on commitments and meeting the employee expectations raised by the program.

Management and supervisory development involves the training of managers and supervisors in basic leadership skills, enabling them to function effectively in their positions. For managers, training initiatives are focused on providing them with the tools to balance the effective management of their employee resources with the strategies and goals of the organization. Managers learn to develop their employees effectively by helping employees learn and change, as well as by identifying and preparing them for future responsibilities. Management development may also include programs for developing decision-making skills, creating and managing successful work teams, allocating resources effectively, budgeting, business planning, and goal setting.

Unfortunately, while many businesses understand the importance of training, obstacles and challenges prevent many small businesses from implementing training programs. Sixty-three percent of small and medium-sized businesses report that conflicting demands and required attendance at work hinder the ability of employees to participate in training. Further, 43 percent of owners of small and medium-sized businesses refer to cost as a serious obstacle for training. Thirty-three percent of respondents reported that employee participation in training was low as a result of employees working off-site. These obstacles must be managed and controlled in order for a company to create and manage effective employee training programs.

TRANSACTION PROCESSING

Transaction process is a term that refers to the adding, changing, deleting, or looking up of a record in a data file or database by entering the data at a terminal or workstation. Most transaction processing systems also include a method of ensuring that all the information entered as a transaction is simultaneously saved. When a large number of transactions are taken and then stored to be dealt with at a later time, the process is known as batch processing. Different examples of transaction processing include automated teller machines, credit card authorizations, online bill payments, self-checkout stations at grocery stores, the trading of stocks over the Internet, and various other forms of electronic commerce.

At the center of most commercial interactions is a transaction, so every business has to deal with its commercial transactions in some form. How a company decides to manage these transactions can be an important factor in its success. As a business grows, the number of transactions it must manage usually grows as well. Careful planning must be done in order to ensure that transaction management does not become too complex. Transaction processing is a tool that can help growing businesses deal with their increasing number of transactions.

TRANSACTION PROCESSING AND THE INTERNET

One place where transaction processing has made a big splash is on the Internet. The advent of online technology has made the international distribution of goods and

information a quick and often simple process. Customers have grown accustomed to placing orders online. The emergence of features like secure servers, one-click shopping, and tracking of packages over the Internet have helped make them feel more at ease with the process.

Transaction processing on the Internet includes several options for those who want to use a credit card or a checking account to pay for goods that do not originate from a typical e-business site, almost as if it is digital cash. One example of this type of service is PayPal (www.paypal. com), the world's first successful instant and secure online payment service. With PayPal, anyone can register to send and receive payments through the Internet. This service has gained most of its popularity on auction sites like eBay but can also be used for simple transactions between any two people in the world that have access to the Internet. Users have found this to be a safe, fast, easy, convenient, and inexpensive way to distribute money in the digital world. PayPal's service is free to most consumers, although there can be small service fees to businesses that decide to use it for a large number of transactions. PayPal only requires that users have either a valid credit card or active checking account.

Google Checkout entered the scene in 2006 as a competitor to PayPal. Google Checkout offered a universal checkout process, promising to streamline the checkout process by allowing customers to use their service at many different online retailers. In addition to the convenience of not having to fill out forms repeatedly, this uniform transaction processing and checkout service also promised increased safety for consumers; since their credit card information and personal data would be stored only on Google's centralized server as opposed to on the servers of multiple different online Web sites, the security risk of their information being improperly accessed declined.

Retailers have also enjoyed the benefits of jumping on the Internet bandwagon to help with the processing of their transactions. A company can set up a Web site through which its customers can purchase merchandise and the order can be taken, fulfilled, and processed by a subcontractor. If a business decides to go this route, it should investigate thoroughly the shipping charges that a particular firm will charge to send its goods. Many times, the shipping charges for products purchased over the Internet become inflated, causing consumers to become annoyed and even angry, feeling as if the shipping charges are a hidden extra fee. Any business must work to avoid losing a customer due to the poor service provided by a subcontractor. Other possible problems that often plague the online world such as computer system outages, slow servers, and security issues should also be considered.

THE TRANSACTION PROCESSING PERFORMANCE COUNCIL

The Transaction Processing Performance Council (TPC) is a nonprofit corporation that defines transaction processing and provides database benchmarks which it shares with the industry. The TPC emerged in the early 1980s just as ATMs, self-service, self-pay gasoline pumps, and other electronic payment devices began to gain in popularity. The industry has grown since then and now the online transaction processing industry registers billions of dollars in yearly sales transactions. The TPC also monitors and measures transaction processing and database performance in terms of how many transactions a system can perform in a given amount of time.

Furthermore, in February 2010 The TPC launched an energy performance specification system that helps users choose more energy efficient data processing servers and system components associated with transaction processing. Many businesses can benefit from the work of the TPC, including retail stores, online businesses, electronic stock brokers, and travel agencies. Their dedication will only ensure that the quality of conducting transactions remains at the highest possible level. More information about TPC is available at its Web site, www.tpc.org.

SMALL BUSINESSES AND TRANSACTION PROCESSING

The growth in the transaction processing industry portends good things for small businesses. A company that distributes and manages coin-operated video games and vending machines, for example, can expand its business by teaming up with a transaction processing firm that will help allow the machines to accept credit cards. A small antique store can increase business by marketing its goods over the Internet and then accepting payments through PayPal or another similar service. As is the case with most sound business decisions, managers should acquire proper education and knowledge about transaction processing before committing to it. It is, after all, just a new way to manage commercial transactions.

TRANSPORTATION

Transportation concerns the movement of products from a source, such as a plant, factory, or workshop, to a destination, such as a warehouse, customer, or retail store. Transportation may take place by air, water, rail, road, pipeline, or cable routes, using planes, boats, trains, trucks, and telecommunications equipment as the means of transportation.

The goal for any business owner is to minimize transportation costs while also meeting demand for products. Transportation costs generally depend upon the distance between the source and the destination, the means of transportation chosen, and the size and quantity of the product to be shipped. In many cases, there are several sources and many destinations for the same product, which adds a significant level of complexity to the problem of minimizing transportation costs. "The United States has the world's most extensive freight transportation network when measured in kilometers of public-use paved roads, railways, waterways, and pipelines, and number of airports," according to a 2010 report by the Research and Innovation Technology Administration Bureau of Transportation Statistics. The United States boasts more than four million kilometers' worth of roads, a railroad network that could circle the earth almost seven times if laid out in a straight line, and enough oil and gas lines to circle the globe fifty-six times.

The decisions a business owner must make regarding transportation of products are closely related to a number of other distribution issues. For example, the accessibility of suitable means of transportation factors into decisions regarding where best to locate a business or facility. The means of transportation chosen will also affect decisions regarding the form of packing used for products and the size or frequency of shipments made. Although transportation costs may be reduced by sending larger shipments less frequently, it is also necessary to consider the costs of holding extra inventory. The interrelationship of these decisions means that successful planning and scheduling can help business owners to save on transportation costs.

BASIC MEANS OF TRANSPORTATION

Transportation is divided into modes based on the type of transportation used waterborne, rail, road-based, air, and pipeline. In turn "single-mode" and "multiple-mode" materials movements are recorded, the latter type sometimes referred to as "intermodal transport." This mixed mode of transport involves two or more modes to make a shipment. An example is oil transport to a port facility by tanker followed by pipeline transport of the crude to a refinery.

Water, rail, and truck transportation modes are each capable of transporting anything moving in commerce *physically*, but these modes have different levels of access to customers, different speeds, and thus carry different types of cargo. Barges very rarely carry packaged-good shipments, and trucks almost never move bulk commodities except over very short distances. Air transport is limited in transporting very bulky and very heavy objects, but air transport is ideal for light packages and for items that must be transported rapidly; pipelines move liquids and gases.

Air Transport. Air transportation offers the advantage of speed and can be used for long-distance transport. However, air is also the most expensive means of transportation; it is often used for smaller items of relatively high value (such as electronic equipment) and items for which the speed of arrival is important (such as perishable goods). Increasingly, air transport is used for just-in-time inventory management to reduce inventory carrying costs. "Worldwide international air cargo reached 28 million tons in 2007, growing at an annual average rate of 5 percent over the past decade," according to the 2010 Bureau of Transportation Statistics report. This growth trend also reflects the increasingly global nature of commerce.

Air transport is centralized at airports; the lack of landing sites, even for helicopters, makes air transport a hub-to-hub method. The U.S. Department of Transportation (DOT) therefore considers ancillary transportation associated with air shipments part of air shipments, such as truck or rail delivery of goods to and from airports to final destinations. Despite what has been said about limitations on weight and size, as these relate to air transportation, an astonishing variety of goods have been flown occasionally under certain circumstances, including very big and heavy equipment.

Railways. The rail transportation network in the United States included 139,326 miles of rail and 565 rail companies as of 2008, according to the Association of American

Railroads. Trains are ideally suited for shipping bulk products and can be adapted to meet specific product needs through the use of specialized cars tankers for liquids, refrigerated cars for perishables, and cars fitted with ramps for automobiles. Roughly two-thirds of all freight moved by rail consists of coal shipments in dedicated trains that run from points of coal mining to electric utilities that burn the coal.

Rail transportation is typically used for long-distance shipping. Less expensive than air transportation, it offers about the same delivery speed as trucks over long distances and exceeds transport speeds via marine waterways. In fact, deregulation and the introduction of freight cars with larger carrying capacities has enabled rail carriers to make inroads in several areas previously dominated by motor carriers. But access to the rail network remains a problem for many businesses.

Motor Carriers. Unless a business is located directly at a sea or river port or is served by a railroad siding, it is going to receive its inputs, and ship its products, using truck transportation over the highway network. Transport systems designed around trucks are the most flexible because a mix of small and large equipment can be readily assembled and deployed and because all points are accessible to trucks. For this reason, by the last quarter of the twentieth century, trucking became the dominant mode of transportation. The chief limitations of transport by motor carrier is that large bulk shipments of commodities are expensive to move because, in effect, each railcar equivalent of load requires its own engine and driver. Commodity movements by truck are therefore very limited.

Water Transport. Water transportation is the least expensive and slowest mode of freight transport. It is generally used to transport heavy products over long distances when speed is not an issue. Although accessibility is a problem with ships because they are necessarily limited to coastal area or major inland waterways piggybacking is possible using either trucks or rail cars. The main advantage of water transportation is that it can move products all over the world. In 2007 "the volume of worldwide international oceanborne cargo reached more than 8 billion tons. During the past decade, the annual average growth rate was about 3 percent," according to the 2010 Bureau of Transportation Statistics report. As markets become increasingly global, water transport will continue to play an important transportation role.

Pipelines. Pipelines are used predominantly to transport natural gas and oil. To move such materials long distances in pipes, booster stations must be built at intervals which receive the gas, recompress it, and push it back into the pipeline or receive the liquid and pump it on its way under higher pressure. Chemicals and slurries (e.g., powdered coal in water) can also be transported in pipelines. The most extensive network consists of natural gas pipelines, comprising around 276,000 miles of transmission lines from which around 920,000 miles of distribution lines carry gas to users. In its overall freight statistics, the DOT includes only petroleum shipments by pipeline.

TRANSPORTATION OF EXPORTS

An important part of the international trade process for exporters of any size is ensuring that the goods that are shipped reach their destinations intact and in a timely fashion. Appropriate packaging and proper documentation are essential in meeting these goals.

INTERNATIONAL FREIGHT TRANSPORTATION OPTIONS

The exporter's options for transporting goods are dictated in large measure by their final destination and how soon the customer needs the exported goods. U.S. exporters preparing goods for shipment to Mexico or Canada, for instance, will often make arrangements to transport their merchandise over land routes via truck or rail, while exports that are headed for destinations unreachable via land routes have to be transported by air or water.

Exporters who are faced with the choice of air or water modes of transport need to be cognizant of the advantages and disadvantages of those two options. While shipping by water is generally less expensive than transporting by air, the difference in cost is narrowed somewhat by ancillary costs associated with sea transport, such as the cost of transporting goods to the dock. Merchandise shipped over water also takes longer to reach its ultimate destination, and since some export transactions do not require the importer to pay until they are in possession of the goods, exporters in

immediate need of cash infusions will need to weigh this factor carefully. Of course, the sheer size and tonnage of some export shipments render air transportation impractical.

Due to the high volume of imports in the United States, the country's port infrastructure is geared more toward imports than exports. Lack of export capacity can present problems to time-sensitive shipments. The *Wall Street Journal* reported in March 2010 that shipping carriers had been idling and scrapping ships to reduce capacity and increase prices. When exports rose as the recession of 2008 and 2009 ended, the decreased capacity meant that goods were taking weeks to months longer to be delivered.

EXPORT PACKAGING

Consultants to companies that engage in exporting note that the merchandise they ship will generally be subject to more handling and potentially damaging forces during transport than will goods headed for domestic destinations. Intelligent packaging, then, is a key component of the exporting process. Ideally, exporters should use a packaging approach that minimizes the cost of transportation while simultaneously ensuring that the goods reach their destination intact. Many small exporting companies that do not have the financial or operating resources to take care of packaging themselves utilize firms that specialize in providing such services.

Exporting firms need to keep abreast of labeling and marking requirements on goods intended for international destinations as well. Pharmaceutical products, for instance, require special labeling that varies from country to country. In addition, many countries enforce regulations requiring that imported goods bear the name of the country of origin on the outside of their packaging. Packaging containing merchandise intended for foreign ports also typically includes markings indicating the height and weight of the packages, as well as any additional handling instructions.

NECESSARY EXPORT DOCUMENTS

The documentation required for international trade is quite extensive (and potentially confusing), but exporters need to make certain that they have their papers in proper order if they wish to avoid potentially damaging delays in shipment. Documents required for the export of goods include the following:

Export License. While most merchandise can be shipped to overseas customers without benefit of an actual license, some goods are subject to additional regulations and require an Individually Validated Export License (IVL). "Should your particular export be subject to export controls," explained the Small Business Administration, "then a 'validated' license must be obtained. In general, your export would require a 'validated' license if export of the goods would: threaten United States national security; affect certain foreign policies of the United States; or create short supply in domestic markets."

Shipper's Export Declaration (SED). This important document is required for mail shipments of $500 or more, all shipments of more than $2,500 value, and any shipment that is covered by an IVL. SEDs are utilized by the U.S. Bureau of the Census to track export trends in the United States.

Commercial Invoice. The commercial invoice is used by both exporters and importers. Exporters use the document as proof of ownership and an aid in securing payment for goods delivered, while importers use it to confirm that the merchandise they have received matches what they ordered. Commercial invoices are also used by Customs officers to figure the correct duty on the goods being imported, so U.S. exporters generally provide translated copies of the invoice when shipping goods to destinations for which English is not the primary language spoken.

Consular Invoice. This kind of invoice serves the same general purpose as the commercial invoice, but it must be worded in the language of the nation for which the goods are intended. Consular invoices are so named because they can be obtained from the destination country's consulate.

Bill of Lading. This document serves as evidence of ownership of the goods being exported, and also specifies the responsibilities of the transporting company. Two types of ocean bills of lading can be used. The first, known as the straight bill of lading, provides for delivery of merchandise *only* to the person named in the bill of lading. Under the second bill of lading option, called the shipper's order, goods can be delivered not only to the person named in the bill but also to other designated people. Under the latter option, financing institutions are empowered to take possession of the goods being exported if the buyer defaults; they retain title on the merchandise until all payments and conditions of sale have been fulfilled. For exports that are transported by air, documents known as air waybills serve the same general purpose.

Certificate of Origin. Some countries require shipments of goods from foreign ports to include certificates that indicate where the merchandise originated. In instances wherein the importing country has trade agreements in place with the country that is doing the exporting, lower tariffs on those goods can sometimes be imposed.

Export Packing List. This highly involved document provides a detailed description of the contents being shipped. It covers the material in each individual package, providing information such as individual net, legal, tare, and gross weights and measurements for each package. These data are typically presented in both metric and U.S. measurement figures. Export packing lists are used

by the shipper (or the freight forwarder) to confirm the shipment's contents and figure the total weight and volume of the shipment.

Inspection Certificate. This documentation is bestowed by independent inspection firms, whose services are required when foreign purchasers ask for independent corroboration that the goods meet agreed-upon specifications. This is usually done for goods that would be prohibitively expensive to return to the manufacturer, such as equipment and machinery.

Insurance Certificate. Some international transactions require the exporting firm to provide insurance on the shipment. The insurance certificate describes the type and amount of merchandise contained in the shipment and confirms that the shipment has been insured.

Inland Bill of Lading. These documents known as "waybills on rail" in the railroad industry and "pro forma bills" within the trucking industry provide information on the inland transportation of goods and the port that will eventually send the exporter's goods on their way.

Dock Receipt. This paper is the international carrier's acknowledgment that goods have been received. It serves to transfer responsibility for those goods from the domestic to the international carrier.

Shipper's Instructions. This document serves to provide transporters of exports with any other information necessary to ensure the effective movement of goods to their final destination.

THE FREIGHT FORWARDER

International freight forwarders are important players in the exporting process for U.S. firms. Knowledgeable about all aspects of international trade including international and U.S. regulations, import and export rules, and shipping options freight forwarders serve as agents for exporting businesses, overseeing the transportation of their cargo to overseas destinations.

As the Small Business Administration (SBA) noted in its *Breaking into the Trade Game*, many freight forwarders provide services at the very beginning of the exporting process by advising exporting firms about freight costs, port charges, insurance costs, consular fees, handling fees, and other expenses. They can also advise small exporters about packaging options and in some cases can make arrangements to have goods containerized or packed at the port. Freight forwarders have the power to reserve space on freighters and other ocean vessels in accordance with client specifications.

In order to represent their exporting clients as effectively as possible, freight forwarders may review the wide array of documentation necessary for international business transactions, including letters of credit, commercial invoices, and packing lists. Exporters can also ask freight forwarders to prepare necessary documentation for the exporting process, including bills of lading. Once this documentation has been taken care of, they can be forwarded as needed. Finally, the exporter can also ask the freight forwarder to make arrangements with the customs broker to ensure that their merchandise is in compliance with customs export documentation regulations. Given the wide array of services that they provide, and the importance of those services to the exporting process, trade experts view freight forwarders as an extremely valuable resource for small exporting firms. "The cost for their services," contended the SBA, "is a legitimate export cost that should be figured into the price charged to the customer."

TUITION ASSISTANCE PROGRAMS

Tuition assistance programs are a type of employee benefit in which an employer reimburses employees for the costs associated with continuing education. Assistance usually comes in the form of reimbursements for tuition, fees, and books. Many progressive companies pay for an unlimited number of courses that may or may not be directly related to an employee's current job. While a 2005 survey conducted by the Society for Human Resource Management and reported on in an *HR Magazine* article found that 60 percent of corporations offer

some form of tuition assistance, this benefit is one of the first to be cut when a company is struggling financially. "A Graduate Management Admission Council survey shows that only 29 percent of U.S. employers offered tuition reimbursement or scholarships to recent M.B.A. graduates in 2009 that's down from 37 percent in 2008" reported Amy Bell for the *San Francisco Chronicle*.

Companies offering tuition assistance reason that today's rapidly changing work environment requires employees to possess a wide variety of skills, and that education provides a way for them to improve their skills and adapt to the new realities of the business world. Other companies adopt tuition assistance programs on a smaller scale, providing partial reimbursement of certain costs associated with job-related courses.

Although tuition assistance programs can be costly for businesses, there are a number of proven strategies that can be applied to help keep costs down. In addition, tuition assistance programs offer companies a number of important benefits. For example, companies that provide their employees with tuition assistance are building a more educated work force by encouraging workers to pursue higher education. Tuition assistance programs can also provide companies with an effective recruiting tool, enabling them to attract highly motivated people. Finally, tuition assistance can lead to reduced employee turnover and increased loyalty to the company.

COMMON CONCERNS ABOUT TUITION ASSISTANCE

Many companies resist instituting tuition assistance programs because of the cost involved. In fact, poorly planned tuition assistance programs do waste money. But as Heather Kirkwood observed in *Kansas City Business Journal*, "experts say a well-designed tuition reimbursement program can turn what seems like a cash-sucking recruiting tool into a revenue-increasing program that creates loyal employees."

There are a number of different strategies that businesses can take to limit the expense of tuition assistance programs. The first step is to determine the specific educational goals of employees in order to help them select their courses. Outside educational advisory services can help employees understand their goals and thus decrease the chance that they will begin one course of study only to quit and start another. Similarly, specialists within the company can be made available to advise employees about their educational options, rather than simply explaining the features of the tuition assistance program to them. These individuals can help guide employees in educational directions that will benefit both themselves and the company for which they work.

Experts also recommend that employers reimburse fees as well as tuition in order to reduce costs. State-supported universities tend to charge lower tuition rates but higher additional fees than private colleges, which might cause some employees to choose to attend the more expensive private colleges in order to save on out-of-pocket expenses. Another way companies can save money in their tuition assistance programs is to investigate negotiating discounts with the schools. Larger companies or even smaller ones with specific educational needs may be able to save money by providing a certain number of students for a course. If, for example, a dozen employees from one company need to take a basic class, that company may be able to arrange a reduced rate or even a special class just for employees. Employers may also find it beneficial to arrange to pay certain local colleges and universities directly in order to reduce paperwork and other hassles for their employees.

Another way for companies to save money, as well as make the idea of continuing education more attractive to employees, is to provide access to nontraditional education options, such as "distance learning," over the Internet. Thousands of accredited courses are available through this alternative means, which allow busy employees with family responsibilities to fulfill course requirements on their own time without having to sit in a formal classroom. However, it is important to make sure that such programs are regionally accredited so any credits earned will transfer to traditional schools if necessary.

Employers can also save money on tuition assistance programs by helping employees receive college credit for skills and knowledge they may already possess. For example, about 600 colleges offer students the opportunity to demonstrate their knowledge of various subjects through a life-experience portfolio. When employees have mastered the content of a course through work experience, they may be able to obtain college credit without actually having to spend time or money on a class. This option might, for instance, enable a person employed as a bookkeeper to pass out of an intermediate accounting course.

Assessment tests, offered by college testing services, provide a similar, relatively inexpensive, option. Such testing enables some employees to reduce the amount of formal education they need to obtain a degree, which also reduces the time and cost involved in their education. In addition, gaining credit for skills and knowledge can enhance employees' self-esteem and bring them recognition for their skills at work.

Will Employees Apply Themselves?. Some firms worry that offering a liberal tuition reimbursement policy will not be fully taken advantage of if participants do not invest the effort required to earn passing grades. These firms will often include guidelines and restrictions in

their tuition reimbursement policies that attempt to guard against this possibility. For instance, companies can tie reimbursement to grades a certain percentage for an A, a B, a C, and so on. Employers can also avoid this potential problem by requiring students who fail a course to either repeat it or pay back the company for related tuition and fees.

Employees May Take the Education and Then Leave the Company. Many businesses providing tuition assistance to employees fear that the worker will depart for greener pastures after taking advantage of the program. In order to reduce the likelihood of losing newly educated employees, some companies require participants in their tuition assistance programs to remain at the company for a certain length of time or else reimburse the company for part of the tuition paid on their behalf. Many businesses also limit enrollment in such programs to individuals who have already been with the company for a certain amount of time (typically 6 months to 1 year). Other companies take the more positive step of rewarding employees who earn their degrees with a gift of company stock. The stock can be set up to mature over a few years, thus giving the employee added incentive to remain at the company.

Complex Tax Implications. Finally, some companies are reluctant to establish tuition assistance programs for their employees because of the paperwork related to tax compliance. Some forms of tuition assistance to workers are tax-deductible especially if the coursework is necessary to maintain professional licenses or otherwise ensure that the employee in question can adequately fulfill his or her workplace obligations and responsibilities. If a company reimburses employees for their tuition expenses rather than paying the educational institution directly, that amount is considered taxable income over the first $5,250 of tuition assistance. This increase in taxes and reduction in take-home pay can come as a shock to employees, and companies should educate employees about the tax consequences of tuition assistance. Businesses interested in establishing tuition assistance programs for their employees should first consult with an accounting or tax professional to discuss these and other potential factors.

U

UNDERCAPITALIZATION

Undercapitalization is a situation in which a business has insufficient funding, or capital, to support its operations. Although undercapitalization can affect any business, it is particularly common and problematic for small businesses. In fact, undercapitalization is one of the warning signs of major financial trouble for small businesses, as well as a significant cause of small business failure. Undercapitalization also acts to limit the growth of many small businesses, because without sufficient capital they cannot afford to make the investments necessary for expansion. In this way, undercapitalization can pose a problem even for profitable small businesses. "What separates the successful entrepreneur from the unsuccessful? In many cases, it seems to be whether the prospective business owner has access to sufficient funds," Brian Hamilton wrote in the Small Business Administration (SBA) publication *Financing for the Small Business.* Without sufficient capitalization, companies are unprepared to ride out slow periods in the business cycle, or to fend off a new competitor, or to work through any number of shocks that buffet all businesses from time to time.

There are a number of factors that determine how much capitalization any small business needs. Businesses that offer a service usually require fewer funds than those that manufacture a product. Similarly, businesses in which the owners perform most of the work tend to need less upfront capital than businesses with employees. A company's initial capitalization also depends on the entrepreneur's ability to invest personal funds and institute a sound business plan.

In order to avoid future problems with undercapitalization, entrepreneurs need to perform a realistic assessment of their expenses and financial needs. Some of the major expenses facing a new business include facility rental; salaries and wages; equipment and tools; supplies; utilities; insurance; advertising; and business licenses. The SBA advises entrepreneurs to assess start-up costs accurately: "A realistic startup budget should only include those things that are necessary to start that business. These essential expenses can then be divided into two separate categories: fixed and variable. Fixed expenses include rent, utilities, administrative costs, and insurance costs. Variable expenses include inventory, shipping and packaging costs, sale commissions, and other costs associated with the direct sale of a product or service." Based upon this information, the entrepreneur should prepare a cash flow projection on a monthly basis for the first year. The difference between the funds the entrepreneur is able to contribute, the amount of income the business is expected to generate, and expenses the business is projected to incur provides a rough estimate of the business's financial needs. Ideally, an entrepreneur will secure the necessary equity from various sources to make up the difference and provide the business with sufficient capitalization.

CASH MANAGEMENT AND PLANNING

Managing cash flows is an important aspect of staying ahead of the capital needs that a growing company may have. The goal of cash management is to manage the cash balances of an enterprise in such a way as to maximize the availability of cash not invested in fixed assets or inventories and to do so in such a way as to avoid the risk of

insolvency. Factors monitored as a part of cash management include a company's level of liquidity, its management of cash balances, and its short-term investment strategies.

Cash is the lifeblood of a business. Managing it efficiently is essential for success. In some ways, managing cash flow is the most important job of business managers. If at any time a company fails to pay an obligation when it is due because of the lack of cash, the company is insolvent. Insolvency is the primary reason firms go bankrupt. Obviously, the prospect of such a dire consequence should compel companies to manage their cash with care. Moreover, efficient cash management means more than just preventing bankruptcy. It improves the profitability and reduces the risk to which the firm is exposed.

Cash management is particularly important for new and growing businesses. Cash flow can be a problem even when a small business has numerous clients, offers a product superior to that offered by its competitors, and enjoys a sterling reputation in its industry. Companies suffering from cash flow problems have no margin of safety in case of unanticipated expenses. They also may experience trouble in finding the funds for innovation or expansion. It is, somewhat ironically, easier to borrow money when you have money. For this reason, planning ahead is essential. Knowing when new funds will be necessary and securing those funds ahead of the need is far easier than approaching a bank once there is a funding crunch in the business.

