Introduction and User's Guide

INTRODUCTION

While the actions of large companies are the subject of most business news cycles, small businesses are the backbone of the American economy. These businesses employ over half of all U.S. workers, and they account for 64 percent of net new jobs. Small business (often defined as a business with less than 100 workers) may be small, but it is everywhere. It is innovative, adaptive, and has a ubiquitous presence in most every American city.

Like many small firms, the fourth edition of the *Encyclopedia of Small Business* has adapted to fit the current economic times. This edition, like its predecessors, features new entries and reflects the rapidly changing environment by intensive updating of its contents. Since the last edition the global economy has been convulsed by a recession brought on by disruptions in the world's financial sector, and a comprehensive overhaul of the American health care system has been signed into law, to name just two events with significant long-term economic implications. This encyclopedia reflects all of these changes. Virtually every entry has had to be revised, many rather extensively, to mirror accurately the dynamically changing economic environment.

EOSB-4, like earlier editions, is intended as a resource for the small-business owner, for the would-be entrepreneur, and for students of business generally. It deals extensively with most aspects of business activity, from human resources on up to organizational issues; production and productivity; financial activities from accounting details on up to stock trading; purchasing, sales, and marketing; accounting and measurement issues, including various forms of valuation and assessment; and also with legal forms and regulatory requirements. It deals with starting, buying, and selling businesses as well as taking them public or buying them back from the public. *EOSB-4* also attempts to cover major issues that shape the business environment, like globalization and Web 2.0, or shape the company, like business ethics. In most cases, the point of view reflected is that of the small-business owner. All events in all companies have the same fundamental character, but the same issue confronting a small business will very often play out differently than it will in a huge organization.

EOSB-4 has 605 entries of which 40 are new. These new entries cover the emergence of such twenty-first-century topics as Social Media, Crowdsourcing, Socially Responsible Investment, and Sustainable Business Practices. Most of the other existing entries have also been rewritten on the basis of new research and information. Users of *EOSB* who like

to follow a subject closely might wish to look up and read again entries that have helped them in the past. All other entries have been carefully reviewed and updated in light of regulatory, market, legislative, technological, or global changes. Some have been redone to make points previously present more sharply or with additional documentation.

USER'S GUIDE

The essays in *EOSB-4* are presented alphabetically by topic in two volumes, with Volume 1 covering essays beginning with A-I and Volume 2 containing essays J-Z. In the very nature of things, some topics are covered in more than one entry depending on context. An example is the broad subject of Internet Security. Some cross-referencing is provided at the bottom of entries under the **See Also** heading. A look at the index will provide references to other essays in which the topic may be covered in part or touched upon. Each entry is also followed by a **Further Reading** section in which the reader can identify books, periodicals, and government or other Web sites from or on which additional information may be obtained.

EOSB-4 features a Master Index at the back of Volume 2. The index contains alphabetical references to important terms in accounting, finance, human resources, marketing, operations management, organizational development, and other areas of interest to small business owners; names of institutions, organizations, associations, government agencies, and relevant legislation; and "see also" references. Each index term is followed by volume and page numbers, which easily direct the user to main topics as well as to all secondary reference terms as mentioned above.

EOSB-4 works equally well as a reference work to look up some category on which more information is needed, e.g., Discounted Cash Flow or as a book used for browsing. It can also be used as a source of general information on trends or practices, the reader sampling an essay and being moved, perhaps, to read another that comes up in the context of the first. However used, it is the editors' hope that the *Encyclopedia of Small Business* will have served the reader well in presenting the subjects and in provoking thought and best of all profitable action.

COMMENTS AND SUGGESTIONS

A

ABSENTEEISM

Absenteeism is the term generally used to refer to unscheduled employee absences from the workplace. Many causes of absenteeism are legitimate personal illness or family issues, for example but absenteeism can also be traced to factors such as a poor work environment or workers who lack commitment to their jobs. If such absences become excessive, they can adversely impact the operations and, ultimately, the profitability of a business.

COSTS OF ABSENTEEISM

Unscheduled absences are costly to business. According to the U.S. Department of Labor, companies lose approximately 2.8 million workdays a year because of employee injuries and illnesses. The inability to plan for these unexpected absences means that companies hire last-minute temporary workers, or pay overtime to their regular workers, to cover labor shortfalls; they may also maintain a higher staffing level regularly in anticipation of absences. According to a 2007 study conducted by CCH Inc., a provider of human resource research, the absenteeism rate has reached an average of 2.5 percent per day, with only 35 percent of those total absences caused by personal illness. Companies rated with poor or fair morale programs suffered an even larger 2.9 percent absenteeism rating. To compensate, most companies continually overstaff by 10 to 20 percent to mask lost productivity.

Small businesses are, of course, not immune to such "expenses." There are obvious costs associated with an absent employee, including consequences difficult to measure. The most obvious cost is in the area of sick leave benefits provided that the business offers such benefits but there are significant hidden costs as well. The *SOHO Guidebook* cites the following as notable hidden cost factors associated with absenteeism:

- Lost productivity of the absent employee
- Overtime for other employees to fill in
- Decreased overall productivity of those employees
- Costs incurred to secure temporary help
- Possible loss of business or dissatisfied customers
- Problems with employee morale

The costs associated with absenteeism can be controlled. While scheduled time off for vacations and illnesses is an inevitable cost of doing business, creating a comprehensive absence policy to discourage excessive absenteeism is well worth the effort. Some larger companies have been able to cut absenteeism by as much as 85 percent by creating such plans, and small businesses can stop absenteeism before it becomes a problem by developing such policies.

The growing field of telework is also having a signficant impact on absenteeism. Telework refers to completing work tasks at home, or using at-home resources such as the Internet and a telephone to complete work projects. One of the primary benefits cited for small businesses to use and encourage teleworking is that rates of absenteeism tend to drop in the presence of telework options. By giving the option to work from home in certain cases, many employees are able to find a work/life balance that allows them still to be productive while taking care of issues that would have kept them away if they had been required to go to work. The cost savings associated with teleworking can be significant.

If a small business owner wants to create a teleworking option for employees, the key is clarity. Telework can be done

by accountants, marketers, secretaries, journalists, and many different types of workers, but businesses need clear guidelines on what counts as teleworking, what the limits of teleworking are, how to notify managers concerning a period of teleworking, and what the expected results of such work are.

DEVELOPING AN ABSENCE POLICY

Many small-business owners do not establish absenteeism policies for their companies. Some owners have only a few employees and do not feel that it is worth the trouble. Others operate businesses in which "sick pay" is not provided to employees. Workers in such firms thus have a significant incentive to show up for work; if they do not, their paycheck suffers. Still other small-business owners feel that absenteeism is not a significant problem; they see no need to institute new policies or make any changes to the few rules that might already be in place.

Many small-business consultants counsel entrepreneurs and business owners to consider establishing formal written policies that conform to state and federal laws. Written policies can give employers added legal protection from employees who have been fired or disciplined for excessive absenteeism provided that those policies explicitly state the allowable number of absences, the consequences of excessive absenteeism, and other relevant aspects of the policy. Moreover, noted the *SOHO Guidebook*, "a formal, detailed policy that addresses absences, tardiness, failure to call in, and leaving early can serve to prevent misconceptions about acceptable behavior, inconsistent discipline, complaints of favoritism, morale problems, and charges of illegal discrimination. General statements that excessive absenteeism will be a cause for discipline may be insufficient."

Changes in company culture and policy have been cited as effective in reducing absenteeism. The use of flexible schedules, whenever possible, is one way to offer employees a means of managing their own personal time needs and thus reducing unscheduled absences. Many small businesses that have introduced flextime, compressed work weeks, job sharing, and telecommuting options to their workforce have seen absenteeism fall significantly; these policies provide employees with much greater leeway to strike a balance between office and home that works for them (and the employer).

Small businesses should also be aware of when they may fall under federal or state laws that they were previously exempt from fulfilling. The Family and Medical Leave Act, for instance, applies to private businesses when they have more than fifty employees in a 75-mile radius. As businesses grow, owners should be aware of when they fall under such guidelines and have plans to meet their requirements.

ABSENTEEISM POLICIES

Most employees are conscientious workers with good attendance records. If they are forced to miss significant amounts of work, the reasons are usually legitimate. However, it is estimated that three out of every hundred workers are likely to exploit the system by taking more than the allotted sick time or more days than are necessary to recover from illness.

In times of economic recession, employees are more likely to stay at work, and absenteeism rates tend to drop noticeably. However, this is not considered a welcome trend, since such employees are those who would choose to be absent were they not afraid of losing their jobs. The preferable employees are those who are dedicated enough to the business that they arrive and work industriously regardless of economic conditions.

To address absenteeism, many small businesses choose between two policies. The first is a traditional absenteeism policy that distinguishes between excused and unexcused absences. Under such policies, employees are provided with a set number of sick days (also sometimes called "personal" days in recognition that employees occasionally need to take time off to attend to personal/family matters) and a set number of vacation days. Employees who are absent from work after exhausting their sick days are required to use vacation days under this system. Absences that take place after both sick and vacation days have been exhausted are subject to disciplinary action. The second policy alternative, commonly known as a "no-fault" system, permits each employee a specified number of absences annually (either days or "occurrences," in which multiple days of continuous absence are counted as a single occurrence). This policy does not consider the reason for the employee's absence. As with traditional absence policies, once the employee's days have been used up, he or she is subject to disciplinary action.

"Use It or Lose It". Some companies do not allow employees to carry sick days over from year to year. The benefits and disadvantages of this policy continue to be debated in businesses across the country. Some analysts contend that most employees do not require large numbers of sick days and that systems that allow carryovers are more likely to be abused by poor employees than appropriately utilized by good employees, who, if struck down by a long-term illness, often have disability alternatives.

A more employee-friendly feature that can be added onto a "use it or lose it" sick day policy is the option of donating unused earned days to a leave bank for colleagues suffering from catastrophic illnesses. Although this may not be an incentive to all employees to conserve sick days, it does offer dedicated employees a means of putting what they may consider legitimately earned hours to a positive use.

ESTABLISHING A SYSTEM FOR TRACKING ABSENCES

Absenteeism policies are useless if the business does not also implement and maintain an effective system for tracking employee attendance. Some companies are able to track absenteeism through existing payroll systems, but those who do not have this option need to make certain that they put together a system that can: 1) keep an accurate count of individual employee absences; 2) tabulate company wide absenteeism totals; 3) calculate the financial impact that these absences have on the business; 4) detect periods when absences are particularly high; and 5) differentiate between various types of absences.

ACCELERATED COST RECOVERY SYSTEM (ACRS)

The Accelerated Cost Recovery System (ACRS) is a method of depreciating property for tax purposes; it allows individuals and businesses to write off capitalized assets in an accelerated manner. Adopted by the U.S. Congress in 1981 as part of the Economic Recovery Tax Act, ACRS assigns assets to one of eight recovery classes ranging from 3 to 19 years depending on the assets' useful lives. These recovery classes are used as the basis for depreciation of the assets.

The idea behind ACRS was to increase the tax deduction for depreciation of property and thus increase the cash flow available to individuals and businesses for investment. It was put in place during an economic recession and "unleashed a torrential flow of corporate cash," according to Elizabeth Kaplan in *Dun's Business Month.* In fact, at the time it was enacted, ACRS was expected to add between $50 and $100 billion to the incomes of individuals and businesses over a 10-year period.

Proponents of ACRS claimed that this depreciation method and related changes in tax law led to a huge increase in investment that helped the U.S. economy recover. But other people criticized ACRS for making reported business earnings look better than they actually were. "The dangers of treating depreciation as merely an accounting convention and not a real economic cost that provides for the eventual replacement of plant and equipment were exacerbated by ACRS, which allowed companies to take ultra rapid depreciation on capital-intensive assets," Kaplan explained. "By reducing corporate tax bills, ACRS also exaggerated the disparity between cash flow and reported earnings. The cash generated by a company's operations is being hailed as a far more reliable barometer of financial health than the more traditional earnings yardstick, which can be skewed by accounting conventions."

Perhaps the most dangerous trend to grow out of the favorable tax treatment of capitalized assets was a large number of hostile takeovers. "ACRS inadvertently unleashed a potent weapon for corporate raiders who specialize in leveraging the assets of the target company to finance their attacks," Kaplan noted.

SWITCH TO MACRS

Responding to criticism, the U.S. Congress revised the ACRS as part of the 1986 Tax Reform Act. The new depreciation method for tangible property put in use after 1986 is called the Modified Accelerated Cost Recovery System (MACRS). The main difference between ACRS and MACRS is that the latter method uses longer recovery

periods and thus reduces the annual depreciation deductions granted for residential and nonresidential real estate.

Some people expressed concern that the change would spur consumption at the expense of investment and thus end the period of economic recovery and growth. Others worried that the frequency of changes would unnecessarily complicate the tax code. Ultimately, MACRS was considered a success and the IRS still requires business to follow its guidelines although generally accepted accounting practices (GAAP) allow for other accounting methods such as straight-line accounting for purposes besides taxes. MACRS went through only minor revisions from 1990 to 2010, with most additions encompassing new technology or business practices not available when the method was created.

MACRS actually encompasses two different depreciation methods, called the General Depreciation System (GDS) and the Alternative Depreciation System (ADS). GDS is used for most types of property. ADS applies only to certain types of property that which is used for business purposes 50 percent of the time or less, is used predominantly outside the United States, or is used for tax-exempt purposes, for example but can also be used if the taxpayer so chooses.

Small businesses can use MACRS not only to depreciate large business expenses like vehicles or equipment, but also to see if small items can be included as business expenses. If small-business owners have questions as to whether particular trips in a vehicle or certain uses of equipment can be counted, they can consult MACRS to see if such items are listed as business expenses. Counting such items as expenses and properly depreciating expensive assets can make a large difference to small businesses, not only in the taxes that they need to pay but also in the recorded profits the business makes.

MACRS also makes more room for recovering energy-efficient or green investments detailed in the original ACRS. Several types of renewable energy technologies are rated as 5-year properties, including:

1. solar electric and solar thermal systems
2. fuel cells
3. geothermal systems
4. small wind systems
5. combined heat and power systems (CHP)

These and similar small changes were made to encourage businesses to adopt healthier operating practices.

CHANGES IN MACRS

In March 2004 temporary and proposed changes to MACRS were published by the IRS. The changes concern how depreciation is handled for property acquired in one of two specific ways. Property acquired in a like-kind exchange and/or as a result of an involuntary conversion are to be handled differently if both the relinquished and the replacement property are subject to MARCS in the acquiring taxpayer's hands. The property in question must also have changed hands prior to February 27, 2004.

The federal economic stimulus act of 2008 added a 50 percent bonus depreciation provision for eligible renewable energy systems that were acquired and placed in service in 2008. This was later extended to include all of 2009 as well. Under this amendment, the property owner can deduct 50 percent of the adjusted basis of the property in 2008 and 2009, while the remaining 50 percent is deducted along the regular 5-year timeline.

These temporary additions to MACRS were designed to encourage business owners who want to start environmentally friendly operations. By being able to deduct half of a property's base value in one year, businesses can significantly reduce their on-book costs and related taxes in the following years, essentially making large renewable energy systems more tax deductible. This and similar federal measures can give small-business owners a boost if they use alternative energy sources, improving not only the profit appearance of their companies but also letting them pay associated taxes more quickly.

ACCOUNTING

Accounting has been defined as "the language of business" because it is the basic tool to keep score of a business's activity. It is with accounting that an organization records, reports, and evaluates economic events and transactions that affect the enterprise. As far back as 1494 the importance of accounting to the success of a business was known. In a book on mathematics published that year and written by the Franciscan monk Luca Paciolo, the author cites three things any successful merchant must have: sufficient cash or credit, an accounting system to track how he is doing, and a good bookkeeper to operate the system.

Accounting processes document all aspects of a business's financial performance, from payroll costs, capital expenditures, and other obligations to sales revenue and owners' equity. An understanding of the financial data contained in accounting documents is regarded as essential to reaching an accurate picture of a business's true financial well-being. Armed with such knowledge, businesses can make appropriate financial and strategic decisions about their future; conversely, incomplete or inaccurate accounting data can cripple a company, no matter its size or orientation. The importance of accounting as a barometer of business health past, present, and future and tool of business navigation is reflected in the words of the American Institute of Certified Public Accountants (AICPA), which defined accounting as a "service activity." Accounting, said the AICPA, is intended "to provide quantitative information, primarily financial in nature, about economic activities that is intended to be useful in making economic decisions making reasoned choices among alternative courses of action."

A business's accounting system contains information relevant to a wide range of people. In addition to business owners, who rely on accounting data to gauge the financial progress of their enterprise, accounting data can communicate relevant information to investors, creditors, managers, and others who interact with the business in question. As a result, accounting is sometimes divided into two distinct subsets financial accounting and management accounting that reflect the different information needs of the end users.

Financial accounting is a branch of accounting that provides people outside the business such as investors or loan officers with qualitative information regarding an enterprise's economic resources, obligations, financial performance, and cash flow. Management accounting, on the other hand, refers to accounting data used by business owners, supervisors, and other employees of a business to gauge the enterprise's health and operating trends.

GENERALLY ACCEPTED ACCOUNTING PRINCIPLES

Generally accepted accounting principles (GAAP) are the guidelines, rules, and procedures used in recording and reporting accounting information in audited financial statements. In order to have a vibrant and active economic marketplace, participants in the market must have confidence in the system. They must be confident that the reports and financial statements produced by companies are trustworthy and based on some standard set of accounting principles. The stock market crash of 1929 and its aftermath showed just how damaging uncertainty can be to the market. The results of U.S. Senate Banking and Currency Committee hearings into the 1929 crash caused public outrage and lead to federal regulation of the securities market as well as a push for the development of professional organizations designed to establish standardized accounting principles and to oversee their adoption.

Various organizations have influenced the development of modern-day accounting principles. Among these are the American Institute of Certified Public Accountants (AICPA), the Financial Accounting Standards Board (FASB), and the Securities and Exchange Commission (SEC). The first two are private sector organizations; the SEC is a federal government agency.

The AICPA played a major role in the development of accounting standards. In 1937 the AICPA created the Committee on Accounting Procedures (CAP), which issued a series of Accounting Research Bulletins (ARB) with the purpose of standardizing accounting practices. This committee was replaced by the Accounting Principles Board (APB) in 1959. The APB maintained the ARB series, but it also began to publish a new set of pronouncements, referred to as Opinions of the Accounting Principles Board. In mid-1973 an independent private board called the Financial Accounting Standards Board (FASB) replaced the APB and assumed responsibility for the issuance of financial accounting standards. The FASB remains the primary determiner of financial accounting standards in the United States. Comprised of seven members who serve full time and receive compensation for their service, the FASB identifies financial accounting issues, conducts research related to these issues, and is charged with resolving the issues. A super-majority vote (i.e., at least five to two) is required before an addition or change

to the Statements of Financial Accounting Standards is issued. Such changes are made to encourage certain business trends or stop unhealthy business practices, as seen in the 2009 FASB approval of accounting changes that allowed technology companies to sell bundled software and hardware devices more easily.

In 2004 FASB added a small-business advisory committee in an attempt to receive more input from the small-business sector of the U.S. market. FASB has received input from small-business organizations since its beginning, but this is the first in-house board designed to look at accounting matters from a small- business perspective. The committee consists of twenty-four various lenders, investors, and analysts from the small-business community.

The Financial Accounting Foundation is the parent organization to FASB. The foundation is governed by a sixteen-member Board of Trustees appointed from the memberships of eight organizations: AICPA, Financial Executives Institute, Institute of Management Accountants, Financial Analysts Federation, American Accounting Association, Securities Industry Association, Government Finance Officers Association, and National Association of State Auditors. A Financial Accounting Standards Advisory Council (approximately thirty members) advises the FASB. In addition, an Emerging Issues Task Force (EITF) was established in 1984 to provide timely guidance to the FASB on new accounting issues.

The Securities and Exchange Commission, an agency of the federal government, has the legal authority to prescribe accounting principles and reporting practices for all companies issuing publicly traded securities. The SEC has seldom used this authority, although it has intervened or expressed its views on accounting issues from time to time. U.S. law requires that companies subject to the jurisdiction of the SEC make reports to the SEC giving detailed information about their operations. The SEC has broad powers to require public disclosure in a fair and accurate manner in financial statements and to protect investors. The SEC establishes accounting principles with respect to the information contained within reports it requires of registered companies. These reports include: Form S-X, a registration statement; Form 10-K, an annual report; Form 10-Q, a quarterly report of operations; Form 8-K, a report used to describe significant events that may affect the company; and Proxy Statements, which are used when management requests the right to vote through proxies for shareholders.

On December 20, 2002, the SEC proposed a series of amendments to the rules and forms that it imposes on companies within its jurisdiction. These changes were mandated as part of the passage of the Sarbanes-Oxley Act of 2002. This law was motivated, in part, by accounting scandals that came to light involving firms as well known as Enron, WorldCom, Tyco, Global Crossing, Kmart, and Arthur Andersen, to name a few.

INTERNATIONAL STANDARDS

If small businesses are interested in starting international trade, they should be aware of the IFRS, or international financial reporting standards. IFRS are not fully developed, but it is expected that most U.S. businesses will be required to adher to IFRS by 2016, including small businesses who trade internationally and as time goes on possibly even other businesses. The American Institute of Certified Public Accountants, which governs small business auditing, has already recognized the developing IFRS as a potential new standard.

Another change that may concern small businesses is the development of the Financial Statement Presentation Project (FSPP). This is a new proposed format for displaying balance sheet and income statement information more like a cash flow statement is displayed, with data separated out into business, financing, and income categories, among others. Decisions on the Financial Statement Presentation Project are expected in 2010. For the most part, changes would affect large businesses and how they display information to investors, but a trickle-down effect can be expected for small businesses as well. If the changes do go into effect, small businesses can be expected to keep up with the new formats, especially if they ever intend to go public.

ACCOUNTING SYSTEM

An accounting system is a management information system responsible for the collection and processing of data useful to decision-makers in planning and controlling the activities of a business organization. The data processing cycle of an accounting system encompasses the total structure of five activities associated with tracking financial information: collection or recording of data; classification of data; processing (including calculating and summarizing) of data; maintenance or storage of results; and reporting of results. The primary but not sole means by which these final results are disseminated to both internal and external users (such as creditors and investors) is the financial statement.

The elements of accounting are the building blocks from which financial statements are constructed. According to the Financial Accounting Standards Board (FASB), the primary financial elements directly related to measuring performance and the financial position of a business enterprise are as follows:

- Assets probable future economic benefits obtained or controlled by a particular entity as a result of past transactions or events.
- Comprehensive Income the change in equity (net assets) of an entity during a given period as a result

of transactions and other events and circumstances from non-owner sources. Comprehensive income includes all changes in equity during a period except those resulting from investments by owners and distributions to owners.

- Distributions to Owners decreases in equity (net assets) of a particular enterprise as a result of transferring assets, rendering services, or incurring liabilities to owners.
- Equity the residual interest in the assets of an entity that remain after deducting liabilities. In a business entity, equity is the ownership interest.
- Expenses events that expend assets or incur liabilities during a period from delivering or providing goods or services and carrying out other activities that constitute the entity's ongoing major or central operation.
- Gains increases in equity (net assets) from peripheral or incidental transactions. Gains also come from other transactions, events, and circumstances affecting the entity during a period except those that result from revenues or investments by owners. Investments by owners are increases in net assets resulting from transfers of valuables from other entities to obtain or increase ownership interests (or equity) in it.
- Liabilities probable future sacrifices of economic benefits arising from present obligations to transfer assets or provide services to other entities in the future as a result of past transactions or events.
- Losses decreases in equity (net assets) from peripheral or incidental transactions of an entity and from all other transactions, events, and circumstances affecting the entity during a period. Losses do not include equity drops that result from expenses or distributions to owners.
- Revenues inflows or other enhancements of assets, settlements of liabilities, or a combination of both during a period from delivering or producing goods, rendering services, or conducting other activities that constitute the entity's ongoing major or central operations.

When businesses first begin, they usually choose between cash method accounting or accrual method accounting. Cash method accounting records income and expenses in the month and year in which they were received or paid. This is often easier for service-based businesses, while businesses that deal with inventory or manufacturing must depend on the accrual method. Accrual method accounting records income and expenses as they are incurred, not when the money exchanges hands. There are also hybrid methods that combine the two methods, which are useful for businesses that offer services along with products.

FINANCIAL STATEMENTS

Financial statements are the most comprehensive way of communicating financial information about a business enterprise. A wide array of users from investors and creditors to budget directors use the data it contains to guide their actions and business decisions. Financial statements generally include the following information:

- Balance sheet (or statement of financial position) summarizes the financial position of an accounting entity at a particular point in time as represented by its economic resources (assets), economic obligations (liabilities), and equity.
- Income statement summarizes the results of operations for a given period of time.
- Statement of cash flows summarizes the impact of an enterprise's cash flows on its operating, financing, and investing activities over a given period of time.
- Statement of retained earnings shows the increases and decreases in earnings retained by the company over a given period of time.
- Statement of changes in stockholders' equity discloses the changes in the separate stockholders' equity account of an entity, including investments by distributions to owners during the period.

Notes to financial statements are considered an integral part of a complete set of financial statements. Notes typically provide additional information at the end of the statement and concern such matters as depreciation and inventory methods used in the statements, details of long-term debt, pensions, leases, income taxes, contingent liabilities, methods of consolidation, and other matters. Significant accounting policies are usually disclosed as the initial note or as a summary preceding the notes to the financial statements.

ACCOUNTING PROFESSION

There are two primary kinds of accountants: private accountants, who are employed by a business enterprise to perform accounting services exclusively for that business, and public accountants, who function as independent experts and perform accounting services for a wide variety of clients. Some public accountants operate their own businesses, while others are employed by accounting firms to attend to the accounting needs of the firm's clients. While starting businesses may not be able to outsource accounting to another firm, it is common for businesses to use outside accountants as they grow larger.

A certified public accountant (CPA) is an accountant who has 1) fulfilled certain educational and experience requirements established by state law for the practice of public accounting and 2) garnered an acceptable score on a rigorous 3-day national examination. Such people become licensed to practice public accounting in a particular state. These licensing requirements are widely credited with maintaining the integrity of the accounting service industry, but in recent years this licensing process has drawn criticism from legislators and others who favor deregulation of the profession. Some segments of the business community have expressed concern that the quality of accounting would suffer if such changes were implemented, and analysts indicate that small businesses without major inhouse accounting departments would be particularly impacted.

The American Institute of Certified Public Accountants (AICPA) is the national professional organization of CPAs, but numerous organizations within the accounting profession exist to address the specific needs of various accounting professionals. These groups range from the American Accounting Association, an organization composed primarily of accounting educators, to the American Women's Society of Certified Public Accountants.

ACCOUNTING AND THE SMALL BUSINESS OWNER

"A good accountant is the most important outside advisor the small- business owner has," according to the *Entrepreneur Magazine Small Business Advisor.* "The services of a lawyer and consultant are vital during specific periods in the development of a small business or in times of trouble, but it is the accountant who, on a continuing basis, has the greatest impact on the ultimate success or failure of a small business."

When starting a business, many entrepreneurs consult an accounting professional to learn about the various tax laws that affect them and to familiarize themselves with the variety of financial records that they will need to maintain. Such consultations are especially recommended for would-be business owners who anticipate buying a business or franchise, plan to invest a substantial amount of money in the business, anticipate holding money or property for clients, or plan to incorporate.

If a business owner decides to enlist the services of an accountant to incorporate, he or she should make certain that the accountant has experience dealing with small corporations, for incorporation brings with it a flurry of new financial forms and requirements. A knowledgeable accountant can provide valuable information on various aspects of the start-up phase.

Similarly, when investigating the possible purchase or licensing of a business, a would-be buyer should enlist the assistance of an accountant to look over the financial statements of the licensor-seller. Examination of financial statements and other financial data should enable the accountant to determine whether the business is a viable investment. If a prospective buyer decides not to use an accountant to review the licensorseller's financial statements, he or she should at least make sure that the financial statements that have been offered have been properly audited (a CPA will not stamp or sign a financial statement that has not been properly audited and certified).

Once in business, the business owner will have to weigh revenue, rate of expansion, capital expenditures, and other factors in deciding whether to secure an inhouse accountant, an accounting service, or a year-end accounting and tax preparation service. Sole proprietorships and partnerships are less likely to have need of an accountant; in some cases, they will be able to address their business's modest accounting needs without utilizing outside help. If a business owner declines to seek professional help from an accountant on financial matters, pertinent accounting information can be found in books, seminars, government agencies such as the Small Business Administration, and other sources.

Even if a small-business owner decides against securing an accountant he or she will find it much easier to attend to the business's accounting requirements if a few basic bookkeeping principles are followed. These include maintaining a strict division between personal and business records; maintaining separate accounting systems for all business transactions; establishing separate checking accounts for personal and business; and keeping all business records, such as invoices and receipts.

Small businesses usually choose to buy some kind of accounting software to help them keep track of expenditures, wages, and other day-to-day aspects of accounting. Popular accounting software packages include QuickBooks and Peachtree, which offer a base software structure that organizations can use to purchase the specific modules they need to keep track of their business. These accounting software programs help businesses be more accurate and mindful of accounting practices even after they grow large enough to hire outside professionals.

CHOOSING AN ACCOUNTANT

While some small businesses are able to manage their accounting needs without benefit of in-house accounting personnel or a professional accounting outfit, the majority choose to enlist the help of accounting professionals. There are many factors for the small-business owner to consider when seeking an accountant, including personality, services rendered, reputation in the business community, and expense.

The nature of the business in question is also a consideration in choosing an accountant. Owners of small businesses who do not anticipate expanding rapidly have little

need of a national accounting firm, but business ventures that require investors or call for a public stock offering can benefit from association with an established accounting firm. Many owners of growing companies select an accountant by interviewing several prospective accounting firms and requesting proposals which will, ideally, detail the firm's public offering experience within the industry, describe the accountants who will be handling the account, and estimate fees for auditing and other proposed services.

Finally, a business that utilizes a professional accountant to attend to accounting matters is often better equipped to devote time to other aspects of the enterprise. Time is a precious resource for small businesses and their owners, and according to the *Entrepreneur Magazine Small Business Advisor*, "Accountants help business owners comply with a number of laws and regulations affecting their record-keeping practices. If you spend your time trying to find answers to the many questions that accountants can answer more efficiently, you will not have the time to manage your business properly. Spend your time doing what you do best, and let accountants do what they do best."

The small-business owner can, of course, make matters much easier both for his or her company and for the accountant by maintaining proper accounting records throughout the year. Well-maintained and complete records of assets, depreciation, income and expense, inventory, and capital gains and losses are all necessary for the accountant to conclude her work; gaps in a business's financial record only add to the accountant's time and, therefore, her fee for services rendered.

The potential management insights that can be gained from a study of properly prepared financial statements should not be overlooked. Many small businesses see accounting primarily as a paperwork burden and something whose value is primarily in helping to comply with government reporting requirements and tax preparations. Most experts in the field contend that small firms should recognize that accounting information can be a valuable component of a company's management and decision-making systems, for financial data provide the ultimate indicator of the failure or success of a business's strategic and philosophical direction.

ACCOUNTING METHODS

Accounting methods refer to the basic rules and guidelines under which businesses keep their financial records and prepare their financial reports. There are two main accounting methods used for recordkeeping: the cash basis and the accrual basis. Small business owners must decide which method to use depending on the legal form of the business, its sales volume, whether it extends credit to customers, whether it maintains an inventory, and the tax requirements set forth by the Internal Revenue Service (IRS). Some form of record-keeping is required by law and for tax purposes, but the resulting information can also be useful to managers in assessing the company's financial situation and making decisions. It is possible to change accounting methods later, but the process can be complicated. Therefore it is important for small-business owners to decide at the outset which method to use, based on what will be most suitable for their particular business.

Small-business owners also need to be aware of how the two different accounting methods (or combinations of the two) will affect their tax deductions. Deductions can only be made in the year in which the expense is paid, not incurred. Therefore, if a business incurs an expense in 2009 but does not pay it until 2010, the business has to wait until the 2010 tax period to receive the deduction.

CASH BASIS

Accounting records prepared using the cash basis recognize income and expenses according to real-time cash flow. Income is recorded upon receipt of funds, rather than based upon when it is actually earned; expenses are recorded as they are paid, rather than as they are actually incurred. Under this accounting method, therefore, it is

possible to defer taxable income by delaying billing so that payment is not received in the current year. Likewise, it is possible to accelerate expenses by paying them as soon as the bills are received, in advance of the due date. This can alter the appearance of accounting statements from year to year, allowing businesses to improve certain statements, at least on paper.

ACCRUAL BASIS

A company using an accrual basis for accounting recognizes both income and expenses at the time they are earned or incurred, regardless of when cash associated with those transactions changes hands. Under this system, revenue is recorded when it is earned rather than when payment is received; expenses are recorded when they are incurred rather than when payment is made. Incurred income and expenses are defined as being completely certain, unchangeable by any other events. If small businesses have trouble identifying when to record the sales date or purchase, all items should be recorded on the day they are received, and all services on the day they are completed.

CASH VS. ACCRUAL BASIS

As can be seen, the key difference between the two methods of accounting has to do with how each method records cash coming into and going out of the company. At any one point in time, a company's accounts will look very different depending on which accounting method was used to prepare those accounts. Over time, these differences diminish since all expenses and revenues are eventually recorded.

If a company called, say, Cash Method Company, pays its annual rent of $12,000 in January, rather than paying $1,000 per month all year, it will show a rent expense of $12,000 in January and no rent expense for the rest of the year. If another organization, Accrual Method Company, made the same rental payment in January, its records would show a $1,000 rent expense in January as well as in each month of the year. At the end of the year, the expense records of the two companies will look very similar. At any point earlier in the year, however, the two company records will look very different.

The cash method offers several advantages: it is simpler than the accrual method; it provides a more accurate picture of cash flow; and income is not subject to taxation until the money is actually received. A disadvantage of the cash method is that expenses and revenues are not matched in time. For example, if a company provides landscaping services to a client in early April, it will likely send that client an invoice in May and may not receive payment for the services provided until June. Meanwhile, employees will be paid for the time they spent on the project in April and May. Accordingly, the accounting records will show high expenses in April and May with no corresponding income.

Small businesses using the cash accounting method should be aware that according to the doctrine of constructive receipt, there are some types of income that must be recorded as soon as they are incurred, no matter whether the business has received the payment or not. This includes checks received that have not been cashed, and certain types of proration.

In contrast, the accrual method is designed to recognize income and expenses in the period to which they apply, regardless of whether or not money has changed hands. Under the accrual basis of accounting, the income associated with the landscaping services described above would be recorded in April, the month in which the services were provided, even though the payment for those services may not arrive until June. Consequently, the company using an accrual method of accounting will have records that show expenses and revenues for the landscaping job in the same month. The main advantage of the accrual method is that it provides a more accurate picture of how a business is performing over the long-term than the cash method. The main disadvantages are that it is more complex than the cash basis and that income taxes may be owed on revenue before payment is actually received.

Under generally accepted accounting principles (GAAP), the accrual basis of accounting is required for all businesses that handle inventory, from small retailers to large manufacturers. It is also required for corporations and partnerships that have gross sales over $5 million per year, although there are exceptions for farming businesses and qualified personal service corporations,such as doctors, lawyers, accountants, and consultants. A business that chooses to use the accrual basis must use it consistently for all financial reporting and for credit purposes. For anyone who runs two or more businesses, however, it is permissible to use different accounting methods for each.

HYBRID ACCOUNTING METHODS

Hybrid accounting methods combine aspects of cash and accrual methods for businesses that benefit from or require both methods. These hybrid methods are unusual, but small businesses can use them more easily than large corporations. Any business that grosses $5 million or more needs to receive permission from the IRS to use a hybrid system, but businesses with a lower gross profit can use any combination as they see fit. Hybrid methods are most useful when a business offers services but also has an inventory, such as a computer store that sells circuit boards but also repairs or installs computer systems.

CHANGING ACCOUNTING METHODS

In some cases, businesses find it desirable to change from one accounting method to another. A company wanting to make a

change must file IRS Form 3115 in duplicate and pay a fee. A copy should be attached to the taxpayer's income tax return and the other copy must be sent to the IRS.

Any company that is not currently under examination by the IRS is permitted to file for approval to make a change. Applications can be made at any time during the tax year, but the IRS recommends filing as early as possible. Taxpayers are granted automatic six-month extensions provided they file income taxes on time for the year in which the change is requested. The amended tax returns using the new accounting method must also be filed within the six-month extension period. In considering whether to approve a request for a change in accounting methods, the IRS looks at whether the new method will accurately reflect income and whether it will create or shift profits and losses.

Changes in accounting methods generally result in adjustments to taxable income, either positive or negative. For example, say a business wants to change from the cash basis to the accrual basis. It has accounts receivable (income earned but not yet received, so not recognized under the cash basis) of $15,000, and accounts payable (expenses incurred but not paid, so not recognized under the cash basis) of $20,000. Thus the change in accounting method would require a negative adjustment to income of $5,000. It is important to note that changing accounting methods does not permanently change the business's long-term taxable income, but only changes the way that income is recognized over time.

If the total amount of the change is less than $25,000, the business can elect to make the entire adjustment during the year of change. Otherwise, the IRS permits the adjustment to be spread out over 4 tax years. Obviously, most businesses would find it preferable for tax purposes to make a negative adjustment in the current year and spread a positive adjustment over subsequent years. If the accounting change is required by the IRS because the method originally chosen did not clearly reflect income, however, the business must make the resulting adjustment during the current tax year. This provides businesses with an incentive to change accounting methods on their own if they realize that there is a problem.

ACCOUNTS PAYABLE

Accounts payable (AP) is the term used to describe the unpaid bills of a business; the money owed to suppliers and other creditors. The sum of the amounts owed to suppliers is listed as a current liability on the balance sheet. The accounts payable category is, along with accounts receivable, a major component of a business's cash flow. Aside from materials and supplies from outside vendors, accounts payable might include such expenses as taxes, insurance, rent (or mortgage) payments, utilities, and loan payments and interest.

For many small businesses, limited access to capital leaves little room for error in managing cash flow and accounts payable. Mismanaging of accounts payable can lead to significant problems with overdue payments. For this reason, it is essential for entrepreneurs and small-business owners to deal with the accounts payable side of the business ledger in an effective manner. Bills left unpaid or addressed in a less than timely manner can snowball into major credit problems which can easily cripple a business's ability to function.

By making informed projections and sensible provisions in advance, the small business can head off many credit problems before they get too severe. Whenever possible, obligations to creditors should be paid off concurrently with the collection of accounts receivable. Payment checks should not, however, be dated any earlier than the bills' actual due date. In addition, many small companies will find that their business profits will take on a cyclical character; they will need to plan for accounts payable obligations accordingly.

For instance, a small grocery store located near a major factory or mill may experience surges in customer traffic in the day or two immediately following the days on which the neighboring facility pays its workers. Conversely, the store may see a measurable drop in customer traffic during weeks in which the factory or mill is not distributing paychecks to employees. The observant shop owner will learn to recognize these patterns and address the accounts payable portion of his or her business accordingly.

Generally, not all bills will need to be paid at once. Expenses such as payroll, federal and local taxes, loan installment payments, and obligations to vendors will, in all likelihood, be due at various times of the month. Some such as taxes may only be due on a quarterly or annual basis. (Tax payments should always be made on schedule, even if it means delaying payment to vendors; it is far better to dispute a tax bill after it has been paid than to run the risk of incurring costly fines). It is important, then, for small-business owners to prioritize their accounts payable obligations.

Some small businesses choose to outsource their accounts payable to another company, often an international business, many of which are located in Europe and Asia. This allows small businesses to divert AP invoices, data entry, payment disbursement, and recordkeeping to a third party who will follow the business's policies as far as they concern payment. While this means small businesses have to pay for a service which can be handled in-house, it also grants business owners the time they would have spent dealing with their accounts. These third-party companies also tend to be accurate and timely in their AP management, which can be beneficial for businesses struggling to handle their accounting.

PRIORITIZING AND MONITORING

Every business must work to keep a reasonable balance between the money coming into and flowing out of its coffers. This task is especially important for small-business owners who often have limited flexibility in dealing with shortfalls of cash. Entrepreneurs who find themselves struggling to meet their accounts payable obligations have two options. One is to "rest" bills for a short period in order to satisfy short-term cash flow problems. This basically amounts to waiting to pay off debts until the business's financial situation has improved. There are obvious perils associated with such a stance: delays can strain relations with vendors and other institutions that are owed money, and over-reliance on future good business fortunes can easily launch entrepreneurs down the slippery slope to bankruptcy.

The second option, which is perhaps more palatable, is making partial payments to vendors and other creditors. This good-faith approach shows that an effort is being made to meet financial obligations; it can help keep interest penalties from rising too sharply. Partial payments should be set up and agreed to as soon as payment problems are foreseen or as early as possible. It is also a good idea to try to pay off debts to smaller vendors in full whenever possible unless there is some clear benefit to be had in making installment payments to them.

Usually, signs of cash flow problems will start to show up well before the company's financial fortunes become truly desperate. One clear sign of cash flow problems is an increase in aged payables. Aged payables are those for which the due date has passed. Bills should never be allowed to "ripen" more than 45 to 60 days beyond the due date unless a special payment arrangement has been made with the vendor in advance. At 60 days, a company's credit rating could be jeopardized; this could make it harder to deal with other vendors and loaning institutions in the future.

Outstanding balances can drive interest penalties even higher, and this trend is obviously compounded if many bills are overdue at the same time. Such excessive interest payments can seriously damage a business's bottom line. Explaining to vendors and creditors one's current problems and the planned solutions can deflect ill feelings and buy more time. It is often in the best interest of the vendor or other creditor to keep a fledgling business solvent so that continued business may be done with this client. Some though by no means all creditors may be willing to waive, or at least reduce, growing interest charges, or make other changes to the payment schedule.

It is crucial to the success of a small business that accounts payable be monitored closely. Ideally, this aspect of the firm's operations would be supervised by a financial expert (either inside or outside the company) who is not only able to see the company's financial "big picture" but is also able to analyze and act upon fluctuations in the company's cash flow. This also requires detailed recordkeeping of outstanding payables. Reports ought to be checked on a weekly basis, and when payments are made, copies should be filed along with the original invoices and other relevant paperwork. Any hidden costs, such as interest charges, should also be noted in the report. Over a period of time, these reports will start to paint an accurate cash flow picture.

Many small businesses choose to use an accounts payable aging schedule, This works like an accounts receivable aging schedule, but lists instead all the amounts businesses owe to their suppliers, by supplier. The schedule contains pertinent information like the total amount owed to the supplier, the debts owed in the current month, and other debts by age, divided into 30-days-old, 60-days-old, and over-60-days categories. This allows small-business owners to see at a glance what they owe suppliers and what the latest and largest debts are.

Effective monitoring practices not only ensure that payments are made to vendors in a complete and timely fashion, but also serve to protect businesses against accidental overpayment. These overpayments, which often take the form of overpaying sales and use taxes, can be caused by any number of factors: internal miscommunication, encoding errors, sloppy or inadequate recordkeeping practices, or ignorance of current tax codes. Internal audits of accounts payable practices can be an effective method of addressing this issue, especially for expanding companies. "As companies grow, owners tend to become less involved in day-to-day operations and relinquish control of some functions to staff,"

stated Cindy McFerrin in *Colorado Business Magazine.* "Set up systems and procedures in your company that encourage communication, provide for staying current with tax codes, and lessen the risk of multiple payments and other mistakes. Laying the groundwork for accuracy today can keep you profitable and in control tomorrow."

If a small business uses accounts payable to keep track of gift cards and associated deferred revenue liability, then it should be noted that the 2010 CARD Act sets down several regulations for how businesses manage sold gift cards. In addition to making it more difficult for companies to charge fees for unused gift cards, the Act also draws out the life of the card to at least 5 years before the company can record it as unredeemable.

ACCOUNTS RECEIVABLE

The quantity of cash, goods, or services owed to a business by its clients and customers is referred to as accounts receivable (AR). These unpaid customer invoices, and any other money owed by customers, are listed as a current asset on the balance sheet. How companies handle the collection of their outstanding bills is a key factor in their profitability. This is particularly true for a small business, where fewer clients mean fewer chances to collect. The first step of the cash flow process is closing the sale, but if monetary compensation cannot be collected then so-called sales are basically useless. Failure to collect what it is owed creates a domino effect for the company as it then has trouble paying off the bills (accounts payable) it owes to others.

In the past, customers have been able to get away with "the check is in the mail" excuse. However, in the early 2000s, the ability to transfer monetary value electronically (e-payment) between two entities to pay for goods and services has greatly improved the account receivable process. Mail and processing times are faster, and clear time is quicker, thereby improving the availability of the funds. In fact, using e-payment solutions, companies are able to:

- Reduce costs
- Make payroll effortless
- Simplify employee expense reimbursements
- Automate tax payments at federal, state, and local levels
- Submit just-in-time remittances to vendors
- Create new efficiencies across all payment types
- Aggregate data to enhance administrative control and compliance

MAKING COLLECTIONS

Regardless of the payment method, however, companies are still faced with collecting the funds they are owed. Companies sometimes extend credit to a client selling on payment terms other than cash up front. By doing this, a business is basically lending the client money. Many small-business owners depend on the goodwill of their clients as a collection policy. They simply send out an invoice and wait. However, the collection of this money is critically important to the financial well-being of a company. It is wise for small businesses to spell out when they expect payment. These "terms"are quoted in a variety of forms; one of the most common is "net 30 days from shipment". This means that payment is required within 30 days of the shipment date. Sometimes the terms offer customers a bonus, such as a 1 percent discount, if the bill is paid early.

E-payments make collecting easier. If a company has decided to follow the electronic collection path, it can be a challenge to convince customers that the process will benefit them. Small businesses should offer several alternative methods for payment on the Web site, and the ability to use debit and credit card payments. The goal is to show customers how easy it is to pay electronically.

In a perfect world, a company's accounts receivable collections coincide with the firm's accounts payable schedule. However, many outside factors work against timely payments. Seasonal demands, vendor shortages, stock market

fluctuations, and other economic factors are problematic for even the most vigilant manager. By recognizing these factors and incorporating them into the cash flow contingency plan, small-business owners can establish a solid accounts receivable system.

By reviewing receipts from past billing cycles, small-business owners may notice recurring cash flow problems with some clients. Of course, the small business owner must examine clients on a case-by-case basis. In some instances, repeated reminding may prompt an inattentive sales force or accounts payable department to make its payment obligations. In other cases, the debtor company may simply need a little more time to meet its financial obligations. At times, the creditor company should consider easing up on such establishments. A business owed money by a company that files for bankruptcy protection is not likely to see what it is owed. However, a business that has determined that its late-paying customer is well managed may decide to give that customer a little more time. By doing this, the small business may give the customer a chance to grow and prosper, and become a valued long-term client.

Methods of Collecting. By highlighting the importance of accounts receivable to the entire company and making collections a top priority, a small business will most likely improve its cash flow. Stakeholders within the company should review invoice statements for each outstanding account on a regular basis and establish a weekly schedule of collection goals. Additional advice for accounts receivable collection includes:

- Get credit references for new clients and thoroughly review them before agreeing to extend the credit to the client.
- Immediately make follow-up calls, especially with clients who have a history of paying late.
- Include a prepaid payment envelope with each invoice to limit late-payment excuses.
- Encourage the customer to set up an automatic electronic payment.
- Let go of bad accounts; if a debt has been on the books for so long that the cost of pursuing payment is outweighing the eventual benefit, consider giving up and moving on.
- Use collection agencies only as a last resort.

The longer it takes a small business to collect on an invoice, the less likely the business is to collect the money. Jeff Cornwall, Director of the Center for Entrepreneurship at Belmont University, recommends, "Never let any one customer represent a larger percentage of your total sales than your average profit margin. That way if you need to fire a customer, you can still pay your bills" (Cornwall, 2005).

ACCOUNTS RECEIVABLE FINANCING

Accounts receivable financing provides cash funding on the strength of a company's outstanding invoices. Lenders use invoices as collateral against which they extend short-term loans, rather than buying accounts. In addition to benefiting a business in debt, accounts receivable financiers can assume greater risks than traditional lenders; they also lend to new and vibrant businesses that demonstrate real potential.

This financing is often referred to as "accounts receivables factoring." In its simplest terms, the "factor" company gives the small business advance payment of the money it is owed. The advanced payment is usually 70 percent to 90 percent of the total value of receivables. With the exception of a small fee, the remaining balance is released upon full receipt of the payment for all the invoices.

An accounts receivable lender, or the factor company, is also willing to handle other account aspects, including collections and deposits. This enables the small business to focus on other areas of productivity. However, this type of financing is risky; agreements are typically lengthy and full of legalese. Before considering short-term loans, a small-business owner should seek an expert assessment of the specific collection situation.

Many small and large businesses have changed the way they invoice and accept payment with e-payment solutions. Small and large businesses are turning more often to these solutions that enable customers to pay online, over the phone, or via fax. PayPal is a very popular e-payment solution. Using PayPal, businesses can easily accept credit cards, automate their invoice process, and encourage instant payment from customers. However, it is just one option for small businesses to investigate to simplify their accountable receivable processes.

ACTIVITY-BASED COSTING

Using activity-based costing (ABC), business owners have access to an accounting method that enables them to gather data about their operating costs. In ABC, costs are assigned to specific activities planning, engineering, or manufacturing and then the activities are linked with different products or services. Using the ABC method, a business owner is able to decide the products, services, and resources that are increasing profitability; the owner also sees the things that are contributing to losses. With data generated by ABC, small-business owners create a better budget and gain a deeper understanding of the expenses required to keep the company running smoothly. Generally, activity-based costing is most effective when used over a long period of time.

Activity-based costing was introduced in the 1980s as a way to measure accurately all of a business’s costs and relate them to the goods and services produced. This was a departure from the traditional cost accounting methods designed for the companies operating in the early twentieth century. At that time, direct labor and materials were the two largest costs associated with producing goods and services. Automation was minimal and overhead costs were a very small percentage of total costs. Furthermore, most companies offered a narrow range of products and/or services. By the middle of the century, automation was being incorporated into all businesses; overhead costs rose as the support services needed to design and manage this automation were removed from the production floor. Despite these changes, business owners continued primarily to measure the costs of direct labor and materials, and arbitrarily allocated their overhead costs. But overhead costs continued to grow as a share of total costs, and these traditional cost accounting methods misrepresented the actual business activities.

ABC is based on the principle that the majority of business activities support the production and delivery of goods and services. To get a true picture of the cost of producing a good or service, the costs of all business activity must be allocated to specific products and services. Factory and corporate overhead, as well as other indirect resource costs, are assigned to activity categories using ABC. The management team is then able to assess how much overhead is consumed by each product, product line, or service. Harvard Business School professor Robert S. Kaplan was a pioneer in developing this more sophisticated system to allocate costs directly and more accurately to the goods and services produced by that business.

HOW ACTIVITY BASED COSTING PROGRAMS WORK

Upper management must properly plan and be committed to the implementation of an activity-based costing program. It is best to do a trial study or test run on a department whose profit-making performance is below company standards. In underperforming departments, the ABC program has a greater chance of succeeding and demonstrating that it is worth the effort. If the pilot study yields no cost savings, the activity-based costing system has either been improperly implemented or it may not be right for the company.

Step one when using ABC is to set up a team charged with determining which activities are necessary for the product or service in question. This team must be comprised of experts from different areas of the company, including finance, technology, and human resources. An outside consultant may also be helpful.

The team should assemble data on such topics as utilities and materials, and determine the elements of each activity that cost money. Many of these costs may be hidden so the team must pay keen attention to detail. As Joyce Chutchian-Ferranti wrote in an article for *Computerworld*: “The key is to determine what makes up fixed costs, such as the cost of a telephone, and variable costs, such as the cost of each phone call.” Chutchian-Ferranti further noted that even though technology has replaced human labor costs in many instances (such as in voice-mail systems), a business manager must still examine the hidden costs associated with maintaining the service. Non-activity costs like direct materials and services provided from outside the company usually do not have to be factored in because this has been done previously.

Once all of these costs are determined and noted, the information is entered into a computer application. Chutchian-Ferranti explained that the software can be a simple database, off-the-shelf ABC software, or a

customized software program written for the specific job. Over time, this data accumulation will give the company a detailed picture of exactly where in the process they are spending heavily and in which areas they are most efficient.

After the business managers have had enough time to analyze the data obtained through activity-based costing they can determine the steps needed to increase profits. Activities deemed cost prohibitive can be outsourced, cut back, or eliminated altogether. The implementation of these changes is known as activity-based management (ABM).

ACTIVITY BASED COSTING AND SMALL BUSINESSES

Regardless of the size of the business, activity-based costing can help companies be more efficient. While ABC seemingly has had more success when implemented by larger companies, service industries such as banks, hospitals, insurance companies, and real estate agencies have all improved their profitability with ABC. Still, as Mark Henricks noted in an article in *Entrepreneur*, "Companies with only a few products and markets aren't likely to get as much benefit from basing costs on activities as companies operating with diverse products, service lines, channels, and customers." But since setting up activity-based costing for a business usually takes less time for a smaller project, a small business that is unsure about the effectiveness of ABC can consider a simple test program to determine whether it is right for them.

Douglas T. Hicks, an advocate of activity-based costing for small businesses, wrote a 1999 *Journal of Accountancy* article titled "Yes, ABC Is for Small Business, Too," in which he presented a case study for one of his clients, a small manufacturer that built components for the automobile industry. Hicks detailed how this manufacturer was able to triple sales and increase profits fivefold in a 4-year span after adopting ABC. "Much of this improvement came from a profitable mix of contracts generated by a costing/quoting process that more closely reflects the actual cost structure of the company," Hicks stated. "This has enabled the company to improve the management of its contracts." Hicks also cited isolating and measuring the cost of material movement and using the data to justify many operational changes as the success his client had with ABC.

Hicks noted a change in management's attitude after the success of ABC: "On an important but less tangible level, management's knowledge of and attitude toward cost information have undergone a substantial change. Where once managers had their own way of measuring the cost impact of management actions, they now measure those costs in a formal, uniform way. When managers contemplate changes, they have a mental model that directs them toward changes that truly benefit the organization."

POTENTIAL PITFALLS OF ACTIVITY BASED COSTING

Companies that implement activity-based costing programs run the risk of spending far too much time, effort, and even money on gathering and accessing the data. Too many details can prove frustrating, and sometimes the outcome is a failure to act on the results. On the other hand, too light a touch means lack of actionable information.

Over the years, ABC has seen highs and lows in its usage. For instance, the 1990s saw a resurgence in ABC. At that time, businesses were developing expensive customer relationship management (CRM) initiatives such as overnight delivery and 360-degree customer service. Companies were challenged to show that these initiatives actually benefited their bottom line. While CRM did seem to increase customer satisfaction, and therefore customer loyalty, it also often led to declining profits. This was because the increased services were not accompanied by increases in prices or order volumes. Using ABC, companies could justify an increase in their prices to make up for the increased service.

However, activity-based costing lost some of its New Economy popularity during the accounting scandals of the early to mid-2000s. At that time, complex internal data gathering and reporting was tossed out in favor of simpler, more transparent systems.

In early 2005 activity-based costing proponent Robert S. Kaplan published an article in the *Harvard Business School Working Knowledge* titled "Rethinking Activity-Based Costing." In the article, Kaplan acknowledged problems with implementing ABC programs, recognizing that ABC had proven to be too much work and too complicated for many companies to use and maintain over time. Yet the author insisted that "the solution to problems with ABC is not to abandon the concept." Instead, he outlined a new ABC program that he and his co-author Steven R. Anderson called time-driven ABC. The new time-driven ABC method was described as a simplification of the original ABC method.

Thus, in order to simplify the set-up and implementation of an ABC system, Kaplan and Anderson recommended time-driven ABC. For each department within the company, time-driven ABC requires estimates of only two parameters:

- The entire overhead expenditure of a single department divided by the total number of minutes of employee time available
- An estimate of how much time it takes to carry out one unit of each kind of activity; for example, the time it takes to process one order

In an interview about his research, Kaplan said that regardless of a company's size, the time-driven ABC model can result in significant benefits: "We have seen companies with less than $10 million in annual sales get enormous insights about products and customers that were losing money and that could be quickly transformed into profitability once the executives saw what was driving the losses."

Instead, Kaplan said that diversity of products and customers is the key to an effective system. In companies with hundreds of different products and hundreds or thousands of customers, traditional cost systems do not accurately trace a company's expense base to each product and customer, leading to a distorted view of the company's economic model. Using even a simple time-driven ABC model, companies discover ways to change fundamentally the way the company manages its process improvements, its product variety, and its individual customer relationships.

"Typically, time-driven ABC projects pay back in less than a year as companies increase their net profit margin by 1 to 2 percent of sales within months," Kaplan said. "These improvements are significant for both small and large companies."

Armed with Kaplan's research, many organizations rushed to replace their current costing solutions with the time-driven ABC model. However, many companies learned that the model was not suited to all businesses. In 2008 Tony Adkins wrote in his article "Five Myths About Time-Driven Activity-Based Costing" that "organizations should be able to choose resource and activity cost drivers that best fit their situations. They should be able to build sustainable costing models that support the real goal of ABC: better decision making."

Adkins recommended time-driven ABC to track used and unused capacity and associated costs, and for situations of highly repetitive work and thin profit margins. However, he also said that if businesses want to ascertain what things cost and why, a traditional ABC model is still the fastest, easiest way to get those answers. "Time-driven ABC offers advantages over traditional ABC costing to meet certain goals, but it doesn't dramatically simplify the process of creating and managing models. It should be considered complementary to, not a replacement for, traditional ABC," Adkins wrote.

As the ways in which companies manufacture things change, so too will the systems and methods used to track costs and properly associate them with the products and services being produced. In order to produce goods and services efficiently it is important to know the price of the inputs to the system, both direct and indirect. The more accurately a business is able to track these costs, the more efficiently it will be able to create effective processes.

ADVERTISING AGENCIES

Advertising agencies are full-service businesses able to manage every aspect of an advertising campaign, Businesses hire agencies which vary widely in size and scope to plan, create, and handle their advertising. Ad agencies cater to different kinds of customers. Some have only one or two major clients; others have numerous field offices from which they service hundreds of clients spread throughout the country or the world.

With the advent of the World Wide Web, advertising agencies gained a new vehicle to promote products. Before traditional advertising agencies those that managed accounts, provided the creative services, and purchased media access for their clients were ready to rely on the Internet as a key medium in their advertising mix, interactive agencies began exploiting the capabilities of the Internet.

These agencies offer clients web design and development services, Internet advertising and marketing strategies, and e-business consulting solutions. According to David Meerman Scott in his 2007 book *The New Rules of Marketing and PR,* "The Web has opened a tremendous opportunity to reach niche buyers directly with targeted messages that cost a fraction of what big-budget advertising costs."

STRUCTURE OF ADVERTISING AGENCIES

Most agencies today offer their clients a mix of traditional and interactive services. Within these types of full-service agencies, different departments work on the separate aspects of an account. An account manager or the account planning department coordinates the work of these departments to ensure that all the client's needs are met. The departments within a full-service agency typically include the following areas.

Research. The research department provides clients with some details about the prospective audience of the final advertising campaign as well as information about the market for the product being advertised. Specific market research provided by this team leads to a very focused ad campaign directed to the target audience.

Creative Services. In an agency, experts in many creative fields provide quality, professional services. Copywriters write the text for print ads, web pages, blogs, and microblogs. They also write scripts for television or radio advertising, as well as for short videos that companies may post to video-sharing sites. Graphic designers are responsible for the presentation of print and web ads, and the art department is responsible for providing the necessary images for whatever format advertisement is decided upon. Advertising agencies also have a technical staff with expertise in web design and implementing online advertising campaigns. In an interactive agency, technical expertise can often be found within several of the agency's departments. Some agencies have in-house photographers and printers; others regularly employ the services of contractors.

The individuals involved in creative services are responsible for developing the advertising platform. The platform sets the theme and tone of the ad campaign. It should draw upon specific, positive features of the product advertised and highlight the benefits the consumer could expect to receive as a result of using the product. With this platform as a guide to development, the campaign should prove to be eye-catching, memorable, and in some way unique. The ads consumers remember stand out from the rest; it is the advertising agency's (and specifically the creative services department's) responsibility to provide this quality for clients.

The final advertising provided by an agency should be fully developed and polished, and should prompt customers to take some action. Television commercials should be produced with professionalism. Print ads should be attractive, informational, and attention-getting. Radio spots should be focused and of high audio quality. Online ads should be well placed and drive traffic to the client's own website or a site through which the client's products or services are offered. After watching, reading, or listening to these ads, prospective customers should be motivated to investigate the product further.

MEDIA BUYING

An important function of the traditional agency (and a major source of revenue) is the placement of the ad in various media. The activity is aimed at achieving the largest targeted audience at the lowest cost. The research conducted by the agency will inform any media-buying decisions.

An agency will be able to negotiate the terms of any contracts made for placing ads in any of various media. A full-service agency will deal confidently with television, radio, newspapers, magazines, and the Internet. Many agencies also use direct mail marketing and point of purchase incentives to increase sales. Another area in which agencies will look for ad placements is in the local yellow pages and on outdoor advertising locations (which can include billboards and commercial signs on public buses, subways, or trains).

The mediabuying staff draws on its experience and research. Some factors to be considered in the development of the media plan include:

Cost Per Thousand: This refers to the cost of an advertisement per one thousand potential customers reached. Media-buyers use this method to compare various media options. For example, television ads are considerably more expensive than newspaper ads, but they also reach many more people. Cost per thousand is a straightforward way to evaluate how best to spend advertising dollars: if a newspaper ad costs $100 and potentially reaches two thousand customers, the cost per thousand is $50. If a television ad costs $1,000 to produce and place in suitable television spots and reaches a potential of forty thousand viewers, the cost per thousand is only $25.

Cost per click and *click-through rate* are popular measurement methods used to assess the cost of accessing potential customers on the Internet. Agreements are often made under which a company places a small ad on another entity's website. Rather than a fee for placing the ad, a fee is assessed only if and when the visitor to the host site clicks on the ad. Sophisticated systems are used to track the number of clicks an ad generates and the owner of the ad is charged on a weekly, monthly, or quarterly basis for resulting service of forwarding potential clients. The fees are based on a prearranged cost per click basis. This is also referred to by many as

a pay-per-click agreement. Unlike the widely applicable cost per thousand figure, cost per click measurements are only useful in assessing online ad campaign activity levels.

Keyword searches on the Internet often lead to quality exposure for advertisements. According to the *Economist*, potential customers query a search engine with keywords, scan the search results and the sponsored links from advertisers, and then click on the link. Keyword search costs are low; they can be as much twenty-five times more valuable as the exposure to a print or television ad.

The term *reach* is used when discussing the scope of an advertisement. The ad's reach is the number of households that can confidently be assumed will be affected by the client's message. This is usually expressed as a percentage of total households. For example, if there are one thousand households in a town and two hundred receive the daily paper, the reach of a wellplaced newspaper ad could be expressed as 20 percent: one-fifth of the households in the community can be expected to see the advertisement.

The *frequency* of a message refers to how often a household can be expected to be exposed to the client's message. Frequency differs widely between media and even within the same medium. For example, fewer households read newspapers on Saturdays; many more households read more thoroughly on Sundays. Fluctuation like this occurs in all media.

The media-buyer also must consider the timing of advertisements. The buyer may recommend that ads be evenly spread over the course of a day (for radio or television advertisements), a week (for radio, television, or print advertisements), or a month (radio, television, print, or other media). The type of product and the time of year also influence the placement of advertisements. Clothing retailers may need to run more advertisements as a new school year approaches or when new summer merchandise appears. Hardware stores may want to emphasize their wares in the weeks preceding the Christmas holiday. Grocery stores or pharmacies, however, might benefit from more evenly distributed advertising, such as weekly advertisements that emphasize the year-round needs of consumers.

INTERACTIVE ADVERTISING AGENCIES

Interactive advertising, which gained widespread acceptance during the second half of the 2000s, allows companies to get immediate and continuous feedback from their customers and potential customers via the Web. Advertising agencies use social sites, such as Facebook and MySpace, not only to target their customers better, but also to initiate conversations with them. This is a diversion from traditional advertising, which for many products and services is too wide and broad to be effective. According to David Meerman Scott, in his 2007 book, *The New Rules of Marketing and PR*, big media advertising buys may work for products with mass appeal and wide distribution, but it is not always the most effective avenue for niche products, local services, and specialized nonprofit organizations.

In a survey conducted in 2009 and reported in *Advertising Age*, Forrester Research found more than half of the marketers surveyed believed that the effectiveness of direct mail, TV, magazines, outdoor, newspapers, and radio would stay the same or decrease within 3 years. Conversely, more than 70 percent expected channels like social media and online video to become more effective.

Today, Web sites that are dedicated to social networking or that simply deploy a few social features enable the two-way dialogue between companies and their target audiences. Interactive, digital advertising relies on the Web to share information. In addition to being cheaper, the real-time results made possible by different web programs actually improve advertising campaigns. Another goal of digital advertising is to create messages that will "go viral," meaning that people will share them via e-mail, Facebook, Twitter, and other social Web sites.

SETTING AN ADVERTISING BUDGET

Deciding on an advertising budget is highly subjective; it depends on the type of business, the competitive atmosphere, and the available funds. How well established the business is and the goal of the advertising are also factored into the budget decisions. Often trade publications provide information on industry standards for advertising budgets, and help businesses set reasonable budgets.