Companies should always keep track of revenue and expenses to avoid running out of cash when bills are due. One of the easiest ways to produce cash is to speed up customer payments sending invoices as soon as they become payable; collecting from customers who have not paid within 30 days; and offering discounts for early payment. Inventory management is another key to healthy cash flow. The length of time before inventory turns into cash should be carefully considered before additional inventory is purchased otherwise, the business owner may run out of cash before enough inventory is sold.

UNDERCAPITALIZATION AND CORPORATE LIABILITY

A little-known problem associated with undercapitalization is that it can increase the likelihood of the owners of a corporation being held personally liable for business-related matters. One of the main reasons that entrepreneurs choose the corporate form of business organization is to protect themselves against personal liability for business debts and court judgments. Incorporation does not afford automatic protection, however. Corporate owners can be held personally liable in a number of situations, including cases where personal and corporate assets are commingled, the corporation does not keep adequate records, or corporate owners intentionally defraud their creditors.

But perhaps the most critical factor in determining whether there should be personal liability for corporate debts is whether the owners provided sufficient capitalization for the business. The ultimate test is whether there are enough corporate assets to satisfy corporate obligations. For example, an entrepreneur could not contribute only $500 to start a new business, knowing that it actually required an initial capital outlay of $10,000, and expect his or her personal assets to be protected in case the business became insolvent. In this instance, a court would be likely to rule that the extreme undercapitalization of the corporation made the owner personally liable for its debts.

UNDERWRITERS LABORATORIES (UL)

Underwriters Laboratories (UL) is the largest and best-known independent, not-for-profit testing laboratory in the world. Based in Northwood, Illinois, UL conducts safety and quality tests on a broad range of products, from fire doors to closed-circuit cameras. The laboratory provides a full spectrum of conformity and quality assessment services to manufacturers and other organizations. It also assists jurisdictional and provincial authorities, offers educational materials to consumers, and works to strengthen safety systems around the world.

UL provides comprehensive diagnostic testing services for more than 19,000 products in the following areas: fire testing; medical device testing; EPH services (food service equipment, drinking water certification, plumbing equipment); audio/video; home electronics; Source Verification and Inspection Services (SVIS); electric vehicle components and systems; EMC testing and certification; information technology equipment (ITE) industry services; and telecom industry services. It conducts tests on products in these areas to see whether they meet standards set by UL engineers in conjunction with input from manufacturers and product users, but it will also test products to see whether they meet standards set by outside entities, such as a city (in the case of building codes, for instance). In 2010 UL conducted product evaluations in sixty-eight laboratory, testing, and certification facilities that it operated around the world. As of 2010, UL Marks appeared on 66,000 products.

In addition to its work in the U.S. market, Underwriters Laboratories maintains services for companies looking to test products for international markets. According to its Web site, UL serves companies in 102 countries. This division of UL studies international product certification standards, assists clients with the application process, helps with correspondence and translation, and can coordinate the exchange and review of test data. In order to increase its efficiency in these international realms, Underwriters Laboratories has also launched a sustained effort to establish common standards for safety requirements, testing protocols, and certifications around the world. The impetus for this effort, according to UL, is a recognition that companies seeking to establish a presence in multiple overseas markets sometimes need as many as twenty separate safety certifications for a single product, a requirement that "can cost as much as $8,000 per safety mark per product. Many companies have annual certification budgets of $5 million or more."

UL is continuously adding new testing facilities and studying safety standards for new products. In April 2010 the company announced that it was the Nationally Recognized Testing Laboratory for the EV Project, a study of electric vehicle charging station infrastructure. UL also added a solar panel testing facility and even analyzes the effectiveness of companies' corporate social responsibility programs. In response to competitive pressures, UL announced in 2007 that it would create a for-profit subsidiary for testing and certification. The existing non-profit company would continue to develop safety standards and perform other work for the public good.

UL Designations "Underwriters Laboratories, which has been in existence for more than 100 years, is very sensitive to the prevalent but mistaken belief that it approves products," wrote Robert C. Cook in *Security Management.* "The only entity that can actually approve or reject a product is a federal, state, or local government agency known generally as the 'Authority Having Jurisdiction' or AHJ." However, an AHJ whether it is a local health code inspection department or the federal Occupational Safety and Health Administration often requires products to be tested by Underwriters Laboratories or another lab before the agency will approve its use.

UL hands out one of three different designations to products that pass its tests: UL listed, UL recognized, or UL certified. Businesses should note that there is no such designation as "UL approved"; companies that mistakenly tout their products with such a designation will arouse the ire of Underwriters Laboratories, which will insist that the company clarify the matter immediately.

UL Listed. This designation means that the tested product meets the laboratory's standards and can be used by itself.

UL Recognized. This designation is granted to equipment components that are used in combination with other pieces of equipment to create a finished product.

UL Certified. This designation is used by UL when it has been successfully tested to the standards of an outside authority, such as a city's building code requirements.

Businesses considering enlisting the services of Underwriters Laboratories (or similar labs) should be aware that testing can be both expensive and time-consuming. Bills of several thousand dollars per product tested are not unusual in many industry sectors, and the testing procedures usually take about 6 months to complete, with some tests extending well beyond that time frame. However, the importance of UL acknowledgment is very significant to marketplace image in many industries.

UNIFORM COMMERCIAL CODE (UCC)

The Uniform Commercial Code (UCC) is a collection of modernized, codified, and standardized laws that apply to all commercial transactions with the exception of real property. Developed under the direction of the National Conference of Commissioners on Uniform State Laws, the American Law Institute, and the American Bar Association (ABA), it first became U.S. law in 1952. Since that time, it has undergone a process of constant revision.

The Uniform Commercial Code arose out of the need to address two growing problems in U.S. business: 1) the increasingly cumbersome legal and contractual requirements of doing business; and 2) differences in state laws that made it difficult for companies located in different states to do business with one another. Businesspeople and legislators recognized that some measures needed to be taken to ease interstate business transactions and curb the trend toward exhaustively detailed contracts. They subsequently voiced support for the implementation of a set of standardized laws that would serve as the legal cornerstone for all exchanges of goods and services. These laws the Uniform Commercial Code could then be referred to when discrepancies in state laws arose. They freed companies from painstakingly including every conceivable business detail in all of their contractual agreements.

DEVELOPMENT OF THE UNIFORM COMMERCIAL CODE

Work on the UCC began in earnest in 1945. Seven years later, a draft of the code was approved by the National Conference of Commissioners on Uniform State Laws, the American Law Institute, and the American Bar Association. Pennsylvania became the first state to enact the UCC, and it became law there on July 1, 1954. The UCC editorial board issued a new code in 1957 in response to comments from various states and a special report by the Law Revision Commission of New York State. By 1966 forty-eight states had enacted the code. Currently, all fifty states, the District of Columbia, and the U.S. Virgin Islands have adopted the UCC as state law, although some have not adopted every single provision contained within the code.

BUSINESS ISSUES ADDRESSED IN THE UCC

Many important aspects of business are covered within the UCC, and several of them are of particular import to entrepreneurs and small-business owners. The code provides detailed information on such diverse business aspects as breach of contract (and the options of both buyers and sellers when confronted with a breach); circumstances under which buyers can reject goods; risk allocation during transportation of goods; letters of credit and their importance; legal methods of payment for goods and services; and myriad other subjects.

Articles. The UCC consists of ten articles. Article 1, titled General Provisions, details principles of interpretation and general definitions that apply throughout the UCC. Article 2 covers such areas as sales contracts, performance, creditors, good faith purchasers, and legal remedies for breach of contract. Given its concern with the always important issue of contracts, small-business owners should be thoroughly acquainted with this section. Article 3, which replaced the Uniform Negotiable Instruments Law, covers transfer and negotiation, rights of a holder, and liability of parties, among other areas. Article 4 covers such areas as collections, deposits, and customer relations; it incorporated much of the Bank Collection Code developed by the American Bankers Association.

Article 5 of the Uniform Commercial Code is devoted to letters of credit, while Article 6 covers bulk transfers. Article 7 covers warehouse receipts, bills of lading, and other documents of title. Article 8, meanwhile, is concerned with the issuance, purchase, and registration of investment securities; it replaced the Uniform Stock Transfer Act. Article 9 is another provision that is particularly important to small-business owners. Devoted to secured transactions, sales of accounts, and chattel paper, it supplanted a number of earlier laws, including the Uniform Trust Receipts Act, the Uniform Conditional Sales Act, and the Uniform Chattel Mortgage Act.

Finally, Article 10 provides for states to set the effective date of enactment of the code and lists specific state laws that should be repealed once the UCC has been enacted (Uniform Negotiable Instruments Act, Uniform

Warehouse Receipts Act, Uniform Sales Act, Uniform Bills of Lading Act, Uniform Stock Transfer Act, Uniform Conditional Sales Act, and Uniform Trust Receipts Act). In addition, Article 10 recommends that states repeal any acts regulating bank collections, bulk sales, chattel mortgages, conditional sales, factor's lien acts, farm storage of grain and similar acts, and assignment of accounts receivable, for all of these areas are covered in the UCC. Individual states may also add to the list of repealed acts at their own discretion.

The UCC has a permanent editorial board, and amendments to the UCC are added to cover new developments in commerce, such as electronic funds transfers and the leasing of personal property. Individual states then have the option of adopting the amendments and revisions to the UCC as state law. For current information on changes within and interpretations of the Uniform Commercial Code, business owners may consult the Uniform Law Commission at www.nccusl.org under "Final Acts & Legislation." Also of use is a Web site made available by Cornell Law School which offers the entire text of the UCC in an easily searchable format, located at www.law.cornell.edu/uniform/ucc.html.

U.S. CHAMBER OF COMMERCE

The U.S. Chamber of Commerce is a national not-for-profit business federation devoted to promoting business interests in the United States and around the globe. Founded as a national federation in 1912 and headquartered in Washington, D.C., the U.S. Chamber of Commerce has long championed the cause of large and small businesses alike. Primary areas of activity by the Chamber include efforts to ease perceived overregulation of business activities; cut taxes on businesses; strengthen trade relations with other nations; improve labor relations; increase productivity and innovation in all industry areas; develop new markets; study major business policy issues; improve socioeconomic conditions in communities; and reduce business-related litigation.

In 2010, the membership of the U.S. Chamber of Commerce included 830 business associations; approximately 250 accredited local and state chambers of commerce; 113 American chambers of commerce based in 100 foreign countries; and more than 300,000 member businesses. The Chamber counts most of the largest corporations in the United States, but according to Chamber of Commerce data, more than 96 percent of the federation's members are small businesses with 100 or fewer employees.

In addition to its intensive lobbying activities on behalf of its membership, the U.S. Chamber of Commerce boasts several affiliated organizations engaged in policy areas of interest to small and large businesses alike. The National Chamber Foundation (NCF), for instance, is a public and business policy research institution dedicated to exploring issues and solving problems found in the modern business world. The Chamber also supports two organizations devoted to legal issues. Its National Chamber Litigation center (NCLC) represents businesses in legal proceedings, while the Institute for Legal Reform (ILR) is dedicated to tort reform and other probusiness changes to the U.S. legal system.

Other foundations associated with and supported by the Chamber include the Center for International Private Enterprise (CIPE), which promotes business development in developing countries, and the Institute for a Competitive Workforce, which endeavors to boost workforce education and training initiatives in all industries. The Business Civic Leadership Center (BCLC) addresses corporate citizenship issues and promotes the positive effect business can have on society. TradeRoots advocates for increased free trade legislation and helps businesses expand globally, while the Global Intellectual Property Center educates interested parties about the importance of intellectual property protection.

The national offices of the U.S. Chamber of Commerce are located at 1615 H. Street NW, Washington, DC 20062-2000, (800) 638-6582. The Chamber also maintains a Web site at www.uschamber.com.

U.S. DEPARTMENT OF COMMERCE

The Department of Commerce, which was established in 1903, is one of the main government agencies intended to assist businesses large and small and represent their interests domestically and abroad. The agency states that its broad range of responsibilities include expanding U.S. exports, developing and promoting innovative technologies, gathering and disseminating statistical data and other important economic information, measuring economic growth, granting patents, promoting minority entrepreneurship, and providing stewardship. The department promotes these goals by encouraging job creation and economic growth through exports, free and fair trade, technology and innovation, entrepreneurship, deregulation, and sustainable development. As of 2010, the department had a budget of $6.5 billion and employed 38,000 people.

One of the key offices within the Department of Commerce is the Office of Business Liaison. That office serves as the intermediary between the business community and the agency. Its objectives include:

- To be proactive in its dealings with the business community and to be responsive and effective in its outreach efforts.
- To keep the current administration aware of problems and issues facing the business community.
- To keep the business community abreast of key administration decisions and policies.
- To meet regularly with members of the business community.
- To help businesses navigate their way through all the federal agencies and regulations through its Business Assistance Program. In addition to producing a wide variety of published materials, the Assistance Program also provides specialists who are available to answer specific questions on government policies, programs, and services.

Another office that is of interest to small-business owners is the Office of Small and Disadvantaged Utilization. This office is responsible for ensuring that the department purchases goods and services from small businesses. It helps small businesses identify contract and subcontract opportunities, clarifies who the key individuals at that bureau are, and provides small businesses with basic information on the procurement process. The Office of Small and Disadvantaged Utilization also helps businesses develop marketing strategies.

Following is a list of other key offices, departments, and programs at the Department of Commerce that are also of interest to small-business owners:

- Bureau of the Census every 10 years it performs a full census of the U.S. population, collecting a wide variety of information, as well as sorting and analyzing it. The bureau makes this information publicly available, and business owners often use the information for demographic or marketing purposes. Also of interest to small businesses is the bureau's economic census performed every 5 years, and the many different economic surveys gathered annually, quarterly, and monthly for various sectors of the economy.
- Bureau of Economic Analysis promotes a better understanding of the U.S. economy by providing the most timely, relevant, and accurate economic accounts data in an objective and cost-effective manner.
- Economic Development Administration responsible for creating new jobs, retaining existing jobs, and stimulating industrial and commercial growth in economically challenged areas of the United States.
- International Trade Administration helps U.S. businesses compete in the global market by assisting exporters, helping businesses gain equal access to foreign markets, enforcing U.S. trade laws and agreements, and making it easier to compete against unfairly traded imports. Includes separate units for trade development and import administration. At the end of the first decade of the twenty-first century it partnered with the Ewing Marion Kauffman Foundation to create a public-private partnership focused on best practices in entrepreneurship to advance economic growth in the United States and globally. More information can be found at www.entrepreneurship.gov.
- Trade Compliance Center part of the International Trade Administration, the center monitors foreign compliance with trade agreements and provides businesses with information about their rights and

obligations under existing trade agreements with other nations.

- Minority Business Development Agency devoted to fostering the creation, growth, and expansion of minority businesses in the United States.
- Office of Consumer Affairs exists to bridge the gap between businesses and consumers, to help businesses improve the quality of the services they offer consumers, to educate consumers, and to speak for the consumer in regards to each administration's economic policy development. The office also works with U.S. businesses to help them become more competitive in the global marketplace.
- Patent and Trademark Office protects innovation in the marketplace by providing inventors and authors with exclusive rights to their creations. This is where a small business should file patents and trademarks, search for existing patents and trademarks, and learn about domestic and international intellectual property (IP) laws.
- National Institute of Standards and Technology promotes economic growth by working with businesses to develop and apply technology, measurements, and standards. The institute maintains a Web site, www.manufacturing.gov, which provides information on the competitiveness of U.S. manufacturers and service industries.
- STAT-USA provides the public with access, including electronic access, to export, import, and international economic information.

Extensive information on the department and its various bureaus and programs is available on the Web site that it maintains, located at www.commerce.gov.

U.S. SMALL BUSINESS ADMINISTRATION GUARANTEED LOANS

The U.S. Small Business Administration (SBA) is a major source of financing for small businesses in the United States. This Federal agency was created by Congress in 1953 to provide small business with similar access to bank loans that larger, more established businesses enjoyed. The SBA acts as either a direct lender or a loan guarantor, depending on the loan program, and provides management and technical assistance as well as contracting opportunities to small businesses. The SBA's various loan programs have provided needed funding for thousands of small enterprises that were unable to secure loans from lending institutions on their own; indeed, businesses cannot solicit loans from the SBA unless they are unable to get funding independently.

Some of today's most successful businesses, including Intel, Apple, and FedEx, were each given a much-needed boost in their early days by SBA loans. This record of success, coupled with the trend toward small-business start-ups and entrepreneurship in the United States, has encouraged both the SBA and its lending partners to continue to expand its loan programs. The SBA has subsequently set new records in various loan guarantee categories since the mid-1990s. As of September 2009, the SBA had guaranteed $62.2 billion worth of loans.

TYPES OF SBA GUARANTEED LOANS

The SBA's 7(a) Loan Program is the most popular of the agency's programs. During the fiscal year 2009, when businesses were reeling from the effects of a recession, the SBA approved more than 41,000 of these loans totaling over $9 billion. That was down from a loan volume of $14.5 billion in 2006. Under this program, the SBA does not actually make direct loans to small businesses. Instead, it assures the institution that is making the business loan usually a bank that it will make payment on the loan if the business defaults on it. Since the SBA is taking responsibility for the loan, it is usually the final arbiter of whether a loan application will be approved or not.

The 7(a) Loan Program was formed to meet the long-term financing needs of small businesses. The primary advantage of 7(a) loans is that business enterprises are able to repay the loan over a very long period of time. Ten-year maturities are available for loans for equipment and working capital (though 7-year terms are more commonplace), and loans for real estate and major equipment purchases can be paid back over as long as 25 years. The SBA can guarantee 85 percent of loans up to $150,000, and 75 percent of loans of over $150,000. The interest rate of 7(a) loans ranges from 2.25 percent to 4.75

percent over the prime lending rate, depending on the loan amount and time to maturity.

The SBA maintains several individual loan programs under the 7(a) umbrella. These include CAPLines, LowDoc, SBAExpress, EWCP, DELTA, and an assortment of other lending initiatives targeted at specific sectors of the small-business world.

CAPLines. CAPLines loans are given to small businesses with short-term working capital needs. "Under CAPLines," notes the SBA, "there are five distinct short-term working capital loans: the Seasonal, Contract, Builder's, Standard Asset-Based, and Small Asset-Based lines." For the most part, the SBA regulations governing the 7(a) Program also govern this program, including maximum loan amounts and interest rates. The exception is the Small Asset-Based Lines, which have a maximum loan amount of $200,000.

LowDoc. The Low Documentation Loan (LowDoc) Program is a simplified version of the 7(a) loan for businesses with strong credit histories seeking less than $150,000. It combines a streamlined application process (for many loan requests, the application is only one page long) with the elimination of several bureaucratic steps to improve response time to requests. Any small business that posted average annual sales over the previous 3 years of $5 million or less and employs 100 or fewer individuals (including all owners, partners, and principals) is eligible to apply for a Low Documentation Loan. Since its inception, the LowDoc Program has proven enormously popular with small-business owners and entrepreneurs.

SBAExpress. This relatively new pilot program is only available through selected lending institutions. It makes loans of up to $150,000 to qualified businesses.

Export Loan Programs. The SBA offers two loan programs to help small businesses expand or develop their export activities. Most banks do not lend against export orders, receivables, or lines of credit, but through the Export Express program, businesses can obtain SBA-backed financing (up to 90 percent guaranty) on loans and lines of credit up to $250,000.

The Export Working Capital Program (EWCP) guarantees loans for qualified small businesses engaged in export transactions. It replaced another SBA program known as the Export Revolving Line of Credit Program. Most of the SBA regulations governing the 7(a) Program also govern this program. Loan maturities, however, may be for up to 3 years, with an option for annual renewals. EWCP loans can be extended for either single or multiple export sales.

DELTA. The Defense Loan and Technical Assistance (DELTA) Program was implemented to help ease the impact of national defense cuts on defense-dependent small businesses. According to the SBA, DELTA loans of up to $1.25 million must be used to retain jobs of defense workers, create new jobs in impacted communities, or to make operating changes with the aim of remaining in the "national technical and industrial base." While listed under the 7(a) umbrella of loan programs, DELTA actually uses the 504 CDC program as well, discussed further below.

MicroLoans. SBA MicroLoans are short-term loans of up to $35,000. In fiscal year 2009 the SBA provided $23 million worth of MicroLoans, disseminated through nonprofit groups. These loans are intended for the purchase of machinery and other equipment, office furniture, inventory, supplies, and working capital. The typical MicroLoan size was $13,000 in 2010.

International Trade Loan (ITL). The ITL provides long-term financing assistance to small businesses that are involved in international trade or have been hurt by imports. Under this program, the SBA guarantees loans for up to $1.75 million for a combination of fixed-asset financing and working capital needs (though the working capital portion of the guarantee is limited to $1.25 million).

Pollution Control Program. This program extends loans to small businesses engaged in the planning, design, or installation of pollution control facilities.

504 Loans. The Small Business Administration's other major loan program is the 504 CDC (Certified Development Companies) Program. CDCs are nonprofit corporations established to aid communities in their economic development efforts. The 504 CDC Program is designed to provide growing businesses with long-range, fixed-rate financing (up to $4 million for qualified applicants) for major expansion expenditures in the realm of fixed-asset projects. These include real estate purchases and improvements, including existing buildings; grading; street improvements; parking lots and landscaping; utilities; long-term machinery and equipment; renovation of existing facilities; and building construction. Monies from the 504 CDC Program cannot be used for refinancing, working capital or inventory, or consolidating or repaying debt.

The SBA describes the program thusly: "Typically, a 504 project includes a loan secured with a senior lien from a private-sector lender covering up to 50 percent of the project cost, a loan secured with a junior lien from the CDC (a 100 percent SBA-guaranteed debenture) covering up to 40 percent of the cost, and a contribution of at least 10 percent equity from the small business being helped." Businesses that create or retain a job for every $65,000 of a loan can borrow up to $1.5 million. Small manufacturers can borrow up to $4 million, but they must create

or maintain a job for every $100,000 of loan value. Businesses can borrow up to $2 million if they meet a public policy goal, including expansion of exports; rural development; business district revitalization; expansion of businesses owned by minorities, veterans, or women; or changes necessitated by federal budget cutbacks or federally mandated standards or policies.

Disaster Assistance Loans. The SBA offers these loans to businesses that have been victims of natural disasters (fires, floods, hurricanes, earthquakes, etc.). In 2009 the SBA approved 21,780 disaster loans totaling $1.2 billion. These loans, limited to $2 million and not available to firms that were insured for their losses, are available to businesses of any size that need to repair or replace facilities to ''predisaster'' condition. Economic Injury Disaster Loans are also made available to companies that suffered severe economic damage as a result of a given disaster. These loans, which are capped at $1.5 million, are meant to help businesses cover ordinary operating expenses ''which would have been payable barring disaster,'' according to the SBA. It is worth noting that businesses can apply for either type of disaster loan assistance, but they can be awarded no more than a total of $2 million from the two programs unless they qualify as a major source of employment for the region in which they operate.

INTEREST RATES ON SBA LOANS

The interest rates on SBA-guaranteed loans are negotiated between the borrowing business and the lending institution, but they are subject to SBA-imposed rate ceilings, which are linked to the prime rate. Interest rates on SBA loans can be either fixed or variable.

According to the SBA, fixed rate loans are not allowed to exceed the prime rate plus 2.25 percent if the loan matures in less than 7 years. If the maturity of the loan is 7 years or more, however, the rate can be boosted to the prime rate plus 2.75 percent. For SBA loans totaling less than $25,000, the maximum interest rate cannot exceed the prime rate plus 4.25 percent for loans with a maturity of less than 7 years (for loans that mature after 7 years, the interest rate can be as much as the prime rate plus 4.75 percent). For SBA loans between $25,000 and $50,000, maximum rates are not permitted to exceed 3.25 percent (for loans that mature in less than 7 years) and 3.75 percent (for loans with longer terms of maturity).

Variable rate loans, notes the SBA, may be pegged to either the SBA optional peg rate or the lowest prime rate. (The optional peg rate is a weighted average of rates that the federal government pays for loans with maturities similar to the average SBA loan.) Under variable rate loan plans, the lender and borrower negotiate the amount of the spread to be added to the base interest rate. Such agreements also provide for regular adjustment periods wherein the note rate can be changed as needed. Some agreements call for monthly adjustment periods, while others provide for quarterly, semiannual, or annual adjustments.

ELIGIBILITY ISSUES

The Small Business Administration defines businesses eligible for SBA loans as those that cannot obtain a loan without SBA assistance; operate for profit; are engaged in, or propose to do business in, the United States or its possessions; have reasonable owner equity to invest; and use alternative financial resources (such as personal assets) first. In addition, to secure SBA assistance, a company must qualify as a ''small business'' under the terms of the Small Business Act. That legislation defined an eligible small business as one that is independently owned and operated and not dominant in its industry.

Since the passage of the Small Business Act, the SBA has developed size standards for every industry to gauge whether a company qualifies as a ''small business'' or not. Size standards are arranged by Standard Industrial Classification (SIC) code, but in general, the following guidelines apply for major industry groups:

- Manufacturing A key criteria for manufacturing establishments is the size of their work force. Generally, 1,500 employees is the cut-off point for SBA consideration, but even establishments that have between 500 and 1,500 employees may not qualify as small businesses; in such instances the SBA bases its determination on a size standard for the specific industry in which the business under consideration operates.
- Wholesaling Generally, wholesale establishments seeking SBA financial assistance should not have more than 100 employees.
- Retail and Service Financial information is the key consideration here; ideally, retail and service industry businesses seeking SBA assistance should not have more than $3.5 million in annual receipts, although the requests of larger establishments are considered (depending on the industry). Establishments engaged in construction or agriculture industries are also evaluated on the basis of their financial reports.

The Small Business Administration also considers other factors in determining whether an establishment qualifies as a small business. For example, if a business is affiliated with another company, the owners must determine the primary business activity of both the affiliated group and the applicant business before submitting a

request for SBA assistance. If the applicant business and the affiliated group do not both meet the SBA's size standards for their primary business activities, then the loan request will not be considered.

The SBA also has a number of eligibility rules that apply to specific kinds of businesses. Franchisees, for example, are often favored by the SBA because their businesses enjoy a higher success rate than do other businesses. Nonetheless, SBA officials will examine a franchisee's franchise agreement closely before extending any loan guarantees to him or her. If the officials decide that the franchisor wields so much control over the franchise's operations that the franchisee is basically an employee, then the SBA will turn down the request. Other types of businesses, such as those in agriculture or the fishing industry, are free to apply for SBA assistance, but they are directed to look first to government agencies that deal directly with their industries. Farmers, for example, should first explore loan programs available through the Farmers Home Administration (FHA), while some members of the fishing industry depending on the nature of their need should first consult with the National Marine Fisheries Service (NMFS). The SBA also notes that some businesses are disqualified from consideration from the outset by the industry in which they operate. Businesses that operate in gambling, investment, or media-related fields, for example, are all ineligible for SBA loans.

Finally, the SBA notes that loans that they guarantee are only to be used for specific business purposes, including "the purchase of real estate to house the business operations; construction, renovation, or leasehold improvements; acquisition of furniture, fixtures, machinery, and equipment; purchase of inventory; and working capital." Using the money for other purposes payment of delinquent withholding taxes, acquisition of another business, refinancing of debt, and a whole host of other actions is not allowed.

APPLYING FOR AN SBA LOAN

The chief challenge of any business seeking to secure a loan from the Small Business Administration is to convince the SBA that it has the ability to be successful in its chosen field. To do so, the small-business owner should be equipped with a complete understanding of his or her operation (whether existing or proposed) and the benefits that a loan, if granted, will bring to the business. Of course, it is also necessary to articulate this information to the SBA effectively. Business owners disseminate this data through a variety of documents.

Principal documents that should be submitted by the entrepreneur who hopes to start a new business include résumé (and résumés of any other key people involved in the proposed enterprise); current financial statement of all personal assets and liabilities; summary of collateral; proposed operating plan; and statement detailing revenue projections. Perhaps the most important document, however, is the loan request statement itself, for it is this document that should detail all aspects of the proposed business. For established business owners seeking an SBA loan, the most important documents besides the loan application are the company balance sheet, personal financial statements, and business income statements. Consultants urge small-business owners to be both careful and realistic in preparing these records. They also caution entrepreneurs and small-business owners not to distort figures or facts in their presentation. The SBA does not look kindly on misrepresentations in financial statements or any other part of the loan application.

The Loan Application. The SBA loan application form serves to summarize much of the information detailed elsewhere in the total application package. Applicants are directed to furnish basic information about themselves and their businesses, including personal information (full legal name, street address); basic business information (employer ID number, type of business, number of employees, banking institution used); names and addresses of management personnel; estimated business expenditures and costs (including details on the SBA loan request); summary of collateral; summary of previous government financing; and listing of debts.

The SBA loan application form also provides a complete listing of the various other items of information that must be provided for a business's application to be considered. These include a personal history statement; personal and business financial statements; business description; listing of management personnel; equipment list; cosigners; summary of bankruptcies, insolvencies, and lawsuits (if any); listing of any familial relationships with SBA employees; subsidiaries, either proposed or in existence; franchise agreements; and statements of financial interest in any establishments with which applicant business does business, if applicable.

V

VALUATION

Valuation is the process of putting a price on an asset. The value of businesses, personal property, intellectual property (such as patents, trademarks, and copyrights), and real estate are all commonly determined through the practice of valuation. Businesses are valued for many tax, legal, and business reasons but selling the business is the usual motive. Determining the value of a business is simple yet complex. The fair market value is what a knowledgeable buyer is willing to pay and a knowledgeable seller willing to accept. What price should a buyer be willing to pay? Here things become complicated. "It is sometimes said that business valuation is part science and part art; that's because judgment of shifting market forces plays a large role in any thorough valuation of assets," wrote Jeffrey Reinhardt for the *Baltimore Business Journal*.

Valuations are closely linked to economic conditions. In good times, businesses have higher revenue and profits and therefore higher valuations based on an earnings multiple. In bad times, buyers have a harder time obtaining credit, even if the price of a business is lower. According to a 2009 study by *Inc.*, "the median sale price for a private company fell 27 percent in 2008, to $400,000 from $551,000." If credit can be obtained, a downturn is a good time to buy solid performing companies.

More than one valuation method exists but each one takes into account future earnings if continued operations are planned. Theory recognizes three approaches to business valuation: the income-based approach, asset-based approach, and the market approach. The income approach is the most commonly used and is based on an entity's estimated future income stream. The asset-based approach is based on a straightforward determination of the collective value of an entity's assets. The market approach is a hybrid form of the earlier two. Using the market approach usually involves utilizing some market multiple of assets and income.

Putting a value on a small company is much more difficult than establishing the value of a large, publicly traded company. Publicly traded companies have a known value on any given day the value of their outstanding stock. The value of small companies is much harder to establish, especially family-owned or closely held companies, companies that are unique in the marketplace, or companies built by creative entrepreneurs who will not be running the companies in the future. The valuation of a small company is usually best accomplished by using more than one method and melding the results of various assessments in a way that best reflects the individual business.

APPROACHES TO VALUATION

Of the many methods used in determining the value of a business, some are better suited to certain business types than others. Finance companies tend to value a business at what the assets will bring at a liquidation auction. Investment bankers and venture capitalists, on the other hand, tend to be interested in rapid appreciation and high return on investment and thus value a business on a discounted future cash flow basis. Statisticians tend to use complex deviation curves based on historical performance to project future earnings when doing a business valuation. Corporate America looks to the prevailing profit-to-earnings (P/E) ratios, unless the market is depressed, in which case they

use book value. Each of these methods also try to account for risk factors facing the business.

Rules of Thumb. Because the cost of having a formal appraisal performed may be prohibitive for small businesses, owners will frequently turn to their accountants for assistance with a business valuation. Accountants faced with this task often revert to what are known as business valuation rules of thumb to try and determine a range of values for their clients. However, the use of rules of thumb or typical selling ranges can value a company too low or too high as it does not take into account anything particular to that business, such as intangibles, or positive or negative factors.

Rules of thumb are standards established for businesses in the same industry. Brokers and financial intermediaries involved in mergers and acquisitions observe how certain types of businesses are valued and sold and over time patterns emerge. Based upon these empirical data they derive and publish rules of thumb to guide the valuation of businesses by industry and type. Examples of such rules of thumb are: dry cleaning businesses sell from 75 percent to 90 percent of gross revenues; property and casualty insurance businesses sell for 1.2 to 1.6 times book value; dental practices sell for 50 percent to 60 percent of gross revenues; optometrist practices sell for the value of their net fixed assets plus the most recent year's net income. Many books and professional journals provide information about these rules of thumb. Trade associations are another source of information about industry-specific, business valuation rules of thumb.

Income Statement Methods of Valuation. The two related valuation methods listed below are by far the most frequently used means of assessing the value of a small business.

- Historical Cash Flow Approach This is the most commonly used of all valuation methods. Many buyers view this method as the most relevant of all valuation approaches for it tells them what the business has historically provided to its owners in terms of cash. Lawrence Tuller noted in *The Small Business Valuation Book*, "the value of assets might be interesting to know, but hardly anyone buys a business only for its balance sheet assets. The whole purpose is to make money, and most buyers feel that they should be able to generate at least as much cash in the future as the business yielded in the past." This method typically takes financial data from the company's previous three years in drawing its conclusions.
- Discounted Future Cash Flow (DCF) Approach This method uses projections of future cash flows from operating the business to determine what a company is worth today. The DCF approach requires detailed assumptions about future operations, including volumes, pricing, costs, and other factors. DCF usually starts with forecast income, adding back noncash expenses, deducting capital expenditures, and adjusting for working capital changes to arrive at expected cash flows. The future cash flow method also is notable for its recognition of industry reputation, popularity with customers, and other "goodwill" factors in its assessment of company value. Once the value of the business's assets has been settled upon, the appropriate discount rate must be determined and used to bring the future cash flows back to their present day value. DCF in its single-period form is known as capitalization of earnings, which usually involves "normalizing" a recent measure of income or cash flow to reflect a steady-state or going-forward amount that can be capitalized at the appropriate multiple.

Balance Sheet Methods of Valuation. These methods of valuation are most often employed when the business under examination generates most of its earnings from its assets rather than from the contributions of its employees. These methods are also used, wrote John A. Johansen in *How to Buy or Sell a Business.* "when the cost of starting a business and getting revenues past the break-even point doesn't greatly exceed the value of the business's assets."

- Liquidation Approach This method assesses the value of a business by gauging its value if it were to cease operations and sell its individual assets. Under this approach, the business owner would receive no compensation for business "goodwill" nontangible assets such as the company's name, location, customer base, or accumulated experience. This method is further divided into forced liquidations (as in bankruptcies) and orderly liquidations. Values are typically figured higher in the latter instances. Asset-based lenders and banks tend to favor this method, because they view the liquidation value of a company's tangible assets to be the only valuable collateral to the loan. But it is unpopular with most business owners because of the lack of consideration given to goodwill and other intangible assets, such as patents, copyrights, trade secrets, and customer relationships.
- Asset Value Approach This approach begins by examining the company's book value. Under this method, items listed on a business's balance sheet (at historical cost levels) are adjusted to bring them in line with current market values. In essence, this method calls for the adjustment of an asset's book value to equal the cost of replacing that asset in its current

condition. This method is most often used to determine the value of companies which feature a large percentage of commodity-type assets. The net asset value method, also referred to as net worth or owner's equity, is one of the more commonly employed of all valuation approaches. While flawed in some respects, the net asset value method is popular because this approach can be easily figured from existing financial records.

Valuing Personal Service Businesses. The valuation of a personal service business, like a medical practice, is often approached somewhat differently. While equipment, supplies, real estate and other assets are included in assessing personal service business values, they are often of little consequence to potential buyers of the business in question. After all, a buyer may have an entirely new location in mind for the business, and costs associated with leases, utilities, and taxes often change dramatically with relocation. Instead, wrote Tuller, the most important consideration in valuing any personal service business "is how much gross billings can be generated from the customer/client base, not what profits have been recorded or how much cash [the owner has] taken out.... A key consideration to keep in mind if you are selling a professional practice is that the goodwill you have built up over the years is really what you are selling. Sometimes, it is called customer or client lists, or client files, but it is really just goodwill."

VALUATION ISSUES AND STANDARDS

It is important to recognize and deal properly with certain subtleties and standards in the field of valuation. Issues and standards to keep in mind include:

Treatment of Debt. If the method used to determine company value uses a predebt-service income measure, then debt must usually be subtracted from the resulting figure.

Control Premiums. If the valuation methodology used is based on price-earnings ratios of comparable public companies and the interest being valued is the entirety of a company, a control premium may be imposed.

Discount for Lack of Marketability. This discount, also known as the liquidity discount, comes into play in situations where the business owner's ability readily to sell his or her business is questionable. For example, publicly traded companies are highly marketable, and their shares can be quickly turned into cash. Closely held companies, however, are sometimes far more difficult to sell. Depending on the valuation, it may be necessary to subtract a discount for lack of marketability or add a premium for the presence of marketability.

Standard of Value. When determining valuation of a company, the standard of value must be clearly defined. That is, it must be clear whether the valuation is based on book value, fair market value, liquidating versus going-concern value, investment value, or some other definition of value. Defining the standard of value is important because of adjustments that are necessary under some, but not all, of these standards.

"As Of" Dates. Valuation methods determine the value of a company at a given point in time. Thus, businesses that undergo a valuation process are said to be worth X dollars "as of" a certain date. Values of businesses inevitably change over time, so it is critical to state the date for any valuation. In addition, the information used by the appraiser should be limited to that which would have been available at the "as of" date.

Form of Organization. The legal definition of the organization under examination is an important factor in any valuation. Different legal forms of entity corporations, S corporations, partnerships, and sole proprietorships are all subject to different tax rules, rules which impact the value of the enterprise being appraised.

Focus of Valuation. The focus of the valuation must be clearly identified. The portion of the business enterprise being acquired, the type(s) of securities involved, the nature of the purchase (asset purchase or stock purchase), and possible impact of the transaction on existing relationships (such as related party transfers) can all affect the value of the entity under examination.

Going through a business valuation exercise is useful for any business owner. He or she will learn a lot about the business by applying any one or several of the valuation methods discussed here. In the end, however, the true value of a business is, much like beauty, in the eye of the beholder. Or, in the case of a business owner who wishes to sell, it is the price another is willing to pay for the business.

VALUE-ADDED TAX

A value-added tax (VAT) is a fee that is assessed against businesses by a government at various points in the production of goods or services usually any time a product is resold or value is added to it. In many countries this tax is referred to as a Goods and Services Tax (GST). Value is added to a product or service whenever the value increases as a result of the application of a company's factors of production, such as labor and equipment. VAT must be paid by every company that handles a product during its transition from raw materials to finished goods. For example, tax is charged when a manufacturer sells to a wholesaler and again when a wholesaler sells to a retailer.

In calculating the VAT, the taxable amount is based on the value added at each stage of the process of producing goods and bringing them to market. As an example, say that a company that makes socks buys cotton yarn for $1,000; adds $500 to its value in terms of labor, depreciation of knitting machines, and profits; then sells the completed socks for $1,500. VAT would be calculated as a percentage of the $500 value added by turning cotton yarn into socks. Of course, the sock company would also get credit for the amount of VAT it paid on the purchase of inputs, like cotton yarn.

In general, the total VAT accrued during the production of goods is reflected in the price of items sold to final consumers, because each reseller along the way usually passes along its VAT costs. In this way, VAT is somewhat similar to a national sales tax, and the two forms of taxation are often compared by governments. Experts claim that VAT entails higher administrative costs but is easier to enforce than a national sales tax.

The concept of VAT was first adopted by France in 1954. As of 2010, there were nearly 150 countries around the world that had implemented a VAT or GST. In most cases, the percentage of tax charged varies based on the necessity of the particular product, so the tax on food would generally be less than the tax on luxury items like boats. The United States is the only member country of the Organization for Economic Co-operation and Development (OECD) that does not have a value-added tax. According to the OECD, countries with a VAT collect on average one-fifth of their total tax revenue through this tax.

VAT has been proposed for use in the United States as a way to simplify business and personal income tax laws. In a 2010 interview, U.S. President Barack Obama said, "I know that there's been a lot of talk around town lately about the value-added tax. That is something that has worked for some countries. It's something that would be novel for the United States." Proponents claim that VAT would replace other forms of taxation and reduce the costs of tax compliance. In fact, some people say that adopting VAT would eliminate tax returns for individuals and make the Internal Revenue Service obsolete. On the other hand, opponents argue that VAT would be more complicated to implement than other tax-reform options, such as a national sales tax. They also worry that it would increase the cost of food, medicine, and other necessities, which would hurt the poor.

VAT AND E COMMERCE

VAT is a common form of taxation in the European Union (EU). In fact, VAT rates are as high as 25 percent in some EU countries. With the rise of e-commerce, the EU began to enforce a value-added tax on goods sold online. Not only did this funnel more money to the governments within the EU, but it can also level the playing field between online retailers and traditional brick-and-mortar retailers. Many Internet-based businesses are frustrated with the hassle and financial burden of calculating and collecting taxes for purchases made across country borders. Some have found ways to avoid paying the necessary value-added tax. This is often done by operating the business in a tax-haven country, or more often, making it appear as though the business is operated out of one of these countries. The EU is currently trying to crack down on companies using VAT loopholes to dodge paying the proper taxes.

VARIABLE PAY

Variable pay programs are an increasingly popular mode of compensation in the business world. In 2009 WorldatWork conducted a survey regarding employee pay and found that 80 percent of the businesses they surveyed had an incentive or bonus program in place at that time. These programs, which are also sometimes referred to as "pay-for-performance" or "at-risk" pay plans, provide some or all of a workforce's compensation based on employee performance or on the performance of a team. Variable pay proponents contend that providing tangible rewards for superior performance encourages hard work and efficiency and serves as an effective deterrent to mediocre or otherwise uninspired work performance.

Variable pay programs are made up of a variety of different compensation methods. In the broadest sense, variable pay programs include annual incentives or bonus payments; individual incentive plans; lump-sum payments; technical achievement awards; cash profit-sharing plans; small group incentives; gainsharing; and payments for newly acquired skill and knowledge. Some analysts argue that variable pay programs should be defined far more restrictively, but most agree that all of the above share a common emphasis on recognizing achievement, which is the ultimate goal of variable pay plans. In a 2010 article in *Inc.* about profit-sharing plans, Peter Vander Bos wrote that such plans "can be a powerful incentive for employees to work harder for the company and gain a sense of satisfaction from knowing they'll all get a cut of the profits. It's also likely that the added productivity will increase the overall financial performance of the company."

VARIABLE PAY AND THE MODERN BUSINESS ENVIRONMENT

The growing prevalence of variable pay alternatives in business compensation strategies has been attributed in part to a couple of other business trends. Rapidly changing technologies have had an impact on the ways in which people work. Along with these changes have come rapidly changing job descriptions and a need for people with flexible skill sets to fill these positions. At the same time, business observers point out that increased emphasis on quick reactions to changing competitive conditions have triggered a growth in movement toward employee empowerment. And as employees become more empowered, employers have had to find new ways to compensate them for their contributions to the overall enterprise.

Other analysts frame the issue of variable pay in terms of return on investment (ROI). In an environment of heightened business risk, businesses must reduce their investment in fixed costs and maximize the use of variable costs, which they incur only if they achieve certain results. Nowhere is this situation seen more clearly than in the balance between fixed and variable pay, since employee compensation in many industries is a company's single largest expense.

ADVANTAGES AND DRAWBACKS OF VARIABLE PAY

Most criticisms of variable pay can be traced to concerns about the nature, implementation, and execution of such programs rather than the theories upon which they are based. In practice, many companies fail to make variable pay programs meaningful to individual employees, which in turn robs the program of much of its power to facilitate increased productivity.

In a report published by the Institute of Management & Administration titled "Companies Are Not Getting Full Value from Variable Pay Programs," the findings showed, as the title implies, that companies report very mixed results from variable pay programs. The survey reported on was carried out by the firm Hewitt Associates. The Hewitt data showed that about half of companies with single-digit revenue growth believed that the cost of their variable pay programs outweighed the benefit. Companies with double-digit revenue growth, however, almost all reported positive outcomes from their variable pay programs. The report stated: "The fact that many companies don't benefit from variable pay plans is a significant issue, as they're spending more than $54 million a year on this type of pay. We've found that companies achieving high-revenue growth have successful programs because they provide the appropriate amount of administrative, communication, and monetary support. These organizations know

that if this type of pay plan is implemented correctly, it will reinforce a performance culture."

One of the key differentials between companies with a positive and those with a negative experience with variable pay programs was the selection of appropriate performance measures. Those measures are the primary motivation for employees and they communicate to employees what the objectives of the company are. Companies that focused variable pay measures on the ability to reduce costs reported less satisfaction with the programs than those companies using increases in sales as the measure upon which variable pay was linked. According to Paul Shafer, a manager with Hewitt Associates, "If a company wants growth, it can't reward for cutting costs. Cost reduction and growth can be competing, rather than complementary, goals, so by blending the two, companies run the risk of confusing employees and, in all likelihood, accomplishing neither."

The recession that began in 2008 and the subsequent monetary support that the U.S. government gave to many struggling corporations highlighted the issue of inflated executive pay, which is a common form of variable pay. As a result, the government has begun to scrutinize these policies and has created stricter guidelines for what and how much executives can be paid in bonuses and perks. It is important even for small businesses to keep track of these changes in policy when implementing variable pay plans.

ESTABLISHING A VARIABLE PAY SYSTEM

Proponents of variable pay programs contend that implementation of such a system is far more likely to be successful if the following conditions are met:

- Employees must have control over their performance. If employees are overly dependent on the actions and output of other employees or processes, they may have little control over their own performance. Variable pay programs that are not based on principles of employee empowerment are almost certainly doomed to fail.
- Differences in performance must mean something to the business. Employees must see that mediocre and high-quality performances are not rewarded equally, and that results count.
- Business goals must be clearly defined and adequately disseminated to employees, and they should be arrived at with their assistance.
- Performance must be measured regularly and reliably. A clear system of performance appraisal and feedback must be put in place, with regularly scheduled meetings as one component.
- Employers should use variable pay as a tool in reaching ambitious business goals. The targets should be set high so that extra effort is needed to reach them.
- Businesses should make sure that their variable pay plans reward employees for actions or skills that actually further the aims of the company.

VARIANCE

A variance has several meanings in business. In an accounting sense, a variance is the difference between an actual amount and a predetermined standard amount or the amount budgeted. In a statistical sense, a variance is a measure of the amount of spread in a distribution. It is computed as the average squared deviation of each number from its mean. Finally, variance has a meaning related to land use called a zoning variance. A zoning variance is an administrative exception to land use regulations.

ACCOUNTING VARIANCES

In accounting, a variance could be a cost variance, where actual costs may be different from the estimated standards for costs. Variances can be favorable or unfavorable. A variance from standard cost is considered favorable if the

actual cost is less than the standard or budgeted cost, and it is considered unfavorable if the actual cost is more than was budgeted. It is also possible to break down the cost variance into the factors that may have caused it to occur such as a quantity variance, or the difference between the actual quantity and the standard quantity; and a price variance, or the difference between the actual price and the standard price.

When a variance occurs, like the cost variance in this example, top management should examine the circumstances to determine the factors that created it. By doing so, management should be able to identify who or what was responsible for the variance and take steps to correct the problem. For example, assume that the standard material cost for producing 1,000 units of a product is $8,000, but that materials costing $10,000 were actually used. The $2,000 unfavorable variance may have resulted from paying a price for the material that was higher than the standard price. Alternatively, the process may have used a greater quantity of material than standard. Or there may have been some combination of these factors.

The purchasing department is usually responsible for the price paid for materials. Therefore, if the variance was caused by a price higher than standard, responsibility for explaining the problem rests with the purchasing manager. On the other hand, the production department is usually responsible for the amount of material used. Thus, the production department manager is responsible for explaining the problem if the process used more than the standard amount of materials. However, the production department may have used more than the standard amount of material because its quality did not meet specifications, with the result that more waste was created. Then the purchasing manager is responsible for explaining why the inferior materials were acquired. On the other hand, the production manager is responsible for explaining what happened if the analysis shows that the waste was caused by inefficiencies.

Thus variances like the cost variance in the example above trigger questions to be answered within the organization. These questions call for answers that, in turn, should lead to changes designed to correct the problem and minimize or eliminate the variances for the next reporting period. In studying variances in expenditures, a company may find that the assumptions upon which its budgets were made were in error. These too should be corrected so that the budget will more accurately reflects the likely outcome in the next period. As Edward VanDerbeck noted in his 2009 book *Principles of Cost Accounting*, "Variances . . . provide a basis on which management can take appropriate action to eliminate inefficient operating conditions."

A performance report may identify the existence of the problem, but it can do no more than point the direction for further investigation of what can be done to improve future results. Other common variances in accounting include overhead rate and usage variances.

STATISTICAL VARIANCES

In statistics, a variance is also called the mean squared error. The variance is one of several measures that statisticians use to characterize the dispersion among the measures in a given population. To calculate the variance, it is necessary first to calculate the mean or average of the scores. The next step is to measure the amount that each individual score deviates or is different from the mean. Finally, that deviation is squared by multiplying the number by itself. Numerically the variance equals the average of the squared deviations from the mean.

VENTURE CAPITAL

Venture capital is a type of equity investment usually made in rapidly growing companies that require a lot of capital or start-up companies that can show they have a strong business plan. Venture capital may be provided by wealthy individual investors, professionally managed investment funds, government-backed Small Business Investment Corporations (SBICs), or subsidiaries of investment banking firms, insurance companies, or corporations. Such venture capital organizations generally invest in private start-up companies with a high profit potential. In exchange for their funds, venture capital organizations usually require a percentage of equity ownership of the company (between 25 and 55 percent), some measure of control over its strategic planning, and payment of assorted fees. Due to the highly speculative nature of their investments, venture capital organizations expect a high rate of return. In addition, they often wish to obtain this return over a relatively short period of time, usually within 3 to 7 years. After this

time, the equity is either sold back to the client-company or offered on a public stock exchange.

Venture capital offers several advantages to small businesses, including management assistance and lower costs over the short term. The disadvantages associated with venture capital include the possible loss of effective control over the business and relatively high costs over the long term. Overall, experts suggest that entrepreneurs should consider venture capital to be one financing strategy among many and should seek to combine it with debt financing if possible.

Venture capital is traditionally more difficult for a small business to obtain than other sources of financing, such as bank loans and supplier credit. However, with the onset of the 2008 recession and the ensuing credit crisis, bank loans and other standard forms of credit became acutely scarce, increasing the importance of venture capital (along with angel investment) for small businesses. But the overall recession also resulted in a significant decline in venture capital raising activities. According to industry analyst Vincent Fernando, writing in mid-2009, "The second quarter of 2009 saw the lowest level of capital going into VC funds since the first quarter of 2003, according to the National Venture Capital Association."

THE EVALUATION PROCESS

Before providing venture capital to a new or growing business, venture capital organizations require a formal proposal and conduct a thorough evaluation. Even then, they tend to approve only a small percentage of the proposals they receive. An entrepreneur with a small start-up should not consider venture capital if, for example, her objective is to grow her fledgling graphic design service into a mid-size regional greeting card business. This profile does not fit with the venture capitalists' objectives. Venture capital firms usually look for investment opportunities with firms that offer rapid growth as well as something new, such as a new technology or technology application, a new chemical compound, a new process for the manufacture of a product. Once an entrepreneur's venture has been determined to be of a kind that may interest venture capitalists, the next move is to start planning. The most important thing an entrepreneur can do to increase his or her chances of obtaining venture capital is to plan ahead.

Since it is often difficult to evaluate the earnings potential of new business ideas or very young companies, and investments in such companies are unprotected against business failures, venture capital is a highly risky industry. As a result, venture capital firms set rigorous policies and requirements for the types of proposals they will even consider. Some venture capitalists specialize in certain technologies, industries, or geographic areas, for example, while others require a certain size of investment. The maturity of the company may also be a factor. While most venture capital firms require their client companies to have some operating history, a very small number handle start-up financing for businesses that have a well-considered plan, something "new," and an experienced management group.

In general, venture capitalists are most interested in supporting companies with low current valuations but with good opportunities to achieve future profits in the range of 30 percent annually. Most attractive are innovative companies in rapidly accelerating industries with few competitors. Ideally, the company and its product or service will have some unique, marketable feature to distinguish it from imitators. Most venture capital firms look for investment opportunities in the $250,000 to $2 million range. Since venture capitalists become part owners of the companies in which they invest, they tend to look for businesses that can increase sales and generate strong profits with the help of a capital infusion. Because of the risk involved, they hope to obtain a return of three to five times their initial investment within 5 years.

Venture capital organizations typically reject the vast majority 90 percent or more of proposals quickly because they are deemed a poor fit with the firm's priorities and policies. They then investigate the remaining 10 percent of the proposals very carefully and at considerable expense. Whereas banks tend to focus on companies' past performance when evaluating them for loans, venture capital firms tend to focus instead on their future potential. As a result, venture capital organizations will examine the features of a small business's product, the size of its markets, and its projected earnings.

As part of the detailed investigation, a venture capital organization may hire consultants to evaluate highly technical products. They also may contact a company's customers and suppliers in order to obtain information about the market size and the company's competitive position. Many venture capitalists will also hire an auditor to confirm the financial position of the company and an attorney to check the legal form and registration of the business. Perhaps the most important factor in a venture capital organization's evaluation of a small business as a potential investment is the background and competence of the small business's management. For many venture capital firms the most important factor in their assessment is determining the capabilities of the management team, not the potential product. Since the abilities of management are often difficult to assess, it is likely that a representative of the venture capital organization would spend a week or two at the company. Ideally, venture capitalists like to see a committed management team with experience in the industry. Another plus is a complete management group

with clearly defined responsibilities in specific functional areas, such as product design, marketing, and finance.

VENTURE CAPITAL PROPOSALS

In order to ensure that a proposal will be seriously considered by venture capital organizations, an entrepreneur should furnish several basic elements. After beginning with a statement of purpose and objectives, the proposal should outline the financing arrangements requested, including how much money the small business needs, how the money will be used, and how the financing will be structured. The next section should feature the small business's marketing plans, from the characteristics of the market and the competition to specific plans for getting and keeping market share.

A good venture capital proposal will also include a history of the company, its major products and services, its banking relationships and financial milestones, and its hiring practices and employee relations. In addition, the proposal should include complete financial statements for the previous few years, as well as *pro forma* projections for the next 3 to 5 years. The financial information should detail the small business's capitalization a list of shareholders and bank loans and show the effect of the proposed project on its capital structure. The proposal should also include biographies of the key players involved with the small business, as well as contact information for its principal suppliers and customers. Finally, the entrepreneur should outline the advantages of the proposal including any special and unique features it may offer as well as any problems that are anticipated.

If, after careful investigation and analysis, a venture capital organization should decide to invest in a small business, it then prepares its own proposal. The venture capital firm's proposal would detail how much money it would provide, the amount of stock it would expect the small business to surrender in exchange, and the protective covenants it would require as part of the agreement. The venture capital organization's proposal is presented to the management of the small business, and then a final agreement is negotiated between the two parties. Principal areas of negotiation include valuation, ownership, control, annual charges, and final objectives.