Price Structures. Advertising agencies charge their clients for all the itemized expenses involved in creating finished ads, including hiring outside contractors to complete necessary work. The agencies send invoices for all such expenses. For example, the client may receive an invoice for a television ad that includes a photographer's fee, a recording studio's fee, an actor's fee, and the cost of the film itself. The client is also charged for the cost of placing the final advertisement in whatever media the agency has chosen (and the client has agreed to, of course).

Advertising agencies also charge for their services. This fee pays for the extensive account management, creative services, research, and media placement provided by the agency, all the hidden costs involved in the production of a quality advertising campaign, and profit margin.

When working with a new client, and particularly with a small business, an agency may ask that the client put the agency on a retainer. A retainer fee is a fixed amount of money that a client agrees to pay to secure the services of a

consultant or freelancer. For advertising agencies, the fee usually paid on an ongoing basis (typically monthly or quarterly). This retainer consists of the full advertising budget agreed upon, and is used to pay all production expenses and media buying costs, as well as provide the agency with its fee. The client should still insist on detailed and accurate invoices for expenses taken from the retainer.

DECIDING TO USE AN AGENCY

Before hiring an advertising agency, the small-business owner should consider whether an investment in the services of an advertising agency will yield meaningful returns. The owner must determine how important advertising is to the overall health of the particular business, and whether there are sufficient resources available for advertising.

Benefits of Advertising Agencies. Advertising agencies provide a valuable resource for any enterprise seeking to increase its customer base or its sales. They bring together professionals with expertise in a wide array of communication fields, and often though not always produce polished, high-quality ads that are well beyond the capacities of the client. Agencies are generally knowledgeable about business strategy and media placement as well. The media-buying experts at an agency will develop a strategic, targeted media plan for their clients, drawing upon years of experience and close relationships with media professionals.

The right agency will also educate the business owner on the benefits of less costly digital media. The new digital expertise that agencies are gaining provides new options for the business owner. Small businesses are encouraged to investigate these relatively new channels.

An agency's experience, connections, and knowledge both with traditional and digital media journalists are likely not available to the small-business owner and can be important factors in launching a successful media campaign.

Drawbacks of Advertising Agencies. The added stress of dealing with unfamiliar people and unknown territory is a downside to using an agency. Choosing the right agency takes time; the process of creating a satisfactory ad campaign can be taxing and time-consuming (especially if the client is vague about his or her desires or expects a top-dollar campaign at a bargain-basement price). As with any outside contractor, the small-business owner must carefully review the materials and work received for his or her hard-earned dollar.

The small-business owner must weigh the potential benefits against the costs of the advertising agency. Advertising agency campaigns are often very valuable in terms of shaping market share, product recognition, and public image. The small-business owner should consider if his or her advertising really requires a team of experts to develop. If the ads will be fairly simple, or if they will be placed only in one medium (such as a local newspaper), the owner should probably attempt to create the ads without the aid of an agency. It will be more economical to hire one expert, such as a graphic designer, and to place the ads personally than to hire an agency. Likewise, the small-business owner should also consider taking advantage of the Internet for the advertising campaign. This option can be developed using a small agency and often offers more targeted audiences and results.

SELECTING A PARTICULAR ADVERTISING AGENCY

It is important for a small business to work with an agency able to devote the time needed to insure a successful ad campaign. Smaller, local agencies can usually offer more one-on-one attention. Large agencies with a stable of large corporate clients may not pay the small-business owner the attention he or she thinks is needed. Difficult choices arise when a business is mid-sized and needs the "heavy hitters" before it can become one itself. By considering the goals of his or her company, the small-business owner can further narrow the list of potential agencies.

Ideally, an agency should be familiar with the specific set of concerns shared by most small businesses: a limited advertising budget, finding a niche in a community, and establishing a loyal customer base. Finding a well-informed agency experienced in the customer's line is very helpful. If the potential client's business is a bookstore, for example, and the agency has never promoted a bookstore before, it does not mean they will necessarily be a poor choice to create and manage an advertising campaign. They may have done work for other local retail stores that have faced the same obstacles and challenges.

In an article for *Entrepreneur*, Kim T. Gordon outlined a series of questions that small-business owners should ask in picking an agency.

- Ascertain whether the agency is familiar with the target audience and knows how to reach them.
- Make sure that the agency has done extensive work in the media they plan to use most extensively.
- Ask potential agencies about the results the agency has achieved in working with similar clients.
- Ask for a clear picture of what they should expect to accomplish with their specific advertising budget.

Word-of-mouth is one of the best ways to choose an agency: small-business owners can ask others they trust what agency they are using. If friends, neighbors, or fellow business owners have had positive results from an agency, it is worth further inquiry. Once a business has identified advertising it really likes, the next step is to call the business and compliment them on their good taste; then ask who prepares their ad copy. The agency-client

relationship is very much trust-based; the creative work agencies do is subjective. Small-business owners should work with an agency whose collective personality and creative work make them feel comfortable. These services will cost a considerable amount; starting off with a firm the owner feels optimistic about will help insure satisfaction throughout the relationship. The American Association of Advertising Agencies (AAAA) helps match agencies and clients through its New Business Web site, located at www.aaaa.org.

During the introductory meeting, the agency will show samples of their work. These are called case histories; they should be relevant to the small business. These samples should reflect the agency's understanding of the needs of the small business including who the customer base is and a working knowledge of the kind of marketing necessary to sell the product. The potential client should ask many questions concerning the approach of the advertisements, the audience reached by certain media, and what media plans have been developed for similar businesses. An agency, though, should never be asked to do work "on spec." Advertising agencies cannot afford to use their considerable creative resources doing free work for potential clients. The case histories they provide, along with the answers to questions, should be sufficient to make an informed decision.

Once the small-business owner has found an agency he or she feels c=omfortable with, and a budget has been agreed upon, as well as a timeline for the advertising, the agency will begin producing copy for approval. Laying a strong foundation, including asking questions as they arise, will pave the way for a productive, mutually beneficial relationship.

ADVERTISING BUDGET

Advertising is part of a company's sales and marketing effort. Therefore, the advertising budget is typically a subsection of the larger sales budget and, within that, the marketing budget. Since advertising aims to attract new customers, money spent on it can be viewed as an investment in building the business.

The advent of the Internet and its ever-increasing capabilities have had a huge impact on the advertising budgets of all businesses. In a survey conducted in 2009 and reported in *Advertising Age,*, Forrester Research found that digital advertising accounted for about 12 percent of the 2009 budgets of those surveyed and would grow to over 20 percent by 2014. This type of advertising is less costly; small-business owners should heavily consider making digital advertising a large part of their ad budgets.

Regardless of the medium selected, the advertising budget should support a business's promotional and marketing goals. To ensure that this is the case, a business owner should answer several important questions:

1. Who is the target consumer? Who is interested in purchasing the product or service, and what are the specific demographics of this consumer (age, employment, sex, attitudes, etc.)? Often it is useful to create a consumer profile to give the abstract idea of a "target consumer"; a face and a personality that can then be used to shape the advertising message.
2. What media will be most useful in reaching the target consumer?
3. What is required to get the target consumer to purchase the product? Does the product lend itself to rational or emotional appeals? Which appeals are most likely to persuade the target consumer?
4. What is the relationship between advertising expenditures and the impact of advertising campaigns on product or service purchases? In other words, how much profit is likely to be earned for each dollar spent on advertising?

These questions highlight the market conditions and identify the specific goals that the business expects to achieve with an advertising campaign. After the market analysis is complete, the business determines how best to budget for the task and allocate budgeted funds.

BUDGETING METHODS

Several allocation methods are used in developing a budget. The most common are listed below:

- Percentage of sales method
- Objective and task method
- Competitive parity method
- Market share method
- Unit sales method
- All available funds method
- Affordable method

It is important to note that often these methods are combined in a number of different ways, depending on the situation. Therefore, these methods are building blocks that can be combined, modified, or discarded as necessary. Using budgeting methods that are not rigid enables a business to be flexible. When marketing and customer situations change, the company can swiftly react changing course, goals, and philosophy.

Percentage of Sales Method. Small businesses most often use the percentage of sales method. When using this simple method, an advertiser takes a percentage of either past or anticipated sales and allocates that percentage of the overall budget to advertising. Critics of this method say that using past sales figures for determining the advertising budget is too conservative and may actually slow growth. While small-business owners who are unsure of their future returns may benefit from using the percentage of sales method, an established business, with well-established profit trends, gets more return on its investment by using anticipated sales when figuring advertising expenditures. This latter method can be especially effective if the business compares its sales with those of the competition (if available) when figuring its budget.

Objective and Task Method. Most large businesses use the objective and task method for their budgets since setting objectives is so important to the long-term success of the company. Using this method, the advertiser correlates advertising expenditures with overall marketing objectives. Advertising spending, therefore, is focused on primary business goals.

With this method, a business must establish concrete marketing objectives, often articulated in the "selling proposal." The management team must then develop complementary advertising objectives, which are spelled out in the "positioning statement." After establishing these objectives and factoring in fiscal realties the advertiser determines the budget needed to meet them. The small-business owner must be realistic about goals. The owner should make sure that objectives are reachable within the company's current financial situation. For instance, larger objectives, such as the expansion of area market share by 15 percent within a year, only through advertising expenditures, may be beyond the capacity of a small business.

Competitive Parity Method. Using the competitive parity method to establish an advertising budget, a small-business owner compares his or her company's advertising spending with that of its competitors. In order to stay competive, the small business may want to budget amounts similar to what its competitors are spending. While copying a competitor's budget does not ensure the same marketing outcome (much depends on how that money is spent), a marketing budget gauged on those of other participants in the same market is a reasonable starting point.

Market Share Method. Like the competitive parity method, the market share method bases its budgeting strategy on external market trends. Using the market share method, a business equates its market share with its advertising expenditures. Drawing on market share numbers to create the advertising budget has it pitfalls. Critics contend that companies often use arbitrary guidelines that do not adequately reflect future goals.

Unit Sales Method. The unit sales method of budgeting obtains the cost of advertising an individual item and multiplies it by the number of units the business wishes to sell. This method is only effective when the cost of advertising a single unit can be reasonably determined.

All Available Funds Method. Using the aggressive all available funds method, the business owner allocates all available profits to advertising purposes. This means that no money is being used to help the business grow in other ways (purchasing new technologies, expanding the work force, etc.). This method is most often used in start-up businesses that want to increase consumer awareness of their products or services. A business using this approach needs to make sure that its advertising strategy is effective and that funds which could help the business expand are not being wasted.

Affordable Method. With the affordable method, advertisers base their budgets on what they can afford. In order

to do this, the small-business owner must incorporate overall objectives and goals, competition, presence in the market, unit sales, sales trends, operating costs, and other factors to determine what advertising he can afford.

MEDIA SCHEDULING

Once a business decides how much money it can allocate for advertising, it must then decide where it should spend that money. The mix of media selected to convey the message is key to the advertising strategy. Options include print media (newspapers, magazines, direct mail), radio, television (ranging from 30-second ads to 30-minute info-mercials), and the Internet.

Selecting Media. Business owners base their selection of media on three main factors: the target consumer, the product or service being advertised, and the cost. They also weigh additional factors that may include overall business objectives, desired geographic coverage, and availability (or lack thereof) of media options.

In an article titled "Selecting the Best Media for Your Ad," Kim T. Gordon, author, marketing coach, and media spokesperson, offers three general rules to follow when trying to select a media vehicle for advertising.

Rule number 1: eliminate waste. The key to selecting the right media is to choose the source "that reaches the largest percentage of your particular target audience with the least amount of waste." It does not benefit a business to pay to reach a larger number of people if that particular audience has only a small percentage of likely customers. Instead, Gordon recommends advertising in a paper or magazine with a smaller distribution if the readers of that paper or magazine are more likely to be in the market for your product or service.

Rule number 2: follow your customer. Through the research phase of budget creation, the business owner should learn what sources the target market looks to for information about its type of product or service. Businesses should take advantage of this research and apply advertising dollars accordingly.

Rule number 3: buy enough frequency. Your target audience is constantly bombarded with advertisements and images. To make an impression, your ad must be frequently viewed. Gordon emphasizes that it is "essential to advertise consistently over a protracted period of time to achieve enough frequency to drive your message home."

Scheduling Criteria. Many factors comprise a successful advertising campaign; two of the most critical are the timing of advertisements and the duration of an advertising campaign. Advertisers use three methods to schedule advertising. Each is listed below with a brief explanation.

- Continuity. Using this type of scheduling, the advertiser spreads advertising at a steady level over the entire planning period (often a month or year, rarely a week). It is most often used when demand for a product is relatively even.
- Flighting. This type of scheduling is used when there are peaks and valleys in product demand. Advertisers employ a stop-and-go advertising pace to match the uneven demand. Unlike "massed" scheduling, advertisers using flighting advertise over the entire planning period, just at different levels. The "pulse method" is another kind of flighting. With this method, advertisers base their scheduling on the pulse or quick spurts experienced in otherwise consistent purchasing trends.
- Massed. This type of scheduling places advertising only during specific periods and is most often used when demand is seasonal, such as at Christmas or Halloween.

Internet Advertising. In advertising models based on Internet technologies, consumers themselves often take the initiative by willingly showing up and interacting with what they find online, according to a special report in the *Economist*. The article, "The Ultimate Marketing Machine," noted that during this process, the potential customer queries a search engine with keywords, scans the search results and the sponsored links from advertisers, and then clicks on one such link. In effect, reported the magazine, "the consumer has expressed an intention twice (first with his query, then with his click)."

ADVERTISING NEGOTIATIONS AND DISCOUNTS

Small businesses can make their advertising more cost effective regardless of the selected allocation method. In his book *The Entrepreneur and Small Business Problem Solver*, William Cohen offers small businesses a list of "special negotiation possibilities and discounts" to help maximize advertising dollars:

- Mail order discounts. Many magazines offer significant discounts to businesses that use mail order advertising.
- Per inquiry deals. Television, radio, and magazines sometimes only charge advertisers for advertisements that actually lead to a response or sale.
- Frequency discounts. Some media may offer lower rates to businesses that commit to a certain amount of advertising with them.
- Stand-by rates. Some businesses will buy the right to wait for an opening in a vehicle's broadcasting

schedule. Using this approach, advertisers can sometimes save between 40 and 50 percent on usual rates. However, if advertising is key to the company's success, this may not be a good option since the ability to get the ad aired is based on unforeseeable future events.

- Help if necessary. Under this agreement, a mail order outfit will run an advertiser's ad until that advertiser breaks even.
- Remnants and regional editions. Advertisers can purchase regional advertising space in magazines (often unsold), at reduced rates.
- Barter. Some businesses may be able to trade products and services in return for reduced advertising rates.
- Seasonal discounts. Many media reduce their advertising costs during certain parts of the year.
- Spread discounts. Some magazines or newspapers offer lower rates to advertisers who regularly purchase space for large (two to three page) advertisements.
- An in-house agency. Some businesses develop their own advertising agencies in-house and negotiate with media outlets to receive the same discounts as other agencies.
- Cost discounts. Some media, especially smaller outfits, offer discounts to those businesses that pay for their advertising in cash.

Just because an advertising medium appears to be a good deal, it may not deliver the most value for a specific business. Small-business owners must ensure that their chosen advertising channels can indeed deliver their message to present and potential customers.

RELATIONSHIP OF ADVERTISING TO OTHER PROMOTIONAL TOOLS

A company's promotional mix includes advertising, publicity, sales promotion, and personal selling. All these methods of promoting a company must be considered when developing the advertising budget. Like a media mix, a promotional mix is necessary to reach as much of the target audience as possible.

The message that the business owner is trying to communicate to the target audience determines the selection of promotional tools. Public relations-oriented promotions, for instance, may be more effective at building credibility within a community or market than advertising, which many people see as inherently deceptive. Using sales promotion, the business owner is able to target both the consumer and the retailer, which is often necessary for the business to get its products stocked. With personal selling, the business owner gains immediate feedback about the product. Personal selling allows the business owner to collect information on competitive products, prices, and service and delivery problems.

ADVERTISING, EVALUATION OF RESULTS

The increased sales that advertising promises usually do not happen immediately. Measuring the results of an advertisement is not an exact science, so expecting returns at a specific time often leaves business owners frustrated. While advertising can be an effective means of increasing profitability, the probable positive outcomes even from well-planned, well-placed, and well-executed advertising will likely take some time.

CUMULATIVE EFFECTS

Advertising experts agree that one major benefit of advertising any business is the cumulative effect of the message on consumers. As consumers are repeatedly exposed to advertising, they become familiar with it and the ads remain in their memory. Even though the advertisement may not have had an immediate effect, the consumers often recall the message when the need arises for the advertised product or service. Because of the cumulative effects of advertising, the consumer will already be familiar with the

business's name, as well as the image that it has cultivated through its advertising campaigns. For example, a consumer may have heard a carpet cleaning company's ads for months, but until the need arises for a clean carpet, he or she has no reason to contact the company. When that need does arise, however, the consumer will already know the name of the company and feel familiar enough with it to engage its services.

Consistency. Over time, consumers learn to associate businesses with certain advertisements, design elements, or themes. These associations, however, often take time to sink in. This slow recognition of an ad's performance often leads to a business owner feeling restless or bored with a long-running campaign. The owners of a small business may want to change a long-running advertisement simply because of a desire to try a new, more exciting avenue. While stagnant sales and changing competitive dynamics may provide valid reasons for creating new ads, advertising experts discourage businesses from yanking advertisements that continue to be effective just for the sake of change. Similarly, industry observers counsel small-business owners to maintain a level of consistency with the advertising media they utilize (provided those media are effective, of course).

The small-business owner creates a strong foundation for his or her company by choosing an appropriate style and theme, and carefully placing ads in effective media. Maintaining an advertising campaign in itself advertises the stability, dependability, and tone of a business. If customers are finding the ads useful, then the advertising is working; changing the ads could diminish their effectiveness.

STRATEGIES FOR TRACKING ADVERTISING'S EFFECTIVENESS

Before the advertiser decides to stick with one advertising plan for the next several years, he or she must be sure that the advertising is having some effect. For years, a chief complaint about advertising has been the inability to measure the results. While this continues to be a problem with traditional advertising, digital advertising firms are able to offer more concrete results for campaigns that take advantage of the Web.

Still, both types of advertising produce a cumulative effect, which can sometimes be difficult to ascertain. The following are suggestions for the often vague science of tracking the effectiveness of advertising:

Monitoring Sales Figures. This strategy involves tracking sales from a period before the business used the current advertising, and then comparing those figures to sales made during the time the advertising is active. One pitfall of this strategy is not choosing a representative time period. One month's worth of sales figures may not be enough to gauge the effectiveness of an ad. Ideally, the business owner could compare figures from long periods of sales to exclude changes due to factors other than advertising, such as seasonal fluctuations and holiday sales.

Running a Coupon. One satisfyingly concrete way of tracking how many customers were exposed to advertising is to use coupons. These coupons, which will typically provide a discount of some kind or some other incentive to customers can be easily tabulated, providing businesses with tangible evidence of the advertising campaign's level of effectiveness. Such measurements, however, are limited to print campaigns or to coupons that are printed from a Web advertisement. Another similar option that is effective across media types is to encourage customers to mention their exposure to an ad in return for a bonus. For example, a radio ad might include the sentence, "Mention this ad for an additional 5 percent off your purchase!"

Surveying Customers. One of the most accurate and easiest methods of tracking the effectiveness of a media campaign is simply to ask customers how they found a business. Business owners and their employees can ask if a customer saw a particular ad, or more generally ask how they came to know about the shop or service. Consumers are generally pleased to be asked for their input, and they can give firsthand accounts of how advertising affected them.

Internet Ad Tracking. One of the unique aspects to using the Internet for advertising is the fact that it is easier to track the number of people who actually see and register the ad. Because of the interactive nature of the Internet and the methods used to advertise online, a company can track the number of people who both see their ad and take some resulting action, like clicking on a hypertext link. However, knowing how many people have seen an ad does not automatically yield information about what percentage of new sales are the result of this exposure. Assessing the value of this Internet exposure must be done in the same ways that advertising generally is assessed through careful tracking and monitoring.

Tracking Ads in Digital Magazines. With more publications both newpapers and magazines moving to increasingly digital formats, advertisers are getting crash courses on how to rate the effectiveness of ads placed in these publications. These digital ads can provide data such as open rates, clickthroughs, time spent on entire issues and on each page, and pass-along data. Advertisers also have information on the action taken by the consumer such as clickthroughs on hyperlinks, and sharing via e-mail or social media. Publishers, who now receive such data quickly, will be expected to provide advertisers with this additional information as well as interpretations of this data.

REGULATIONS FOR ONLINE ADVERTISING

As more data is collected about consumers on the Web information about their web surfing, shopping habits, and overall interests it is becoming necessary to regulate the practice. In response to a Federal Trade Commission report created in early 2009, a group of high-profile Web companies created a follow-on report in an effort to monitor themselves. Effective in 2010, the report is titled "Self-Regulatory Principles for Online Behavioral Advertising," and affects more than five thousand companies, including Google, Microsoft, Yahoo, Disney, and Verizon.

Key regulations noted in the report include:

- Members must inform consumers that behavioral information is being collected. This information can no longer be hidden in the privacy policy, but must to placed in the ad or on the Web site.
- An enforcement process will enable competitors or consumers to bring complaints against companies who violate the rules.
- Consumers must have the opportunity to approve the collection of financial, health, and other sensitive data.

ADVERTISING MEDIA—AUDIO

The most common audio advertising medium is FM radio. Placement of an advertisement on FM radio costs about as much as an advertisement placed in a metropolitan newspaper. Traditionally, FM radio has been associated with favorable levels of acceptance in given localities and high selectivity levels both demographically and geographically. These advantages favor small-business advertisements targeting particular audiences. In their 2007 book *Marketing: An Introduction*, Gary Armstrong and Phillip Kotler acknowledge the revolution in radio that followed the liberalization of the FM frequencies, which has transformed radio from a "half heard medium" image to a widely accepted medium of mass communication. The increase in demand for radio advertising has led to increase in radio advertising costs, particularly for the small business enterprises.

In addition, radio is often more dynamic than print alternatives because it allows the advertiser essentially to talk with the consumer. As a result, many small-business consultants believe that an entertaining and informative radio advertising campaign can be a major asset. They usually temper this view by adding that a reliance on radio advertising alone is not recommended. Most businesses incorporate a media mix when attempting to sell their products or services, utilizing radio advertising in concert with print and other advertising media. The key for small-business owners is to study what types of advertising best suit their products and services and to use that media to spearhead their advertising campaign.

ADVANTAGES AND DISADVANTAGES OF RADIO

Radio stations feature many different programming emphases or categories. These categories range from music-oriented formats such as country, adult contemporary, classic rock, and alternative rock to news- or talk-oriented formats. Since these different formats attract different demographic segments of the total audience, business owners can reach their target audience simply by buying time on appropriate stations and within specified programming categories.

Another major advantage of radio advertising is that it is inexpensive to place and to produce, allowing small-business owners to place advertisements on more than one station in a given market. In addition, radio advertising content can be changed quickly to meet changes in the market or to reflect new business objectives. Finally, radio reaches large numbers of commuters, income-generating people who often pay more attention to radio advertising than to other advertising media, especially if they are driving alone.

The costs associated with purchasing radio advertising time reflect this emphasis on reaching the commuter audience. Timing stands out as one of the most important requirements for radio advertisements, with many small business enterprises targeting morning hours and evening hours when listeners tend to be more receptive to radio entertainment. The four time slots, or "dayparts," offered for advertisers by most radio stations are the morning drive, daytime, afternoon drive, and evening. The two most expensive but also most effective advertising slots are the morning and afternoon drive times. Getting advertisement slots for such

prime time hours of the day is very costly, yet small businesses can overcome these challenges by designing brief, concise, and clear ads.

Although radio advertising is effective, there are drawbacks to consider when deciding whether to create and place a radio spot. Aspects to consider include competitor clutter, the cumulative costs associated with long-term radio spots, and the fleeting nature of a radio message. In addition to these drawbacks, several other legal and procedural guidelines need to be considered. These include:

1. Be sure a clear disclaimer is used within the advertisement if celebrity soundalikes are used.
2. Always work with a contract in place when working with a station or advertising agency to create a radio spot.
3. Treat the competition fairly, always avoiding slanderous statements. Federal law mandates that advertisers must accurately depict the competition.
4. Be prepared to run a radio advertisement often. Industry analysts agree that an advertisement needs to be heard by a consumer on several occasions before it is likely to generate a response.
5. Be cautious about excessive reliance on one station. On rare occasions the products and services a business offers may be best promoted on a single station. For example, a dealer in sports paraphernalia may want to limit radio spots to the lone sports-talk station in town. Usually, however, small businesses are better served by maximizing exposure and using more than one radio station for their audio advertising.

AM RADIO

AM radio is a curious anomaly for most young adults who grew up with FM radio, cassettes, and CDs. Yet AM radio still exists, has a folksy charm, and is listened to by a significant percentage of the population. AM offers alternative programming to the predominantly music formats broadcast on FM stations. AM stations, which suffered serious declines in the 1960s and 1970s, now broadcast talk shows, sporting events, news programs, and traffic and weather reports. In addition, AM radio broadcasts can reach remote locations, such as those found in many western states places that truckers and summer vacationers traverse.

SATELLITE RADIO

The steady growth of satellite radio has also contributed immensely to the expansion of radio advertising. Indeed, satellite radio is effectively national radio, a development that has allowed radio stations to reach a national audience on the stations with advertising. According to statistics from Sirius XM quoted at the Web site of Plunkett Research, the number of satellite radio subscribers rose to nineteen million in 2008. The In-Stat report summarized in "Worldwide Demand for Digital Radio Continues to Rise" forecasts a growth of terrestrial digital radio and satellite radio shipments throughout the early 2010s. The positive growth trends in digital and satellite radio are also attributable to reduction in the prices of receivers and expansion of digital programming.

AD CREATION

Radio advertising for small business relies heavily on creative design of specific appeals to the target audience in terms of:

- Meaningful appeals relative to benefits that a product or service portends to listeners.
- Believable appeals relative to convincing listeners of the utility potential of the product or service.
- Distinctive appeals relative to a product's comparison to competing brands.

The costs of radio advertising have increased over the years, a situation that poses major challenges to small business enterprises. In an article titled "Clear Channel Moving to Build up National Advertising Base," W. Scott Bailey observes that the 2008 2009 global economic crises impacted negatively on the radio advertising industry, with statistics from Nielsen Co. indicating an 11.5 percent drop in overall spending on advertisements in the United States. As such, radio advertising is highly dependent on business volumes, revenues, and profits.

Statistics from the Radio Advertising Bureau (RAB) indicate that total radio advertising revenue in the United States stood at $19.5 billion in 2008. The RAB statistics further indicate a 23 percent and 22 percent decline in local and national radio ad revenue respectively in 2009, with radio advertising having registered its lowest ad revenue levels in the first quarter of 2009 following the devastating effects of the 2008 global recession. According to statistics in a RAB report summarized by the AIM Group in "Radio Advertising Bureau Reports Upward Revenue Trends Q309," there was a recovery in radio advertising in the third quarter in 2009. This recovery was ignited by the shift by advertisers to more competitive and innovative radio broadcasting segments. The relatively high costs of terrestrial radio advertising prompted many advertisers to switch over to Internet radio which is experiencing a fast growth occasioned by its affordability, demographic attractiveness, and enthusiastic audience.

Nonetheless, terrestrial radio adopted numerous tactical approaches such as advertising price reductions and

discounts to remain relevant in the advertising market. As such, radio stations were not closed down in high numbers as was earlier projected, with statistics from the Federal Communications Commission (FCC) showing there were a total of 9,557 FM radio stations, 4,854 AM radio stations, and 1,701 authorized digital broadcasting radio stations in the United States as of March 2009.

The summary of an In-Stat report mentioned earlier, "Worldwide Demand for Digital Radio Continues to Rise" confirmed that the decline in consumer confidence towards the end of the first decade of the twenty-first century did not deter growth in the digital radio market, with the segment having experienced an 85 percent growth between 2007 and 2008. The report attributes the positive growth of the digital radio segment to the accelerated developments in digital audio broadcasting technology and subsequent enhancement of the functionalities of high definition (HD) radio devices such as HD radio receivers.

ADVERTISING MEDIA— INFOMERCIALS

Infomercials are long TV commercials, usually lasting about half an hour. They are often hosted by celebrities and are designed to look like celebrity talk shows or light and entertaining news shows. Another term used to refer to infomercials is "direct response TV." Even though viewers often consider them annoying, infomercials have gained an undeniable reputation for effectiveness that has gained them respectability within the business community. Past research shows that infomercials are an established advertising venue, and that most people who make purchase decisions while watching infomercials are between the ages of twenty-five and forty-four, a sought-after demographic.

An article in *Forbes* titled "So Long, Suzanne Somers," by Peter Lattman, explains that what started off as a much-mocked advertising method has gained respectability and has become lucrative enough to attract large corporations and the so-called A-list celebrities.

Much of this success is due to the creativity of infomercial advertisers who use the infomercial's marginality to create a kind of cultural or sub-cultural symbol, giving a voice in the form of purchasing power to the late-night and early-morning consumer. These consumers are likely to be homemakers, blue-collar workers, and salespeople. This demographic information is an essential component in determining which products are selected for infomercial treatment.

One sign that the legitimacy of infomercials as an effective marketing tool has been recognized is the growing attention that larger companies have paid to the practice. As more companies and larger companies get involved with infomercials, prices for ad spots on cable stations has risen. Nonetheless, according to *AdWeek*, infomercials are still a more efficient and flexible way to acquire ad time and target prospective customers. "Direct response inventory tends to sell for 50-70 percent cheaper than traditional spots and can be used for the same purpose as conventional

ads." The ability to incorporate traditonal media tools like Nielsen and MRI ratings with an infomercial campaign is proving to be both powerful and cost effective.

People continue to watch a lot of television despite the steady decline in the ratings for major networks, a trend that is attributable to strategic approaches adopted by cable television networks. Such strategies include the focus on specific program segments that include infomercials. As such, infomercials remain important revenue streams for TV channels that continue to harness the high viewer interest in infomercials to compensate for the overall diminishing ratings for major networks.

Nielsen media statistics contained at the Web site of Plunkett Research place the number of households with televisions at 115.8 million in 2009, while statistics at the same Web site estimate the total advertising revenues for 2008 at $76.2 billion. As such, television advertising is still a force to reckon with, particularly for small business enterprises. Indeed, the advent of digital TV contributed immensely to the sustained consumer interest in TV infomercial broadcasting following enhanced program quality and viewing experience. In the United States, for example, the switch from analog to digital TV was officially commissioned in June 2009. All TV stations were required to implement a transition to digital broadcasting only, effectively bringing to an end analog TV broadcasting. Digitized TV broadcasting enables TV stations to broadcast different programs concurrently, thereby serving multiple viewer interests and segments. These developments have impacted positively on infomercial advertising by sustaining viewer interest despite the dip in television advertising revenues.

In his article titled "6 Advantages of Infomercials You Might Not Have Known" Timothy Rudon observes that infomercials account for "most paid programs listed on TV, with 2008 statistics indicating that channels running an average of four infomercials in a day rake in more than $11 million." Rudon identifies six main advantages associated with infomercials advertising:

- TV infomercials provide a platform for advertisers to ignite direct response from the target audiences.
- The off-peak airing of infomercials on TV creates a captive audience.
- Interested buyers can buy products advertised through infomercials from the comfort of their homes.
- The use of experts such as beauticians, clinicians, or doctors to conduct TV infomercial promotions and endorsement builds interest and confidence on the part of viewers for the products being advertised.
- Audience ratings for infomercials hosted by famous individuals and celebrities are boosted by their many thousands of fans.
- The testimonials contained in infomercials facilitate the process of convincing TV viewers.

Indeed, infomercials are considered to have significant impact in the promotion of products and services for large and small businesses alike, thanks to the high ratings of TV infomercials. Small business enterprises can take advantage of the infomercial segment of TV advertising because they are usually run during the low-cost broadcast hours, making them more affordable than prime time advertisements.

Infomercials usually work best with products that are easy to demonstrate, so that an interaction with the viewing audience can be achieved. This interaction is quite often that of teacher to student, so that infomercials become a medium for instruction, teaching people (or claiming to teach) how to better their social lives or improve their bodies. Such an approach creates a dialogue that the viewer can take part in, which often leads to a viewer inquiry for more information or to a purchase.

Small businesses can apply different TV infomercial execution strategies to optimize the effect of their consumer-targeted messages. Such strategies include slice of life, lifestyle, fantasy, mood and image; musical, personality symbols, scientific evidence, and testimonial evidence. The slice of life strategy demonstrates the product's use in informal settings, while the lifestyle strategy identifies a product with a particular lifestyle. Whereas fantasy creates imaginative excitement about a product, mood seeks to tie the physical aspects of a product to a desirable mood or emotion (such as serenity, for a restaurant, or love, for a perfume product). The musical strategy involves the use of individuals praising a product or service through songs. The personality symbol strategy involves the representation of products using human characters, while testimonial evidence involves the use of believable or likable sources to endorse a product or service. As using sports, music, and movie stars in testimonial endorsements may be too expensive, small business enterprises can achieve this approach by using multiple testimonies from previous customers.

Another useful approach is to create a "storymercial," in which the infomercial sells its product by encasing it and the targeted consumer within a story. These "storymercials" often look and feel like documentaries in which, say, a family goes about their daily lives aided tremendously by the advertiser's product. Testimonials, or little product-specific anecdotes, are similar; both pull viewers into a world where the product is essential to success and happiness. All in all, these infomercials attempt to show the consumer how to answer the question "How can this product help me?"

When planning an approach, advertisers often consider several criteria, such as how similar products have fared in other markets, time slots, and seasons. Most infomercial producers believe that even low television ratings for an infomercial can translate into strong returns.

ADVERTISING MEDIA—INTERNET

The invention of the World Wide Web created a new way to reach out to people and for business to reach its customers. The World Wide Web is a communications network; as such, it is a natural venue for communicating advertising messages. In the early days of the Web, people needed computer know-how and command of communications protocols to use it. That is no longer the case. The increased levels of Internet connectivity in the early twenty-first century has increased Internet use, reduced internet connection costs, and enhanced Internet interactive capacity. According to the Internet Usage Statistics Web site, the percentage penetration of Internet use in the North American population rose to 74.2 percent in 2009, with the first decade of the twenty-first century having registered a growth of 134 percent from 108,096,800 users in 2000 to 252,908,000 in 2009. Worldwide, the Internet experienced a 380.3 percent increase during the same period.

The first graphical browser was created in the early 1990s. With that and the later spread of high-speed connections to the network, the World Wide Web became a powerful economic engine. The volatility associated with the early days of Internet growth has settled a bit; however, it remains an enormous economic and cultural force, and continues to change the ways in which people work and communicate.

Advertising on the Internet, online advertising, has seen many ups and downs. Exactly how best to use the Internet as an advertising medium is still a subject of debate. What is certain is that more and more people are using the Internet more and more regularly. The Internet has "the eyeballs," and advertising is about the eyeballs.

Small businesses may have a unique opportunity for advertising success on the Internet. There are many ways to do so. The sophistication of online advertising campaigns has grown with the proliferation of techniques, from banner ads and pop-ups to direct e-mail and paid search terms. The key to a successful campaign is getting the proper mix of techniques.

MEANS OF ADVERTISING ON THE WEB

To get started involves an initial investment. This is the cost of building an online presence, a Web page or Web site, which is necessary because most Internet advertising involves bringing users to a Web site, "generating traffic." The Web site itself may consist primarily of a simple presentation of information about a company, its products and services. The site may also be a more interactive display with e-commerce capabilities, allowing a visitor to read about and see pictures of products, to place an order or purchase and pay for items online. An e-commerce-capable site is often referred to as a cyberstore. The cost of building a Web site will depend on its complexity.

The first questions to ask when deciding on the best way to advertise on the Web are the same questions that would be posed in launching an ad campaign.

- Who is the target consumer? Who is interested in purchasing the product or service? What are the specific demographics of this consumer (age, employment, sex, attitudes, etc.)?

- How does the targeted customer like to buy? How does he or she use the Internet?
- What is required to get the target consumer to purchase the product? Does the product lend itself to rational or emotional appeals?
- How much profit is likely to be generated for each dollar spent on ads?

Once these questions are answered, planning and designing a Web site and online advertising campaign can begin.

ADVERTISING TOOLS

There are many tools available for Internet advertising. These include paid search terms, search engine optimization, banner ads, and e-mail advertising.

Paid Search Terms. Internet users usually navigate the Web by starting their session at an Internet search engine site, most notably Google. The goal of an advertiser is to capture those users who may be interested in his or her product or service. Google was one of the first search engines to offer advertisers the opportunity to do just that. Today, many search engine businesses offer this opportunity by selling terms. The practice is called paid search terms, or pay-per-click (PPC) search-engine advertising, or, in the case of Google, AdWords. By purchasing a term through a search engine, the buyer purchases the right to have a hypertext link appear on the result page of any search phrase that included the term purchased. For example, a user types the words "air filtration system" into a search engine. The company that has purchased the term "air filtration system" from the search engine will appear on the list of results for that search, and the user will have the opportunity to link directly to the advertising company's Web site. The advertising air filtering company only pays if and when the user actually clicks through to its Web site. This is called pay-per-click.

The use of paid search terms is an established method of online advertising. It is also the most potentially powerful online advertising tool for the small business, according to Seth Stevenson in his article titled "Words That Sell." This is particularly true for companies dealing with specialized items. "Do a search for 'sling-back shoes,' for example, and you will find small e-commerce sites competing head-to-head with major retail chains," explains Stevenson. This form of advertising helps to level the playing field.

Paid search terms are an evolving advertising model. With popularity, the cost for terms will increase since they are sold in an auction format. Nonetheless, a carefully tailored advertising plan can maximize the traffic generated from the purchase of just a few words. And, if nobody clicks through to the merchant's site, the merchant pays nothing.

Google Adsense has emerged as a widely used mode of paid search terms. Google AdSense is an innovative program for advertising that involves the creation of text advertisements by advertisers to be displayed in relevant Web sites throughout the Internet. Advertisers are required to sign up at www.google.com/adsense to be able to upload their desired ads to be displayed. The advertisers are charged a set fee by Google for each time an advertisement is clicked, after which Google submits a share of the revenue to the owner of the Web site where the ad was displayed. The AdSense program is considered to be a cost-effective tool for tracking and measuring the effectiveness of an ad's throughput because advertisers only have to pay when the ad displays are clicked by potential customers while browsing the Internet. As such, Google AdSense has revolutionized online advertising for small-business owners through the creation of affordable ad display links between large numbers of advertisers and Web site owners.

Social networking sites such as Facebook and Twitter have also gained momentum as popular advertising channels for small businesses because of the high volume of traffic associated with online social networks. Small business enterprises are able to advertise their services and products through pay-per- click advertisement displays on these social networking Web sites.

PPC is an internet advertising program that enables users to determine advertising budget with reference to keywords that the advertisers estimate are used by the target audiences to search for particular products in the Internet. PPC largely relies on a bidding system to reach out to the target audience, with the competitiveness of the keyword determining the cost of an advert. In an article titled "Companies Get Big Boost with PPC," Dom Donaldson states that PPC advertising presents advertisers with the "most economical and sure fire ways of getting a potential client." Indeed, unlike the traditional advertising channels such as radio, TV, and magazine ads, which estimate the demographics of a particular channel's audience on the basis of an educated guess, PPC is credited for targeting active consumers by ensuring that a company's product is prioritized in Internet searching processes.

Search Engine Optimization. Before the advent of paid search terms, search engine optimization (SEO) was the primary means of capturing the attention of Web users as they began an Internet session with a search engine query. It is still a useful method for gaining exposure.

Through the use of SEO, companies can use a combination of HTML design elements (meta tags, links to and from other sites), text, and keywords to ensure that their Web sites are picked up by the search engines and appear high on a search results page. If done properly, this can increase traffic to the company's Web site without incurring

a pay-per-click fee. However, implementing a successful SEO plan takes a great deal of expertise. That must be acquired or purchased; either way a cost is involved.

Banner Ads. Banner advertisements are graphic advertisements that appear on a Web site and are intended to build brand awareness or generate traffic for the advertiser's Web site. Banner ads were once the leading form of advertising online. They are still an important advertising method.

Often banners are part of a "link exchange," or cooperative advertising arrangement, in which two businesses with complementary products and services advertise each other on their respective sites in order to reach a large segment of a given market. However, some Web advertising agencies claim that few people access Web pages through banners; these agencies are now trying new motion and graphic technologies to make the banners more inviting. Some experts suggest that businesses consider advertising banners as just one part of an online marketing mix.

A 2009 research report by Dynamic Logic, a firm that measures the effectiveness of digital advertising, revealed that the integration of banner ads into Web page content has great potential to create brand awareness and stimulate purchases. To this end, small-business display ads should be positioned both tactically and strategically because smaller banner ads like rectangles and half banners integrated within the Web content perform better than large banner ads framing an entire Web page. According to the Dynamic Logic research findings, small-business advertisers can enhance the effectiveness of banner ads through the adoption of the following strategies:

- Establish clear objectives for branding in the initial stages of advertising campaign.
- Use less expensive formats (such as simple Flash animation) to overcome budgetary constraints.
- Combine rich media and video so as to optimize the initial exposure of ads.
- Frame ad messages consistently with reference to the product being advertised.

Banner ads also provide advertisers with the advantage of tracking response levels to their display advertisements. For example, advertisers using online content display categories such as Google Adsense banners can request for feedback on the ranking of their banner ads.

The narrowing gap between cost per thousand impressions (CPM) and revenue per thousand impressions (RPM) is gradually decreasing the costs of online display advertising. In an article titled "Display Advertising Rates: CPM vs RPM," Gowri Naveen projects a reduction of CPM costs to $3.15 in 2011, down from $3.50 in 2006, a clear indication of the positive growth trends for online display advertising. Banner ads therefore portend a wide outreach network at lower costs for small businesses. Some of the commonly used banners in online advertising include expandable banners, pushhyphen;down banners, floating banners, and polite banners.

E-mail Advertising. Sending advertisements by e-mail is another method of using the Internet as an advertising vehicle. The use of mass direct e-mail, in which businesses send unsolicited email messages to a list of e-mail accounts, has fallen out of favor and in many cases breaks new laws designed to crack down on spamming.

An online newsletter sent out by e-mail is a more sophisticated way in which to reach actual and potential customers. An increasing number of businesses have supplemented their general customer satisfaction surveys with queries concerning customers' willingness to be put on a direct mailing list. Online surveys are also a way to build up an e-mail address mailing list that can be used to send out company information relatively inexpensively. When this is well done, the newsletter or promotional piece will include hypertext links to the company's Web page and will encourage the reader to pass the newsletter on to other interested parties.

In addition to the online advertising methods listed here, there are many others. Companies use referral services through which link exchanges are managed. Some companies sponsor Web sites for other groups in exchange for links to their own Web site. Some publication sites sell classified advertisement space, much as it is done on more traditional print advertising. The list of options is lengthy and the field of online advertising is still quite dynamic.

The key to success is to build a Web site that will serve clients and customers well. This is not always easy to achieve but it is essential to the success of any online ad campaign. Once the site is built, the task becomes generating traffic to that site. The methods described above are some of the more successful methods developed for that purpose, so far.

ADVERTISING MEDIA—PRINT

The two most common print media are newspapers and magazines, but print media also include outdoor billboards, transit posters, the yellow pages, and direct mail. Print media is important because it can reach such a large audience, and the great numbers of specialized publications on the market enable businesses to focus on a target audience with a specific set of characteristics. Print media are allowed to advertise most anything, other than products intended for children and sold to children. All other publications may advertise most anything sold legally, such as cigarettes, liquor, and contraceptives; however, many publications will not accept what they consider to be controversial ads.

The elements of format and design portend major differences in the cost and impact of a print advertisement. In the 2007 book titled *Marketing: An Introduction*, Gary Armstrong and Phillip Kotler acknowledge that the effect of an advertisement for a small business enterprise can be increased immensely through enhancement of all the key aspects of design that include illustration, headline, and copy. Illustration is the core element of a small-business print advertisement seeking to capture a reader's attention. The illustration used should therefore demonstrate adequate strength to command the readers' attention. The headline element is significant by way of enticing the target audience into reading a copy. The element of copy serves as the main text block of an advertisement and should be expressed in simple but steadfast and convincing form. As such, print advertising for small business enterprises requires the integrative application of three elements so as to achieve customer value persuasively.

TYPES OF PRINT MEDIA

The different types of print media include newspapers, magazines, direct mail, yellow pages, and outdoor advertising. Each has its advantages and disadvantages.

Newspapers. When deciding upon a newspaper in which to advertise, there are three physical criteria to consider: distribution, size, and audience. Newspapers are either daily or weekly, come in a standard or tabloid size, and reach a large percentage of the reading public. Indeed, newspapers

offer wide-ranging advertising benefits for small business enterprises, given the advantages of flexibility, extensive coverage of the local market, timeliness, and broad acceptability. However, Armstrong and Kotler warn that adequate recognition should be accorded to the inherent limitations of the relatively small pass-along audience and brevity of life characteristic of newspaper channels. Because of the broad demographic reach of most newspapers it is difficult to target a specific audience; however, newspapers are effective in increasing awareness of a business' products and services in a specific geographical area.

Types of ads placed in newspapers include: display ads, classified ads, public notes, and preprinted inserts. Newspaper ads have some flexibility in their size. For instance, some are small boxes that take up only a small portion of a page, while others might span one or two full pages (the latter, however, are typically only bought by larger corporations). Regardless of this flexibility, newspaper ads can only use limited special effects, such as font size and color. These limitations lead to advertising "clutter" in newspapers because all the ads look very similar. Therefore, advertisers must use original copy and headings to differentiate their ads from those of their competitors. The quick turnover of newspapers also allows the advertiser to adjust ads to meet new market conditions; however, this turnover means that the same ad may need to be inserted over a significant period of time in order to reach its target audience.

In an article titled "Newspaper Advertising Advantages and Disadvantages," Mike Brassil observes that the wide outreach of paid circulation community and national newspapers is what motivates business enterprises to advertise in newspapers. However, this trend is threatened by the persistent decline in the number of community newspapers created by a steady decline in reader subscriptions.

Numerous newspaper organizations folded up following the adverse effects of the 2008 global recession that led to significant reductions in revenue from newspaper ads. According to newspaper industry performance metrics statistics contained at the Web site of the Newspaper Association of America (NAA), 2009 registered the lowest subscriber levels in 15 years. The statistics from the NAA Web site further indicate that total paid newspaper circulation decreased from 51,246,000 in 2007 to 49,115,000 in 2008, with average weekday readership among adults dropping from 55.1 percent at the onset of the twenty first century to 48.4 percent in 2007. In her article titled "Online Newspaper Ad Sending Down by 8 percent in Q4 2008," Kate Kaye confirms the fears that online newspaper advertising has also been on the decline, with the fourth quarter of 2008 having registered an 8 percent decline in total spending on online newspaper ads. Kaye also points out that the year 2008 also registered 37.8 percent drop in the total print and online advertising revenues compared to 2007.

Consequently, many newspaper organizations are folding up, leading to substantial reductions in the outreach capabilities of the newspaper advertising channel. Indeed, the operational costs for running newspaper organizations are very high considering that the majority of paid circulation newspapers are delivered to homes compared to purchases made from newspaper stands. This situation can only be sustained by expanding the revenue income base of newspaper organizations through the pursuit of high volumes of reader subscriptions. These developments have impacted negatively on small business enterprises because the lack of sufficient readership levels for community newspapers limits the access and effectiveness of demographically targeted ads.

Magazines. With magazines an advertiser can focus on a specific target audience. As the U.S. Small Business Administration (SBA) pointed out in *Advertising Your Business*: "Audiences can be reached by placing ads in magazines which have [a] well-defined geographic, demographic, or lifestyle focus." An attractive option for many small businesses may be placing an ad in the local edition of a national magazine. In addition to prestige, high reproduction quality, credibility, long life, and substantial pass-along readership, magazines are characterized by high selectivity both geographically and demographically. But magazine advertisements often have a lag time of a couple of months between the purchase of ad space and the publication of the issue in question. Magazines, then, are sometimes not the optimum option for businesses seeking to target fast-changing market trends.

In addition to the above factors, it is also important to consider the nature of the magazine ad copy. Magazines allow elaborate graphics and colors, which give advertisers more creative options than newspapers. Also, recent surveys have indicated that informative ads are the most persuasive. Therefore, it is important to include copy and art work that are direct and that present important product information to the consumer, such as how the product works, how it benefits the consumer, and where it can be purchased.

Unlike newspaper organizations, magazine publishers were able to overcome operational challenges associated with the 2008 recession by focusing their efforts on specific market niches and segments. For example, a fashion magazine may focus their target on a male or female market niche; a music magazine may focus on a specific type of music; and a golf magazine may focus on a wealthy market niche. Therefore, small businesses can effectively advertise their products through magazines because they provide the advantage of having a wide outreach for specific demographic audiences.

Direct Mail. Many consultants feel that direct mail is the best way for a small business to begin developing awareness in its target consumers. Mailing lists can be generated (even though they are often difficult to maintain) with the names of those people most likely to purchase the advertiser's

products or services. However, direct mail is not always cost effective. A direct mailing campaign can cost as much as $1,000 to reach 1,000 people, whereas television can reach a similar number of potential customers at a fraction of that cost. But business experts indicate that direct mail does tend to generate more purchasing responses than television, and they observe that the products of many small businesses are often more suited to a direct mailing campaign than to indirect, image advertising.

Yellow Pages. The SBA states in "Advertising Your Business" that a yellow page ad is often used to "complement or extend the effects of advertising placed in other media." Such an ad has permanence and can be used to target a specific geographic area or community. Essentially, a yellow page ad gives the consumer information needed to make a purchase. Therefore the key information to convey in such an ad includes: the products and services available; location; phone number; business hours; special features, such as the acceptable kinds of payment (i.e., credit cards, checks); parking availability; discounts; and delivery policies and emergency services. The best way to arrange this information is in a list, so that the consumer will be able to scan the ad for the desired information.

A major consideration with a yellow page ad is where to place it, which primarily depends on the directory (or category) under which businesses choose to locate their ads. Central to this choice are the products or services that the company wishes to emphasize. The ad copy should complement the directory, indicating the main products and services for sale, so that the ad will stand out from the similar looking ads that surround it.

Outdoor Advertising. Outdoor advertising usually comes in two forms: billboards and transit posters. Like yellow page ads, outdoor advertising is usually used to support advertisements placed in other media. One of the greatest strengths of outdoor advertising is as a directional marker to point customers toward your business. Since the prospective consumer often has only fleeting exposure to billboards and transit posters, the advertising copy written for these media needs to be brief, with the ability to communicate ideas at a glance. To do this well graphics and headings must be used efficiently and artfully.

ADVERTISING MEDIA—VIDEO

Video advertising can be an effective avenue for reaching an audience. The term *video advertising* is used here to refer to all full-motion visual presentations of information. Most such presentations include audio and text elements but what differentiates video advertising from other forms of advertising is its full-motion video aspect. The use of video advertising has grown with the proliferation of video-ready equipment in American homes televisions, cable channels, VCRs, DVDs, and computers connected to the Internet via broadband or high-speed connections.

In the past, video gave advertisers the ability to reach primarily a broad audience and was therefore oriented toward consumers. This has begun to change. The market for video advertising is growing as high-speed connections to the Internet make video viable online. Many new technologies are making video presentations viable in unexpected places (AdsOnFeet, wearable flat-screen LCD TV vests) and on small new devices such as smartphones and iPods. These increased outlets for video advertising both increase the size of the market and increase the advertiser's ability to target a message to a particular audience.

Ongoing developments in video advertising are making this form of advertising ever more useful to the small business. When video was primarily used to reach a broad consumer audience, it was not ideal for a small business or one operating in a niche market. With the ability to focus the message and the distribution of the message through new video advertising outlets, small businesses can put video to use effectively. Although video advertising can still be very expensive, by focusing the message for a well-defined audience it can also be very effective.

TYPES OF VIDEO ADVERTISING

There are several video options that can be used effectively by small businesses of modest financial means. These include network television, cable and satellite television, and streaming video for the Internet.

Network Television. Network television reaches the largest audience of all advertising media. As the U.S. Small Business Administration noted in *Advertising Your Business*, most small businesses use "spot television," which is an ad "placed on one station in one market." Placing such a spot ad on one of the national networks can be rather expensive, depending on the size of the audience reached and the demand of the specific time slot desired. In any case, such network television spots are often priced well beyond the financial means of small businesses.

Local television, on the other hand, is much more affordable, and many small businesses use it to reach local consumers. Local network advertising time is usually purchased as 30-second "spot announcements," which are similar to the network spot ads. The time slots for local ads begin in the early morning and continue up until the network news broadcasts begin. As with network television, the cost for such a spot depends on the size of the audience determined to be watching and the demand for the particular time slot.

Cable and Satellite Television. Cable and satellite stations offer selectivity, low cost, and flexibility. Since many cable stations, such as *ESPN* and the *History Channel* broadcast specific kinds of programs that appeal to certain demographic groups, a defined audience can be targeted. Spot ads are purchased from either a national cable network or from a local cable station. The cost depends on the cable penetration in the area and the channel's viewership. For example, most infomercials are broadcast on cable stations, such as the *Lifetime Network*, because of the programming flexibility and comparatively low advertising costs.

Drawbacks associated with the purchase of advertising time on cable television include fragmentation (which refers to the wide range of viewing options available on cable and thus the dilution of impact that any one ad may have) and image. The latter factor is primarily associated with local cable stations, which typically have low budgets and viewerships. Moreover, some locally produced cable shows are amateurish and/or feature offensive content.

Streaming Video for the Internet. The use of video on the Internet was made possible by the increased speed of data transmission. If data can be sent at a very fast speed from an Internet site to an end user's computer then video can be sent and viewed almost simultaneously. The sending of such video material on the Internet is often referred to as streaming video.

The use of video online is often part of an existing Internet advertising campaign in which video is added to Web sites or existing banner ads. The inclusion of video material on a company's own Web site is a relatively simple matter. Online applications in which this sort of video usage is being seen a great deal include:

- Real estate brokers using streaming video and interactive video to offer prospective buyers a virtual tour of properties on the market.
- Entertainment sites using streaming video to present previews for movies and music.
- Television sites using streaming video to offer their programs, or excerpts of their programs, to Web visitors.
- Online consultants and advertising agencies using streaming video by way of demonstrating their expertise in producing online ads.

The advent of digital video has further enhanced the advantages of video advertising channels because of high image qualities and tape-free production processes. In his article titled "Online Advertising Expenditure Forecast, 2009 2010," Enid Burns estimates a total of $699 million was spent on video advertising in 2009 alone, representing an 8.6 percent growth, with all indicators confirming that the trend will grow by 20 percent in subsequent years. Burns further observes that video game advertising experienced a 12 percent growth in 2009 accounting for total expenditures of $908 million and forecasts confirm a 12 percent growth in excess of $1 billion in 2010. Some of the

advantages of video advertising for small business enterprises include:

- Use of less space compared to more sophisticated channels such as film
- No processing requirement
- Convenience of editing by use of non-linear technology

Compression technology is a key aspect of digital video productions for small business advertising relative to generation of high volumes of traffic for video images in YouTube and the Internet as a whole. The reliability of the streaming application delivery process to multiple users at the same time increases overall traffic, a development that has necessitated the use of video compression technology to achieve significant savings. The advent of digital camcorders has further enhanced access to processing of video images and files of small business enterprises for incorporation into dissemination channels such as YouTube.

Outlets for online video advertising, beyond a company's own Web site, are multiplying. Services that offer to aggregate video advertising spots and manage their distribution online are appearing. These services are somewhat like online advertising agencies. They bring together the videos from a large number of advertisers and have agreements with Web entities willing to host ads. Then they match up the host sites with suitable advertisements and handle all tracking and financial arrangements for the host sites and the advertisers. Various such services (like Instream, Inc.,launched in late 2005) are widely used by small business enterprises.

YouTube facilitates real-time video uploads and sharing across networks. According to statistics contained in the Crunch Base Web site, daily YouTube views hit one billion viewers per day in the third quarter of 2009. Small businesses therefore need to harness the potential of YouTube as a wide-reaching advertisement channel for video clips. Just like Google Adwords, ads.youtube.com allows small businesses to create their own ads, choose appropriate videos, and upload them as promotional videos advertisements in pay per click format. As such, small business entrepreneurs pay for the advertisement costs when they are clicked and viewed by Internet users.

All the ways in which video will expand on the Internet are not clear. The technology upon which the Internet rests is developing rapidly and making things possible that were not possible just a few years ago. What the Internet offers is a unique chance to reach out to a very well-defined audience and not only pass along a message but also interact almost immediately with that portion of the audience for whom the products or services are of interest. This is a powerful tool for businesses of any size.

ADVERTISING STRATEGY

An advertising strategy is a plan to reach and persuade a customer to buy a product or service. The basic elements of such a strategy are:

1. the product itself and its advantages
2. the customer demographic
3. other sources such as collateral materials and Web sites where the customer can become informed about the product
4. the optimization of marketing strategies given budgetary constraints

DEVELOPING THE STRATEGY

For an advertising strategy to be effective, aims must be clear, the environment must be understood, the advertising priorities must be ranked, and choices must be made based on available resources. Effective product assessment, market definition, media analysis, and a budget will give the advertiser the formula for the best advertising and marketing plan.

Positioning Statement. Formal advertising strategies are based on a "positioning statement," a technical term referring to what the company's product or service is, how it is differentiated from competing products and services, and by which means it will reach the customer. The positioning statement covers the first two items in the listing above.

Implicit in a good positioning statement is what the industry calls the *product concept*, namely a cluster of values that the product or service represents and the associational frameworks in which it fits. A hunting knife will thus have a very different product concept than a handheld device with a built-in projector. The product concept will later guide the choice of written copy, images, graphic design, and message content to be used in actual ads (the "copy platform"). The positioning statement must also implicitly include the profile of the targeted customer and the reasons why he or she would buy this product or service. At a later stage, more data on the target consumer is developed as the strategy is fleshed out. The strategy and advertising materials should not be static collateral material and Web sites should be updated as products and demographics change, and blogging about the product or service continually will create an online advertising presence better than any platforms used in past decades.

Target Consumer. The target consumer is a complex combination of persons. First, it includes the person who ultimately buys the product. Next, it includes those who, in certain circumstances, decide which product to buy, and within that subset, which brand to buy; this group has not yet executed the purchase. Finally, the target consumer is surrounded by other potential decision makers, including children, spouses, friends, and co-workers. In practice small-business owners understand the target customer and their demographic better than an advertising agency, so it is their responsibility to inform the advertising firm of every nuance of their audience.

Communication Media. Once the product and its environment are understood and the target consumer has been specified, the methods for reaching the consumer must be assessed. This refers to the medium of communication. Five major channels are available to the business owner:

- Internet: Company Web sites, company blogs, social networking sites (Twitter, Facebook, YouTube, etc.), advertising on search engines such as Google and Yahoo!, and Internet banner ads and pay-per-click ads
- Television: Commercials, infomercials, and logo bugs (the little ads in the corner of a television screen)
- Print: Newspapers (both weekly and daily), local and national magazines, and product newsletters
- Audio: Internet pop-up ads with audio, satellite radio such as Sirius XM, FM and AM radio
- E-mail blasts: Newsletters and business letters sent en masse via e-mail to a predetermined list of potential clients
- Direct mail: flyers and mailers, buck slips in bulk mailers (Valpak)
- Outdoor advertising: Billboards, bench ads, scrolling light boxes (electron billboards), and advertisements on and in public transportation (cabs, buses, light rails)

Each of the channels available has its advantages, disadvantages, and varying costs. A crucial stage in developing the advertising strategy, therefore, is how to choose the optimum means, given budgetary constraints, to reach the largest number of target consumers with the appropriately formulated message.

IMPLEMENTATION

The advertising campaign itself is distinct from the strategy, but the strategy is meant to guide implementation. Therefore across-the-board consistency is highly desirable. Written copy and Web content, artwork, images, graphic design, logos, spokespersons, and music all aspects of the campaign should reflect the same message consistently throughout. This is especially important when multiple channels are used: Internet, e-mail blasts, print, television, and direct mail, for instance. To achieve a maximum coherence, many effective advertisers develop a unifying thematic expressed as an image, a logo, a slogan, or a combination which is central to all the elements that ultimately reach the consumer and shape his understanding of the product.

AFFIRMATIVE ACTION

Affirmative action refers to concrete steps that are taken not only to eliminate discrimination whether in employment, education, or contracting but also to attempt to redress the effects of past discrimination. Initially, the underlying objective for affirmative action was the Constitutional principle of equal opportunity, which holds that all persons have the right to equal access to self-development. In other words, persons with equal abilities should have equal opportunities.

The extent to which affirmative action programs attempt to overturn discrimination differs widely. Some programs simply institute reviews of the hiring process for women, minorities, and other affected groups. Other affirmative action programs explicitly prefer members of affected groups. In such programs, minimum job requirements are used to create a pool of qualified applicants from which members of affected groups are given preference.

Affirmative action affects small businesses in two main ways. First, it prevents businesses with fifteen or more employees from discriminating on the basis of race, color, sex, sexual orientation, religion, national origin, and physical capability in practices relating to hiring, compensating, promoting, training, and firing employees. Second, it allows the state and federal governments to favor women-owned and minority-owned businesses when awarding contracts, and to reject bids from businesses that do not make good faith efforts to include minority-owned businesses among their subcontractors.

The interpretation and implementation of affirmative action has been contested since its origin in the 1960s. A central issue of contention was the definition of discriminatory employment practices. As the interpretation of affirmative action evolved, employment practices that were not intentionally discriminatory but that nevertheless had a "disparate impact" on affected groups were considered a violation of affirmative action regulations.

Another central issue of contention is whether members of affected groups may receive preferential treatment and, if so, the means by which they are to be preferred. This issue is sometimes referred to as the "debate over quotas." Though affirmative action programs came under heavy attack during the administrations of presidents Ronald Reagan and George H. W. Bush, the principles of affirmative action were reaffirmed by the Civil Rights Act of 1991. In 1997, however, California's Proposition 209 banned affirmative action in that state. In 2003 a group of affirmative action opponents began a campaign to challenge its use in Michigan. Ward Connerly, a California businessman and national leader in the campaign to end affirmative action, has pushed for the Michigan Civil Rights Initiative, which would bar the use of race and gender in government hiring, contracting, and university admissions. The Michigan Civil Rights Initiative was passed into law on December 22, 2006. Anti-affirmative action Initiative 424 in Nebraska passed in 2008, but that same year the Colorado Civil Rights Initiative was defeated. The legal battles over affirmative action and how it may and may not be used continue. On a state-by-state basis, challenges to affirmative action programs are being made. The question becomes, have Americans reached an era in which affirmative action is an unnecessary organ of the civil rights movement, or is affirmative action the very thing that cleared the path to make civil rights possible?

HISTORY OF AFFIRMATIVE ACTION

Affirmative action has its roots in the civil rights movement. In March 1961, President John F. Kennedy signed Executive Order 10925, which established the President's Commission on Equal Employment Opportunity. The order stated that contractors doing business with the government "will take affirmative action to ensure that applicants are employed, and employees are treated during their employment, without regard to their race, creed, color, or national origin." The order did not advocate preferential treatment of affected groups but rather sought to eliminate discrimination in the traditional sense.

The legal status of affirmative action was solidified by the Civil Rights Act of 1964. This landmark legislation prohibited discrimination in voting, public education and accommodations, and employment in firms with more than fifteen employees. Title VII of the Civil Rights Act offered a similar understanding of affirmative action as Executive Order 10925, stating that the act was not designed "to grant preferential treatment to any group because of race, color, religion, sex, or national origin." The act's sponsors, Senators Joseph Clark and Clifford Case, emphasized this non-preferential interpretation of affirmative action when they wrote: "There is no requirement in Title VII that an employer maintain a racial balance in his workforce. On the contrary, any deliberate attempt to maintain a racial balance, whatever such a balance may be, would involve a violation of Title VII, because maintaining such a balance would require an employer to hire or refuse to hire on the basis of race."

The Civil Rights Act did not provide criminal penalties for employers that discriminated, nor did the civil remedies established by the act include compensation for pain and suffering or punitive damages. Rather, the act sought to

establish a conciliation process by which victims would be restored to the situation they would have had in the absence of discrimination. To carry out the conciliation process, the act created a new federal agency as a branch of the U.S. Department of Labor, the Equal Employment Opportunity Commission (EEOC). The EEOC acts as a facilitator between plaintiffs and private employers and also pressures violating employers to provide compensation, whether in the form of back pay or restitution. The EEOC also provides legal support for plaintiffs should the plaintiffs pursue their grievances in court.

Two important issues were contested in the wake of the Civil Rights Act of 1964: whether unintentional or structural discrimination constituted violation of the principle of equal opportunity; and the extent to which preferential treatment should be given to affected groups. These issues came to the forefront during the administration of President Lyndon B. Johnson. In a 1965 commencement speech, President Johnson argued that equality of opportunity required more than simply ending discrimination. Rather, he argued for a more active interpretation of affirmative action that would assure "equality as a result."

In 1966 the U.S. Department of Labor began collecting employment records with breakdowns by race in order to evaluate hiring practices, overturning earlier policies of the Dwight D. Eisenhower and Kennedy administrations. In 1968 the Office of Federal Contract Compliance issued regulations which required, for the first time, that specific targets be set by which the effects of affirmative action programs could be evaluated. The regulations stated that "the contractor's program shall provide in detail for specific steps to guarantee equal employment opportunity keyed to the problems and needs of minority groups, including, when there are deficiencies, the development of specific goals and timetables for the prompt achievement of full and equal employment opportunity." It was in these regulations and analogous measures by the EEOC that the debate over affirmative action quotas had its origins.