The valuation of the small business and the entrepreneur's stake in it are very important, as they determine the amount of equity that is required in exchange for the venture capital. When the present financial value of the entrepreneur's contribution is relatively low compared to that made by the venture capitalists for example, when it consists only of an idea for a new product then a large percentage of equity is generally required. On the other hand, when the valuation of a small business is relatively high for example, when it is already a successful company then a small percentage of equity is generally required. It is quite normal for venture capital firms to value a company at below the valuation the company has for itself. It is best if the small business looking for venture capital prepare for such an outcome.

The percentage of equity ownership required by a venture capital firm can range from 10 percent to 80 percent, depending on the amount of capital provided and the anticipated return. But most venture capital organizations want to secure equity in the 30-50 percent range so that the small-business owners still have an incentive to grow the business. Since venture capital is in effect an investment in a small business's management team, the venture capitalists usually want to leave management with some control. In general, venture capital organizations have little or no interest in assuming day-to-day operational control of the small businesses in which they invest. They have neither the technical expertise nor the managerial personnel to do so. But venture capitalists usually do want to place a representative on each small business's board of directors in order to participate in strategic decision making.

Many venture capital agreements include an annual charge, typically 2-3 percent of the amount of capital provided, although some firms instead opt to take a cut of profits above a certain level. Venture capital organizations also frequently include protective covenants in their agreements. These covenants usually give the venture capitalists the ability to appoint new officers and assume control of the small business in case of severe financial, operating, or marketing problems. Such control is intended to enable the venture capital organization to recover some of its investment if the small business should fail.

The final objectives of a venture capital agreement relate to the means and time frame in which the venture capitalists will earn a return on their investment. In most cases, the return takes the form of capital gains earned when the venture capital organization sells its equity holdings back to the small business or on a public stock exchange. Another option is for the venture capital firm to arrange for the small business to merge with a larger company. The majority of venture capital arrangements include an equity position, along with a final objective that involves the venture capitalist selling that position. For this reason, entrepreneurs considering using venture capital as a source of financing need to consider the impact a future stock sale will have on their own holdings and their personal ambition to run the company. Ideally, the entrepreneur and the venture capital organization can reach an agreement that will help the small business grow enough to provide the venture capitalists with a good return on their investment as well as to overcome the owner's loss of equity.

THE IMPORTANCE OF PLANNING

Although there is no way for a small business to guarantee that it will be able to obtain venture capital, sound planning can at least improve the chances that its proposal will receive due consideration from a venture capital organization. Such planning should begin at least a year before the entrepreneur first seeks financing. At this point, it is important to do market research to determine the need for its new business concept or product idea and establish patent or trade secret protection, if possible. In addition, the entrepreneur should take steps to form a business around the product or concept, enlisting the assistance of third-party professionals like attorneys, accountants, and financial advisors as needed.

Six months prior to seeking venture capital, the entrepreneur should prepare a detailed business plan, complete with financial projections, and begin working on a formal request for funds. Three months in advance, the entrepreneur should investigate venture capital organizations to identify those that are most likely to be interested in the proposal and to provide a suitable venture capital agreement. The best investor candidates will closely match the company's development stage, size, industry, and financing needs. It is also important to gather information about a venture capitalist's reputation, track record in the industry, and liquidity to ensure a productive working relationship.

One of the more important steps in the planning process is preparing detailed financial plans. Strong financial planning demonstrates managerial competence and suggests an advantage to potential investors. A financial plan should include cash budgets prepared monthly and projected for a year ahead that enable the company to anticipate fluctuations in short-term cash levels and the need for short-term borrowing. A financial plan should also include *pro forma* income statements and balance sheets projected for up to 3 years ahead. By showing expected sales revenues and expenses, assets and liabilities, these statements help the company to anticipate financial results and plan for intermediate-term financing needs. Finally, the financial plan should include an analysis of capital investments made by the company in products, processes, or markets, along with a study of the company's sources of capital. These plans, prepared for 5 years ahead, assist the company in anticipating the financial consequences of strategic shifts and in planning for long-term financing needs.

VENTURE CAPITAL NETWORKS

Venture capital networks, or clubs, are groups of individual and institutional investors that provide financing to risky, unproven business ventures. Like other providers of venture capital which may include professionally managed investment funds, government-backed Small Business Investment Corporations (SBICs), or subsidiaries of investment banking firms, insurance companies, and corporations members of these networks generally invest in private start-up companies with a high profit potential. In exchange for their funds, the venture capitalists usually require a percentage of equity ownership of the company, some measure of control over its strategic planning, and payment of assorted fees. Due to the highly speculative nature of their investments, venture capitalists hope to achieve a high rate of return over a relatively short period of time.

The main difference between venture capital networks and other venture capital providers is their degree of formality. Venture capital networks are informal organizations

that exist to help entrepreneurs and small businesses connect with potential investors. Additionally, the people involved in venture capital networks tend to be more informal in their approach to potential investors and investment partners. For example, in a post on its Web site made on April 20, 2010, the European Venture Capital Network wrote, "Please join us for the next Paris informal Young VCs, drinks taking place at the Hotel Particulier Montmartre. It"s a semi-secret bar in the heart of the historical Montmartre."

The membership of venture capital networks consists primarily of wealthy entrepreneurs who recognize both the financial potential of new businesses and the importance of capital in the early stages of a business's life. In many cases, these investors wind up sitting on the boards of the companies they fund, where they can provide valuable, first-hand management advice based on their own experiences.

HOW NETWORKS WORK

In the past, it was extremely difficult for entrepreneurs to find and make contact with private investors. In response to this problem, many business groups and universities created networks to help entrepreneurs gain access to interested investors. One of the earliest such efforts was the Venture Capital Network, a computer database that was established by a professor at the University of New Hampshire. This and other computerized networks are similar to computer matchmaking services. Each entrepreneur posts a business plan and a set of financial projections on the network, while each investor submits information describing his or her interests and investment criteria. Due to their previous business experience, different investors may be most interested in investing in companies of a certain size, in a certain industry, or with certain capital requirements. The computer then provides participants with a list of possible matches. Interested parties are left to make contact with one another and try to reach an agreement.

Noncomputerized venture capital networks operate in basically the same way. A central clearinghouse solicits business plans from companies seeking capital, then distributes profiles of the companies to private investors who belong to the network. If a certain investor wants to know more about a particular company, he or she might arrange for a formal presentation. In many cases, both business and investor profiles are distributed anonymously without names attached until both parties express an interest in proceeding further. Another similar type of arrangement can be found in a private investment club. These are community-based organizations in which several individuals pool their resources to invest in new and existing businesses on a local level. Such clubs generally solicit business plans and then distribute them to members, but then invest as a group.

The financing provided through venture capital networks can range dramatically in size from investments of $25,000 to more than $1 million, with the majority of financing deals being under $100,000. Entrepreneurs searching for venture capital assistance usually pay a small fee to participate in a network typically less than $500 annually while institutional investors may pay a somewhat higher fee. Although venture capital networks are usually better sources of funding for start-up companies than formal venture capital firms, merely joining a network does not guarantee that a small business will obtain financing. There are usually at least two companies for every one investor listed in databases. In addition, even if a match is made, the entrepreneur still must sell the investor on the proposal and negotiate a mutually beneficial agreement.

VENTURE PHILANTHROPY

Venture philanthropy is an approach to solving social problems that applies the business practices of for-profit enterprises to the challenges facing nonprofit organizations and other groups. Sometimes called "philanthrocapitalism," venture philanthropy draws on the sophisticated business management techniques of large corporations and the entrepreneurial and financial innovations of venture capital firms. The resulting engagement supplies nonprofit foundations not only with funds but also with management

techniques and support to help meet humanitarian and social goals.

The philosophy of venture philanthropy is often closely tied to social entrepreneurship, which uses entrepreneurial techniques to tackle social problems. In *The Foundation*, Joel Fleishman wrote there is "significant overlap" between the two practices. Social enterprise brings entrepreneurial strategies to nonprofit organizations, including diversifying income streams to help the organization become self-sustaining and applying corporate techniques for measuring progress towards goals. "Social enterprise can therefore be understood as a hybrid of the nonprofit and for-profit sectors," Fleishman added. In a separate article for the *Stanford Social Innovation Review*, Fleishman noted that philanthrocapitalism has grown with an increase in the number of nonperpetual foundations being created in the United States in recent years.

In *Social Entrepreneurship Management*, Anant Verma defined venture philanthropy as "social venture funds characterized by high levels of engagement with the social entrepreneur, long investment horizons, higher levels of risk-taking, and a rigorous focus on auditing social impacts, where possible." In addition to funding social initiatives and organizations, Verma wrote, "Venture philanthropists typically provide networking, management advice, and an array of other supports to organizations within their portfolio." However, venture philanthropy funds account for less than 1 percent of the total money given, indicating the model's major significance lies in the involvement of entrepreneurs in the causes they support rather than the amount of funding, Verma added.

Pervez Ghauri made a similar point in an article in the *Journal of World Business*. Venture philanthropy groups "take a more active approach by providing management guidance and monitoring the progress against benchmarks," Ghauri wrote. In the pharmaceutical industry, for example, groups such as the Bill and Melinda Gates Foundation are backing research in areas that are not highly prioritized by such groups as the National Institute of Health.

Venture philanthropy can also be referred to as tactical philanthropy or high-engagement philanthropy. The *Chronicle of Philanthropy* distinguishes strategic philanthropists as more traditional givers who are addressing social problems through grants to groups that would then tackle the situation. However, tactical philanthropists are more highly engaged in the receiving organization, going beyond basic financial support. That engagement may include taking a seat on the board of directors or providing training to the group's managers. However, the degree of engagement can vary greatly among tactical philanthropists. Still, both approaches have their place in modern philanthropy, the article noted.

CHARACTERISTICS OF VENTURE PHILANTHROPY

The origins of venture philanthropy are often traced to Andrew Carnegie, the ninteenth-century industrialist who argued that wealthy donors should do more than simply write checks for worthy causes. Carnegie maintained that entrepreneurs should also share their knowledge and expertise to ensure that the groups receiving charitable funds were prepared to use them to their best extent. Carnegie's work in establishing a series of public libraries and creating the Carnegie Foundation are evidence of his philosophy.

However, Carnegie's approach was not commonly followed until the 1990s, when venture capitalists began to apply their techniques in the commercial sector to nonprofits. Donors had become frustrated when they donated large sums of money to groups that were unable to manage those funds efficiently or effectively. Entrepreneurs decided to become more involved in the organization, strategy, and operations of groups receiving their funds. Lending more direct support to those nonprofits led to the development of modern venture philanthropy.

Common characteristics of venture philanthropy include:

- Supplying nonfinancial support to recipients. In addition to providing grants, endowments, or other financial aid, venture philanthropists are more highly engaged with the receiving groups than typical donors. They apply their entrepreneurial expertise at running a company to supporting a charitable or social enterprise. Venture groups may provide guidance on developing strategy, delve into day-to-day operational management, share their networking contacts, or offer advice on building sustainable financial models.
- Emphasis on measurable results. Much as a venture capitalist would not give funds to a start-up business without a solid business plan that includes expected goals, a venture philanthropist also strives to quantify what results will result from his or her investment of time, money and resources. The venture philanthropist works with the receiving group to define expected results, devise methods for measuring progress, and set periodic benchmarks to track results.
- Develop sustainable revenue streams. Traditional philanthropists typically set up endowments and other types of financial vehicles that provide funds over a long period to support a charitable, social, medical, or other cause. While venture philanthropists may donate money to specific programs or campaigns, they are typically more interested in helping organizations develop income streams that will make the group become self-supporting.

- Direct involvement with recipients, including taking positions on a nonprofit's board of directors.
- Developing new models for nonprofit organizations. Entrepreneurs explore options beyond the traditional perpetually endowed private foundations in their quest to find the optimal approach to meeting social needs. They may work with an existing community foundation, create one tied closely to their own corporation, pool private and corporate funds, devise new partnerships between private and public entities, or create a hybrid group to tackle the unique challenges of the social problem they wish to address.
- Higher levels of risk, in both the organizations they create and the causes they support, such as developing new drugs and medical techniques. "The risks in venture philanthropy are high," Richard Haugh wrote in *Hospitals and Health Networks*. "But unlike their corporate brethren, for venture philanthropists, the payoff isn't financial it's in human lives."

EXAMPLES OF VENTURE PHILANTHROPY

The universe of venture philanthropy spans a number of different social causes, business models, and financial arrangements. Social entrepreneurs bring their creativity in solving business problems to the not-for-profit world, resulting in a number of novel approaches to meeting philanthropic goals.

For example, the Bill and Melinda Gates Foundation focuses on global health and education initiatives. A single grant from the Gates Foundation can exceed $1 billion. The Gates Foundation is also one of many groups that have become active in microlending: providing grants to support loans to start small businesses in developing countries.

Another group with a focus on developing nations is the Acumen Fund, which was initiated by the Rockefeller Institute. Acumen channels private funds towards investing in start-ups that make products or provide services at affordable prices that are urgently needed in developing countries, according to Fleishman's *The Foundation*. Fleischman wrote that Acumen-backed for-profit companies create "affordable hearing aids, affordable eye glasses and long-lasting, affordable mosquito nets to reduce the risk of malaria."

Fleischman also noted that venture philanthropists devise a wide variety of models for their work. He pointed to the differing structures in the approaches taken by Pierre Omidyar, the founder of eBay, in his Omidyar Network; the founders of Google.org; and Richard Branson, founder of Virgin Air. "Omidyar's is his personal money plus the foundation he had already established," Fleischman wrote. " Google's is a $1 billion fund totally inside a corporation, which includes a pre-existing foundation of about $100 million, and Branson's is the dedication of a profit stream over a period of 10 years."

Fleischman added these examples "demonstrate not only how much energy and passion there is today to put large pools of wealth to work solving pressing social problems, but also the seemingly endless hybridization of the means by which they can be put to work. That suggests that the day of the private, independent foundation as the exclusive vehicle for philanthropic initiative has ended."

Venture Philanthropy Partners, founded by venture industrialist Mario Morino, is another commonly cited example. Mario invested his own money and persuaded others to join in his cause. The group has spent millions to support programs that target needy youths in the Washington, D.C., area. But in addition to financial backing, the group supports these initiatives with management expertise benefiting the nonprofits that receive those funds.

Other venture philanthropy groups focus on the arts. For example, Creative Capital goes beyond the typical artist grants from traditional foundations. The group also provides retreats and fellowships with practical guidance in such areas as how to market works of art and run a successful creative business. A number of Creative Capital beneficiaries have won major awards, held high-profile exhibitions, and moved beyond the "starving artists" stereotypes to launch profitable businesses. In Indianapolis, Indiana, the Efroymson Family Fund also follows a venture philanthropy approach to provide artist grants, renovate museums and support environmentally friendly community garden projects.

The medical field also benefits from venture philanthropy. Traditional investors and venture firms prefer to back treatments and drugs that provide a better profit profile by tackling common diseases, such as cancer. However, venture philanthropists provide capital to fund clinical trials for treatments that tackle rarer conditions. In his article "Disease Foundations Prime the Drug Pump," Richard Haugh noted that groups such as the Cystic Fibrosis Foundation and the Muscular Dystrophy Association have turned to venture philanthropy to help bring drugs for those diseases to market.

"Nonprofit foundations fill the gaps in research funding left by public sector and the for-profit private sector," Pervez Ghauri wrote in the *Journal of World Business*. "They often fund research that is scientifically speculative, politically unpopular and where commercial value is not clear." Ghauri added that venture philanthropists often fund "translational research" in the early stages of the pharmaceutical development process.

The education field has also drawn venture philanthropists. In Chicago, Illinois, several foundations are working in conjunction with the school district to upgrade local educational institutions. Venture philanthropists are providing seed money, ideas, and hands-on support in a

variety of initiatives in such areas as charter schools, teacher pay, and educator certification. Programs supported by these funds aim to become self-sustaining as independent entities or they may be absorbed back into the school system after the initial support period ends. Similar programs are also seen in such areas as San Francisco, California.

Venture philanthropy has also spread beyond the United States. *Private Equity International* reported that the European Venture Philanthropy Association (EVPA) grew from five members in 2004 to 101 members by 2008. EVPA includes venture philanthropy funds, charitable foundations, private equity firms and universities. The group brings together private equity firms and the institutions that serve the social needs to the continent in order to support the spread of the venture philanthropy model.

Regardless of the geographic location, the venture philanthropy movement aims to bring both money and know-how to bear on society's problems. "We can all write checks," Bruce Rauner of private equity firm GTCR Golder Rauner told *Education Week* in an article on the Chicago school projects. "Venture philanthropy goes beyond feeling good and trying to be helpful, to being very focused and demanding results. It's about using philanthropic dollars to change a process and change a system."

VERTICAL MARKETING SYSTEM

A vertical marketing system (VMS) is one in which the main members of a distribution channel producer, wholesaler, and retailer work together as a unified group in order to meet consumer needs. In conventional marketing systems, producers, wholesalers, and retailers are separate businesses that are all trying to maximize their profits. When the effort of one channel member to maximize profits comes at the expense of other members, conflicts can arise that reduce profits for the entire channel. To address this problem, more and more companies are forming vertical marketing systems.

Vertical marketing systems can take several forms. In a corporate VMS, one member of the distribution channel owns the other members. Although they are owned jointly, each company in the chain continues to perform a separate task. In an administered VMS, one member of the channel is large and powerful enough to coordinate the activities of the other members without an ownership stake. Finally, a contractual VMS consists of independent firms joined together by contract for their mutual benefit. One type of contractual VMS is a retailer cooperative, in which a group of retailers buys from a jointly owned wholesaler. Another type of contractual VMS is a franchise organization, in which a producer licenses a wholesaler to distribute its products.

The concept behind vertical marketing systems is similar to vertical integration. In vertical integration, a company expands its operations by assuming the activities of the next link in the chain of distribution. For example, consider the 2010 merger between Live Nation, the biggest U.S. concert promoter, and Ticketmaster, the biggest ticketing company. The result was a new company called Live Nation Entertainment, which is directly involved in nearly every aspect of concert promotion, including concert booking, ticket and merchandise sales, and artist management. Vertical marketing should not be confused with horizontal marketing, in which members at the same level in a channel of distribution band together in strategic alliances or joint ventures to exploit a new marketing opportunity.

As Tom Egelhoff wrote in an online article titled "How to Use Vertical Marketing Systems," a VMS can hold both advantages and disadvantages for small businesses. "The main advantage of VMS is that your company can control all of the elements of producing and selling a product. In this way, you are able to see the whole picture, anticipate problems, make changes as they become necessary, and thus increase your efficiency. However, being involved in all stages of distribution can make it difficult for a small business owner to keep track of what is happening. In addition, the arrangement can fail if the personalities managing of the different areas do not fit together well."

For small-business owners interested in forming a VMS, Egelhoff recommended starting out by developing close relationships with suppliers and distributors. "What suppliers or distributors would you buy if you had the money? These are the ones to work with and form a strong relationship," he wrote. "Vertical marketing can give many companies a major advantage over their competitors."

VIRAL MARKETING

Viral marketing is a form of word-of-mouth marketing that relies on social networks particularly Internet-based platforms to spread a marketing message from one person to another. Companies have known for generations that a satisfied customer who recommends a product to a friend is a more effective advocate than paid advertising, celebrity endorsements, or other marketing techniques. By using the broad reach and instant communication of the World Wide Web, viral marketing is a powerful tool that spreads messages more quickly and to greater numbers of people. Much like a virus quickly spreads cold germs among the human population, viral marketing can rapidly disseminate a message to a broad cross-section of people around the world.

Writing in the *Sacramento Business Journal*, Scott Lenet of the pioneering viral marketing firm DFJ Frontier defined viral marketing as "any technique that uses a pre-existing social network to spread a marketing message without additional cash expenditures. Good viral marketing acts like an epidemic, spreading quickly and efficiently."

A similar definition is found in *Marketing in Travel and Tourism*. The authors wrote, "Viral marketing is the term used for activities that encourage individuals to pass on marketing communications to their friends. Its name reflects the way the marketing message spreads from person to person rather like a virus. It is not entirely new in principle as creating word-of-mouth recommendation and using incentives for customers to recruit their friends have always been a part of marketing. The Internet and the mobile phone, however, have made it much more prominent with potentially global coverage. While incentives and rewards are still used, the most effective way of stimulating viral marketing is to produce something that users want to pass on because their friends will find it amusing or interesting."

Viral marketing can be passed along through a number of online platforms, including e-mail, blogs, message boards, newsletters, video hosting sites like YouTube, and social networking sites such as Facebook and Twitter. Viral marketing has also moved beyond the personal computer into more portable devices. The explosive growth of cellular phones and "smart phones" like the iPhone and Blackberry allows viral messages to spread more widely and quickly via mobile devices.

While it is most commonly linked with word-of-mouth marketing, viral marketing is also commonly associated with guerilla marketing, which uses low-cost and creative approaches to building a brand of product or service. Other related terms include buzz marketing, which aims to build chatter or "buzz" around a brand among high-profile or influential persons; and grassroots marketing, where volunteers spread the word about a product or service. Viral marketing is also commonly a component of a "seeding" campaign, in which marketers place a product or service among influential users (such as bloggers or celebrities) in hopes the "influencers" will share positive experiences and opinions with other consumers.

EVOLUTION OF VIRAL MARKETING

While the natural phenomenon of word-of-mouth has existed since the dawn of time, it has been a subject of formal attention by both sociologists and marketers since at least the 1940s. A television commercial from the late twentieth century illustrates the real power of word-of-mouth marketing. In the advertisement for Faberge Organic Shampoo, customers are encouraged to "tell two friends, they'll tell two friends, and so on, and so on." That message is accompanied

by a screen in which the images or a growing number of friends spreading the word about the product rapidly fills the screen. The commercial shows not only the effectiveness of word-of-mouth where a trusted member of one's network is touting the product but also the speed and depth with which personal recommendations move throughout personal social networks. Adding the speed and reach of the Internet to the word-of-mouth process creates viral marketing.

The most widely cited early viral marketing success story is Hotmail. In *E-Riches 2.0 Knowledge Management Research & Practice*, Scott Fox wrote about how Hotmail started in 1996 by giving away free e-mail accounts at a time when most customers obtained one e-mail access through their Internet provider. "By merely inserting a small promotional line of text at the bottom of email users sent from the Hotmail system that said, 'Get your free email at Hotmail.com,' Hotmail created the first widely recognized 'viral loop' a self-spreading and self-reinforcing virtuous cycle of customer adoption," Fox wrote. "The more users there were who used the Hotmail system, the more others saw the attractive offer and signed up. Then those new users started sending emails and even more people saw the offer and started using Hotmail, and so on. Hotmail grew from nothing to more than 12 million users in just 18 months."

Fox said the Hotmail story illustrates how marketers should approach their viral campaigns. "Try to build incentives into the pitch, or into the product itself, that are spread and reinforced by the customer's natural behavior," he continued. "Doing so can allow the product message to be spread virally through their daily activity."

Since that time, sites such as YouTube, that allow users to share videos with friends and family, provide an effective viral platform, Fox noted. Online games, interactive Web sites, and mobile phone applications that are easily shared with other members of a person's network are also powerful tools for spreading a viral message.

Other examples of successful viral marketing approaches include:

- Skype, where users can make free telephone calls on the Internet but must recruit their friends to also download the software so they can communicate.
- Facebook, Twitter, LinkedIn, and other sites, where the usefulness of a social network relies on convincing one's friends, relatives and co-workers to join that network also (and they, in turn, bring more users into the system).
- Blendtec, a blender manufacturer that became an online sensation by producing its "Will It Blend?" series of infomercials. The humorous videos show a variety of items being combined in a Blendtec blender with varying results.
- Campaigns for films such as *The Blair Witch Project*, *The Dark Knight*, and *Cloverfield*, in which studios used a variety of viral marketing techniques to build "buzz" for the movies in advance of their release.
- GoDaddy.com, which used Super Bowl commercials that showed a series of edgy, irreverent, and often racy videos as teasers. Viewers had to visit the company's Web site to see the rest of the video, which drove consumer awareness and Web traffic.

ADVANTAGES OF VIRAL MARKETING

One of the major strengths of viral marketing is that, like other word-of-mouth (WOM) approaches, it is more effective than convention promotional techniques. In "Effects of Word-of-Mouth Versus Traditional Marketing" in the *Journal of Marketing*, the authors noted recent surveys show consumer attitudes towards traditional advertising continue to decline. The study modeled the results of messages transmitted through an online social networking site. The authors found "WOM referrals have substantially longer carryover effects than traditional marketing actions and produce substantially higher response elasticities."

The study added, "Word-of-mouth communication strategies are appealing because they combine the prospect of overcoming consumer resistance with significantly lower costs and fast delivery especially through technology, such as the Internet."

Those remarks point to another advantage of viral marketing: its lower cost when compared to other techniques. Matt Smith, co-founder of marketing firm The Viral Factory, told *New Media Age* that when company's advertising and marketing budgets were cut during the recession of 2008 and 2009, his clients flocked to viral marketing. While viral market is not cheap, he said, it is less expensive that traditional formats such as television.

Smith added that since consumers are spending more time online, it makes sense for companies to follow them into the virtual world with their messages. In "Can You Create a Viral Hit?" David Myron wrote that the levels of Internet users worldwide continues to grow. Viral marketing allows companies, political parties, social causes, and other groups to spread their message easily from one individual to that person's "communities of friends, relatives, colleagues, peers, and people with common interests and tastes," Myron added.

It is also easier for marketers to track the spread and effectiveness of their viral messages than it is to quantify return on investment for traditional techniques. For example, Smith noted that the analytic tools on YouTube show

how much distribution an individual video gets. Similar measurement tools are available for corporate Web sites, photo-sharing sites, e-mail campaigns, and other platforms commonly used in viral marketing.

Viral marketing becomes even more effective when it targets influencers people who are natural leaders in a community and whose recommendations carry weight with others in the group. In "The Cure for the Common Virus," Jessica Tsai notes that influencers are "more willing to recommend, they're more connected, charismatic, credible, and more influential in the word-of-mouth process." Marketers who can identify the influencers can gather information about what their target audience is interested in and potentially affect the behavior of those consumers.

A related advantage is that viral marketing provides a method for avoiding the challenges of unwanted e-mails ("spam"). A message from a person's trusted contact has a much higher change of getting through to the recipient, plus the e-mail is more likely to be opened and the contents will carry more validity because it comes from a known acquaintance. Many Web sites and social networks have a button that allows viewers to forward their content to a friend to encourage viral distribution of videos, games, news articles, and other resources.

VIRTUAL PRIVATE NETWORKS

Virtual private networks (VPNs) are systems that use public networks to carry private information and maintain privacy through the use of a tunneling protocol and security procedures. By using the shared public infrastructure, these ***virtual*** private networks are far more cost effective than were early ***real*** private networks which companies built using costly private lines and systems. In a VPN some of the parts of the network are connected using the Internet (the public infrastructure). Data that travel over the Internet are encrypted, so the entire network is "virtually" private. This allows users to share private information over a public infrastructure. A typical VPN application would be one created by a company with offices in different cities. By setting up a VPN the company uses the Internet as the connector between the networks in its two offices, effectively merging their networks into one. Encryption is used on all transmissions within the network that use the Internet link, making it a private network.

The public infrastructure that provides the backbone for most VPN systems is the Internet. VPNs can connect remote users and other off-site users (such as vendors or customers) to a larger centralized network. Before the Internet, and particularly before the easy availability of high-speed and broadband connections to the Internet, a private network required that a company install proprietary and very expensive communication lines. The expense of such an investment once put private networks out of the reach of most small to mid-size firms. This is no longer the case. This fact, along with the universal appeal of the Internet, has enabled the rapid spread of VPN technology. The result is remote access that is quicker, more secure, and wider in scope. However, although there are benefits from the use of VPNs and even a driving business imperative to use them there are also significant concerns associated with their use. As a *Businessweek* article noted, "Sending information over the public Internet can be risky, not to mention slow. Yet providing remote access to critical business information is often necessary for small businesses looking to accelerate growth."