Goals and timetables were established by the U.S. Department of Labor using "utilization analysis," which statistically compared the proportion of employed women and minorities in a firm with the proportion of women and minorities in the regional workforce, deriving a measure of what the department called "disparate impact." In the absence of discrimination, it was assumed that these proportions would and should be roughly equal. Since these regulations focused on results and not intent, the structural nature of discrimination was officially recognized. In addition, these regulations provided an official and measurable basis for the preferential treatment of affected groups.

The 1970s and 1980s. In the landmark *Griggs v. Duke Power Co.* case of 1971, the Supreme Court unanimously ruled against Duke's requirement of high school diplomas or IQ tests for those applying for unskilled jobs. The decision held that "Title VII forbids not only practices adopted with a discriminatory motive, but also practices which, though adopted without discriminatory intent, have a discriminatory effect on minorities and women." The ruling provided a legal foundation for cases of "disparate impact," asserting that employers may not use job requirements that adversely affect women and minorities unless required by what it termed "business necessity." (For example, in the case of serious health or safety threats to co-workers or customers.)

The EEOC was strengthened by the Equal Employment Opportunity Act of 1972, which enabled the Commission to file class action suits. Under the administration of President Jimmy Carter, the Uniform Guidelines on Employee Selection established the "four-fifths rule." This rule was significant in that it provided an explicit benchmark to determine disparate impact, which had been left vague in earlier U.S. Department of Labor regulations. The four-fifths rule held that firms contracting with the federal government should not be allowed to hire any race, sex, or ethnic group at a rate below four-fifths that of any other group.

Another significant Supreme Court ruling on affirmative action came in a 1978 case, *Regents of the University of California v. Bakke.* Under the University of California at Davis's admission policies, sixteen of one hundred places were set aside for minority applicants. Allan Bakke was a white applicant who was denied enrollment to Davis's medical school, even though his test scores were higher than the minority students who were admitted. Casting the deciding vote, Justice Lewis Powell held that Bakke should be admitted to the program since Davis's policies constituted a rigid quota, but that, nonetheless, Davis could continue to favor minorities in its admission practices and that it had a "compelling state interest" to attain a diversified educational environment.

The tide favoring affirmative action began to turn in the 1980s during the Reagan and Bush administrations. In his 1980 campaign, Reagan stated, "We must not allow the noble concept of equal opportunity to be distorted into federal guidelines or quotas which require race, ethnicity, or sex rather than ability and qualifications to be the principal factor in hiring or education." Through court appointments, hiring and firing decisions, and budget cuts, the Reagan administration sought to end affirmative action as it had evolved since the Johnson administration. Between 1981 and 1983, the budget of the EEOC was cut by 10 percent and the staff by 12 percent. The Office of Federal Contract Compliance was hit harder yet, with budget cuts of 24 percent and staff cuts of 34 percent during these same years.

Two important Supreme Court rulings in the late-1980s also acted to weaken affirmative action substantially. The 1988 case, *Watson v. Fort Worth Bank and Trust* overturned

the landmark 1971 case, *Griggs v. Duke Power Co.*, shifting the burden of proof in employment discrimination cases from employers to plaintiffs. In the 1989 case *Wards Cove Packing Company v. Antonio*, the Court ruled that a plaintiff could not simply show disparate impact to prove discrimination but must demonstrate that a specific employment practice created the existing disparity.

AFFIRMATIVE ACTION IN THE 1990S AND 2000S

In an effort to fight the rollback of affirmative action, Congress passed the Civil Rights Act of 1991. The Act returned the burden of proof to employers in disparate impact cases, requiring employers to prove that employment practices that resulted in disparate impact were "job related" and "consistent with business necessity." The act thus overturned the Supreme Court's rulings in *Watson v. Fort Worth Bank and Trust* and *Wards Cove Packing Company v. Antonio*. In addition, the Civil Rights Act of 1991 addressed issues of unlawful harassment and intentional discrimination, allowing minority and female victims of intentional discrimination to be awarded up to $300,000 in compensatory damages in addition to back pay and restitution.

In 1994 the Federal Communications Commission (FCC) initiated one of the largest affirmative action programs ever. The FCC voted unanimously to earmark one thousand of two thousand new radio licenses for small businesses owned by women and minorities. These licenses were for businesses serving the rapidly growing number of users of pocket-sized telephones, fax machines, pagers, and handheld computers. Small companies owned by women or minorities could receive up to a 60 percent discount on the cost of these licenses, which federal officials estimated had a total market value of $10 billion. One of the concerns expressed about the FCC ruling was that it would enable the rise of companies that were only nominally headed by women or minorities. This could occur as a result of the acquisition provisions of the ruling, which allowed up to 75 percent of the equity and 49.9 percent of the voting stock of a small firm to be acquired by a larger firm, and yet the small firm would still qualify for licensing discounts.

Despite such efforts, the mid-1990s saw affirmative action programs continue to be rolled back by the Republican-controlled U.S. Congress, as well as by state legislatures and court decisions. Critics charged that affirmative action was a form of "reverse discrimination," meaning that by favoring minorities and women it discriminated against white males. In addition, they argued that affirmative action sometimes prevented companies from hiring the best available worker, and in so doing caused resentment toward minority workers on the job.

In 1996 California voters passed Proposition 209, which banned preferential treatment on the basis of gender or race in public employment, education, and contracting in the state. In effect, the measure eliminated affirmative action programs in California, except as necessary to comply with federal law. Although civil rights groups quickly blocked the measure with a court injunction, it took effect in August 1997 when the injunction was overturned on appeal. It was widely believed that if the U.S. Supreme Court upheld Proposition 209, many states would follow California's lead and make dramatic changes to their affirmative action programs. The battle over 209 raged on; in April 2009, California Solicitor General Manuel Medeiros released a brief stating that 209 was unconstitutional, and that it potentially impeded the good works of minority outreach programs that would otherwise be protected by the Fourteenth Amendment and federal law.

Two important cases were decided by the U.S. Supreme Court in 2003 *Gratz v. Bollinger* and *Grutter v. Bollinger*. In the latter case, the Court upheld the right of the University of Michigan Law School to consider race and ethnicity in admissions. The Court ruled that although affirmative action was no longer justified as a way to redress past oppression and injustice, it promoted a "compelling state interest" in diversity at all levels of society. In the former case, the Court invalidated a particular admissions policy used by the University of Michigan's College of Literature, Science, and the Arts. In this case the race-conscious admissions policy was deemed to be rigid and to fail to provide for individual consideration of applicants. This decision was seen as a rejection of the use of quotas in admission policies at public institutions of higher education.

Although court cases during the 2000s have addressed state use of affirmative action policies, and not their use in the private sector, they demonstrate the direction in which this wide social debate was tending during the first decade of the twenty-first century. In June 2008, prior to becoming the first African American president of the United States, Barack Obama was asked his opinion on affirmative action. As reported by the Associated Press in an article, "Does Obama Threaten Affirmative Action?" Obama stated "So I still believe in affirmative action as a means of overcoming both historic and potentially current discrimination, but I think that it can't be a quota system and it can't be something that is simply applied without looking at the whole person, whether that person is black, or white, or Hispanic, male or female."

Hillstrom, Northern Lights
updated by Diaz, Anaxos

AGE DISCRIMINATION

Age discrimination is the practice of letting a person's age unfairly become a factor when deciding who receives a new job, a promotion, or other job benefit. It most commonly affects older workers who feel they have been discriminated against in favor of younger workers, but there have been cases involving younger workers being displaced by older workers. According to a 2008 survey conducted by FindLaw.com and reported by Thomson Reuters, 34 percent of one thousand adult U.S. workers stated that they have experienced age discrimination. However, according to the Business and Human Rights Resource Center, complaints of age discrimination filed to the Equal Employment Opportunity Commission (EEOC) were down by 7 percent in 2009.

One factor that may be involved in age-related discrimination is the state of the economy caused by the recession that began in 2008. This downturn prompted many aging employees to continue working because they could no longer afford to retire. Much of this is due to diminishing retirement packages. According to the results of a survey conducted by Age Wave in March 2009, "Today's pre-retirees say they will need to postpone their retirement 4.2 years on average, which would be the first time in history that retirement age significantly increased in America."

THE AGE DISCRIMINATION IN EMPLOYMENT ACT (ADEA)

Age discrimination has officially been a major employment issue since 1967, when the U.S. government passed the Age Discrimination in Employment Act (ADEA). The Act's stated purpose is "to promote employment of older persons based on their ability rather than age; to prohibit arbitrary age discrimination in employment; to help employers and workers find ways of meeting problems arising from the impact of age on employment." Specifically, the act prevents employees over the age of from from being unfairly fired, demoted, or offered reduced pay or benefits, and it makes it illegal to discriminate against a person on the basis of age in regard to any employment benefits. Older and younger workers must receive access to equal benefits, which generally include: the same payment options; the same type of benefits, such as health care and pension; and the same amount of benefits. A new addition to the ADEA of 1967, the Lilly Ledbetter Fair Pay Act, was signed into law by President Barack Obama in January 2009. This act makes discriminatory practices in wage payment illegal both when adopted by a firm and when executed by that firm. The ADEA applies to companies with more than twenty employees that are "engaged in industry affecting commerce." Only W-2 employees are covered; independent contractors are not.

There are exceptions to these rules, but they are few in number and closely monitored. For example, companies are allowed to offer early retirement incentives to older workers without penalty. But the early retirement benefits can only be offered if participation in the plan is voluntary and all other parts of the plan are nondiscriminatory. A company cannot force its workers to accept an early retirement offer, nor can it offer an early retirement plan that reduces benefits as a worker's age increases.

There are also some exemptions regarding the employees who are covered. Jobs that involve public safety, such as police and firefighters, are allowed to have age restriction clauses. Top-level executives who meet certain criteria are excluded from the ADEA. In addition, a company may still utilize an official seniority system, which has long been an accepted practice in the American workplace. The ADEA has strict rules about how a seniority system is to be administered, however, and requires that such systems include merit factors as well as years of employment as determining factors. Finally, if faced with an age discrimination suit, employers may argue that the job in question had a "bona fide occupation qualification" (BFOQ) that required a younger worker. If challenged in court, the company must prove that the BFOQ was legitimate and not just a ruse to skirt the law. Generally, this means proving that *all* people above the age limit for the position can be shown to be inappropriate for the job. This is extremely difficult to prove, so most companies do not try to challenge the ADEA in this manner.

Employers must prominently display notices about the ADEA and the protection it offers older workers. They must also maintain detailed records as required by the EEOC, which can take action against an employer if it feels discrimination has occurred. Individuals may also file civil suits on their own. The plaintiff may sue to recover back pay, front pay, and liquidated damages from the employer. If an employee proves that the age discrimination was willful, back pay damages are doubled. State laws also permit punitive damages to be assessed, which can add millions of dollars to a judgment. To prove his or her case, the plaintiff can present direct evidence of discrimination (such as when an employee is plainly told he is being fired because he is too old for the job), prove that a pattern of discrimination exists through the use of statistical analysis, or provide circumstantial evidence that discrimination occurred.

Since it was first written into law in 1967, the ADEA has been updated a number of times, including the above-mentioned Lilly Ledbetter Fair Pay Act. The Older Workers Benefit Protection Act was passed in October 1990. Among its provisions were clear requirements that had to be met if a company wished to settle an ADEA lawsuit brought by an employee. The employee must sign a waiver releasing his or her claim. The waiver must:

- Be "knowing and voluntary," meaning that it must be in writing
- Refer to the specific portions of the ADEA that were applicable to this case
- Provide the employee with some form of compensation or consideration, over and above what he or she would have normally received if they had not signed the waiver
- Recommend, in writing, that the employee has the right to consult an attorney
- Indicate that the employee has 21 days to sign the waiver
- Be revocable for 7 days after being signed by the employee
- Make certain information available to the employee if the case involves employment termination

While not a direct update of the ADEA, a 1993 court case has proven to be extremely important in the field of age discrimination. In *Hazen Paper Co. v. Biggins*, the U.S. Supreme Court ruled that, even though a decision by the paper company adversely affected older workers more than younger workers, the decision did not constitute age discrimination. For the case in question, the company claimed that money was the basis for its decision, not the age of the employees affected, and the court accepted its defense. In cases since that time, the "cost, not age" defense has been widely accepted by the courts. An example of this is the 2007 Supreme Court case of *Kentucky Retirement Systems v. EEOC.* In 2008 Justices voted 5-4 in favor of Kentucky Retirement Systems (KRS), noting that the benefits calculations made by KRS were based on analysis and not on the basis of discrimination.

WHO IS PROTECTED

During the 1990s and 2000s court rulings affirmed the idea that retirees should also be protected from age discrimination. The 1997 Supreme Court case *Robinson v. Shell Oil Co.* that primarily focused on racial discrimination determined that "employee benefits" encompass benefits provided to a company's current employees and to its retirees. As a result, there were more court cases involving retirees and age discrimination under the ADEA's equal cost or equal benefit provisions. In the 2000 case *Erie County Retirees Association v. County of Erie*, the U.S. Third Circuit court ruled that, while companies could continue the common practice of reducing company-provided medical benefits once a retiree qualified for Medicare medical benefits, the companies had to follow the equal cost, equal benefit standards and could not reduce the benefits more than those standards allowed. Employers are also barred by the ADEA from retaliating against employees who have participated in ADEA litigation against the company in any way, be it filing a claim themselves or testifying at someone else's trial.

One of the tools an employee can use to prove age discrimination is through comments made in the workplace. These comments, under certain circumstances, can come from the employee's supervisor, other management personnel, co-workers, or even the company's chief executive officer. Comments that are directly related to the job and the employee in question and that show bias are always admissible in court, while other comments face different qualifying standards. Comments from the CEO are almost always allowed because they are indicative of the company's official policy. Remarks made by senior managers and other employees, even if they are a year or more old, can be admissible if they indicate that a pattern of bias is present in the corporate culture.

THE STATE OF AGE DISCRIMINATION LAW IN THE TWENTY FIRST CENTURY

In 2000 the U.S. Supreme Court made two important rulings that extended the scope of the ADEA. In *Reeves v. Sanderson Plumbing Products, Inc.*, an employee who had been with the firm for forty years was fired. The employee sued, saying that a reason given by Sanderson was really just a pretext for the real reason that the company wanted a younger worker. A jury agreed with the employee, but an appeals court overruled the jury, stating that the employee had to offer additional proof that he was discriminated against proving that the company lied about why they

fired him was not enough to prove age discrimination. The U.S. Supreme Court disagreed, reinstating the original verdict affirming the employee was discriminated against. The court ruled that the employee did not have to provide "pretext plus," as the rule requiring additional evidence of discrimination was called.

Another significant case was *Kimel v. Florida Board of Regents* in 2000, in which the court sided with the employers. In the Kimel case, the court ruled by a 5-4 vote that under the 11th Amendment to the Constitution, state governments were shielded from age discrimination suits. In other words, no state employee could sue his employer for age discrimination. This does not totally wipe out an older employee's right to seek recourse, but it does make it tougher for employees. Every state has its own laws making age discrimination illegal, and employees may still take action under those state laws. But each state law is different and, in general, not as tough as federal laws.

In March 2005 the U.S. Supreme Court's decision in the case *Smith v. City of Jackson, Mississippi*, answered an important question: Must a plaintiff prove discriminatory intent or is proof of disparate impact enough? The ruling in this case, although in favor of the defendant (the employer), was a victory for civil rights plaintiffs. The ruling laid out a rationale by which disparate impact may be used in cases brought under the ADEA, supporting the use of disparate impact as an alternative to employer intent. The requirement that a plaintiff prove that there was discriminatory intent on the part of an employer, when bringing a discrimination case under the ADEA, has long been an obstacle for plaintiffs. The decision in *Smith v. City of Jackson, Mississippi* reduced the obstacle and cleared the way for claims that rest on proof that there was a disparate impact on older employees regardless of the employer's intentions. The practical reality is that it is much easier for a plaintiff to prove disparate impact than discriminatory intent. This case highlights the need for employers to establish strong anti-discrimination policies and to have demonstrated business reasons for employment decisions that may adversely affect older workers.

The 2008 ruling in *Meacham v. Knolls Atomic Power Laboratory* was an important step for workers in that it placed the burden of proof on the employer when establishing reasonable factors other than age (RFOA). Knolls was using a performance test to determine which employees would be fired of the forty who were subsequently fired based upon performance results, thirty-one were over the age of forty.

AGE DISCRIMINATION IN EMPLOYMENT ACT

The Age Discrimination in Employment Act (ADEA) prohibits any employer from refusing to hire, discharge, or otherwise discriminate against any individual because of age. The act covers compensation, terms, conditions, and other privileges of employment including healthcare benefits. This act specifically prohibits age-based discrimination against employees who are at least forty years of age. The purpose of the act is to promote the employment of older persons and to prohibit any arbitrary age discrimination in employment.

The Age Discrimination in Employment Act became law in 1967 but its roots can be traced back to 1964, when the U.S. government enacted Title VII of the 1964 Civil Rights Act. This act radically changed working life in the United States. The core of Title VII was to prohibit discrimination in employment based on race, color, sex, national origin, or religion. This statute provided a way for women and minorities, in particular, to challenge barriers that limited equal opportunities in organizations. States adopted similar legislation as well. One variable noticeably missing from Title VII was age discrimination. Three years later, the U.S. Senate and the House of Representatives enacted the 1967 Age Discrimination in Employment Act (ADEA).

SCOPE OF COVERAGE

The ADEA covers individuals, partnerships, labor organizations and employment agencies, and corporations that: 1) engage in an industry affecting interstate commerce and 2) employ at least twenty individuals. The act also controls state and local governments. Referrals by an employment agency to a covered employer are within the ADEA's scope regardless of the agency's size. In addition, the ADEA covers labor union practices affecting union members; usually, unions with at least twenty-five members are covered. The ADEA protects against age discrimination in many employment contexts, including hiring, firing, pay scales, job assignments, and fringe benefits.

Under the act, employers are forbidden to refuse to hire, to discharge, or to discriminate against anyone with respect to the terms, conditions, or privileges of employment because of a person's age. The act also forbids employers from limiting, segregating, or classifying an individual in a way that adversely affects his or her employment because of age. The act states that all job requirements must be truly job-related and forbids employers to reduce the wage rate of an employee to comply with the act. It forbids seniority systems or benefits plans that call for involuntary requirements due to age and also makes it illegal for employees to indicate any issue related to age in advertisements for job opportunities.

The ADEA was enacted to promote the employment of older persons based on ability rather than age and to help employers and employees find ways to work around problems that arise from the impact of age on employment. As a result, the act authorizes the Secretary of Labor to perform studies and provide information to labor unions, management, and the public about the abilities and needs of older workers and their employment potential and varied contributions to the economy.

PROCEDURAL REQUIREMENTS AND DEFENSES UNDER ADEA

The procedural requirements for an ADEA suit are complicated. Before an individual can sue in his or her own right, a private plaintiff must file charges with the Equal Employment Opportunity Commission (EEOC) or with an appropriate state agency. The EEOC may also sue to enforce the ADEA. A 3-year statute of limitations exists for both government and private suits starting from the date of an alleged willful violation. For cases of nonwillful violations, the statute of limitations is 2 years from the date of the alleged violation.

The plaintiff does not need to prove that age was the *only* factor motivating the employer's decision, but must establish that age was one of the determining factors guiding the employer's discriminatory actions. Once the plaintiff establishes a *prima facie* case, the burden of evidence shifts to the employer. The employer must provide a legitimate, nondiscriminatory reason for the employee's demotion or discharge. Charges filed and resolved under the ADEA are tracked by the Office of Research, Information, and Planning, which gets its data from the EEOC's Charge Data System.

The ADEA allows employers to discharge or otherwise discipline an employee for good cause, and to use reasonable factors other than age in their employment decisions. It also allows employers to observe the terms of a bona fide seniority system, except where such a system is used to require or permit the involuntary retirement of anyone age forty or over.

In addition, the ADEA provides for a bona fide occupational qualification (BFOQ) defense. In general, an employer seeking to use this defense must show that its age classification is reasonably necessary to the safe and proper performance of the job in question. Specifically, the employer must show either: 1) that it is reasonable to believe that all or most employees of a certain age cannot perform the job safely, or 2) that it is impossible or highly impractical to test employees' abilities to tackle all tasks associated with the job on an individualized basis. For example, an employer that refuses to hire anyone over the age of sixty as a pilot has a potential BFOQ defense if it has a reasonable basis for concluding that pilots age sixty and over pose significant safety risks, or that it is not feasible to test older pilots individually.

ADEA ISSUES IN THE 2000S AND BEYOND

Age discrimination cases will be of increasing concern to businesses in the future as the work force in the United States and in many developed countries continues to mature and as U.S.-based companies continue to ship jobs overseas to lower overhead. In addition, changes in Social Security laws are increasing the age at which a person may begin to draw full Social Security benefits, and this will cause many more workers to stay on the job until much later in life. As if these factors were not enough to make age discrimination more prominent, the recession in 2008 and 2009 affected many workers over fifty-five whose salaries were highest within most firms, both in the public and private sectors. As layoffs increased due to the downturn in the economy, age discrimination became a very real concern for companies who had little choice in letting go employees that were the most expensive to keep on. Damages can be substantial and may take the form of back pay, front pay, overtime pay, emotional distress pay, liquidated damages, and multipliers for intentional violations of the law. Remedies can also include equitable relief, hiring, reinstatement, and promotion. Employers are cautioned to consider ADEA laws when restructuring the workplace.

Another important issue facing employers in this realm is the legal interpretation of the ADEA as it relates to retirees.

Federal court rulings in the mid-2000s indicated that under the Age Discrimination in Employment Act, employers had to provide the same healthcare benefits to Medicare-eligible retirees that they do to younger retirees who do not yet qualify for Medicare. Known as 'legacy costs,' the price of health benefits heavily impacts mainly large companies. As an example of this, General Motors asserts that an average of $1,750 of a car's sticker price covers the cost of employee medical benefits.

The recession that started in 2008 caused many large companies to cut the benefits of retirees, including those who had worked for the company for more than thirty years. Cutting the benefits of such employees increased concerns of age discrimination, especially for employees who retired younger than sixty-five many of these employees were offered early retirement packages in an effort to bring on younger talent that would cost less for corporations to sustain.

Amid a flood of protests from employers and labor organizations, the EEOC reviewed the question of differential healthcare benefits for retirees of different ages, those under and those over the age of Medicare-eligibility. A government sponsored "insurance pool" has been discussed to assist companies struggling to pay for health benefits. This program would act much the same as federal health coverage plans currently offered to most federal employees.

As healthcare costs continue to rise, layoffs continue, and the workforce ages, issues of age discrimination on both ends of the age spectrum are likely to remain an issue of importance for all employers.

AIDS IN THE WORKPLACE

Acquired immune deficiency syndrome (AIDS) is a disease that impairs the human immune system and renders it susceptible to infections that would be repelled by a functioning immune system. The terminal stage of the human immuno-deficiency virus (HIV), AIDS is transmitted by contamination of the bloodstream with HIV-infected body fluids, specifically blood, semen, breast milk, and vaginal fluid. The virus is principally spread through vaginal or anal intercourse, by the transfusion of virus-contaminated blood, by the sharing of HIV-infected intravenous needles, or by mothers to fetuses during pregnancy. Literature from the U.S. Centers for Disease Control and Prevention (CDC) emphasizes that "no additional routes of transmission have been recorded, despite a national sentinel system designed to detect just such an occurrence." AIDS is not spread by casual physical contact, insect bites, or airborne means, and transmission through body fluids such as saliva and tears has never been documented. Once a person becomes infected with HIV, the incubation period averages 8 years before AIDS symptoms appear.

Given a supportive work environment and early detection, people with HIV and AIDS can continue to be productive members of the workforce. Studies have shown that for half of the people who contract HIV, it takes more than a decade to develop AIDS; with the right pharmaceutical cocktail, those with HIV can stave off AIDS for quite a long time. With medical treatment, many can manage the infection as a chronic, long-term condition, similar to many other medical disorders. The numbers of people with HIV and their extended life expectancy means there will be more employees on the job with HIV in the future.

GOVERNMENT AGENCIES AND POLICIES RELATING TO AIDS

The Business Responds to AIDS (BRTA) program was formed in 1992 as a public-private partnership among the CDC, the public health sector, other organizations and agencies, and business and labor to provide workplace education and community services in order to prevent the spread of HIV. The BRTA program now called Business Responds to AIDS/Labor Responds to AIDS, or BRTA/LRTA assists

businesses of all sizes in the creation and implementation of workplace-based HIV and AIDS policies. In addition to education, service, and prevention of the spread of HIV, the program's goals are to prevent discrimination and foster community service and volunteerism both in the workplace and in the community. In order to achieve these goals, BRTA/LRTA has developed materials and technical assistance to help businesses form comprehensive HIV and AIDS programs, including training for management and labor leaders and education for employees and their families.

Corporate HIV and AIDS policies and practices should comply with federal, state, and local legislation and Occupational Safety and Health Administration (OSHA) guidelines. Federal laws regarding AIDS in the workplace include: the Occupational Safety and Health Act of 1970; the Vocational Rehabilitation Act of 1973 (VRA); the Employee Retirement Income Security Act of 1974 (ERISA); the U.S. Consolidated Omnibus Budget Reconciliation Act of 1986 (COBRA); and the Americans with Disabilities Act (ADA) of 1990.

The ADA, which applies to any company with fifteen or more employees, forbids discrimination against any employee affected by a disability or chronic disease, including HIV and AIDS. It defends people who are infected, people perceived to be at high risk, and the relatives and caregivers of people with AIDS in matters ranging from hiring and promotion to resignation and retirement. Basically, employers cannot treat employees who are affected by AIDS any differently than other employees, and they are required to provide appropriate accommodations whenever possible. The ADA does make a slight exception for restaurants, however, in that they are permitted to reassign employees with HIV or AIDS to positions in which they are not required to handle food.

In 1998 the U.S. Supreme Court also stipulated that asymptomatic HIV patients (those without visible signs of illness) should be included under the Americans with Disabilities Act. The Court ruled in a 5-4 decision (in *Bragdon v. Abbott*) that asymptomatic patients should still be covered by the ADA because HIV infection interferes with "major life activities" in this case, the major life activity of reproduction.

PROACTIVE AIDS POLICIES FOR BUSINESSES

Despite the growing impact of AIDS and AIDS-related illnesses on American businesses, very few companies are aware of their legal obligations to affected employees or have enacted policies to ensure compliance with the law. BRTA/LRTA provides detailed recommendations for companies on how they can establish and implement a simple AIDS policy.

An AIDS policy is used to clarify a company's consistent response to issues of HIV/AIDS in the workplace. The CDC strongly recommends having an employee HIV education program available to all employees. Such an educational program can reduce fear, prevent discriminatory behavior which may result in discrimination lawsuits, prevent loss of productivity, and stave off challenges that may arise when an employee discloses his or her HIV or AIDS status.

According to AVERT, an AIDS and HIV charity and AIDS/HIV statistics source, in 2007 approximately 50 percent of new AIDS cases were in African American males who fall into the group of "men who have sex with men" (MSM). People in this demographic have a twofold discrimination probability in the workplace; as minorities and people living with HIV/AIDS, the importance of programs to fight all brands of discrimination are highly recommended for all companies.

In its relatively short history, AIDS has become the most litigated health concern in American legal history. The majority of these lawsuits are employment related. Having a well-designed AIDS policy can help clarify a company's position for all parties and can help to avoid the situations that arise and often lead to litigation. A good policy will assist with management questions, concerns of HIV-infected employees, and concerns of any other co-workers. The following five actions should be covered and documented in a solid AIDS policy.

- Show compliance with the law. The company should state that it adheres to the Americans with Disabilities Act and its protections for people with HIV, including acceptable performance standards, non-discrimination and reasonable accommodation.
- Provide educational materials on HIV/AIDS. Policies should contain a component stating that HIV/AIDS is not transmitted through casual contact, and that employees with HIV/AIDS are not a health risk to their co-workers. employees should be invited to receive more information on HIV through human resources, or advised that there will be regular employee education.
- Protect all employees. Employees should be assured that their individual health status is confidential and will not be disclosed. Also it should be stated that the safety of all employees including that of the person living with HIV/AIDS is of utmost importance.
- Give clear direction. Employees should be told where they can go for HIV/AIDS information or answers to questions about HIV transmission. Supervisors should get direction from upper management on dealing with HIV issues in their department. Incorporating an open door policy for all employees is an effective way to ensure that issues can be addressed before they create a negative impact.
- Disseminate policy information. Companies should be certain all employees at all levels read and understand the company's AIDS policy.

The prevalence of HIV and AIDS in the U.S. population was estimated by the CDC in 2006 to be one in every 268 people. As of 2009, the World Health Organization (WHO) reported that approximately thirty-three million people have been diagnosed with HIV/AIDS; of that group, 1.1 million are American. The prevalence is highest in the age group twenty-five to forty-four years of age, and in 2007, reports indicated that 75 percent of the overall HIV/AIDS population was comprised of males. AIDS has surpassed cancer and personal injury (including car accidents) as the leading cause of death for persons in this age group. Most companies will deal with the HIV/AIDS issue, and likely hire employees living with HIV/AIDS. Having a clear and well-publicized AIDS policy and readily available information for all employees is key in avoiding misunderstandings and legal liability that may arise in the absence of an established policy.

ALIEN EMPLOYEES

An alien employee is any employee working in the United States who is not a citizen of the United States. Those employees who enter the country and secure employment legally do so by first obtaining employment visas. Employment visas are classified into two categories: immigrant visas and nonimmigrant visas. Immigrant visas are used by aliens who are approved for permanent residency in the United States, while nonimmigrant visas provide for temporary stays in the country of up to 7 years.

The subject of alien employees is often complicated by the issue of illegal aliens. Foreigners may enter the United States legally, on, for example, a tourist visa, and then seek employment illegally. Or, foreigners may enter the country illegally. Employers must be very careful when hiring to establish that a prospective foreign employee is eligible to work in the United States.

Immigration law has often been characterized as the second most complicated field of U.S. law, second only to tax law. As a result, it is advisable for any business wishing to employ foreign nationals or alien employees either to develop an in-house expertise in immigration law or consult with an expert in the field. For many businesses, alien employees are of great value, bringing unique talents and knowledge to the business and thereby justifying the additional work involved in hiring them.

IMMIGRANT AND NONIMMIGRANT VISAS

Immigrant visas are given to aliens who are granted permanent residency in the United States. These individuals tend to be highly educated persons with experience and skills that are in high demand by companies in the United States. Immigrant visas that are most frequently granted are in the following employment areas: business executives and managers; notable professors, researchers, and other academics; advanced degree professionals; professionals with bachelor's degrees; investors in new business ventures. Skilled and unskilled workers are also sometimes granted immigrant visas.

Nonimmigrant visas are issued to foreigners whose stay in the United States will be temporary, though may extend to a length of 7 years. There are twenty nonimmigrant visa classifications, of which only six normally allow for work while in the United States. These nonimmigrant visas are frequently bestowed upon aliens working in the following areas: students engaged in educational pursuits (work authorization is available for practical training after they complete their course of study); registered nurses; temporary agricultural workers; workers in the service sector; trainees; intra-company transfers; artists and entertainers; athletes; and aliens of "distinguished merit" or "extraordinary ability," especially in such fields as the sciences, high technology, education, the arts, business, or athletics.

KEY LEGAL CONSIDERATIONS PERTAINING TO ALIEN EMPLOYEES

The regulatory picture for employing alien workers is an ever-changing one in the United States. The 1990s was a period of economic growth and saw U.S. corporations turn strongly to alien employees to fill positions in specialized areas, high technology in particular. Correspondingly, the U.S. government passed major immigration laws throughout the 1990s and the early 2000s. Among these laws were the Immigration Act of 1990, the Illegal Immigration Reform and Immigrant Responsibility Act of 1996, the

American Competitiveness and Workforce Improvement Act of 1998 (ACWIA), and the Enhanced Border Security and Visa Entry Reform Act of 2002. All this legislation, which included new sanctions for companies found in violation of alien labor regulations, should be consulted before making any hiring decisions regarding alien workers.

Basically, the law states that American employers have to make sure that all of their employees are eligible to work in the United States when they begin their work. Immigration experts recommend that businesses conduct a Form I-9 audit to make sure that they are in full compliance with all pertinent immigration laws. Such audits not only help employers meet all legal obligations, but also may be regarded as evidence that they made good-faith attempts to follow employer verification requirements. (For further information, see "Hiring Alien Employees" below).

These laws were initially interpreted and enforced by executive agencies such as the Department of Labor (DOL) and the Immigration and Naturalization Service (INS). As a result of the national security reorganization that followed the terrorist attacks of September 11, 2001, the INS ceased to exist. Its functions were moved to three new agencies within the newly created Department of Homeland Security (DHS): U.S. Citizenship and Immigration Services (USCIS), Immigration and Customs Enforcement (ICE), and Customs and Border Protection (CBP). Many of the DOL functions were also transferred to the DHS.

IMMIGRATION REFORM EFFORTS

With the slowing of the economy in the first decade of the new century, and the 9/11 terrorist acts, the general mood regarding alien workers changed, ushering in a new era of attempts at immigration reform. Many immigration bills were proposed in the 2000s; however, few became law and fundamental changes to the immigration system did not occur as a result.

In 2004 President George W. Bush proposed legislation that would both strengthen efforts along the U.S. border to halt the entry of illegal aliens and establish a temporary or guest worker program. Under the proposed plan, undocumented immigrants would be allowed to get a 3-year work visa, extendable for an additional 3 years. This proposed legislation was met with little support and never gained traction.

In 2005 senators John McCain and Edward Kennedy co-sponsored the Secure America and Orderly Immigration Act, also known as the McCain-Kennedy Bill. This bill, the twenty-first century's first comprehensive approach to immigration reform, included three main components: legalization of some current illegal immigrants, creation of new guest worker programs, and funding and support for enhanced border enforcement. The bill also would have altered existing visa requirements, annual quotas, and the penalties imposed on employers who hire illegal workers. The bill became a lightning rod for both supporters and opponents of immigration reform; however, it was never voted on in the Senate.

The Comprehensive Immigration Reform Act of 2006 was introduced by Arlen Specter, then a Republican, based on compromises made to increase support for the McCain-Kennedy Bill. This bill was passed by the Senate by a vote of 62 to 36. A similar bill was passed by the House of Representatives by a vote of 239 to 182. Negotiators from the House and the Senate who attempted to reconcile differences between the two bills were unable to find a compromise acceptable to all parties, so neither bill became law. Another Comprehensive Immigration Reform Act was introduced in 2007 by Democratic Senate Majority Leader Harry Reid, but this bill was killed by a Republican filibuster which prevented the Senate from voting on it.

The immigration reform debate is an ongoing battle in Congress. In December 2009 Representative Luis V. Gutierrez, a Democrat from Illinois, introduced an immigration reform bill referred to by supporters as "comprehensive immigration reform." This bill, if passed, will allow illegal immigrants already living in the United States to stay if they prove that they had been working, pay a $500 fine, learn English, and undergo a background check. This bill differs from others proposed in Congress because it does not require immigrants to return to their homeland first.

HIRING ALIEN EMPLOYEES

The restrictions on alien hiring place a lot of requirements on employers. Companies should make sure that they are familiar with the basics of utilizing alien employees in their workplaces. There are a few steps that all small- business owners should take when hiring new employees to minimize the likelihood of employing an unauthorized worker and possibly incurring legal penalties.

First, employers should ask all job applicants if they are authorized to work in the United States. It is discriminatory to ask whether applicants for employment are U.S. citizens; however, all employment applications can and should ask prospective employees whether they are authorized to work in the United States and if so, establish the basis of this authorization citizenship or an employment visa. In a 2005 *BusinessWeek* article titled "The Visa Maze," Bill Reilly, unit chief for the Office of Investigations at the U.S. Immigration and Customs Enforcement (ICE), wrote about a program that small businesses can join that will help them comply with the law. Reilly suggested that entrepreneurs join Basic Pilot (now renamed e-Verify), an employment-verification system run by ICE that determines whether or not a noncitizen is eligible to work in the United States by searching databases at the Social Security Administration and the Homeland Security

Department. According to the Department of Homeland Security, e-Verify is used by more than 126,000 employers nationwide, with one thousand new businesses joining each week. DHS claims that e-Verify instantly verifies 93 percent of prospective employees and verifies an additional 1.2 percent after a 24-hour check with the U.S. Citizenship and Immigation Service.

For prospective employees who do have visas, it is sometimes necessary for employers to file appropriate documentation with the USCIS before the person in question can begin work. Requirements vary considerably from situation to situation, so it is often a good idea for small businesses to secure the services of an attorney with experience in immigration law for guidance. While companies are obviously under no obligation to hire a person who has the appropriate authorization to work in the United States, they also may not discriminate against an alien authorized to work in America on the basis of his or her citizenship. Given this situation, a company should determine its policy of sponsoring work visas and apply it equally to all employees. Such a policy need only oblige a company to sign the visa forms for alien employees and comply with wage and hiring requirements.

It is also important for employers to be aware of prevailing wage structures for positions that may be filled by alien workers. By law, employers are required to compensate immigrant workers at roughly the same levels that non-aliens in the same positions and in the same geographic region earn. These laws were passed so that alien employees would be fairly compensated for their work. Businesses that neglect to meet minimum standards of compensation may be assessed fines and penalties by the DOL. Small-business owners seeking "prevailing wage" information can contact their state's Bureau of Employment Services or secure a wage survey compiled by an authoritative source, such as an employment agency.

ALIEN EMPLOYEES AND AMERICAN CULTURE

Business owners who hire alien employees also may face challenges outside of the legal realm. Managing a culturally diverse work force can be a difficult process at times, although successful integration of people from different cultural and ethnic backgrounds can be a tremendously rewarding experience for a business on a wide range of levels, both socially and economically.

One key to creating a strong multicultural environment in the workplace is anticipating the difficulties that alien employees sometimes have with various aspects of American culture. Depictions of American culture are commonplace around the world, but these depictions are often exaggerated or slanted, and they may provide aliens with fundamentally erroneous impressions of life in the United States. And, of course, immersion into any society, let alone one as complex and fast-moving as America's, can be a disorienting experience.

There are myriad aspects of life to which alien employees will have to adjust themselves, including a new language in many cases, recognition of the regional dialects, a new culture, different ways of shopping, banking, obtaining medical attention, commuting, to name but a few.

Another difficult adjustment for non-Americans has to do with socializing and a sense of community. If work interactions do not lead to corresponding social interactions, alien employees may view it as rejection. "One barrier to acceptance for international employees is the failure to follow U.S. workplace culture," one business consultant told Carla Joinson for her *HR Magazine* article on the subject. "For instance, in a brainstorming or solution-oriented meeting, it is our way to jump in, talk and solve the problem. However, folks from other cultures may feel this is a waste of time because we haven't thought it all through and are throwing out various solutions that may not work. We then say, 'What's wrong with them? Why don't they speak up?' Then, there's a domino effect: They get invited to meetings less and less." In addition, "inpat" employees may also struggle to adjust to the so-called "benefit gap" that exists between the United States and many other countries. Some of those from cultures other than the United States are used to more generous benefits in such realms as annual paid vacation, length of lunch hour, and subsidies for commuting costs.

Experts agree that business owners who want to ease the transition for alien employees into the American workplace (and the larger community) can do so by establishing a system of education, mentoring, and training. "Companies that do a good job of accommodating diversity and are willing to locate and use specialized expertise find that the addition of international workers adds to their success," stated Joinson.

ALTERNATIVE DISPUTE RESOLUTION (ADR)

Alternative dispute resolution (ADR) is a term that refers to several different methods of resolving disputes outside traditional legal and administrative forums. These philosophically similar methodologies, which include various types of arbitration and mediation, have surged in popularity in recent decades because companies and courts became extremely frustrated over the expense, time, and emotional toll involved in resolving disputes through the usual legal avenues. "The adversarial system is expensive, disruptive, and protracted. More significantly, by its very nature, it tends to drive the parties further apart, weakening their relationship, often irreparably" pointed out Wayne Hoagland in *Business Insurance.* ADR programs emerged as an alternative, litigation-free method of resolving business disputes.

Analysts also trace the rise of ADR methods to changing attitudes within the American judicial system. *Business Horizons* contributor Stephen L. Hayford observed that until the 1980s, "attempts by business firms to avoid litigation… were frustrated by a longstanding hostility on the part of the courts toward any devices that infringed on their jurisdiction." But Hayford noted that during the 1980s a new body of case law emerged that sanctioned the use of binding arbitration provisions in commercial contracts between companies, business partners, employees and employers. This body of law continued to evolve during the 1990s. The federal government formally incorporated ADR methods into its administrative process with the adoption of the Administrative Dispute Resolution Act of 1996. The Alternative Dispute Resolution Act of 1998 extended ADR mechanisms throughout the federal district court system. As Simeon Baum stated in *CPA Journal,* "the act recognizes that ADR, when properly accepted, practiced, and administered, can not only save time and money and reduce court burdens, but also 'provide a variety of benefits, including greater satisfaction of the parties, innovative methods of resolving disputes, and greater efficiency in achieving settlements.'"

Congress continued to expand the use of ADR in both executive and judicial agencies throughout the late 1990s and 2000s, making ADR into a normal part of judicial and administrative processes. According to Title 28 of the U.S. Code, updated in January 2008, "each district court shall… require that litigants in all civil cases consider the use of an alternative dispute resolution process at an appropriate stage in the litigation. Each district court shall provide litigants in all civil cases with at least one alternative dispute resolution process, including, but not limited to, mediation, early neutral evaluation, minitrial, and arbitration" (Title 28, Part III, Chapter 44, section 652).

In the 2000s, legal and corporate acceptance of alternative dispute resolution as a legitimate remedy for addressing business disagreements was reflected in the language of business contracts. ADR contingencies became a standard element in many contracts between companies and their employees, partners, customers, and suppliers. As *U.S. News & World Report* noted, "virtually every state has experimented with some form of ADR." With the growth of ADR has come a growing number of organizations and associations designed to assist commercial entities in the use of these alternative dispute resolution methods.

ARBITRATION ASSOCIATIONS AND ORGANIZATIONS

There are several U.S. organizations and agencies that are involved in exploring arbitration issues, training arbitrators and mediators, and conducting arbitration services. The National Academy of Arbitrators (NAA), founded in 1947, is a nonprofit organization whose mission is to foster high standards for arbitration and arbitrators and to promote the process. The NAA works to attain these objectives through seminars, annual conferences, and educational programs. The American Arbitration Association (AAA), another nonprofit organization, offers its services for voluntary arbitration as part of its mandate to promote the use of arbitration in all fields. In 2009 Congress directed the AAA to administer an auto industry arbitration program which owners of car dealerships could use to seek reinstatement if they believed that their businesses were improperly closed by automobile manufacturers during the implementation of the Emergency Economic Stabilization Act of 2008. The Federal Mediation Conciliation Service (FMCS) is a government agency that handles arbitration and mediation of labor disputes and contract negotiations. The FMCS, in addition to conducting arbitration services, maintains a roster from which arbitrators can be selected, and it champions procedures and guidelines designed to enhance the arbitration process.

PRIMARY FORMS OF ADR

ADR takes a number of different forms, including various types of arbitration, as well as mediation, ombudsman,

and neutral evaluation. These methods are described in the sections below.

Arbitration. Arbitration is the procedure by which parties agree to submit their disputes to an independent neutral third party, known as an arbitrator, who considers arguments and evidence from both sides, then hands down a final and binding decision. This alternative, which can be used to adjudicate business-to-business, business-to-employee, or business-to-customer disputes, can utilize a permanent arbitrator, an independent arbitrator selected by the two parties to resolve a particular grievance, or an arbitrator selected through the procedures of the AAA or FMCS. A board of arbitrators can also be used in a hearing.

After the arbitrator is selected, both sides are given the opportunity to present their perspectives on the issue or issues in dispute. These presentations include testimony and evidence that are provided in much the same way as a court proceeding, although formal rules of evidence do not apply. Upon completion of the arbitration hearing, the arbitrator reviews the evidence, testimony, and the collective bargaining agreement, considers principles of arbitration, and makes a decision. The arbitrator's decision is generally rendered within 60 days. Hayford noted that "[binding arbitration] minimizes pre-hearing machinations with regard to discovery, motion practice, and the other preliminary skirmishes that extend the time, expense, and consternation of court litigation. In exchange, the parties to a contractual binding arbitration provision agree to accept the risk of receiving an unfavorable decision."

Other forms of arbitration include the following:

- Expedited arbitration is a process intended to speed up the arbitration process with an informal hearing. Under this process, decisions are generally rendered within 5 days. It was first used in 1971 in settling disputes in the steel industry.
- Interest arbitration is the use of an arbitrator or board of arbitrators to render a binding decision in resolving a dispute over new contract terms.
- Final offer selection arbitration is an interest arbitration process in which the arbitrator or board of arbitrators selects either the union or management proposal to the solution. There can be no compromised decisions. This process is also termed either-or arbitration.
- Tripartite arbitration is a process wherein a three-member panel of arbitrators is used to reach a decision. Both labor and management select an arbitrator and the third is selected by the other two arbitrators or the parties to the dispute as a neutral participant.

Mediation. In contrast to arbitration, mediation is a process whereby the parties involved utilize an outside party to help them reach a mutually agreeable settlement. Rather than dictate a solution to the dispute between labor and management, the mediator who maintains scrupulous neutrality throughout suggests various proposals to help the two parties reach a mutually agreeable solution. In mediation, the various needs of the conflicting sides of an issue are identified, and ideas and concepts are exchanged until a viable solution is proposed by either of the parties or the mediator. Rarely does the mediator exert pressure on either party to accept a solution. Instead, the mediator's role is to encourage clear communication and compromise in order to resolve the dispute. The terms "arbitration" and "mediation" are sometimes used interchangeably, but this mixing of terminology is careless and inaccurate. While the mediator *suggests* possible solutions to the disputing parties, the arbitrator makes a final decision on the labor dispute which is *binding* on the parties.

In November 2009, Google sought mediation through the National Arbitration Forum (NAF) for a dispute with 207 Media, the operators of Groovle.com. Google filed a complaint stating that the Web site's domain name was "confusingly similar" to the Google trademark. The NAF, which offers businesses arbitration and mediation services, dismissed the complaint in December 2009. The three-person NAF panel stated that the name was not similar enough to cause confusion and decided that the "Groovle.com domain name remain with respondent."

Mediation can be a tremendously effective tool in resolving disputes without destroying business relationships. It allows parties to work toward a resolution out of the public eye (the courts) without spending large sums on legal expenses. Its precepts also ensure that a company will not become trapped in a settlement that it finds unacceptable (unlike an arbitration decision that goes against the company). But Hayford commented that "mediation only works when the parties employing it are willing to go all out in the attempt to achieve settlement," and he warned that "the mediator must be selected carefully, with an eye toward the critical attributes of neutrality, subject matter and process expertise, and previous track record." Finally, he noted that with mediation, there is a "lack of finality inherent in a voluntary, conciliation-based procedure."

Other forms of mediation often employed in labor disputes include "grievance mediation" and "preventive mediation." Grievance mediation is an attempt to ward off arbitration through a course of fact-finding that is ultimately aimed at promoting dialogue between the two parties. Preventive mediation dates to the Taft-Hartley Act (1947) and is an FMCS program intended to avoid deeper divisions between labor and management over labor issues. Also termed technical assistance, the program encompasses

training, education, consultation, and analysis of union-management disputes.

Ombuds. An ombudsman is a high-ranking company manager or executive whose reputation throughout the company enables him or her to facilitate internal dispute resolutions between the company and employees. Hayford points to several benefits of ombud-based ADR: "It provides a confidential, typically low-key approach to dispute resolution that keeps conflicts 'in the family.'....Properly effected, the ombuds mechanism can do much to enhance the perception that the company is concerned and eager to address the problems of its employees by providing them with an accessible, nonthreatening avenue for seeking redress when they believe they have been wronged." The primary drawback of ADR by the ombud process, however, is that many companies whether large or small do not have an individual equipped with the reputation, skills, or training to take on such a task.

Neutral Evaluation. In neutral evaluations, a neutral individual, with a background in ADR, listens to each party lay out its version of events. After their perspectives have been considered, the neutral evaluator offers his or her opinion on the disagreement. This opinion is not binding in any way, but if the neutral party is respected and trusted by both sides, it can help the parties reassess their negotiating positions with an eye toward finding common ground.

UTILIZING ADR

The popularity of alternative dispute resolution increased dramatically in the first decade of the twenty-first century, and industry analysts expect that this trend will continue. According to a 2009 *U.S. News & World Report* article, "Employment in arbitration, mediation, and conciliation is expected to expand by 1,400 jobs, or 14 percent, between 2008 and 2018 a growth rate above the average for all occupations." Small- and medium-sized businesses have contributed to this surge in use, drawn by the promise of cost and time savings. But ADR provisions need to be weighed carefully before they are incorporated into any business agreement with partners, employees, vendors, or clients. The questions to ask are: when is an ADR resolution method preferable to litigation; when is it to be avoided; and, if ADR is preferred, what form of ADR should be pursued? Legal assistance is particularly vital for small-business owners who wish to answer these questions fully and incorporate ADR provisions into their contracts and agreements.

AMERICAN RECOVERY AND REINVESTMENT ACT

Signed into law in February 2009, the American Recovery and Reinvestment Act (ARRA) is an omnibus spending bill designed to bolster a national economy weakened by a global recession that began in 2008. The $787 billion law has three main fiscal components:

- $288 billion in tax cuts and benefits for both businesses and individuals
- $224 billion in funds for education and health care
- $275 billion in federal contracts, grants, and loans

The financial outlay authorized by ARRA had multiple goals, including: creating as well as saving jobs; boosting economic growth and increasing long-term investment activity; computerizing health care records potentially to reduce medical costs; improving infrastructure in areas such as the

nation's electrical grid as well as its roads and bridges; and providing financial aid to school districts facing budget shortfalls. These were only some of the goals, for the bill apportioned funding to more than fifteen different broad areas such as defense, energy, and agriculture with multiple benchmarks in each category and sub-category.

In theory, the massive federal expenditure provided by ARRA will provide job opportunities across the country to various businesses and organizations that might otherwise fail due to tough economic conditions. In the long run, the hope is that ARRA's investment in infrastructure and items such as renewable energy will help modernize and strengthen the American economy.

The American Recovery and Reinvestment Act also came with its own Web site, <www.recovery.gov>, as another objective of the bill is to provide the American people with concrete, timely data regarding where ARRA's funds are being allocated. Anyone with Internet access can visit the site and discover how much money each state has been awarded, how many grants have been awarded (more than 100,000 in the first 9 months, totaling almost $140 billion), and how many jobs have been created or saved, although the accuracy of the jobs figure has been disputed by some.

ARRA AND THE SMALL BUSINESS ADMINISTRATION

Under the provisions of the ARRA, the Small Business Administration (SBA) was allocated $730 million in funds. The bulk of this funding, $630 million, was to be used to help loosen the small-business lending market and make it easier for small businesses to gain access to capital. The $630 million was divided into two segments. One portion, $255 million, went to fund the SBA's America's Recovery Capital Loan Program. These loans, also known as ARC loans, provided up to $35,000 to qualified small businesses. Small businesses receiving an ARC loan could use this money to make interest or principal payments on existing business debt.

ARC loans are designed to allow a small business to keep operating during a rough financial period, and repayment does not begin until 1 year after the final disbursement of funds. The SBA charges no fee and guarantees the loan in full. (It should be noted here that the SBA is usually not the actual lender, as some people might believe. Instead, the SBA primarily acts as an guarantor of loans). As of November 6, 2009, almost 4,000 ARC loans totaling roughly $125 million had been approved by the SBA. The ARC Loan Program was scheduled to run until September 30, 2010, or until funding is exhausted.

The other portion of the $630 million in funding $375 million was meant to increase the volume of small-business lending in a variety of ways. For instance, the funding allowed for fees to borrowers to be reduced or eliminated. The SBA has also increased the guarantee on certain loans to 90 percent (up from the usual 75 percent), made refinancing available for some SBA-backed loans, changed certain surety bond rules to allow small businesses to compete for federal contracts more effectively, and expanded loan eligibility requirements to include some 70,000 additional small businesses. The overall effect of these maneuvers was an increase in small-business lending in the eight 8 months after ARRA was passed.

While ARRA funding to the SBA illustrates a direct way in which the bill helps small businesses, most of the ARRA aid to small businesses has or will come indirectly in the form of federal contracts awarded to small businesses. For instance, in the first 9 months after the ARRA was passed, more than thirteen thousand ARRA contracts were awarded totaling more than $17 billion. There is little doubt that these contracts will provide many American firms with much-needed work, saving jobs while creating new ones as well.

OTHER PROVISIONS OF ARRA

Large amounts of ARRA funding were designed to help states make up budgetary shortfalls, as the national economic downturn left many states facing budget deficits. By September 2009, states had received roughly $48 billion in funding, with most of this money going to health care (Medicaid) and education. Overall, ARRA allocated around $90 billion for Medicaid and a similar amount for education. Around half of the education funds were to be used to help local school districts retain teachers, with the remaining funds divvied up for various projects including Head Start programs ($2.1 billion), Pell grants ($15.6 billion), and special education initiatives ($12.2 billion).

In addition to various federal contracts, many businesses stood to benefit from changes to the tax code. ARRA altered some laws to make it easier for firms to receive tax refunds, while tax credits for renewable energy were extended to 2014. Various other tax programs were aimed to help individuals as well. Tax credits were expanded in various ways for homebuyers, payroll workers, and people who make their homes more energy-efficient. By offering this last tax credit, the government hoped to weatherize one million private homes; in addition, another goal of ARRA is to weatherize 75 percent of all federal buildings.

Along with renewable energy and weatherizing, many other "green" themes can be found throughout ARRA's 407 pages. There are taxpayer credits for electric vehicles and a provision for $300 million to upgrade the government vehicle fleet with plug-in electric and hybrid motor vehicles. Billions are designated to modernize the nation's electrical grid and to assist further research into geothermal energy,

carbon capture and sequestration, and improved battery technology. The hope is that advances in these areas will yield benefits later in the twenty-first century.

Funding for research is by no means limited to just these few areas, however. The stimulus package also devotes funding to the National Aeronautics and Space Administration (NASA), various universities, the Department of Energy, the National Oceanic and Atmospheric Agency (NOAA), and the National Science Foundation. Other non-research agencies receiving ARRA allocations include the Bureau of Indian Affairs ($500 million), the Forest Service ($650 million), the National Endowment for the Arts ($50 million), and the National Cemetery Administration ($50 million).

RECOVERY.GOV AND RECOVERY.ORG

As mentioned earlier, how many jobs have been or will be saved or created by ARRA is a matter or some debate. Many political opponents of ARRA claim that the bill is simply wasteful spending that will not aid economic recovery but serve only to push the country deeper in debt. In an effort to create greater transparency within the federal government and to show the positive effects generated by ARRA, President Barack Obama appointed Earl Devaney as chairman of the Recovery Accountability and Transparency Board. An inspector general with the Interior Department, Devaney's task was to operate the <www.recovery.gov> website and track all movement of funds related to ARRA. His office received $84 million in ARRA funding to achieve its objectives.

A visit to recovery.gov does provide a wealth of data regarding ARRA spending. An interactive map allows visitors to search for grants, contacts, and loans on a national level, a state-by-state basis, or even by zip code. Contracts up for bid and awarded are published regularly, updated from another government Web site, <FedBizopps.gov>. One section of the home page lists the number of jobs created or saved, a figure that stood at 640,329 at the end of October 2009.

The created/saved jobs number is a bit problematic, however, since the number is self-reported by the recipients of the federal funds. Many errors in this figure, both large and small, have been documented since this number was released. An analysis by the *Wall Street Journal* asserted that this amount was overstated by roughly twenty thousand. In response, the White House admitted that the figure was not "100 percent accurate" but that the general trend still held true jobs were being created by ARRA's stimulus funds.

Those doubtful of the impartiality of the government's Web site can turn to <www.recovery.org>, operated by the Seattle-based firm Onvia. Onvia compiles bid solicitations from all levels of government and sells them to other companies (such as contractors) for a subscription fee. To increase awareness of its business, Onvia has operated <www.recovery.org> free of charge. Onvia's data is compiled by researchers sifting through government and contractor notices in newspapers and online. Onvia's site makes no mention of jobs saved or created, since this data rarely appears in a contract notice, if ever.

The end result, then, is two similarly named Web sites covering the exact same omnibus spending bill but with different data. For instance, the government site notes that the state of Arkansas had been awarded 1,659 grants, loans, and contracts by the end of October 2009. Onvia's site notes that Arkansas had 1,241 active recovery projects at the same point in time. One reason for this discrepancy can be found in the difference between "awarded" projects and "active" ones, since projects awarded might not have been started. However, since both sites are compiling slightly different data from different sources, it is also possible that the data from both sites will never precisely mesh, even though both places are compiling data on the same bill.

The existence of two distinct Web sites one government, one private sector tracking the same bill gives ARRA spending an unprecedented level of transparency. It does not resolve arguments about the actual data itself, however.

EFFICACY AND PARTISANSHIP

Congressional debate regarding ARRA occurred mainly along partisan lines, and its final passage happened primarily because in both Houses the Democratic majority overcame the Republican minority. Since then, debate regarding ARRA has remained fractured along these same political lines. Supporters of the bill tout the many work programs created and jobs saved, while opponents dispute the jobs number and point out instances where they believe government money is being wasted.

This short-term disagreement about ARRA could easily extend into the long-term as well. ARRA supporters will claim that the bill played a significant role in any economic recovery in the United States, while opponents will point to other factors claiming they, not ARRA, lifted the American economy out of its doldrums. Ultimately, what can be stated with certainty is that ARRA provided a large injection of federal funds into the nation's economy at a time when it was weak, and that these funds allowed many Americans to continue working at a time when unemployment was rising.

AMERICANS WITH DISABILITIES ACT (ADA)

The Americans with Disabilities Act (ADA) was signed into law by President George H. Bush on July 26, 1990. The ADA is a revolutionary piece of legislation designed to protect the civil rights of people who have physical and mental disabilities, in a manner similar to that in which previous civil rights laws have protected people of various races, religions, and ethnic backgrounds. According to the U.S. Department of Justice, the principal administrator of this law, "Barriers to employment, transportation, public accommodations, public services, and telecommunications have imposed staggering economic and social costs on American society and have undermined our well-intentioned efforts to educate, rehabilitate, and employ individuals with disabilities. By breaking down these barriers, the Americans with Disabilities Act (ADA) will enable society to benefit from the skills and talents of individuals with disabilities, will allow us all to gain from their increased purchasing power and ability to use it, and will lead to fuller, more productive lives for all Americans."

The 1990 passage of ADA aimed to provide better access to employment and services for the disabled population. The ADA mandates changes in the way that both private businesses and the government conduct business to ensure that all Americans have full access to and can fully participate in every aspect of society. The ADA requires the removal of barriers that deny individuals with disabilities equal opportunity and access to jobs, public accommodations, government services, public transportation, and telecommunications. The law applies to small companies as well as to large ones, so small-business owners must be aware of its provisions and how they affect their companies' employment practices, facilities, and products. The Equal Employment Opportunity Commission (EEOC) is the federal agency charged with enforcing the various aspects of the ADA.

The population covered by the ADA was expanded in 2008 with the passage of the ADA Amendments Act (ADAAA) of 2008, signed into law by President George W. Bush on September 25, 2008. The ADAAA went into effect on January 1, 2009. The ADAAA was passed largely in response to court rulings in disability cases that Congress determined were too narrow. It was intended to provide broader protection for disabled workers by, among other things, changing the way that the term "disabled" is interpreted. According to the EEOC, this amendment "emphasizes that the definition of disability should be construed in favor of broad coverage of individuals to the maximum extent permitted by the terms of the ADA and generally shall not require extensive analysis." The EEOC goes on to point out that the ADAAA "makes important changes to the definition of the term 'disability' by rejecting the holdings in several Supreme Court decisions and portions of EEOC's ADA regulations. The effect of these changes is to make it easier for an individual seeking protection under the ADA to establish that he or she has a disability within the meaning of the ADA."

On September 16, 2009, the EEOC approved a Notice of Proposed Rulemaking (NPRM) to bring its ADA regulations in line with the ADAAA.The EEOC conducted a public comment period between September 23 and November 23, and the EEOC and the Department of Justice's Civil Rights Division offered four full-day Town Hall Listening Sessions to obtain input from the business, disabled, and disabled-advocacy communities. As of early 2010, the EEOC was evaluating the comments received and making revisions to the NPRM in preparation for issuing final regulations.

THE DISABLED POPULATION

According to the U.S. Census Bureau"s 2008 report, about one in five U.S. residents 54.4 million Americans reported some level of disability in 2005. This is roughly equal to the combined total populations of California and Florida. The last total tally of the population conducted by the 2000 Census enumerated a disabled population of 49.7 million people (19.3 percent of the population aged five or over). A further subdivision showed that 5.8 percent of those aged five to fifteen, 18.6 percent of those sixteen through sixty-four, and 41.9 percent of those aged sixty-five

and over had some disability. The census provided four main categories of disability. Those with *physical* disabilities were 8.2 percent of the population aged five or older (21.2 million physically handicapped); *mentally* disabled were 4.8 percent of population (12.4 million), those with *sensory* handicaps were 3.6 percent (9.3 million), and those unable to provide *self-care* were 2.6 percent of the total population (6.8 million actual cases).

As defined in the ADA, the term "disability" applies to three categories of individuals: 1) people who have a physical or mental impairment that substantially limits one or more major life activities; 2) people who have a record of an impairment which substantially limits major life activities; and 3) people who may be regarded by others as having such an impairment. For an employee or job applicant to be protected by the ADA, an individual must be "disabled" in one or more of the above manners, be "otherwise qualified" for the position, and be able to perform the essential functions of the job, "with or without accommodation."

The ADAAA impacted interpretation of these terms in several significant ways by:

1. directing EEOC to revise that portion of its regulations defining the term "substantially limits"
2. expanding the definition of "major life activities"
3. clarifying that an impairment that is episodic or in remission is a disability if it would substantially limit a major life activity when active
4. changing the definition of "regarded as" so that it no longer requires a showing that the employer perceived the individual to be substantially limited in a major life activity, and instead says that an applicant or employee is "regarded as" disabled if he or she is subject to an action prohibited by the ADA based on an impairment that is not transitory and minor.

PROVISIONS OF THE ADA

The legal structure of the ADA is based on the Civil Rights Act of 1964 and the Rehabilitation Act of 1973. The ADA uses concepts of disability, accessibility, and employment which were introduced in the Architectural Barriers Act of 1968 and the Rehabilitation Act of 1973. These two federal laws were the predecessors of the ADA that mandated a level of accessibility in federally funded buildings and programs. The ADA expanded the requirements of accessibility to the new and existing facilities of privately funded companies for the first time.

The ADA consists of five separate parts or titles: Title I relates to employment; Title II concerns public services; Title III pertains to public accommodations and commercial facilities; Title IV refers to telecommunications; and Title V covers miscellaneous other items.

Title I of the ADA prohibits discrimination in employment against qualified individuals with disabilities. For companies with twenty-five or more employees, the requirements became effective on July 26, 1992. For employers with between fifteen and twenty-four workers, the requirements became effective on July 26, 1994.

Title II of the ADA prohibits discrimination in programs, services, or activities of public entities (state and local governments), including public transportation operated by public entities. The provisions of Title II which do not involve public transportation became effective on January 26, 1992.

Title III, pertaining to public accommodations and commercial facilities, requires that private businesses that are places of "public accommodation" including restaurants, health clubs, department stores, convenience stores and specialty shops, and hotels and motels allow individuals with disabilities to participate equally in the goods and services that they offer. This title also requires that all future construction of commercial facilities including office buildings, factories, and warehouses and places of public accommodation be constructed so that the building is accessible to individuals with disabilities.

Title III also mandates modifications in policies, practices, and procedures. Commercial businesses and places of public accommodation are required to provide auxiliary aids and services, and to make accessible transportation available when transportation services are offered. In addition, companies are required to remove architectural and communications barriers and to comply with ADA in any ongoing or new construction. The Act stipulates that all fixed-route or on-demand transportation services such as hotel-to-airport and other shuttle services be accessible to persons in wheelchairs and other disabled individuals.

Title IV of the ADA requires telephone companies to make relay services available for persons with hearing and speech impairments.

Title V ties the ADA to the Civil Rights Act of 1974 and its amendments. It includes a variety of miscellaneous legal and technical provisions, including one that stipulates that the ADA does not override or limit the remedies, rights, or procedures of any federal, state, or local law which provides greater or equal protection for the rights of individuals with disabilities.

The ADA draws an important distinction between the terms "reasonable accommodations" and "readily achievable." For small businesses and other employers, no modifications to their facilities must be undertaken to fulfill the requirements of the ADA until a qualified individual with a disability has been hired. At that point, "reasonable accommodations" must be made unless they impose a significant difficulty or expense. In contrast, the terminology "readily achievable" refers to business obligations to clients or guests

and applies to actions that can be accomplished without much difficulty or expense. "Readily achievable" modifications must be made in anticipation of a disabled guest's or client's needs, before he or she ever arrives on the premises.

Compliance with the various provisions of the Americans with Disabilities Act also lies with both landlord and tenant, so either or both parties may be held legally liable for violations of the ADA. Assignation of ADA responsibilities is generally made via the lease agreement. Small- business owners who lease their office space or other place of business, then, should examine these agreements closely.

BUSINESS OBLIGATIONS UNDER ADA

The portion of the Americans with Disabilities Act that most directly relates to business obligations to disabled customers is Title III, dealing with public accommodations. Title III requires that private businesses open to the public including retail establishments, restaurants, and hotels and motels give individuals with disabilities the same access to their goods and services that nondisabled customers enjoy. This section of the ADA also requires that all future construction of commercial facilities, including office buildings, factories, and warehouses, as well as places of public accommodation, be constructed so that the building is accessible to individuals with disabilities.

ADA places Title III requirements on businesses of all sizes. These, principally, are: 1) to modify policies and practices that discriminate against the disabled; 2) to comply with access design standards when modifying existing or building new structures; 3) to remove existing barriers in existing structures where easily achievable; and 4) to provide auxiliary aids and service to ensure effective communication with those who have hearing, sight, or speech impairments.

Modified Policies. Examples of modified policies include accommodating guide dogs in stores that would not otherwise permit pets or always keeping open a checkout counter capable of handling wheelchairs. The law specifically mentions specialists in diseases who in the past, evidently, refused to treat disabled persons with those diseases; now such selectivity is prohibited as a policy.

Access Standards. Many people still believe that the central issue of ADA is access to buildings. That is certainly an important element of the law, but it is not the only one. Since 1992 building modification has been aided by the *ADA Standards for Accessible Design*, a ninety-two-page document which clearly describes accommodations to newly built or altered buildings. The first fifty-eight pages deal in detail with external facilities such as parking accommodations and internal access and accommodation matters applicable to any facility, such as walkways, support rails, access to shelving, toilet facilities, communications devices, and many more areas of contact between people and structural facets. The remaining pages specify requirements unique to restaurants and cafeterias, medical care facilities, business and mercantile structures, libraries, accessible transient lodgings, and transportation facilities.

Removal of Barriers. A public accommodation is required to remove architectural barriers in existing facilities, including communication barriers that are structural in nature, where the removal is readily achievable, that is, it can be accomplished easily and can be carried out without much difficulty or expense. The law lists twenty-one examples, as follows:

1. Installing ramps
2. Making curb cuts in sidewalks and entrances
3. Repositioning shelves
4. Rearranging tables, chairs, vending machines, display racks, and other furniture
5. Repositioning telephones
6. Adding raised markings on elevator control buttons
7. Installing flashing alarm lights
8. Widening doors
9. Installing offset hinges to widen doorways
10. Eliminating a turnstile or providing an alternative accessible path
11. Installing accessible door hardware
12. Installing grab bars in toilet stalls
13. Rearranging toilet partitions to increase maneuvering space
14. Insulating lavatory pipes under sinks to prevent burns
15. Installing a raised toilet seat
16. Installing a full-length bathroom mirror
17. Repositioning the paper towel dispenser in a bathroom
18. Creating designated accessible parking spaces
19. Installing an accessible paper cup dispenser at an existing inaccessible water fountain
20. Removing high-pile, low-density carpeting
21. Installing vehicle hand controls

Where such accommodations are difficult to achieve, work-arounds are permissible, such as providing help for reaching shelves or allowing a multiscreen theater, where it is not possible to provide access to all screens, to meet the law by rotating the films shown so that each appears on one of the screens accessible to wheelchair-bound customers.

Auxiliary Aids and Services. Auxiliary aids and services are intended to give customers or clients access to commercial and other services despite their disabilities. An example is to provide instructions in Braille and large print, telecommunications devices for the deaf, and other means to help communications. The service provider may be exempted from such requirements if he or she can prove that doing so would fundamentally alter the nature of the enterprise or would impose a significantly large expense.

The small-business owner is well advised to make the necessary effort to examine his or her compliance with ADA. The ADA is the law of the land. Its requirements under Title III are sometimes difficult but certainly achievable. They ultimately relate to making goods on display accessible to all, be they disabled or not. Making them so must, ultimately, be good for business. Gathering information on compliance is relatively easy. Both the EEOC and the Department of Justice provide extensive information on compliance in government publications and on their Web sites. Additional Web guidance aimed at making business compliance easier to understand and achieve is provided by groups such as Business & Legal Resources.

THE ADA AND THE MENTALLY DISABLED

The fastest-growing area of legal activity relating to the Americans with Disabilities Act concerns mentally disabled employees. Claims that businesses failed to accommodate their employees' psychological problems according to the provisions of the ADA grew rapidly in the late 1990s but stabilized in the early years of the 2000s at around 13 to 14 percent of all ADA claims received by the Equal Employment Opportunity Commission. Under the original language of the ADA, the Act applied a higher standard for legal redress to individuals whose disabilities stemmed from "any mental or psychological disorder." But legislative efforts to eliminate this higher standard have intensified in recent years.

Problems associated with mentally disabled employees may include workplace socialization difficulties, limited stamina, irregular attendance, difficulty dealing with stress or criticism, and limited attention spans. But many experts in both the mental health and business fields insist that the mentally disabled can be valuable additions to the workforce if companies provide appropriate accommodations.

One valuable tool that business owners and managers can utilize in establishing and maintaining a productive work environment for mentally disabled employees is the EEOC Enforcement Guidance, a comprehensive legal guidebook issued in 1997. As *Business Horizons* points out, the Guidance stipulates that "traits or behaviors are not, in themselves, mental impairments. This means that stress does not automatically indicate a mental impairment, although it may be a symptom. Similarly, such traits as irritability, chronic lateness, and poor judgment are not, in themselves, mental impairments, although they may be linked to them." Legitimate mental disabilities do, however, include major depression, bipolar disorder, various anxiety disorders, schizophrenia, mental retardation, and special learning disorders.

Under the ADA, companies employing mentally disabled individuals are not responsible for every aspect of the employees' behavior. For instance, they are not required to relieve employees of work responsibilities or excuse them from violations of established work policies. Nor are they required to employ workers who are deemed a safety threat. Moreover, employers are not legally responsible for mental disabilities of which they are unaware.

But employers are required under ADA law to make "reasonable accommodations" for mentally disabled employees. These may include leaves of absence; minor modifications in work policy, supervision, or job position; or flexible work schedules. "Although the nature or form of accommodation is up to the employer, and is only 'reasonable' if it helps the employee do a better job, in some instances the employer might wish to consider professional assistance in the communication process," wrote Robert Schwartz, Frederick Post, and Jack Simonetti in *Business Horizons*. "Managers should also verify that the condition qualifies as a psychiatric disability and whether the person can perform the job's essential functions with or without accommodation. Management can request reasonable documentation from a health care professional about the disability and the need for accommodations."

Compliance with the ADA's mental disability provisions can help companies retain productive employees and protect themselves from legal peril. But "even beyond mere compliance, socially responsible businesses may elect to embrace these legal mandates as changes that advance the common good of society," noted Schwartz, Post, and Simonetti. "By doing so, they would be helping millions of mentally ill citizens become gainfully employed and saving society billions of government dollars spent supporting the presently unemployed mentally ill."

THE ADA IN PRACTICE

Since the Americans with Disabilities Act was signed into law in 1990, its provisions, enforcement measures, and effectiveness have all come under scrutiny. Supporters have credited the ADA with improving the quality of life of millions of disabled citizens and opening new economic opportunities for disabled workers across the nation. In addition, C. C. Sullivan noted in *Building Design and Construction* that "the landmark civil rights law changed the way U.S. businesses and institutions understand the rights and abilities of disabled citizens." But Sullivan also voiced a common lament among business owners and managers that "the ADA's open-ended, murky language has been a decade-long minefield of confusion and

litigation." Indeed, even supporters of the Act admit that efforts to clarify various provisions of the ADA now underway are needed to reduce litigation.

Critics of the ADA in its current incarnation at least also note that employment among people with disabilities was lower in the late 1990s, a period of great economic expansion in the United States, than it was when it was passed in 1990. Measuring unemployment is a difficult task in the best of conditions. Measuring the unemployment rate for disabled people is more difficult yet. People often stop looking for employment after an extended and unsuccessful search. The act of giving up on job searching removes a person from the rolls of the unemployed. The most recent data available on the unemployment rate for disabled people dates back to 2000 when, according to the U.S. Department of Labor, the rate at which disabled Americans were unemployed stood at approximately 30 percent, more than six times higher than the nation's overall unemployment rate.

Some observers attribute these high rates of unemployment, a decade after the ADA passed, to lax ADA compliance and enforcement efforts by federal agencies charged with seeing that the Act's provisions are carried out. Another factor contributing to the seemingly negligible impact of the ADA on employment rates for disabled people has to do with demographics. As the large baby boom generation ages, many of its members are dropping out of the workforce before the age of retirement. Of these, a very large percentage is departing the workforce based on disability, according to a 2004 Congressional Budget Office report on the subject titled *Disability and Retirement: The Early Exit of Baby Boomers from the Labor Force.*

Whatever difficulties exist in tracking and measuring the benefits that the ADA has had on increasing accessibility for disabled Americans, attention has been drawn to the subject of disability in American society. Across the society, efforts to comply with the law are being made, in the private sector as well as the public sector, by small organizations as well as large. As time passes and data are collected, more analysis of how effective efforts have been to integrate disabled Americans more thoroughly into all aspects of social life will be possible.

AMORTIZATION

Amortization is an accounting practice whereby expenses or charges are accounted for as the useful life of the asset is consumed or used rather than at the time they are incurred. Amortization includes such practices as depreciation, depletion, write-off of intangibles, prepaid expenses and deferred charges. By amortizing an asset or liability the value of the item is reduced gradually over time by some periodic amount (i.e., via installment payments). In the case of an asset, it involves expensing the item over the "life" of the item the time period over which it can be used. For a liability, the amortization takes place over the time period that the item is repaid or earned. Amortization is essentially a means to allocate categories of assets and liabilities to their pertinent time period.

AMORTIZATION AND DEPRECIATION

The key difference between depreciation and amortization is the nature of the items to which the terms apply. The former is generally used in the context of tangible assets, such as buildings, machinery, and equipment. The latter is more commonly associated with intangible assets, such as copyrights, goodwill, patents, and capitalized costs (e.g., product development costs). On the liability side, amortization is commonly applied to deferred revenue items such as premium income or subscription revenue (wherein cash payments are often received in advance of delivery of goods or services), and therefore must be recognized as income distributed over some future period of time.

THE PERIOD CONCEPT

Amortization is a means by which accountants apply the period concept in accrual-based financial statements: income and expenses are recorded in the periods affected, rather than when the cash actually changes hands. The importance of spreading transactions across several periods becomes clearer when considering long-lived assets of substantial cost. Just as it would be inappropriate to expense the entire cost of a new facility in the year of its acquisition since its life would extend over many years, it would be wrong to fully expense an intangible asset only in the first year. Intangible assets such as copyrights, patents, and goodwill can be of benefit to a business for many years, so the cost of accruing such assets should be spread over the entire time period that the company is likely to use the asset or generate revenue from it.

The periods over which intangible assets are amortized vary widely, from a few years to as many as 40 years. In his 2009 book, *Fair Value Measurements: Practical Guidance and Implementation*, Mark Zyla wrote, "The determination of an intangible asset's useful life is an important consideration in measuring the fair value of the asset in financial reporting. Intangible assets with longer lives typically have greater economic returns, which creates a higher value than shorter-lived assets." The costs incurred with establishing and protecting patent rights, for example, are generally amortized over 17 years. The general rule is that the asset should be amortized over its useful life. Small-business owners should realize, however, that not all assets are consumed by their use or by the passage of time, and thus are not subject to amortization or depreciation. The value of land, for example, is generally not degraded by time or use. In fact, the value of land often increases with time. This applies to intangible assets as well; trademarks can have indefinite lives and can increase in value over time, and thus are not subject to amortization.

The term amortization is also used in connection with loans. The amortization of a loan is the rate at which the principal balance will be paid down over time, given the term and interest rate of the note. Shorter note periods will have higher amounts amortized with each payment or period.

RESPONSE TO HOUSING MARKET CRISIS

In response to problems in the housing market that began with the 2008 economic crisis, the administrations of presidents George W. Bush and Barack Obama both attempted to reduce foreclosures by various methods, including re-amortization to restructure lower payments for homeowners potentially facing foreclosure. The practice of restructuring payments lower than the full amount due is called "negative amortization." There have also been calls to use a re-amortization process to help financial institutions climb out of the balance-sheet problems they have faced since the 2008 recession began.

"ANGEL" INVESTORS

Angel investors are wealthy individuals who provide capital to help entrepreneurs and small businesses succeed. They are known as "angels" because they often invest in risky, unproven business ventures for which other sources of funds such as bank loans and formal venture capital are not available. New start-up companies often turn to the private equity market for seed money because the formal equity market is reluctant to fund risky undertakings. In addition to their willingness to invest in a start-up, angel investors may bring other assets to the partnership. They are often a source of encouragement, they may be mentors in how best to guide a new business through the start-up phase, and they are often willing to do this while staying out of the day-to-day management of the business. These individuals want to invest in up-and-coming new companies not only to earn money, but also to provide a resource

that would have been helpful to them in the early stages of their own businesses. In many cases, the investors sit on the boards of the companies they fund and provide valuable, firsthand management advice.

Wealthy private investors provide American small businesses with the majority of their seed money. According to Jeffrey Sohl, the director of the Center for Venture Research at the University of New Hampshire, in 2009 there were an estimated 260,500 active angels in the United States. Outside of the money an entrepreneur saved or money from family and friends, such angels constituted the largest source of start-up capital for small businesses. The credit crisis that began in 2008 made angel investors even more important to start-ups and small businesses as bank lending dried up. Angel investors were called on to fill the funding gap caused by banks' reluctance to make anything other than the safest bets on loans.

Like other providers of venture capital, angel investors generally tend to invest in private start-up companies with a high profit potential. In exchange for their funds, they usually require a percentage of equity ownership of the company and some measure of control over its strategic planning. Due to the highly speculative nature of their investments, angels eventually hope to achieve a high rate of return. Angels have been given tax breaks to encourage their investments. Section 1202 of the tax code allows angels to exclude half the profits from certain small-business investment. In 2009, these tax breaks were increased in an attempt to jump-start investor interest in this provision. In February 2009, Congress increased the tax exclusion from 50 percent to 75 percent until January 2011.

For many entrepreneurs, angels include friends, relatives, acquaintances, and business associates. Nearly 90 percent of small businesses are started with this type of financial help. Some entrepreneurs gain access to angel investors through venture capital networks informal organizations that exist specifically to help small businesses connect with potential investors, and visa versa. The networks which may take the form of computer databases or document clearinghouses basically provide "matchmaking" services between people with good business ideas and people with money to invest.

Angel Capital Association (ACA) is a peer organization of angel investing groups from across North America. The ACA has a Web site that provides information about best practices and offers links to local angel investor groups.

TYPES OF ANGELS

Although an angel can seem like the answer for an entrepreneur who is desperate for capital, it is important to evaluate the person's motives for investing and need for involvement in the day-to-day operations of the business before entering into a deal. Knowing how to recruit the right angel, one who shares the entrepreneur's goals and objectives, and maintaining an open, communicative relationship with the angel can mean the difference between a solid financial foundation and a failing venture.

In an article for *Entrepreneur*, David R. Evanson and Art Beroff described several basic personality types that tend to characterize angel investors. "Corporate angels" are former executives from large companies who have been downsized or have taken early retirement. In many cases, these angels invest in only one company and hope to turn their investment into a paid position. "Entrepreneurial angels" are individuals who own and operate their own successful businesses. In many cases, they look to invest in companies that provide some sort of synergy with their own company. They rarely want to take an active role in management, but often can help strengthen a small business in indirect ways.

"Enthusiast angels" are older, independently wealthy individuals who invest as a hobby. As a result, they tend to invest small amounts in a number of different companies and not become overly involved in any of them. "Micromanagement angels," in contrast, usually invest a large amount in one company and then seek as much control over its operations as possible. "Professional angels" are individuals employed in a profession such as law, medicine, or accounting who tend to invest in companies related to their areas of expertise. They may be able to provide services to the company at a reduced fee, but they may also tend to be impatient investors. Evanson and Beroff stress that understanding the needs of various types of investors can help entrepreneurs to develop positive working relationships.

ANGEL GROUPS OR FUNDS

Although angel investors usually work on an individual basis there has been a trend toward the formation of angel investor groups. These groups usually meet on a regular basis and invite prospective entrepreneurs to present their business ideas for consideration. David Worrell discussed what such a presentation may involve in his article titled "Taking Flight: Angel Investors are Flocking Together to Your Advantage." If invited to present ideas before an angel investor group, "expect to be one of two or three presenters, each given 10 to 30 minutes to showcase an investment opportunity. Speak loudly, as most groups mix presentations with a meal."

Despite the potential for funding through an angel investor group, according to Worrell, individual angels are still likely to be the best source of seed and early stage money for a small business or start-up. "Angel groups can bring more money and other resources, which makes them more effective at later stages."

AVOIDING POTENTIAL PROBLEMS

Regardless of the type of angel a small-business owner is able to recruit, there are a number of methods available to help avoid potential problems in the relationship. Entrepreneurs

should, for example, be very frank and honest when describing their business idea to a potential investor. Entrepreneurs should also interview potential investors to be sure that their goals, needs, and styles are a good fit with the small business. It is important to ask questions of potential investors and listen to their answers in order to gauge their needs and interests. Ideally, the angels' investment approach will be compatible with the entrepreneur's needs. A partnership between angels and entrepreneurs is much like a marriage involving issues of compatibility, cash, and shared goals.

ANNUAL PERCENTAGE RATE (APR)

The annual percentage rate (APR) is the effective rate of interest that is charged on an installment loan, such as those provided by banks, retail stores, and other lenders. Since the enactment of the Truth in Lending Act in 1969, lenders have been required to report the APR in boldface type on the first page of all loan contracts. The truth in lending law requires lenders to disclose in great detail the terms and conditions that apply to consumers when they borrow. Its purpose is to allow consumers who are shopping for credit to compare different offers on the same basis, to compare "apples with apples." In the absence of legal requirements to state interest rate calculations clearly on all loan contracts, it would be possible for a lender to misrepresent the interest rate of a loan through the use of different compounding periods. By insisting upon a clear statement of the APR on loan contracts, the truth in lending law has gone a long way towards eliminating interest rate confusion. However, the APR can be calculated in different ways and can sometimes cause rather than eliminate confusion.

LOANS AND INTEREST RATES

A loan is the purchase of the present use of money with the promise to repay the amount in the future according to a pre-arranged schedule and at a specified rate of interest. Loan contracts formally spell out the terms and obligations between the lender and borrower. Loans are by far the most common type of debt financing used by small businesses. The interest rate charged on the borrowed funds reflects the level of risk that the lender undertakes by providing the money. For example, a lender might charge a start-up company a higher interest rate than it would a company that had shown a profit for several years. The interest rate also tends to be higher on smaller loans, since lenders must be able to cover the fixed costs involved in making the loans.

The lowest interest rate charged by lenders which is offered only to firms that qualify on the basis of their size and financial strength is known as the prime rate. All other types of loans feature interest rates that are scaled upward from the prime rate. Interest rates vary greatly over time, depending on lending policies set forth by the Federal Reserve Board as well as prevailing economic conditions in the nation. For all but the simplest of loans, the nominal or stated rate of interest may differ from the annual percentage rate or effective rate of interest. These differences occur because loans take many forms and cover various time periods. The effect of compounding and the addition of fees may also affect the APR of a loan.

Due to the credit crisis which started in 2008, it became increasingly difficult for small businesses to get bank loans even with the Federal Reserve maintaining some of the lowest interest rates in its history to stimulate borrowing and lending. One of the goals of the rescue and stimulus measures passed by Congress in 2008 and 2009 was to provide more opportunities for borrowing and more money for lending to small businesses. Despite these efforts, which included the disbursement of billions of dollars to large banks under the government's Troubled Asset Relief Program (TARP), the amount of money lent to small businesses decreased in 2009. In December 2009 President Barack Obama urged banks to reconsider small businesses they had rejected for loans. According to the *Wall Street Journal*, many large banks then "announced more generous small-business loan targets for 2010. Bank of America offered to increase its lending to small- and medium-sized businesses by $5 billion next year.

Separately, JPMorgan Chase set its small-business lending goal at $10 billion, while Wells Fargo, the nation's largest small business lender, said it would lend up to a whopping $16 billion in 2010."

CALCULATING THE APR

The effective rate of interest on a loan can be defined as the total interest paid divided by the amount of money received. For simple interest loans in which the borrower receives the face value of the loan and repays the principal plus interest at maturity the effective rate and the nominal rate are usually the same. As an example, say that a small-business owner borrows $10,000 at 12 percent for 1 year. The effective rate would thus be $1,200 / $10,000 = 12 percent, the same as the stated rate.

But the effective rate would be slightly different for a discount interest loan, wherein the interest is deducted in advance so the borrower actually receives less than the face value. Using the same example, the small business owner would pay the $1,200 interest up front and receive $8,800 upon signing the loan contract. In this case, the effective interest rate would be $1,200 / $8,800 = 13.64 percent.

The most problematic differences between the nominal and effective rates of interest occur with installment loans. In this type of loan, the interest is calculated based on the nominal rate and added back in to get the face value of the loan. The loan amount is then repaid in equal installments during the loan period. Using the same example, the small-business owner would sign for a loan with a face value of $11,200 and would receive $10,000. Since the loan is repaid in monthly installments, however, the business owner would not actually have use of the full loan amount over the course of the year. Instead, assuming twelve equal installments, the business owner would actually have average usable funds from the loan of $5,000. The effective rate of the loan is thus $1,200 / $5,000 = 24 percent, twice the stated rate of the loan.

True APR calculations should also include any up-front fees or penalties that are applied to a loan. These amounts are totaled and added to the interest figure. In the case of mortgage loans, such charges can be significant. They might, for example, include a mortgage insurance premium, points, lost interest earnings on escrow accounts, and prepayment penalties.

ANNUAL REPORTS

Annual reports (AR) are formal financial statements that are published yearly and sent to company stockholders and various other interested parties. The reports assess the year's operations and discuss the company's view of the upcoming year and the company's place and prospects. Both for-profit and not-for-profit organizations produce annual reports.

Annual reports have been a Securities and Exchange Commission (SEC) requirement since 1934 for businesses owned by the public. Companies meet this requirement in many ways. At its most basic, an annual report includes:

- General description of the industry or industries in which the company is involved.
- Audited statements of income, financial position, cash flow, and notes to the statements providing details for various line items.
- A management's discussion and analysis (MD&A) of the business's financial condition and the results that the company has posted over the previous two years.
- Brief description of the company's business in the most recent year.
- Information related to the company's various business segments.
- Listing of the company's directors and executive officers, as well as their principal occupations, and, if a director, the principal business of the company that employs him or her.
- Market price of the company's stock and dividends paid.

Some companies provide only this minimum amount of information. Annual reports of this type usually are only a few pages in length and produced in an inexpensive fashion. The final product often closely resembles a photocopied document. For these companies, the primary purpose of an annual report is simply to meet legal requirements.

ANNUAL REPORT AS MARKETING TOOL

Many other companies, however, view their annual report as a potentially effective marketing tool to disseminate their perspective on company fortunes. Since the 1990s marketing and design firms have been increasingly involved in the production of annual reports as firms realize the marketing potential of annual reports. As the design firm of Curran & Connors notes in its own marketing materials aimed at generating annual report business, "Annual reports are as distinct as the stories they tell" and they should " effectively connect with stakeholders, clearly communicate messages and value drivers, and build trust and support." With these principles in mind, many medium-sized and large companies devote large sums of money to making their annual reports as attractive and informative as possible. In such instances the annual report becomes a forum through which a company can relate, influence, preach, opine, and discuss any number of issues and topics.

An opening "Letter to Shareholders" often sets the tone of annual reports prepared for publicly held companies. The contents of such letters typically focus on topics such as the past year's results, strategies, market conditions, significant business events, new management and directors, and company initiatives. The chairman of the board of directors, the chief executive officer (CEO), the president, the chief operating officer or a combination of these four usually sign the letter on behalf of company management. Some of these letters may run a dozen or more pages and include photographs of the CEO in different poses (some even expound on topics that, while perhaps of only tangential interest to stockholders and other readers, are of importance to the CEO). More often, however, these letters are significantly shorter, amounting to 3,000 words or fewer.

Annual reports usually advance a theme or concept that has been embraced by company management and/or its marketing wings. Catch phrases such as "Poised for the Twenty-first Century" or "Meeting the Needs of the Information Age" can unify a company's annual report message. In addition, particular events or economic conditions of a given year may be incorporated into the themes advanced in an annual report. Companies also use milestone anniversaries including industry as well as company anniversaries in their annual reports. Promoting a long, successful track record is often appealing to shareholders and various audiences, for it connotes reliability and quality. Still other companies have developed a tried-and-true format that they use year after year with little change except updating the data. Whatever the theme, concept, or format, the most successful reports are ones that clearly delineate a company's strategies for profitable growth and cast the firm in a favorable light.

With the increasing importance of the Internet in the 2000s, marketing and design firms have been pushing companies to adopt online annual reports to supplement their print reports. However, online annual reporting continues to be seen as a lesser marketing tool by companies and AR analysts. As the *AR Trends 2007* notes, "Print remains more invasive than the web. It can have more impact. It's easier to use. And a printed report invites leisurely reading. As designers, writers and communication consultants we strongly believe a well written, well designed report remains at the heart of an effective investor relations program."

TARGET AUDIENCES FOR ANNUAL REPORTS

Current shareholders and potential investors remain the primary audiences for annual reports. Employees (who today are also likely to be shareholders), customers, suppliers, community leaders, and the community-at-large are also targeted audiences.

Employees. The annual report serves many purposes with employees. It provides management with an opportunity to praise employee innovation, quality, teamwork, and commitment, all of which are critical components in overall business success. In addition, an annual report can also be used as a vehicle to relate those company successes a new contract, a new product, cost-saving initiatives, new applications of products, expansions into new geographies that have an impact on its work force. Seeing a successful project or initiative profiled in the annual report gives reinforcement to the employees responsible for the success.

The annual report can help increase employee understanding of the different parts of the company. Many manufacturing locations are in remote areas, and an employee's understanding of the company often does not go beyond the facility where he or she works. An annual report can be a source for learning about each of a company's product lines, its operating locations, and who is leading the various operations. The annual report can show employees how they fit into the "big picture."

Employees also are often shareholders. So, like other shareholders, these employees can use the annual report to help gauge their investment in the company. In this case, the annual report can serve as a reminder to employees of the impact that the work they do has on the value of the company's stock value.

Customers. Customers want to work with quality suppliers of goods and services, and an annual report can help a company promote its image with customers by highlighting its corporate mission and core values. Describing company initiatives designed to improve manufacturing processes, reduce costs, create quality, or enhance service can also illustrate a company's customer orientation. Finally, the annual report can also show the company's financial strength. Customers are reducing their number of suppliers, and one evaluation criterion is financial strength. They want

committed and capable suppliers that are going to be around for the long term.

Suppliers. A company's abilities to meet its customers' requirements will be seriously compromised if it is saddled with inept or undependable suppliers. Successful companies quickly weed out such companies. By highlighting internal measurements of quality, innovation, and commitment, annual reports can send an implicit message to suppliers about the company's expectations of outside vendors. Sometimes an annual report will even offer a profile of a supplier that the company has found exemplary. Such a profile serves two purposes. First, it rewards the supplier for its work and serves to further cement the business relationship. Second, it provides the company's other suppliers with a better understanding of the level of service desired (and the rewards that can be reaped from such service).

The Community. Companies invariably pay a great deal of attention to their reputation in the community or communities in which they operate, for their reputations as corporate citizens can have a decisive impact on bottom-line financial performance. A company would much rather be known for its sponsorship of a benefit charity event than for poisoning a local river, whatever its other attributes. Annual reports, then, can be invaluable tools in burnishing a company's public image. Many annual reports discuss community initiatives undertaken by the company, including community renovation projects, charitable contributions, volunteer efforts, and programs to help protect the environment. The objective is to present the company as a proactive member of the community.

This sort of publicity also can be valuable when a company is making plans to move into a new community. Companies seek warm welcomes in new communities (including tax breaks and other incentives). Communities will woo a company perceived as a "good" corporate citizen more zealously than one that is not. The good corporate citizen also will receive less resistance from local interest groups. The company's annual report will be one document that all affected parties will pore over in evaluating the business.

READING AN ANNUAL REPORT

People read annual reports for widely different purposes and at dramatically different levels. Generalizations, however, are difficult. The stockholder with five shares might be as careful and discriminating a reader of an annual report as the financial analyst representing a firm owning one million shares.

It may require an MBA to understand all the details buried in an annual report's footnotes. Nevertheless, a good understanding of a company is possible by focusing on some key sections of the report.

Company Description. Most companies will include a description of their business segments that includes products and markets served. Formats vary from a separate fold-out descriptive section to a few words on the inside front cover. A review of this section provides readers with at least a basic understanding of what the company does.

The Letter. Whether contained under the heading of Letter to Shareholders, Chairman's Message, or some other banner, the typical executive message can often provide some informative data on the company's fortunes during the previous year and its prospects for the future. Readers should always bear in mind that it is invariably in the executive's best interests to maintain a fundamentally upbeat tone, no matter how troubled the company may be. This is often the most widely read portion of the entire annual report, so business owners and managers should make a special effort to make it both informative and engaging.

For example, in Microsoft's 2009 annual report, it was apparent that the financial crisis that year affected the company, but the CEO, Steven Ballmer, was quick to point out the positive highlights. The following are the first two sentences of the shareholder letter:

> A worldwide economic recession that created the most difficult business environment since the Great Depression made fiscal 2009 a challenging year for Microsoft Corp. But thanks to our fiscal strength and prudent approach to investment, a strong pipeline of products, and a renewed focus on efficiency, we responded to the changing economic environment with speed and success.

Management's Discussion and Analysis (MD&A). This section of an annual report provides, in a fairly succinct form, an overview of the company's performance over the previous 3 years. It makes a comparison of the most recent year with prior years. It discusses sales, profit margins, operating income, and net income. Factors that influenced business trends are outlined. Other portions discuss capital expenditures, cash flow, changes in working capital, and anything "special" that happened during the years under examination. The MD&A is also supposed to be forward-looking, discussing anything the company may be aware of that could affect results either positively or negatively. An MD&A can be written at different levels of complexity, but business consultants generally urge companies to make the information from balance sheets to management analysis comprehensible and accessible to a general readership. This means forsaking jargon and hyperbole in favor of clear and concise communication.

Financial Summary. Most companies will include a 5-, 6-, or 11-year summary of financial data. Sales, income, dividends paid, shareholders' equity, number of employees, and many other balance sheet items are included in this summary. This

section summarizes key data from the statements of income, financial position, and cash flow for a number of years.

Management/Directors. A page or more of an annual report will list the management of the company and its board of directors, including their backgrounds and business experience.

Investor Information. There almost always is a page that lists the company's address and phone number, the stock transfer agent, dividend and stock price information, and the next annual meeting date. This information is helpful for anyone wanting additional data on the company or more information about stock ownership.

PACKAGING THE ANNUAL REPORT

For most companies, large or small, the financial information and the corporate message are the most important aspects of an annual report. Many companies also want to be sure, however, that their targeted audiences are going to read and understand the message. This is less essential for privately owned businesses that do not need to impress or soothe investors, but they too recognize that disseminating a dry, monotonous report is not in the company's best interests.

The challenge for producers of annual reports is to disseminate pertinent information in a comprehensible fashion while simultaneously communicating the company's primary message. In many ways the annual report serves as an advertisement for the company, a reality that is reflected in the fact that leading business magazines now present awards to company reports deemed to be of particular merit. In recent years, companies have also chosen to make their annual reports available in a variety of electronic media that lend themselves to creative, visually interesting treatments.

Of course, the personality of the company and perhaps most importantly, the industry in which it operates will go a long way toward dictating the design format of the annual report. The owner of a manufacturer of hospital equipment is far less likely to present a visually dramatic annual report to the public than are the owners of a chain of suntanning salons. The key is choosing a design that will best convey the company's message.

SUMMARY ANNUAL REPORTS

Few major trends have shaken the tradition of annual reports, but one is the "summary annual report." In 1987 the SEC eased its annual reporting requirements. It allowed companies to produce a summary annual report, rather than the traditional report with audited statements and footnotes. Public disclosure of financial information was still required, but with the new rulings, filing a Form 10-K provided it contained this information and included audited financial data and other required material within a company's proxy statement (another SEC-mandated document for shareholders) met SEC requirements. Promoters of the summary annual report see it as a way to make the annual report a true marketing publication without the cumbersome, detailed financial data.

In some respects, annual reports are like fashions. Certain techniques, formats, and designs are popular for a few years and then new ideas displace the old. Several years later, the old ideas are back in vogue again. Other formats are "classic," never seeming to go out of style or lose their power. A key to a successful annual report is not getting caught up in a trend but deciding what works best for conveying the message.

With the corporate accounting scandals of the early 2000s and the financial crisis that began in 2008, critics have pointed out that corporate executive teams have not been providing shareholders with sufficient information and that the government has not been investigating illegal behavior vigorously enough. Shareholder-advocacy groups have begun advocating for more full disclosure, including information about executive compensation packages and bonuses. As of 2009, neither Congress nor the SEC has strengthened annual reporting requirements. However, in her 2009 end-of-the-year message, Mary L. Shapiro, Chairman of the SEC, announced that the SEC had initiated "changes to revitalize the Enforcement Division" and that the agency was focusing on making extensive reforms to protect investors and restore their confidence.

ANNUITIES

An annuity is an interest-bearing financial contract that combines the tax-deferred savings and investment properties of retirement accounts with the guaranteed-income

aspects of insurance. Annuities can be described as the flip side of life insurance. Life insurance is designed to provide financial protection against dying too soon. Annuities provide a hedge against outliving your retirement savings. While life insurance plans are designed to create principal, an annuity is designed to liquidate principal that has been created, usually in the form of regular payments over a number of years.

Annuities can be purchased from insurance providers, banks, mutual fund companies, stockbrokers, and other financial institutions. They come in several different forms, including immediate and deferred annuities, and fixed and variable annuities. Each form has different properties and involves different costs. Although the money placed in an annuity is first subject to taxation at the same rate as ordinary income, it is then invested and allowed to grow tax-deferred until it is withdrawn. Distribution is flexible and can take the form of a lump sum, a systematic payout over a specified period, or a guaranteed income spread over the remainder of a person's life. In most cases annuities are a long-term investment vehicle, since the costs involved make it necessary to hold an annuity for a number of years in order to reap financial benefits. Because of their flexibility, annuities can be a good choice for small-business owners in planning for their own retirement or in providing an extra reward or incentive for valued employees.

TYPES OF ANNUITIES

There are several different types of annuities available, each with different properties and costs that should be taken into consideration as business owners put together their retirement investment portfolio. The two basic forms that annuities take are immediate and deferred.

Immediate Annuity. An immediate annuity, as the name suggests, begins providing payouts at once. Payouts may continue either for a specific period or for life, depending on the contract terms. Immediate annuities which are generally purchased with a one-time deposit, with a minimum of around $10,000 are not very common. They tend to appeal to people who wish to roll over a lump-sum amount from a pension or inheritance and begin drawing income from it. The immediate annuity would be preferable to a regular bank account because the principal grows more quickly through investment and because the amount and duration of payouts are guaranteed by contract. Immediate annuities are also known by the name income annuities. What is important to remember when considering an immediate annuity is that "at the end of the day, you've got to remember what you're buying is insurance, not an investment vehicle like a stock or mutual fund," explains Rob Nestor in an article by Murray Coleman in *Investor's Business Daily.*

Deferred Annuity. Deferred annuities delay payouts until a specific future date. The principal amount is invested and allowed to grow tax-deferred over time. More common than immediate annuities, deferred annuities appeal to people who want a tax-deferred investment vehicle in order to save for retirement.

There are also two basic types of deferred annuity: fixed and variable. Fixed annuities provide a guaranteed interest rate over a certain period, usually between 1 and 5 years. In this way, fixed annuities are comparable to certificates of deposit (CDs) and bonds, with the main benefit that the sponsor guarantees the return of the principal. Fixed annuities generally offer a slightly higher interest rate than CDs and bonds, while the risk is also slightly higher. In addition, like other types of annuities, the principal is allowed to grow tax-deferred until it is withdrawn.

The more popular of the deferred annuity types is the variable annuity which offers an interest rate that changes based on the value of the underlying investment. Purchasers of variable annuities can usually choose from a range of stock, bond, and money market funds for investment purposes in order to diversify their portfolios and manage risk. Some of these funds are created and managed specifically for the annuity, while others are similar to those that may be purchased directly from mutual fund companies. The minimum investment usually ranges from $500 to $5,000, depending on the sponsor, and the investments (or subaccounts) usually feature varying levels of risk, from aggressive growth to conservative fixed income. In most cases, the annuity principal can be transferred from one investment to another without being subject to taxation. Variable annuities are subject to market fluctuations, however, and investors also must accept a slight risk of losing their principal if the sponsor company encounters financial difficulties.

FEATURES OF ANNUITIES

Variable annuities have a number of features that differentiate them from common retirement accounts, such as 401(k)s and IRAs, and from common equity investments, such as mutual funds. One of the main points of differentiation involves tax deferral. Unlike 401(k)s or IRAs, variable annuities are funded with after-tax money meaning that contributions are subject to taxation at the same rate as ordinary income prior to being placed in the annuity. In contrast, individuals are allowed to make contributions to the other types of retirement accounts using pre-tax dollars. That is why financial specialists usually instruct people to first maximize their contributions to 401(k) plans and IRAs before considering annuities. On the plus side, there is no limit on the amount that an individual may contribute to a variable annuity, while contributions to the other types of accounts are limited by the federal government.

Unlike the dividends and capital gains that accrue to mutual funds, however, which are taxable in the year they are received, the money invested in annuities is allowed to grow tax free until it is withdrawn.

Another feature that differentiates variable annuities from other types of financial products is the death benefit. Most annuity contracts include a clause guaranteeing that the investor's heirs will receive either the full amount of principal invested or the current market value of the contract, whichever is greater, in the event that the investor dies before receiving full distribution of the assets. However, any earnings are taxable for the heirs.

Another benefit of variable annuities is that they offer greater withdrawal flexibility than other retirement accounts. Investors are able to customize the distribution of their assets in a number of ways, ranging from a lump-sum payment to a guaranteed lifetime income. Some limitations, however, do apply. For example, the federal government imposes a 10 percent penalty on withdrawals taken by anyone before they reach the age of 59½ years. But contributors to variable annuities are not required to begin taking distributions until age eighty-five, whereas contributors to IRAs and 401(k)s are required to begin taking distributions by age 70½.

COSTS ASSOCIATED WITH ANNUITIES

In exchange for the various features offered by annuities, investors must pay a number of costs. Many of the costs are due to the insurance aspects of annuities, although they vary among different sponsors. One common type of cost associated with annuities is the insurance cost, which averages 1.25 percent and pays for the guaranteed death benefit in addition to the insurance agent's commission. Regulators have begun scrutinizing annuity sales due to the size of sales commissions and the prospect that older individuals are being sold annuities that are not appropriate for them, according to Theo Francis in his 2010 article for *Business Week*. There are also usually management fees, averaging 1 percent, which compensate the sponsor for taking care of the investments and generating reports. Many annuities also charge modest administrative or contract fees.

One of the more problematic costs of annuities, in the eyes of their critics, is the surrender charge for early removal of the principal. In most cases, this fee begins at around 7 percent but then phases out over time. However, the surrender fee is charged in addition to the 10 percent government penalty for early withdrawal if the investor is under age 59½.

All of the costs associated with variable annuities detract somewhat from their attractiveness as a financial product when one compares them to mutual funds. The costs also mean that there are no quick profits associated with annuities; instead, they must be held as a long-term investment. In fact, it can take as long as 17 years for the benefits of tax deferral to outpace the administrative expenses of an annuity. For investors who wish to put money away for an extended period, a variable annuity may be a very good investment vehicle.

DISTRIBUTION OPTIONS

On the positive side, investors in annuities have a number of options for receiving the distribution of their funds. The three most common forms of distribution all of which have various costs deducted are lump sum, lifetime income, and systematic payout. Some investors who have contributed to a variable annuity over many years may elect to take a lump-sum withdrawal. The main drawback to this approach is that all the taxes are due immediately. Other investors may decide upon a systematic payout of the accumulated assets over a specified time period. In this approach, the investor can determine the amount of payments as well as the intervals at which payments will be received. Finally, some investors choose the option of receiving a guaranteed lifetime income. This option is the most expensive for the investor and does not provide any money for heirs, but the sponsor of the annuity must continue to make payouts even if the investor outlives his or her assets. A similar distribution arrangement is joint-and-last-survivor, which is an annuity that keeps providing income as long as one person in a couple is alive.

Annuities are rather complex financial products, and as such they have become the subject of considerable debate among experts in financial planning. As mentioned earlier, many experts claim that the special features of annuities are not great enough to make up for their cost as compared to other investment options. As a result, financial advisors commonly suggest that individuals maximize their contributions to IRAs, 401(k)s, or other pre-tax retirement accounts before considering annuities. (Investors should avoid placing annuities into IRAs or other tax-sheltered accounts because the tax shelter then becomes redundant and the investor pays large annuity fees for nothing.) Some experts also prefer mutual funds tied to a stock market index to annuities, because such funds typically cost less and often provide a more favorable tax situation. Contributions to annuities are taxed at the same rate as ordinary income, for instance, while long-term capital gains from stock investments are taxed at a special, lower rate usually 20 percent. Still other financial advisors note that, given the costs involved, annuities require a very long-term financial commitment in order to provide benefits. It may not be possible for some individuals to tie up funds for the 17 to 20 years it takes to benefit from the purchase of an annuity.

Despite the drawbacks, however, annuities can be beneficial for individuals in a number of different situations. For example, annuities provide an extra source of income and an

added margin of safety for individuals who have contributed the limit allowed under other retirement savings options. In addition, some kinds of annuities can be valuable for individuals who want to protect their assets from creditors in the event of bankruptcy. An annuity can provide a good shelter for a retirement nest egg for someone in a risky profession, such as medicine. Annuities are also recommended for people who plan to spend the principal during their lifetime rather than leaving it for their heirs. Finally, annuities may be more beneficial for individuals who expect that their tax bracket will be 28 percent or lower at the time they begin making withdrawals.

Annuities may also hold a great deal of appeal for small businesses. For example, annuities can be used as a retirement savings plan on top of a 401(k). They can be structured in various ways to reward employees for meeting company goals. In addition, annuities can provide a nice counterpart to life insurance, since the longer the investor lives, the better an annuity will turn out to be as an investment. Finally, some annuities allow investors to take out loans against the principal without paying penalties for early withdrawal. Overall, some financial experts claim that annuities are actually worth more than comparable investments because of such features as the death benefit, guaranteed lifetime income, and investment services.

During the economic crisis which began in 2008 and the near-collapse of American International Group (AIG) that same year, many annuity owners became concerned that their money would not be there for them when they needed it. At the time, AIG was said to be the largest issuer of annuities in the United States. AIG was able to bounce back with the help of a government bailout, but it is important for investors to remember that even though annuities are marketed as a guarantee of money for life, there are always risks with any investment.

A small-business owner considering setting up an annuity should consider all options, look carefully at both the costs and the returns, and be prepared to put money away for many years. It is also important to shop around for the best possible product and sponsor before committing funds.

APPLICATION SERVICE PROVIDERS

According to the Information Technology Association of America, an application service provider (ASP) is "a company that provides a collection of IT resources to clients or subscribers who access those resources via the Internet or other networking arrangements." With the many challenges that businesses face every day, the last thing they need to worry about are a lot of technological issues that are beyond their area of expertise. Many businesses that run their own applications are forced to increase their staffs to include information technology experts who maintain and upgrade application software. Over time, this can become an expensive endeavor.

Many businesses are deciding to outsource the management of the applications to an application service provider. While cost is usually the main reason for a company to enlist the help of an ASP, other benefits include saving time, gaining access to top-tier software, and providing scalability. The speed at which advances are made in the field of computerization means that a significant investment must be made to remain knowledgeable and informed about the newest applications in the field. The cost-benefit assessment of this investment for a single user is often not favorable. Quite simply, an ASP allows managers the opportunity to do what they do best and invest in acquiring knowledge about their own industry and not the computer systems industry.

An application service provider can handle many aspects of a business. ASPs manage and deliver application capabilities to multiple entities from a single data center across the private or public Internet on a rental basis. Typical of the sorts of hosted applications that ASPs offer include: enterprise resource planning applications (human resources, financials, manufacturing, supply chain management); e-commerce applications; customer relationship management packages, (sales automation, customer services, and other front-office applications); productivity applications (collaboration, workflow management, project management office); and e-mail and messaging services.

Some businesses have concerns about using ASPs. Security and reliability are just two of the issues that have made businesses reluctant to turn over full control of their applications to an outside source. The ASP industry as a whole has worked diligently to address these concerns and prove that their services are valid and cost efficient. Their initial efforts appeared to be successful. As Samuel Greengard stated in his 2000 book *Workforce*, "Where there was once fear and distrust, there's now growing acceptance of the idea that outside companies can manage hardware, software, and telecommunications remotely. And, make no mistake, these so-called application service providers are forever changing the way companies view technology and how they use it to gain a competitive advantage." Other concerns include the need for more industry-specific software. While not all ASPs can offer industry-specific services across a wide range of industries, the ASP industry as a whole has expanded to include more niche-oriented companies that can address this concern.

By the end of the 2000s, the general use of ASPs was well-entrenched, and their appeal and target market expanded. As Charles King wrote in 2010 in *E-Commerce Times* about Software as a Service (SaaS), which he dubbed "a not-so-distant relative of the application service providers (ASPs)," its viability "depends on the availability of robust, inexpensive bandwidth" which is "in far greater supply today than it was in 2000."

While ASPs initially began as general IT providers, and there are still some that function in this role, the industry has evolved during the late-2000s with the spread of the Internet. By the mid-2000s, it was uncommon for any business, however small, not to have a Web presence. Yet, as with other areas of IT handled by ASPs, creating and maintaining a Web presence, even a minor one, can absorb a lot of time, money, and personnel. Inexpensive ASPs that provide web-hosting services are now commonly used by a wide range of small businesses and individuals.

These companies, such as GoDaddy.com, provide all-in-one Web solutions with a variety of low-cost packages. Domain names can be registered and hosted for as little as $10 per year, and services like increased storage and bandwidth, excess e-mail capacity, Web design, site surveys, search-engine maximization, and connections to social networking sites such as Facebook and Twitter are offered as add-ons, usually also at a relatively low cost. These companies also offer a wide range of business services such as merchant accounts and shopping carts, logo design, brand identity services, and e-mail marketing.

Before entering into a formal relationship with an application service provider, businesses should make sure they fully understand the service level agreement (SLA). The SLA is a document that protects the interests of both the business and the ASP, and usually guarantees performance levels in areas such as uptime, bandwidth, and interapplication communication. By taking the time to understand the SLA at the outset, a business cuts down on the number of potential problems and headaches later.

Small businesses are one sector that stands to benefit from the expertise of an application service provider. It is a quick and affordable way to acquire the necessary applications to run a successful business or establish a quick and inexpensive Web presence. When using an ASP for a broad range of IT, a small business (or any business, for that matter) should always make sure that the ASP is specific to their industry, offers a full line of business applications, is able to scale as the business grows, and can manage custom applications and solutions that are unique to the company. The ability of the ASP to integrate with the company's customers, suppliers, and partners can also be a crucial element in the business relationship.

ARTICLES OF INCORPORATION

For small businesses that decide to incorporate, one of the first steps they must take is filing the articles of incorporation (sometimes called a certificate of formation, certification of

organization, or charter) at a Secretary of State's office or with the Department of Commerce. A company can file in the state in which it does business or in any other state of its choosing. At one time, businesses were often advised to incorporate in Delaware because of its simple and advantageous corporate laws. However, many other states have reformed their tax codes in order to keep businesses at home, thus muting the advantages previously associated with incorporating in Delaware.

In Anthony Mancuso's 2009 book, *Incorporate Your Business: A Legal Guide to Forming a Corporation in Your State*, Mancuso strongly advises small-business owners to incorporate in their home state. According to Mancuso, large, publicly held businesses may benefit by incorporating in Delaware, but small businesses are unlikely to benefit.

In most states, the Secretary of State can provide blank forms online or by mail. Some states allow businesses to fill out the form on their Web site and download it directly to the office. The forms differ from state to state, but they are fairly straightforward and only require a person to fill in the blanks. In a few states, no forms are available, and the applicant will have to draw up the articles of incorporation from scratch. Anyone may prepare the articles of incorporation on their own (there are many guides available, some of which are specifically created for a certain state and include sample forms), or they may hire a lawyer to do this. But even if someone takes on the task themselves, it is a good idea to ask an attorney to look over the form.

Generally, the articles of incorporation include the following sections:

- Corporate Name.
- Registered agent (sometimes called initial agent or resident agent) and office. This is usually the corporate president or one of the directors. In any case, this is the contact person to whom all legal notices and official mailings will be sent.
- Purpose for which the Corporation is organized. In most states, this section does not need to be filled in. It will already contain a statement to the effect that the Corporation can do anything that is legal for a corporation to do in that state. If the form does need to be filled in, it is best to leave the language as general as possible. That way, if the nature of the business should change, there will be no need to amend the articles of incorporation.
- The Duration of the Company. This is usually listed as perpetual.
- Authorized Shares, Issued Shares, and Classification of Stock. The amount of information about authorized or issued shares required in this section varies by state. A person may be asked to list the total number of shares authorized to be issued, the number of shares actually issued, the class of stock (common, preferred or both), the value per share, or the consideration received for the shares.
- Directors of the Corporation and their addresses.
- Name(s) and Address(es) of Incorporator(s). This section should list the names of those individuals who have performed the incorporation and prepared the articles of incorporation (attorneys, directors, or owners).
- Estimated Property and Gross Revenue. This section, which is optional in some states, may include an estimate of the business's property value and the estimated gross amount of business which will be transacted during the following year.

Once the form is complete, it should be sent to the Secretary of State or Department of Commerce in the state in which the business will operate. In some cases, the forms can be e-mailed to the requisite office. Any fees that are due should be sent with the form or paid online. Each state has a filing fee, and there are usually other fees such as a franchise tax (usually based on the company's capitalization), a fee for designating a registered agent, or an organization tax based on the number and value of stock. These fees vary considerably from state to state.

When the articles of incorporation are returned to the business owner after being accepted by the Secretary of State, they will probably need to be filed with the Recorder of Deeds in the county where the corporation's home office is located. The articles of incorporation, now the company's charter, then become public record.

ASSEMBLY LINE METHODS

An assembly line is a manufacturing process in which interchangeable parts are added to a product in a sequential manner to create an end product. In most cases, a manufacturing assembly line is a semi-automated system through which a product moves. At each station along the line some part of the production process takes place. The workers and machinery used to produce the item are stationary along the line and the product moves through the cycle, from start to finish.

Assembly line methods were introduced to increase factory productivity and efficiency. Advances in assembly line methods are made regularly as new and more efficient ways of achieving the goal of increased throughput (the number of products produced in a given period of time) are found. While assembly line methods apply primarily to manufacturing processes, business experts have also been known to apply these principles to other areas of business, from product development to management.

The introduction of the assembly line to American manufacturing floors in the early part of the twentieth century fundamentally transformed the character of production facilities and businesses throughout the nation. Thanks to the assembly line, production periods shortened, equipment costs accelerated, and labor and management alike endeavored to keep up with the changes. Today, using modern assembly line methods, manufacturing has become a highly refined process in which value is added to parts along the line. Increasingly, assembly line manufacturing is characterized by "concurrent processes" multiple parallel activities that feed into a final assembly stage. These processes require sophisticated communications systems, material flow plans, and production schedules. The fact that the assembly line system is a single, large system means that failures at one point in the "line" cause slowdowns and repercussions from that point forward. Keeping the entire system running smoothly requires a great deal of coordination between the parts of the system.

Technology has enabled tracking systems to become more sophisticated and this, in turn, has made it possible to reduce the costs associated with holding inventories. Just-in-time (JIT) manufacturing methods have been developed to reduce the cost of carrying parts and supplies as inventory. Under a JIT system, manufacturing plants carry only one or a few days' worth of inventory in the plant, relying on suppliers to provide parts and materials on an "as needed" basis.The use of JIT systems relies on historical sales data that is processed by high-powered computer and database systems that are now common in manufacturing business. A JIT system was once an expensive process accessible to only the largest of businesses, but in the 2010s many businesses, small and large, have the computer and data resources to take advantage of such systems.

VARIATIONS IN ASSEMBLY LINE METHODOLOGIES

The passage of years has brought numerous variations in assembly line methodologies. These new wrinkles can be traced back not only to general improvements in technology and planning, but to factors that are unique to each company or industry. Capital limitations, for example, can have a big impact on a small business's blueprint for introducing or improving assembly line production methods, while changes in international competition, operating regulations, and availability of materials can all influence the assembly line picture of entire industries. Following are brief descriptions of assembly line methods that are currently enjoying some degree of popularity in the manufacturing world.

- Modular Assembly. This is an advanced assembly line method that is designed to improve throughput by increasing the efficiency of parallel subassembly lines feeding into the final assembly line. As applied to automobile manufacturing, modular assembly would involve assembling separate modules chassis, interior, body on their own assembly lines, then joining them together on a final assembly line.
- Cell Manufacturing. This production method has evolved out of increased ability of machines to perform multiple tasks. Cell operators can handle three or four tasks, and robots are used for such operations as materials handling and welding. Cells of machines can be run by one operator or a multi-person work cell. In these machine cells it is possible to link older machines with newer ones, thus reducing the amount of investment required for new machinery.
- Team Production. Team-oriented production is another development in assembly line methods. Where workers used to work at one- or two-person work stations and perform repetitive tasks, now teams of workers can follow a job down the assembly line through its final quality checks. The team production approach has been hailed by supporters as one that creates greater worker involvement in the manufacturing process and knowledge of the system.
- U--shaped assembly "line." A line may not be the most efficient shape in which to organize an assembly line. On a U-shaped line, or curve, workers are collected on the inside of the curve and communication is easier than along the length of a straight line. Assemblers can see each process; what is

coming and how fast; and one person can perform multiple operations. Also, workstations along the "line" are able to produce multiple product designs simultaneously, making the facility as a whole more flexible. Changeovers are easier in a U-shaped line as well and, with better communication between workers, cross-training is also simplified. The benefits of the U-shaped line have served to increase their use widely.

In his 2008 book, *The Greatest Innovation Since the Assembly Line: Powerful Strategies for Business Agility* Michael Hugos warns that businesses need to go one step beyond the efficiency of the assembly line model and look toward flexibility and responsiveness if they want to succeed in the global economy. Hugos advises bringing people, process, and technology together to create a nimble environment that can quickly react to a "fluid, real-time economy."

As new assembly line methods are introduced into manufacturing processes, business managers look at the techniques for possible application to other areas of business. One such application is called Joint Application Development, or JAD. The JAD process is based on the idea that workers who perform a task have a greater understanding of the process and that the workers who design and implement the technology know best what is possible technologically. In turn, the process of working together on a common goal gives each worker a sense of ownership for the new system.

In a similar way the fundamentals of assembly line theory have been applied to business processes with success. These new methods of organizing work all share the common goal of improving throughput by reducing the amount of time individual workers and their machines spend on specific tasks. By reducing the amount of time required to produce an item, assembly line methods have made it possible to produce more with less.

ASSETS

Assets are anything of value that is owned by a company, whether fully paid for or not. These range from cash, inventory, and other "current assets" to real estate, equipment, and other "fixed assets." Intellectual property and other intangibles (such as exclusive use contracts, copyrights, and patents) are also regarded as assets.

CURRENT ASSETS

Also known as soft or liquid assets, current assets include cash, government securities, marketable securities, notes receivable, accounts receivable, inventories, raw materials, prepaid expenses, and any other item that could be converted to cash in the normal course of business within 1 year. For the purposes of doing business, current assets tell potential investors and corporate clients what a firm has at its immediate disposal.

Cash is, of course, the most liquid of assets. But in business circles, the definition of cash is expanded beyond currency (coins and paper money) to include checks, drafts, and money orders; the balance in any company checking account (provided there are no restrictions attached to the account); and even less liquid assets that are nonetheless commonly regarded as cash equivalents. These include certificates of deposit (CDs) with maturities of less than a year, money market funds, Treasury bills, and even fixed assets that could be quickly converted into cash because they have high cash value or are in high demand and low supply.

For many small businesses, cash comprises the bulk of their current assets. Cash is flexible and can be quickly and easily converted into needed goods or services. But the very ease with which it can be used makes it attractive for disreputable people both internal and external to the business. Small-business owners should take appropriate precautions when handling cash assets. Consultants often recommend that their clients take out insurance policies to protect themselves from financial losses as a result of employee theft or error; this practice is commonly known as "bonding." Cash on hand, if it exceeds what is necessary to run the business, can be placed in a trust or limited liability company (LLC)

outside of the existing company this will protect it from lawsuits and judgments against the original company.

Another important practice that helps to safeguard current assets has to do with dividing up tasks. To reduce the likelihood of any one malicious individual being able to rob or embezzle from a company, it is useful to have different people in charge of tracking both receipts and disbursements. Splitting up the responsibilities for handling cash, bookkeeping, and bank statement reconciliation is an easy way to be sure that various people are all monitoring current assets. In small businesses, these tasks are often handled by one individual. Having at least two people involved in these tasks on a regular basis increases the chances that errors, whether intentional or not, are found and remedied in a timely fashion.

The use of a petty cash fund is a practical way to provide for small outlays without exposing a larger percentage of a company's current liabilities. While small businesses may not be able to institute the elaborate systems used in larger enterprises, cash control is important. Something as simple as a small lockbox with receipts for what was taken out and by whom can work as a petty cash system; but it needs to be kept in mind that access and proximity create a higher risk of theft. Control of petty cash by someone with a track record of honesty and experience with money is a sound practice.

Accounts receivable is another type of current asset. Accounts receivables are sums owed to the company for services or goods rendered. Inventories are important current assets as well, particularly for business firms engaged in manufacturing and merchandising. Inventories typically held by merchandisers include finished goods ready for sale or resale, while the inventories of manufacturing establishments can include raw materials, supplies used in manufacture, partially completed work, and finished goods. Receivables held in Internet accounts such as PayPal or Web site shopping carts are considered receivables just as an uncashed check would be.

FIXED ASSETS

Also known as hard assets, fixed assets include real property, physical plants and facilities, leasehold improvements, equipment (from office equipment to heavy operating machinery), vehicles, fixtures, and other assets that can reasonably be assumed to have a life expectancy of several years. Most fixed assets, with the notable exception of real estate, will lose value over time. This is known as depreciation and is typically figured into a business's various financial documents (the expense of real estate purchases can also be depreciated when figuring taxes). Small-business consultants note, however, that this depreciation can be figured by several different formulas. The smart business owner should take the time to figure out which formula is most advantageous for his or her company by enlisting the help of a corporate or estate planning attorney. In addition, it is extremely important for small business owners to protect their personal assets, which could be taken if the company is sued and personal assets are not held in a trust or other shelter such as a family limited liability company (FLLC).

Fixed assets are among the most important assets that a company holds, for they represent major investments of financial resources. Indeed, fixed assets usually comprise the majority of a business's total assets. Intelligent allocation of resources to meet the company needs for land, facility, and large equipment can bring it assets that will serve as cornerstones of successful operation for years to come. Conversely, a company saddled with unnecessary, unutilized, outdated or obsolete fixed assets will find it much more difficult to be successful. This is especially true for small businesses, which have a smaller margin of error.

Fixed assets are also very important to small-business owners because they are one of the things that are examined most closely by prospective lenders. When a bank or other lending institution is approached by a small business owner who is seeking a loan to establish or expand a company, loaning agents will always scrutinize the prospective borrower's hard assets. Bankers view these fixed assets as a decisive indicator of a business's financial health.

When examining the fixed assets of a company, lenders are typically most concerned with the following factors:

1. The type, age, and condition of equipment and facilities
2. The depreciation schedules for those assets
3. The nature of the company's mortgage and lease arrangements
4. Likely future fixed asset expenditures

RISKY VS. RISKLESS ASSETS

The monetary flow that a business owner receives from an asset can vary because of many different factors. When comparing the value of various assets, the monetary flow of an asset is an important consideration, especially relative to the value or cost of a given asset. A risky asset provides a monetary flow that is at least in part random; in other words, the monetary flow is not known in advance. In contrast, a "riskless" asset is one that features a known level of monetary flow to its owner. Bank savings accounts, certificates of deposit (CDs), and Treasury bills all qualify as riskless assets because the monetary flow of the asset to the owner is known. Finally, the "return" on an asset whether risky or riskless is the total monetary reward it yields as a fraction of its price.

ASSET UTILIZATION RATIOS

A financial ratio is a simple mathematical comparison of two or more entries from a company's financial statements. Business owners and managers use ratios of all sorts to chart a company's progress, uncover trends, and investigate potential problems. Bankers and investors look at these ratios when deciding whether or not to invest or lend to the company.

The asset utilization ratio is a measure of the speed at which a business is able to turn assets into sales, and thus, revenue. The use of ratio analysis, especially with a small company, is of greatest value when done over time to chart changes in the company's performance and compare the company's performance with others within the same industry.

The four primary asset utilization ratios are: 1) Receivables turnover, which studies the number of times that receivable balances are collected annually; 2) Inventory turnover, which is determined by dividing the annual cost of sales by the average inventory at both the beginning and the end of the period being studied; 3) Fixed asset turnover; and 4) Total asset turnover. Asset turnover ratios measure the efficiency with which a company uses its assets to generate sales; the higher the turnover ratio, the more efficient the company. Fixed asset turnover ratios are not particularly useful to compute if the company under examination does not have a significant amount of hard assets, frequently true with small, new, and/or service-oriented businesses.

TOXIC ASSETS

Toxic assets are those held by a company that cause financial strain due to their falling value. However, selling of these assets just for the sake of unburdening the company can be perilous. The central issue is that during economic recession and depression, the cost of holding on to assets, especially real property which requires upkeep and maintenance, can be even more dangerous than selling them off.

Toxic assets, just like all other assets, can include anything from homes and cars to intellectual property and artwork and other hard assets. Generally, toxic assets do not include liquid assets or anything that can easily be liquidated to funnel capital back into a firm to keep it from going bankrupt. Toxic assets were a factor in the global financial meltdown that started in 2008. After a bubble in the U.S. housing market collapsed, many mortgages (especially subprime mortgages) went delinquent. These mortgages had often been bundled with other loans, and so when the mortgages soured, so did the mortgage-backed securities created with them. The end result was that banks worldwide were stuck with a massive amount of toxic assets and bad loans on their books. According to one estimate by the International Monetary Fund, the total value of these toxic assets and bad loans amounts to almost $3 trillion.

ASSUMPTIONS

An assumption is a statement that is presumed to be true without empirical data to support it. In the business world, assumptions are used in a wide variety of situations to enable companies to plan and execute decisions in the face of uncertainty. Perhaps the most common use of assumptions is in the accounting function, which uses assumptions to facilitate financial measurement, forecasting, and reporting.

There are four basic types of assumptions used regularly in accounting. They are:

- The separate-entity assumption, which holds that the particular business entity being measured is distinct and separate from similar and related entities for accounting purposes.
- The continuity or "going concern" assumption. This assumption holds that the entity will not cease operations or liquidate its assets during the accounting period.
- The time-period assumption. According to this assumption, accounting reports are assumed to apply to a short time period, usually one fiscal year.
- The unit-of-measure assumption which is sometimes referred to as the "stable monetary unit assumption." This assumption holds that the U.S. dollar is the common denominator or measuring stick for all accounting measurements taken for American companies. As market conditions change, and in the global market place, the measuring stick may also be the Euro, the British pound, or some other currency.

In addition to these underlying accounting assumptions, there are also a number of smaller assumptions that are commonly made in certain calculations. For example, companies must make several assumptions in computing the value of pension and medical benefits that will be provided to retirees in the future. These funds which are built up over time and held as investments until needed, but are actually owed to employees at some future point are reported by companies as assets and liabilities on their financial statements. The assumptions made by a company help determine the monetary amounts that are reported, and thus may affect the company's current reported earnings and tax liability.

In the case of pensions that are provided to employees following retirement, companies must make assumptions regarding the likely rate of wage inflation and the discount rate to be applied to projected future payments. Similarly, the calculation of health care benefits provided to retirees includes assumptions about the discount rate and medical cost trend rate, as well as demographic assumptions such as the employee turnover rate, the average age of employees at retirement, and the percentage of married retirees. As the retirement age increases and as changes to health care occur in the United States, pensions may be lowered and early retirement packages may be offered so that corporations can bring on younger, less costly talent. Assumptions about retiring employees will therefore change, perhaps dramatically. Changing one of these assumptions can have a marked effect on a company's results. For example, increasing the discount rate reduces the present value of the company's liabilities and the amount of annual contributions that must be made to fund the retirement accounts, therefore increasing the company's current earnings.

The ease with which a company's current earnings may be improved by changed assumptions in forecasting highlights the need to avoid the natural inclination towards overly optimistic assumptions. The early 2000s exposed serious problems for many companies and public institutions because of the overly optimistic assumptions made in the 1990s about pension fund financing. Similarly, the recession which began in 2008 may have been avoided if large corporations, namely those in the banking and auto industries, had made more accurate assumptions about assets, retiring employees' compensation, the increasing cost of health care, and the diminishing worth of hard assets.