STRUCTURAL OVERVIEW OF VPN SYSTEMS

In the most basic terms, a computer network is a group of computers that are connected with cable. Usually, one or more computers acts as a server within the group. A network may also be formed with computers that communicate through wireless connections, but the wireless signal must be caught and transmitted by hardware that is located reasonably near both the sending and receiving machines.

Companies have long networked computers. Until the advent of the Internet, however, the entire infrastructure of these networks had to be built by the companies themselves. They had to purchase and lay cables to connect their computers. They had to purchase and install boosters or repeaters to augment the signals transmitted through cables when large distances were involved. They had to lease high-capacity, dedicated phone lines in order to connect computers or networks in remote locations. They had to build or lease transmission towers in order to send wireless signals long distances, and they had to purchase and install the systems used to send and receive these signals. Not surprisingly, most companies did not go far beyond networking computers in a single building since the cost of the infrastructure requirements for anything larger were prohibitive.

With the advent of the Internet and the growth in availability of high-speed, broadband communication lines, new technologies were developed to use the Internet as the conduit through which to connect remote computers or networks. A company no longer had to absorb the full cost of building the infrastructure needed for wide area networks (WANs).

THE COST OF VIRTUAL PRIVATE NETWORKS

The costs of implementing a virtual private network are reasonable for any company that already has a network and high-speed access to the Internet. The two biggest components of a VPN, for those with networks in place, are the software and setup of the same, and the need in many cases to upgrade the Internet connection service. Because a VPN uses the Internet address of the network server as the access for those logging on the system through the Internet, a company must have a static IP address. Internet Service Providers usually charge slightly more for a service that holds the IP address static.

The software needed to manage a VPN is commonly sold as a part of many network operating systems. Setting up this software takes networking knowledge but can be done by any competent network administrator or network outsourcing supplier.

When a business decides to use an outside provider, it immediately eliminates any costs for purchasing and maintaining the necessary equipment. The most the business will have to do is maintain security measures (usually a firewall) as well as provide the servers that will help authenticate users. Of course, this too can be done by an outside provider for an additional price. Outsourcing also cuts down on the number of employees that would be required to manage and maintain the virtual private network.

For a firm that does not already have a computer network with Internet access, the task of setting up a VPN is a much larger undertaking.

VIRTUAL PRIVATE NETWORKS AND SECURITY

Virtual private network systems are constantly evolving and becoming more secure through four main features: tunneling, authentication, encryption, and access control. These features work separately, but combine to deliver a higher level of security while at the same time allowing all users (including those from remote locations) to access the VPN more easily.

Tunneling creates the connection between a user (either from a remote location or separate office) to the main LAN. This connection is called a tunnel and is essentially the circuit-like path that transfers encrypted private information through the Internet. This requires an IP address which is an Internet address to which the client PC can direct itself, a pointer to the company network. Unlike other IP addresses, this one is not open to the public but is rather a gateway through which VPN users may enter, and after authentication and logging on, have access to the network.

To avoid crowded connections, a tunneling feature called "switching" was developed. This feature helps differentiate between direct and remote users to determine which connections should receive the highest priority. The switching can either be programmed directly into the virtual private network or upgraded so that the hardware recognizes each connection on an individual basis.

Incoming callers to the virtual private network are identified and approved for access through features called authentication and access control. These features are usually set up by the IT manager who enters a user's individual identification code or password into the main server, which cuts down on the chances that the network can be manipulated from outside the company. Authentication also offers the chance to regulate access to the material on the LAN so that users can be provided access to specific information only.

Encryption is the security measure that allows information on virtual private networks to be scrambled so that it becomes meaningless to unauthorized users. Encrypted data is eventually unscrambled at the end of the tunnel by a user with the proper authorization. This process is usually

done via a private IP address that encrypts the information before it leaves the LAN or a remote location. There are two main types of encryption systems: symmetric-key encryption and public-key encryption. With symmetric-key encryption, each computer is equipped with a secret key that it uses to encrypt information before it is sent over a public network to another computer. To use this kind of encryption, the key is installed on each computer that will share information. The key code essentially provides to key to decode incoming messges. Public-key encryption combines the use of a private key and a public key. The private key is known only to one computer while the public key is given to other computers. Decoding an encrypted message requires the use of the public key and a private key.

Despite these precautions, some companies are still hesitant to transfer highly sensitive and private information over the Internet via a virtual private network and still resort to tried-and-true methods of communication for such data.

THE FUTURE OF VIRTUAL PRIVATE NETWORKS

Virtual private networks have continued to evolve rapidly during the twenty-first century. The number of outlets hosting VPNs has multiplied, and several providers have experimented with running VPNs over cable television networks, a solution that offers high bandwidth and low costs but less security. The rapid spread of wireless technology toward the end of the first decade of the twenty-first century has accelerated the deployment of VPNs, as has the development of a new protocol for VPN systems, the Secure Sockets Layer or SSL. According to an article in *Network World*, "The biggest difference between SSL VPNs and traditional IP Security VPNs is that the IP Security standard requires installation of client code on the end user's system, while SSL VPNs focus on making applications available through any Web browser."

The popularity of VPNs continues to grow and evolve, providing companies of all sizes a means with which to leverage the Internet to reduce the costs of communication. However, with rapid changes in technology continuing to occur, and the ever-present need to innovate to maintain a competitive edge, new developments and innovations always threaten to overawe IT managers and particularly small-business owners. As Gail La Grouw notes in *Getting to Cloud*, "No longer is the business waiting for suitable tools they now simply cannot keep up with the number of tools being announced, or launched onto the market."

VIRTUAL WORLDS

A virtual world is an offshoot of virtual reality concepts and technologies. It does not exist in a physical sense. Rather it portrays traits from the physical world in an alternative reality that is sustained in cyberspace. Users can interact with the computer-generated environment and with other users, represented in three-dimentional character form called avatars, to affect and assess outcomes. This is of particular interest to businesses, which are increasingly realizing that virtual worlds are more than just "massively multiuser online games" (MMOGs) for computer geeks. Virtual worlds have the ability to transform the way businesses operate by providing a new template for collaboration, training, marketing, and product development.

Virtual worlds can be traced to NASA technology from the early 1970s. At that time, developers had created a game called Maze War in which eyeball avatars were controlled by users on networked computers. In 1986 LucasFilm Games created Habitat, a more two-dimensional environment with humanoid avatars, that was played through an early online service called Quantum Link. It was not until the advent of the World Wide Web in the mid-1990s, however, that

virtual worlds resembling today's versions began to appear. They began to falter almost immediately due to rigorous hardware and bandwidth requirements and rapid deflation of the dot-com bubble.

Virtual worlds got a second chance with Linden Lab's Second Life. Launched in 2003, Second Life enables participants to explore diverse landscapes and cityscapes, chat with friends, build virtual homes on plots of imaginary land and conduct real business with money that can be converted into U.S. dollars using a credit card at online currency exchanges. Businesses soon began to take notice, and it was not long before major marketers such as Coca-Cola and Adidas launched their own virtual sites within the Second Life world. By 2006 many of the major media companies, including Turner, Viacom, Disney, and the BBC, began introducing their own virtual worlds outside of Second Life tailored to targeted audiences. Every year more and more businesses, large and small, leap onto the virtual bandwagon.

VIRTUAL WORLDS IN BUSINESS

According to technology and market research company Forrester Research, the market for virtual worlds is doubling year over year, with estimated annual revenue of $8-10 billion anticipated in 2015. Small businesses seeking to enter the market should approach it like any other business activity with intent. Small-business owners must define the business imperative driving the move, says Erik Hauser, president of virtual world consultancy Swivel Media. He says: "You've got to answer the fundamental question of 'why'. . . Your virtual presence needs to be strategized like any normal marketing program. The reason might be to recruit technology personnel or do business online, but once you understand 'the why,' then all the other decisions will flow naturally." Those decisions include which platforms to use, which technology providers to partner with, and how best to use the virtual environment to achieve real-world internal and external business goals.

The two key points that small-business owners must remember, according to Forrester Research, is that virtual worlds are not all about avatars and conferencing. A company's avatar(s) should strive to provide a good graphical representation of the business, and nothing more. Showy graphics are unnecessary and could be costly in terms of development and maintenance. Similarly, small businesses should view virtual communication as the new world that it is, not merely as oversized Web conferencing. The virtual environment offers interaction and experiences within a framework that both simulates and stimulates the full range of human activities, providing invaluable opportunities for collaboration and learning. Companies are not restricted by directed online meetings and static PowerPoint presentations. They can use virtual worlds such as Second Life, HipiHi, Qwaq, There.com, and ActiveWorld to engage employees and facilitate teamwork through interactive virtual workshops, panel discussions, retreats, training exercises, simulation scenarios, and even social events.

Virtual worlds also provide small businesses with new channels to promote their brand and the company's offerings externally, to current and potential vendors, partners, clients, and consumers. Marketing in the virtual world follows the basic tenets of marketing in the real world. While it does pose unique challenges as a relatively new marketing frontier, it also offers exciting opportunities for innovation approaches that may not be viable in the brick-and-mortar world of the business.

VIRTUAL WORLD CHALLENGES

Virtual worlds are not Utopia. Just like the real world, they have their own share of problems. The biggest issues associated with virtual worlds include scalability, usability, and interoperability. In terms of scalability, even the largest providers continue to be plagued by routine outages and user-volume limitations. As for usability, virtual world applications must be downloaded and configured onto user computers, posing broad challenges in terms of time and expertise for information technology departments. Moreover, many users find the virtual world interface to be more cumbersome than most business applications, requiring a mastery of new keystrokes and mouse movements in order to interact even at a basic level in the virtual world. Interoperability is also a key challenge. The principal players in the burgeoning virtual world market have so far preferred to develop their own environments to attract customers rather than creating worlds that can interact with each other. Even if they did decide to play in the same sandbox, so to speak, they would face a mountain of technological hurdles. Just to name a few: avatar configuration and security credentials would need to transition between worlds, cross-platform communications and travel would be required, virtual objects would have to be made transferable, and accommodations would have to be created to handle currency exchange.

As with any new frontier, virtual worlds present a mix of challenges and opportunities. For small businesses, the virtual world environment can provide cutting-edge tools and technologies to improve innovation, execution, and results throughout the company.

WARRANTIES

A product or service warranty (also known as guarantee) is a promise, from a manufacturer or seller, to stand behind the product or service. It is a statement about the integrity of the product and about the seller's commitment to correct problems should the product or service fail. Product and service warranties have become standard practice in most U.S. industries, although opinions vary somewhat regarding their impact on sales. But misleading language in these guarantees has the capacity to spark significant legal troubles for small businesses that run afoul, however inadvertently, of legal guidelines. Consumers can ask the courts to enforce warranties, whether they are express, implied, written, verbal, or given in any other way. Federal, state, and local government entities establish the regulatory basis upon which warranties are judged. The Federal Trade Commission (FTC) is the ultimate arbiter of warranty law in the United States. The FTC's primary tool in monitoring product and service guarantees is the Magnuson-Moss Consumer Warranty Act.

According to a 2009 report from *Warranty Week*, lowered sales and profits in 2009 had a negative effect on product warranty financing for many businesses. The report states that, "U.S.-based manufacturers paid out $25.2 billion to satisfy warranty claims worldwide, a 12.2 percent reduction from 2008. But they set aside only $21.1 billion to finance future warranty claims, a 22.3 percent reduction. And as a result, they saw their collective warranty reserves shrink from $37.8 billion at the end of 2008 to $33.8 billion at the end of 2009." As with all business decisions, small businesses should consider carefully whether to offer warranties other than the ones required by law.

EXPRESS AND IMPLIED WARRANTIES

The law recognizes two basic kinds of warranties implied warranties and express warranties.

Implied Warranties. Implied warranties are unspoken, unwritten promises, created by state law, that go from the seller or merchant to the customers. Implied warranties are based upon the common law principle of "fair value for money spent." The Uniform Commercial Code (UCC) provides for two basic types of implied warranties that occur in consumer product transactions. They are the implied warranty of merchantability and the implied warranty of fitness for a particular purpose. The "implied warranty of merchantability" is a seller's basic promise that the goods sold will do what they are supposed to do and that there is nothing significantly wrong with them. In other words, it is an implied promise that the goods are fit to be sold. According to the law, merchants make this promise automatically every time they sell a product they are in business to sell. By contrast, the implied warranty of "fitness for a particular purpose" is a promise that a seller makes when the customer relies on the advice that a product can be used for some specific purpose. For example, suppose a woman comes to an office supply store and asks for a printer that is able to print 1,000 sheets of paper per hour. If the office supply company recommends a particular model, and the customer buys that model on the strength of this recommendation, the law says that the office supply company has made a warranty of fitness for a particular purpose. If the printer recommended proves unable to produce 1,000 pages per hour, even though it may effectively print 800 pages an hour, the implied warranty of fitness for a particular purpose is breached.

Express Warranty. Unlike implied warranties, express warranties are not automatically a part of the sales contract based on state law; rather, they are explicitly offered warranties. They are promises and statements, made voluntarily by the seller or manufacturer, about a product or service and about the commitment to remedy defects or malfunctions that the customer may experience. Express warranties can take a variety of forms, ranging from advertising claims to formal certificates. An express warranty can be made either orally or in writing. While oral warranties are important, only written warranties on consumer products are covered by the Magnuson-Moss Warranty Act.

ELEMENTS OF A WARRANTY

The Federal Trade Commission requires that written warranties bestowed in connection with the sale of a product or service explicitly detail the following information:

- Who is covered by the warranty
- Length of warranty
- Description of the products, parts, properties, or characteristics covered by or excluded from the warranty
- Steps for customer in the event that warranty coverage comes into play
- Warrantor's response when confronted with product/service malfunctions, defects, or failures
- Any exclusions of or limitations on relief such as incidental or consequential damages
- Statement that indicates that some states do not allow such exclusions or limitations
- Statement of consumer legal rights
- Any limitations on the length of implied warranties, if possible

FULL AND LIMITED WARRANTIES

The Magnuson-Moss Act does not require businesses to provide warranties to customers. Indeed, some business owners decide that written warranties are not even necessary to enjoy success in their chosen field of endeavor. But other manufacturers and retailers are convinced that warranties help sell their products, pointing to the popularity of service contracts and the like.

Businesses that choose to provide written warranties may choose from two types: full and limited. FTC regulations concerning full warranties are considerably more stringent than those that apply to limited warranties. According to the Magnuson-Moss Act, "fully guaranteed" products or services must meet the following five criteria:

- Customer receives full money back or replacement or repair of any defective part of product in the event of a complaint
- Prompt and free repairs
- If repairs are not fully satisfactory to the buyer, a prompt refund is available
- Customer has no responsibility beyond reporting the defect to the company
- Acknowledgment of all implied warranties

Limited warranties, which must be prominently labeled as such, limit the liability of the manufacturer or service provider. A limited warranty may offer to replace defective parts free, but only do so for a limited length of time, or require that the consumer ship the product to a manufacturer-approved service center. The distinctions between full and limited warranties and the obligations of manufacturers to honor them vary from state to state, so it is up to the consumer to read the literature carefully and understand what is covered before the purchase.

Disclaimers. Vulnerability to express or implied warranties can be reduced somewhat through the use of disclaimers. A disclaimer is a means of denying that a seller is making one or more express or implied warranties. In the absence of a disclaimer, a breach of warranty will often give the purchaser of the faulty item the right to recover the cost of the item as well as additional damages caused by that breach of warranty.

Small-business consultants note that warranties both express and implied can be negotiated with buyers, but they urge business owners to use specific language when adding such disclaimers to a sales contract. The term "exclusive remedy," for instance, can give a seller of products or services significant legal protection when it is used to explicitly limit a buyer's legal options in the event of complaints about product defects or workmanship. If, however, the customer is left without a working product, the seller may be sued no matter what agreement was signed, on the grounds that it's a remedy that "fails of its essential purpose." Obviously, the obligations imposed by law in the areas of warranty are extensive, so small-business owners should make sure that they consult a legal expert so that they can develop the most effective disclaimer possible.

EXTENDED WARRANTIES

Extended warranties are somewhat controversial, but often profitable, warranty packages offered by manufacturers and service providers. Manufacturers sell these warranties, which are basically extensions of basic warranty packages, in hopes that the extended warranty will not be needed or used, thereby resulting in profits. Consumers buy them for

peace of mind, reasoning that they are protecting their initial outlay of money. Many consumers eschew extended warranties, believing them to be unnecessary; however, a report issued by the Service Contract Industry Council in early 2010 indicated that purchases of extended warranties were up 10 percent in 2009.

There is some controversy around what the warranties cover. Some extended warranties are actually service agreements, resulting in higher charges than might be expected under a warranty. In other cases the fine print in the warranties exclude the very things that the consumer assumes would be covered.

WEB PROGRAMMING LANGUAGES AND TOOLS

Web programming languages (scripting languages) and tools are used to create Web site layouts and place objects within those layouts. These languages differ from ordinary programming languages in their capabilities: scripting languages are used mostly for design and display, not to create computer programs. There are a wide variety of web programming languages for a small business to choose from when deciding how to create a Web site presence.

HTML AND XML

Hypertext Markup Language (HTML) is an authoring tool that is used in creating Internet Web pages. When using HTML a block of text is surrounded with tags that indicate to an Internet browser how the text is to appear (for example, in bold face or italics). HTML is a collection of platform-independent styles (indicated by markup tags) that define the various components of a Web document. It is the preferred tool for creating Web pages because it is understood by all Internet browsers. Many Web designers who use HTML find it simple to learn and easy to use, because it offers a stripped-down approach to Web design that does not rely a lot on extraneous features.

Because of HTML's weaknesses in the area of graphics, a tool known as dynamic HTML was created to enhance the capabilities in Web page design. Several other tools were also designed to replace HTML, such as eXtensible Markup Language (XML), which allows for the standardized exchange of information between computers. XML uses a similar framework to HTML but streamlines certain capabilities for modern Web design. When people refer to HTML programming they generally mean XML. CFML, an alternative programming language that stands for ColdFusion Markup Language, is also popular. ColdFusion is used to create more detailed and dynamic pages with a mixture of HTML and CFML languages.

HTML Options. Small businesses will typically find that some HTML knowledge is necessary no matter what type of scripting language or Web applications they choose to use. Since it is so basic, HTML forms the foundation of much Web design, and even businesses that have little interest in creating a Web page from the ground up may need to use HTML in certain situations. Other types of popular scripting languages are used within HTML, requiring a knowledge of both formats.

While HTML may be useful when creating business blogs or other low-maintenance Web sites, it is vital when using a Web design program. These programs essentially allow a person to move and manage large chunks of HTML code without having to type it all out or even know the specifics of the code itself. The programs are very useful when building a simple business Web site with an outside application. It is not easy to get away from HTML no matter what type of Web site or scripting language is being used.

The Drawbacks of HTML. HTML is not a perfect tool for designing graphic-intensive sites or those that contain a large overall amount of information. The fact that the documents contained in a HTML structure are static pages does not make it the tool of choice for sites that contain animation, either.

HTML also lacks the ability to create custom window sizes, compress files, and implement other standard navigational controls. Distribution size is also a crucial issue because the standard HTML file format is not suited for delivering a large amount of content over a network. In addition, an HTML programmer may have difficulty dealing with a large number of HTML and graphics files at once. Certain software does exist to help deal with all of these problems.

JAVASCRIPT

JavaScript is strictly a scripting language that is used to create small programs that are used from within Web browsers. It should not be confused with the programming language Java, which a separate protocol for creating entire computer programs. JavaScript is very popular for building Web sites that allow interaction between viewers, the browser, and the Web content.

Using JavaScript, a small business can create more complex visuals within the HTML building blocks of a Web site, giving viewers visual feedback that changes a button when they move their mouse over it, or displaying certain text in a status bar. Short animations can also be programmed in with JavaScript, along with changing time or date boxes. JavaScript can also be used to manage more analytical functions, such as altering Web site information based on the type of browser a viewer is using.

JavaScript is very popular as a browser-side scripting language, which means it is used to run Web-based programs on the viewer's computer. Some viewers and businesses may block JavaScript for security reasons, which can lower the possible audience for a small business's Web site, but this is rare. If a business is designing a Web site using an HTML structure then JavaScript is very useful and can be included to enhance the Web site visually. Costs are typically limited to learning JavaScript itself, since most HTML applications will naturally support it while building a Web site.

PHP

PHP is another popular scripting language and, mark-up values aside, can resemble JavaScript to many untrained users. However, the two languages are used for very different things. PHP is used to generate HTML content and perform Web-based tasks on servers. This means that it runs programs on the server itself, instead of when the browser window is opened (client-based). This means that a small business will be able to test its JavaScript by simply going to its own Web site, but will need to test PHP by using a different Internet connection entirely and accessing the server from the outside.

Typically, PHP is used for powerful Web sites that need to accomplish a variety of tasks quickly for many different users. This makes it very popular for e-commerce sites. A typical Web site has both JavaScript and PHP elements, with a focus on JavaScript because of its user orientation.

RUBY

Ruby is a highly object-oriented programming language that has risen in popularity thanks to the development of Ruby on Rails. Ruby itself is an amalgam of Perl, Smalltalk, and other older computer languages, and is designed to be more intuitive and minimalistic, which makes it easier for people to learn and use in a variety of programming situations.

The flexible programming language specifically useful in a Web context is the Ruby on Rails program, a free Web design system that is used to create Web applications for clients. Ruby on Rails makes it very easy for small businesses to create simple but powerful tools for clients to use, such as search engines, forums, or auction sites. However, for a site that focuses on Web design and information, Ruby on Rails is rarely needed. If a small business is interested in a hybrid site, it could consider pairing Ruby with scripting language to create a workable design.

CASCADING STYLE SHEETS (CSS)

Cascading Style Sheets (CSS) is a ubiquitous method of Web site design. It is not so much a scripting language as a grammar for existing scripting languages, specifically basic HTML. It is used to reduce loading times, make sites easier to navigate, and allow search engines to access Web sites more easily, which are all good things from a small-business perspective.

The goal of CSS is to separate the elements of the Web page into content and design, so that the design can be changed and the content will smoothly follow without being interrupted or misplaced. CSS deals with the design elements, while HTML and scripting languages deal with the content. Using CSS applications, basic design structure can be created and then applied to a wide variety of Web pages, making it easy for a business to change a Web site as well as create it. Many Web design programs, such as Dreamweaver, allow users to write CSS.

ACTIONSCRIPT

ActionScript is an Adobe scripting language that is used with Flash creators and players. Flash is an animation format that can be used to create interactive multimedia applications for Web sites. ActionScript is used while creating a Flash program and when publishing a Flash project online. Businesses can use Flash to give their Web sites a highly dynamic and animated feeling, and Flash is often used for Web site introductions along with other important animations.

While ActionScript is very easy to learn and use, it has a very narrow scope of use (only Flash projects) and may be one of the most expensive scripting languages, since it requires buying at least a Flash player program that allows businesses to design and integrate their own Flash projects. However, if the business already uses Adobe's Dreamweaver to construct Web pages, then Flash can be incorporated with minimal effort, and ActionScript can be considered a worthwhile pursuit.

WEB PROGRAMMING TOOLS

Programming tools refers to all the applications used by Web designers to help build Web sites and their background functions. There are many of these tools, and they range from free applications that can be downloaded online to complicated programs which are able to handle a variety of tasks. Small businesses will probably already be equipped with some of the basic tools needed to start programming, such as Microsoft Notepad, but other tools are often needed, such as:

- Java. The Java platform allows people with experience in JavaScript to construct and deploy different kinds of Java applications for Web site activity. There are Java Platform kits designed especially for businesses.
- Topstyle 4. Topstyle is a CSS editor that allows small businesses to do basic style design and several very useful functions, including the ability to preview Web pages before publishing them and see what they will look like on multiple browsers, depending on what browsers clients are likely to use.
- Flash 4. This popular Flash program is used to create and publish Flash animation projects, and is very useful for most types of macromedia work for businesses interested in creating a more interactive Web site.
- 1st Page 2000. This is a free HTML editor that is very useful for small businesses looking for an inexpensive and basic method to construct Web pages. It includes a variety of JavaScript and Perl scripts for specifying basic functions.
- Photoshop. While Photoshop is not used to build Web sites or any of their component parts directly, it is used by most Web developers to improve any type of image before it is published online. As a quality control and development tool it is very valuable and can be incorporated into any Web design plan.

WEB SITE DESIGN

Web site design is the process of creating a site on the Internet. Internet users view Web sites with a software program known as a Web browser. Each Web site has a unique address usually referred to as a unique resource locator or URL. Web sites can consist of text, graphics, audio files, video files, and animation. For many businesses, a Web site can be a virtual "storefront" that enables the company to sell products and services to customers and clients around the world at a relatively small price.

The most common way that small companies establish a presence on theInternet is by setting up a simple homepage that provides potential customers with information on

the company and its products. This can include computerized versions of brochures and press releases; product catalogs, complete with photos; a company overview; news and notes related to the industry the company serves; and contact and technical support information. This makes it easy for consumers to locate information about the company 24 hours a day.

Business Web sites also provide visitors with the means to order goods and services electronically. With direct online purchasing, customers identify an item they wish to purchase from the company, fill out an order form and provide their credit card number, and then transmit that information electronically to the company. The product is then shipped directly to the customer. The advantages to this method of selling are obvious. Instead of being restricted to a local market, even the smallest company can now reach users around the world. Customers can locate information about the company or order a product 24 hours a day. Customers with questions can now find very specific information about a company's products or services.

HOW TO DESIGN A WEB PAGE

When designing a Web page, certain information should always be included:

- Basic Company Information. This can include vision or mission statements, a history of the business, and a summary of business philosophy.
- Product Line Information. Commercial Web pages should include photos and text descriptions outlining the benefits of the products. Features, applications, and examples can also be highlighted. Consultants often recommend that businesses establish separate pages or sections for each major product line.
- Technical support. Frequently asked questions, parts information, product diagrams, and technical specifications are just some of the ways a company can provide support from its Web site.
- Ordering information. Companies should include an electronic mail or hardcopy form with instructions on how to order a product.
- Service section. Free information that is of interest to potential customers, including news articles and industry updates. This is useful when selling business to business or when advertising to professional clients who are knowledgeable about the industry.
- "What's New." This section is essentially intended to inform visitors of new initiatives or products that are covered on the Web site.

Web pages are often written using a language called the Hypertext Markup Language. HTML, as it is more commonly known, is a series of tags and codes that instruct a Web browser on how the text on that page should be displayed. Once a page has been written using HTML, the page must be placed on the host computer, or server, of an Internet provider. HTML can be created using any common word processing package or via any one of the proliferating HTML editor software packages available in the marketplace.

Having a Web site does not, of course, guarantee visitors. As the Internet has grown it has become much more like any other established marketplace. To attract visitors and attention requires a great deal of marketing work. Web design firms can be very helpful in establishing a marketing program designed to promote a new Web site. By advertising it in other Internet locations, new site exposure can be increased dramatically.

Small businesses should be sure to test prototype sites to ensure their site is free of flaws and has the desired layout. Some small businesses hire independent Web site designers to create a more artistic and appealing Web site than they have the capability to create themselves. Typical costs for a third-party design run from $500 to $1,000 for basic construction. A small business should also factor in other costs, including several hundred dollars for the necessary software to manage the site and monthly payments if the server capabilities are outsourced.

STEPS TO USABILITY

Usability is the most important factor when establishing a business Web site. It refers to the collective appearance and handling of the Web site from the perspective of the customer. Guidelines have been established for creating a website with good usability using primary components such as:

- Homepage. The homepage is the first thing a visitor will see and is very important in terms of message and aesthetics. It should be simple, elegant, and focus only on one or two primary images. Tabs linking to other information in the Web site should be easily accessible. If the business has a hook or a special kind of differentiation, the homepage should be constructed to advertise it.
- Flow. Flow refers to how the Web site guides viewers through its features and allows them to find necessary information. A Web site with good flow should never confuse the viewer, but should instead direct a viewer to the desired page with minimal effort. The best business Web sites are intuitive and uncluttered, with layouts that are easy to understand.
- Navigation. While flow involves the intuitive structure of the Web site, navigation refers to moving between pages on the Web site. Is the navigation bar easily accessible and always in the same place without being distracting? Are the links named accurately? Is the Web

site divided by products, different types of services, or business divisions?

- Readability. As a rule, the text should be large enough to be easily read but small enough to include enough pertinent information. The color of the text and the color of the background should complement each other. Readability also covers white space, proper placement of images, and other aesthetic features.
- Search. Most business Web sites should have a search function that allows viewers to look for a specific product or section of information. This search bar should always be easily accessible. There are many different types of searches that can be conducted, depending on the search engine and scripting code being used. Testing is an important step in making search options intuitive and accurate.
- Consistent Interface. Whatever style a small business chooses for its Web site, it should keep that style throughout its pages so that they display a sense of cohesion.

When small businesses begin to focus on these important features and what data the Web site will include, it is helpful to find out what sort of questions customers have. Many small businesses conduct informal interviews with customers that pass through to find out common questions. This gives the business a good idea of what information should be placed on the Web site. When a basic layout is created, the business should also test out the prototype before it goes online. Again, one easy way is to print out the primary Web pages and ask for customer opinions on them.

POSITIONING AND MAINTAINING A BUSINESS HOMEPAGE

Even after a Web site has been successfully launched and is up and running, the work does not end. The site needs to be updated on a regular basis to ensure continued content integrity, either by the small business or an outside firm. Businesses should be sure they consistently update important product information such as price changes and alterations to the availability or features of products. If the business expands in new areas, then the Web site should expand in a similar way. Links should be carefully monitored and eliminated or updated to keep information current. Images that portray products, people, and storefronts should also be updated at intervals to reflect current changes.

WEB 2.0 STRATEGIES

Web 2.0 refers to the collaborative and social aspects of the Internet and how businesses can use these aspects to their benefit. Some Web 2.0 features are well known, such as blogs and social network sites. These tools can add informality and develop valuable relations for a small business. Websites should always include links to Facebook pages or Twitter feeds, and if the business has a blog then it should have a primary link in the Web site structure.

Other Web 2.0 applications are less known but still valuable. Mobile integration, or the ability of Web pages to have an accurate alternative format for viewing over cell phones or PDAs, is a consistently growing trend and should be embraced by small businesses. GPS services, if applicable, are also an excellent way to attract customers with location-based services. Other 2.0 applications involve online payment plans and other financial features that make it easier for customers to pay how they want.

WHOLESALING

Wholesalers are "middlemen." Wholesaling is the selling of merchandise to anyone person or organization other than the end consumer of that merchandise. Wholesalers represent one of the links in the chain along which most

goods pass on their way to the marketplace. As intermediaries between producers and consumers of goods, wholesalers facilitate the transport, preparation of quantity, storage, and sale of articles ultimately destined for customers.

The U.S. Department of Labor's Bureau of Labor Statistics (BLS) states, "Wholesale trade firms are essential to the economy. They simplify flows of products, payments, and information by acting as intermediaries between the manufacturer and the final customer.... They provide businesses, institutions, and governments a convenient nearby source of goods made by many different manufacturers, which allows them to devote minimal time and resources to transactions. For manufacturers, wholesalers provide a national network of a manageable number of distributors of their goods that allow their products to reach a large number of users. In addition, wholesalers help manufacturers by taking on some marketing, new customer sales contact, order processing, customer service, and technical support work that manufacturers otherwise would have to perform." For the most part, wholesale businesses are small businesses. According to BLS, there were six million people working in the wholesale trade in 2008. Most workplaces employ fewer than twenty workers approximately 90 percent of wholesalers in the industry.

Wholesalers are successful only if they are able to serve the needs of their customers, who may be retailers or other wholesalers. Some of the marketing functions provided by wholesalers to their buyers include:

- Offering the goods of a producer to resellers in appropriate quantities
- Providing wider geographical access and diversity in obtaining goods
- Ensuring and maintaining quality verification with the goods that are being obtained and resold
- Providing cost-effectiveness by reducing the number of producer contacts needed
- Offering ready access to a supply of goods
- Assembling and arranging goods of a compatible nature from a number of producers for resale
- Minimizing buyer transportation costs by buying goods in larger quantities and distributing them in smaller amounts for resale
- Working with producers to understand and appreciate consumerism in their production process

TYPES OF WHOLESALERS

There are a number of ways to classify wholesalers. The categories used by the U.S. Department of Commerce in preparing its various Economic Census Reports are the ones used most often. The three categories used in the Census of Wholesale Trade are: 1) merchant wholesalers; 2) agents, brokers, and commission merchants; and 3) manufacturers' sales branches and offices.

Merchant Wholesalers. Merchant wholesalers are firms engaged primarily in buying, taking title to, storing, and physically handling products in relatively large quantities and reselling the products in smaller quantities to retailers; industrial, commercial, or institutional concerns; and other wholesalers. These types of wholesaling agents are known by several different names, depending on the services that they provide. These merchant wholesaler names include, jobber, distributor, industrial distributor, supply house, assembler, importer, exporter, or simply, wholesaler.

The merchant wholesaling category can be further broken down. There are two basic kinds of merchant wholesalers: 1) service (sometimes referred to as full-service wholesalers); and 2) limited-function or limited-service wholesalers. Businesses in the latter category, which itself is often divided up into little niches, offer varying levels of service in such areas as product delivery, credit bestowal, inventory management, provision of market or advisory information, and sales.

Agents, Brokers, and Commission Merchants. Agents, brokers, and commission merchants are also independent middlemen who usually do not take title to the goods in which they deal, but instead are actively involved in negotiating and other functions of buying and selling while acting on behalf of their clients. Commission merchants typically deal with agricultural goods and commodities like cement, steel, or coal and the like. These types of wholesalers are usually compensated in the form of commissions on sales or purchases. Agents, brokers, and commission merchants usually represent the noncompeting products of a number of manufacturers to several retailers. This category of wholesaler is particularly popular with producers with limited capital who cannot afford to maintain their own sales forces.

Manufacturers' Sales Branches and Offices. Manufacturers' sales branches and offices are owned and operated by manufacturers but are physically separated from manufacturing plants. They are used primarily for the purpose of distributing the manufacturers' own products at the wholesale level. Some have warehousing facilities where inventories are maintained, while others are merely sales offices. Some of them also wholesale allied and supplementary products purchased from other manufacturers.

THE CHANGING LANDSCAPE OF WHOLESALING

The BLS projects that employment in the wholesale trade will grow by only 4 percent from 2008 to 2018, compared to 11 percent growth projected for all industries. Two main

factors are contributing to this slow employment growth, and the related changes taking place within the wholesale industry: 1) the spread of new technologies improving efficiency; and 2) consolidation within the industry. Both of these trends are likely to remain strong well into the twenty-first century.

As the BLS noted, " There is strong competition among wholesale distribution companies, manufacturers' representative companies, and logistics companies for business from manufacturers. Cost pressures are likely to continue to force wholesale distributors to merge with other firms or to acquire smaller firms." This consolidation is being aided by the spread of new technologies that are able to serve their customers better and in many cases develop systems that interact automatically with those clients.

Inventory management is one area in which wholesalers may be able to offer added value to their clients on both ends of the relationship, their suppliers and their customers. One of the newest trends in the area of inventory control and management is vendor-managed inventory (VMI) systems and agreements. One way in which a wholesaler can participate in a VMI system is by agreeing to take over the inventory management for its customers. Based on daily reports sent automatically from the customer to the wholesaler or distributor, the wholesaler replenishes the customers' stocks as needed. The wholesaler sees what is selling in the customers' place of business and makes all necessary arrangements to send the customer new products or parts automatically. No phone calls or paperwork are necessary, which allows the supply chain process to remain uninterrupted.

The benefits that can accrue to both parties in a VMI arrangement are noteworthy. Both parties should experience a savings of time and labor. The customer is able to maintain fewer items in stock and can rely upon a steady flow of products or parts. The wholesaler benefits in two ways. First, the wholesaler is able to anticipate the customers' requirements better. Second, the wholesaler benefits from a strong relationship with the customer, one that is more difficult to alter than would be a vendor-customer relationship in which such automated systems did not exist.

Another new technology is radio frequency identification (RFID), which has the potential to streamline the inventory and ordering process further and replace the need for manual barcode scans, eliminating most counting and packing errors. As the BLS noted in its 2009 report on wholesalers, "Radio frequency identification (RFID) technology is being used more frequently by larger wholesale distributors with warehouses. RFID tags coupled with a satellite and receiver system allow wholesalers to keep track of the goods they have in stock and through transit to ensure delivery. RFID technology has the potential to streamline the inventory and ordering processes, eliminating the need for manual barcode scans and reducing counting and packing errors. However, not all wholesalers will implement this technology as it may not be cost-effective for some smaller firms or clients."

Perhaps the strongest factor influencing consolidation is the e-commerce enabled by the Internet, which makes it easier for firms to bypass wholesalers to order directly from manufacturer and suppliers. As e-commerce spreads, wholesalers are responding by putting more emphasis on customer service, offering services such as installation, maintenance, assembly, and repair, in an effort to distinguish themselves from other suppliers.

WIDE AREA NETWORKS (WANS)

A wide area network (WAN) is a data network, usually used for connecting computers or other devices, that spans a wide geographical area. WANs can be used to connect cities, states, or even countries. According to *Computer Networking for LANs to WANs: Hardware, Software and Security*, a 2009 book by James L. Antonakos and Kenneth C. Mansfield, the Internet can be seen as the "ultimate WAN." Businesses often start with a local area network (LAN), which links several workstations and computers together across a building or a few buildings. This allows the company to communicate effectively. However, as multiple LANs are created and businesses grow geographically, WANs are usually needed to allow effective communication between many computers over a wider area of space and to allow specialized devices to be added to the network.

WANs have traditionally been used by larger corporations or organizations to facilitate the exchange of data, and in a wide variety of industries corporations with facilities at multiple locations have embraced WANs. However, in the first decade of the twenty-first century, small businesses were increasingly using WANs as a way of increasing their

communications capabilities. Also, small businesses often rely on WAN providers to conduct everyday business. For example, long-distance telephone service is a WAN, and the companies that provide this service are essentially providing a WAN service.

Although WANs serve a purpose similar to that of LANs, WANs are structured and operated quite differently. The user of a WAN usually does not own the communications lines that connect the remote computer systems; instead, the user subscribes to a service through a telecommunications provider. Unlike LANs, WANs typically do not link individual computers but rather are used to link LANs. WANs also transmit data at slower speeds than LANs. WANs are also structurally similar to metropolitan area networks (MANs), but provide communications links for distances greater than 50 kilometers.

WANs have existed for decades, but new technologies, services, and applications have developed over the years, resulting in a dramatic increase in their efficacy for business. WANs were originally developed for digital leased-line services carrying only voice rather than data. As such, they connected the private branch exchanges (PBXs) of remote offices of the same company. WANs are still used for voice services but are used more frequently for data and image transmission (such as video conferencing). These added applications have spurred significant growth in WAN usage, primarily because of the surge in LAN connections to the wider networks.

HOW WANS WORK

WANs operate either point-to-point, involving a direct connection between two sites, or across packet-switched networks, in which data are transmitted in packets over shared circuits. Point-to-point WAN service may involve either analog dial-up lines, in which a modem is used to connect the computer to the telephone line, or dedicated leased digital telephone lines, also known as ''private lines.'' Analog lines, which may be either part of a public-switched telephone network or leased lines, are suitable for batch data transmissions, such as nonurgent order entry and point-of-sale transactions. Dedicated digital phone lines permit uninterrupted, secure data transmission at fixed costs. WANs may also use satellite or microwave transmission to transmit information.

Point-to-point WAN service providers include both local telephone companies and long-distance carriers. Packet-switched network services are typically chosen by organizations which have low volumes of data or numerous sites, for which multiple dedicated lines would be too expensive.

Depending on the service, WANs can be used for almost any data-sharing purpose for which LANs can be used. Slower transmission speeds, however, may make some applications less practical for WANs. The most basic uses of WANs are for electronic mail and file transfer, but WANs can also permit users at remote sites to access and enter data on a central site's database, such as instantaneously updating accounting records. New types of network-based software that facilitate productivity and production tracking, such as groupware and work-flow automation software, can also be used over WANs. Using groupware, workers at dispersed locations can more easily collaborate on projects. WANs also give remote offices access to a central office's other data communications services, including the Internet.

Not surprisingly, the focus of new WAN technology and applications is to increase coverage while also allowing more seamless transfer of multiple forms of data. In his 2008 book, *Enterprise Mobility: Applications, Technologies and Strategies*, R. C. Basole argued that the aim of most networking technologies is ''convergence,'' allowing businesses and individuals the ability to be ''always connected'' to various technologies and services. Some new technologies, such as the Femto Cell Basole describes, extend coverage of WANs. Other technologies permit specialized devices to be included in WANs. Wireless WANs allow for a wider coverage of information transmission. Other technologies allow greater integration between different uses of WANs. For example, Voice Over Internet Protocol (VoIP) systems and other technologies allow businesses to transmit data and voice information to various devices and computers.

WOMEN ENTREPRENEURS

Although popular perception has traditionally seen business as a male-dominated enterprise as evidenced by the stereotype of the male, cigar-smoking executive statistics show that perceptions as well as realities have shifted dramatically in the late twentieth and the beginning of the twenty-first centuries. In their 2009 book, *Small Business Management: Launching and Growing Entrepreneurial Ventures*, authors? Justin G. Longenecker, J. William Petty, Leslie E. Palich, and Carlos W. Moore noted that while at the start of the twentieth century most business ownership lay the in the hands of men, in the first decade of the twenty-first century, a large percentage of businesses were owned by women. Longenecker, Petty, Palich, and Moore noted that women were majority owners in about 40 percent of all U.S. firms in 2008. These firms owned by women entrepreneurs contributed $2 trillion in sales to the economy and created about 13 million jobs.

Women have owned and operated businesses for decades, but they were not always recognized or given credit for their efforts. Often women entrepreneurs were "invisible" as they worked side by side with their husbands, and many only stepped into visible leadership positions when their husbands died. But a variety of factors have combined in recent years to contribute to the visibility and number of women who start their own businesses. According to U.S. Department of Labor statistics, female participation in the workforce was less than 40 percent in 1960 but is predicted to reach 62 percent by the year 2015. As women enter the workforce in ever-greater numbers, they gain professional experience and managerial skills, both necessary to be successful entrepreneurs. Flexibility is also a factor in many women's decision to start a business. Entrepreneurship is often seen as an ideal way to juggle the competing demands of career and family. Finally, the disparity in the salaries and wages that women earn as compared to men on average has been a factor in motivating some women to decide to establish their own businesses.

According to Longenecker and his colleagues, in 2008 most women entrepreneurs owned businesses in the retail and service industries. However, that same year saw increasing numbers of women entrepreneurs enter nontraditional industries. In fact, in 2008, many of the fastest-growing construction, computer, and manufacturing companies were owned by women. In the same year, about $400 billion in revenues was generated by wholesalers and wholesaling companies owned by women.

REASONS WOMEN BECOME ENTREPRENEURS

Many studies indicate that women start businesses for fundamentally different reasons than their male counterparts. While men start businesses primarily for growth opportunities and profit potential, women most often found businesses in order to meet personal goals, such as gaining feelings of achievement and accomplishment. In many instances, women consider financial success as an external confirmation of their ability rather than as a primary goal or motivation to start a business, although millions of women entrepreneurs will grant that financial profitability is important in its own right. The importance of financial success is especially notable given the continued discrimination women face when it comes to pay in the workplace. According to a 2009 *BusinessWeek* article by Damian Joseph, women earn about 77 cents for every dollar men earn, making wage discrimination a significant issue. President Barack Obama signed the Lilly Ledbetter Fair Pay Act of 2009 to address the issue of wage discrimination, but changing long-ingrained wage discrimination may take more than a new piece of legislation. Some women also become entrepreneurs in order to bypass the corporate glass ceiling. According to Joseph, only about 28 percent of CEOs in the country's 1000 largest firms are women.

PROBLEMS FACED BY WOMEN ENTREPRENEURS

One of the main problems facing women entrepreneurs is obtaining financing. Studies have shown that women face discrimination when dealing with lenders and venture capitalists. According to Joseph's article, only about 6.8 percent of venture capital funding went to women-owned businesses in 2008. This may create a glass ceiling for women entrepreneurs. According to the Center for Women's Business Research, about 3 percent of all firms owned by women had revenues of $1 million or more. In comparison, 6 percent of companies owned by men had revenues of $1 million or more. Increased access to venture capital and other forms of funding could help more women entrepreneurs generate larger revenues and build larger companies.

In an effort to bring more equity into the capital acquisitions area, the Small Business Administration's Women's Prequalification Pilot Loan Program was developed. Introduced in 1994 and expanded nationwide in 1997, the program helps women seeking loans of under $250,000 to complete their loan applications. It also provides an SBA guarantee for repayment of their loans. Women are prequalified based on their character, credit rating, and ability to repay the loan from future business earnings, rather than on collateral. The prequalification statement from the SBA enables the women to obtain funding much more readily.

Another area in which women business owners have been historically shortchanged is procurement, or the selling of their goods and services to city, state, and federal governments. In the past, fewer than 5 percent of the women-owned firms in the United States were certified to do business with their state government, and only 1.5 percent

of the billions of dollars in federal contracts went to women-owned firms. Some efforts have been undertaken to rectify this situation. If a company is 51 percent owned and controlled by a woman, it can obtain certification and bid on government contracts. In addition, many government agencies at the state and federal levels have created set-aside programs that specifically help women-owned businesses in the bidding process. Nevertheless, evidence still suggests that women-owned companies face discrimination when it comes to lucrative government contracts. In May 2010, the Empire State Development Corporation released a study showing that businesses owned by women and minorities in New York have significantly less access to government contracts and financing than businesses owned by men.

RESOURCES

A number of resources exist to support women entrepreneurs. In 1988, Congress authorized the Small Business Administration Office of Women's Business Ownership (OWBO), which created a "Low-Doc" loan program which makes it easier for women entrepreneurs to obtain SBA financing. The SBA also has established a Women's Network for Entrepreneurial Training (WNET) which links women mentors with protegees. Small Business Development Centers (SBDC) are also cosponsored by the SBA and operate in every state. They offer free and confidential counseling to anyone interested in starting a small business. In addition, many states now have a Women's Business Advocate to promote women entrepreneurs within the state. These advocates are represented by an organization, the National Association of Women Business Advocates.

A number of trade associations also represent women entrepreneurs. The National Association of Women Business Owners is the largest group in the country, with 8,000 members and eighty chapters across the United States. There are also some smaller regional groups, which can be located through the Yellow Pages or local chambers of commerce. The American Business Women's Association provides leadership, networking, and educational support. The Association of Women's Business Centers helps women secure funding for business and offers support and resources. The National Association of Female Executives makes women aware of the need to plan for career and financial success. As women-owned businesses continue to create jobs and become an increasingly important factor in the U.S. economy, the resources to support them will continue to grow as well.

WORKERS' COMPENSATION

Workers' compensation is a mandatory type of business insurance that provides employees who become injured or ill while on the job with medical coverage and income replacement. According to Fred Steingold's 2008 book, *Legal Guide For Starting & Running A Small Business*, workers' compensation is mutually beneficial because it is a "no-fault system." On the one hand, workers' compensation ensures that employees are compensated for work-related injuries regardless of whether an unsafe workplace or their own recklessness caused an injury. On the other hand, employers are protected from private lawsuits through workers' compensation and also only have to contribute to insurance which pays for lost income and

medical costs. Workers' compensation does not pay for suffering, mental anguish, and other such additional costs.

Businesses are required by law in all fifty states to pay for the medical treatment and lost wages of employees who suffer job-related injuries or illnesses. Any small business with any employees is required to have this form of insurance. Businesses can contact their state workers' compensation office to learn more about specific requirements. Information about each state office can be found at www.workerscompensation.com.

In order to avoid crippling expenses, companies purchase workers' compensation insurance policies of one kind or another. Most states give businesses the choice of buying workers' compensation policies either directly from the state or from a private insurer. Each state determines its own system's payment schedules, employee eligibility requirements, and rehabilitation procedures. Although provisions of each state's laws differ greatly, the underlying principle is the same that employers should assume the costs of injuries, illnesses, and deaths that occur on the job, without regard to fault, and partially replace wage income lost. While income replacement under workers' compensation is usually a percentage of the actual wage, it is counted as a transfer payment and thus is not subject to federal income tax for the employer or employee. Some state laws exempt certain categories of employees from coverage. Those most likely to be excluded are domestics, agricultural workers, and manual laborers.

Given the mandatory nature of workers' compensation coverage and the potential expense involved, the cost of workers' compensation insurance policies is a considerable concern for small-business owners. In fact, workers' compensation premiums stand as most companies' second-largest operating expense, after payroll. These rates are based on the employer's total payroll, the classification of the employees, and the employer's accident record. The wages paid each employee are assigned a rate based on the occupational classification in which that employee works. For example, an employee who does office work will be assigned a rate that is lower than one who works reroofing. The employer's cost of workers' compensation for the office worker will likely be in the range of 0.25 to 1.0 percent of wages earned, while the employee who works on roofing projects will cost the company as much as 10 to 15 percent of that employee's gross wages.

Small-business owners have less control over the cost of workers' compensation coverage than they do over health insurance costs. State legislatures set the level of benefits and employers pay the full cost, so medical cost-containment strategies like copayments do not apply. Some insurers avoid handling workers' compensation policies for small businesses because they feel that smaller companies lack the funds to provide a safe working environment. In general, the rates depend upon the type of business, number of employees, and company safety record.

Penalties for failing to carry workers' compensation insurance policies can be severe. In general, business owners who are neglectful in this manner can be held liable for the medical expenses incurred by the worker in their employ. Nonetheless, many businesses engage in what is known as "premium fraud," in which they either do not carry insurance as required or lower the costs of their policy premiums through fraudulent record keeping. Methods used to reduce insurance premiums fraudulently include underreporting of employee count or the wages they are paid, paying workers under the table in order to falsify the number of employees, and misclassifying the kind of work engaged in by employees in order to reduce premiums through a misclassification of their occupation. However, momentum is building to increase penalties for these kinds of fraudulent actions, which injure insurers and honest employers alike. Honest employers end up with higher insurance premiums as a result of these sorts of fraud. Law-abiding employers may suffer as a result of fraud in another way as well. Construction companies, for example, may lose out on projects to bidders whose lower bids are made possible because they are absorbing lower overhead costs through intentional workers' compensation fraud.

TYPES OF COVERAGE AVAILABLE

There are three basic methods available for employers to obtain the required workers' compensation protection: state insurance funds, private insurance, and self-insurance through insurance pools. The latter option which involves setting aside funds in anticipation of workers' compensation claims, rather than purchasing insurance is seen as a cost-saving method for safety-oriented firms. In the states that permit it, many large employers now self-insure, and many small businesses form groups to insure themselves and decrease the risks.

Group self-insurance plans are worth consideration for small businesses with better-than-average workplace safety records. Such plans work best when the companies involved are in the same or similar industries, so that their level of risk is roughly equivalent. The companies can then join together to purchase stop-loss coverage to protect themselves against claims over a certain amount. Though self-insurance can be less expensive than private workers' compensation policies, small businesses should make sure that they have the financial resources to withstand potential losses. Self-insurance requires a large amount of liquid capital ready at all times to address any claims.

In some states, state funds or trusts have the same role as group self-insurance. For example, in New York, trusts were permitted after 1966 to help small businesses

deal with large workers' compensation costs. A third-party administrator in these trusts helps find and combine businesses in the same industry under the same workers' compensation insurance, providing savings to businesses. Unfortunately, in the years leading up to 2009, several such trusts dissolved after financial problems left them unable to cover workers' compensation claims. This left small-business owners responsible for workers' compensation claims as well as leaving them with no workers' compensation insurance.

MANAGING WORKERS' COMP CLAIMS AND COSTS

Small businesses can explore a variety of other measures to reduce their workers' compensation premiums as well. These include the following:

First and foremost, make the workplace as safe as possible. Companies can reduce premiums by minimizing the number of claims made by their workforce. This requires the implementation of safety programs in such areas as materials handling and ergonomics.

Select the right insurer. Business owners seeking workers' comp insurance policies should seek out insurers with proactive claims adjusting policies. In addition, *Occupational Hazards* contributor Shawn Adams counsels companies to give preference to insurers who assign specific adjusters for accounts. "[When] claims are . . . handled on a file basis . . . your account is handled by whatever adjuster happens to be assigned the file for your claim. An assigned adjuster is one who can take responsibility for your account, as opposed to having different adjusters handle different claims against your policy but not coordinating the claims in a comprehensive manner."

Pay attention to your own claims trends. Businesses should take steps to monitor all aspects of their work safety record and insurance coverage and ensure that all subcontractors carry workers' compensation coverage.

Understand workers' compensation claims and rules regarding contractors. Businesses need to make sure that their contracts with contractors stipulates that they are not employees. Businesses also need to ensure that contractors have their own insurance. Since 2008 in California, any company hiring unlicensed subcontractors or contractors is responsible for the workers' compensation claims of these workers.

Combine liability coverage, property insurance, and workers' compensation. Companies that buy workers' compensation from private insurers can often save money by combining their insurance and buying all coverage from the same insurer or insurance broker.

WORKPLACE ANGER

Workplace anger and hostility often manifest in ways that have received a great deal of attention from business owners, researchers, legislators, and members of the business press in recent years. Workplace violence and sexual harassment are probably the two most commonly written about forms of workplace anger and hostility. But anger and hostility can manifest themselves in other, less dramatic ways that can nonetheless have a tremendously negative impact on a business. They can produce an environment marked by poor or nonexistent communication, sagging morale, excessive employee absenteeism or turnover, and a host of other undesired conditions. Business owners, managers, and employees who are unable to control their own anger or effectively respond to the angry outbursts of others will likely find that their business or career suffers as a result. Organizations that fail to recognize and deal effectively with the problem of workplace anger may end up with even more serious problems to deal with. Inappropriate displays of anger can lead to all sorts of undesirable outcomes, and in the most serious cases a company may even be legally liable if it allows a hostile environment to persist.

Statistics bear out the perception that workplace anger is dangerous. According to a 2009 study published in the *Annals of the American Psychotherapy Association*, about one million U.S. workers each year become victims of nonfatal violence during working hours. Researchers have established a clear link between these types of violence and anger.

Of course, many small businesses will never be confronted with the challenge of addressing and correcting problem workers who behave in an angry or hostile manner toward co-workers or customers. This may be because very small firms may not have employees at all, and small firms

with employees often feature a positive work environment and employ staff who enjoy their jobs and relate to one another in a professional manner. But most small-business owners that have a payroll will eventually encounter someone who exhibits angry or hostile behavior and looms as a potential threat to the financial or psychological health of the organization. According to a research study published in a 2008 issue of *Environment and Behavior* magazine, one out of four employees in the United States identify themselves as "chronically angry."