Edward Siedle, a former Securities and Exchange Commission attorney, discusses assumption in the pension field in a *Fort Worth Star-Telegram* article. "In my experience, every pension fund I've ever seen has an actuarial assumption that is more akin to wishful thinking than what is reasonably foreseeable. You just want to laugh out loud." Assumptions about pension fund obligations may be somewhat more difficult than forecasting other obligations because of the long time period over which they must extend. Nonetheless, the mass failure of companies to assess pension fund requirements accurately in the 1990s and in the first decade of the twenty-first century show just how important it is to base assumptions on as sound a footing as possible and avoid overly optimistic forecasts. As was demonstrated in 2009, a sizable amount of the American public does not like footing the bill for the very companies who have paid them cut-rate wages or offered them little to no health care benefits over the years. Bailing out companies like AIG who abused the monies given by the American taxpayers left a bitter taste in the mouths of many American workers who worked for the very companies they were then made to carry financially with their taxes.

Experts recommend that companies review their accounting assumptions every 12 to 36 months to see whether making a change would be beneficial, and to verify that assumptions about the company, its hard and soft assets, and the state of the economy are still accurate.

AUDITS, EXTERNAL

An audit is a systematic process of objectively obtaining and evaluating the accounts or financial records of a governmental, business, or other entity. Whereas some businesses rely on audits conducted by employees these are called internal audits others utilize external or independent auditors to handle this task (some businesses rely on both types of audits in some combination).

External auditors are authorized by law to examine and publicly issue an opinion on the reliability of corporate financial reports. With the passage of the Securities Act of 1933 and the Securities Exchange Act of 1934, all publicly

traded companies were required to conduct independent financial audits. The purpose of this requirement was to ensure that the financial status and operating performance of publicly traded companies were fairly and accurately disclosed to the public. The rules that must be followed by publicly traded companies changed in 2002 with the passage of the Sarbanes-Oxley Act. This Act came about in the wake of the 2001 bankruptcy filing by Enron and subsequent revelations about fraudulent accounting practices within the company. Enron was only the first in a string of high-profile bankruptcies. Serious allegations of accounting fraud followed and extended beyond the bankrupt firms to their accounting firms. In response, the legislature acted to fortify financial reporting requirements and stem the decline in confidence that resulted from the wave of bankruptcies.

The Sarbanes-Oxley Act is a wide-reaching and complex law that imposes heavy reporting requirements on all publicly traded companies. Meeting the requirements of this law has increased the workload of auditing firms. In particular, Section 404 of the Sarbanes-Oxley Act requires that a company's annual report include an official write-up by management about the effectiveness of the company's internal controls. The section also requires that outside auditors attest to management's report on internal controls. An external audit is required in order to attest to the management report.

Even with the increased reporting requirements mandated by the Sarbanes-Oxley Act, there were several high-profile fraud and bankruptcy cases during the mid- and late 2000s. The most notable of these was the Madoff investment scandal, in which financier Bernard Madoff defrauded thousands of investors in a huge Ponzi scheme. Although the Madoff case was not the kind of situation the Sarbanes-Oxley Act was specifically designed to correct Madoff's was not a publiclytraded company this multi-billion-dollar case of fraud revealed that there were other problem areas in the system of public oversight for which external auditing was one potential remedy. Beginning in 2009, Congress started considering a wide range of regulatory reforms to prevent not only fraud of the Madoff type, but also of legal yet highly risky financial dealings that are not covered by the terms of the Sarbanes-Oxley Act.

USES OF EXTERNAL AUDITS

Firms not obliged by law to perform external audits often contract for such accounting services nonetheless. Smaller businesses, for example, that do not have the resources or inclination to maintain internal audit systems will often have external audits done on a regular basis as a safeguard against errors or fraud.

The primary goal of internal auditing is to determine the extent to which the organization adheres to managerial policies, procedures, and requirements. The independent or external auditor is not an employee of the organization. He or she performs an examination with the objective of issuing a report containing an opinion on a client's financial statements. The attest function of external auditing refers to the auditor's expression of an opinion on a company's financial statements. The typical independent audit leads to an attestation regarding the fairness and dependability of the statements. This is communicated to the officials of the audited entity in the form of a written report accompanying the statements (an oral presentation of findings may sometimes be requested as well). During the course of an audit study, the external auditor also becomes well-acquainted with the virtues and flaws of the client's accounting procedures. As a result, the auditor's final report to management often includes recommendations on methodologies of improving internal controls that are in place.

Major types of audits conducted by external auditors include the financial statements audit, the operational audit, and the compliance audit. A financial statement audit (or attest audit) examines financial statements, records, and related operations to ascertain adherence to generally accepted accounting principles. An operational audit examines an organization's activities in order to assess performances and develop recommendations for improvements, or further action. Auditors perform statutory audits which are performed to comply with the requirements of a governing body, such as a federal, state, or city government or agency. A compliance audit has as its objective the determination of whether an organization is following established procedures or rules.

INDEPENDENT AUDITING STANDARDS

The auditing process is based on standards, concepts, procedures, and reporting practices that are primarily imposed by the American Institute of Certified Public Accountants (AICPA). The auditing process relies on evidence, analysis, conventions, and informed professional judgment. General standards are brief statements relating to such matters as independence, professional judgment, competence, and quality control and assurance. AICPA standards are laid out in its*Government Auditing Standards* revised in 2003 following the changes brought about by the Sarbanes-Oxley Act which declares that:

- In all matters relating to the audit work, the audit organization and the individual auditor, whether government or public, should be free both in fact and appearance from personal, external, and organizational impairments to independence.

- Professional judgment should be used in planning and performing audits and attestation engagements and in reporting the results.
- The staff assigned to perform the audit or attestation engagement should collectively possess adequate professional competence for the tasks required.
- Each audit organization performing audits and/or attestation engagements in accordance with generally accepted government auditing standards should have in place and monitor an appropriate internal quality control system and should undergo an external peer review at least once every three years.

Standards of fieldwork provide basic planning standards to be followed during audits. The AICPA's standards for fieldwork stipulate that:

- Audit documentation related to planning, conducting, and reporting on the audit should contain sufficient information to enable an experienced auditor who has had no previous connection with the audit to ascertain from the audit documentation the evidence that supports the auditors' significant judgments and conclusions. Audit documentation should contain support for findings, conclusions, and recommendations before auditors issue their reports.
- Auditors should consider the results of previous audits and attestation engagements and follow up on known significant findings and recommendations that directly relate to the objectives of the audit being undertaken.
- If the auditors' report discloses deficiencies in internal control, fraud, illegal acts, violations of provisions of contracts or grant agreements, or abuse, auditors should obtain and report the views of responsible officials concerning the findings, conclusions, and recommendations, as well as planned corrective actions.
- If certain pertinent information is prohibited from general disclosure, the audit report should state the nature of the information omitted and the requirement that makes the omission necessary.
- Government auditors should submit audit reports to the appropriate officials of the audited entity and to appropriate officials of the entities requiring or arranging for the audits, including external funding entities such as legislative bodies, unless legal restrictions prevent it. Auditors should also send copies of the reports to other officials who have legal oversight authority or who may be responsible for acting on audit findings and recommendations and to others authorized to receive such reports. Unless the report is restricted by law or regulation, or contains privileged and confidential information, auditors should clarify that copies are made available for public inspection. Nongovernment auditors should clarify the report distribution responsibilities with the party contracting for the audit and follow the agreements reached.

THE EXTERNAL AUDITING PROCESS

The independent auditor generally proceeds with an audit according to a set process with three steps: planning, gathering evidence, and issuing a report.

In planning the audit, the auditor develops an audit program that identifies and schedules audit procedures that are to be performed to obtain the evidence. Audit evidence is proof obtained to support the audit's conclusions. Audit procedures include those activities undertaken by the auditor to obtain the evidence. Evidence-gathering procedures include observation, confirmation, calculations, analysis, inquiry, inspection, and comparison. An audit trail is a chronological record of economic events or transactions that have been experienced by an organization. The audit trail enables an auditor to evaluate the strengths and weaknesses of internal controls, system designs, and company policies and procedures.

The Audit Report. The independent audit report sets forth the independent auditor's findings about the business's financial statements and their level of conformity with generally accepted accounting principles. A check is made to verify that representations over a period of years are consistent. A fair presentation of financial statements is generally understood by accountants to refer to whether the accounting principles used in the statements have general acceptability. This includes such things as: 1) the accounting principles are appropriate in the circumstances; 2) the financial statements are prepared so they can be used, understood, and interpreted; 3) the information presented in the financial statements is classified and summarized in a reasonable manner; and 4) the financial statements reflect the underlying events and transactions in a way that presents an accurate portrait of financial operations and cash flows within reasonable and practical limits.

The auditor's unqualified report contains three paragraphs. The *introductory* paragraph identifies the financial statements audited, states that management is responsible for those statements, and asserts that the auditor is responsible for expressing an opinion on them. The *scope* paragraph describes what the auditor has done and specifically states that the auditor has examined the financial statements in accordance with generally accepted auditing standards and has performed appropriate tests. The *opinion* paragraph expresses the auditor's opinion (or formally announces his or her lack of opinion

and why) on whether the statements are in accordance with generally accepted accounting principles.

Various audit opinions are defined by the AICPA's Auditing Standards Board as follows:

- Unqualified opinion. This opinion means that all materials were made available, found to be in order, and met all auditing requirements. This is the most favorable opinion that can be rendered by an external auditor about a company's operations and records.
- Explanatory language added. Circumstances may require that the auditor add an explanatory paragraph (or other explanatory language) to his or her report. When this is done the opinion is prefaced with the term, "explanatory language added."
- Qualified opinion. This type of opinion is used for instances in which most of the company's financial materials were in order, with the exception of a certain account or transaction.
- Adverse opinion. An adverse opinion states that the financial statements do not accurately or completely represent the company's financial position, results of operations, or cash flows in conformity with generally accepted accounting principles. Such an opinion is obviously not good news for the business being audited.
- Disclaimer of opinion. A disclaimer of opinion states that the auditor does not express an opinion on the financial statements, generally because he or she feels that the company did not present sufficient information. Again, this opinion casts an unfavorable light on the business being audited.

The fair presentation of financial statements does not mean that the statements are fraud-proof. The independent auditor has the responsibility to search for errors or irregularities within the recognized limitations of the auditing process. Investors should examine the auditor's report for citations of problems such as debt-agreement violations or unresolved lawsuits. "Going-concern" references can suggest that the company may not be able to survive as a functioning operation. If an "except for" statement appears in the report, the investor should understand that there are certain problems or departures from generally accepted accounting principles in the statements, and that these problems may call into question whether the statements fairly depict the company's financial situation. These statements typically require the company to resolve the problem or somehow make the accounting treatment acceptable.

DETECTING FRAUD

Detection of potentially fraudulent financial record keeping and reporting is one of the central charges of the external auditor. According to *Fraudulent Financial Reporting, 1987 1997*, a study published by the Committee of Sponsoring Organizations of the Treadway Commission, most companies charged with financial fraud by the Securities and Exchange Commission (SEC) posted far less than $100 million in assets and revenues in the year preceding the fraud. Not surprisingly, fraud cropped up most often in companies in the grip of financial stress, and it was perpetrated most often by top-level executives or managers. According to the study, more than 50 percent of fraudulent acts uncovered by the SEC involved overstatements of revenue by recording revenues prematurely or fictitiously.

As the study's authors, Mark Beasley, Joseph Carcello, and Dana Hermanson, noted in *Strategic Finance*, fraudulent techniques include reporting false sales, recording revenues before all terms were satisfied, recording conditional sales, improper cutoffs of transactions at period end, improper use of percentage of completion, unauthorized shipments, and recording of consignment sales as completed sales. In addition, many firms overstated asset values such as inventory, accounts receivable, property, equipment, investments, and patent accounts. Other types of fraud detailed in the study included misappropriation of assets (12 percent of charged companies) and understatement of liabilities and expenses (18 percent).

With the onset of a global recession in 2008, there was a new rise in corporate accounting fraud of the type that the Sarbanes-Oxley Act was intended to prevent. A November 2009 Reuters report, "Global Corporate Accounting Fraud Up Sharply: Survey," cited a survey of 3,000 senior executives from accounting firm PricewaterhouseCoopers. This survey showed that accounting fraud grew to 38 percent of all economic crimes in 2009, which was up from the 2007 figure of 27 percent. The report, which attributed this rise to the pressures of the recession, noted, "The increase in accounting fraud has come as employees face increased pressures to meet performance targets, keep their jobs and keep access to funding or financing from outside institutions."

Accidental misstatements are almost always detected in audits. But these errors should not be confused with fraudulent activity. Errors can occur at any time, in any place with unpredictable financial statement effects. Fraud, on the other hand, is intentional and is often more difficult to detect than are errors. Part of the job of an external auditor is to recognize when conditions indicate potentially higher risks of employee or management fraud and then increase the scrutiny of all records accordingly.

WORKING WITH EXTERNAL AUDITORS

Experts urge business owners to establish proactive working relationships with external auditors. In order to accomplish this, companies should make sure that they:

- Select an auditing firm with expertise in their industry and a proven track record.
- Establish and maintain efficient record keeping systems to ease the task of the auditor.
- Make sure that owners, executives, and managers know the basics of financial reporting requirements.
- Establish effective lines of communication and work processes between external auditors and internal auditors (if any).
- Recognize the value that external auditors can have as objective reviewers of existing and proposed operational processes.
- Focus on high-risk areas of operations, such as inventory levels.
- Focus on periods of change and expansion, such as transitions to public ownership or expansion into new markets.
- Build an effective audit committee that can provide cogent financial and operational analysis based on audit results.

ACCOUNTING FIRMS AND CONSULTING SERVICES

The 1980s and 1990s saw an increase in the types of service offered by accounting firms. The situation became so prevalent that, according to an article by A. Reed in *Internal Auditor*, 307 of the Standard & Poor's 500 companies paid their audit firms, on average, almost three times as much in fees for nonauditing services as for auditing itself. Many analysts believe that it was the resulting conflict of interest that was at least partially responsible for the rash of bankruptcies of large corporations which occurred in the early 2000s. How important accounting firm collaboration was in the accounting fraud of the early 2000s has yet to be fully determined. However, passage of the Sarbanes-Oxley Act in 2002 put into place increased restrictions on the consulting services that an accounting firm can offer the clients for which it performs audits. Because of the persistence of accounting fraud, and systemic problems noted in the aftermath of the 2008 financial meltdown, Congress has been considering a number of regulatory reforms to shore up public oversight. Further regulatory work is likely to be done during the 2010s.

AUDITS, INTERNAL

Internal auditing is an independent appraisal function that is performed in a wide variety of companies, institutions, and government agencies. Internal auditors are employees of the firm which they are auditing this is what differentiates them from government auditors and public accountants. Their allegiance is to their organization, not to an external authority. Because internal auditing has evolved only within the last several decades, the roles and responsibilities of internal auditors vary greatly from one organization to another. Internal audit functions have been structured based on the differing perceptions and objectives of owners, directors, and managers. Since the passage in 2002 of the Public Company Accounting Reform and Investor Protection Act, commonly called the Sarbanes-Oxley Act, the function of the auditor has been highlighted in compliance with the new regulations. In publicly held corporations, the internal auditing function has been greatly expanded as a part of fulfilling the requirements of Sarbanes-Oxley.

The structure given to the internal auditing function within a company depends to a great extent on four things: 1) the size of the company; 2) the industry it is in; 3) the philosophy of the management group, and 4) the level of interest or concern placed on auditing by the chief executive and the board of directors. In a very small business, the owner-manager will usually perform the role of internal auditor by continuously monitoring all business activities. In larger

companies, employees who fulfill internal auditing functions are known by a wide variety of titles control analysts, systems analysts, business analysts, internal consultants, evaluators, and operations analysts.

The Institute of Internal Auditors (IIA) is an international governing body for internal auditors that brings some uniformity and consistency to the practice. The IIA provides general standards for performing internal audits and serves as a source for education and information. In its standards, the IIA defines the internal auditing function as an independent appraisal function established within an organization to examine and evaluate its activities as a service to the organization. The objective of internal auditing is to assist members of the organization in the effective discharge of their responsibilities.

There is theoretically no restriction on what internal auditors can review and report about within an organization. In practice, internal auditors work within the parameters of the company's overall strategic plan, performing internal auditing functions so that they are coordinated with the larger goals and objectives of the organization. Internal auditors perform a variety of audits, including compliance audits, operational audits, program audits, financial audits, and information systems audits. Internal audit reports provide management with counsel and information for making decisions or improving operations. When problems are discovered, the internal auditor serves the organization by finding ways to prevent them from recurring. Internal audits can also be used in a preventative fashion. For example, if the internal auditor communicates potential problems and risks in business operations during his review, management can take preemptive action to prevent the potential problem from developing.

DEVELOPMENT AND CURRENT STATUS OF INTERNAL AUDITING PRACTICES

Prior to the twentieth century, companies and other institutions relied on external auditing practices for financial data and other information that affected their operations. The growing complexity of American companies after World War I, however, required better techniques for planning, directing, and evaluating business activities. These needs, coupled with the stock market crash of 1929 and increased evidence of questionable accounting practices by corporations, led to the creation of the Securities and Exchange Act of 1934. This legislation established the Securities and Exchange Commission (SEC) as a monitor of corporate financial reporting. In the wake of these developments, the new thrust for internal auditing was to verify financial statements, as well as to continue testing transactions. World War II led internal auditors into the assurance of compliance with government regulations. The boom that followed, with the growth of conglomerates and international subsidiaries, imposed further responsibility upon the auditors, requiring them to review the adequacy of corporate procedures and practices in operational evaluations, as well as performing the financial audit.

The importance of quality internal auditing was further underlined with the passage of the Foreign Corrupt Practices Act and the establishment of the Financial Accounting Standards Board. While these developments did not specifically call for an internal auditing function, internal auditors were poised to help management fulfill the additional requirements implicit therein. In the 1980s, highly publicized business failures and fraudulent financial statements that went undetected by external auditing firms gave further merit to the concept of internal auditing.

In December 2001, the Enron Corporation, which had ranked as the seventh-largest U.S. corporation in terms of revenue just one year earlier, filed for bankruptcy protection. A string of similar high-profile bankruptcies of very large corporations followed. Serious allegations of accounting fraud were made and extended well beyond the bankrupt corporations to include some of the nation's largest and most reputable accounting firms. Confidence was shaken, the country was still reeling in the aftermath of the terrorist attacks of September 11, 2001, and the stock market was dropping. The SEC acted by proposing regulations requiring enhanced certification of the financial statements of all publicly traded companies by their CEOs and CFOs. The U.S. Congress was quick to follow suit and passed the Sarbanes-Oxley Act, which was signed by President George W. Bush in July 2002.

The Sarbanes-Oxley Act is a wide-reaching and complex law that imposes heavy reporting requirements on all publicly traded companies. Meeting the requirements of this law has increased the workload of auditing firms and increased the need for internal audits and controls in publicly held companies. In particular, Section 404 of the Sarbanes-Oxley Act requires that a company's annual report include an official write-up by management about the effectiveness of the company's internal controls. The section also requires that outside auditors attest to management's report on internal controls.

Private companies are not covered by the Sarbanes-Oxley Act. However, analysts suggest that even private firms should be aware of the law and how it may affect them in specific circumstances. For example, if a private company anticipates being acquired by a public company, it will need to comply with Sarbanes-Oxley's requirements on internal controls for several quarters before the acquisition date in order to reassure the acquiring company's CEO and CFO that they may certify the consolidated financials. In general, Sarbanes-Oxley has raised the bar in terms of expectations regarding internal controls and corporate governance. Even so, the Act is by no means foolproof; many toxic assets that led to the global financial meltdown that began in 2008 were

in plain sight for all auditors to see. Unfortunately, the complexity of many of these securities hid their true risk.

INTERNAL AUDITING AND INTERNAL CONTROL

The manner in which internal auditing has evolved has linked it directly to the concepts and objectives of internal control. The IIA clearly advocates an internal control focus when it defines the scope of internal auditing: "The scope of internal auditing should encompass the examination and evaluation of the adequacy and effectiveness of the organization's system of internal control and the quality of performance in carrying out assigned responsibilities." At the most basic level, internal controls can be identified as individual preventive, detective, corrective, or directive actions that keep operations functioning as intended. These basic controls are aggregated to create whole networks and systems of control procedures which are known as the organization's overall system of internal control.

The IIA's *Standards of Professional Practice* outlines five key objectives for an organization's system of internal control: 1) reliability and integrity of information; 2) compliance with policies, plans, procedures, laws, and regulations; 3) safeguarding of assets; 4) economical and efficient use of resources; and 5) accomplishment of established objectives and goals for operations or programs. It is these five internal control objectives that provide the internal auditing function with its conceptual foundation and focus for evaluating an organization's diverse operations and programs.

KEY ASSUMPTIONS ABOUT THE INTERNAL AUDIT FUNCTION

There are three important assumptions implicit in the definition, objectives, and scope of internal auditing: Independence, competence, and confidentiality.

Independence. Internal auditors have to be independent from the activities they audit so that they can evaluate them objectively. Internal auditing is an advisory function, not an operational one. Therefore, internal auditors should not be given responsibility or authority over any activities they audit. They should not be positioned anywhere in the organization where they would be subject to political or monetary pressures that could inhibit the auditing process, sway their opinions, or compromise their recommendations. Independence and objectivity of internal auditors must exist in both appearance and in fact; otherwise the credibility of the internal auditing work product is jeopardized.

Related to independence is the assumption that internal auditors have unrestricted access to whatever they might need to complete an appraisal, including unrestricted access to plans, forecasts, people, data, products, facilities, and records necessary to perform their independent evaluations.

Competence. A business's internal auditors must possess the necessary education, experience, and proficiency to complete their work competently, in accordance with accepted internal auditing standards. An understanding of best business practices is essential for internal auditors. They must have the capability to apply broad knowledge to new situations, to recognize and evaluate the impact of actual or potential problems, and to perform adequate research as a basis for judgments; this includes the ability to access information through database programs and the Internet; in some cases, it may require access to employee e-mails. They must also be skilled communicators and be able to deal with people at various levels throughout the organization.

Confidentiality. Evaluations and conclusions contained in internal auditing reports are directed internally to corporate officers and the management board, not to stockholders, regulators, or the public. Presumably, officers and members of management can resolve issues that have surfaced through internal auditing and implement solutions privately, before problems become insurmountable. Management is expected to acknowledge facts as stated in reports, but has no obligation to agree with an internal auditor's evaluations, conclusions, or recommendations. After internal auditors report their conclusions, management and the board have responsibility for subsequent operating decisions to act or not to act. If action is taken, management has the responsibility to ensure that satisfactory progress is made and internal auditors later can determine whether the actions taken have the desired results. If no action is taken, internal auditors have the responsibility to determine that officers and the management board understand and have assumed any risks of inaction. Under all circumstances, internal auditors have the direct responsibility to apprise officers and the management board of any significant developments that the auditors believe warrant ownership/management consideration or action.

It should be noted, however, that the confidential aspect of the internal audit function is not absolute. According to the SEC, internal audit reports must be made available for review in case of regulatory inquiries. Business owners may dislike this standard because of an understandable reluctance to divulge sensitive business information. But the SEC cites Section 21 of the Securities and Exchange Act, which grants the agency the power to subpoena financial records as part of investigations. The major stock exchanges of the United States, NASDAQ and the New York Stock Exchange (NYSE), have adopted similar positions regarding their own inquiries into alleged misdeeds, seeing internal audits as key indicators of supervision, policies, and controls within the firm in question. These exchanges generally regard failure

to produce internal audit reports or other records when demanded as violations of their basic tenets.

Under some circumstances, however, experts contend that a firm may be able to claim a legal foundation for withholding particular internal audit reports. According to *Compliance Reporter*, "If a specific report has been prepared under the supervision of legal counsel and for the purpose of providing legal advice to the firm and not for more routine business purposes, or the report has been specifically prepared at the direction of attorneys in anticipation of threatened litigation, then the report may be protected by either the attorney-client privilege or the attorney work product doctrine."

DIFFERENCES BETWEEN INTERNAL AND EXTERNAL AUDITING

Internal auditors and external auditors both perform the same function, but have different objectives and different focuses. Internal auditors generally consider operations as a whole with respect to the five key internal control objectives, not just the financial aspects. External auditors focus primarily on financial control systems that have a direct and significant effect on the figures reported in financial statements. Internal auditors are generally concerned with even small incidents of fraud, waste, and abuse as symptoms of underlying operational issues. But the external auditor may not be concerned if the incidents do not materially affect financial statements which is reasonable given the fact that external auditors are engaged to form an opinion only of the organization's financial statements. The external auditor does perform services for management, including making recommendations for improvement in systems and controls. By and large, however, these are financially oriented, and often are not based on the same level of understanding of an organization's systems, people, and objectives that an internal auditor would have. It should be recognized, however, that the traditionally limited role of the external auditor has broadened in recent years to include an increased operational review; this may be a direct repercussion of corporate fraud in the first decade of the 2000s.

The comparison of internal auditing to external auditing considers only the external auditors' traditional role of attesting to financial statements. During the 1990s a number of the large public accounting firms began establishing divisions offering "internal auditing" services in addition to existing tax, actuarial, external auditing, and management consulting services. Predictably, the event has caused a flurry of debate among auditors about independence, objectivity, depth of organizational knowledge, operational effectiveness, and true costs to the organization. In light of government bailouts of large corporations, it is essential for internal auditing practices to be completely above board if an external audit is performed and finds discrepancies, legal action may ensue.

One option available to small business enterprises is to investigate the possibility of "co-sourcing" its internal audit functions with an outside consultancy. "Co-sourcing arrangements with outside vendors allow the in-house auditors to retain responsibility for the internal audit process while relying on the outside entity for specialized technical skills and personnel," wrote C. William Thomas and John T. Parish in *Journal of Accountancy.* "By contract, a company that outsources loses day-to-day control over its activities to the vendor usually a professional service firm."

As Thomas and Parish note, the relative autonomy of the internal audit function makes it an ideal candidate for co-sourcing. Under such an arrangement, the outside vendor can attend to specialized elements of the internal audit function, such as "reconciliation of specialized accounts; valuation, disclosure and Environmental Protection Agency compliance issues for certain types of inventory; and reconciliation of foreign accounts where business customs pose review problems." In return, the company saves expenses on permanent staff, gains greater in-house flexibility in evaluating projects and practices, and garners the ability to maximize its access to specialized knowledge by selecting vendors for each functional area.

There are potential drawbacks to the co-sourcing arrangement, however. Thomas and Parish cite staff concerns over long-term job security, the possibility of "turf battles" between in-house auditors and outsourced consultants, and loss of in-house focus on "big picture" issues of company-wide profitability and efficiency as stumbling blocks. However, they charge that "a cost-conscious, proactive internal audit group with custom-designed co-sourcing programs retains the advantages of outsourcing along with the benefits of having an in-house internal audit staff, such as knowledge of management methods, accessibility, responsiveness, loyalty, and a shared vision for the organization's strategic business goals."

TYPES OF INTERNAL AUDITS

Various types of audits are used to achieve different objectives. The types of audits briefly described below illustrate a few approaches internal auditing may take.

Operational Audit. An operational audit is a systematic review and evaluation of an organizational unit to determine whether it is functioning effectively and efficiently, whether it is accomplishing established objectives and goals, and whether it is using all of its resources appropriately. Resources in this context include, but are not limited to, funds, personnel, real property, equipment, materials, information, intellectual property, and physical space used by that department. Operational audits can include evaluations of workflow and propriety of performance measurements. These audits are tailored to fit the nature of the operations being reviewed. "Carefully

done, operational auditing is a cost-effective way of getting a higher return from the audit function by making it helpful to operating management," wrote Hubert D. Vos in *What Every Manager Needs to Know About Finance.*

System Audit. A system analysis and internal control review is an analysis of systems and procedures for an entire function such as information services or purchasing.

Ethical Practices Audit. An ethical business practices audit assesses the extent to which a company and its employees follow established codes of conduct, policies, and standards of ethical practices. Policies that may fall within the scope of such an audit include adherence to specified guidelines in such areas as procurement, conflicts of interest, gifts and gratuities, entertainment, political lobbying, ownership of patents and licenses, use of organization name, speaking engagements, fair trade practices, and environmentally sensitive practices.

Compliance Audit. A compliance audit determines whether the organizational unit or function is following particular rules or directives. Such rules or directives can originate internally or externally and can include one or more of the following: organizational policies; performance plans; established procedures; required authorizations; applicable external regulations; relevant contractual provisions; and federal, state, and local laws.

Financial Audit. A financial audit is an examination of the financial planning and reporting process, the conduct of financial operations, the reliability and integrity of financial records, and the preparation of financial statements. Such a review includes an appraisal of the system of internal controls related to financial functions.

Information Systems Audit. A systems development and life cycle review is a unique type of information systems audit conducted in partnership with operating personnel who are designing and installing new information systems. The objective is to appraise the new system from an internal control perspective and independently test the system at various stages throughout its design, development, and implementation. This approach intends to identify and correct internal control problems before systems are actually put in place because modifications made during the developmental stages are less costly. Sometimes problems can be avoided altogether. There is risk in this approach that the internal auditor could lose objectivity and independence with considerable participation in the design and installation process. In this type of audit, an internal auditor may benefit from a background in information technology (IT).

Program Audit. A program audit evaluates whether the stated goals or objectives of a certain program or project have been achieved. It may include an appraisal of whether an alternative approach can achieve the desired results at a lower cost. These types of audits are also called performance audits, project audits, or management audits.

Fraud Audit. A fraud audit investigates whether the organization has suffered a loss through misappropriation of assets, manipulation of data, omission of information, or any illegal or irregular acts. It assumes that intentional deception has occurred.

INTERNAL AUDIT PLANNING FOR THE SMALL BUSINESS OWNER

Business consultants strongly encourage small-business owners to establish self-auditing practices. "Not many years ago a company measured its success by how much of its product it was able to sell," stated Jeffrey Davidson and Charles Dean in *Cash Traps: Small Business Secrets for Reducing Costs and Improving Cash Flow.* "Today success is heavily influenced by the ability to keep costs under control and, of course, to maintain a healthy cash flow. Volatile interest rates, shrinking profit margins, and increasing operational costs are causing many businesses to reassess and upgrade their internal control procedures."

For a small-business owner, knowing what areas to audit and where to commit resources is an integral part of the internal audit function. A long-range audit plan provides a complete view of audit strategy and coverage in relation to the relative significance of functions to be audited. The goal is to plan an audit strategy that is cost-effective and emphasizes audit projects that have high impact or address areas of significant risk. An in-depth understanding of the organization and how it operates is a prerequisite for the audit planning process. Developing the plan first requires identifying and listing all auditable units or functions. (This is frequently called the "audit universe.") Next, a rational system must be devised to assign significance and risk to each auditable unit or function. Based on perceived significance and estimated risk, the audit priorities and strategies are documented in the audit plan.

Business owners and managers, however, should recognize that the internal audit process must be dynamic. Its emphasis should adapt to the changes that take place in the organization over time. Departure of key people, changes in markets, changes in customer demographics, new competitors, and other factors can dramatically affect the operations of small businesses and corporations. Some organizational practices and existing internal control systems may become obsolete as new technology emerges. Legal and regulatory environments shift as government agencies shift from one political standpoint to another. Consequently, risks and

significance rankings, the audit universe, and audit strategies will change. The successful small-business owner, though, will learn to anticipate such changes, and adjust his or her internal auditing strategies accordingly.

AUTOMATED GUIDED VEHICLE (AGV)

The term "automated guided vehicle" (AGV) is a general one that encompasses all transport systems capable of functioning without driver operation. The term "driverless" is often used in the context of automated guided vehicles to describe industrial trucks, used primarily in manufacturing and distribution settings, that would conventionally have been driver-operated.

Since their introduction in 1955, automated guided vehicles have found widespread industrial applications. AGVs are now found in all types of industries, with the only restrictions on their use mainly resulting from the dimensions of the goods to be transported or spatial considerations. Many applications of AGVs are technically feasible, but the purchase and implementation of such systems is usually based on economic considerations.

The uses of AGVs can be divided into four main areas of application: 1) supply and disposal at storage and production areas; 2) production-integrated application of AGV trucks as assembly platforms; 3) retrieval, especially in wholesale trade, and 4) supply and disposal in special areas, such as hospitals and offices. In all of these settings, AGVs have been found to reduce the damage to inventory, make production scheduling more flexible, and reduce staffing needs. But, as with any other major capital decision, implementation of these robotic systems must be undertaken cautiously.

AGVS AS PART OF A FLEXIBLE MANUFACTURING SYSTEM

AGV usage is growing. One reason is that as manufacturers strive to become more competitive, they are adopting flexible manufacturing systems (FMS). These systems integrate automated material handling systems, robots, numerically controlled machine tools, and automated inspection stations. Flexible manufacturing systems offer high capital utilization and reduced direct labor costs. They also reduce work-in-process inventories and make it possible to work with much shorter lead times. Because the systems are flexible, they are more responsive to changes in production requirements. These systems offer high product quality and increased productivity.

Flexible manufacturing systems can benefit from the linkage with AGVs. While robots are often highlighted as saving billions in production costs, at some plants including steel and other metals plants automated material-handling systems have made the biggest inroads. Today, there are hundreds of instances of computer-controlled systems designed to handle and transport materials, many of which have replaced conventional human-driven platform trucks. Although only a single component of a flexible manufacturing system, automated material handling systems have advantages of their own. These include reduction in damage to in-process materials, simplified inventory tracking and production scheduling, increased safety, and the need for fewer personnel than in conventional systems.

ECONOMIC VIABILITY OF AGVS

United States Steel-Posco, I/N Tek and I/N Kote, Allegheny Ludlum, Logan Aluminum, Alcoa, and Kennecott Copper all use automated guided vehicles to move steel, aluminum, and copper coils within their mills. Although the choice of a transport system is often viewed as a technical issue, like every capital decision it demands a comparative economic study. When selecting an investment calculation procedure a business should consider that transport systems provide assistance only in achieving the actual production performance of the organization (i.e., the application of a transport system has no actual market value).

In *Industrial Management Principles of Automated Data Processing*, Hartmann suggests following a simple investment formula to compare the costs of AGV systems. The cash value of savings from the AGV divided by the cash value of extra costs (compared to the old system), plus the difference in initial outlay (which sets the cash value difference of extra costs and cash value difference of the initial outlay against savings) will determine the true cost of implementing AGVs. The larger the comparison factor, the more favorable the investment. In performing this calculation, a business must consider both fixed and variable costs. Fixed costs are incurred independently of the degree of loading, while variable costs depend on the degree of loading the AGVs.

PLANNING FOR AGV IMPLEMENTATION

It is difficult to improve the material flow in existing organizations, since in most cases there are relatively few opportunities to reorganize existing installations or to recover the costs involved. Once the decision to restructure material flow using AGVs has been made, however, certain criteria need to be examined to achieve the full advantages of an automated, yet flexible system.

The first criterion is the physical material flow. By examining the type of goods transported (or load units), the order of transport operations, the quantity framework of the material flow, and the distances of connections within the network, the organization can begin to outline the type of transportation best suited for its material handling requirements. Once the type of transportation is identified, the space and floor conditions need to be addressed. The width of transport lanes or gangways, any gradients that have to be negotiated, and the type of floor installation required for specific types of trucks all need to be considered carefully. Finally, the choice of AGV can be made. Again, close consideration must be given to transport function, the material flow densities, and the overall process organization.

Computer simulations are often used in planning complex transportation systems. Facilities may require pathways, wire-guidance systems, automatic cranes, and additional computer software and hardware to run the entire AGV system. Some AGV systems use laser scanners or a form of virtual vision as guidance systems. AGV systems can reduce manual handling damage, and the vehicles are always available, alleviating problems associated with scheduling employees on nights, weekends, and holidays.

As more and more industries turn to AGVs to lower overhead costs, more layoffs could result; in addition, employees who stay on will need a higher level of education or experience, and may even need a strong background in IT and robotics to operate and work with AGVs properly and safely. The trend in AGVs is on an upward turn, and implementation is no longer confined to large factories or mass production. Warehouses, factories, and other spaces that utilize AGVs are often referred to as "smart warehouses." AGVs are an important variable in the trend of money- and energy-saving tactics for both small businesses and larger coporations.

UNUSUAL APPLICATIONS

Unique applications of a very customized AGV system are the Mars rovers, Spirit and Opportunity. These are automated guided vehicles that are operated on Mars and are directed via radio-transmitted instructions from Earth by a team at the National Aeronautics and Space Administration (NASA). They have spent over 5 years (originally landing in 2004) travelling the surface of Mars, frequently stopping to collect materials and perform scientific analysis. Their mission is a big success for NASA and represents one of the more unusual applications of AGV to date.

AUTOMATED STORAGE AND RETRIEVAL SYSTEMS (AS/RS)

Automated storage and retrieval systems (AS/RS) are inventory management systems that are widely used in manufacturing facilities, distribution centers, and "smart" warehouses throughout the United States and the world. AS/RS systems generally consist of machines that move up and down one or multiple parallel storage aisles on tracks, wires, or other markers. AS/RS machines store and retrieve products and materials for dissemination to internal and external destinations alike.

The advantages of these systems are numerous. They provide users with increased inventory control and tracking, including greater flexibility to accommodate changing business conditions. They are well utilized to fufill Internet orders and automated recurring orders from specific merchants and buyers. These AS/RS systems are comprised of modular

subsystems that can be easily replaced to minimize downtime and extend the service life of the overall system. They also reduce labor costs, thereby lowering necessary workforce requirements, increasing workplace safety, and removing personnel from difficult working conditions (such as cold food storage environments and the tight confines of a server room). Perhaps most significantly, however, AS/RS systems can produce major savings in inventory storage costs, as vastly improved warehouse space utilization both vertically and horizontally creates greater storage density.

CONDITIONS THAT ARE FAVORABLE TO AS/RS

The facilities in which AS/RS are used vary greatly. In an article that appeared in *Material Handling Management*, Howard Zollinger discussed some of the more favorable operational conditions and environments into which these systems have been successfully installed. The environments in which AS/RS can offer the greatest benefit are cold storage, frozen foods, and those in which very strict item tracking is necessary. In terms of the conditions into which an AS/RS installation may be most successfully installed, Zollinger listed the following ten conditions:

- Two or three shifts
- Critical inventory levels
- Production flexibility is essential
- Joint storage of parts and tools
- High land cost areas
- No limit on building height
- Skilled technicians are on-staff or available
- High value parts or assemblies are used
- The number of stock keeping units (SKUs) in not large
- Tight existing site space in which an AS/RS installation may eliminate the need to move

Every situation is different but these guidelines provide an overview of the sorts of applications that are best suited to AS/RS.

INSTALLATION CONCERNS

Automated storage and retrieval systems do require a considerable upfront investment to install and an ongoing financial commitment to maintain. "Maintaining highly integrated systems requires training and experience and is not without occasional frustrations," noted Michael Wigington in *Plant Engineering*. "Even the most experienced AS/RS user struggles to support the changing requirements of maintaining aging technology and tired mechanization." The cost of purchasing and implementing an effective automated storage/retrieval system is significant as well, encompassing everything from pre-purchase analysis of supply chain and inventory management needs to the actual purchase price of AS/RS equipment and software. In addition, experts in the use and maintenance of AS/RS systems note that companies often experience significant ongoing costs for maintenance and updating of various subsystems.

These capital expenses can tempt some business owners to cut financial corners, buying "bargain" systems that are ill-equipped for extensive, long-term use. In many cases, such decisions can end up costing far more in the long run. "A long and reliable service life [for an AS/RS system] begins with procurement, not maintenance," wrote Wigington. "Light-duty storage systems are particularly vulnerable by failing to deliver well-engineered equipment and software. These systems require a high level of upkeep and experience a sticky, entangled web of mechanical, electrical, and software problems." When such disruptions occur, the impact can be devastating to small and mid-sized businesses, especially if the only manner in which they control and file inventory information is automated or held on servers that can crash. (For this reason, backup external data stores are always recommended.) The toll of interrupted AS/RS service extends from the measurable (lost production and shipping revenue, increased labor costs for repair) to the intangible (diminished workforce confidence in the company's operations, downgraded client confidence). As a result, businesses are urged to examine the long-term implications of their choices when they incorporate an automated storage and retrieval system into their operations.

An AS/RS can make a marked difference in production and progress for many large operations, but may not be best suited for smaller firms whose employees rely heavily on human interaction to effectively operate as a team and meet the goals of the company. Technology is not always the answer; keeping a human element even in a smart warehouse or factory is still important to a firm's overall success. While automated storage and retrieval systems can save on costs and create a more organized environment, like all technology, the supervision of such a system is always important; to err is not always solely a human characteristic.

MOVING INTO NEW MARKETS

AS/RS systems have helped many industries hurdle the difficulties of storage and retrieval in warehouses and factories. In 2010 automated storage and retrieval systems were implemented by pharmaceutical company Boston Scientific. This is an intriguing development, since drugs and medical supplies are sensitive products that have traditionally been controlled only by human hands, not robotic ones. According to Boston Scientific's vice president of operations, Ken Pucel, the AR/RS system employed "is able to provide us a proven

solution with the flexibility and ease-of-use of a single technology for our needs". Other industries with highly sensitive inventories where AS/RS systems may eventually move into include computer servers, computer components, and logic chips.

AUTOMATION

Automation is the art of making processes or machines self-acting or self-moving. Automation also means the technique of making a device, machine, process, or procedure more fully automatic, and therefore more efficient. Automated machinery may range from simple sensing devices to autonomous robots and other sophisticated equipment. Automation of operations may encompass the automation of a single operation or the automation of an entire facility.

There are many different reasons to automate. Increased productivity is normally the major reason for many companies desiring a competitive advantage. A faster pace in "smart warehouses" is fueled by the consumer need to receive anything from pharmaceuticals to handheld devices faster; as consumer needs quicken their pace, so does the need for faster ways of storing and retrieving inventory.

Automation also offers low operational variability. Variability is directly related to quality and productivity. Other reasons to automate include the presence of a hazardous working environment and the high cost of human labor. Some businesses automate processes in order to reduce production time, increase manufacturing flexibility, reduce costs, eliminate human error, or make up for a labor shortage. Decisions associated with automation are usually concerned with some or all of these economic and social considerations.

For small-business owners, weighing the pros and cons of automation can be a daunting task. The speed with which technology is advancing combined with a natural resistance to change makes it easy for a business owner to put off changes in the hope that by waiting he or she will be able to acquire more powerful automation equipment for less in the near future. But consultants contend that it is important not to put off implementation of new and more efficient technologies.

TYPES OF AUTOMATION

Although automation can play a major role in increasing productivity and reducing costs in service industries as in the example of a retail store that installs bar code scanners in its checkout lanes automation is most prevalent in manufacturing industries. Over the past few decades, the manufacturing field has witnessed the development of major automation alternatives. Some of these types of automation include:

- Information technology (IT)
- Computer-aided manufacturing (CAM)
- Numerically controlled (NC) equipment
- Robots
- Flexible manufacturing systems (FMS)
- Computer integrated manufacturing (CIM)
- Virtual Receptionist
- Photonics Module Align, Assembly, and Test (PMAT)

Information technology (IT) encompasses a broad spectrum of computer technologies used to create, store, retrieve, and disseminate information both wirelessly on local networks, and on the Internet through FTP sites and other virtual storage centers. Most of the more flexible and non-industry-specific advances are now being made within the information technology field.

Computer-aided manufacturing (CAM) refers to the use of computers in the different functions of production planning and control. CAM includes the use of numerically controlled machines, robots, and other automated systems in the manufacturing process. Computer-aided manufacturing also

includes computer-aided process planning (CAPP), group technology (GT), production scheduling, and manufacturing flow analysis. Computer-aided process planning (CAPP) means the use of computers to generate process plans for the manufacture of different products. Group technology (GT) is a manufacturing philosophy that aims at grouping different products and creating different manufacturing cells for the manufacture of each group.

Numerically controlled (NC) machines are programmed versions of machine tools that execute operations in sequence on parts or products. Individual machines may have their own computers for that purpose; such tools are commonly referred to as computerized numerically controlled (CNC) machines. In other cases, many machines may share the same computer; these are called direct numerically controlled machines.

Robots are a type of automated equipment that may execute different tasks that are normally handled by a human operator. In manufacturing, robots are used to handle a wide range of tasks, including assembly, welding, painting, loading and unloading of heavy or hazardous materials, inspection and testing, and finishing operations.

Flexible manufacturing systems (FMS) are comprehensive systems that may include numerically controlled machine tools, robots, and automated material handling systems in the manufacture of similar products or components using different routings among the machines.

A computer-integrated manufacturing (CIM) system is one in which many manufacturing functions are linked through an integrated computer network. These manufacturing or manufacturing-related functions include production planning and control, shop floor control, quality control, computer-aided manufacturing, computer-aided design, purchasing, marketing, and other functions. The objective of a computer-integrated manufacturing system is to allow changes in product design, to reduce costs, and to optimize production requirements.

Virtual Receptionists are a type of automation used to answer client calls. The caller is funneled to the proper department after answering a few questions asked by the virtual receptionist. Highly sophisticated systems have been used by larger corporations since the early 2000s. By 2010, small-business owners began to understand that Virtual Receptionists can give callers the information they seek more rapidly while also lowering the cost of hiring several receptionists to be available 24 hours a day. The Virtual Receptionist can provide directions to the office, give office hours, and through a series of questions give clients information such as the balance owed on an account (or access to other account information). These automated systems can also route callers to the appropriate representative allowing them to leave a message or be rerouted to a human receptionist to make an appointment during business hours.

Photonics Module Align, Assembly, and Test (PMAT) allows makers of transducers, LEDs, photosensors, and fiber optic devices (known collectively as optoelectronics) to reduce production time, making it possible to get new products to market faster. This is a huge advantage to smaller companies in an industry where technology changes so rapidly. By using "fixturing and control software" PMAT gives producers of such products the ability to produce and machine a highly diversified inventory in far less time than any previous automated systems used in the optoelectronics industry.

AUTOMATION AND THE SMALL BUSINESS OWNER

Understanding and making use of automation-oriented strategic alternatives is essential for manufacturing firms of all shapes and sizes. It is particularly important for smaller companies, which, due to their inherent advantage of being more flexible, are able to implement changes somewhat more quickly and thus gain competitive advantage more quickly. But experts note that whatever the company's size, automation of production processes is no longer sufficient in many industries. The need for more advanced automation systems, such as those that allow "distance automation," are necessary to automate certain actions when a factory or warehouse is overseas and commands are coming from a control center in the United States, for example. Using distance automation allows smaller firms to stay ahead of the curve by giving them extra time to change product specs before going to market.

With technology trends changing at a dramatic pace, some technology is at risk of becoming obsolete before it reaches the shelf. Having the ability to make minor changes in how a product is made from a great distance will allow businesses to forego releasing products that will not sell in a fast-paced technology marketplace.

The computer has made it possible to control manufacturing more precisely and to assemble more quickly. Today, with the aid of computer-automated systems, companies must move to the next logical step in automation the automatic analysis of data into information that is useful to employees in implementing on-the-fly changes to production processes. Opportunities now lie primarily in the automation of information and not in automation of labor. The work that is being done now in advanced manufacturing is work to manage and control the process.

Small-business owners face challenges in several distinct areas as they prepare their enterprises for the technology-oriented environment in which the vast majority of them will operate. Three primary issues are employee training, management philosophy, and financial issues.

Employee Training. Many business owners and managers operate under the assumption that acquisition of sophisticated automated production equipment or data processing systems will instantaneously bring about measurable improvements in company performance. But as countless consultants and industry experts have noted, even if these systems eliminate work previously done by employees, they ultimately function in accordance with the instructions and guidance of other employees. Therefore, if those latter workers receive inadequate training in system operation, the business will not realize the full benefits of new system put into place.

An essential key to automation success for small-business owners is the establishment of a thorough education program for employees. It is also useful to set up a framework through which workers can provide input on the positive and negative aspects of new automation technology. The application of automation technology is growing, but it is the human factor that remains essential in assuring the effective installation and use of these new technologies.

Management Philosophy. Many productive business automation systems, whether in the realm of manufacturing or data processing, call for a high degree of decision-making responsibility on the part of those who operate the systems. As both processes and equipment become more automatically controlled, the need for human management of these automated systems does not diminish. These new technologies, which can be thought of as enabler tools, are changing the employee's job from one of physically laboring to one of monitoring and supervising an entire process.

But many organizations are reluctant to empower employees to this degree, either because of legitimate concerns about worker capabilities or a simple inability to relinquish power. In the former instance, training and/or workforce additions may be necessary; in the latter, management needs to recognize that such practices ultimately hinder the effectiveness of the company. Part of implementing automating systems includes the reworking of the entire process, including the roles and tasks held by all members of an organization.

Managers must be sensitive to employee fears of automation systems they can have an intimidating presence and employees who have been in a given industry for decades might find the transition daunting. Another legitimate fear employees may have is being laid off or being replaced by machines. Managers should lay these issues to rest by helping workers understand that automated systems have to be supervised and maintained, and that while job descriptions may change, humans still play a role in storage and retrieval. As Mark J. Perry, professor of economics and finance at the University of Michigan at Flint, noted in 2009, "Workers today produce twice as much manufacturing output as their counterparts did in the early 1990s and three times as much in the early 1980s, thanks to innovation and advances in technology that have made today's workers the most productive in history."

Financial Issues. It is essential for small businesses to anticipate and plan for the various ways in which new automation systems can impact on bottom-line financial figures. Factors that need to be weighed include tax laws, long-term budgeting, and current financial health.

Depreciation tax laws for software and hardware are complex, which leads many consultants to recommend that business owners use appropriate accounting assistance in investigating their impact. Budgeting for automation costs can be complex as well, but as with tax matters, business owners are encouraged to educate themselves for this ongoing process. With the relatively short life of most new technology, it is critical that annual reinvestments on technology become a part of all business plans. Deciding upon an affordable spending level requires a strategic look at the business to determine the role that new technologies play in the success of the business.

Once new automation systems are in operation, business owners and managers should closely monitor financial performance for clues about their impact on operations. As with any potentially cost saving or time saving process, the savings are only achieved if the process is correctly implemented. Proper monitoring of the new systems helps to identify problems with their implementation and make corrections so that the anticipated savings can be obtained. The cost of business lowers with the use of automation only when proper training and management occur; with more complex technology in play, the "average employee" will need to be highly skilled a background in IT will be increasingly important as automation technology becomes an integral part of nearly all industries.

AUTOMATION AS A PRODUCT

While most people think of efficiency within a company warehouse or storage facility, the Green movement has turned automation into a product sold to consumers, mainly by small businesses specializing in automation, retrofitting, "smart homes," and sustainable structures. With the exponential increase in green homebuilding, home automation systems are the next generation in home energy management. Putting the consumer in the driver's seat, home automation allows homeowners to control how much electricity, gas, water, and other utilities they are using at any given time. Home automation saves energy in the home much the same way that it does in factories and warehouses by circumventing human intervention which cannot measure output with the accuracy that a computer or robot can. As with any automated system, its effectiveness will be determined by who

is in control of automated devices and the degree to which they value saving energy.

AUTOMOBILE LEASING

Leasing an automobile is an alternative to purchasing that usually enables consumers to pay lower up-front costs and make affordable monthly payments. In addition, leasing cars allows small-business owners to free up liquid assets to be used toward other items needed to open or run a business. At the end of the lease period, however, the leasee does not own the vehicle. Instead, he or she may opt for automobile leasing arrangements to pay for the use and depreciation of the vehicle over the duration of the lease. For an individual, purchasing automobiles with cash is usually the most cost-effective option, followed by financing a purchase and, finally, leasing. However, when it comes to small businesses, leasing cars or fleets of cars may be a more cost-effective business move.

The best option in leasing a car depends to a large extent on the financial situation an individual or small business finds itself in. In many cases, leasing affords individuals and businesses access to more expensive vehicles, or the option to pay a lower monthly amount than they would under a purchase arrangement. Leasing can be an attractive option for small-business owners because of the tax deductibility of lease payments on cars used for business purposes. Many special lease deals have been established with small-business owners in mind, especially when businesses opt for fleet leasing a deal with a fleet car dealership that enables businesses to lease many cars, vans, or other vehicles at an even lower cost than an individual lease.

BUY OR LEASE?

In 2009 automakers like General Motors had a lean time leasing vehicles because of the difficulty in obtaining financing for consumers and small businesses. Indeed, car leasing for most in the auto industry fell dramatically in 2008 and 2009, but experienced a mild upswing in the first quarter of 2010. Many consumers and business owners alike have to resort to leasing a vehicle by putting more money down and paying higher interest rates due to poor credit or a previous Chapter 7, Chapter 11, or Chapter 13 bankruptcy not an uncommon financial situation in the wake of the 2008 housing bubble and mortgage crisis.

The decision of whether to buy or lease an automobile depends upon a number of factors. First, it depends upon how long consumers tend to keep cars before obtaining new ones. Leasing tends to make more sense when consumers or entrepreneurs such as real estate agents change cars at least every 4 years, because then monthly car payments are a basic part of their budget. Second, the buy-or-lease decision depends upon the amount of annual mileage the consumer tends to put on cars. Leasing is less attractive for people who regularly drive long distances, since most leases impose mileage limits (generally 12,000-15,000 miles annually) and charge a high fee for excess mileage. However, many car dealers allow buyers to purchase extra miles at a reduced rate at the time the lease is signed. Finally, the decision depends upon the consumer's budget. Leasing is a good way for people on a limited budget to minimize up-front costs, since they are usually required to pay a down payment consisting only of the first month's lease rate plus a security deposit.

It is also important to note, however, that there can be hidden costs associated with leasing. For example, many dealers charge a variety of lease-end fees. A disposition fee of several hundred dollars is common for consumers who

do not wish to purchase the car. In addition, dealers often levy "excessive wear and tear" charges against customers when they turn in their vehicle (typical charges are for significant paint scratches, large windshield cracks and chips, upholstery and carpet burns, mismatched or bald tires, etc.). According to an article published in *Business Week*, "Leases: Dings to Watch," dealers penalize customers for such charges on nearly 30 percent of leased vehicles, charging an average of $1,600 per vehicle. In addition, some dealers establish maintenance rules for leased vehicles and charge fees when consumers fail to perform the required maintenance. In some cases, there are higher liability insurance requirements for leased vehicles than for those acquired through a purchase arrangement, which also costs consumers more money. Finally, most dealers include a premature termination clause in the lease contract and charge consumers a disposition fee, the car's residual value, and the remaining lease payments to end the lease early.

HOW AUTOMOBILE LEASES WORK

Like most financed purchases, automobile leases require consumers to make monthly payments. Rather than covering the principal and interest on a loan, however, these payments cover the use and depreciation of the car over the lease period. The amount of the payment is calculated using the purchase price (capitalized cost) of the vehicle, its expected residual value (cost less expected depreciation) at the end of the lease, a fraction of the going interest rate (called the leasing factor), and applicable taxes. In some lease agreements an additional fee is included to cover all regular maintenance requirements.

The first step in calculating the monthly payment is to determine the monthly lease rate. This rate is equal to the capitalized cost, plus the residual value, multiplied by the leasing factor. The next step is to find the monthly cost of depreciation on the vehicle by subtracting the residual value from the capitalized cost, then dividing by the number of months in the lease.

A closed-end lease   the most common kind   means that the dealer assumes the risk that the car's residual value will be lower than expected at the end of the lease period. In this type of lease, the consumer can either buy the car for the residual value or walk away. In contrast, an open-end lease means that the consumer assumes the risk that the residual value will be lower than expected, and must make up the difference if this is the case. In exchange for accepting greater risk, the consumer usually makes lower payments in this type of lease. In general, 2- or 3-year leases tend to be the most cost-effective for consumers. Shorter leases do not justify the added taxes, while longer leases mean that the car will require too many repairs.

TAX BENEFITS OF LEASING

Leasing rather than buying an automobile often holds some tax benefits for small businesses. "Leasing may beat buying when it comes to tax benefits," wrote Donald J. Korn in "Lessees: Drive Hard for Every Tax Break," an article published in *Black Enterprise*. "Under current law, the interest you pay on a car loan is usually not deductible. However, when you lease, the finance charges are included in the monthly payment. If you get to deduct three-quarters of your lease payment, you're actually deducting three-quarters of the interest as well."

Small-business owners can deduct a percentage of their automobile lease payments   as well as fuel, maintenance, and insurance costs   from their federal income taxes. To calculate the deduction on a leased vehicle, a small-business owner would use the actual-expense approach. This approach adds up all the costs of operating the car for a year and multiplies that total by the percentage of the annual mileage that was attributable to business purposes. It is necessary to maintain an accurate mileage log and associated automobile expenses in order to support the deduction.

The mileage deduction is a better deal for self-employed people than for those who work for companies. Self-employed persons merely report the leasing expense with their other business expenses. Employees, on the other hand, must report leasing expenses with other miscellaneous itemized deductions; the deduction is only allowed for the amount by which the expense exceeds 2 percent of their adjusted gross income. It is also important to note that commuting to and from work is considered personal rather than business mileage for employees.

FLEET VEHICLE LEASING FOR SMALL BUSINESSES

A fleet of vehicles is a group of cars, trucks, vans, and other modes of transportation that are either sold or leased to a business enterprise for the purpose of carrying out their business. Delivering flowers or pizzas, transporting goods, or traveling to places where business services are provided are all examples of how fleet vehicles allow a small or medium-sized business to operate. But how do business owners decide whether buying or leasing a fleet is for their venture? Generally, on-hand capital is the deciding factor. Another major factor, as previously discussed, is the tax deduction available for business owners when leasing a car or a fleet of cars.

In addition, leasing a fleet can be a better option because business owners can allocate the monthly cost of the fleet into overhead, while buying a fleet of cars means that the entrepreneur underwrites the cost of depreciation without the option to lease new vehicles when the lease terms are completed. However, this does not mean that leasing is

always the best option. For example, a business owner needs to ensure through precise calculation that his or her fleet will not go over the mileage restrictions of a lease, and leased fleets will require a higher level of auto insurance than a fleet that was purchased outright.

WHY IS NEW LIFE BEING BREATHED INTO THE AUTO LEASING INDUSTRY?

As more businesses and consumers come out of the dark financially, they see the value in leasing again, and banks again have more leeway to lend them money in the wake of government programs such as the 2009 "Cash for Clunkers." That program allowed car buyers to put money they had gotten for an old car down for a new lease or purchase the idea was for consumers to buy and lease more environmentally friendly vehicles. (The "Cash for Clunkers" program did restrict the trade-in of a "clunker" to help pay for a lease only if that lease was for 5 or more years.)

B

B CORPORATIONS

Benefit Corporations, or B Corporations, are for-profit enterprises dedicated to solving social and environmental problems. Unlike traditional businesses with a social *component*, it is the *mission* of a B Corporation to be socially responsible. While not yet a legal status of incorporation, to be called a B Corporation a business must meet comprehensive and transparent social and environmental performance standards established by B Lab, the nonprofit organization that manages B Corp certification and adherence.

According to B Lab associate Hardik Savalia, "B Corp Certification differentiates companies 'walking the talk' from companies claiming to be green or socially responsible. This isn't just good news for consumers, but also investors and policymakers who want to support 'responsible businesses' but don't know how to identify them."

B CORPORATION CERTIFICATION

The process to become a certified B Corporation is straightforward. The business must first complete a survey assessing its policies and procedures based on standards of social responsibility as outlined by B Lab and submit documentation in support of those claims. If a company is found to be eligible based on its validated survey responses, B Lab requires the enterprise to alter its articles of incorporation to embed social responsibility into its legal framework in the form of consideration of the interests of employees, suppliers, customers, community, and the environment. Institutionalizing these values makes it more likely they will survive new investors, new management, and even new leadership. Once the changes are made, the business signs a 2-year agreement that certifies its relationship with B Lab; it can then begin to use B Lab's B Corporation logo in its branding and advertising. B Lab audits members to ensure continued compliance. The entire certification process is carried out online and is totally transparent.

BENEFITS OF BECOMING A B CORPORATION

Becoming a B Corporation provides three key advantages to certified businesses says Bart Houlahan, who cofounded B Labs with Jay Coen Gilbert and Andrew Kassoy. These are: "standards to define a sustainable company, a legal framework that allows companies to scale and raise capital, and a brand that makes it easy to support and patronize good businesses."

Certified B Corporations can differentiate their business from the growing cadre of green and cause-centered campaigns that are more marketing spin than actual ideology. The third-party certification allows organizations to "prove" that they truly embody socially responsible values and do not merely pay them lip service. B Corporations therefore can serve as business and community role models. They can also become market leaders, bolstered by billions of dollars of collective market presence provided by some 200 B Corporations in more than thirty-one industry segments across the United States. The exposure helps attract both consumers and investors looking to align with businesses that have a social conscience.

B Corporations also gain access to a wealth of information and resources through B Labs. This is designed to help them improve their social and environmental performance. Membership in a growing community of like-

minded entrepreneurs who are eager to share best practices likewise provides valuable intelligence and support.

B CORPORATION: ONE EXAMPLE

Greyston Bakery is a $6.5 million for-profit business owned by the nonprofit Greyston Foundation, which operates several intensive self-sufficiency programs in Yonkers, New York. The foundation started the bakery in the mid-1980s. Today the bakery makes various confections for retailers such as Ben & Jerry's. The company embodies the values it espouses as a B Corporation by hiring and training individuals with little or no work experience. Many employees come from troubled backgrounds involving drug dependency, homelessness, and abuse.

BACKGROUND CHECKS

A background check is a process involving authentication of information provided to a potential employer by an employee candidate during the application process. Background checks can also be used as part of promotion, reassignment, and retention decisions involving existing personnel. Confirming the veracity of a candidate's statements helps the business avoid the risks and liabilities associated with workplace fraud, theft, and violence that may come from poor hiring decisions.

Background checks typically include verification of employment and work performance history; income; criminal, military, driving, education (including professional licensure) records; workers' compensation claims; and credit history. Many employers also require drug testing as a condition of hire or continued employment. It is important to note, however, that businesses do not have unlimited rights to investigate an applicant's background and personal life. Employers that go too far may find themselves facing a lawsuit and significant financial liability, not to mention potentially devastating loss to public credibility.

In the small business enterprise, background checks are typically conducted by human resources personnel. Sometimes the supervisor of the position being filled also participates in the verification process. Outsourcing background checks to a third-party vendor is another option that provides the business with marginally more legal protection while freeing up substantial in-house time and resources.

BACKGROUND CHECK BASICS

Most small businesses cannot afford to make even one bad hiring decision; it could literally mean the difference between success and failure for some. The U.S. Chamber of Commerce reports that 30 percent of small-business failure is a result of employee theft. The following information can help businesses reap the rewards of background checks.

Liability Protection. Any enterprise in which employees interact with or provide a direct service to the public is liable if an employee harms a customer (or other employee) and it is discovered that the errant employee had a prior history of wrongdoing. Many small businesses cannot recover from such a blow. On the positive side, insurance companies may offer a discount to businesses that conduct prehire background checks.

Vendor Selection. Before selecting an outside provider to perform background checks, business owners should do some research to make sure the vendor is best suited to the company's specific background check needs. For example, a hazardous waste company may have different screening requirements than a uniform supply firm. "Instant databases" should be avoided; they may be inaccurate or out of date. It is best to choose an accessible, reputable company that will ensure the data collected is current and correct.

Fair Credit Reporting Act. It is important to understand and adhere to the provisions of the federal Fair Credit Reporting Act (FCRA). Paramount is the fact that employers must obtain employee/candidate written consent in order to perform a background check. The act is designed to protect employees/candidates and give them legal recourse in the event of a dispute, so compliance is key.

Payment Options. Background check providers try to encourage businesses to purchase every piece of information they uncover about an applicant. That increases fees greatly. Small business enterprises can save money by paying only for the information they need. Not all details are required for all positions.

Supplemental Background Checks. An Internet search offers a great complement to professional background checks because it enables the business to get a more personal sense

about the candidate. Valuable information, both positive and negative, can be gleaned from a person's blog or Facebook page.

BACKGROUND CHECKS AND THE LAW

Federal and state governments require background checks in certain situations, such as when issuing security clearances or dealing with disabled or elderly individuals. While there are no laws specifically governing employment background checks, some employment-related provisions of current laws do address related issues. Provisions of FCRA set privacy, accuracy, and other standards for credit checks, which are a major component of most background checks. The Federal Bankruptcy Act makes it unlawful for employers to discriminate against employees and job applicants based on bankruptcy status or bad debt incurred prior to filing for bankruptcy. Similarly, federal discrimination laws stipulate that employers cannot use poor credit reports as a ruse for discriminating against low-income minorities or disabled individuals in any aspect of employment. On the state level, defamation laws protect employees from libel and slander by former employers, potentially arising from the background check process. Some state civil rights and credit check laws also cover issues related to background checks.

The majority of existing background check-related laws seek to protect the employee from privacy violations and discrimination. As a rule they are not designed to significantly shield the business from potential legal consequences. In fact, many are intended to restrict the types of information that employers can collect and the extent to which that information can be used to make employment decisions.

BALANCE SHEET

A balance sheet is a financial report that provides a snapshot of a business's position at a given point in time, including its assets (economic resources), its liabilities (debts or obligations), and its total or net worth (assets less liabilities). "A balance sheet does not aim to depict ongoing company activities," wrote Joseph Peter Simini in *Balance Sheet Basics for Nonfinancial Managers.* "It is not a movie but a freeze-frame. Its purpose is to depict the dollar value of various components of a business at a moment in time."

Many small-business owners dread putting together balance sheets partly because it can be tedious, but also because it forces business owners to look at the real value of their business after subtracting liabilities. Nowadays, balance sheets, also sometimes referred to as statements of financial position or statements of financial condition, can be drafted far more accurately and quickly thanks to software, including QuickBooks, PeachTree, and Microsoft Office Accounting for Small Business. Many of these programs are designed specifically for small-business owners and offer step-by-step guidance for drafting balance sheets and other complex business documents.