The problem of angry outbursts is a growing problem in society generally. In an article in the magazine *Supervision*, Robert D. Ramsey discussed the seemingly epidemic levels to which anger in American society has grown He wrote, "It's a modern day epidemic. Rage rules. On the road. In the airways. At sports events. And increasingly, on the job as well. . . . Anger is a dictator that can control lives and drive behavior. It blots out reason and blurs good judgment. Worst of all, it can lead to dangerous outbursts of violence or other destructive behaviors. Obviously, anger has no legitimate place in any business, office, shop or factory. When it occurs, someone has to see that it doesn't take root or take over the workplace. If managers don't do it, who will?"

Entrepreneurs, like all business leaders, need to prepare themselves for the day when an employee's actions or words seem to be based on feelings of anger or hostility. Some small-business owners underestimate the impact that workplace anger and hostility can have on their business and on their staff, and they do so at their peril. One employee who lashes out inappropriately can cause a decline in a company's general morale, friction with colleagues, and enough distraction that productivity declines. The expression of anger may even be distracting enough to pose a safety hazard.

Small-business owners should be aware that failure to address workplace hostilities can also open them up to legal liability. Moreover, the person who engages in hostile workplace behavior does not have to be an owner or supervisor for the business owner to be vulnerable to charges concerning that person's behavior. In the eyes of the law, business owners have the power and obligation to control their employees.

CAUSES OF WORKPLACE ANGER AND HOSTILITY

Workplace hostility can often be traced to attitudes that have little to do with the current employment situation in which workers find themselves. Deep-seated feelings of hostility toward other people because of their gender, skin color, sexual orientation, political beliefs, or other factors are often firmly in place long before the person begins working at a company. Often, the small-business owner faced with such an employee will have limited options available to deal with such problems; instead, he or she will concentrate efforts on making sure that those undesirable attitudes do not disrupt the workplace.

On the other hand, factors that cause workplace anger can sometimes be addressed directly. While workplace anger sometimes can be traced back to prejudices that are at the root of deep-seated hostility, on many other occasions, work-oriented factors serve as the primary catalysts. Common causes of workplace anger include:

- General harassment, whether sexual or some other form
- Favoritism of one employee over another
- Rejection (whether arbitrary or for good reason) of a proposal or project in which an employee has a significant emotional investment
- Insensitivity by owners or managers
- Criticisms of employees in front of staff or clients
- Depersonalized workplace environment
- Unfair (or tardy) performance appraisals or criticism
- Lack of resources for the employee to meet his or her objectives
- Inadequate training
- Frustration of employee goals
- Lack of knowledge about how to cope with negative emotions
- Lack of teamwork
- Withdrawal of earned benefits
- Lack of outlets for harmful or negative emotions
- Betrayal of trust extended to manager or owner
- Unreasonable demands on employees
- Downsizing
- Lack of flexibility on part of owner or manager
- Poor communication
- Feedback is wholly or primarily negative in tone
- Absentee leadership (such as instances wherein needed disciplinary action is absent)
- Micromanagerial environment in which staff decision-making opportunities are limited

Of course, sometimes a distinction must be made between legitimate and illegitimate catalysts of workplace anger. For example, an employee may express great anger over a negative performance review even though the appraisal was conducted fairly and honestly. Small-business owners and managers cannot jettison basic principles of management simply to avoid making one of their employees angry.

Small-business owners must also realize that in some cases, anger is displaced. An employee may feel angry about an employee policy, for example, but may not feel able to express anger at the company due to financial concerns or

other issues. The employee may then express anger towards other employees instead of targeting the perceived source of the problem. This is one reason why careful communication as well as possible third-party intervention may be needed to get to the true source of anger in the workplace.

Many employers, when faced with workplace anger, want the anger eliminated at once so that a healthy and productive workplace can resume. However, addressing anger in the workplace is often a long and complex process. While some businesses are tempted to initiate disciplinary actions or simply to get rid of perceived troublemakers in the workplace, this strategy can backfire. Employees who display anger in the workplace may be very effective and productive employees, for example, and may need only some help to perform at peak levels. In addition, disciplinary action and termination of work can in some cases escalate anger and even lead to violence. Finally, termination can lead to allegations of discriminatory practices. Employers are better served by trying to resolve conflict in ways that encourage communication. At the least, employers who believe that an angry employee may not have a permanent place in the company may wish to keep careful records of conflicts and displays of anger to offset any future allegations of unfairness on the part of management. In general, making an honest effort to improve the situation is more effective at diffusing anger than rushing to get rid of the person who is deemed to be displaying anger.

Warning Signs. Workplace anger is often sublimated by employees until they reach a point where they suddenly lose control. This bursting point may manifest itself in a variety of ways. One employee may just yell at his manager, while another may impetuously decide to quit. Still others may resort to workplace violence or vandalism. Small-business owners and managers should acquaint themselves with the warning signs of hidden anger so that they can address the causes of it and head off an incident before it occurs. Other employees, meanwhile, may exhibit behavior that is more obviously troubling. Following are a range of behaviors that may signal a need for intervention:

- Sarcastic, irritable, or moody behavior
- Apathetic or inconsistent work performance
- Prone to making direct or veiled threats
- Aggressive and antisocial behavior
- Overreaction to company policies or performance appraisals
- Touchy relationships with other workers
- Obsessive involvement or emotional attachment to job

Bullying Behavior. Explicit workplace violence, sexual harassment, and episodes of discrimination garner the most headlines and receive the bulk of attention from consultants because of their potential legal impact on business enterprises. But researchers contend that simple bullying behavior may be as great a threat to business health and productivity as are any of the above-mentioned problems. Sometimes bullying takes place between employees, but it is often most evident in supervisor-worker relationships, in which one person is perceived to wield greater power. Bullying is not just the problem of an individual, however, but must be seen as a problem of the organization and its culture as a whole. Bullying can take many forms, from persistent, low-key intimidation to devious efforts to make a colleague appear professionally incompetent. These menacing tactics can be difficult to identify and bring to light. It is very important, therefore, to have an avenue through which people feel free and safe to air their concerns about co-workers, supervisors, and subordinates. As long as communications flow reasonably freely, patterns may emerge which make it more apparent where serious problems lie. There are always those who will put forward the argument that the making of snide remarks or jokes at another's expense is part of social interaction. However, office banter which is not really designed to offend is recognizably different from the persistent downgrading or undermining of a person by another, particularly if the offender is in a position of relative power within the hierarchy.

Confronting bullies about their behavior is often difficult. Where bullying exists, the only way to address the matter is through dealing directly with the bully and prevailing upon him or her to change. But since the bully is very unlikely to see the situation in the same way as the victim of his or her aggression, the first challenge will be to establish that change is needed. Like all human resource problems, the challenge is great. Small-business owners and managers, however, should stand fast. Bullying behavior generally does not take place in a vacuum; other employees are usually aware of the situation, and they should be consulted. Finally, owners seeking to eliminate bullying behavior need to make it clear that anyone who is the victim of bullying tactics will receive their full support.

Peer Conflict. Another common cause of workplace anger and hostility is peer conflict. Unlike instances of bullying, wherein one employee makes a conscious decision to engage in behavior that is hurtful or uncomfortable for another employee, peer conflict is characterized by mutual feelings of animosity between two individuals. Peer conflicts are usually caused by differences in personality or perception, moodiness, insensitivity, impatience, or sensitive emotional states such as jealousy, annoyance, and embarrassment. When these rivalries evolve into skirmishes or outbursts, the conflict may cause damage to those involved as well as

others in the vicinity. Since work relies heavily on the ability of people to interact in a cooperative and harmonious fashion, conflict between employees represents a serious breakdown of the effective working relationship.

According to management theorist Peter Drucker, managers can pursue one of the following routes when attempting to resolve peer conflicts:

1. Convince both workers to accept a mutually agreeable view or agreement about the issue that was the cause of the conflict.
2. Support the position of one employee and reject the position of the other.
3. Make a decision about the issue and force both people to comply with the manager's perception.

What is important for the manager to keep in perspective is the fact that the problem belongs to those in conflict, and only they can resolve it. However, when that problem affects the company then it is the manager's job to insist upon and facilitate a resolution.

Small-business owners who find themselves mediating a peer conflict should avoid taking sides (especially if both workers' views have merit), provide an objective viewpoint, keep the discussion from going off on tangents or degenerating to name-calling, and help each worker to understand the perspective of the other. Finally, the small-business owner's overriding concern should be explicitly to restate his or her expectations of staff performance, including the ways in which staff members should behave toward one another.

KEYS TO STOPPING OR PREVENTING EXPRESSIONS OF WORKPLACE HOSTILITY AND ANGER

Attempts to address inappropriate workplace behavior through negotiation and mediation are not always effective. In some instances, an employee's conduct or performance will leave the small-business owner with no alternative but to resort to disciplinary action. This discipline can take a variety of forms, from suspension to negative comments in the employee's personnel file to taking the worker off a plum project. Reports on the effectiveness of such steps vary considerably. Some firms contend that such measures inform the employee that his or her problematic behavior will not be tolerated and can be an effective tool in triggering behavioral reforms, especially if the punishment has a financial dimension. But others insist that such measures especially if used without first pursuing other options may only deepen feelings of animosity and hostility.

According to a 2009 article in the *Annals of the American Psychotherapy Association*, too few workplaces have an appropriate way of dealing with anger in the workplace. Researchers have found that less than 30 perent of workplaces have plans for dealing with workplace trauma and less than 60 percent of *Fortune* 1000 companies have a working crisis management program. Yet experts agree that prevention programs can be an effective deterrent when it comes to workplace anger.

No two small business enterprises or employees are alike. Researchers agree, however, that there are a number of steps that employers can take to address the issues of workplace anger and hostility before they erupt into full-blown crises.

1. Explicitly state the company'absolute opposition to inappropriate behavior in writing. This can often be included as part of a new hire's employee guidelines package, but small-business owners should also consider displaying such "zero tolerance" statements in public areas. Such statements should also clearly delineate which types of comments and actions are regarded as offensive.
2. Encourage an environment that values diversity.
3. Hire new employees carefully. Businesses should consider personalities and cooperation among employees when hiring new workers. New employees can be screened for emotional maturity, calmness, and ability to work with others. Compiling a work team with an eye to cooperation can improve communication and camaraderie in the workplace.
4. Encourage cooperation in the workplace. Some companies create retreats, teamwork seminars, or other events to allow employees to interact and get to know each other better. Some companies also host picnics or other family-centered events in the workplace to help build empathy and friendliness in the workplace and to keep anger in check.
5. Recognize that incidents of workplace hostility tend to get worse over time if they are not addressed. For example, remarks that might at first seem to be merely in mildly bad taste can eventually escalate into full-fledged racist, sexist, or otherwise mean-spirited harassment. Learning to deal with workplace anger issues is critical to creating a workplace that is comfortable and therefore productive for employees. Therefore, business owners should respond to incidents of workplace anger or hostility promptly and decisively. The whole workforce will likely be watching, looking for some signal about whether management takes such transgressions seriously, or whether it implicitly gives the green light to further incidents.
6. Create a pleasant work environment. According to a research study published in a 2008 issue of *Environment and Behavior* magazine, a pleasant and

aesthetically pleasing work environment can have a positive impact on employee anger. Researchers found a significant reduction in the stress and anger levels of employees who worked in environments where abstract and nature paintings were placed on the walls, for example. Male workers seemed to respond especially well to pleasant changes in the workplace environment.

7. Learn to recognize the symptoms of workplace anger and try to provide employees with constructive avenues to express frustrations and concerns.
8. Monitor workplace culture to ensure that it does not provide fertile ground for unwanted behavior.
9. Organize third-party intervention when needed. Researchers writing in a 2009 issue of *Journal of Behavioral and Applied Management* noted that third-party interventions in the form of anger management programs, empathy-building interventions, counseling after workplace traumas, and specialized workplace forgiveness programs were effective in decreasing anger by removing resentment. According to the researchers, lack of forgiveness was one of the leading contributors to workplace anger, allowing relatively small transgressions and perceived slights to escalate into anger.

WHEN THE SMALL BUSINESS OWNER IS ANGRY

Small-business owners should also be aware of the challenges of managing their own anger in the workplace. Entrepreneurship brings with it a host of responsibilities and pressures that can make it difficult for business owners to manage strong emotions such as anger. But it is important for small-business owners to handle their anger in an effective manner. Expressing anger can be constructive when the true intent is to maintain, reestablish, or restore a positive relationship with the person who has caused offense. When handled professionally, constructive confrontations assure future harmony, better performance, and improved productivity. The key, of course, is to express anger professionally and as calmly as possible. It helps to be as specific as possible. The problem should be stated clearly and the other party given a chance to express his or her side. The business owner is advised to listen and try to understand what caused the conflict. Whenever possible, it should be emphasized that it is the behavior, not the person, that is in question or needs to change.

WORKPLACE GIVING

Workplace giving is when employees make voluntary financial contributions to charitable organizations through an employer-administered program. Most business philanthropy campaigns are designed so that employees can donate a designated amount to eligible nonprofit organizations through regular or one-time automatic payroll deductions. Some employers offer to match the dollar amount of their employees' contributions, generating twice the charitable bang for an employee's donated buck. These contributions add up to nearly $5 billion for U.S. charities and nonprofits each year.

One of the biggest workplace giving campaigns in the United States is the federally sponsored Combined Federal

Campaign, which supports a variety of registered nonprofits providing health and human services to communities across the nation. United Way is also strongly entrenched in theworkplace giving arena. In fact, its employee-participation fundraising initiatives served as the model for most early workplace giving programs. Today there are nearly as many unique approaches to employer-administered charitable giving campaigns as there are diverse charities reaping the financial rewards.

The benefits of workplace giving, however, extend beyond providing the nation's charitable organizations with much-needed funds and exposure. Workplace contribution programs also give employees a convenient way to support a national or community cause, and they enable employers to engage employees and improve morale while enhancing community relations. For small businesses, these programs can also help form important professional partnerships and generate new business. Both the individual employee and the corporate enterprise may receive tax benefits from donating to eligible not-for-profit enterprises. However, it is important to make sure the recipient organization is a legitimate public charity prior to including it as part of any type of workplace donation program and to keep meticulous records of all contributions and cause-related business expenses.

ESTABLISHING A SUCCESSFUL WORKPLACE GIVING CAMPAIGN

Approaches to workplace giving programs vary widely based on the company's goals, culture, and resources. However, the most successful campaigns share a number of common characteristics. These are outlined below.

1. Do the research. It is essential to assess employees' charitable interests, thoroughly research suitable donation recipients, and align the campaign accordingly. This approach will help to increase levels of employee interest and giving.
2. Involve the top echelons. Keeping the company's executives engaged as role models and cheerleaders helps drive interest and participation throughout the ranks.
3. Form a workplace giving committee. Even if the committee has a membership of only one or two individuals, it establishes a dedicated support structure for the campaign to handle administration and help with implementation and publicity.
4. Establish clear goals. Setting contribution targets gives employees something to strive toward. Having goals also serves to build competition, camaraderie, and a sense of achievement when objectives are met or exceeded.
5. Host a fun and informative kickoff event. It helps to generate excitement about the campaign and offers an opportunity to educate employees about program processes and the individual causes of the recipient charities. Keep the momentum going over time with smaller events like contests, giveaways, or gatherings throughout the campaign.
6. Maintain a flow of ongoing communication. Use internal communication channels such as staff meetings, newsletters, and the intranet to keep employees informed about the campaign details and progress toward the stated goals.
7. Celebrate the achievements of the campaign. Even if the workplace giving program is ongoing, it is important to recognize individuals and departments that accomplish financial, participation, and other types of milestones. This acknowledgement helps instill a sense of pride and accomplishment upon which to build subsequent campaigns or drive momentum within the current campaign.

THE FUTURE OF WORKPLACE GIVING

Businesses, charities, and industry observers predict that the future of workplace giving campaigns is likely to center on increasing the recipient pool offered by individual programs, facilitating participation and administration with dedicated technology tools, and providing more channels and opportunities for employees to give.

Specifically, workplace giving programs will offer more choices of eligible recipients in an effort to reflect employees' growing diversity and varied charitable interests. This trend will force charities to adhere to higher standards of accountability as they jockey for a seat at the lucrative workplace giving table. At the same time, advanced technology tools that are implemented in-house or via outsourced partners will make program participation easier for employees and campaign administration more efficient for the business. Backed by better electronic systems, more companies may begin offering automatic payroll deduction and matching employer contributions. Providing multiple ways for employees to give is also on the horizon, say many analysts. This may include establishing individual giving accounts. These enable employees to create separate personal accounts to hold payroll deductions for charitable contributions until they are ready to designate specific recipients from among the eligible candidates and identify how much money each designated charity is to receive. In addition, companies are likely to increase the longevity of workplace giving campaigns to allow for year-round giving, and they may expand the ways in which employees are permitted to give. For example, some businesses may recognize employee volunteerism as a charitable contribution under the program

rather than using monetary donation as the sole measure of employee participation.

Kristin Tillquist, author of *Capitalizing on Kindness: Why 21st Century Professionals Need to Be Nice*, emphasizes that philanthropy benefits both the recipient and the giver. As she explains in an article by Denise O'Berry, "Giving away money, products or 'in kind' assistance not only helps others but also builds product awareness, positive brand and image, customer loyalty, and positive community relations all of which contribute to a healthy bottom line."

WORKPLACE SAFETY

Workplace safety refers to the working environment at a company and encompasses all factors that impact the safety, health, and well-being of employees. This can include environmental hazards, unsafe working conditions or processes, drug and alcohol abuse, and workplace violence. Workplace safety is monitored at the national level by the Occupational Safety and Health Administration (OSHA). OSHA has three stated goals that serve as the cornerstones of its policies and regulations: 1) improve the safety and health for all workers, as evidenced by fewer hazards, reduced exposures, and fewer injuries, illnesses, and fatalities; 2) change workplace culture to increase employer and worker awareness of, commitment to, and involvement in safety and health; and 3) secure public confidence through excellence in the development and delivery of OSHA's programs and services. The federal guidelines imposed by this agency are complemented by state regulations that are often tougher than those proposed by OSHA. However, OSHA has been making strides to crack down on employers who do not provide safe workplaces. The new Severe Violator Enforcement Program (SVEP) was implemented in 2010 and offered additional inspections and crackdowns on known safety violators. In 2009, the Protecting America's Workers Act was introduced in Congress. This bill, which had not passed as of 2010, would raise penalties for serious violations to $12,000 (from $7, 000) and would increase willful workplace safety violations from $70, 000 to $250,000.

NATIONAL WORKPLACE INJURY AND ILLNESS DATA

Every year the Department of Labor, through its Bureau of Labor Statistics, publishes the workplace injury and illness data that it gathers and compiles. In 2008 5,214 people lost their lives while on the job in the United States. This represents the lowest annual total of workplace fatalities since 1992. About 263 fatalities in the workplace were caused by suicide, while transportation fatalities accounted for 2,053 deaths. In about 680 cases, deaths were caused by falls, and in 794 cases, fatalities were caused by violence. In 2008 equipment-related fatalities accounted for 923 deaths while harmful environments and substances claimed the lives of 432 workers that same year.

In total, there were 3.7 million cases of nonfatal injuries and illnesses in the workplace in 2008, many of them not requiring any time away from work. The nonfatal injuries and illnesses reported in 2008 that were serious enough to require time away from work, numbered 1.1 million, a rate of injury equivalent to 113 per 10,000 full-time workers. These data include all work-related injuries and illnesses that resulted in time away from work beyond the day on which the injury occurred. The median number of days away from work per incident in 2008 was 8 days. By category of injury, the national data for 2008 break down as follows: Sprains and strains (416,620 cases), bruises and contusions (93,650 cases), fractures (89,650 cases), cuts and lacerations (87,060 cases), heat burns (15,630 cases), punctures (12,760 cases), and carpal tunnel syndrome (10,080 cases) with other injuries making up the rest of workplace injuries. In 43,960 cases in 2008, injuries were caused by multiple traumatic injuries.

The goods-producing industries have a higher rate of on-the-job injury than do the service industries, with one exception. Businesses in the transportation sector are part of the service industry but they have a very high rate of on-the-job injuries. About 30 percent of injuries and illnesses requiring days away from work in 2008 involved eight occupations. These occupations included laborers and

freight, stock, and material movers (79,590 injuries in 2008), truck drivers (57,700 injuries), nursing aides, orderlies, and attendants (44,610 injuries), construction laborers (31,310 injuries), retail salespersons (28,900 injuries), janitors and cleaners (excluding maids and housekeeping cleaners; 28,110 injuries), truck drivers (light or delivery services; 28,040 injuries), and maintenance workers (20,800 injuries). By industry, the occupations with the highest rate of injuries included transportation and material moving occupations (217,070 injuries in 2008), production occupations (138,890 injuries), and construction and extraction occupations (120,890 injuries).

IMPROVING WORKPLACE SAFETY AT A SMALL BUSINESS

Most small-business owners take steps to try and assure that their place of work is a safe one because it is the right thing to do. Beyond being the right thing to do, smaller companies usually recognize that the benefits to be gained by a safe work environment are many. Attention to safety issues can not only help businesses avoid legal penalties, but also improves employee morale, productivity, and retention.

Moreover, effective workplace safety programs often have a tremendous impact on a company's bottom-line financial performance. In addition to the hidden benefits in retention and productivity that go hand-in-hand with such programs, businesses armed with solid workplace safety policies and records realize enormous benefits in the realm of insurance. An employer's workers' compensation premium is based on several factors. These include payroll, a classification of employees by occupational type, and the company's accident history. No factor has more control over insurance premiums or is less understood by policy holders than the experience modification or "mod." The mod is an indicator of how an individual operation's accident rate compares to other businesses within its industry. Three consecutive years of actual workers' compensation claims provide the statistical basis for an employer's mod. Under this system, companies that are deemed to have a higher accident rate (as determined by workers' compensation claims over a 3-year period) than the industry average pay higher premiums. Conversely, companies that boast a claim rate lower than the industry average will benefit by paying less expensive premiums. Safety programs may also affect liability insurance, property insurance, and other coverage costs.

Workplace safety programs can take many forms and cover many potential areas of concern. The sorts of actions taken by companies to maximize the safety of the work environment that they create are varied and include:

- Providing for personal safety equipment
- Creating, distributing, and encouraging communication about, and enforcement of, a formal safety policy
- Installing equipment controls
- Controlling high employee turnovers, since high employee turnover has been linked to decreased workplace safety
- Creating and disseminating operational manuals
- Encouraging employees to complete tasks for which they are trained and able, avoiding nonroutine work, which has a higher instance of injury
- Establishing and enforcing hazardous materials handling policies
- Adopting a drug and alcohol testing program
- Posting clear warning labels and signs near relevant equipment and hazardous materials
- Identifying employees at risk and focusing safety efforts on these employees
- Offering employee counseling services
- Offering first aid and safety stations in the workplace and providing instructions on the use of these stations
- Centralizing safety programs so that they work across an entire company culture
- Creating a company culture in which safety is a priority and questions about safety procedures can be readily asked and answered
- Implementing safety training programs

Following are several avenues that small firms can pursue when implementing or updating a workplace safety program.

Safety Managers and Committees. One method that many firms have had success with is to appoint one person in the organization as the safety coordinator. The ideal candidate has a background in safety, but if no one fits that profile, the candidate who best relates to workers and management, has strong communication skills, and has an interest in and commitment to safety should be chosen. A common title for this person is "safety manager."

For the safety manager to do his or her job, he or she must have direct access to the top manager in the company. Without management buy-in, safety initiatives will not last long. The manager must also have access to every department and work area and must be able to question people freely for the purpose of gathering information. Regular status reports should be prepared that update management on current safety initiatives and identify areas that still need improvement. Ideally, the safety manager's role will remain an advisory one: responsibility for implementing the manager's suggestions should fall to upper management and the individuals or teams that are singled out by the safety

manager. The safety's manager's mandate is to facilitate change, not implement it.

Many analysts believe that businesses should make certain that safety managers are adequately educated on workplace safety issues as well. Business owners are thus often encouraged to send managers to training and education seminars or classes as part of an overall policy of ongoing education. Additionally, management should encourage the manager to seek out safety professionals at other companies to help him or her build a network of contacts and information. Upper management is also responsible for ensuring that safety performance is made a part of every employee's job responsibility and performance reviews. Only when every employee is held accountable for safety will it become a part of a company's culture.

The best starting point for a new safety manager is often to review company records of past safety problems. By drawing up a list of areas that are known problems, the manager can identify the best place to begin implementation of new safety measures. Of course, it is also important that the manager immediately follow up on any disquieting patterns or dangerous situations that are discovered and implement action steps to correct the problems. Unfortunately, in some instances, safety managers will find that workplace safety reports are scant or nonexistent. In such instances, the manager should start from ground zero and establish a formal accident/safety reporting system to gather data. Some experts also advise safety managers to gather information and analyze data about "near accidents." In many companies, near accidents are ignored because they do not lead to claims or injuries, but these incidents often provide important clues about safety hazards in a workplace. Analyzing these incidents can help safety managers prevent accidents and injuries.

Documentation and record keeping serve two additional purposes. They provide written evidence that the new safety program is providing positive results, and they can be used to protect the firm in the event that a lawsuit is filed or safety inquiry launched. Documentation of employee training sessions is especially important, including the topics covered, the date and time at which the sessions were held, and any test scores earned by employees at the sessions. Consultants cite testing as a potentially valuable way of determining employee retention of safety information.

The safety manager should seek to involve all employees and managers in safety initiatives. Inspections should be conducted by the personnel of each department, not the safety manager. In fact, the manager should let each department handle most of its own safety problems. If proper training has been given to all employees, the safety manager should only have to address serious problems that require his or her knowledge and authority.

Hiring a safety manager can also have added benefits. A University of Kentucky study discussed in a 2008 article in the *Occupational Hazards* journal noted that employees respond better to safety information when it is presented in a personalized manner by someone in authority. Researchers found that having access to this type of information in this manner improved employee compliance with safety procedures. Thus, having someone in authority who can discuss specific safety features and techniques with employees can help employers create a safer workplace.

Studies have shown that safety committees can be valuable tools in implementing and maintaining safety programs as well. Safety committees, which typically feature representation from all operational areas, have been shown to reduce the injury rate at companies, which in turn can boost morale and efficiency. Companies that use committees have also reported some unexpected benefits, including an increased sense of teamwork, better sharing of information, and a drop in absenteeism, discrimination claims, grievances, and sick days. Not all small business enterprises reach a size that warrant creation of such committees. But for growing businesses with a significant payroll, safety and health committees can provide important benefits. The committees, which ideally will include a cross-section of employees, should serve as a central gathering and dissemination point for all information related to safety.

Outside Safety Analysis. Another potentially useful option for entrepreneurs interested in determining workplace safety is to have an outside firm conduct a safety analysis. These firms specialize in safety and hazardous materials and can offer many suggestions on how to improve safety. Analysts note that reports submitted by these organizations often range from warnings of regulatory breaches to suggestions on alternative production methods. Not all safety improvement suggestions are implemented, of course. Some courses of action may be deemed excessively expensive, while others are dismissed because of employee resistance or skepticism about their ultimate impact on workplace safety.

Safety Incentives. Business owners and consultants alike agree that safety managers and consultants will likely not have a meaningful impact on a company's safety records if the employees are not willing to do their part to help make things better. One of the best ways to ensure employee cooperation is to offer incentives tied to improvements in safety, although observers are quick to add that safety incentives are not an adequate substitute for a strong safety program. In fact, only companies that have a strong program already in place should even think of using incentives. Cash and noncash awards should only be used to motivate employees to practice what the already-in-place program preaches, which reinforces behavior and encourages participation.