Balance sheets are typically presented in two different forms. In the report form, asset accounts are listed first, with the liability and owners' equity accounts listed in sequential order directly below the assets. In the account form, the balance sheet is organized in a horizontal manner, with the asset accounts listed on the left side and the liabilities and owners' equity accounts listed on the right side. The term "balance sheet" originates from this latter form: when the left and right sides have been completed, they should sum to the same dollar amounts in other words, they should balance.

CONTENTS OF THE BALANCE SHEET

Most of the contents of a business's balance sheet are classified under one of three categories: assets, liabilities, and owner equity. Some balance sheets also include a "notes" section that holds relevant information that does not fit under any of the above accounting categories. Information that might be included in the notes section would include mentions of pending lawsuits that might impact future liabilities or changes in the business's accounting practices. Business owners can often benefit by creating separate limited liability companies (LLCs) that hold different assets and liabilities in different entities: if a judgment is filed against an LLC, only the balance sheet that shows what that LLC owns will be vulnerable in the lawsuit in most cases. Creating one LLC for equipment and another for real property, for example, will separate these items on balance sheets and better protect the assets of a business.

Assets. Assets are items owned by the business, whether fully paid for or not. These items can range from cash the most liquid of all assets to inventories, equipment, patents, intellectual property, and deposits held by other

businesses. Assets are further categorized into the following classifications: current assets, fixed assets, and miscellaneous or other assets. How assets are divided into these categories, and how they match corresponding liability categories, are important indicators of a company's health.

Current assets include cash, government securities, marketable securities, notes receivable, accounts receivable, inventories, prepaid expenses, and any other item that could be converted to cash in the normal course of business within one year.

Current assets should reasonably balance current liabilities. Current assets divided by current liabilities produce one of the "health indicators" of a company, the "Current Ratio." If that ratio is unfavorable, the company may lack liquidity meaning the necessary resources to meet its cash obligations. Since inventories are sometimes difficult to turn into cash, the "Acid Test" is another ratio used. It includes Current Assets less Inventory divided by Current Liabilities. The company's "Working Capital" is determined by deducting Current Liabilities from Current Assets. Rather than being a ratio, it is a dollar-denominated indicator of a company's health.

Fixed assets include real estate, physical plant, leasehold improvements, equipment (from office equipment to heavy operating machinery), vehicles, fixtures, and other assets that can reasonably be assumed to have a life expectancy of several years. In practice most fixed assets excluding land will lose value over time in a process called depreciation. Fixed assets are reported *net of depreciation* in an attempt to claim only their current value.

Fixed assets also include intangibles such as the value of trademarks, copyrights, and a difficult category known as "good will." When someone buys a company and pays more for it than the worth of current and fixed assets combined, the difference is written into the books of the acquired entity as "good will." The value of this good will cannot be extracted again unless by sale to another willing buyer.

Fixed assets, of course, should be in some reasonable balance with long-term liabilities. If a company owes more for capital purchases than those purchases are worth on its books, that is an indicator of potential problems.

Liabilities. Liabilities are the business's obligations to other entities as a result of past transactions. These entities range from employees (who have provided work in exchange for salary) to investors (who have provided loans in exchange for the value of that loan plus interest) to other companies (who have supplied goods or services in exchange for agreed-upon compensation). Liabilities are typically divided into two categories: short-term or current liabilities and long-term liabilities.

Current Liabilities are due to be paid within a year. These include payments to vendors, payable taxes, notes due, and accrued expenses (wages, salaries, withholding taxes, and FICA taxes). Current liabilities also include the "current" portion of long-term debt payable during the coming year. *Long-term liabilities* are debts to lenders, mortgage holders, and other creditors payable over a longer span of time.

Owners' Equity. Once a business has determined its assets and liabilities, it can then determine owners' equity, the book value of the business: the remainder after liabilities are deducted from assets. Owners' equity, also called stockholders' equity if stockholders are involved in the business, is in essence the company's net worth.

A company's "leverage" is calculated using its total equity. "Leverage" is long-term debt divided by total equity. The higher the leverage, the more a company is financed by borrowing. People then say that it is "highly leveraged," that is, it is more vulnerable to market shifts which make it difficult for it to service its debt. If leverage is small or modest, the company is able to control its own destiny with greater certainty.

BALANCE SHEETS AND SMALL BUSINESSES

As shown above, the balance sheet, if studied closely, can tell the small- business owner much about the enterprise's health. In *Balance Sheet for Nonfinancial Managers,* for instance, Simini points out that "in a well-run company current assets should be approximately double current liabilities." He goes on: "By analyzing a succession of balance sheets and income statements, managers and owners can spot both problems and opportunities. Could the company make more profitable use of its assets? Does inventory turnover indicate the most efficient possible use of inventory in sales? How does the company's administrative expense compare to that of its competition? For the experienced and well-informed reader, then, the balance sheet can be an immensely useful aid in an analysis of the company's overall financial picture."

THE IMPORTANCE OF BALANCE SHEET SOFTWARE FOR BUSINESS OWNERS

Unless a well-seasoned certified public accountant is handling the books, the small-business owner must rely on his or her own mathematical skills and understanding of how a balance sheet works. This includes understanding depreciation, how assets and liabilities weigh out, how to calculate equity, and other relatively complex details. In his 2008 book, *Practical Financial Management: A Guide to Budgets, Balance Sheets and Business Finance*, Colin Barrow discusses a "Business Brains Test" that was completed by 1,000 business professionals on the Internet. Of those tested,

more than one half were unable to perform a simple balance sheet computation correctly. According to Barrow, "This would indicate that many owner managers might not have any real idea what their accounts are actually telling them, particularly on matters of profitability."

Most small-business owners do not have the time to learn the complexities and minutia associated with drafting a perfectly accurate balance sheet. Balance sheet software offers entrepreneurs the ability to plug in pertinent data and get an accurate depiction of what is really going on with their business. Ease-of-use and quick delivery of a more accurately calculated balance sheet helps the small-business owner see where money is going, where it is coming from, and the true financial condition of the venture.

ENTERPRISE RESOURCE PLANNING AND SOFTWARE AS A SERVICE FOR BALANCE SHEETS

Enterprise Resource Planning (ERP) and Software as a Service (SaaS) offer both virtual and software methods for balancing books, maintaining Sarbanes-Oxley compliance, and compiling transaction history. ERP and SaaS give business owners an Internet-based program for bookkeeping and client management. Balance sheets can be updated in the blink of an eye, so if a new investor knocks on the door, facts and figures can be in his or her hands within moments. Both ERP and SaaS are gaining popularity with both small and medium-sized business owners. In a survey conducted by CompTIA in 2010, of 400 business owners that fall in the small to medium range, 30 percent said they would implement SaaS within the year these numbers are up 8 percent from 2009, and 16 percent from 2008.

E COMMERCE: GET PAID FASTER, IMPROVE YOUR BALANCE SHEET

It is often said that a business cannot consider a sale of a good or service a profit until the check has cleared or cash is in hand. The technology of today provides much faster ways of getting paid, and therefore improving the worth of the business on paper. This is especially important when financial climates make getting small-business loans more difficult.

Small businesses selling products on the Internet have a host of options that allow them to process payments in real time. PayPal is an Internet-based system that allows small businesses and sole proprietors to get paid by anyone with a PayPal account. Using a simple system that identifies PayPal account holders by their e-mail address, transactions are made using either the account holder's credit card or his or her bank account. In addition, small businesses can pay contractors and other employees using PayPal, which provides tracking of incoming and outgoing transactions that can be easily entered into balance sheets, invoices, payroll, accounts payable and receivable, and other financial documents. Other online systems that work like PayPal and offer similar features for small-business owners include Google Checkout and MoneyBookers. There are also software programs that incorporate a "shopping cart" onto a Web site, allowing real-time credit card transactions. All of these immediate forms of payment will help a business show profit margins much more quickly than the days of cash on delivery, when people had to wait for checks to clear or for money orders to arrive.

The small-business owner, by mastering the concepts hidden in the balance sheet, can also effectively foresee what a bank or other lender will see when looking at the company's balance sheet. Using this knowledge, the owner can know what to do in advance to make the numbers look better by making changes in purchasing, collections, prepayments, and by other management actions within the owner's purview.

BANKRUPTCY

Bankruptcy is a legal proceeding, guided by federal law, designed to address situations where a debtor either an individual or a business has accumulated obligations so great that he or she is unable to pay them off. Bankruptcy law does not require filers to be financially insolvent at the time of the filing. Rather, it applies a criterion in which approval is granted if the filer is "unable to pay debts as they

come due." Once a company is granted bankruptcy protection, it can terminate contractual obligations with workers and clients, avoid litigation claims, and explore possible avenues for reorganization.

Bankruptcy laws are designed to distribute the debtor's assets as equitably as possible among his or her creditors. Most of the time, with some exceptions, bankruptcy also frees the debtor from further liability. Bankruptcy proceedings may be initiated either by the debtor a voluntary process or may be forced by creditors.

According to the Administrative Office of the U.S. Courts, in Fiscal Year 2009, 1,402,816 bankruptcies were filed in federal courts, a 34.5 percent increase from the 1,042,993 filed in FY 2008. Of those in 2009, 58,721 were business bankruptcies a 52 percent increase from the 38,651 filed in FY 2008. Bankruptcy statistics are dominated by personal filings; these have been increasing sharply due in large part to rapidly increasing levels of personal indebtedness. In 2009 there were 1,344,095 "nonbusiness" bankruptcies an increase of 34 percent from the 1,004,342 nonbusiness bankruptcies filed in FY 2008. Both personal and business bankruptcies skyrocketed in the wake of the mortgage crisis of 2008, which left millions of Americans with adjusted rate mortgages (ARMs) and other subprime mortgages unable to keep up with house payments, subsequently forcing them to foreclose, sell their home for a loss, or face Chapter 13 bankruptcy for protection against lenders and creditors.

A major overhaul in bankruptcy law occurred in 2005. The Bankruptcy Abuse Prevention and Consumer Protection Act of 2005 (BAPCPA) was signed into law on April 20, 2005, and became effective October 17 of the same year. The law was designed, in part, to eliminate the practice of serial bankruptcy filings by individuals to escape carelessly accumulated debt. However, the vast majority of Americans filing for bankruptcy in 2008 and 2009 did so for protection against mortgage lenders, and not for the sake of evading credit card lenders. For many Americans, a Chapter 13 bankruptcy was a way to create a clean slate financially after dealing with a foreclosure or loan modification that did not enable them to save their home. Many small-business owners who owned real property that they were "upside-down on" had to file for Chapter 7 to protect personal assets from creditors looking for ways for business owners to make good on the debts accrued by their business.

CHANGES IN BANKRUPTCY LAW

Because of the mortgage crisis that began in 2008, President Barack Obama moved to change legistlation in bankruptcy in 2009. Part of his legislation, a mortgage modification bill dubbed the "Cram-Down bill," was passed by the House of Representatives on March 5, 2009. The bill would have allowed Americans facing severe arrearage on their mortgages to file for bankruptcy in an effort to pay arrearages on a payment plan while maintaining new monthly mortgage payments at a reduced interest rate. However, the legislation was killed in the Senate before the summer of 2009.

The vast majority of Republicans disagreed with the bankruptcy legislation that ultimately did not pass. Many Democrats argued that Americans facing job loss, foreclosure, and bankruptcy deserved the protection the mortgage modification bill would have offered, especially after footing the bill for the Emergency Economic Stabilization Act of 2008 (often referred to as a bailout of the U.S. financial system) that cost taxpayers in excess of $700 billion. In 2009 a stimulus package, the American Recovery and Reinvestment Act,was enacted to cut taxes as well as stimulate spending to breathe new life into the U.S. economy. While the stimulus package did not directly correlate to personal or business bankruptcy, it may have helped some businesses bounce back due to mild increases in spending throughout the remainder of 2009.

TYPES OF BANKRUPTCY

Types of bankruptcy are named after chapters of the bankruptcy code. Individuals may file under the provisions of Chapter 7 or Chapter 13. Corporations usually file under Chapter 11.

Chapter 7 Bankruptcy. Under Chapter 7 bankruptcy law, all of the debtor's assets including any unincorporated businesses that he or she may own are fully liquidated. Assets deemed necessary to support the debtor and his or her dependents, such as a residence, may be exempted. Even with the sharp rise in business bankruptcy filings in 2009, the "liquidation bankruptcy" is the most common filing for business failures, accounting for about 75 percent of all business bankruptcy filings.

The federal bankruptcy court develops a full listing of the debtor's assets and liabilities. The court identifies assets deemed to be exempted, such as a family home, and then divides remaining assets among the various creditors; a trustee is appointed to oversee distribution of proceeds. Unpaid taxes receive top priority; secured creditors are usually considered next. After all assets are liquidated and distributed, the debtor is freed of all further obligations. John Pearce II and Samuel DiLullo note the pros and cons of this procedure in *Business Horizons* as follows: "This type of filing is critically important to sole proprietors or partnerships, whose owners are personally liable for all business debts not covered by the sale of the assets unless they can secure a Chapter 7 bankruptcy allowing them to cancel any debt in excess of exempt assets. Although they will be left with little personal property, the liquidated debtor is discharged from paying the remaining debt." The debts thus discharged exclude certain items which the debtor is

required to pay despite the Chapter 7 filing. These include child support, alimony, recent income taxes, and student loans guaranteed by government.

The BAPCPA passed in 2005 limits the ability of a debtor to file under Chapter 7. The debtor can only file for "liquidation bankruptcy" if his or her median income is below the state median income; if it is higher, and the person can afford to pay out $100 monthly to liquidate debt, he or she may only file under Chapter 13. The new law also mandates credit counseling ahead of filing in a government-approved program.

Chapter 13 Bankruptcy. An individual or business filing under Chapter 13 turns over his or her finances to the bankruptcy court and is then obliged to make payments at the court's direction. Whereas Chapter 7 is characterized by full discharge of debt, Chapter 13 results in a repayment plan. Debtors prefer Chapter 7 because it usually allows them to hold on to their equity but, after a brief time, all obligations except such as listed above (child support, alimony, etc.) are eliminated. Courts prefer filings under Chapter 13 if the individual has any ability to satisfy the debt over time, and BAPCPA codifies this leaning of the courts by defining a "threshold" the state median income and an ability to pay $100 a month toward the indebtedness.

Provisions of BAPCPA have made Chapter 13 filings more burdensome for filers. Under the old dispensation, Chapter 13 filers enjoyed more protection against legal actions by litigants intending to recover funds or to impose new costs. Filers were protected against evictions; under BAPCPA they no longer are. They may lose their driver's licenses. They must continue to respond to divorce and child-support actions. BAPCPA has also moved family members with financial claims (e.g., for child support, alimony) to the first rank of recipients, ahead of secured creditors. Like Chapter 7 filers, Chapter 13 filers are also required to participate in mandatory financial management education.

Chapter 11 Bankruptcy. In a bulletin titled *Corporate Bankruptcy* the U.S. Securities and Exchange Commission summarizes why corporations file for bankruptcy under Chapter 11: "Most publicly-held companies will file under Chapter 11 rather than Chapter 7 because they can still run their business and control the bankruptcy process. Chapter 11 provides a process for rehabilitating the company's faltering business. Sometimes the company successfully works out a plan to return to profitability; sometimes, in the end, it liquidates. Under a Chapter 11 reorganization, a company usually keeps doing business and its stock and bonds may continue to trade in our securities markets."

Companies generally turn to Chapter 11 protection after they are no longer able to pay their creditors. Once a company has filed under Chapter 11, its creditors are notified that they cannot press suits for repayment (although secured creditors may ask the court for a "hardship" exemption from the general debt freeze that is imposed). Creditors are, however, permitted to appear before the court to discuss their claims and provide data on the debtor's ability to reorganize. In addition, unsecured creditors may appoint representatives to negotiate a settlement with the debtor company. Finally, creditors who feel that the debtor company's financial straits are due to mismanagement or fraud may ask the court to appoint an examiner to look into such possibilities.

Once a company asks for Chapter 11 protection, it provides the court, lenders, and creditors with a wide range of financial information on its operations for analysis even as it continues with its day-to-day operations; during this period, major business expenditures must be approved by the court. The business will also prepare a reorganization plan, which, according to *CPA Journal* contributor Nancy Baldiga, "details the amount and timing of all creditor payments, the means for effectuating such payments (such as the sale of assets, refinancing, or compromise of disputed claims), and the essential legal and business structure of the debtor as it emerges from Chapter 11 protection." Another important component of this plan is the disclosure statement, which presents projected business fortunes, proposed financial settlements with creditors and equity holders, and estimates of the liquidation value of the company. "The information included in the disclosure statement is critical to a creditor's evaluation of the reorganization plans offered for acceptance, as compared to possible other plans or even liquidation," wrote Baldiga.

The reorganization plan, if approved by the court and a majority of creditors, becomes the blueprint for the company's future. Principal factors considered in determining the feasibility of reorganization proposals include:

- Status of the company's capital structure
- Availability of financing and credit
- Potential earnings of the company after reorganization
- Ability to make creditor payments
- Management stability
- General economic conditions in the industry
- General economic conditions in geographic regions of operation

BAPCPA also introduced a number of changes governing Chapter 11 filings related to leases, payments made immediately prior to the bankruptcy filing, improved ability of creditors to reclaim products, caps on wage claims applicable to the pre-filing period, and other matters.

SMALL BUSINESS CREDITORS

Small businesses facing a bankrupt client have few options to protect themselves. If the debtor is engaged in questionable or fraudulent business activities, the small business may use legal actions beyond simply waiting patiently for a bankruptcy court to act. In situations where the debtor has incurred debt only a short time before filing for bankruptcy, creditors can sometimes obtain judgments that put added pressure on the debtor to make good on that liability. In addition, noted the *Entrepreneur Magazine Small Business Advisor*, "the law provides for a '60-day preference' rule. This rule is designed to prevent debtors from paying off their friends right before they file bankruptcy while leaving others stiffed. The 60-day rule allows the court to set aside any payments made up to 60 days before the actual filing of bankruptcy. Creditors who have been paid must return the money to the bankruptcy court for it to be placed in the pot. Business owners should keep in close contact with their ongoing customers so that they will have a good enough relationship to know far in advance to avoid being caught up in this rule." Indeed, small-business owners in particular should always be watching for clients/customers who show signs of being in financial distress. If such indications become present, the owner needs to determine the depth of that distress and whether his or her small business can withstand the likely financial repercussions if that client/customer declares bankruptcy. If a bankruptcy declaration would be a significant blow, then the business owner should weigh various alternatives to protect his or her business, such as cutting back on business dealings with the endangered company or tightening up credit arrangements with the firm.

Finally, advisors typically counsel small-business creditors to file confirmations of debt with the court even if it seems highly unlikely that they will ever be compensated. This filing allows creditors to write off bad debts on their taxes.

HOW LARGE CORPORATE BANK RUPTCIES AFFECT SMALL BUSINESS

The years 2008 and 2009 were unprecedented for corporate bankruptcy. The collapse of Lehman Brothers in 2008 was the largest bankruptcy in history. Many other large corporations filed for bankruptcy from 2008 to 2009, perhaps most notably General Motors, Chrysler, Washington Mutual, and CIT Group. The Obama administration's Auto Task Force assisted General Motors and Chrysler with financial planning and management. The task force gave Chrysler only one month to merge with another auto maker before the 30-day mark, Chrysler merged with Fiat, which then became a minority holder in Chrysler. In an effort to get the Chrysler brand back on its feet, the U.S. Treasury funded the merger.

The case for General Motors was different. In 2009, President Obama forced then-CEO of General Motors, Richard Wagoner, Jr., to resign. Obama decided on Frederick Henderson as the replacement for Wagoner. More than 50 percent of GM's officers were replaced as well. The Obama administration expected these carmakers to turn around their prospects by restructuring. GM opted to end several lines of their brand over time, including Pontiac, Saab, Hummer, and Saturn.

Because of the bankruptcy and restructuring of both Chrysler and GM, many small-business owners were adversely affected. Car dealerships that sold many GM and Chrysler brands were forced into closing. In June 2009, nearly 790 Chrysler dealerships were shut down with no compensation; they were given mere weeks of notice to tie up loose ends. More than 1,300 GM dealerships were closed as well, and dealers for both automakers filed for arbitration in an effort to recoup damages caused by having to shut down with little to no notice. An estimated 95,000 dealership jobs were lost, adding to the already staggering job loss statistics across small, medium, and large businesses in the United States. Many dealers felt slighted. Given that these automakers were bailed out with more than $60 billion in government aid, many small business dealerships felt that they should have been given a chance to stay open, or at least a fairer chance at closing with the same integrity with which they had loyally sold the carmakers' products.

ALTERNATIVES TO BANKRUPTCY

A company that runs into serious financial difficulties has alternatives to bankruptcy. It can liquidate the business on its own and make payments to its creditors. "Such action may be achieved efficiently if [the business's] creditors... are few... and the assets... can readily be converted to cash," wrote Pearce and DiLullo. "If the number of creditors is large and the assets are numerous and difficult or time-consuming to sell (such as real estate), the protection, structure, and authority of the court may be needed."

Another option is for the company to place liquidation of assets in the hands of a trustee who subsequently pays creditors. The principal advantage of this avenue, wrote Pearce and DiLullo, is that the assets are thus protected from individual creditors who might otherwise file liens on the assets. "Composition agreements," meanwhile, can be used in situations where creditors agree to receive proportional (pro rata) payments of their claims in return for freeing the debtor company from the remainder of its debts.

These alternative strategies may enable some business owners to avoid the stigma of bankruptcy. But Pearce and DiLullo noted that pursuing these options involves considerable risk: "astute creditors will recognize such actions as precursors to bankruptcy and may modify their relationships with [the company], which could precipitate a

bankruptcy filing. If creditors believe that continuing in business will result in reduced assets, they may force a bankruptcy in order to stop operations and preserve the existing assets to pay outstanding debts."

CREDIT DENIED TO SMALL BUSINESSES: BANKRUPTCY AND FINANCIAL CRISIS

Large corporations were not the only ones hit by the Wall Street meltdown of 2008. Due to the tightening purse strings of national and small community banks in 2008 and 2009, thousands of small businesses were unable to get new lines of credit to keep the doors of their businesses open. In "Small Businesses in Distress," a January 2010 article in the *Detroit News*, Ed Deeb, president and CEO of the Michigan Business and Professional Association was quoted as saying, "You could go up and down any street and see stores closed, restaurants closed and gas stations closed because they couldn't get credit." Deeb added, "These people are frustrated. They don't know what to do." Deeb's sentiments were echoed by small-business owners who reluctantly filed for bankruptcy, went out of business, or had to let go employees they had worked with for years.

When small businesses do not have access to loans, their ability to grow or just keep up with inflation and weather drops in consumer activity is stunted. In better economic climates, small-business owners often turn to personal lines of credit to sustain a business venture. However, with business owners and other consumers already facing foreclosure, personal bankruptcy, or loan modification by the end of 2009, personal lines of credit were simply not an option for most.

While bankruptcy can be a good way to start fresh for many small-business owners, the effects it has on reputation and business relationships can be worse than losing assets. Small-business owners should look at all of their options, including alternatives to bankruptcy before filing; the assistance of an attorney that specializes in small-business bankruptcy is helpful, and often, consultations with this type of legal counsel is free. As the backbone of the American economy, small businesses must strive for financial independence through pragmatic money management, especially when the economic forecast is bleak.

BANKS AND BANKING

The banking sector of the economy can be viewed bottom-up or top-down. The top-down view shows central banks overseeing financial activities for an entire nation. Beneath them, full-service national commercial banks conduct business. At the bottom of the system are small, full-service community banks and specialized savings and loan institutions. Other specialized institutions, some regional, some local, fill in the fabric of banking. These include trusts and credit unions. Of greatest interest to the small business is the local community bank or the local branch of a national commercial bank.

Conisderable changes have taken place in the banking industry since 2003 due to a laissez-faire approach on the part of the U.S. government. The basic premise was that when operating in the absence of excessive regulation, investment banking and commercial banking markets would tend to correct themselves. This approach allowed

investment bankers to come into the commercial banking arena, leading to the creation of new investment vehicles that in many instances were so convoluted and complicated that no one truly understood how they worked. The ten largest banks in the United States were grossly overleveraged, causing a financial crisis that first reared its head in spring of 2008 with the collapse of Bear Stearns. The subsequent set of circumstances threatened to cripple the availability of capital and credit. Absent capital and credit, there was no possibility of commercial activity a scary reality for medium to small businesses as well as large corporations. U.S. taxpayers had to infuse the financial system with enough money to keep it from collapsing, which would have caused a complete seizure in commercial activity.

Since the Great Depression, the banking industry has evolved, and with it the legislation that governs its practice has changed. How financial institutions manage money has changed largely because of changes in legislation since the 2008 collapse. Many of these changes are designed to safeguard the marketplace from implosions like the housing bubble and mortgage crisis of 2008. The mortgage crisis was largely caused by buying and selling subprime mortgages from one financial institution to another despite the fact that homebuyers would eventually not be able to keep up with their mortgages. These "toxic debts" were sold to investors who would create pools of mortgages; they would then sell stock against these mortgages which were destined to go belly-up.

Shortly after the onset of the 2008 financial crisis, the former chairman of the Federal Reserve, Alan Greenspan, stated, "I made a mistake... in presuming that the self-interests of organizations, specifically banks and others, were such as that they were best capable of protecting their own shareholders and their equity in the firms." Evolving opinions of other economists and financial experts also caution that free enterprise cannot regulate itself without checks and balances from a centralized bank.

There were numerous mergers and buyouts of banks in 2007 and 2008. Banks that were already large, including Wells Fargo, JP Morgan, and Chase grew even bigger JP Morgan bought Chase, which bought Washington Mutual, and Wells Fargo bought Wachovia, which bought World Savings Bank, just to name a few. All of this merging forced economists to question the dangers of banking monopolies in the wake of an already extreme financial and economic climate for small-business owners and consumers alike. The availability of money typically diminishes in the face of frequent and large acquisitions this meant less money for small-business owners to borrow to grow their enterprises.

THE FEDERAL RESERVE

America's central bank, the U.S. Federal Reserve, operates through twelve regional banks. The Fed, as it is known, provides services like check clearing; more importantly, it regulates the banking sector and sets monetary policy by managing credit and the money supply. Its principal aim is to hold inflation in check. The Fed uses three major tools to do this job. First, it sets the rate at which banks can borrow from the Federal Reserve. High rates discourage and low rates encourage economic activity. Second, under law the Federal Reserve sets "reserve requirements." The nation's banks must place 20 percent of their deposits with the Federal Reserve; they may only lend out the remainder. If the Fed increases the reserve requirement, that takes money out of the economy. Lowering reserve requirements makes money available. Third, the Federal Reserve engages in open market operations that indirectly affect reserves. It either sells or buys Treasury securities on the open market. Holding a Treasury bill is, in effect, a savings: it takes money out of circulation. Thus the Fed sells securities to "cool" and buys securities to "heat up" a sluggish economy. The Fed thus decreases or increases the money supply. Such activities are reflected in interest rates that, of course, affect any small business. In this manner even a very small business is impacted by the activity of the Fed.

The power of the Reserve is not supported by some members of the Senate and Congress on both sides of the aisle. In his 2009 book, *End the Fed*, Ron Paul states, "The Federal Reserve System must be challenged. Ultimately, it needs to be eliminated. The government cannot and should not be trusted with a monopoly on money. No single institution in society should have power this immense. In fact, I believe that freedom itself is at stake in this struggle." In contrast, there are those that vehemently oppose the absence of a central bank as a regulatory agency in light of the events that finally hit critical mass with the collapse of Bear Stearns in the spring of 2008. Contrary to what Paul says, many economists and politicians believe that the mismanagement of the private sector, coupled with poor oversight on the part of regulatory agencies, were the cause of the financial collapse.

COMMERCIAL BANKS

Full-service commercial banks accept deposits from customers; the interest paid on such deposits is relatively low, but the funds up to a maximum of $250,000 are insured by the Federal Deposit Insurance Corporation (FDIC), an entity created by Congress in 1933 to restore faith in the banking system during the Great Depression. The bank places a portion of its deposits with the Fed (the "reserve requirement," see above) and lends the rest to others at a higher rate of interest be these loans to purchase cars, homes, or to finance business activities. Commercial banks

also generate revenues from services such as asset management, investment sales, and mortgage loan maintenance. By their very nature, banks are conservative. Most of their lending is secured. So-called investment bankers that finance start-ups are not to be confused with commercial banks. They are other types of financial entities. A commercial bank may operate an investment banking business, but not as part of its regulated activities. Small businesses should not look to banks to obtain start-up capital.

Most commercial banks are operated as corporate holding companies that own one or several banks. Because of regulatory constraints, banks that are not associated with holding companies must operate under restrictions that often put them at a disadvantage compared with other financial institutions. Holding companies are often used as vehicles to circumvent legal restrictions and to raise capital by otherwise unavailable means. For instance, many banks can indirectly operate branches in other states by organizing their entity as a holding company. Banks are also able to enter, and often effectively compete in, related industries through holding company subsidiaries. In addition, holding companies are able to raise capital using methods from which banks are restricted, such as issuing commercial paper. Multibank holding companies may also create various economies of scale related to advertising, bookkeeping, and reporting.

Commercial banking in the United States has been characterized by: 1) a proliferation of competition from other financial service industries, such as mutual funds and leasing companies; 2) the growth of multibank holding companies; and 3) new technology that has changed the way that banks conduct business. The first two developments are closely related. Indeed, as new types of financial institutions have emerged to meet specialized needs, banks have increasingly turned to the holding company structure to increase their competitiveness. In addition, a number of laws passed since the 1960s have favored the multibank holding company format. As a result, the U.S. banking industry had become highly concentrated in the hands of bank holding companies by the early 1990s. However, in January 2010 President Barack Obama introduced legislation to control some of the larger banking institutions in the United States. Obama's plan to restrict the power of "heavy hitters" on Wall Street was not greeted warmly by lobbyists for the banking industry, though for the most part, global opinion of the legislation was favorable. The idea behind the legislation was to avoid a repeat of the 2008 meltdown that cost American taxpayers hundreds of billions.

THRIFTS AND OTHER BANK LIKE INSTITUTIONS

Savings banks, savings and loan associations (S&Ls), and credit unions are known as thrift institutions or simply as "thrifts." Like commercial banks, they are depository institutions but, under law, deal with individuals rather than businesses. Small businesses are unlikely to do business with thrifts.

Trust companies act as trustees, managing assets that they transfer between two parties according to the wishes of the trustor. Trust services are often offered by departments of commercial banks. Insurance companies and pension funds, which are really outside the banking sector strictly viewed, fulfill some bank-like functions such as the management of savings. They typically invest their assets but are not good sources of small-business financing.

ELECTRONIC INFORMATION TECHNOLOGY IN BANKING

Electronic information technology, another major factor in the evolution of banking, is evidenced most visibly by the proliferation of electronic transactions. Electronic fund transfer systems, automated teller machines (ATMs), and computerized home-banking services all combined to transform the way that banks conduct business. Such technological gains have served to reduce labor demands and intensify the trend toward larger and more centralized banking organizations. A prominent example of this was Chase Bank's introduction of the "envelope-free ATM deposit technology that allows consumers and business owners to insert checks or cash with no envelope into an ATM and receive a receipt showing a scanned picture of checks deposited. This technology allows many checks to be posted more quickly and cash deposits to clear immediately. In addition, a concrete paper trail the deposit receipt with the scanned image of the deposited check is a tremendous advantage to clients if a banking error occurs. These kinds of advances have also diminished the role that banks have traditionally played as personal financial service organizations. Advances in online banking, Internet transfers, and online bill-pay systems are less time intensive and simplify balancing the budget for small- business owners. Sole proprietorships can open "Doing Business As" accounts with many banks that allow them to see their personal accounts and business accounts through one Internet portal, further simplifying transfers and paying both personal and company bills.

BANKS AND SMALL BUSINESSES

Small business is the fastest-growing segment of the American business economy and also a significant source of innovation. As a result, more and more commercial banks are creating special products and programs designed to attract small-business customers. The small-business owner looking for funds is best advised to seek out a local community bank. Tom Henderson, writing in *Crain's Detroit*

Business, sums up the situation: "Name changes and consolidations among the area's biggest banks capture headlines, but industry and government analysts say the activity also creates big opportunities for community banks. Those banks continue to carve out a niche by providing loans and lines of credit to small and medium-sized businesses." How small businesses are doing financially is typically a good indicator of how well the overall economy is doing. Citing a 2004 report by the Federal Deposit Insurance Corporation, Henderson says that "small banks have an advantage in small-business lending because it requires 'local expertise that is both characteristic of community banks and more favorable to some small-business borrowers, such as new or young firms with limited credit history.'"

There are a number of factors a small-business owner should consider when selecting a bank, including its accessibility, compatibility, lending limit, loan approval process, general services provided, and fees charged. Perhaps the best way to approach banks is to obtain referrals to business representatives or loan officers at three to five banks. This approach aids the small-business owner by providing a recommendation or association from a known customer, and also by providing the name of a specific banker to talk to. The company's accountant, business advisors, and professional contacts will most likely be good sources of referrals.

The next step in forming a positive banking relationship is to arrange for a preliminary interview at each bank to get a feel for its particular personnel and services. It may be helpful to bring a brief summary of the business and a list of questions. The small-business owner should also be prepared to answer the bankers' questions, including general information about the business, its primary goods and services, its financial condition, its banking needs, and the status of the industry in which it operates. All of these queries are designed to solicit information that will enable the institution to evaluate the small business as a potential client. After all the face-to-face meetings have taken place, the small-business owner should compare each bank to the list of preferred criteria, and consult with his or her business advisors as needed. It is important to notify all the candidates once a decision has been made.

Ideally, a small business's banking relationship should feature open communication. Consultants recommend regular appointments to keep the banker updated on the business's condition, including potential problems on the horizon, as well as to give the banker an opportunity to update the small- business owner on new services. The banker can be a good source of information about financing, organization, and record keeping. He or she may also be able to provide the small-business owner with referrals to other business professionals, special seminars or programs, and networking opportunities.

The small business climate changes with every change in the banking climate. Ideally, the small-business owner and his banker should have a symbiotic relationship the entrepreneur should be informed of economic changes or mergers that affect his bank just as the bank should be made aware of changes in the business owner's enterprise. With technological advances, all of this is easier to do than ever before.

BAR CODING

Bar coding is an automatic identification technology that allows data to be collected rapidly and accurately from all aspects of a company's operations, including manufacturing, inspection, transportation, and inventory elements. It is the most commonly used tool for automated data entry worldwide, and is widely regarded as one of the most important business innovations of the twentieth century.

Bar codes provide a simple method of encoding text information that can be easily read by inexpensive electronic scanners. The code itself consists of a series of adjacent parallel bars of differing widths similarly spaced apart. This pattern of bars and spaces sometimes referred to as the Universal Product Code represents alphabetic characters or numbers that are the unique identification for a certain product. First utilized in supermarkets and libraries, bar coding identification has grown over the years to have applications in many fields.

The key benefit for small businesses is reduction of time spent in managing inventory. Without barcodes, counting inventory can be a time-consuming process requiring days of labor time, but with bar codes the process can take only hours. Small businesses often consider using bar codes when they have a large amount of inventory, or when they deal in retail, but bar codes can have many additional uses for other types of small businesses. For instance, if the small business uses expensive technology that it cannot afford to lose, known as moveable assets, then the business can imprint these items with barcodes. This makes it easy for employees to check out and check in devices such as cell phones or computers.

There are costs involved in setting up even a simple barcode system. A small business can expect to invest at least $1,000 in a bar code system, including both hardware and software components. Hardware component include not only the scanners, but also the bar code label makers. Larger companies often imprint the bar code on the packaging or product itself, but smaller companies can use a small, specialized printer like a thermal label maker.

Today's retail businesses use bar code elements in complicated electronic point-of-sale (POS) systems. These systems enable businesses to capture information about inventory levels on a continuous basis. For example, a seller of health and beauty aids can scan the bar codes on merchandise as it leaves the store and transmit that data via an Electronic Data Interchange (EDI) system to its main suppliers. The supplier can then replenish the store's inventory automatically. Internally, the retailer can study the point-of-sale data to determine more effective ways of marketing and merchandising its offerings. Manufacturers, meanwhile, utilize bar code technology in work process control, property management, job costing, maintenance, inventory control, and in tracking shipping and receiving activities. In the latter instance, for example, scanners can be placed at the shipping areas of stores to monitor what products are being received by the store and what products are being sent out. This way, invoices can be automatically checked and bills can be immediately sent out with accurate information on what was shipped and when it was delivered.

Users tabulate bar code information with reading devices called scanners. "Contact" scanners are handheld devices that must either touch or come into close proximity to the bar code symbol to read it; these scanners are used in situations where bar codes are difficult to get at or are attached to heavy or large items that cannot easily pass across stationary scanners. "Noncontact" readers, by contrast, are usually stationary scanners permanently installed (at checkout counters, etc.). Some handheld scanners may also use non-contact technology. Whatever the choice, a non-contact scanner does not have to come in contact with the bar code in order to register its contents. It uses reflected beams of light to read the bar code.

A small business planning to use bar codes should familiarize itself with the appropriate symbology to be used on its products. A Web site of the Measurement Equipment Corporation lists more than 230 national and international standards organizations able to assist the user of bar codes depending on the kind of product to be coded. Examples are the Group of Terrestrial Freight Forwarders (GTF), the Chemical Industry Data Exchange (CIDX), and National Hardware Retail Organization (NHRO). Those looking for some general orientation may wish first to visit the Web site of the Uniform Code Council (renamed GS1 U.S. on June 7, 2005, but still referred to by many as UCC) one of the leading umbrella organizations in bar coding. Part of the preparation is to ensure that the bar codes the business produces meet certain standards of print quality. The ink used must be proven to have certain qualities of reflection and constancy so that regulation bar code readers can correctly interpret them. There are also regulations governing any serial numbers or other information that should be included with the bar code itself.

In order to qualify for UPC bar codes, a small business must first apply to GS1 for membership (the U.S. GS1 branch is located in Dayton, Ohio). If the small business qualifies for membership, it will need to pay $750 for an entrance fee and an annual fee of at least $150. This allows GS1 to give the business a unique identification number that no other business in the world has been given. Typically, GS1 bar codes are not needed if a small business only needs to keep track of items within the company itself.

If the small business prefers not to pay for membership dues, there are some companies that provide an alternative by buying the bar codes in bulk from GS1 and reselling them at lower prices. This may work well for businesses that have a small inventory that is relatively easy to keep track of. The method is cheaper but not without risks, and the small business may face trouble if the company from which they purchase bar codes fails, since the codes are technically given to the "parent"

company and part of that information is represented in the codes.

Today, bar coding technology stands as a ubiquitous part of nearly every industry of any size or economic significance. This is unlikely to change any time soon, according to experts. Analysts do note that use of Optical Character Recognition (OCR) technology has grown in the field of document image processing in recent years. OCR uses Portable Document Format (PDF) information to scan for actual shapes and designs, such as letters, with a more detailed scanner. But bar coding technology remains superior to OCR in terms of expense, accuracy, and ease of operator use, and its users continue to find new and innovative uses for its still-developing technology.

BARRIERS TO MARKET ENTRY

Entry into a real-world market is always in some way possible, yet it is also subject to constraints and limitations, except in purely theoretical descriptions. The two theoretical extremes are a state-supported absolute monopoly on the one hand (an insurmountable barrier to a new entrant) and a market on the other hand where entry has zero cost (a totally barrier-free market). Barriers to entry are constantly shifting, subject to a wide variety of factors, and opportunities for small businesses are constantly changing.

In actual practice, barriers to entry are always present to a new entrant: some investment is always required, however minimal it may be. If the market already exists, some unusual effort to convince existing customers to buy, along with channels to carry the goods, will be required. The subject of barriers, therefore, in academic or policy contexts, turns on the concept of maintaining a healthy degree of competition or, in international contexts, fair access to markets. Economic theory asserts that competition holds down prices and thus contributes to the common good. The natural tendency of competitors in the market is to limit competition in order to raise profits to a maximum. A conflict is inherent. Given the great complexity of markets and the presence of all manner of historical, locational, technical, and other advantages, sorting out "natural" and "artificial" barriers to entry or international trade is a never--ending activity.

The major categories that translate into barriers are cost, capital, know-how, location, and state power. These factors are intertwined. To give an example: A company with an absolute cost advantage may have acquired it by investing large amounts of capital, by ownership of patents no one can use except at a high cost, by being located in a region of extremely low labor cost, or because it is highly subsidized by the state. Know-how is often based on patents; patent protection is provided under state laws. Foreign imports may also create barriers to entry if the exporting country is able to keep costs low enough to beat out entrepreneurs who have higher labor costs in the country importing goods, a common barrier seen between the United States and several Asian countries.

In a paper published in the *Journal of Business and Industrial Marketing*, Fahri Karakaya reported the findings of a literature search aimed at determining barriers to entry by all kinds of enterprises. Karakaya found the following top-ranked barriers: 1) absolute cost advantages enjoyed by the incumbent; 2) economies of scale; 3) product differentiation; 4) the degree of firm concentration; 5) capital requirements to enter a market; 6) customers' cost of switching; 7) access to distribution channels; and 8) government policy.

Economies of scale are another form of cost advantage, specifically lower acquisition costs for raw materials (bulk purchasing) and lower overhead (overhead absorbed by more operations). Product differentiation, similarly, represents the consequences of investment in new and specialized products. Firm concentration is another way of saying that oligarchic structures prevent entry. In such cases access to distribution channels is also difficult. The cost of switching customers occurs frequently in industrial societies where highly integrated technical products play a role. It

is difficult, for example, to cause a customer to replace a well-established computer system with a new one. The cost savings must be very high.

Karakaya also conducted his own survey of executives, concentrating on industrial enterprises. His survey disclosed similar but slightly different rankings. The first eight barriers cited by his respondents were: 1) absolute cost advantages; 2) capital requirements; 3) incumbents with superior production processes; 4) capital intensity of the market; 5) incumbents with proprietary product technology; 6) customer loyalty advantage held by the incumbent; 7) incumbents with economies of scale; and 8) amount of sunk cost involved in entering the market.

All of the above applies equally to very large would-be entrants to a market and the aspiring small-business entrepreneur. The small-business owner will benefit by entering a market poorly served locally, especially if a special cost advantage, an unusually good location, or product differentiation exists.

However, small businesses can struggle dealing with the larger barriers to entry set by large corporations with influence and assets beyond the reach of a starting business. For this reason, small businesses find more success in developing their own, smaller barriers to entry after they have entered their own markets by targeting existing consumer needs. These smaller barriers to entry can range from a valued employee with contacts throughout the community to the ability to market "homemade" goods or "local" services that larger companies may not be able to provide. Not all barriers to entry require significant market share or funds to establish.

The most effective barrier to entry that a small business can establish is sales traction the ability to make and hold onto sales. When it comes to this powerful barrier, marketing and advertising are the most important tools for the small business. In order to create a niche for itself, the business must have a highly focused marketing campaign that can target core consumers and establish connections with customers while still falling within the budget and not making claims that the business cannot fulfill.

If a small business is focusing on online sales, there are also Web-based barriers to entry to take into account. Online businesses cannot depend on local barriers and instead must invest heavily in consumer trust. This trust is usually slanted towards younger people, who form most of the online marketing base. A standard Web page constricts business appearance and values to only a few artistic design choices, so it is best to make these choices carefully. Embracing other media opportunities such as online video marketing can also help establish trust and gain online market share. Fortunately, free design tools and easy-to-learn search engine optimization (SEO) practices still make online markets easier to enter for small businesses, although this is matched by a large amount of competition.

BARTERING

Bartering is the exchange of goods and services among businesses. The practice is as old as time, but since the late 1970s it has taken on a new life of its own and has grown into a major national and international activity, more recently mediated by means of the Internet. Bartering organizations and networks have come into being. These organizations have created and maintained new forms of money in the form of "trading credits." Trading profits are taxable; in turn, trading costs are deductible from taxes like any other costs. The principal justification of barter trading is threefold: barter exchanges offer new ways of finding markets, new ways of obtaining goods at lower costs, and bartering lowers participating companies' cash-flow requirements. The last of these justifications usually acts as the driving force, especially for small businesses interested in bartering.

Small-business bartering usually depends on extra goods or time that the business may have. If the business has extra, unused inventory, setting up a bartering system to get rid of it and obtain useful supplies or services instead is an efficient and worthwhile process.

Small business can barter in two different ways: locally and through large networks. Local bartering systems tend to be much more informal and based on immediate need. A small grocery store might agree to a supply a nearby tax consultant with coffee products for a certain number of months in exchange for tax services. Although these types of transactions are mostly informal, they should begin with a bartering contract and must still

be reported for tax purposes. The other type of bartering focuses more on supplies and business networking. This more far-flung system is based on trade networks and typically has strong online components. These larger organizations have their own bartering agreements that must be used, but for one-on-one bartering small businesses can still find and download barter contract templates for personal transactions.

A large amount of the bartering done in the United States is governed by the International Reciprocal Trade Association (IRTA), which is actively involved in bartering systems throughout the world. IRTA estimates that the modern trade and barter system generates approximately $12 billion worldwide ($20 billion, including non-IRTA barterers), earned in part by at least 250,000 businesses in the United States during 2008. The organization expects its numbers to continue growing throughout the 2010s.

BARTERING BASICS

Traditional bartering took the form of simple exchanges: I mow your lawn, you cut my hair. Modern bartering is much more complex. A company wishing to barter first joins a trading exchange. Sign-up fees ranging from $200 to $600 and monthly membership costs are usually involved. A broker may be assigned to the company. The goods or services to be bartered are priced by negotiation. In exchange for these the company receives trading credits. These credits work exactly like money but must be exchanged for goods/services available through the exchange the company has joined or other exchanges with which that exchange is affiliated. Each transaction has its own costs (10 to 15 percent of the transaction's face value) in addition to the assessed membership fees. Bartering exchanges, in effect, "make a new market" and also maintain a "currency" (the trading credits) to be used within that market.

Tina Traster, writing in *Crain's New York Business*, provides some valuable tips for those wishing to participate. She points out that barter transactions take more time; those in a hurry had better use cash. It is best to investigate, in advance, if the exchange has what the would-be participant needs. She reminds the would-be trader that taxes are due on all barter exchanges and the exchange will report them to the IRS on Form 1099B. She suggests that bartering is potentially a way of networking with new customers and should not be viewed as a one-time transaction.

Joanne Sammer, writing in the *New Jersey Law Journal*, shows the manner in which a small business used barter to get going. The story involves a two-lawyer start-up. The new law firm's principal joined two barter exchanges to kick-start the business. Sammer quotes the principal as saying: "As a small firm, we needed opportunities to find clients we ordinarily would not get." The law firm encounters twenty potential barter clients yearly. Many of these contacts eventually become cash-paying clients and also refer other paying customers.

TRENDS AND DIRECTIONS

Web-based barter trading appears to be the next major development in the barter industry. New entities are announced at regular intervals and have features designed to increase participation lower or no fees and a huge variety of difficult-to-find products (on the model of eBay).

One of the most common barter Web sites used for small transactions is Craigslist. While Craigslist can be used to communicate with other businesses locally and is useful for browsing what supplies or services are within reach for bartering purposes, small businesses should keep in mind that they should still have a signed barter contract. The International Monetary Systems barter network is a popular, more professional choice, although in this organization the business does not trade outright, but instead amasses "trade dollars" to buy supplies from others in the barter network. These larger organizations (like IMS and Itex) typically charge fees around 7 to 10 percent of each transaction. Small businesses will be more likely to choose these more complex systems if they can expect a consistent supply of unused inventory or service time.

The barter business appears above all to depend on participants who are low on cash and using barter as a way to get around this problem. This fact is hinted at by IRTA's own Web site, which says: "First things first, make sure that your business is stable with cash flow. If your business is already experiencing cash flow problems, don't assume that barter is going to solve them." If cash problems are the driving force, the ultimate expansion of this business will be indirectly governed by economic conditions unless other factors, such as networking and finding new clients, come to trump the primary motive for participation.

EVALUATING BARTER NETWORKS

Small businesses interested in exploring membership in a local, national, or international barter exchange should consider the following factors when examining networks:

- Examine the roster of network participants/members to ensure that they have goods and/or services of value to the small business concerned.
- Study the number of members and the frequency with which they trade. Some exchanges are much more active than others, depending on the trading philosophy of participants and the rules of the network itself.
- Examine the attractiveness of ancillary network services (consulting, member mixers, information newsletters, etc.) for their company.

- Study the size of the trades made within the network. Companies that are interested primarily in bartering expensive goods or services may find it difficult to find parties willing to engage in a barter agreement.
- Compare pricing structure and other financial aspects of the network to ensure that bartering makes financial sense for their business. Origination, monthly, and transaction fees can all vary significantly from network to network. In addition, entrepreneurs should attempt to gauge the level of sincere interest that the exchange has in helping their business. For example, some bartering networks limit the number of businesses offering the same goods or services so that benefits of membership are not diluted among too many companies.
- Study the geographic location of other businesses within the barter exchange. For some businesses, close proximity to other network participants is essential for membership to be financially viable.

BAYH-DOLE ACT

The Bayh-Dole Act of 1980 is federal legislation that gave universities, small businesses, and nonprofits the right to patent and license inventions arising from scientific research funded by U.S. government agencies. Also known as the University and Small Business Patent Procedures Act, the law provides incentives that encourage government, academics, and businesses to work together to commercialize scientific knowledge for the public good.

BACKGROUND OF ACT

The movement to transfer government-sponsored scientific research from federal laboratories and universities to the commercial sector began in earnest at the end of World War II. A 1945 report by presidential advisor Vannevar Bush outlined the economic benefits of sharing basic scientific research with private industry. Bush's influence led to the increased funding for basic research in defense, medicine, and other fields, plus the establishment of such agencies at the National Science Foundation and National Institutes of Health.

While these efforts did expand scientific knowledge, the government was less successful at putting new technologies into the hands of private business. By 1980 the federal government had some 28,000 patents, but only a small fraction of that total was actually licensed for commercial development. One problem was that the government agencies that funded research done by universities, federal scientists, and contractors retained title to the patents. Licensing policies were complex and inconsistent among the more than two dozen agencies that financed research. Agencies would not grant exclusive licenses for the technologies, so private companies were wary of spending money to commercialize products that others could later license. Also, universities had little incentive to make practical use of their discoveries when the federal government owned the patent.

In 1980 the U.S. Congress passed two laws to address those issues. The more important was the Bayh-Dole Act, which provided a government-wide system for universities, businesses, and nonprofits to patent and license inventions which had been developed using federal funds. The other legislation, the Stevenson-Wydler Technology Act, addressed technology transfer from federal laboratories. Both measures were aimed at using federal research funds to stimulate economic development as well as disseminate scientific breakthroughs for the public good.

The Bayh-Dole Act, sponsored by then-senators Birch Bayh and Robert Dole, reversed the previous assumption that the federal government owned the rights to products developed from research it had financed with taxpayer dollars. Under the new legislation, organizations and businesses could optionally take title to those inventions themselves, which provided financial incentives for universities to put more focus on commercializing basic research. Federal agencies could also grant exclusive licenses to patents they held, which they developed at

their own laboratories, or which they patented if universities and others decided not to take title on their own.

Since its implementation, the Bayh-Dole Act has been credited with substantially increasing the commercial use of academic research, particularly in the life sciences field. While only a handful of U.S. universities had actively patented and commercialized their research before that time, virtually all research universities now have a technology transfer office (TTO) to centralize the patent and licensing process. Statistics from the Association of University Technology Managers (AUTM) show that thousands of patent applications have been filed and licenses granted, plus hundreds of companies formed, as a direct result of Bayh-Dole. A number of other countries have also adopted models based on Bayh-Dole for controlling their intellectual property.

REGULATIONS

The Bayh-Dole Act (P.L. 96 517) was passed by the U.S. Congress in late 1980, with an effective date of July 1, 1981. The initial act was followed by a 1984 amendment, two presidential memorandums, and Office of Management and Budget (OMB) Circular A-124, which provided guidance to federal agencies. Bayh-Dole and the subsequent provisions were implemented into federal regulation in 1987 under 37 Code of Federal Regulation (CFR) 401, a rulemaking published by the U.S. Department of Commerce.

While Bayh-Dole applies to nonprofits and small businesses, most of its application has been among universities. While similar rules apply to all groups, most of the guidelines reflect academic practices.

According to the Council on Government Relations, an association of research universities, the major considerations to the Bayh-Dole Act and the related regulations include:

- Provisions apply to all inventions conceived or made practical under any federal grant or contract, even if the federal government is not the only fund provider.
- Universities must have written agreements with faculty and technical staff which require disclosing and assigning inventions.
- Institutions are obligated to disclose new inventions to the federal agency that provided funding within 2 months of the time the inventor makes written disclosure to the university.
- Universities generally have 2 years after disclosure to decide whether they will retain title to the invention. After that time, the federal agency may elect to take title of the invention.
- After electing to take title, the university has 1 year to file its patent application for the invention. It then has another 10 months to notify the funding agency whether it plans to seek foreign patents. As with the U.S. patent, an agency can file a foreign patent application if the university elects not to pursue patents outside the United States.
- Universities that retain title must provide the government with a global nonexclusive, nontransferrable, irrevocable right to use the invention.
- Reports must be filed periodically with the funding agency that discloses the university's efforts to make practical use of the invention. Agencies also have the right to conduct periodic audits to ensure compliance with the act.
- A company with an exclusive license to a patent for a product to be sold in the United States must substantially manufacture that produce domestically.
- Small businesses with less than 500 employees must be given preference when universities are marketing an invention, if those companies have the resources to commercialize that invention. However, a large company that provided research support in addition to the federal government can also receive the license.
- Universities must share a portion of licensing revenues with the inventor or inventors. Any revenues remaining after inventor royalties and expenses must be used for education or scientific research.
- In certain situations, the funding agency can take over the rights itself or require an institution to grant a license to a third party. The government can only elect these "march-in rights" under certain situations, such as deciding too much time has elapsed bringing the discovery to a practical use, or if health and safety issues arise.

RESULTS OF LEGISLATION

The Bayh-Dole Act is generally considered a success in meeting its goal to improve technology transfer between government agencies and the private sector. The Association of University Technology Managers (AUTM), which had 113 members in 1979, had grown to more than 3,000 by 2009. According to *Fortune* magazine, U.S. universities obtained 264 patents in 1979, the year before Bayh-Dole passed. AUTM's report for fiscal 2008 of academic technology transfer showed almost 19,000 U.S. patent applications, with 3,280 patents issued, 648 commercial products introduced, and 595 new companies formed.

While many of these new start-ups are not household names, a number of significant technology companies began with university research. According to *USA Today*, Stanford University earns more than $48 million

annually from 428 technology licenses. Some 70 percent of academic technology transfers are in the life sciences field, including MRI body scanning and such medications as FluMist, Warfarin, and the hepatitis B vaccine.

In 2002 the *Economist* called the Bayh-Dole act "possibly the most inspired piece of legislation to be enacted in America over the past half-century." The magazine added, "More than anything, this single policy measured helped to reverse American's precipitous slide into industrial irrelevance" following the sluggish technological growth of the late 1970s. In 2010 *Business Week* recognized "the important role that Bayh-Dole played in fueling the entrepreneurial economy of the last 30 years."

Even with that success, Bayh-Dole does have its critics who say the process should be modified to produce better results. A *Research Policy* article by David Mowery and Arvids Ziedonis found Bayh-Dole only had a "modest" impact on research at schools with long histories of patent activity, such as Stanford, Columbia, and the University of California. A study in the *Journal of Technology Transfer*, by Paul Swamidass and Venubabu Valusa, found low rates of commercialization of university inventions. Their survey stated that 75 percent of universities reported they are short of staff and budget for processing inventions. Robert Litan and Leesa Mitchell, writing in *Harvard Business Review*, maintained that requiring researchers to use their university's technology licensing office (TLO) has created a bottleneck that keeps inventions from getting to market quickly enough. Litan and Mitchell proposed letting inventors select their own licensing agent to bring new drugs to market more quickly, for example. A 2005 *Fortune*, magazine report noted that an unintended consequence of Bayh-Dole is a flood of lawsuits as universities, researchers, and corporations vie for control of new discoveries. The *Economist*, which 3 years earlier had hailed the legislation, expressed concern in 2005 that academic concern about potential financial windfalls from new discoveries has made researchers more reluctant to share their findings with peers.

Despite those concerns and periodic calls for reform, the U.S. Congress and federal regulators have generally left Bayh-Dole intact.

SMALL BUSINESS OPPORTUNITIES

While Bayh-Dole has had a major impact on how universities conduct research and how government-funded technology flows to the private sector, the act also provides opportunities for small businesses. Universities are generally required to give priority to businesses with less than 500 employees when they market licenses for new inventions.

An article by Ben Worthen in *CIO Magazine* advised entrepreneurs looking for new technologies to "consider going back to school not for extra credits, but for the tools to make their lives easier. Hundreds of colleges and universities offer access to research through their Offices of Technology and Licensing (TLOs)." Ashwin Rangan, the CIO of Conexant, told Worthen that the semiconductor company considers research universities to be "a source of competitive advantage." Universities can license technology to a firm, provide finance for research, or make start-up funds available to its faculty and students. Similarly, *Governing* magazine reported that a number of state economic development departments are putting millions of dollars into their research universities in a drive to create more jobs and revenues.

A report by *Inc.* magazine entitled "Universities: Your New Best Friend", found that interest in working with private firms has spread from business schools to engineering, medicine, and other academic departments. More schools are offering services to pair professors with entrepreneurs and to make funds available to make new enterprises. The article, by Emily Barker, suggests starting with the business school's entrepreneurship professor, networking with faculty, and opening other avenues of communication with a college or university to explore opportunities.

Overall, for small businesses and large corporations, along with the government, universities, and individual researchers, the Bayh-Dole Act has been credited with generating successful public-private partnerships that turn scientific research into practical products available to the public.

BENCHMARKING

Benchmarking is a management technique aimed at detecting "best practice" in other organizations and then adopting it in one's own.

According to Keith Sisson and his associates, writing in an occasional paper titled "All Benchmarkers Now?" the practice has its roots in Japanese reverse engineering efforts in the 1950s and in *kaizen*, meaning *continuous improvement*, a practice introduced by Toyota. Benchmarking, in other words, is a competitive response: "Others are doing a better job. How do they do it? Let's do the same thing." According to Sisson and his colleagues, the practice is "very much associated with Xerox in the USA, leading to the first book on the subject by the company's head of benchmarking in the 1980s.... Initially, in the late 1970s and early l980s, Xerox focused on the activities of its Japanese competitors. This 'competitive benchmarking' was quickly joined by 'generic benchmarking,' in which Xerox looked beyond immediate competitors, to include companies with strong practices outside their particular industry railways, insurance and electricity generation, for example."

Since that time, benchmarking has been applied in a formal fashion to all manner of technical and administrative procedures. The phrase has also come to be used somewhat loosely to indicate any kind of comparisons between companies, departments, and discrete processes. It may be applied very narrowly to such matters as Internet download time performance and as broadly as comparing marketing campaigns.

Benchmarking has become a well-accepted management tool among larger corporations, both as a means of remaining competitive and in justifying their own performance. Richard T. Roth, in *Financial Executive* begins his article on benchmarking by writing: "The benchmarking concept, a familiar one to most executives, keeps gaining converts. Benchmarking picked up with the onset of the recession in the late 1990s as companies began to use it as a tool to judge contributions to corporate performance and examine particular business failings."

HOW BENCHMARKING WORKS

Benchmarking is a study of best practices elsewhere and the implementation of such findings "back home." Studies may be very broad (generic benchmarking), industry-wide (industry benchmarking), specific to a business function like purchasing (functional benchmarking), or aimed at a particular process (performance benchmarking).

The general procedure involves selection of a target, identifying best practitioners, surveying best practices by interview and other means, analyzing the results, and making whatever changes are needed internally to apply the discoveries made.

Unless the practice is well-integrated and institutionalized, barriers to effective benchmarking abound, especially in smaller organizations. Formal programs usually require a substantial commitment of staff time and direct expenditures. For maximum effect, therefore, top management involvement is vital but not always forthcoming: benchmarking initiatives may arise at lower levels in order to "nudge" upper management. Identifying best practices may prove difficult and may involve extra costs. It is obviously most difficult to benchmark direct competitors: they tend to shy away from sharing the secret of their success. Once best practices have been identified, their analysis can present serious difficulties. Frequently a "best practice" is due to unique circumstances, an intangible quality like a leading personality, and is therefore very difficult to adopt. Finally, implementation of best practice may be fiercely resisted within the company.

For these reasons, benchmarking programs are most successful when their aims are fairly narrow and quantifiable. Awareness of the problem within the company should be widespread and shared, so that the new best practice techniques are reasonably accessible, and implementation is well rewarded.

BENCHMARKING AND SMALL BUSINESS

Benchmarking tends to be a method most suited to large, centralized, and bureaucratically organized institutions.

Smaller companies sometimes attempt it, but success appears to require effective top management participation. James Dodd and Mark Turner, in *National Public Accountant*, accurately assess small-business attitudes toward this management technique: "Most regard their businesses as too unique to warrant detailed comparison across industries," they write. "They [small businesses] see no valid comparisons and, therefore, do not recognize any meaningful benefit from examining practices outside their own industries." In addition, small businesses rarely have enough extra income to spend investigating competitors or other separate industries. The functional equivalent to benchmarking, however, does take place when small-business owners interact with competitors and peers in the marketplace and keep eyes and ears open.

In its most simple form, benchmarking is business comparison, and a small business can make such comparisons locally no matter where it is. Comparing success to general economic conditions and to industry reports can also be useful to small businesses. In the struggle of small businesses to stay meaningful to the public and up-to-date with current business practices, one of the most important tools is the Internet. The advance of social media has allowed even small companies to gather information successfully from a broad spectrum of the public and, in business circles, other companies. There are multiple programs, some available for free download, that allow businesses to search and sort information for terms, phrases, and ideas applicable to their industry. Almost every type of company has online forums, webzines, and other forms of mass communication that small businesses can use as informal benchmark data.

Many small business do not stop at collecting data. The Internet also makes collaborative benchmarking possible, a process in which a number of smaller businesses gather and create a collective benchmark report, combining resources to provide information they would be incapable of accessing otherwise. A strong example is the 2009 study conducted by small businesses using the Information Technology Effectiveness Index to compare IT systems. The collection of businesses entered information in a survey format and received a free benchmark report in return. In this case, the benchmark report showed that one in four small businesses received a failing grade in IT operation, which analysts believed was due to the habit of small businesses of cutting costs for IT projects before other business components.

Benchmarks can also be used by large organizations and governments to provide useful information to all businesses, large and small, about current business practices. This is a common occurrence when a particular initiative is being advocated, such as the corporate use of safer chemicals in consumer products. A primary benchmark report was created for this issue by the International Journal of Corporate Sustainability in 2005, with a 2010 update including information from other studies across America and Europe. These benchmarks are made available to all businesses so they have the ability to see if they are in compliance.

BEST PRACTICES

The phrase "best practices" or, in the singular, "best practice" is business jargon arising from the management tool known as "benchmarking." The assumption underlying this term is that production and management processes are uniform enough so that a "best practice" can be identified and then adopted more or less "as is" by another entity. This is obviously the case in technical areas, where the adoption of a "best practice" by others may be blocked only by patent

protection or cost concerns. When the concept is applied to management procedures, however, the transferability of "best practices" may be more difficult to accomplish. Benchmarking programs attempt to identify best practices in a sector, an industry, or a cluster of competitors. Best practices are quantified to the extent possible by developing measurements ("metrics") and then comparing the numbers to similarly developed values inside the surveying operation.

According to the consulting firm Best Practices LLC, companies exhibiting a best practice may not be best-in-class in every area. But due to industry forces or the firm's goal of excellence, practices have been implemented and developed that have brought the firm recognition in a certain area. Typically the best practices result in higher profits.

For small businesses, best practices are easier to follow than benchmarking information. Benchmarking usually requires outside research beyond the time and cost limits of small businesses, while best practices are the distilled results of industry-wide benchmarking, presented in easily-understood forms. This makes best practice data useful, but it also requires a certain amount of analysis by small businesses. Many larger businesses use the term "best practice" in their own marketing techniques and as a buzzword to sell their products, whether or not they are a benchmark standard.

IDENTIFYING BEST PRACTICES

Some firms are so well known for best practices in certain areas that it is not necessary to consult books, magazines, libraries, or the Internet to find the information. For example, Federal Express is often cited as having best practices among competitors in the expedited small package industry for their on-time delivery and package tracking services. Apple, with its iPod and iPhone, is often cited as being innovative and creative, while the L. L. Bean outdoor products and clothing company is frequently lauded for its customer service practices and return policy guarantees.

When a firm is benchmarking to learn about the best practices of others, often these superior methods are found in companies outside the firm's key industry segment. Thus it is important to research and observe companies in a wide variety of settings, countries, industries (even in the not-for-profit sector) to learn better ways to improve.

Information on best practices and innovative technologies can also be found on the Best Manufacturing Practices (BMP) Web site at www.bmpcoe.org. The goal of this site is to increase the quality, reliability, and maintainability of goods produced by American firms. One way BMP accomplishes this goal is to identify best practices, document them, and share the information across industry segments. They believe that by sharing best practices, they allow companies to learn from others' attempts and to avoid costly and time-consuming duplication of efforts. Companies profiled have submitted abstracts of what their organization does well; they include previous practices, changes to new processes, and information on implementation as well as quantitative details and lessons learned.

When dealing with financial best practices, small businesses are likely to find trends gravitating toward more cohesive and Web-based systems that allow for easier management of payroll and expense information. Instead of being a separate process, best practice payroll techniques are combining payroll with tax reporting, retirement account management, and electronic attendance monitoring. The online management of funds using business debit cards and other electronically based tools is also rising in popularity.

For telecommunications, small businesses should note that business practices as a whole are becoming more integrated with online services. To succeed, a small business needs to be able to manage information, services, and employees from both online and voice-data platforms. Along with this comes the current best practices in wireless networking, online security, and data management, which are subject to frequent updates.

Best practice marketing techniques differ from industry to industry, but they often involve out-of-the-box methods. Some practices (such as product integration) will be beyond the means of small businesses, but others like sensory branding (using scent and sound to differentiate brands) can be incorporated early on in a business's development. Online, best practice marketing dictates easy-to-navigate and simple Web designs.

When it comes to human resources, best practices tend toward solving particular problems, such as ways to integrate multigenerational workforces with mentor relationships, or instituting mandatory vacation time to help employees with work/life balances.

These are only a few different types of best practices. They can differ from practice to practice, and often the best way for a small business to learn best practices is to watch those who have been commended for their own efforts.

LEARNING FROM AWARD WINNERS

Other ways to identify best practices include observing businesses as a consumer or as a mystery shopper. It is also possible to identify best practices by examining professional journals and business periodicals. Companies that win various awards often exhibit best practices to emulate. The Malcolm Baldrige National Quality Award winners are a good group of companies to benchmark for best practices. The award is given to U.S. organizations that have shown achievements and improvements in seven areas: leadership, strategic planning, customer and market focus, information and analysis, human resource focus, process management, and business results.

Learning about the best practices of others is a valuable way for firms to gather fresh insights into possible methods of improving a myriad of aspects of their operations. It should be an important part of an organization's strategic planning activities.

BETTER BUSINESS BUREAUS (BBBs)

Better Business Bureaus (BBBs) are private nonprofit organizations that collect and report information to help consumers make informed decisions when dealing with businesses or charitable organizations. As an organization, the BBB is not a government or law enforcement agency; it does not have the power to collect money, administer sanctions, or impose other penalties against companies or individuals that engage in poor business practices. It does, however, have a certain amount of influence on both business and customer decisions. Faced with the prospect of losing customers because of unfavorable BBB rankings, companies have a significant incentive to adhere to proper business practices and address customer complaints.

In addition to their information-gathering activities, local BBBs also provide mediation services when disputes arise between customers and businesses, promote ethical business standards, maintain standards for truthful advertising, and share pertinent information (about possible fraudulent activity, etc.) with local and national law enforcement agencies. With the rise of e-commerce in the late 1990s, they have also become involved in efforts to address business fraud on the Internet. BBBs are licensed by the Council of Better Business Bureaus (CBBB) and governed by their own local boards of directors.

The most widely used service of the Better Business Bureau is its inquiry and information service, which daily updates information on industries. In fact, the BBB receives as many as 1,000 inquiries a day from consumers and businesses seeking reports on firms. These reliability reports are limited to marketplace practices and do not provide information on either individual or business credit information. BBB reliability reports contain information about the nature of the business, its principal officers, a 3-year summary of any complaints processed, and any government action involving the company's marketplace practices. Most Bureaus also note BBB membership (if any) in their public reports and indicate whether the firm in question participates in any special BBB programs to improve customer satisfaction. In addition, the BBB issues reports on products, services, and general business topics to promote educated comparison shopping by consumers and businesses alike. These reports are available on the Better Business Bureau Web site (www.bbb.org), which also provides businesses and consumers with the ability to file complaints.

Many small businesses and consumers also utilize the BBB's arbitration program. This system was instituted in 1973 as a way to help businesses and customers avoid litigation. "[It] uses trained volunteer arbitrators from the community," noted *Business First-Columbus.* "[They] perform their duties as a public service, the arbitration process is provided at no cost to the consumer and, in most instances, at no cost to the business. Depending on the dollar amount in dispute, the arbitration is either conducted by a single arbitrator or by a panel of three. The arbitrators' decisions are rendered within 10 days after the close of the hearing, and most cases are completed within 45 days after the process has been chosen by the parties."

In 2008 there were approximately 860,000 complaints filed through the BBB structure of the United States. Approximately 73 percent were settled through official inquiries, 23 percent were not settled, and the rest could not be pursued by the BBB. At the top of the list were cell phone service companies and auto dealers, followed by service industries such as banks, online shopping sites, and satellite providers.

USING A BBB

Locally, a small business can become connected with two of the most common business-oriented organizations: the chamber of commerce and the local BBB. The purpose of the chamber of commerce is to encourage local businesses and advertise their benefits to consumers. The purpose of the BBB is to protect local consumers from fraudulent or improper business practices.

For small businesses, BBBs can be an excellent source of information, especially when deciding on marketing methods or business practices. The online BBB

organization, for instance, offers information on ethical advertising practices and management purposes that can be viewed free of charge, an excellent resource for businesses planning new methods of operation. Businesses that do use the codes offered by the BBB will also be in excellent position to join their local chapter.

In addition to the codes that they maintain for ethical business practices, BBBs also collect and distribute best practice information and useful tips that are available to all interested businesses. BBB.org, for instance, offers a complete section on data security for small businesses. Launched in 2009, this resource offers information on handling and transferring sensitive data, dealing with customer data and data theft, and becoming part of the global data community to receive news on legal and technological developments.

BBBs also produce occasional reports on fraudulent business activities which can be useful for companies that want to avoid being targeted by scams. According to report issued by BBB.org, the top three scams of 2009 were: 1) Acai supplement "free trial" offers; 2) stimulus and government grant scams; and 3) robocalls offering lower interest rates or membership to no-call lists. Other useful reports are issued throughout the year.

BBB MEMBERSHIP

Each Better Business Bureau is independently supported by businesses that operate within their designated service area. BBBs receive their operating funds from the membership dues that are paid by business and professional groups in those service areas. Companies that become members of their local Better Business Bureau receive several benefits in return. These usually include: 1) membership identification on the company's place of business; 2) access to all BBB publications, programs, and services; 3) right to participate in BBB training programs in such areas as arbitration, customer service, and mediation; and 4) affiliation with other member businesses.

The BBB maintains certain standards for membership to ensure that the organization's integrity remains unquestioned. Companies with bad track records are not accepted, and companies that do become members have to adhere to certain rules. For example, BBB members must respond to consumer complaints presented by the BBB; if they do not do so, they lose their membership. In addition, the BBB attaches a number of conditions to ensure that companies do not join simply for the purpose of trumpeting their membership. BBBs do not endorse or recommend businesses or what they sell. They do not allow members to advertise their membership, because consumers may reach the erroneous conclusion that the BBB is endorsing the member's business. In addition, BBB membership dues are not tax deductible for federal income tax purposes, though they may be tax deductible as an ordinary and necessary business expense. Finally, the CBBB has noted that membership does not confer any advantages when complaints arise: "The BBB's integrity is on the line every time we review and process a complaint. If a Bureau were to favor members over nonmembers in a complaint, such action would destroy our most valuable asset the public trust that we have held for over 80 years."

A branch of the Council of Better Business Bureaus maintains information on various charitable organizations. These reports, which are maintained by the national Council but updated by local BBBs, cover charitable and other nonprofit organizations. Information typically included in these reports includes the group's background, its current programs (if any), the structure of its governing body, its tax-exempt status, its fundraising practices, its financial standing, and notification as to whether the organization complies with the CBBB's "Standards for Charitable Solicitations."

These reliability reports can be invaluable to both individual and business customers who want to make sure that they are conducting business with an ethical company. The BBB cautions, however, that it does not maintain reports on every business operating in a given area. The reasons for this vary. In some cases, the business is relatively new. In other instances, the company may simply operate in such a manner that customers see no reason to file a complaint.

BIOMETRICS

Biometrics is a field of science that uses computer technology to identify people based on physical or behavioral characteristics such as fingerprints or voice scans. "Bio" in the name refers to the physiological traits measured; "metrics" refers to the quantitative analysis that provides a positive identification of an individual. Biometrics is gaining widespread use in the business world as means to make the workplace more secure and efficient. The technology provides a high level of security for facilities and computer networks. It also helps employees increase their productivity by providing instant identification for time cards, payroll processing, computer logins, phone or copy machine usage, and myriad other purposes. In the age of terrorism, biometrics is increasingly recruited to help in tracking potentially dangerous individuals.

The U.S. government is deploying biometrics as well. On January 1, 2006, the U.S. State Department announced the installation of biometric "entry systems" at U.S. land ports. According to the State Department release, "The program compares biometric data such as digital and inkless fingerscans and digital photos, as well as biographical information collected by the Department of State, against U.S. terrorist and criminal watch lists to identify and intercept criminals and violators who try to enter the United States."

One benefit of biometrics is that it relieves people from the burden of remembering dozens of different passwords to company computer networks, e-mail systems, and Web sites. In addition to creating distinct passwords for each system they use or Web site they visit, people are expected to change their passwords frequently. Employees who have trouble remembering their passwords may be more likely to keep a written list in a desk drawer or posted on a bulletin board, thus creating a security risk. But biometrics offers an easy solution to this problem. "An employee may not be able to remember a dozen passwords and PINs, but is very unlikely to forget or misplace his or her thumb," P. J. Connolly wrote in "Future Security May Be in the Hands, or Eyes, of Users," an article in *InfoWorld.*

Biometrics systems, which once cost tens of thousands of dollars to install, were originally used only by large corporations and the government. But now less expensive systems, costing as little as a few hundred dollars per desktop, are making the technology available to smaller businesses and individual consumers. As a result, analysts believe that the usage of biometrics will grow over the next few years, so that the technology will become prevalent on the Internet as well as in businesses.

BIOMETRICS FOR SMALL BUSINESS

Since small businesses are constrained by budgets, their use of biometric systems will probably be limited to fingerprint and palm print systems, which have seen the largest decrease in cost. Fingerprint scanners are useful for single computer stations or devices, while palm print devices used more often for security and time clock purposes. These systems can be purchased from companies throughout the biometrics market who offer packages to small businesses tailored to specific needs.

When it comes to computer systems, there are different levels of biometric security that small businesses will need to choose from when deciding on a security framework. The first application is in logging on and off computer systems like Windows. Many laptops come pre-equipped with this technology, and USB-based additions for desktop models can be bought from third-party providers. Small businesses can also use biometrics to secure access to software applications designed only for employee use. There is also a set of biometric applications designed to protect online access, such as the business side of Web sites or Internet accounts specific to the business. The business can also choose to limit access to local files with biometric security that can be used to divide data management appropriately throughout the business.

Trends in biometric data are also leading to increasing government involvement, since biometric information provides an easy way for governments to consolidate accurate information on a large number of people. In 2009 Switzerland began officially to switch to electronic passports based on a national fingerprint registry. Even the U.S. Federal Bureau of Investigation (FBI) is putting a system in place to exchange biometric data on criminals with other countries. These changes could eventually require all companies, including small businesses, to integrate biometric information into their operations, especially in matters related to government.

HOW BIOMETRICS SYSTEMS WORK

The main biometrics systems on the market work by scanning an individual's fingerprints, hands, face, iris, retina, voice pattern, signature, or strokes on a keyboard. According to Hogan, finger scanning accounts for 34 percent of biometric system sales, followed by hand scanning with 26 percent, face scanning with 15 percent, voice scanning and eye scanning with 11 percent each, and signature scanning with 3 percent. Retinal scanning which reads the blood vessels in the back of the eye and requires the user to be within 6 inches of the scanning device is the most accurate system but also the least likely to enjoy widespread use because of people's natural protectiveness toward their eyes.

Once the scanner reads the user's physiological information, the computer begins analyzing it. "The system reads the physical or behavioral characteristic, looks for telltale minutiae, and applies an algorithm that uniquely expresses those minutiae as a very large alphanumeric

key," Bill Orr explained in the *ABA Banking Journal.* "This sample key then goes to a repository where it is compared with a key (called a template) that was created by the approved user when she enrolled in the system. This in turn generates a score based on how closely the two samples match."

Some experts suggest that the various types of biometric technologies will be combined as needed to fit different user applications. "If you already have a telephone in your hand, the most natural thing in the world is to use voice scanning for identification," Samir Nanavati of the International Biometric Group told Hogan. "If you're already typing at a keyboard, the unique pattern of how you type makes the most sense. And if you need an electronic signature anyway, why not do a biometric match for identification purposes?"

The difficulty of biometric technology is that it is a permanently unique system of data. No one else shares a user's fingerprint, or iris pattern, or DNA. While in theory this provides the user with an extremely personal security system, applications have shown flaws in the system. Biometric devices typically have a 1 to 3 percent failure rate, and the more simple systems can be cheated using simple devices to fool the scanners. Even the more complicated systems have inherent problems: if biometric data is hacked and stolen from the system, there is no way to replace it. While businesses can give employees and customers new passwords, they cannot give them new fingerprints, raising issues with security and long-term applicability.

Perhaps the most difficult obstacle to overcome in adopting biometric technology is employee or customer concern about its invasiveness. For example, many people think the technology could be used to collect fingerprints for a huge database. "But that's not how it works," Hogan noted. "While biometrics may make you more efficient at matching your Web site visitors to the customer profiles you keep of them, it doesn't provide any more information about the user at the point of access than the typical password system."

To deal with privacy issues, it is common for businesses to follow certain benchmark guidelines. In the United States, the Privacy Act controls the use of biometric information to a certain extent, but the legislation does not apply to small businesses, among other organizations. If a small business is worried about how biometric systems will affect employee morale or customer perception, it can choose to follow other guidelines used by industries interested in protecting data. The Biometrics Privacy Code, for instance, is a private reference created by the Biometrics Institute in 2009 for use by businesses that want to advocate responsible use of biometric technology. Businesses can choose to sign up for the code formally or simply follow the best practice information it provides.

BOARD OF DIRECTORS

A corporation is a legal entity created ("chartered") either under federal or state law. The corporation is an artificial "person" distinct from the individuals who own it. This prompted a jurist once to remark that a corporation has "neither a soul to damn nor a body to kick" (as quoted by John Downes and Jordan Elliott Goodman in Barron's *Dictionary of Finance and Investment Terms*). This legal person is nevertheless entitled to own property, borrow money, bring law suits, and to have its communications protected under the First Amendment. The charter of this institution is its "constitution," the

shareholders are its "people," the management is its "executive," and the board of directors is its "legislature."

In theory, stockholders elect board members, and board members elect the chief executive. Thus a "board of directors" is associated with companies organized as corporations. Partnerships and sole proprietorships do not have boards. The minimum and maximum number of board members is usually specified by state law; three is a typical minimum membership; the maximum may not exceed the number of shareholders. The board's duties are defined by the corporate charter which, in turn, is structured by state and/or federal law.

HISTORICAL PERSPECTIVE

In discussing boards generally, it is important to note that all boards are different. Despite major trends over time, specific boards have exhibited every variety of function associated with such bodies, often in defiance of prevailing custom.

By historic origin, boards initially were the investors the three or four wealthy people who funded an energetic entrepreneur. The distinction between investors and boards developed over time as the number of investors grew larger; boards then took on the role of bodies representing stockholders. The presence on the board of major stockholders, however, in person or by proxy, has never disappeared. Through much of the sustained growth period that followed World War II, boards retained their governance functions but often exercised them weakly ("rubber stamp boards"), especially in successful, growing corporations led by dominant executives.

In the opening years of the twenty-first century, in response to major corporate scandals, a strong role for boards has reemerged, mandated by federal law. But these changes are specific only to publicly traded companies. The role of boards in privately held corporations continues to be shaped by other factors, most prominently by the degree to which major stockholders wish to be involved. Private boards may be quite active in some companies and may exercise supervisory powers; in others, board members are chiefly used as resources and as ambassadors to other interests; in yet other boards, the members are a mere formality required by law.

BOARDS AND THEIR ORGANIZATION

Corporate boards have members, usually called "directors," who are elected by the stockholders. A privately held corporation has board members selected by the consensus of the company's founders without a formal election. When the company goes public and stockholder numbers increase substantially, the company prepares slates of board candidates and submits these to stockholders for a vote. The stockholder may accept the recommended slate, choose one of the alternatives, name others who do not appear on the list, or give his or her vote ("proxy") to the company itself to exercise.

Board members are called "inside directors" if they are members of the management or "outside directors" if they have no direct role in the company itself. Outside directors are typically well-known figures in the business community recruited for service on the board to provide valuable advice and counsel; they may not be executives of competitors or sit on competitors' boards. Outside directors may also be drawn from community organizations sometimes representing academia, law, labor, or other large constituencies or interests. Outside directors are also called independent directors because they are not under the influence of the chief executive of the corporation. In publicly held companies, directors receive compensation for their services. Compensation may also be paid in privately held organizations.

Under the rules of the Securities and Exchange Commission (SEC), directors of either category are held to be "insiders" and therefore prohibited from trading stock based on "inside knowledge."

In large corporations the board is frequently subdivided into committees with functional roles such as Executive, Finance, Compensation, Strategy, Audit, and so on. Board members are assigned to committees and these, in turn, develop positions on issues pertinent to the functional matter assigned to the committee. They make recommendations to the full board. Under legislation passed in 2002, audit committees are mandatory and their functions and membership are precisely defined.

Boards set their own rules of operation. If the corporation's bylaws or charter specify that *Robert's Rules of Order* will be followed, procedures may take the parliamentary form or do so if conflicts arise.

In large corporations the board and its committees will have full-time staffs engaged in preparatory and administrative work related to board activities. Employees of such staffs are also considered to be insiders because of their unique access to sensitive data.

THE EVOLUTION OF A BOARD

In a small, privately held corporation, the board will typically be a so-called working board, with its members all engaged in the business. In addition, one or two additional family members may be on the board but inactive in operations. Board meetings tend to be rather informal in such situations because operational and board decisions coincide. The paperwork connected with the board activity recording legally mandated board meetings, for instance will be seen as rather a nuisance. If the business begins to grow, the board will tend to evolve.

A growing business tends to enlarge its board by inviting new investors to serve or may have to welcome a new investor (or his or her representative) willingly or not. The owners also often see great benefit in drawing in people who can bring new points of view and important skills and knowledge in guiding the company as it expands. An "advisory board" thus develops. Board meetings take on a real value at this stage. They serve to clarify directions and to gather information. Management learns to view itself more clearly and consciously by explaining the business to others at board meetings. Board members bring suggestions, make contacts, redirect efforts by good advice, identify opportunities, and otherwise participate in consulting capacities.

The board may finally develop into a "governing board," seeking either to cash out its assets for the owners or to raise funds for the next stage of expansion, when it "goes public" and becomes a publicly traded entity. At that point the company comes under the regulatory aegis of the SEC. Its board members now are exposed to the colder and harsher winds of securities law. The character of the board will change automatically even if its inside management remains in control by retaining more than half the outstanding shares. The most important duties of a public board are the selection of senior executives, approving issuance of additional shares, declaring dividends, and overseeing financial activities through its auditing committee. Under securities laws, board members are held responsible for the lawful discharge of their duties; failing to do so may result in heavy fines and imprisonment.

PUBLIC COMPANIES AND SOX

The spectacular collapse of Enron Corporation in 2001 was ultimately traced back to hidden and suspicious off-balance-sheet transactions, fraudulently overstated earnings, and failures in formal external audits. This brought into laserlike focus a long-building and widespread critique not only of top management but also of boards of directors viewed as cheerleaders for flamboyant chief executives willing to approve actions without exercising due diligence.

Enron brought a very energetic legislative response in the form of the Sarbanes-Oxley Act of 2002, abbreviated as SOX. SOX overhauled financial reporting requirements, created a national Public Accounting Oversight Board to reform all auditing procedures, and criminalized a number of executive and director actions. An important provision of Sarbanes-Oxley was the requirement that every public board must have an audit committee made up exclusively of outside (independent) directors.

SMALL BUSINESSES AND BOARDS OF DIRECTORS

Small businesses do not usually have much interest in creating a board of directors. Since smaller businesses are usually started by a single owner or group of owners with a cohesive vision and a limited area of activity, a board of directors is rarely needed or expected. Only when a small business grows large enough to incorporate or trade stock publicly does it consider forming a board of directors.

The problem with this procedure is that it can cram small businesses into a very small window of action when it is finally time to form a board of directors. A better method is to prepare for an eventual board of directors as soon as the business begins to grow. One of the first steps a growing business can take is to create a set of official bylaws. These bylaws should govern the overall structure of the board and detail how large the board would be, how members would be chosen and how long they would serve, what the committee structure would be like, and how the performance of the board would be judged.

The business will also need to decide how much board members will be paid, and whether or not to impose age and salary limits on the members. These decisions will be based on the structure and purpose of the business itself. Plans will also need to be made for distributing company information to board members and allowing them to express their own opinions.

When a small business does begin to develop a board of directors, it is usually in the form of an advisory board made up of independent directors designed only to give the business feedback. This can provide both a useful method for the business to analyze its own market activity and be an intermediary step on the way to an official and legal board of directors, which can improve the business's standing in the eyes of investors.

An advisory board is a flexible alternative, since it can be used as the business owners see fit. If the board or a board member is not working out, the business can easily replace them. An official board of directors, on the other hand, cannot simply be replaced. It becomes an institution of the company, responsible for its welfare. A good board of directors can bring connections, experience, and funding that a single owner or partnership could not achieve alone. Of course, this also requires that small-business owners give up some of their control to a board that can choose to outvote them on certain decisions.

BONDS

Bonds are tradeable instruments of debt issued by institutions to finance their activities. Bonds have a face or par value (e.g., $1,000), a fixed interest rate also known as the coupon rate (e.g., 8 percent a year), and a maturity (e.g., 10 years). Bonds are routinely traded, which means they are sold and bought after the initial acquisition from the bond issuer. When a bond is sold at a rate higher than its face value, it is sold "at a premium"; when sold below face value, it is sold "at a discount." Trading in bonds is motivated by the coupon value of the bond in comparison with currently prevailing rates of interest, as discussed below.

Bonds are named after the issuing institutions. Best known are "treasuries," issued by the U.S. Treasury, "municipals," issued by municipalities and other levels of government, and "corporate bonds," issued by corporations. Municipals are tax-free; their earnings are not taxed, a special advantage. Other major categories are "mortgage bonds" issued by such agencies as the Government National Mortgage Association and the Federal Home Loan Mortgage Corporation, "federal agency bonds" issued by departments other than Treasury, "money market bonds" such as bankers' acceptances and commercial paper, and "asset-backed bonds" where the bonds, issued by either private or public bodies, are tied to a specific object or activity.

TRADING IN BONDS

According to SIFMA, the Securities Industry and Financial Markets Association that monitors bond and security activity internationally, approximately $66 trillion of bonds were issued in the United States in 2009. This was a 43 percent increase from 2008, with the largest increase seen in treasury bonds, which more than doubled in issuance.

Just like stocks, bonds are actively traded. Why would a person holding a bond with a par value of $1,000 sell it for $800? Why would a person purchase a bond, par value $1,000, for $1,200? The determining factors are the components of the bonds (face value, coupon rate, and maturity) and the characteristics of competing securities and their fluctuating values.

To take "maturity" first, a 10-year bond ties up the invested amount for a 10-year period. An individual who, because of changing circumstances, needs to have cash now ("liquidity") can sell the bond to someone else. The purchaser will take advantage of the seller's situation by bidding less than the face value of the bond. The seller realizes cash immediately; the seller has a bond with a higher yield.

The yield of a bond is calculated by dividing its interest rate (which is fixed) by its face value (which can change when it is sold). When initially purchased, a $1,000 bond yielding $80 a year in interest has an 8 percent yield. If the bond is sold for $800, the yield becomes 10 percent (80 divided by 800). Conversely, if the bond is sold for $1,200, the yield drops to 6.7 percent (80 divided by 1200). Trading in bonds is based on a more complex formula called "yield to maturity." The calculation involves summing up all future yields until maturity, discounting future earnings to current value by using currently achievable interest rates, and deriving a new value. (The calculation is based on the general assumption that future earnings are worth less than cash in hand.) If the resulting "Yield to Maturity" (YTM) is higher than the owner of the bond can achieve by other means, he or she holds on to the bond; if not, the bond can be sold at a discount and the money reinvested elsewhere.

Because bonds have a par value and a fixed coupon rate, they are inherently safer than stocks. For this reason, bond prices tend to rise as stock prices drop and vice versa. A downturn in stocks brings money into the bond market; bonds with the most desirable features based on bond ratings, YTM, and tax-exempt status of earnings tend to go up most. When stocks surge, money tends to leave the bond market because greater appreciation is possible holding stocks than is possible to achieve by a combination of bond par values and yields.

BOND RATINGS

Bonds are rated by Moody's Investor Service, Standard & Poor's, Fitch Bond Rating Agency, and others. Using Moody's ratings, similar to S&P/Fitch ratings, Aaa is the highest quality rating, Aa is high quality, A is strong, and Baa is medium grade; all of the above are "investment grade." Ba, B is a speculative "junk grade" bond, Caa/Ca/C is a highly speculative junk bond. S&P and Fitch use D to indicate a bond in default. The label "junk" in all cases indicates that the bond holder is in some kind of financial difficulty.

The higher a bond's rating, the lower will be its coupon rate. Junk bond issuers, by contrast, attempt to attract buyers by paying a high rate in compensation for the greater risks.

SMALL BUSINESSES AND BONDS

Small businesses may have trouble trading successfully in the bond market when they are first beginning, although there are some types of bonds particularly suited to companies of a smaller size. IDRBs, or Industrial Development Revenue Bonds, are one example which are granted by local government agencies to fund particular industrial projects. With these bonds, the government acts as an intermediary and sells the bonds to private investors so that the small business can use the profits for the project.

Even smaller projects are governed by mini-bonds, a type of low-fee and low-interest bond that is specifically targeted at independent business owners, especially those in the manufacturing business. These bonds aim for a savings of 1.5 to 2 percent over traditional loans, and can finance businesses from $500,000 to $2 million. The process of application for mini-bonds is very similar to applying for a traditional loan.

The type of bond many project-oriented small businesses may be familiar with is the surety bond. This is a three-party contract bond designed to back up a project contract between the small business and the client. The business and client sign a contract for a particular project, and a third-party surety (often a bank or sometimes the government, depending on local laws) issues a bond that acts as a guarantee that the project will be completed, offering financial protection for the project owners. There can be various types of surety bonds depending on the industry, including bid bonds, payment bonds, performance bonds, and ancillary bonds.

One change enacted by the 2009 American Recovery and Reinvestment Act (ARRA) was an increase in the limit that the Small Business Administration (SBA) would guarantee. Originally, the SBA allowed only $2 millions' worth of surety bonds to be guaranteed per business, but this was increased to $5 million until September 2010. This was designed to allow small businesses that have struggled in obtaining surety bonds from other sources to receive the SBA guarantee for a larger amount of money, thus financing larger projects. The SBA typically covers anywhere from 70 to 90 percent of the costs incurred if the business defaults on the project.

BOOKKEEPING

Bookkeeping is the task of recording all business transactions amounts, dates, and sources of all business revenue, gain, expense, and loss transactions. Bookkeeping is the starting point of the accounting process. Having accurate financial records helps managers and business owners answer important questions. Is the business making money, or losing it? What are the exact profits or losses? Is the business on sound financial ground, or are troubling trends in cash flow pointing to an instability of some kind? A sound bookkeeping system is the foundation for gathering the information necessary to answer these questions.

Bookkeeping involves keeping track of a business's financial transactions and making entries to specific accounts using the debit and credit system. Each entry represents a different business transaction. Every accounting system has a chart of accounts that lists actual accounts as well as account categories. There is usually at least one account for every item on a company's balance sheet and income statement.

BOOKKEEPING PROCESS

The process of bookkeeping involves four basic steps: 1) analyzing financial transactions and assigning them to

specific accounts; 2) writing original journal entries that credit and debit the appropriate accounts; 3) posting entries to ledger accounts; and 4) adjusting entries at the end of each accounting period. Bookkeeping is based on the principle of equilibrium: every debit must have an equal credit and all accounts must balance.

A chronological record of all transactions is kept in a journal used to track all bookkeeping entries. Journal entries are typically made into a computer from paper documents that contain information about the transaction to be recorded. Journal entries can be made from invoices, purchase orders, sales receipts, and similar documents, which are usually kept on file for a specified length of time. For example, the journal entry for a transaction involving a cash payment for a new stapler might debit the cash account by the amount paid and credit the office supplies account for the value of the stapler.

Journal entries assign each transaction to a specific account and record changes in those accounts using debits and credits. Information contained in the journal entries is then posted to ledger accounts. A ledger is a collection of related accounts and may be called an Accounts Payable Ledger, Accounts Receivable Ledger, or a General Ledger, for example. Posting is the process by which account balances in the appropriate ledger are changed. While account balances may be recorded and computed periodically, the only time account balances are changed in the ledger is when a journal entry indicates such a change is necessary. Information that appears chronologically in the journal becomes reclassified and summarized in the ledger on an account-by-account basis.

Bookkeepers may take trial balances occasionally to ensure that the journal entries have been posted accurately to every account. A trial balance simply means that totals are taken of all of the debit balances and credit balances in the ledger accounts. The debit and credit balances should match; if they do not, then one or more errors have been made and must be found.

Reconciling bank statements on a monthly basis is another important task for the bookkeeper. Most banks will send a monthly confirmation of the transactions they have facilitated for the business. Reconciling refers to the process of comparing these bank statements to the business books and making sure the transactions and amounts involved match. Bookkeepers may also make adjustments to entries that modify account balances so that they more accurately reflect the actual situation at the end of an accounting period. Adjusting entries usually involves unrecorded costs and revenues associated with continuous transactions, or costs and revenues that must be apportioned among two or more accounting periods.

Larger companies may use temporary revenue and expense accounts to provide information for the company's income statement. These accounts are periodically closed to owners' equity to determine the profit or loss associated with all revenue and expense transactions. An account called Income Summary (or Profit and Loss) is created to show the net income or loss for a particular accounting period. Closing entries means reducing the balance of the temporary accounts to zero, while debiting or crediting the income summary account.

SMALL BUSINESS BOOKKEEPING

For small businesses, the most basic decisions concerning bookkeeping and accounting practices will be the most important. Every business, for instance, must choose an accounting method to follow when setting out a bookkeeping system. This accounting method may be: accrual-based, which counts for income and expenses as they are incurred; cash-based, which counts income and expenses when the money actually changes hands; or a hybrid method involving both cash and accrual, depending on the type of business.

Small businesses must also decide whether to hire an outside bookkeeper to come in and maintain their records, or to take care of all records in-house for less expense. Accounting and recording software must also be chosen based on the needs of the business, and arrangements must be made with banks and other financial institutions regarding monthly statements and other services.

Sometimes small businesses can make bookkeeping assumptions that can prove detrimental to business, especially for tax purposes. While some companies disregard all receipts over a certain amount, small businesses should keep all receipts no matter the amount, since these small amounts can add up significantly over time and provide documentation for any deductions the businesses may want to make for taxes. Another common mistake small businesses make is to pay for certain expenses by personal means, such as a personal credit card or cash, and then forget to track these expenses so that reimbursement can be made.

Small businesses should also make sure they are paying attention to bookkeeping details that are sometimes missed. Deduction of small taxes like sales taxes should always be accounted for, and if the small business uses petty cash, then proper recording procedures should always be followed when the cash is used. If the small business uses employees, they should be properly categorized, especially if outside help such as freelancing or consulting is used. In general, the small business should remember that the burden of proof for its income and expenses will always belong to the business itself, and that it must have documentation to back up all financial information.

Good bookkeeping is an essential part of good business management. Bookkeeping enables the small-business

owner to support expenditures made for the business in order to claim all available tax credits and deductions. It also provides detailed, accurate, and timely records that can prove invaluable to management decision making, or in the event of an audit.

BOUNDARYLESS

"Boundaryless" is a neologism that has become a slogan of sorts in business practice, usually in the form of "a boundaryless organization." Such an organization is supposed to transcend the rigid lines of bureaucracy and divisional boundaries within a corporation. It also ignores the borders where the corporation itself is separated from its markets, customers, and "stakeholders."

The emphasis of the boundaryless organization is on fluid and adaptive behavior modeled on organic structures rather than mechanical. Change is a welcomed constant. Professionals inside the organization form networks and links, and emphasize collaboration on projects. In both large and small businesses, salespeople and customer-contact service employees are examples of employees who have traditionally worked with fewer boundaries; these employees have experience forming relationships with customers and others outside their own company.

In a boundaryless organization, business relationships are informal and people come together when they share a common need or problem. Employees are grouped by competencies centered around technology, information, and expertise. Global operations and, indeed, the outsourcing of labor, are implicit in the concept.

According to Russell H. Mouritsen writing in *American Salesman* and others Jack Welch coined the term. Welch was the larger-than-life chairman and chief executive of General Electric between 1981 and 2001. His immense popularity, in turn based on GE's performance during his tenure, has made him a management guru.;

THE CHANGING ROLE OF EMPLOYEES

To be successful in the new boundaryless world of business, a person must be a team player. Employees must feel at ease in free-form work structures and situations that may border on the chaotic. The tremendous networking and linking that occur changes the role of employees to that of consultants. Employees no longer work in isolation but as part of a team on broad, companywide projects, like quality management, just-in-time methods, lean production, and supply-chain management. Strategic alliances and collaborative arrangements, often between competitors and vendors, are another facet of the boundaryless organization.

Because technology plays a major role as a communication medium in the boundaryless organization, much work is done from a distance via e-mail, phone, and videoconferencing. Employees do less work in traditional face-to-face settings. Virtual collaboration makes it easier to use the expertise of a broader range of individuals. With telecommuting, international employees are more easily incorporated into all business processes. Employees often like the freedom that boundaryless work offers them, particularly with virtual teams and more flexible work plans, arrangements, and schedules.

Small businesses and consultants are partnering with large organizations, further blurring boundaries and organizational affiliations. Partnerships are also occurring with other informal networks of groups, professional organizations, and businesses. The emphasis is on expertise and not location or affiliation. Employees may be part of multiple networks and organizations in the new workplace. Because employees change roles and affiliations, the responsibility for training, education, and development now rests more with the employee and not specifically with the organization.

Boundary Spanners. Many companies are moving from being straight product companies to also providing services. Traditionally, many of these product-centric companies have had a hierarchical division of labor, and now seek the help of "boundary spanners" employees who better understand how to manage intricate customer and stakeholder relationships to expand their service offerings. These "spanners" are multitalented. They are highly proficient in their company's services, technologies, and

processes, and they are also expert relationship builders. In theory, boundary spanners gather key information and customer feedback from the external environment, and then interpret and relay that information back into their organization. An effective boundary spanner introduces new strategies, processes, and products to his company and colleagues.

The role of the boundary spanner is tricky because there is no specific job description. Businesses regardless of their size are challenged to find, compensate, and retain boundary spanners. Organizations look for people with track records of developing strong internal and external networks. They also look for curious people; boundary spanners are expected to uncover key issues and convey that information to the organization. Finally, organizations look for influencers. Boundary spanners must be persuasive with external stakeholders and within their own workplaces. They must have a knack for finding senior-level employees within their organizations to act as champions and help them gain organizational support and buy-in.

While some companies recognize the value that boundary spanners bring to the organization and reward them accordingly, the role of the boundary spanner is often misunderstood within the organization. Boundary spanners are highly skilled employees in many different areas of the business, but they often experience job frustration and leave the company. This has serious consequences if the boundary spanner is the only employee with strong external stakeholder relationships.

In any organization, some boundary-spanning activities take place like creating common task groups, focus groups, and cross-departmental teams. In a broader context, when the Small Business Administration offered small businesses tips for surviving the economic crisis that began during the latter part of 2008, one of its suggestions was for a small business to co-market with another small business that offered complementary products or services. While employees of small companies sometimes are called upon to work across departments, working with another company requires that more employees be capable of performing in a boundary spanner role and excel at creating relationships both inside and outside of their own company.

BRAINSTORMING

Brainstorming is a problem-solving technique in which a group of people freely and spontaneously present their ideas and build upon each other's productivity until solutions and goals emerge. The technique is designed to suspend critical and negative thinking so that ideas can flow freely and may be expressed without embarrassment.

A. F. Osborne is credited with inventing the technique in 1941. Osborne published his ideas in 1957 in a book titled *Applied Imagination.* The well-known author Arthur Koestler (1905 1983), who is famous for his novel *Darkness at Noon*, laid out the manner in which humor, invention, and artistic creativity all result from unsuspected linkages between seemingly different ideas and images a phenomenon used in brainstorming.

Brainstorming is widely applicable to the solution of any problem. It is used most often in businesses to diagnose particular problems in work flow and create workable solutions. Both physical manufacturing processes and service-oriented tasks can be analyzed using brainstorming. Administrative functions may also be reinvented. Small businesses use brainstorming most often when entering new markets, creating new approaches to products or services, and developing new marketing campaigns. Often, small businesses find brainstorming effective due to the personal and open atmosphere of informal small meetings.

Three critical factors determine the success of a brainstorming effort. First, the group must strive to produce a large quantity of ideas, increasing the possibility that quality ideas will emerge. Second, the group must be certain to withhold judgment of the ideas as they are expressed. Third, the group leader must create a positive environment for the brainstorming session and channel the creative energies of all the members in the proper direction.

During the brainstorming session, general rules are established and maintained:

- Specific goals should be created to work with. If sales are a problem, then the goal should be to increase

sales by, for instance, 20 percent within the next year. Brainstorming sessions should always begin with specific amounts and time frames for those present to use.

- The aim of the session is to generate a large quantity of ideas. Self-censorship is counterproductive. A brainstorming session is successful when the sheer quantity of ideas forces participants to move beyond preconceived notions and explore new territory.
- Discussions of the relative merits of ideas should not be undertaken as they are voiced; this slows the process and discourages creativity.
- Participants should feel equal and encouraged to be creative.
- A lively atmosphere should be maintained, and when activity lags, someone should strive to introduce a novel and surprising perspective. A brainstorming team might, for example, shift the viewpoint and ask: How would a five-year-old look at this problem?

After the brainstorming portion of the meeting has been completed, the leader or group should arrange all the ideas into related categories to prioritize and evaluate them. These lists can then be evaluated by the group, after which a new series of ideas emerges, more focused on the problem at hand. These ideas are synthesized into a workable solution. If the brainstorming session lasts longer than one meeting, the group moderator may ask members to report back later on ideas they consider worthy of action, and to offer any ideas they might have about implementation.

There are a number of variations on the basic theme of brainstorming. In "brainwriting," the members of a group write their ideas down on paper and then exchange their lists with others. When group members expand upon one another's ideas in this way, it frequently leads to innovative new approaches. Another possibility is to brainstorm via a bulletin board, which can be hung in a central office location or posted on a computer network. The bulletin board centers upon a basic topic or question, and people are encouraged to read others' responses and add their own. Small-business owners can also conduct solo brainstorming when necessary, writing down ideas on index cards and comparing them as needed.

BRAINSTORMING CREATIVITY PROCESSES

There are a number of different processes that can be used in a brainstorming session. These include grouping techniques, improvisation, round robin, and feedback.

Grouping Techniques. Grouping refers to dividing the brainstorming team into different groups. These groups are often given a physical location, such as different corners of the room. They may be divided based on personality traits, to make sure each group has a fair mix of people, or based on skills, so that each group represents a different skill set. The groups are then assigned problems to brainstorm on, or specific levels of a problem to which they are most inclined. Groups may be moved or switched to encourage new thinking patterns.

Improvisation. Improvisation covers the role-playing and out-of-the-box thinking that can help brainstorming teams develop their ideas. Improv games may be freelance and based on similar theater training exercises, or involve specific meetings with customers and clients, with different members of the team taking on the different roles as required. This is designed to reveal different marketing techniques and approaches that would not normally be thought of or accepted. Improvisation may also include the use of toys and building blocks which encourage the team to think in new ways.

Round Robin. Round robin refers to the practice of going around the room and asking each person in turn what he or she thinks of the problem, and for any ideas he or she may wish to contribute. This is useful in an accepting environment, where quiet people can be encouraged to speak and no one is overpowered by the noise or commotion that brainstorming sessions can sometimes generate.

Feedback. The feedback style of brainstorming is a more structured event where participants write down their ideas on papers or notecards and then pass them around the room or pair up for a more detailed examination of their ideas. As ideas are traded, no negative criticism is allowed, and participants are usually required to say what they like about the idea before writing down ways to improve it. Ideas are then collected and examined to develop broader solutions.

PROBLEMS TO AVOID

Businesses should always avoid making fun of or immediately criticizing ideas that are produced. This can be more difficult for small businesses, which often have a more informal atmosphere when brainstorming, but clear guidelines should always be established for proper conduct and respect.

There can also be a tendency in brainstorming to focus only one idea, aspect, or topic. This type of fixation can exclude other possibilities, and the moderator should try to keep the team consistently moving through options.

Brainstorming can be a noisy process with active members, and at times this noise can interfere with thinking or stop quieter members from speaking out. At times like

these, the moderator should quiet the team or use a different technique such as a round robin to encourage listening.

BRAND EQUITY

"Brand equity" is the public's valuation of a brand; it is associated with wide recognition, customer loyalty, and the market share enjoyed by the branded product or service. Wide familiarity, strong loyalty, and a dominant market share tend, in the long run, to be the consequences of consistently favorable performance by the owner of the brand. A long-standing and very strong brand equity may result in that brand being used as the name of an entire category. "Kleenex," "Coke," and "Xerox" are examples where the brand equity is clearly evident. Tissues are often referred to as "Kleenex"; people order different kinds of "Coke" at restaurants, and make "Xeroxes" even when the copier used is of another brand. In these situations the brand equity of Kleenex, Coca-Cola, and Xerox copiers is clearly evident. Coca-Cola's brand equity is the highest in the world.

Brand equity, however, can also turn negative. Examples are communications services that get a reputation for wretched customer service, automobiles with a dangerous design defect, or a widely-used pharmaceutical that is discovered, later, to cause heart problems. Unless corrected, negative brand equity soon results in oblivion.

Brand equity is just one way of saying that a product or service has superior features and is therefore profitable for the company that owns the brand. This profitability may be due to market share and/or to the price commanded by the product because of its brand equity. Branded products invariably command a higher price than so-called generic or store brands even when the product is itself a commodity like sugar. In such cases the higher price is due almost entirely to the power of the brand. Quite evidently, therefore, "brand," as such, is separable from the product or service narrowly viewed. Brands can be bought and sold. The buyer acquires the brand equity and attempts, thereafter, to maintain it by selling a product that measures up to the brand's reputation. Similarly, the owner of a famous brand can put on the market an inferior product and at least temporarily enjoy benefits brought by the brand's equity until the customer becomes wise.

MEASURING AND PROTECTING BRAND EQUITY

For these reasons, brand equity management has become a business specialty complete with competing "brand equity models" and "brand strategies." Models are built from formulae in which elements of brand equity are assigned different values (market share and price, for instance) or built out of very extensive surveys on how customers perceive the brand. The models are then modified in order to increase brand equity. All of these techniques, in effect, are attempts better to understand why one product performs better than another.

An example of such modeling is presented in an article in *Nilewide Marketing* titled "Mind and Market Share?". The anonymous author begins: "While some believe that brand equity is a function of its market share, others believe that it is how the brand is held in the customer's mind." It is possible for a brand to have a higher "mind share" than "market share." One reason for this might be that the brand is held in high regard but its pricing is just out of reach for many who admire it. Modifying the pricing component of the model could therefore potentially bring "mind share" into better balance with "market share."

Brand equity is also recognized to be complexly related to many other factors: the product and service, and customer perceptions. Measurement of brand equity, therefore, involves a holistic attention to all the factors, including the channel through which the product flows and services rendered to the channel. Improved relations with the wholesaling and retail channels, for example, could result in much more or more attractive shelf-space for the product.

Brand management also has a defensive component. As Alan Mitchell wrote in *Marketing Week* "Companies which develop good measures of their brand equity have an early warning indicator of likely future profit trends.... If brand equity is falling, you're storing up trouble for yourself... If brand equity is rising, you're investing in future performance, even if it's not showing through in profits

today. Real business performance therefore equals short-term results plus shifts in brand equity."

Building a Brand for Small Business. Small businesses build their brand equity by excelling at every activity that puts them in situations involving customers. Small-business marketing experts suggest that companies follow the same rules that larger companies adhere to: have great customer service, know the customers' needs, and develop relationships. Also, small businesses should actively listen to customer feedback and act on the suggestions that make sense for the company. Similarly, small technology companies targeting tightly-defined niche markets can greatly benefit from creating brand equity. These niche players must employ branding as a means of creating an identity for themselves, their products and services, which can differentiate them from the competition, convey some tangible and psychological benefit, and support the overall strategic plan and corporate direction.

TRANSFERRING BRAND EQUITY ONLINE

Companies often seek to leverage their brand equity by transferring consumers' positive associations with a brand to a related product or service. In the late 1990s, many companies attempted to extend their brands into electronic commerce. Doing business online proved difficult even for established businesses with popular brands. "Think branding an offline business is tough? It's nothing compared with creating a brand for your company's electronic offshoot," Rochelle Garner declared in an article for *Sales and Marketing Management*. "That's because b-to-b [business-to-business] brands are built brick by independent brick with customer service, support, and quality and are cemented by personal relationships. In the offline world, those relationships are forged by a sales force that calls on customers face-to-face. Successful online brands must deliver those same elements, and more, through the use of technology."

Garner outlined a series of steps for companies to take in creating a successful online brand. First, the company must decide whether to use its offline brand name in its new online venture. This strategy may prove effective in cases where the online business is a straightforward extension of the existing brand, but it may also have the effect of diluting the brand equity. Second, Garner wrote that companies should develop an understanding of the benefits they want to deliver through the online business and assess how technology can help in this mission. Third, she emphasized that companies should try to understand customers' expectations for the online business and the brand. Finally, she recommended that companies find ways to use Internet technology to create a rewarding shopping or purchasing experience for their customers.

Overall, according to Garner, the key to extending a brand online is using technology to enhance the buying experience for customers. After all, the Internet offers sellers a number of new ways to service their customers' needs, including bringing together buyers and sellers from all over the world, offering instant electronic customer support, creating new production efficiencies, and reducing order time and costs.

Using Social Media to Increase Brand Equity. The Internet gives businesses the ability to create and capture value quicker and more efficiently than traditional marketing channels. The occasional broadcasted messages of yesterday have been replaced with an information flow. In what is referred to as "viral marketing," potential customers pass product and company information that they like on to their friends and family. In 2009 Ford Motor Co. conducted what the company referred to as "the most visible, formative social media experiment for the automotive world." In the "Fiesta Movement," Ford gave 100 consumers a Ford Fiesta for six months and asked them to complete a specific task every month. These consumers were asked to create a personal profile, develop content, and populate their own networks with the information. Ford hoped that this process would enhance Fiesta's brand. Fiesta got 6.5 million YouTube views and 50,000 requests for information about the car. Ford sold 10,000 units in the first 6 days of sales. The results came at a small fraction of the cost of a typical national TV campaign.

Ford learned that, regardless of company size or industry, marketing in the digital space is a multistep process. The company needed to engage culturally creative consumers to create content that would augment the brand. They also needed to motivate these consumers to distribute their content on social networks and other digital networks.

As Ford demonstrated, social networks open up a new and more cost-effective marketing world. Small businesses, looking to increase brand equity, are employing these social media strategies to market their brands. They are taking advantage of social networks, blogs, and mobile phone texting, as well as creating contests and games to increase product interest.

Increasing brand equity requires some new marketing strategies. Ford's experiment is just one example of how to encourage favorable customer perceptions and increase brand equity. Adam Lavelle, chief strategy officer from iCrossing Marketing, argues that in the digital world, traditional brand equity measurement falls short. Instead, his company coined a new idea "connectedness." Lavelle's company used this concept to measure a brand's equity in the network. "Brands that perform well in our model, we think of as true connected brands. We think connected

brands are better known within the network, and are likely to perform better financially," Lavelle said.

It is clear that when companies take advantage of Internet technology, they have a valuable resource for improving their relationships with their customers and strengthening their brand. When used correctly, the Internet gives businesses, regardless of their size or industry, a huge opportunity to increase brand equity.

BRANDS AND BRAND NAMES

A brand is a name and/or a symbol that uniquely identifies a seller's goods or services in the market. Brands enable customers rapidly to recognize the makers of goods or providers of services. Over time, and with consumer experience, brands acquire reputations for quality, value, price-level, reliability, and many other traits that help consumers choose among competing offerings. They are convenient and highly abbreviated tools of communication.

Brands have been used since ancient times. Cattle-branding crossed the Atlantic from Spain, and potters and silversmiths used "trademarks" long before that time by to identify their products. In legalese, in fact, a brand *is* a trademark. Ornate signs hung on inns and taverns served the same purpose. Since the second half of the nineteenth century, branding has evolved into an advanced marketing tool. The industrial revolution, new communication systems, and improved modes of transporting goods made it both easier and more necessary for companies to advertise brands over larger regions. As manufacturers gained access to national markets, numerous brand names were born that would achieve legendary U.S. and global status.

THE BRAND CONCEPT

Every year Intrabrand, a leading brand consultancy, provides to *BusinessWeek* a scoreboard of the top 100 global brands. In 2009 eight of the top ten global brands were American in origin. In rank order, the ten top brands were Coca-Cola, IBM, Microsoft, GE, Nokia (Finland), McDonald's, Disney, Toyota (Japan), Intel, and Disney. To make the "top 100" a company must sell 20 percent or more of its product outside its home country.

A brand is backed by an intangible agreement between a consumer and the company selling the brand. A consumer elects to buy a brand, rather than a competitor's, based primarily on the brand's reputation. He or she may stray from the brand occasionally because of price, accessibility, or other factors, but some degree of allegiance will continue to exist until a different brand gains the customer's loyalty. Until then the consumer will reward the owner of the brand with dollars, almost assuring future cash flows to the company.

Price and brand are complexly related. Branded goods are always more expensive than "store" or "generic" brands. Some products have a "brand equity" so high that they always command a premium. In some cases high price itself may be a defining aspect of the brand and consumption of that brand may signal to others the consumer's wealth or social status. In more competitive environments, brand commands loyalty only when the price is right.

There are two major categories of brands: manufacturer and dealer. Manufacturer brands, such as Ford, are owned by the producer or service provider. The best-known brands are held by large corporations that sell multiple products or services affiliated with the brand. Dealer brands, like Die-Hard batteries, are usually owned by a middleman, such as a wholesaler or retailer. These brand names often are applied to the products of smaller manufacturers that make a distribution arrangement with the middleman rather than trying to establish a brand of their own. Manufacturers or service providers may sell their offerings under their own brands, a dealer brand, or

as a combination of the two types, called a mixed brand. Under the latter arrangement, part of the goods are sold under the manufacturer's brand and part are sold under the dealer brand.

BRAND STRATEGY

In launching new products into the market, start-ups and small companies have fewer options than large companies with one or more established brands. Start-ups must first decide if the product is likely to reach a wide enough market to merit the costs of formally establishing a brand; if yes, they have to select a name and launch a marketing program to build recognition for the brand. An intermediate position is possible and frequently used. The brand is named and money is spent on suitable packaging and limited advertising. Then the brand is allowed to establish itself slowly by word of mouth. Many brands have been established in this way.

An established company may choose to follow the same strategy. But because it has one or more brands already recognized, it may elect, instead, to launch the new product under an existing name. The downside of this strategy is that it may dilute the equity of the established brand if the new product proves to be unpopular.

Launching new products under a new brand name is in many ways identical to starting a new operation with the difference that many of the basic business operations are already in place. New launches cost more money and are avoided where possible.

A single word or a short tune can prompt consumers to think about a business if that company's branding has been successful. Many large corporations spend millions of dollars building brands. Small businesses can follow some of their examples, but spend less and still build a successful brand. Karen Miller, a small-business coach, advises small business to create a complete package to promote their brand. Small- business owners should make sure that their business has a logo and a tagline, a strong capability statement, coordinated marketing literature, and a Web site. Miller advises taking advantage of the global marketing power of the Web.

ONLINE BRANDING

While expensive branding campaigns often involve television and print ads, the Internet has opened the doors for small businesses to compete better by promoting their brands more cost effectively. A successful online brand presence involves complementary online and offline branding tactics. It is no longer enough simply to launch a Web site and offer some e-commerce functionality. Today, brand managers use the Internet to interact with customers. The feedback they receive enables them to enhance and extend their brand reputation.

Online, it is easy to publish one's thoughts, and people often post reviews of products and services. Online bulletin boards, forums, and consumer review sites have been available for consumer comment since the late 1990s. Social media and the trend of consumer-to-consumer interactions became a popular vehicle for branding and relationship marketing in the mid 2000s. Companies with successful brands have strong social media strategies; they are a committed to participating, responding, and listening to what consumers say about them and their competitors.

LEGAL ASPECTS

By legal definition, a brand is a trademark, also called a service mark when the brand is associated with a service. Trademarks may be protected by virtue of their original use. Most U.S. trademarks are registered with the federal government through the Patent and Trademark Office of the U.S. Department of Commerce. Federal trademark registration helps to secure protection related to exclusive use, although additional measures may be necessary to achieve complete exclusivity. The Lanham Act of 1946 established U.S. regulations for registering brand names and marks. They are protected for 20 years from the date of registration. Various international agreements protect trademarks from abuse in foreign countries.

Trademarks have suffered from infringement and counterfeiting since their inception. The U.S. government, in fact, does not police trademark infringement; it leaves that task to registrants. In FY 2009, U.S. Customs seized $260.7 million worth of so-called gray goods in violation of intellectual property rights, up from $45.3 million in FY 2000, but a decline from the $272.4 million seized in 2008. Substantial sums are involved in seizures alone. Data on total goods reaching the market are not collected. Gray goods do substantial damage to owners of actual brands by depriving them of the extra profits earned by years of high-level performance and also by damaging the brand reputations if the counterfeited goods are of slipshod quality.

With the emergence of the Internet, a new kind of trademark infringement has appeared in which online corporate brands are stolen. According to a 2007 report from MarkMonitor Inc., a San Francisco-based brand protection service, "Media companies are under attack due to the value of their brands and contents as well as the traffic their good names drive." MarkMonitor reported that "cybersquatting," registering a URL that includes a real brand's name, is the biggest threat.

BREAK-EVEN ANALYSIS

Put most simply, a business does not make any money and it also does not lose any money at its break-even point. Using break-even analysis, business owners can figure out when a business will be able to cover all its expenses and begin to make a profit. This practice is especially important for small start-up businesses. Knowledge of the break-even point enables the start-up business owner to calculate the sales revenue figures that the business needs to reach to pay ongoing business expenses. For example, overhead expenses include a plethora of costs, such as payroll, rent, office furnishings, and technologies, to name a few. Yet having a profitable business is not as simple as matching product sales to overhead expenses. The business owner must also consider the cost of purchasing the inventory, for example.

The basic formula for break-even analysis, sometimes abbreviated as BEA, is as follows:

BEQ = FC / (P-VC)

Where BEQ = Break-even quantity

FC = Total fixed costs

P = Average price per unit, and

VC = Variable costs per unit.

Business owners who know these numbers can use one of the many break-even calculators offered free on the Internet. A typical start-up business cost calulator provides users with a detailed breakdown of costs to calculate how much money they will need to launch a business.

Fixed costs are costs that never change no matter how much or little a company produces: administrative salaries, rent or mortgage payments, insurance, interest on borrowed funds, and similar costs. Sometimes these are called overhead costs. *Variable costs* are directly tied to product manufacturing or service provision: direct labor, raw materials, sales commissions, delivery expenses, and more.

In the formula shown above, BEQ, the "quantity," refers to a single unit sold, whatever it might be. It may be a product like a teddy-bear (including its packaging) or something more complicated such a "carpet cleaning job" (including travel to and from the site). BEQ always refers to the actual entity sold (teddy-bear or carpet cleaning job) rather than something that goes into the entity (e.g., teddy-bear stuffing or vacuum cleaner bags). BEQ is the entity the company puts a price on, "the unit." Total sales of this unit, divided by the number of units sold, produces P, the average price. All costs associated with the unit, divided by number of units sold, yields VC, the cost per unit. Note that fixed cost is *not* included in VC.

Price per unit less variable cost per unit produces a surplus if the price is set correctly. In accounting terminology, this is called the "contribution margin." It is the amount the sale of each unit contributes to the ultimate profitability of a corporation. When enough such chunks of contribution have been produced to *equal* fixed costs, the business has reached its break-even point. It is not profitable yet, but all of the overhead has been "absorbed."

Suppose that fixed costs are $150,000. Price per unit is $85 and variable cost per unit is $75. The contribution margin will then be $10. Fixed cost divided by $10 results in 15,000. Therefore this company must sell 15,000 units just to break even. The next unit sold thereafter is the first contribution to profit. This company must sell 15,001 units to make a tiny profit of $10.

This example illustrates how changes can affect break-even. Fixed costs can be lowered, price can be increased, and variable costs can be shaved. Conversely, if variable costs rise and cannot be lowered, contribution margin will sink and break-even will require more sales unless, for example, price is hiked or the company moves to cheaper space and lowers its rent substantially.

DIFFICULTIES AND APPLICABILITY

BEA is easiest to use in situations where the product or service is uniform and variable costs can be very clearly calculated and assigned to the "unit." Significant analytical problems arise with complexity. In a medical practice, for example, the "unit" may be easy to determine: it is a single patient-visit to the practice. But variable cost associated with every visit will vary with the patient's condition, needs, medical insurance policies, the payments those policies cover depending on the diagnosis, the percentage of charges the patient must pay directly, and the variable costs of collecting that contribution. Administrative personnel dealing with insurance companies must maintain exacting records to tie their time not only to patients but to specific visits by each patient. Doctors, similarly, must be meticulous in dividing time between administrative duties (fixed costs) and patient-related activities (variable costs); these activities often extend beyond the visit itself for example, to time spent reviewing test results or studying recent literature on a disease or medication. Very substantial data must be gathered over a long time to arrive at precise data. Unless this is done, the break-even analysis will be too broad to serve informed management decisions.

An example of the difficulties is presented by Merry J. McBryde-Foster writing in *Nursing Economics* about BEA as practiced in a hypothetical nurse-managed center. "[P]rices for visits will vary according to the type of visit billed," writes McBryde-Foster. "The variable costs of visits will vary according to the type of visit." She shows how, in this hypothetical center, contribution margins for each type of visit must be calculated using Current Procedural Terminology (CPT) codes. CPT was developed by the American Medical Association and is a complex structure that frequently changes based on Medicare Payment Schedules.

Similar difficulties arise in many contracting businesses where the size and complexity of the contract which is the "unit" and the great variability of inputs make it very difficult to produce a single number that means break-even.

Despite these difficulties, BEA is universally applicable. Every type and size of business can incorporate the break-even equation into its pricing module. Service- and product-based businesses, and large and small businesses, must have an understanding of direct and indirect costs and how they affect pricing and profitability models. Attempts to apply BEA will bring out deficiencies in accounting and cost-tracking practices and will indirectly improve the management of the business.

BUDGET DEFICIT

The phrase, "budget deficit," is normally applied to situations where, at the end of a calendar or fiscal year, a public entity turns out to have spent more money than it has been able to collect in taxes, fees, and other impositions. Individuals, businesses, not-for-profit entities, and public bodies all operate under budgets. But when a business has a "budget deficit" the phrase means that it has experienced a "loss." Individuals "overspend." When contractors spend more than their contracts provide, they have "overruns."

Public sector deficits are of substantial interest to the public, not least to the commercial sector, because a shortage of available money hampers economic activity. Deficits are invariably covered by borrowing. When governments borrow money they compete for available national savings with the commercial institutions that also wish to borrow money to finance their operations. The federal government, particularly, enjoys an advantage because its treasury bills are of the highest quality and are preferred to any other kinds of bonds.

THE U.S. BUDGET DEFICIT

Federal deficits are nothing new, although the size of the deficit is of growing concern. The federal budget deficit hit an all-time high in 2009 of $1.42 trillion, more than three times the record set in 2008 when it reached $454.8 billion. In the 44-year span from fiscal year (FY) 1965 to FY 2009, the federal government has had a budget surplus only five times, in FY 1969 and in the period FY 1998 to FY2001. In all other years, the government ran in the red.

Small-business owners feel the effects of a large federal government budget deficit, mainly through interest rates and the threat of inflation. When there is a budget deficit, interest rates often rise, and the cost of borrowing to finance a business also increases. These rising interest rates lead to inflation, which makes it harder for small businesses to make purchases. However, rising interest rates do not always coincide with a deficit; in 2009, for example, interest rates remained relatively low even though the deficit soared.

INDIVIDUALS AND HOUSEHOLDS

For businesses to thrive, people must have the money to buy the goods or services that businesses produce. According to the Bureau of Economic Analysis (BEA), an agency in the U.S. Department of Commerce, the personal savings rate in 2009 was about 4 percent. The rate, or the savings as a percentage of disposable income, had been declining for more than two decades, hovering under 1 percent during the decade preceding the economic crash of 2008. After the Emergency Economic Stabilization Act of 2008 (often referred to as a bailout of the U.S. financial industry), personal savings increased as Americans, nervous about job losses and stock and housing prices, began to save their money.

However, some economists warn that when Americans save more of their money, it causes problems for the economy. American businesses depend on consumer spending to make money. In fact, 70 percent of the country's gross domestic economy is the result of consumer spending. When consumers stop spending, American businesses struggle to make ends meet. In response to a slowdown in consumer spending, governments often step in and increase spending in order to help businesses. The problem with this approach, of course, is that this federal spending increases the size of the deficit unless it is somehow offset by increased taxes, but an increase of taxes or tax revenue is a highly unlikely occurrence during difficult financial times.

updated by Schultz, Anaxos

BUDGET SURPLUS

When a governmental entity has revenues from taxes, fees, and other impositions which exceed its budgeted outlays, it is said to have a budget surplus. When a business underspends its budget but all else remains the same, that is, sales are at projected levels, it is said to have "improved profits" rather than a surplus. Usually both the phrases "budget surplus" and "budget deficit" are applied to public entities.

Surpluses are almost always the consequence of two interacting forces: on the one hand efforts to contain costs or spending have been successful; and, on the other hand, revenues (over which government rarely has any genuine control except by raising or cutting taxes) have exceeded expectations.

THE U.S. FEDERAL BUDGET

In the 44-year period from FY 1965 to FY 2009, the federal government experienced a budget surplus in only 5 fiscal years. The government had a modest surplus of $3.2 billion in FY 1969. In fiscal years 1998 through 2001, the government had surpluses of (in billions) $69.2, $125.5, $236.2, and $128.2 respectively. In all other years of the 1965 2009 period, the government experienced deficits, reaching an all-time high in 2009 of $1.42 trillion. That amount was more than three times the previous record set in 2008, when the deficit reached $454.8 billion.

The government's performance between FY 1998 and FY 2001 was due to the thriving Internet economy

and cuts in expenditures, particularly in defense. However, the terrorist attacks of September 11, 2001, combined with a slowing economy, led the United States into a recession starting in FY 2002, and budget deficits returned. These deficits led to increased national debt and government borrowing.

THE U.S. HOUSEHOLD BUDGET

Although households rarely operate on a formal budget, the Bureau of Economic Analysis (BEA), an agency of the U.S. Department of Commerce, calculates the "surplus" or "deficit" experienced by U.S. individuals and households as part of its National Income and Product Accounts. National Income and Product Account (NIPA) data are used to build Gross Domestic Product estimates. BEA collects data on total and disposable income and total outlays. Disposable income less outlays produces savings. The savings rate (savings divided by disposable income) is positive to indicate a surplus and negative when households, collectively, experience a deficit.

In 2009 the U.S household saving rate rose to 3.6 percent, a rate that in 2005 had dipped to the negative at −0.5 percent. The negative number occurred after years of declining savings rates: BEA data shows that in fiscal years 1992 through 2004, the savings rate went from 7.5 percent of disposable income to zero in 2005.

Also in FY 2005, negative savings rates appeared in the "personal income" category, but picked up to about 4 percent by 2009. Like the household savings, the personal savings rate savings as a percentage of disposable income had been declining for more than two decades, hovering under 1 percent during the decade preceding the economic crash of 2008. After the Emergency Economic Stabilization Act of 2008 (often referred to as a bailout of the U.S. financial industry), Americans began saving more; they were anxious about job losses, the stock market, and housing prices.

Increased personal and household savings seem like a good thing, since this often means that investment grows, but economists caution that increased personal savings are not always a positive for the economy as a whole. When consumers save more by spending less, businesses suffer from a decreased sales caused by the reduction in consumption. In this scenario, unless sales can be increased elsewhere (such as exports), businesses may lose jobs, causing economic woes to continue.

BUDGETS AND BUDGETING

In the broadest sense, a budget is an allocation of money for some purpose. The word once meant "pouch" or "purse"; a budget therefore is "what's in the pouch." Budgeting as an activity ranges in extent from managing household finances to the preparation of the Budget of the United States, undertaken yearly by Congress; that document is rarely less than 1,000 pages in length. This article will focus principally on "formal budgeting" as practiced in corporations, sometimes called the "budget process."

Budgeting has always been part of the activities of any business organization of any size, but formal budgeting in its present form, using modern budgeting disciplines, emerged in the 1950s as the numerical underpinning of corporate planning. Modern corporate planning owes much to operations research and systems theory. A pioneer in that field, Russell L. Ackoff, worked closely with General Electric, Anheuser-Busch, and other major corporations. His first of four books on the subject, *A Concept of Corporate Planning*, had a major impact.