Incentives should reward behaviors that prevent injury by eliminating unsafe work practices. Employees who achieve

"zero accidents" should be rewarded, but business owners are advised to use a broad definition of accident (such as one that would cause an employee to miss time on the job) so that employees do not try to cover up minor injuries in order to keep their zero accident rating. Once the behaviors to be rewarded are identified, then the allocation of awards (individual, department, or company-wide) can be determined.

To make an incentive program really work, several things must be done. First, the incentives must be an ongoing element of the workplace. One-time incentive programs tend to get employees interested for a short time, but they lose interest and fall back into bad habits once the period has passed. Second, meaningful incentives should be chosen. Many experts believe that noncash incentives can be most effective, warning that under cash-based reward systems, employees too often pocket the cash and forget about the ongoing message. Some companies do believe that cash works best, while others feel using cash sends people the wrong message by paying them extra for practices that they should already be doing. Good examples of noncash incentives include recognition awards, token gifts that build morale, customized items (clothing, for example), and, most effective of all, professional advancement. Finally, goals and results must be clearly communicated to employees at every step of the process.

Small-business owners should not be scared of the costs associated with running an incentive program. Even if the program costs several thousand dollars annually, many economists and business experts contend that the expense is insignificant compared to the productivity lost as a result of poor safety practices.

Some companies tie incentives directly to safety training. In a 2008 article in the *Occupational Hazards* journal, Deborah Babin Katz and Jon Kaufman describe an incentives program which links safety training with a rewards system. Employees make use of online learning modules to learn about safety while also earning points or incentives as they learn. This method has proven successful at some companies by eliminating some of the problems inherent in most incentive programs. The earn-to-learn program, for example, does not encourage employees to hide injuries in order to secure bonuses, and it does not require managers to notice employee behaviors to reward them. At the same time, employees using this system get safety training and positive enforcement through incentives.

WORKPLACE VIOLENCE AS A SAFETY ISSUE

Every act of workplace violence leaves scars on every person in the organization. One act of violence can change an entire company permanently. The working environment can become so toxic that no work gets done all employees can think about is what happened. From the company perspective, violence also leaves the company exposed to lawsuits and liability that can cost millions of dollars.

There are steps that can be taken to prevent or at least minimize the chances of workplace violence. The most important step is for the company's leadership to communicate a zero-tolerance policy for workplace violence and behaviors (bullying, harassment, defiance of management, etc.) that can lead to such events. At the same time, businesses should display a corresponding determination to create and maintain a safe workplace for employees by examining their existing security, hiring, and performance appraisal policies.

WORKPLACE VIOLENCE

Workplace violence is an act of aggression, physical assault, or threatening behavior that occurs in a work setting and causes physical or emotional harm to customers, co-workers, or managers. Workplace violence can include assault and in extreme cases homicide, but it can also include written and verbal threats, verbal abuse, threats, harassment, and other acts of aggression. Broad definitions of workplace violence also often include acts of sabotage on work-site property. According to a 2009 article in the *Annals of the American Psychotherapy Association*, most instances of workplace violence involve one or more of the following: family violence which transfers to the workplace, theft, an employee who has been fired or is fearful of being fired, an unhappy employee, an on-strike employee, or a protestor. Since most businesses will have to deal with one of these situations at least once, all businesses are at risk of violence.

Workplace violence has emerged as a subject of considerable interest to both small and large businesses in recent years. Some small-business owners deny that this grim issue is a concern for them, but in reality, workplace violence can strike even tiny start-up firms. Also, as many analysts and business owners have charged, even the threat of violence can have a dreadful impact on the culture and productivity of a small business. Whereas employees of larger firms generally have more avoidance options to choose from when forced to share workspace with a volatile employee, the more modest facilities and resources of smaller businesses do not provide the same level of protection.

Workplace violence is an issue of which all businesses should be aware. According to the U.S. Bureau of Labor Statistics, between 2007 and 2008, 864 deaths in the workplace were attributable to violence. Of these, 628 were homicides. Shooting was the most frequent method of homicide, accounting for 503 of the fatalities, while stabbing accounted for 45 deaths. In 196 workplace fatalities, self-inflicted violence or suicide was the cause of the deaths. The U.S. Bureau of Justice Statistics reports that in 2008, 16,330 instances of serious workplace injury (serious enough to warrant time away from work) were related to violent incidents and assaults in the workplace. These violent incidents include simple assault, aggravated assault, robbery, and rape/sexual assault. Although these crime statistics show a decline over recent years, they also highlight the need for business owners to take precautions and proactive measures to protect employees and co-workers and reduce the likelihood of an incident of violent crime.

TYPES OF WORKPLACE VIOLENCE

In their 2007 book, *Information Security Management Handbook*, Harold F. Tipton and Micki Krause note that most instances of workplace violence fall into one of three categories. Type I incidents occur in the workplace but involve a perpetrator who does not have a relationship with the employees or workplace. For example, robberies are a common type of Type I workplace violence.

In Type II incidents, perpetrators have a relationship with an employee at the workplace but not with the workplace itself. For example, stalkers who assault a female victim in the workplace fall into this category. Female health care workers, according to Tipton and Krause, are the most likely victims of Type II workplace violence. Type II workplace incidents are the most common cause of violence-related serious (nonfatal) workplace injuries. Type III incidents involve altercations between employees in the workplace.

Tipton and Krause further categorize workplace violence into external and internal threats of violence. External threats come from people who do not belong in the place of business, while internal threats come from employees, clients, and others who work in or with a business. As Tipton and Krause note, internal threats are more challenging to manage, since such threats cannot simply be excluded with security systems.

ADDRESSING WORKPLACE VIOLENCE BEFORE IT ERUPTS

Small-business owners can take several steps to address the specter of workplace violence. Hiring and interviewing practices should reflect the company's desire to establish and maintain a good workforce, and the owner should do his or her best to establish a company culture that does not tolerate any form of intimidation. After all, insulting and intimidating behavior, even if nonviolent, can wreak significant mental harm on its victims. It can also escalate to violence and may even provoke a violent response by victims who feel that they have no other recourse. Indeed, some studies have indicated that victims of harassment actually become less productive than employees who suffer from physical assaults.

Many human resource specialists recommend written violence-prevention policies and regular training sessions to inform employees about what to watch for. According to Paul Viollis, president of the company Risk Control

Strategies, writing in *Business Insurance*, "The vast majority of incidents of workplace violence are completely preventable if employees know what to look for and how to report it. While younger individuals and females have increasingly emerged as workplace violence offenders in the past several years possibly a spillover from school violence the demographic and behavioral characteristics of the individuals who typically perpetrate acts of violence have, for the most part, remained the same. Such individuals are predominately male, between twenty-five and forty years of age, do not handle stress well and are chronic complainers, manipulative and socially withdrawn, among other characteristics."

Other actions that a company may take to minimize the likelihood of workplace violence, albeit unpleasant to contemplate, include boosting security precautions by adding security personnel or installing metal detectors or surveillance cameras. Some security consultants urge their clients to make it clear that employee desks and lockers are company property that can be looked through at any time, and they should be encouraged to report all violent acts to legal authorities. Finally, business consultants and security experts counsel small-business owners to recognize that workplace violence frequently stems from external sources. Indeed, the majority of homicides that take place in workplace settings are perpetrated by nonemployees (angry customers, robbers, irate spouses or romantic partners).

STOPPING WORKPLACE VIOLENCE

Experts believe that businesses can take a number of steps to reduce the likelihood of an employee carrying out an act of workplace violence. Many of these are proactive in nature, designed to minimize the business's exposure to violent acts by employees:

Maintain and disseminate detailed policies on workplace behavior. Adopt a zero-tolerance policy that addresses signs of potential violence. Such a policy should clearly state that threats, intimidation, destruction of company property, and violence in any form will not be tolerated. It should also spell out clearly the disciplinary action that will be taken in response to any of these unacceptable actions, providing guidelines that clearly delineate violations that may result in discharge or other disciplinary action so that workers are cognizant of behavioral boundaries. In addition, these policies should explicitly state the company's determination to protect victims and informants of violent acts against any form of retaliation.

Maintain and disseminate workplace violence prevention programs. This plan should cover everything from investigatory steps to take when an employee exhibits questionable behavior to the manner in which problem employees are dismissed. "These training programs should focus on teaching employees how to recognize and report suspicious activity and should provide written information on whom to contact in an emergency," wrote Gillian Flynn in *Workforce*. This aspect of the program needs to be addressed with particular care, for staff participation will only occur if people can express concerns about co-workers in a safe and confidential way. Other elements of these programs typically include disciplinary training for managers, security plans, preemployment screening, and media relations if an incident of workplace violence does take place.

Screen applicants. Every company's workplace violence prevention program should include a thorough investigation of applicants' backgrounds (including employment history and possible criminal record) and qualifications for the job opening. Many experts believe that incidents of workplace violence are more likely to occur when an employee is struggling with his or her responsibilities, so ability to fulfill the responsibilities of the position in question is a particularly relevant consideration. In addition, interviews should include questions that can help identify potential risky hires. According to Michael A. Gips, writing for *Security Management*, such questions include: "What would you do if a fellow employee called you a bad name? Embarrassed you in front of others? What did your previous boss do that made you mad? Tell me about a past supervisor you admired. It is a clear warning sign that a person has problems getting along with others if he can not identify a single past supervisor he liked." In addition to the above background and interviewing techniques, many companies have also adopted drug and alcohol testing, aptitude testing, and honesty testing as part of their overall interviewing process.

Recognize warning signs. Law enforcement and security experts agree that employees who engage in violent acts often though not always exhibit behaviors that serve as "red flags" indicating potential problems. These include engaging in direct or veiled threats against co-workers, paranoid behavior, unreciprocated romantic interest in a co-worker, obsession with weapons, pronounced mood swings, irrational ideas, externalized blaming, sensitivity to criticism, substance abuse, excessive anger over company policies or decisions, decreased productivity, and deteriorating relations with fellow staff, customers, or vendors.

Be cognizant of potential "trigger" events. Business owners should remember that workplace violence does not erupt for no reason, and that if it takes place within the walls of the company, the chances are pretty good that it was triggered by a workplace issue or event. Demotions, critical performance appraisals, layoffs, disciplinary actions, dismissals, and other professional disappointments can all trigger violent behavior. According to Dave Logan, a professor at the University of Southern California's Marshall School of Business, employees who have experienced trigger events sometimes feel that their situation is hopeless. In these cases, they may externalize their anger and become

violent or may start to feel that they have nothing to lose and that therefore any actions, even violent actions, are justifiable in some manner. Employers, according to Logan, should watch carefully for signs of this type of thinking and should take steps to prevent employees from feeling helpless or hopeless.

Counseling. Employee assistance programs can be very valuable to workers who are struggling with stress at home or in the office. When confronted with a volatile employee, a company's natural tendency may be to fire the troublemaker. In some cases, however, this action may exacerbate the situation and can even provoke a violent episode. The better approach is to suggest the troubled employee get professional counseling. Paying for it out of company expenses, if necessary, is worth it, if it will avert a disaster. In addition, some employers have instituted policies designed to give employees an outlet to relate their grievances and concerns. These avenues range from regular meetings with managers to comment boxes or surveys.

Terminate with dignity. Employers can reduce their exposure to workplace violence by instituting and carrying out policies that treat terminated employees with respect. In addition, some consultants encourage companies to offer outplacement counseling for ex-employees as part of their severance packages. Before doing so, however, business owners and managers should discuss possible legal ramifications with a qualified attorney.

Address ex-employees who pose a potential threat. Many businesses erroneously believe that once an employee has been discharged and is no longer in the workplace, he or she no longer poses a threat. But this is not necessarily the case. A study by Northwestern National Life Insurance, for example, stated that 3 percent of the total number of reported incidents of workplace violence were perpetrated by ex-employees. Restraining orders, password changes, and other special security measures may be necessary in some situations.

PROVIDING REFERENCES FOR EX EMPLOYEES

"The mere act of helping a violent or potentially violent ex-employee gain new employment raises problems, according to legal experts," wrote Gips. He noted that according to legal consultants, "there is no legal duty to warn a prospective employer of another company's experiences with an employee. But if the company purports to say something positive about the employee without revealing negative information, [it] might be interpreted as an endorsement of that employee, which could trigger the duty to tell the whole truth including the violence or threatened violence." Other potential legal pitfalls await business owners who are asked to comment on ex-employees who engaged in questionable behavior that nonetheless never became violent in nature. Business owners and managers cannot simply speculate that an ex-employee *might* be a violence risk, if there is no confirmed behavior upon which to base that opinion. Statutes governing defamation liability in this area vary considerably from state to state, so business owners who are asked about ex-employees who are seen as security risks should seek legal advice before responding.

WRITTEN COMMUNICATION

Written communication involves any type of interaction that makes use of the written word. Communication is a key to any endeavor involving more than one person. Communicating through writing is essential in the modern world and is becoming ever more so in what is now commonly called the information age. The ever-increasing use of computers and computer networks to organize and transmit information means the need for competent writing skills is rising. In fact, according to a 2008 article in *Personnel Psychology*, literacy (the ability to write and read effectively) is seen as the most important variable affecting income.

Studies and research support the notion that although writing skills are essential in the workplace, they are also lacking among employees. According to a 2009 article in *Manage Smarter*, about 90 percent of business communication takes place through written electronic communication such as e-mail, while verbal forms of communication amount to only about 10 percent of most company communications on an average day. A 2008 article in *BizTimes* reported that two out of three employees at large companies have writing duties. In small companies, the percentage may be even higher, as sole proprietors are responsible for most work-related tasks, including writing tasks. However, surveyed human resource executives claim that writing skills are the skills most lacking among entry-level candidates. Employers rate about 72 percent of high school graduates and 28 percent of college graduates as "deficient" in necessary writing skills.

The need to develop good writing skills is only highlighted by the fact that in the information age, it is not uncommon to have business relationships with customers and suppliers that are established and maintained exclusively through the use of written communications. In this environment, "the words we write are very real representations of our companies and ourselves. We must be sure that our e-mail messages are sending the right messages about us," explained Janis Fisher Chan, author of *E-Mail: A Write It Well Guide How to Write and Manage E-Mail in the Workplace*, in an article appearing in *Broker Magazine*. The key to communication, of course, is to convey meaning in as accurate and concise a manner as possible. People do not read business memoranda for the pleasure of reading. They do so in order to receive instructions or information on which to base decisions or take action. Therefore, highly literary prose is not desirable in business writing. Overly formal prose may also be counterproductive by seeming standoffish or simply wordy. A style of writing that is too informal can also convey an unintended message, namely that the subject matter is not serious or not taken seriously by the sender. A straightforward, courteous tone is usually the best choice but one that may not come naturally without practice.

According to a 2008 article in *Personnel Psychology*, written communication in the workplace is linked not only to basic writing skills, however, but also to job-specific writing skills. Written communication varies widely by industry and occupation. Researchers, for example, may need to write effective grant proposals and lab reports while attorneys need to write briefs and letters. Occupation-specific writing skills are sometimes referred to as "workplace literacy."

THE COMMUNICATION PROCESS

The basic process of communication begins when a fact or idea is observed by one person. That person (the sender) may decide to translate the observation into a message, and then transmit the message through some communication medium to another person (the receiver). The receiver then must interpret the message and provide feedback to the sender indicating that the message has been understood and appropriate action taken.

As Herta A. Murphy and Herbert W. Hildebrandt observed in *Effective Business Communications*, good communication should be complete, concise, clear, concrete, correct, considerate, and courteous. More specifically, this means that communication should answer basic questions like who, what, when, where; be relevant and not overly wordy; focus on the receiver and his or her interests; use specific facts and figures and active verbs; use a conversational tone for readability; include examples and visual aids when needed; be tactful and good-natured; and be accurate and nondiscriminatory. Unclear, inaccurate, or inconsiderate business communication can waste valuable time, alienate employees or customers, and destroy goodwill toward management or the overall business.

ADVANTAGES AND DISADVANTAGES OF WRITTEN COMMUNICATION

One advantage to using written forms of communication is that written messages do not have to be delivered on the spur of the moment; instead, they can be edited and revised several times before they are sent so that the content can be shaped to maximum effect. Another advantage is that written communication provides a permanent record of the messages and can be saved for later study. Since they are permanent, written forms of communication also enable recipients to take more time in reviewing the message and providing appropriate feedback. For these reasons, written forms of communication are often considered more appropriate for complex business messages that include important facts and figures. Other benefits commonly associated with good writing skills include increased customer/client satisfaction; improved interorganizational efficiency; and enhanced image in the community and industry.

There are also several potential pitfalls associated with written communication, however. For instance, unlike oral communication, wherein impressions and reactions are exchanged instantaneously, the sender of written communication does not generally receive immediate feedback to his or her message. This can be a source of frustration and uncertainty in business situations in which a swift response is desired. In addition, written messages often take more time to compose, both because of their information-packed nature and the difficulty that many individuals have in composing such correspondence. Many companies, however, have taken a proactive stance in addressing the latter issue. Mindful of the large number of workers who struggle with their writing abilities, some firms have begun to offer on-site writing courses or enrolled employees in business writing workshops offered by professional training organizations, colleges, and community education programs.

E MAIL COMMUNICATIONS

Electronic mail is a highly popular business communication tool. Its capacity to convey important corporate communications swiftly and easily has transformed it into a communications workhorse for business enterprises of all sizes and orientations. But many users of e-mail technology pay little attention to basic rules of grammar and format when composing their letters, even when they are penning business correspondence addressed to clients, customers, vendors, business partners, or internal colleagues. This sloppy correspondence style reflects a lack of professionalism and may communicate to the recipient a view of the company behind the message as equally unprofessional. The ease and informality of the medium should not be confused with the writing necessary to use it properly.

Given this unfortunate trend, many business experts counsel companies to install firm guidelines on tone, content, and shape of e-mail correspondence. These guidelines should make it clear that all employees are expected to adhere to the same standards of professionalism that (presumably) remain in place for traditional postal correspondence. Proper spelling and grammar and the ability to frame correspondence in suitably diplomatic language should be hallmarks of electronic mail as well as regular mail, especially if the communication is directed at a person or persons outside the company.

OTHER WRITTEN COMMUNICATIONS

In addition to e-mail, employees may be required to write effectively in a number of formats, including Tweets, social networking messages, instant messages, online chats, letters, reports, briefs, circulars, advertisements, informal notes, and other forms of writing. Employees must choose effective tone and content when writing in different forms. Instantaneous forms of writing, such as Tweets and online chats, require employees to compose well-written texts quickly, often without the benefit of extensive revision.

WRITTEN COMMUNICATIONS SOLUTIONS FOR SMALL BUSINESSES

Larger companies often have the benefit of hiring professional editors and teams of writers to create important written communications, such as company letters, brochures, and other written content. Small-business owners may not be able to afford such professional help, but they do have some choices when excellent written communication is needed.

Small businesses may create content themselves. Hiring one employee with outstanding writing skills to compose letters, reports, and other written communications may be one idea. In the case of a sole proprietorship, business owners may need to improve their own writing skills to communicate effectively through the written word. Many colleges now offer stand-alone business writing courses which teach the basics.

Small-business owners may also choose to hire contract or freelance writers to help with written communication. These writers can be paid a set wage for work produced, so that the cost of these writers can be much more modest than the cost of staff writers. As small businesses are expected to create more polished prose and larger amounts of written communication (in the form of letters, blog entries, and more), hiring occasional help is often an effective solution.

Y

YOUNG ENTREPRENEURS' ORGANIZATION (YEO)

The Young Entrepreneurs' Organization (YEO) is perhaps the best known of several groups that emerged during the 1990s to offer educational opportunities and other kinds of support to young business owners. Membership in such groups has increased dramatically in recent years, as more and more young people have abandoned traditional corporate career paths in favor of the increased autonomy and financial rewards that are possible through entrepreneurship. "Times have changed, and today entrepreneurship has become a key career choice for young Americans," wrote Tariq K. Muhammad in *Black Enterprise*. "Highly publicized corporate downsizings have cast a pall over the traditional path to success, and fueled a general perception that well-paying jobs with room for advancement are scarce. The days when professionals could expect to stay with the same company for a lifetime are long gone. Human resources professionals estimate that today's worker will have an average of five to ten career changes in their lifetime. As a result, interest in entrepreneurship has grown."

YEO was founded in 1987 by a group of five successful young entrepreneurs, including the founders of I Can't Believe It's Not Yogurt, the California Closet Company, and Redgate Communications Corporation. The organization later shortened its name to Entrepreneur's Organization (EO). In 2009 the group included 7,300 business owners based in 42 countries around the world. EO member companies represented more than $111 billion in revenues in 2008. The EO is managed by an international board of directors that oversees the organization's local community chapters.

The mission of EO is to provide its members with mentoring, peer networking, and educational opportunities. Membership is open to individuals who are the founders, cofounders, or majority shareholders of companies grossing over $1 million annually (special exceptions also exist for venture-backed firms). Membership used to be restricted to members under forty years of age but as of early 2010 the average age of members was forty, and membership was restricted to members under the age of fifty. Annual membership fees were US$1,400 as of 2010, and a one-time US$700 initiation fee was an additional expense for new members. In most cases, new members are referred by an existing EO member, although this is not a strict requirement. All new members, however, must undergo an interview and application process to become part of the EO. Before taking part in the monthly forums, new members must also complete training sessions, which can take up to one day.

Local chapters of the EO hold monthly meetings and sponsor regular educational events or presentations. Members may pay local fees as well as EO fees. In addition, the national organization regularly sponsors tours of other countries to study new business strategies, methods, and innovations. Many chapters also feature "self-help" forums where groups of six to twelve entrepreneurs from noncompeting industries get together to work on common problems faced by small-business owners, such as hiring good employees or international expansion. Personal issues are also sometimes explored in these private, confidential settings, which are facilitated by trained moderators. Attendance at monthly forums is mandatory and most of

these monthly events last 3 to 4 hours. All subjects discussed at the forums are confidential.

Another popular EO program is its Inventory of Skills (IOS), in which members can turn to fellow members to solve business problems or garner information on business issues they are facing. "YEO lets me benefit from the experience of my peers, who are also entrepreneurs and have already gone through situations I may be going through," one entrepreneur told *Black Enterprise*. "When I'm looking to enter new markets, I already have a contact in any part of the world because of my affiliation with EO." The EO also is responsible for the Accelerator Program and the Global Student Entrepreneur Awards (GSEA) program. The Accelerator Program offers learning and networking opportunities to help new entrepreneurs grow business revenues to more than US$1 million annually. The GSEA awards student entrepreneurs. Students who run their own businesses compete for business services, networking opportunities, media attention, and money. The EO can be contacted via its Web site at www.eonetwork.org.

Z

ZONING ORDINANCES

Zoning ordinances are local or municipal laws that establish building codes and land usage regulations for properties in a specified area. Most cities and towns are composed of regions that are zoned for residential, commercial, or industrial development, and often these zones are subdivided by additional use restrictions (type of business permitted, etc.). Zoning laws and ordinances may affect such varied issues as parking for customers, setbacks, access for deliveries, the height of new buildings in a specific area, the number and types of employees permitted, and the use of signs or other forms of advertising. These ordinances have to be considered by entrepreneurs/business owners wishing to set up, expand, or relocate business establishments. They should check with their city's zoning office and licensing board for restrictions that may apply within the city. Even particular neighborhoods may have land use regulations that should be researched prior to finalizing any business plan.

Zoning and Commercial Businesses. Review of zoning ordinances for areas designated for commercial or industrial use is a standard procedure for entrepreneurs seeking to establish a business in such places. In most cases, establishing a business in a building that was previously used for commercial purposes will not run afoul of zoning ordinances for the area. However, if the business was dramatically different in scope, it may be worthwhile to check zoning laws and ordinances. As Brigman L. Harman noted in a 2008 article in the *Brigham Young University Law Review*, zoning ordinances often serve the purpose of restricting specific businesses and their secondary effects from specific areas. For example, adult businesses such as adult bookstores will often not be permitted in an area near schools. A number of businesses including bail bond agents, adult businesses, businesses licensed to sell liquor, and establishments that offer gambling or gaming tend to be more heavily affected by zoning ordinances than regular enterprises.

Experts warn, too, that businesses seeking to construct a new facility, acquire an existing building for a new use, or launch extensive remodeling efforts should closely examine local zoning and building codes. In instances where local zoning laws present a problem, the business owner has the option of filing for a zone variance, a conditional-use permit, or a zone change. All three of these options have their drawbacks.

A zone change amounts to a permanent change in the zoning classification of the property. There are cases in which this is desirable, but the procedure to make such a change successfully is generally a cumbersome one that goes through City Hall. After all, bids for reclassification are based on claims that current zoning is in error or no longer reflects the character of the neighborhood. Many municipalities are reluctant to accept such arguments. Variances and conditional-use permits, meanwhile, are in essence requests for special permission to use the property for a purpose other than for which it was zoned. Such permits are often expensive to obtain and can take 2 to 4 months to go through if they are even approved. But they are usually easier to obtain than outright zoning changes.

Zoning and Home Businesses. Checking into local zoning ordinances is a step often overlooked by owners of home-based businesses as well. Such neglect can prove troublesome down the line, for as Janet Attard noted in *The Home*

Office and Small Business Answer Book: "zoning laws are established locally, often at the township, city, or village level. Furthermore, each town or village decides for itself what types of home businesses it will allow. Thus in one community you might be able to run a home business that has up to two employees while in another community the same business might be restricted from having any employees. In still another community you might be able to have a home-based business if you are a fisherman or carpenter but not if you are a real estate agent or insurance broker."

Most zoning ordinances restricting home offices in residential neighborhoods were originally designed to protect residential neighborhoods from becoming cluttered with commercial activity and thus maintain the family-friendly flavor and atmosphere of the area. In the past, these laws often were strictly interpreted to keep residents from conducting any sort of business from their home, even if it did not have a visible impact on the rest of the neighborhood. Through the first decade of the twenty-first century, the explosion in home-based business start-ups has sparked a reevaluation of zoning laws in residential areas, but many of the old zoning laws remain on the books.

Some ordinances are vague regarding the exact types of home-based businesses allowed in a specific area. In these cases, if the case goes to court, a judge will determine what business is and is not allowed in an area. Small home-based businesses, according to Fred Steingold's 2008 book, *Legal Guide for Starting & Running a Small Business* are usually affected by zoning ordinances when it comes to parking, signs visible from the street, traffic associated with the business, the amount of a home dedicated to work, and numbers of employees. Single contractors working from home and changing the tenor of a neighborhood very little or not at all usually face fewer restrictions and challenges than small businesses requiring street parking and attracting customers to an area.

Another problem, according to Steingold, is that most zoning ordinances were created before the current boom in telecommuting and electronic communication. In other words, these ordinances were created at a time when bricks-and-mortar businesses had the power to change the tenor of an area through increased traffic. Telecommuters and online business owners simply do not have the same impact on an area. Indeed, neighbors may not even be aware that someone is running a business out of his or her own home.

It is widely recognized that millions of home-based businesses operate for years in violation of zoning laws, and that many of those businesses prosper without ever running into problems. Indeed, many communities simply ignore violations unless a neighborhood resident or someone else complains. These complaints may be triggered by utterly trivial factors unhappiness with the frequency with which a person mows his or her lawn, for instance, or anger about some real or imagined social slight but in the eyes of the law, the motivations behind the complaint will generally be of little consequence. "You cannot assume ... that it is OK for you to disregard local law because *some* town boards don't enforce regulations and *some* people get away with operating on the sly," said Attard. "If there are laws prohibiting your type of home business, it will only take one complaint to plunge you into a pot of legal hot water." Usually, violating zoning ordinances results in cease and desist letters and may result in misdemeanor charges.