Modern formal budgets not only limit expenditures; they also predict income, profits, and returns on investment a year ahead. They have evolved into tools of control and are also used as a means of determining such rewards as profit sharing and bonuses. Unless the budgetary process is managed with extreme skill and care, the

very virtues of budgeting can turn into negatives and have, of late, emerged into a movement actively working to change this process.

BUDGETING AS A PROCESS

In large corporations, budgeting is a collective process in which operating units prepare their plans in conformity with corporate goals published by top management. Each unit plan is intended to contribute to the achievement of the corporate goals. Unit managers prepare projections of sales, operating costs, overhead costs, and capital requirements. They calculate operating profits and returns on the investment they intend to use. The budget itself is the projection of these values for the next calendar or fiscal year. As part of this process, each unit presents its plans and budget to a reviewing upper management panel and may, thereafter, make whatever changes result from instructions from or negotiations with the higher level. Texts presenting, documenting, and defending the rationales underlying the numbers are usually part of the planning document. Approved budgets then become the road map for operations in the coming year. Ideally, monthly or quarterly budget reviews track performance against the budget. As part of such reviews, changes to the budget may be approved. At year-end managers are judged by their performance against the budget.

While budgets are developed bottom-up, managers must strive to meet top-down corporate goals (e.g., "annual growth in after-tax profits of 39 percent."). Because performance is measured based on meeting or exceeding positive projections (of sales, returns, and profits) and meeting or coming in below negative projections (fixed and variable costs and capital expenditures), managers have strong incentives for projecting the lowest possible "positive" and the highest possible "negative" results. The more successful they are in understating sales and profits and overestimating costs, the higher the likelihood of "meeting the budget." Top management's incentives, by contrast, are to do the opposite. Therefore the budgeting process is inherently marked by potential conflict.

Small businesses, too, benefit from a budget. Because small businesses often have fewer departments and employees, and because there is usually less money flowing in and out of the business, the small-business budget is easier to develop than a large corporation's budget. The small-business budget gives a guideline for expected income and expenses; small-business owners are able to compare anticipated financial goals with the actual numbers.

Difficulties in the budgeting process can be, and usually are, mitigated by rational policies, goodwill on both sides, and straightforward implementation. Projections should be as realistic and quantifiable as possible. If projections are out of line with historical patterns, up or down, management must question the planning. Thus, for instance, a sharply rising projection of costs must have some real-world justification. Overly ambitious revenue projections must also be questioned. Conversely, managers must resist pressures sharply to raise revenue targets unless tangible changes in the market or compensating raises in sales expenditures are present. If the negotiating levels are honest and realistic, the right projections will result. Ideally, operating units should not be measured on activities over which they lack full control. An operation which does not operate its own debt collection, for example, should not be measured on how rapidly invoices are collected. Since budgets are often at least 50 percent guesswork, formal budgetary review at reasonable intervals and realistic adjustments based on actual events must be part of a well-functioning process. All too often, the spring budgeting event is rapidly forgotten.

BENEFITS AND COSTS

The single-most potential benefit of formal budgeting lies in ensuring that responsible managers take time each year (and then at fixed intervals throughout the year) in thinking about their operation by looking at all of its aspects. Budgeting creates a comprehensive picture of the future and makes both opportunities and barriers conscious. This foreknowledge then helps guide day-to-day activities.

The chief cost of the budget process is time. In some corporations the process takes on a life of its own and becomes a convoluted exercise of excessive complexity which, moreover, prevents unit managers from doing any thinking: their time is consumed in efforts to comply with a vast array of requirements dictated from above. Much of the negative attitude that has developed concerning this activity has its roots in unnecessary bureaucratic impositions on the one hand and unreliability because of rapid change a few months out.

Many small businesses fail to create a system of checks and balances in their budgets. When creating their budgets, small-business owners should assign a person to watch over the accounts and thoroughly check records. In fact, at least two people should be heavily involved in account reconciliation. Many small businesses also spend too much on advertising, assuming that it will quickly impact sales. But revenue usually does not start flowing from advertising for several months. Finally, tax bills can be detrimental to small businesses. Small-business owners should stay on top of what they will owe the government in taxes. They should also stay informed of regulations coming out of Washington, D.C.

TYPES OF BUDGETS

The two dominant forms of budgeting are traditional and zero-based. Business planning is usually a combination of

the two. *Traditional* budgeting is based on a review of historical performance and then the projection of such findings to the future with modifications. If inflation is high, for instance, cost trends of the last several years are projected forward but with adjustments both for inflation and for projected growth or decline in business activity. Historical sales patterns, using established trends in sales growth, are projected; new sales from planned new product introductions are then added. *Zero-based* budgeting is the creation of a completely new budget from the ground up as if no history existed. When using this method, the operation must justify and document every item of expenditure and income anew. Brand-new operations will utilize zero-based methods.

In government planning, but only very rarely in business, *performance* budgeting is used as a third alternative. Under this method, the budget is fixed at the outset. The planning activity is to determine exactly what activities will be carried out using the allocated funds. Performance budgeting is sometimes used in the corporate setting when the advertising budget is arbitrarily set as such-and-such a percent to projected sales. The advertising function then uses performance budgeting to allocate the budget to various products and media.

Small-business owners discuss different ways (and sometimes just different names) to set up their budgets. They may choose a cash budget, which tracks cash flow, or an expense budget, which is a comparison of actual and budgeted expenses. Often small businesses choose an *operating* budget. The operating budget is an itemized statement of income, expenses, debt service, and cash flow during a future period; it is a projection of the profitability of a business. This is very similar to the traditional budget, as spelled out above.

CRITIQUES OF THE PROCESS

As early as 1992, the famous guru of management, Peter Drucker, wrote in the *Wall Street Journal:* "Uncertainty in the economy, society, politics has become so great as to render futile, if not counterproductive, the kind of planning most companies still practice: forecasting based on probabilities."

Uncertainty has, if anything, grown since 1992 with the expansion of the Internet, the reality of terrorism, pressures on hydrocarbon fuels, the threat posed by global warming, and worldwide epidemics. In addition to uncertainty, formal budgeting has also come under fire for impeding trust and empowerment, two new concepts in the evolving corporate culture, as well as for stifling innovation. As David Marginson and Stuart Ogden wrote in *Financial Management (UK)*, "Budgets have long had a bad press, but they have attracted even more flak recently for being at best inappropriate to modern business practice and at worst potentially harmful.... The Beyond Budgeting Round Table (BBRT) has been one of their most vociferous critics. It argues, for example, that the necessary conditions of trust and empowerment in today's organizations are not possible with budgets still in place, because the entire system perpetuates central command and control." Innovation is vital for economic survival. But "budgeting stifles trust and empowerment, according to its critics, which in turn stifles innovation."

On its Web homepage, BBRT advocates a set of principles which include continuous planning and controls (rather than an annual budget process), resource allocation as needed (rather than based on annual allocations and plans), high performance standards (rather than detailed rules and budgets), and freedom of action by small frontline teams (rather than direct control of operations from the center).

Often, problems within the budgeting process can be solved; it just requires that owners and accountants think "outside the box". Knowing what the budget is helps business owners understand the changes that must be made. Moreover, budgeting process is a fluid and ever-changing process. For the small-business owner, budgeting in the traditional sense will continue to be a sensible, necessary, and valuable tool practiced, in essence, by examining current resources, eyeing the future, and making rational allocations for the immediate future.

BUSINESS APPRAISERS

Appraisers are agents who establish the value of businesses, personal property, intellectual property (such as patents, trademarks, and copyrights), and real estate through a process known as valuation or appraisal. The demand for valuation of business enterprises has increased in the last several years in many industry sectors for a variety of reasons, including the rise in corporate restructuring, rising incidences of litigation (such as divorce, in which value and possession of closely held businesses may be hotly contested), changing employee-compensation packages, continued purchases of existing businesses, and the proliferation of employee stock ownership plans (ESOPs), which require annual appraisals of value. Indeed, the dramatic surge in popularity of ESOP plans accounts for a significant portion of the increase in appraisal/valuation activity across the American business landscape.

Problems in the Business Appraisal Industry. Beginning in the late 1990s, the appraisal industry began a process of change and consolidation driven primarily by changes in the real estate sector. Steve Bergsman, writing in *Valuation Insights & Perspectives*, provides a summary: "There was a time not so very long ago, at least as recent as the early 1990s, when the appraisal industry residential and commercial was reliant on the mortgage lending business. By the middle of the last decade, however, a number of crosscurrents began to buffet that type of work . . . competition from other appraisers and technology. First, competition caused pricing to flatten; even banks admit there have not been rate increases in a number of years. Second, new technologies, particularly automated valuation models, appeared, and more and more data, i.e., historical records of home sales and multiple listing services, became widely available on the Internet." As a consequence of these developments, real estate appraisal has become a much less profitable part of this business.

There is another challenge for real estate appraisers. Before the housing boom; and subsequent 2007 bust appraisers say they were pressured to get the value the mortgage company asked for appraisals. However, after the housing mortgage shakedown, many appraisers said that nothing had changed. David Streitfeld, in his *New York Times* article "In Appraisal Shift, Lenders Gain Power and Critics," notes that in a memo from U.S. Bancorp posted on the Appraisers' Forum online discussion group in 2009, the group urged lender's appraisers to "try and get the value we need the first time." Additionally, Streitfeld reports that in a 2009 online poll of 2,250 appraisers by *Working RE Magazine*, half the respondents said they sometimes "felt that management companies were ordering them to come up with a value that would make the deal work." Despite the attempt to institute new regulations to oversee the appraisal industry, appraising a property with its true value continues to be a problem.

Finding a Qualified Appraiser. Although the business appraisal industry is in a state of flux, consultants hasten to add that many qualified appraisers do exist and can be of valuable service to small-business owners who take the trouble to investigate the merits of various appraisers. Keys to finding a good appraiser include the following:

- Network. As one tax and estate-planning attorney told *Inc.*, "Ask around, and then ask around some more. Talk to people in your geographical area, even if their businesses aren't just like yours; talk to people with similar businesses, even if they're not in your geographical area. Appraisal is a fraternity, and once you know who's in the fraternity, who's respected, you'll know who to go to. And, very importantly, if the reason you're looking for a valuation has anything to do with taxes, or is likely to somewhere down the line, find out who's respected by the Internal Revenue Service who do they use to do their valuation work?"
- Look for experience and education. Appraisers with significant experience and a good educational background (MBA or CPA) are far preferable to those who are limited in either area. Moreover, some analysts believe that the appraisal industry is moving towards increased specialization (office buildings, hotels, professional practices, retail outlets); if possible, small-business owners should find an appraiser who is familiar with their business area.
- Recognize that valuations vary from client to client. Appraisals of business can vary significantly in terms of their cost, both in terms of time and money. Small-business owners need to learn about standard fees imposed on business that most resemble theirs in terms of size, health, and situation. "The vicissitudes of most projects the standard ESOP valuation being an exception often make it impossible to charge on a flat-fee basis, or even give a

responsible estimate of hourlies," warned Nell Margolis in *Inc.*.

- Find a licensed appraiser. The relative ease with which people are able to secure certification in the appraisal business has drawn fire, but it does establish a ground floor of presumed competence.

BUSINESS ASSOCIATIONS

Business associations are membership organizations engaged in promoting the business interests of their members. These associations typically perform activities that would be unduly costly or time-consuming for an individual company to perform by itself, including lobbying, information gathering, research, and setting industry standards. Association spokespeople contend that by combining their voices under one banner, companies are able to establish a strong and unified presence and effectively protect their shared interests. Leading business associations in the United States include the U.S. Chambers of Commerce, the Better Business Bureau, the National Restaurant Association, the National Retail Federation, and the National Manufacturers Association, but there are tens of thousands more that operate at local, state, regional, and national levels all over America.

Large firms have long been active participants in business associations, using the organization to advance their goals in a wide range of areas, from regulatory issues to research to industry image improvement. But smaller companies benefit from association memberships as well, provided they find an organization that adequately reflects their priorities and needs, which may be dramatically different from those of big corporations. For example, a small-business owner may value an association that provides education, peer contact, and networking opportunities more than one that is focusing its resources on eliminating an OSHA regulation that pertains primarily to large companies.

Before entrepreneurs and small-business owners begin shopping around for an association, they should first compile a chart of specific business and personal goals, as well as a list of talents that they have that would be welcomed by an association. "All too often," explained Robert Davis in *Black Enterprise*, "contact-hungry entrepreneurs and professionals join networking organizations before investigating them thoroughly. Does this sound familiar? You hastily join an organization, only to discover later that it's disorganized, poorly attended and moreover, doesn't meet your needs."

In order to avoid such a scenario, small-business owners should undertake a serious information-gathering effort before committing to an association. People considering an association should first review the association's Web site and request a brochure or information packet on the group that adequately covers its background, philosophy, structure, services, and affiliations, then request a meeting with an association representative or attend an organization meeting or event to get more detailed information. Current and former members of the association under consideration are also potentially valuable sources of information. "Ask them about the level of commitment needed for worthwhile membership," wrote Davis. "Also ask them to compare the benefits they have received from this organization with benefits received from other groups."

Associations can be a positive force for a small business. Many join local or regional chambers of commerce as a means of providing health insurance to their employees. But all associations are not created equal. Some are poorly organized, poorly attended, and offer little benefit to ambitious entrepreneurs. Moreover, some entrepreneurs, already struggling to find time to attend to both business and family needs, are simply unable to invest the necessary time to make association membership worthwhile for them or their company.

THE FUTURE OF ASSOCIATIONS

Associations have touted their ability to gather and send information to members quickly and efficiently. However, technology advances have made this ability less important. Today, members easily contact each other through methods like e-mail, blogs, instant messaging, "webinars," and podcasts, to name a few. They no longer rely on periodicals, conferences, and seminars for information sharing and

networking. These changes have made the traditional communications strengths of the association less important.

In a 2008 article in *Association Magazine*, Jim Carroll wrote that the key to the continued strength of associations is that they must change as their membership changes. He suggested that associations think about potential future members. In 5 or 10 years, association members will be more transient and more temporary. They will have a number of jobs and careers, and their average affiliation with an association will last only a few years, rather than decades. Carroll wrote that members will have more specialized jobs and will be more ethnically diverse. In addition, he wrote that most association members will hang their hats at smaller, scalable, more narrowly focused workplaces that move faster in terms of products and services. In conclusion, Carroll reiterated that association members will be different, and he asked associations to consider if they will be able to change with them.

BUSINESS BROKERS

Business brokers act as intermediaries between buyers and sellers of a business. They may represent either party in the transaction. They do not take possession of goods or property or deal on their own account.

Brokers differ from dealers in that the latter transact on their own account and may have a vested interest in the transaction. Brokers fill the important marketing function of bringing buyers and sellers together and helping them negotiate mutually beneficial agreements. In addition, they facilitate transactions by providing expertise and advice. As Richie Lowe Areinz points out in *NZ Business*, "[B]usiness brokers generally sell an intangible, such as the expected profits or in some cases the losses of a business. Real estate agents sell bricks and mortar. Put another way, agents sell land and buildings while business brokers usually sell an entity or business activity leasing space within a building."

Brokers supply numerous benefits to both buyers and sellers. Sellers benefit because they do not have to spend time and money searching for buyers. Qualified brokers have access to people in the market to purchase a company; they know how to attract and screen potential buyers much more quickly than do typical business owners. The broker may also be able to help the seller place value on his enterprise accurately; he or she can devise a strategy to transfer ownership over time, address necessary paperwork, and overcome legal hurdles related to taxes.

The buyer also benefits. A broker may be able to find a business that suits the buyer's abilities, wants, and financial situation much more quickly. Moreover, good business brokers will not accept overpriced properties, those based on illegal activities, or businesses otherwise fatally flawed. They save buyers the legwork of qualifying prospects. A good brokerage firm typically turns down as many as half of the businesses offered it for sale. In addition to screening, the broker can help the buyer determine what he or she can afford and may be able to assist in arranging financing to purchase the business. And, as with sellers, business brokers can provide help with licenses, permits, and other paperwork. In addition, it is the broker's duty to ensure that the interests of the buyer (and the seller) are protected by any contracts or agreements relating to the sale.

THE BROKER ADVANTAGE

Toby Tatum warns in his 2009 book *Pricing a Small Business for Sale: A Practical Guide for Business Owners, Business Brokers, Buyers, and Their Advisors* that the small-business marketplace is a very inefficient market. Tatum writes, "business brokerage professionals generally agree that approximately 80 to 90 percent of small businesses placed on the market for sale will not sell and that over 90 percent of individuals seeking to buy a small business never succeed in this effort." Failure to negotiate a price acceptable to both parties is the key reason that small-business buyers and sellers do not close the deal.

Perhaps the most valuable broker service, therefore, may be the broker's status as a buffer between the two

sides. The skilled business broker will diplomatically field and address sensitive questions and concerns that, were they delivered directly between the buyer and seller, might damage or ruin the prospects for completing a deal. Brokers that can address the concerns of one side without ruffling the feathers of the other are invaluable to the negotiating process.

For their services, brokers typically receive in compensation a percentage of the total value of the transaction. The fee may be paid by the buyer, seller, or both parties, depending on the nature of the transaction. Commissions vary widely, usually depending on the size of the transaction and the level of service provided by the broker.

THE BROKERAGE PROCESS

Although it is a broker's chief function, bringing buyer and seller together is often the easiest part of his or her job. Closing the transaction, however, is often a complicated process, colored by a spectrum of factors that are unique to each situation. For instance, the seller of a business often views the enterprise as his or her "baby," and subsequently places a value on it that may be greater than its actual worth. Similarly, a buyer may fail to appreciate the amount of work involved in building a business to a certain point. Other major factors that can complicate an agent's task include financing, which can become very complicated, and problems related to employees and/or clients of the business being sold.

As Gabor Garai and Susan Pravda observed in *Mergers and Acquisitions*, the process of securing an agreement typically is a multifaceted one. Once a business broker brings an interested buyer and seller together, he or she often attempts to set a target date for completion of the transaction. This is usually accomplished by means of a letter of intent in which the buyer and seller agree to move toward a deal. The importance of the letter of intent is that it serves as a framework around which to structure negotiations. The letter also reduces ambiguity and misunderstanding, and ensures that both parties are serious about pursuing the transaction. Finally, establishing a deadline through a letter of intent helps to keep the buyer and seller focused on the big issues, rather than on minor details that can drag the deal out for months on end or kill the sale.

After setting a target date, the broker's next task is to close the price gap between what the seller wants and what the buyer is offering to pay. A wide range of considerations has to be taken into account here, including value of inventory, value of accounts receivables, value of community goodwill, inclusion or exclusion of equipment in final purchase price, and tax issues for both buyer and seller. Another possible obstacle to a sale that often crops up around this time is "seller's remorse." Seller's remorse commonly occurs during the latter stages of negotiations, when the seller suddenly realizes that he or she is relinquishing control of the company that has been a cornerstone of his or her life (and often the life of the entire family) for many years. Seller's remorse can kill the deal if the broker fails to confront it early in the negotiations by assuaging the seller's concerns.

After the framework for an agreement has been reached, the business-brokering process moves on to due diligence, wherein various legal technicalities which could thwart an otherwise legal arrangement are identified and addressed. For example, the buyer might want to ensure that he or she is procuring the legal rights to all patents held by the firm. It is the broker's job to facilitate due diligence to protect parties on both sides of the deal.

In the final stage, the broker helps the buyer and seller iron out and sign a final contract. This stage is the one most likely to entail the use of attorneys on both sides, even for smaller transactions. The best way for the broker to reduce the chance that the deal will fail at this critical juncture is to try to address all questions and concerns in the letter of intent and due diligence stages. Despite his best efforts, one or both parties may employ brinkmanship tactics that threaten to scrap the entire deal, such as significantly raising the asking price or demanding that some new contingency be added to the agreement. At this point, the broker's expertise as mediator and peacemaker is key to ensuring that the transaction goes through.

BUSINESS BROKERS AND THE ENTREPRENEUR

Business brokers can be invaluable to both buyers and sellers of small businesses, but the quality of these agents can vary tremendously. Business brokerage firms have traditionally been a notoriously unregulated group, and while there have been some improvements in this regard, complaints about incompetence and/or questionable business practices still crop up. Whether entrepreneurs are looking to start a business through a purchase or sell an existing business to start on a new idea, it is essential that they take steps to ensure that the services of a skilled and qualified broker have been secured.

There are, of course, certain basic kinds of information that any buyer or seller should obtain when shopping for a business broker. "When you're looking for a broker to help you buy or sell a business, ask about the broker's level of experience and pursuit of continuing education," counseled *Nation's Business.* "When getting references, ask for the names of not only buyers and sellers but also attorneys, accountants, and commercial bankers." Another basic aspect of an agent's operation that should be checked is its exclusivity policy (some

brokers will list businesses only if they can do so exclusively, a requirement that limits the business's visibility). But there are other steps that can be taken as well. For example, a broker's record of sales as a proportion of total listings can provide significant insight into his or her abilities. Brokers who are unable to deliver sales on more than 50 percent of listings on the market for 6 months to a year should probably be avoided. Not surprisingly, a broker who can document a successful track record of sales to listings is preferable to one who cannot.

Small-business owners should be patient when selling their businesses. According to Debbie Allen, the author of five books for entrepreneurs, it takes an average of 2 to 4 years to sell a small business. She recommends that small-business owners keep a long-term plan to ensure an eventual successful business sale. Allen also recommends that small-business owners get very involved in the sale of their own business. "Thinking a broker will do all the work in promoting your sale can be deadly. You are the best promoter for your business. Who knows your business better than you? No one is more motivated, passionate and knowledgeable about your business than you!" Allen explained that in selling one of her retail businesses, she had no traction with her broker and realized that her sales associates were the customer's first contact. After months of inactivity with a broker, Allen offered her associates a bonus for finding a buyer a move that quickly led to the sale of the business.

BUSINESS CYCLES

The business cycle is the periodic but irregular up-and-down movement in economic activity, measured by fluctuations in real gross domestic product (GDP) and other macroeconomic variables. A business cycle is typically characterized by four phases recession, recovery, growth, and decline that repeat themselves over time. Economists note, however, that complete business cycles vary in length. The duration of business cycles can be anywhere from about 2 to 12 years, with most cycles averaging 6 years in length. Some business analysts use the business cycle model and terminology to study and explain fluctuations in business inventory and other individual elements of corporate operations. But the term "business cycle" is still primarily associated with larger (industrywide, regional, national, or even international) business trends.

Comparing the performance of a small business to that of a large business during a business cycle does not reveal any sweeping overviews about their differences, according to a study conducted by Joel Popkin and associates for the Small Business Administration (SBA). What SBA's data did show is that business cycles have different effects within an industry. Popkin noted that "there is little evidence of cyclical differences by business size in trade or in the finance, insurance, and real estate industries. In the goods-producing sectors, there are more noticeable differences between small and large business activity during portions of the business cycle. In construction, small firms tend to be more negatively impacted by downturns than large firms, but do slightly better than large firms during an expansion. Manufacturing/mining, especially the non-compensation component, tends to show the opposite pattern from construction."

Popkin summarized that, in general, small businesses show slightly better returns in a downturn but that is tempered by their slightly slower growth during periods of expansion. The service-producing sector offers the most obvious differences in activity based on business size. During a downturn, the small services business fares much better than large service providers, SBA concluded.

STAGES OF A BUSINESS CYCLE

Business cycles go through four stages, as described below.

Recession. A recession also sometimes referred to as a trough is a period of reduced economic activity in which levels of buying, selling, production, and employment typically diminish. This is the most unwelcome stage of the business cycle for business owners and consumers alike. A particularly severe recession is known as a depression.

Recovery. Also known as an upturn, the recovery stage of the business cycle is the point at which the economy

"troughs" out and starts working its way up to a better financial footing.

Growth. Economic growth is in essence a period of sustained expansion. Hallmarks of this part of the business cycle include increased consumer confidence, which translates into higher levels of business activity. Because the economy tends to operate at or near full capacity during periods of prosperity, growth periods are generally accompanied by inflationary pressures.

Decline. Also referred to as a contraction or downturn, a decline basically marks the end of the period of growth in the business cycle. Declines are characterized by decreased levels of consumer purchases (especially of durable goods) and, subsequently, reduced production by businesses.

FACTORS THAT SHAPE BUSINESS CYCLES

For centuries, economists in both the United States and Europe regarded economic downturns as "diseases" that had to be treated; it followed, then, that economies characterized by growth and affluence were regarded as "healthy" economies. By the end of the nineteenth century, however, many economists had begun to recognize that economies were cyclical by their very nature, and studies increasingly turned to determining which factors were primarily responsible for shaping the direction and disposition of national, regional, and industry-specific economies.

Although U.S. presidents are routinely blamed or praised for the state of the nation's economy, many economists argue that a national political leader cannot do much to affect the cycle. A 2008 article in the *New York Times* by Kevin Quealy, titled, "Can a President Tame the Business Cycle?" investigated this topic as the administration of President Barack Obama passed stimulus packages to get the economy moving. "There's some debate about where business cycles come from, but the president's actions are rarely on the list," Quealy wrote. He explained that Americans can get a better picture of cyclical economic behavior through changes in incomes, jobs, and real estate prices. "The president is more likely to be reacting to the economy not the other way around." Economists, corporate executives, and business owners cite several factors as particularly important in shaping the complexion of business environments.

Volatility of Investment Spending. Variation in investment spending is one of the important factors in business cycles. Investment spending is considered the most volatile component of the aggregate or total demand (it varies much more from year to year than the largest component of the aggregate demand, the consumption spending), and empirical studies by economists have revealed that the volatility of the investment component is an important factor in explaining business cycles in the United States. According to these studies, increases in investment spur a subsequent increase in aggregate demand, leading to economic expansion. Decreases in investment have the opposite effect. Indeed, economists can point to several points in American history in which the importance of investment spending was made quite evident. The Great Depression, for instance, was caused by a collapse in investment spending in the aftermath of the stock market crash of 1929. Similarly, the prosperity of the late 1950s was attributed to a capital goods boom. More recent examples include the dot-com expansion around 2000 (unprecedented prosperity and subsequent bust) followed by the wide expansion of home ownership (and later, the subprime mortgage crisis).

There are several reasons for the volatility that can often be seen in investment spending. One generic reason is the pace at which investment accelerates in response to upward trends in sales. This linkage, which is called the acceleration principle by economists, can be briefly explained as follows. Suppose a firm is operating at full capacity. When sales of its goods increase, output will have to be increased by increasing plant capacity through further investment. As a result, changes in sales result in magnified percentage changes in investment expenditures. This accelerates the pace of economic expansion, which generates greater income in the economy, leading to further increases in sales. Thus, once the expansion starts, the pace of investment spending accelerates. In more concrete terms, the response of the investment spending is related to the *rate* at which sales are increasing. In general, if an increase in sales is expanding, investment spending rises, and if an increase in sales has peaked and is beginning to slow, investment spending falls. Thus, the pace of investment spending is influenced by changes in the rate of sales.

Momentum. Many economists cite a certain "follow-the-leader" mentality in consumer spending. In situations where consumer confidence is high and people adopt more free-spending habits, other customers are deemed to be more likely to increase their spending as well. Conversely, downturns in spending tend to be imitated as well.

Technological Innovations. Technological innovations can have an acute impact on business cycles. Indeed, technological breakthroughs in communication, transportation, manufacturing, and other operational areas can have a ripple effect throughout an industry or an economy. Technological innovations may relate to production and use of a new product or production of an existing product using a new process. However, technological innovations

and consequent increases in investment take place at irregular intervals. Fluctuating investments, due to variations in the pace of technological innovations, lead to business fluctuations in the economy.

There are many reasons why the pace of technological innovation varies. Major innovations do not occur every day. Nor do they take place at a constant rate. Chance factors greatly influence the timing of major innovations, as well as the number of innovations in a particular year. Economists consider the variations in technological innovation as random (with no systematic pattern). Thus, irregularity in the pace of innovations in new products or processes becomes a source of business fluctuations.

Variations in Inventories. Variations in inventories expansion and contraction in the level of inventories of goods kept by businesses also contribute to business cycles. Inventories are the stocks of goods firms keep on hand to meet demand for their products. How do variations in the level of inventories trigger changes in a business cycle? Usually, during a business downturn, firms let their inventories decline. As inventories dwindle, businesses eventually use down their inventories to the point where they are short. This, in turn, starts an increase in inventory levels as companies begin to produce more than is sold, leading to an economic expansion. This expansion continues as long as the rate of increase in sales holds up and producers continue to increase inventories at the preceding rate. However, as the rate of increase in sales slows, firms begin to cut back on their inventory accumulation. The subsequent reduction in inventory investment dampens the economic expansion and eventually causes an economic downturn. The process then repeats itself all over again. It should be noted that while variations in inventory levels impact overall rates of economic growth, the resulting business cycles are not really long. The business cycles generated by fluctuations in inventories are called *minor* or *short* business cycles. These periods, which usually last about 2 to 4 years, are sometimes also called inventory cycles.

Fluctuations in Government Spending. Variations in government spending are yet another source of business fluctuations. This may appear to be an unlikely source, as the government is widely considered to be a stabilizing force in the economy rather than a source of economic fluctuations or instability. Nevertheless, government spending has been a major destabilizing force on several occasions, especially during and after wars. Government spending increased by an enormous amount during World War II, leading to an economic expansion that continued for several years after the war. Government spending also increased, though to a smaller extent compared to World War II, during the Korean and Vietnam Wars. These also led to economic expansions. However, government spending contributes not only to economic expansions but also to economic contractions. In fact, the recession of 1953 ;54 was caused by the reduction in government spending after the Korean War ended. In the late twentieth century, the end of the cold war resulted in a reduction in defense spending by the United States that had a pronounced impact on certain defense-dependent industries and geographic regions.

In response to the economic crisis of 2008 the administration of George W. Bush gave $50 billion to the mortgage industry in an attempt to stop foreclosures, and $2 trillion to the financial industry to save the banking system. In the following year, the Obama administration initiated many programs to encourage Americans to start spending. Some programs proved to work the "cash-for-clunkers" program spurred consumers to buy new cars midway through 2009, and the $8,000 federal tax credit for first-time home buyers helped revive housing sales. Congress also passed a $787 billion stimulus package in 2009 with the goal of bolstering economic activity.

In stimulating spending, the government hopes that the money it feeds into the economy will be multiplied, thus expanding the gross domestic product. That is one reason that stimulus packages often include tax reductions. The theory is that when Americans have more disposable income, consumer demand will increase. The end result will be the need for more products and more workers, and even more investments.

Politically Generated Business Cycles. Many economists have hypothesized that business cycles are the result of the politically motivated use of macroeconomic policies (monetary and fiscal policies) that are designed to serve the interest of politicians running for reelection. The theory of political business cycles is predicated on the belief that elected officials (the president, members of Congress, governors, etc.) have a tendency to engineer expansionary macroeconomic policies in order to aid their reelection efforts.

Monetary Policies. Variations in the nation's monetary policies, independent of changes induced by political pressures, are an important influence in business cycles as well. Use of fiscal policy increased government spending and/ or tax cuts is the most common way of boosting aggregate demand, causing an economic expansion. The Central Bank (in the case of the United States, the Federal Reserve Bank) has two legislated goals: price stability and full employment. Its role in monetary policy is a key to managing business cycles and has an important impact on consumer and investor confidence as well.

However, some economists (and a substantial portion of the American public) questioned the monetary policy

supported by the Federal Reserve after it gave trillions of dollars worth of loans and guarantees to private business during 2008 2009. At the same time, the Federal Reserve kept interest rates low. Some worried that this practice would send the wrong message about the real relationships between available savings and desired investment. However, Charles I. Plosser, president and chief executive officer of the Federal Reserve Bank of Philadelphia, said in a December 2009 speech that conditions in financial markets were improving, and "the need for the Fed's extraordinary provision of liquidity will continue to dissipate in the coming months. Withdrawing that liquidity in a timely manner will be important in keeping the outlook for inflation and inflation expectations low and stable." He concluded his speech by saying that as the economy grows, interest rates will rise, and so will the federal funds rate. In this way, Plosser said, "the Fed can promote stable inflationary expectations and achieve its goals of price stability and sustainable growth."

Fluctuations in Exports and Imports. The difference between exports and imports is the net foreign demand for goods and services, also called net exports. Because net exports are a component of the aggregate demand in the economy, variations in exports and imports can lead to business fluctuations as well. There are many reasons for variations in exports and imports over time. Growth in the gross domestic product of an economy is the most important determinant of its demand for imported goods as people's incomes grow, their appetite for additional goods and services, including goods produced abroad, increases. The opposite holds when foreign economies are growing growth in incomes in foreign countries also leads to an increased demand for imported goods by the residents of these countries. This, in turn, causes U.S. exports to grow. Currency exchange rates can also have a dramatic impact on international trade and hence, domestic business cycles as well.

KEYS TO SUCCESSFUL BUSINESS CYCLE MANAGEMENT

Business cycles are difficult to anticipate accurately, in part because of the number of variables involved in large economic systems. Nonetheless, the importance of tracking and understanding business cycles has led to a great deal of knowledge about the subject.

Small-business owners can take several steps to help ensure that their establishments weather business cycles with a minimum of uncertainty and damage. The concept of cycle management is earning adherents who agree that strategies that work at the bottom of a cycle need to be adopted as much as those which work at the top of a cycle. Economic behavior that is successful during the boom leads to failure during the bust; behavior must change depending on the stage of the business cycle. While there is no definitive formula for every company, the approaches generally emphasize a long-term view focused on a company's core strengths and stressing the need to plan with greater discretion at all times. Essentially, efforts are made to adjust a company's operations in such a manner that it maintains an even keel through the ups and downs of a business cycle.

Specific tips for managing business cycle downturns include the following:

- Flexibility. Having a flexible business plan allows for development times that span the entire cycle and includes various recession-resistant funding structures.
- Long-term Planning. Consultants encourage small businesses to adopt a moderate stance in their long-range forecasting.
- Attention to Customers. This can be an especially important factor for businesses seeking to emerge from an economic downturn. Maintaining close relations and open communication with customers is a tough discipline to maintain in good times, but it is especially crucial coming out of bad times. Customers are the best gauges of when a company is likely to begin recovering from an economic slowdown.
- Objectivity. Small-business owners need to maintain a high level of objectivity when riding business cycles. Operational decisions based on hopes and desires rather than sober examination of the facts can devastate a business, especially in economic down periods.
- Study. Timing any action for an upturn is tricky. The consequences of getting the timing wrong, of being early or late, can be serious. How, then, does a company strike the right balance between being early or late? It is useful to listen to economists, politicians, and the media to get a sense of what is happening economically. The best route for small-business owners, however, is to avoid trying to predict the upturn. Instead, they should listen to their customers and know their own response-time requirements.

BUSINESS EDUCATION

Business education is a term that encompasses a number of methods used to teach students the fundamentals of business practices. These methods range from formal educational degree programs, such as the Master of Business Administration (MBA), to school-to-work opportunity systems or cooperative education. Business education programs are designed to provide students with the basic theories of management and production. The main goals of business education programs are to teach the processes of decision making; the philosophy, theory, and psychology of management; practical applications; and business start-up and operational procedures.

TYPES OF BUSINESS EDUCATION PROGRAMS

Traditional academic programs for business education include college courses that teach students the fundamentals of management, marketing, business ethics, accounting, and other relevant topics. These have been supplemented in recent years with extensive course offerings in computer skills, e-commerce management, and other factors in managing a business within the global economy. Students can earn degrees ranging from an associate degree in business to a Ph.D. (Doctor of Philosophy) in business administration. Some programs may consist of classwork only, while others such as tech-prep and cooperative education programs, internships, and school-to-work opportunities combine academics with on-the-job training.

Tech-Prep Programs. A tech-prep program is a 4-year planned sequence of study for a technical field which students begin in their junior year of high school. The program extends through either 2 years of college in occupational education, or a minimum 2-year apprenticeship. Students who complete the program earn either certificates or associate degrees.

Co-ops. Cooperative education (co-op) is a program which offers students a combination of college courses and work experience related to their majors. Co-op programs are available in a wide range of business disciplines, such as information systems, accounting, and sales. Participants enroll in a postsecondary educational program while employed in a related job. Most co-op participants are paid by their employers. The co-op program provides students with the work experience they need to obtain full-time employment after graduation.

Internships. Internships are related closely to co-op programs. The main difference, however, is that those who participate in internship programs are not paid, as internships are designed specifically to provide participants with work experience. Often, interns will complete the program separately from their academic setting, rather than combining the two.

School-to-Work Programs. School-to-work opportunity programs focus on career awareness for students. They provide participants with work mastery certificates and furnish them with links to technical colleges. In these programs, all participants have jobs, apprenticeships, or further schooling after finishing high school.

Career Academies. Career academies are occupationally focused high schools that contain "schools within schools." Primarily, they train high school juniors and seniors in such areas as environmental technology, applied electrical science, horticulture, and engineering. In addition to these schools, there are also privately operated business schools that grant certificates to students who complete their programs.

All of these types of business education programs provide participants with career paths for high-skill technical and professional occupations by formally linking secondary and postsecondary education, and by integrating academic and occupational learning. Students who complete such programs gain an advantage over those who concentrate solely on the academic part of business education.

ENTREPRENEURS AND THE MBA

In the past, many entrepreneurs viewed the MBA degree as unnecessary to small-business success, and some believed that it stifled the creativity that allowed small businesses to develop and grow. Most entrepreneurs counted on their energy, work experience, industry knowledge, and business connections rather than on their formal business education. In the late 1990s this attitude began to change, and increasing numbers of entrepreneurs chose to pursue an MBA degree. Two reasons for this change are often cited. First, today's business world often requires small companies to compete for the same customers as much larger, professionally managed corporations. Second, entrepreneurs are finding that even their smaller competitors are likely to be run by MBAs, as former executives laid off by larger firms decide to start their own companies.

The MBA degree offers entrepreneurs a set of sophisticated management tools that can be brought to bear on the challenges of running a small business, including economic analysis, marketing knowledge, strategic planning, and negotiating skills. In addition, a business education can help many small business owners to broaden their viewpoints and recognize trends within their business or industry.

Yet another reason for the increase in entrepreneurs pursuing MBA degrees is that most such programs have become more practical. In addition to teaching theory, MBA programs are increasingly emphasizing teamwork, hands-on experience, and cross-disciplinary thinking. This approach makes the MBA much more applicable to the entrepreneur's interests and experience.

As MBA programs have become more common, their focus has narrowed to specific topics. Traditional MBAs dealt with primary business concepts such as marketing or management, with relatively few choices. The field has grown to incorporate a number of disciplines and program options. There are Masters of Accounting, Information Technology, and Finance programs that focus on other aspects of running a business. There are also masters programs that deal with specific businesses, such as a Master of Hospital Administration or a Master of Industrial Administration.

MBA programs also offer various time options to fit in work schedules. 1- and 2-year full-time MBA programs are often offered, along with part-time programs for those who are too busy to attend class full time. These part-time options usually offer evening or weekend classes that meet only once a week or every other week. Some MBAs are also offered online.

The popularity of MBA programs has also encouraged other business education organizations to offer their own certifications in even more specific fields. For instance, the Institute of Management Consultants offers a CMC (Certified Management Consultant) designation to individuals who meet requirements and pass the proper exams and interviews. While these programs do not carry the weight of an MBA, they are used to show experience in a select area.

BUSINESS PH.D. DEVELOPMENT

As MBA programs have become more and more common, they have also become less valuable. As the market is flooded with workers holding MBAs, and new, often easier MBA programs have opened in a variety of schools across the world, the demand for MBAs has fallen. In spite of this, however, many management jobs require that those interested in applying hold MBAs, often in a specific field.

As a result, two shifts have occurred. First, which school the worker receives an MBA from has become more important. While there has always been a difference, an Ivy League MBA counts for much more than a degree from a community college, and businesses have learned to care as much about where the MBA is from as whether or not a worker has one.

The second change is a new focus on business Ph.D.s. In some ways Ph.D.s have replaced MBAs, since they tend to be as rare and prestigious as an MBA once was. Fewer schools offer Ph.D. programs, and those that do are likely to have highly developed business programs with a large amount of influence. Many Ph.D. programs require a certain amount of management or executive experience, so those holding a Ph.D. often have long-term work experience, whereas MBA degrees no longer promise such real-world experience.

Universities can offer either Ph.D.s or DBAs. A Ph.D., as a doctorate of philosophy, tends to focus more on theory in management and economics, and it prepares students for research and development of new business practices. A DBA, or Doctorate of Business Administration, focuses more on the practical application of executive business skills, and may be more valued by companies looking to nominate someone to a board of directors.

BUSINESS CERTIFICATION

The trends in business education have not gone unnoticed by businesses themselves, and in the 1990s many large organizations began to develop their own coursework and

programs for employees already working for them. These types of business certification are highly specified and take two different forms.

The first form is business practice and training certification. These are special training programs offered by organizations to teach employees specific skills that will help them work and manage more effectively. One of the most famous examples is Six Sigma training, which teaches various lean manufacturing and management techniques, and awards ranks based on the level of training. Such training can be very valuable to certain businesses looking for experts in Six Sigma or other techniques, and businesses often send employees to such training programs with company funds.

A wide number of large, international corporations use the second form of certification, business-based colleges. Some companies, such as McDonalds and Toyota, have created their own universities with campuses and professors who teach various aspects of business. Other companies, such as Microsoft, have certification centers that teach students and employees more specific skills.

Business universities allow for a variety of workers to learn different skills, and may offer multiple degrees. The university may teach only company-centered techniques and practices, or may develop a wider view of business theory. Students are not always required to work for the company after completing their education, but most students who attend aim for a high-level position within the company, so the transition is common. Smaller educational branches, such as Microsoft's Business Certification (MBC), offer certification that has only relative value outside the company. Microsoft gives two main credentials, an MCAS or Microsoft Certified Application Specialist certification, and an MOS, or Microsoft Office Specialist certification. Both focus on Microsoft programming and practices and are intended mostly for Microsoft-bound students or current employees.

ON THE JOB EDUCATION

Businesses also find it beneficial to offer on-the-job training and education. This is a much less formal method of teaching necessary business skills. Employees may need to learn proprietary systems or have training in specific, service-oriented skills. Sometimes this training is immediate, occurring when an employee is hired. At other times a new computer system is introduced or a new service requirement is created, and entire branches enter training at the same time to learn about the changes.

Companies may either bring in consultants or specialists to train employees, or have experienced personnel train employees in-house. When training managers, manager meetings are often held in collaboration with other departments, while both guest speakers and executives train in new management practices.

Small businesses can often train all employees together as a group and rarely need to hold multiple training sessions. However, as a business grows, training becomes more difficult, and e-learning techniques are often employed. E-learning programs use a Web-based platform to instruct employees on using systems and following proper procedures when dealing with clients and co-workers. They are a cost-effective way to train large numbers of people within a short time frame, and can be used as a constant resource after training is completed.

BUSINESS ETHICS

The ancient Latin proverb, *caveat emptor*mdash;let the buyer beware shows that business ethics has been a societal concern for a very long time. Richard T. De George, a distinguished student of the subject, dates modern interest in business ethics to the 1960s. At that time changing attitudes toward business began to manifest in environmental concerns, increased consumerism, and criticism of multinationals. Businesses began to embrace the idea of social responsibility as a business value. Since then business ethics has been associated with human and

civil rights and other issues on which *Moral Man and Immoral Society* (the title of a 1932 book by theologian Reinhold Niebuhr) collide.

DEFINITIONS

Merriam-Webster's defines ethics as "the discipline dealing with what is good and bad or right and wrong or with moral duty and obligation" (11th edition, 2003). The word derives from the Greek word meaning "moral," a Latin word with roots in "mores" or "customs" in other words the values held by society. Ethicists point out that law represents an ethical minimum and that ethical behavior is more than being within the law. Individuals, and by extension institutions, obtain their values from religion, philosophy, culture, law, and the special requirements of particular professions. An individual may hold that morality is absolute (what is wrong is always wrong) or may hold that morality is relative (the good is defined in part by other factors). Either way it is widely accepted that good and bad exist and can be determined. Very sophisticated theories exist which assert a hierarchy of good even when morality is held to be absolute. For instance, lying is always wrong, but to lie to save the life of a fugitive Jew during the Nazi era was good because it prevented a worse evil. Given these definitions, business ethics involves more than operating a business under existing laws. The values a business adheres to arise from the values held by contemporary society; although the ethics a company defines as its own may hold to even higher standards.

ETHICS IN A COMPETITIVE ENVIRONMENT

The key difficulty surrounding business ethics is that ethics, by definition, goes beyond the merely legal but how far beyond? No institutionalized rules exist defining an upper limit. Public opinion is subject to change and is not a very good guide. Consider the influence the price of gasoline has on public opinions about certain environmental issues. By its very nature, business ethics is embroiled in philosophical and operational difficulties.

The traditional concept of business based on Adam Smith's imagery of the market's "hidden hand" assumes that business entities bring about social goods by maximizing profits while operating within the law. Social goods are thus a by-product of market forces, not an assigned objective to be met bycorporate management. This viewpoint has been long asserted by free market economists like Milton Friedman. In the *New York Times Magazine*, Friedman criticized those who insisted that executives and business owners had a social responsibility beyond serving the interests of their stockholders, writing that such views showed "a fundamental misconception of the character and nature of a free economy." He asserted that in a free economy, "there is one and only one social responsibility of business to use its resources and engage in activities designed to increase its profits, so long as it stays within the rules of the game, which is to say, engages in open and free competition without deception or fraud."

Thus the movement to embrace social responsibility has an ambiguous character. It is not formally mandated but may be rewarded by customer and/or employee loyalty; it may also, indirectly, fend off intrusive legislation. But while it may be easy to be moral when all is going well, it gets more difficult when markets shrink. An article in *Nilewide Marketing* ("Fat Profits and Slim Pickings") explains the matter succinctly: "While the majority of companies claim that employees are their most important asset, they seem to act as though they can do without them, or pay the ones they have a minute proportion of the top salary."

On the surface, it appears that businesses bearing only those costs necessary to meet the letter of the law, while avoiding extra costs associated with ethical behavior, will be more profitable than ethical businesses if all other factors are equal. Many businesses use a more complex approach to this subject based on the idea that high ethical values have positive consequences (in consumer acceptance, brand valuation, employee loyalty, and so on) which may be difficult to measure but are nevertheless real. In line with this perspective, corporations have invented the notion of Return on Value (ROV) but find it difficult to give it a numerical expression. At the same time, there is an awareness abroad that corporations that set their sights no higher than bare legality may foster an environment where managers may slip across the border of legality and create disasters like the Enron bankruptcy in 2002.

GOVERNMENT OVERSIGHT

Late in 2008 it was discovered that prominent investment manager Bernard Madoff did more than slip across the border of legality he took a running leap over the line. For years he had been perpetrating outright fraud in managing the Ascot Partners hedge fund, which turned out to be a Ponzi scheme whereby funds from new investors were used to pay double-digit returns to older investors. The scale and longevity of the scam brings into question the role and effectiveness of government oversight of ethical business operations. In the Madoff case, regulators were informed multiple times over the years about alleged fraudulent activity and at least eight investigations were conducted but the activity was allowed to continue unchecked for at least a decade. The reasons for the lack of effective intervention by the Securities and Exchange

Commission (SEC) and other regulatory bodies remain hazy. Scrutiny has focused on potential conflicts of interest, gaps in regulation, and ineffective application of oversight tools.

The SEC is taking action to reduce the chances that similar scams will occur or go undetected in the future. Among its efforts, the SEC has been revitalizing the Enforcement Division; revamping the handling of complaints and tips; encouraging greater cooperation by "insiders"; enhancing safeguards for investor assets; advocating for a whistleblower program; and enhancing the licensing, education, and oversight regime for "back-office" personnel.

BUSINESS AND EMPLOYEE VALUES

Aside from the structural problems presented by the societal roles of business, corporate policies based on well-formulated ethical principles appear to produce real benefits. A report in *Internal Auditor* by A. Millage about the findings of the Ethics Resource Center's "2005 National Business Ethics Survey"indicated that "70 percent of employees from organizations with a weak ethical culture reported observing at least one type of ethical wrongdoing, whereas only 34 percent of employees from organizations with a strong ethical culture said they have witnessed misconduct." Problems listed included abusive or intimidating behavior toward employees; lying to employees, customers, vendors, or the public; violations of safety regulations; misreporting of time worked; theft; sexual harassment; and other problems. Such unethical activities may ultimately translate into lost sales, higher turnover, and lower profits. Logically, therefore, ethical business behavior is more efficient, and whether measurable or not is likely to facilitate positive ROV.

According to an article by Archie Carroll in the *Athens Banner-Herald*, the Ethics Resource Center's 2009 National Business Ethics Survey indicates that ethical misconduct at work declined to 49 percent, while ethical culture strength rose to 62 percent. The survey researchers attributed the improved numbers to a link between workplace ethics and the larger economic business cycle. They concluded that, "when times are tough, ethics improve." Conversely, they say, instances of misconduct may rise during times of economic improvement.

BUSINESS ETHICS IN SMALL BUSINESS

Business experts and ethicists alike point to a number of actions that owners and managers can take to help steer their company down the path of ethical business behavior. Establishing a statement of organizational values, for example, can provide employees and the company as a whole with a specific framework for expected behavior. Such statements offer employees, business associates, and the larger community a consistent portrait of the company's operating principles why it exists, what it believes, and how it intends to act to make sure that its activities dovetail with its professed beliefs. Active reviews of strategic plans and objectives can also be undertaken to make certain that they are not in conflict with the company's basic ethical standards. In addition, business owners and managers should review standard operating procedures and performance measurements within the company to ensure that they are not structured in ways that encourage unethical behavior. As Ben & Jerry's Ice Cream founders Ben Cohen and Jerry Greenfield stated, "a values-led business seeks to maximize its impact by integrating socially beneficial actions into as many of its day-to-day activities as possible. In order to do that, values must lead and be right up there in a company's mission statement, strategy and operating plan."

Business owners and managers lead by example. If business owners and managers treat employees, customers, and competitors in a fair and honest manner, and suitably penalize those who do not perform in a similar fashion, they are far more likely to have an ethical work force of which they can be proud.

BUSINESS EXPANSION

The economy is notoriously cyclical. It expanded forcefully in the 1990s, reaching a peak growth of 7.3 percent in the fourth quarter (Q4) of 1999. Growth dipped to 1 percent in Q1 of 2000 and hit a negative growth rate of −0.5 percent by Q3 of that year. Growth remained anemic until late 2003, strengthened steadily until 2007, and then plunged into recession in early 2008. Expansions and contractions are a normal part of economic life; most businesses expand in good times and contract somewhat in bad times. A look at business literature from the late 1990s shows scores of articles dealing with the "problems of expansion" and how to deal with them. By 2005 or so, such articles were conspicuously absent. Instead articles began focusing on how a business might plan to trigger its own growth.

Business expansion thus has two aspects. One is planned and carefully managed expansion at the business owner's initiative. The other, which can be much more problematic, is sudden and involuntary expansion that results from situations such as economic expansion or simply because the business caught the market's eye with a novel product or service. Careful management of such good fortune may be even more vital than planned growth. Indeed, the U.S. Small Business Administration lists "unexpected growth" as one of ten common causes of business failure. Whether planned or involuntary, expansion carries risks.

PLANNED EXPANSION

Not all small-business owners wish to expand. Some prefer to maintain the business aspects that led them to launch their enterprise in the first place, namely: close contact with customers, employees, and/or the product or service itself; freedom from the burdens of administrative management; and autonomy provided by sole-proprietorship. Those who plan expansion tend to have a different vision of the business, one in which "smallness" is not in itself a goal but a necessary starting point. Others plan to expand because the very logic of the business indicates that a larger size is desirable to achieve the full potential of the enterprise. Every situation is unique, but by and large businesses seeking to expand will undertake one or more of the following actions: 1) sell more of the same; 2) expand the range of products or services sold; 3) sell something very different; and 4) change the underlying business concept. These strategies are listed roughly in the order in which most small businesses consider them. Moving from category one to category four, each action is progressively more difficult and requires more comprehensive changes and larger investments.

Each action incorporates alternative strategies, some of which may be quite risky. For example, the first choice, to *sell more of the same*, may involve one or a combination of the following: a) regional expansion of outlets; b) significant expansion of production facilities; c) vertical integration whereby more of the product is made in-house; and d) revamping the distribution system.

Julie Monahan, writing in *Entrepreneur*, lists seven expansion strategies with very similar characteristics. These are: 1) introduction of a new product; 2) taking existing product to a new market; 3) licensing the product for others to make; 4) starting a chain; 5) turning the business into a franchise; 6) growing through acquisition or merger; and 7) seeking foreign markets.

Planned expansion particularly one based on more complex strategies requires the same financial, planning, and business skills that were necessary to found the original business and is essentially the same as starting a business from scratch. The exception is that an existing business provides the owner with a minimum base from which to start because important administrative structures are already in place. On the whole business owners who stay closest to their experience will have the fewest regrets.

MANAGING UNEXPECTED GROWTH

Unexpected growth brings positive reinforcement but it also brings the danger of overexuberance. Unless kept in check, excess enthusiasm may lead to careless decisions and a temporary relaxation of the very disciplines that made the business successful in the first place. For this reason, management experts counsel caution when sales suddenly surge. At the same time, businesses deliberately choosing not to respond to strong demand may, as a consequence, be left behind and find themselves constricting. Growth must be managed. Paul Hawken in his popular book, *Growing A Business*, writes that problems are normal to business. The difference between a good business and a bad one is that, "A good business has interesting problems . . . a bad business has boring ones."

Unexpected growth is a business problem, but it is an "interesting problem." Most business owners would rather face growth than empty stores or silent phones.

The chief challenge presented by surging growth tends to be financial. Capacity may have to be expanded and money must be spent to purchase inventory far above normal levels. In service-providing businesses, new people must be hired and trained rapidly. Capital for all of these purposes may be difficult to find, or expensive to borrow. There is also the question of how much funding is needed. The business may be capable of accurately calculating its immediate financial needs but be less able to assess the longevity of the sudden demand. The business owner must retain a certain sobriety and take the time to talk to people when evaluating the situation before deciding to invest.

Most business failures due to unexpected growth are triggered by cash flow problems. The business may have great sales and high profits, but cash in hand may be inadequate because of the time lag between sales and cash collections from the customer. Customers will expect to purchase on credit and commercial customers may be slow in paying. In a rapid growth situation cash receipts tend to lag behind sales and deliveries. If growth continues to expand, the business may find itself unable to pay bills even though it has more than adequate resources coming in later. This can lead to bankruptcies.

In addition to cash flow problems, a host of other potential problems can occur simply because the business is operating at greater speed with more people (many not yet fully trained), overtaxed financial control systems, and stressed management personnel who are less likely to find time to examine financial control systems. Even if not immediately apparent, some problems caused by intense activity may show up later to cause trouble. Customer service may be neglected and brand equity may be damaged as a consequence. Minor disagreements may intensify and result in divided loyalties within the company. Moreover, small-business owners accustomed to a hands-on approach may have to adopt a much more distant and corporate role without adequate preparation or willingness to change.

Problems of this nature have no simple or single solution. Management experts counsel a "go it slow" approach to the situation. They advocate the maintenance of established disciplines, openness and flexibility in meeting problems, working closely with employees, soliciting expert help and following expert recommendations, and if necessary "leaving money on the table" today so that it can be safely picked up tomorrow.

THE SUSTAINABILITY EQUATION

Businesses are not immune to the pressures and promises of the green movement. According to Joel Makower in an article for GreenBiz.com, the greening of business has transformed over the years. He explains: "What began as a seemingly altruistic endeavor, then shifted to a way to cut costs and improve reputation, has become a fundamental business competency, alongside accounting, finance, human resources, marketing, customer service, procurement, knowledge management and others." Makower states that green strategies and practices are becoming increasingly valued throughout the organization, with leaders now viewing them as ways to cut costs, improve operations, foster innovation, engage employees, and satisfy customers. As such, sustainability has emerged as an essential consideration when engaging in business expansion efforts.

While environmental issues may impose certain restrictions on businesses seeking to expand for example, U.S. Environmental Protection Agency regulations regarding land use, emissions limits, and hazardous waste disposal the green movement also provides a wealth of growth opportunities for companies. Specifically, sustainability is driving demand and development of new green technologies and products, feeding innovation and cooperation within and among enterprises, and creating new jobs and skill sets in the workforce.

In *Business Xpansion Journal*, Hardy DeLay IV outlines a "sustainability equation" that attempts to explain sustainability for businesses as it relates to the green movement. The equation is: *Sustainability = Behaviors + Environmentally Safe Products + Energy Management + Energy Efficiency Products + Renewable Energy + Cost Efficiency.* According to DeLay, businesses must consider each factor in the equation to discover hidden opportunities for reducing environmental impact while improving the organization's bottom line. He contends that any approach that accomplishes one without the other is not a viable solution for the modern marketplace.

CHOOSING NOT TO GROW

Given the dynamics of specific markets, choosing not to grow may be another way of deciding to close the business. Most often a rich variety of alternatives remains open permitting the business to stay small, even increasing its reputation and profits in the process. Such adaptiveness, however, also requires action.

Unwelcome rapid growth is in fact just another business challenge similar to the sudden appearance of a formidable competitor. Many successful businesses adapt to stay small. Invariably, however, they will also change. For example, management may decide that, rather than trying to handle the new demand, it will cut back on its product line and retain a portion of it in a new niche. The adjustment of the business may take the form of concentrating on one kind of customer, for example the household market, whereas the company formerly also

worked with corporations. It may mean staying in the high end of a market and repositioning the enterprise accordingly (through changed advertising, signage, sales strategy) while letting others serve the larger but lower-priced segments.

The analogy to competition is apt in this situation because the small business, unwilling to sell a suddenly popular product in much greater quantity *will* see competition. The new demand will create its own expanded supply. The new suppliers will then draw business from the reluctant laggard unless the company adapts by differentiation along the lines outlined above.

BUSINESS FAILURE AND DISSOLUTION

Business failure is narrowly defined as involuntary closure of a business operation due to financial or legal circumstances, such as insolvency, bankruptcy, or legal action.

CLOSURES AND FAILURES: THE NUMBERS

The Office of Advocacy estimates that there were 29.6 million businesses operating in the United States in 2008; 99.9 percent of them were small businesses with fewer than 500 employees (including those with no employees). According to U.S. Census Bureau data, there were 6.0 million firms with employees in 2006 and 21.7 million without employees in 2007. The Census Bureau maintains data on the closure of businesses with employees but does not specify the cause of the closure. Dun & Bradstreet Corporation (D&B) also tracks business failures, but unlike the Census Bureau its database includes one-person enterprises (those without employees). The discrepancy makes it difficult to compare closure statistics.

The Census Bureau data, available from the U.S. Small Business Administration (SBA) on its Web page titled "FAQs: Advocacy Small Business Statistics and Research," shows that in 2008, 595,600 firms with employees closed their doors and 627,200 businesses were launched (referred to as births). In most years births outnumber closures by a small margin.

The terminology employed by statistical agencies does not make it easy to distinguish between business closures or dissolutions from whatever cause and business *failures* resulting from financial or legal causes. Some indication is provided by Census Bureau bankruptcy data. In 2008 43,546 business bankruptcies were equivalent to 13.7 percent of closures. Brian Headd, a researcher for the Census Bureau's Center for Economic Studies looked closely at closure rates of small businesses. He found that 66 percent of small businesses that close are "unsuccessful"; the rest close for other reasons. Bankruptcy, of course, is an extreme form of being unsuccessful.

The logical conclusion from these data is that business *failures* are a subset of total business *closures* and closures are much more common. Most businesses are dissolved voluntarily while still successful. Owners close shop for a variety of reasons or sell their businesses to others who merge them into existing entities.

REASONS FOR BUSINESS FAILURE

The reasons that businesses fail are complex and intertwined. The SBA, citing two well-known authors (Michael Ames and Gustav Berle) provides a ten-point list of the causes of such failures: 1) lack of experience; 2) insufficient capital; 3) poor location; 4) poor inventory management; 5) over-investment in fixed assets; 6) poor credit arrangements; 7) personal use of business funds; 8) unexpected growth; 9) competition; and 10) low sales.

The first item in SBA's list is an important cause of failure because, in a way, it includes all the others. In a study published by the Census Bureau, Robert Fairlie

and Alicia Robb found that individuals who had acquired experience working in a family business were much more likely to succeed in another enterprise including their own. They had acquired what the authors called "human capital," or experience. Acquisition of this experience, writes Scott Cundill in his book, *How NOT To Start and Run Your Own Business*, should be the primary goal of any fledgling entrepreneur not financial gain. He asserts that the chance of first-time entrepreneurs making money on their initial venture is practically zero, so it is best for new business operators to embrace that reality and target experience instead of cash rewards early on. That is not to say that new entrepreneurs should avoid money concerns altogether. They need to stay focused on return on investment avoiding any spending that does not result in a tangible financial return. Cundill gives new entrepreneurs this advice: "Don't bother with window dressing. Business cards, office space, logos and cool names mean very little. Rather invest money in the most important asset you have yourself."

The literature provides many lists like SBA's, but they all touch on the same matters. In a more systemic way, the causes of failure can be assigned to poor planning, poor controls, incompetent execution, and slow adaptability. Planning, which relies on experience, will correctly assess the market environment, including demand, competition, location, and availability of capital and credit. Operational planning will determine the efficiency of the enterprise and will ensure that financial controls are in place and are used to provide early warnings of trouble. Controls are vital to match purchasing to inventory and to trigger timely discounts when inventories become too old or too large. The business must not be started if capital is unavailable or credit arrangements are too loose. Credit arrangements and loan qualifications tightened considerably in the post-2008 economy, but the administration of President Barack Obama introduced several elements aimed at reducing some of the financial burdens for new and existing small businesses. As of 2010, the Obama administration sought to extend small business expensing and bonus depreciation, eliminate capital gains for small businesses, implement a small business tax credit on jobs and wages, create a $30 billion Small Business Lending Fund to provide capital for community banks lending to small businesses, and improve loan limits and fee requirements for certain Small Business Association programs. Businesses must understand, however, that these initiatives are intended to facilitate operations, not fund them. Prospective entrepreneurs must also cultivate a certain humility and realism about the competition. No matter how promising one's own product or service, the competition is not likely to melt away it may respond.

Unexpected growth may appear to be an unusual cause of business failure. However, it is relatively common because business owners may become confused by sudden success and fail to maintain discipline in dealing with a rush of orders. The growth may be temporary, but they overextend themselves in anticipation of its continuation. By expanding too soon and failing to secure financing necessary to meet the increased demand, business owners may find that the market disappointed may suddenly turn away and leave them with very high commitments to vendors.

BANKRUPTCY

Bankruptcy is a legal proceeding, guided by federal law, designed to address situations wherein a debtor either an individual or a business has accumulated debts so great that the individual or business is unable to pay them off. It is designed to distribute those assets held by the debtor as equitably as possible among creditors. Bankruptcy proceedings may be initiated either by the debtor a voluntary process or by creditors an involuntary process. Individuals are allowed to file for bankruptcy under either Chapter 7 or Chapter 13 law. Businesses file under Chapter 11.

Chapter 7 Bankruptcy. Under Chapter 7 bankruptcy law, all of the debtor's assets including any unincorporated businesses that he or she owns are totally liquidated and divided by a bankruptcy court among the individual's creditors.

Chapter 13 Bankruptcy. This is a less severe bankruptcy option for individuals. Under the laws of Chapter 13 bankruptcy, debtors turn over their finances to the court, which distributes funds and payment plans at its discretion.

Chapter 11 Bankruptcy. Chapter 11 bankruptcylaw is designed to provide businesses with the opportunity to restructure their finances and debt obligations so that they can continue to operate. Companies usually turn to Chapter 11 protection after they are no longer able to pay their creditors, but in some instances businesses have been known to act preemptively in anticipation of future liabilities.

RECOVERING FROM BUSINESS FAILURE

Business failure can be a demoralizing event in a person's life. It impacts both professional and personal self-esteem. Indeed, many experts believe that the entrepreneur who experiences a business failure goes through many of the same stages as individuals who suffer from the loss of a friend or loved one shock, denial, anger, depression, and eventually acceptance. But observers are quick to point out that people who experience business failure can still go on to lead rewarding professional lives, either as part of another company or down the line in another entrepreneurial venture.

Many analysts believe that chances of subsequent success in the business world often hinge on the entrepreneur's activities in the first year or two after the failure has occurred. The best response, after the initial shock has passed, is a realistic look at the reasons for the failure. This assessment, carried out by the individual with help from uninvolved friends or mentors, may pinpoint the fatal turn which, if corrected, could lead to a more successful run in the future. For some, of course, the conclusion might be that life as an entrepreneur is not what they are seeking. Paul Hawken, a very successful small businessman and author of *Growing A Business*, makes the important point that business is*about* problems; they cannot be avoided. The art of management involves turning bad problems that overwhelm into new challenges that stimulate creative response.

BUSINESS HOURS

The term "business hours" refers to the "open" and "closed" schedule set by a business for its operations. Businesses adhere to a wide range of business hours depending on such factors as type of business, customer expectations, available technology, and seasonal fluctuations in business. Online shopping via the Internet also known as e-commerce, e-business, or, from a business perspective, e-tailing has expanded the concept of business hours to include "24/7" operations. The number of businesses that have expanded their hours has increased in part because of Internet pressure and expanding hours worked by the public. As George Russell observed in the *Fairfield County Business Journal* "The business community is not in a 24/7 work mode yet but we're no longer in a 9 to 5, Monday through Friday world. Business owners and their employees work past dinner-time, on weekends and often into the early hours of the morning. And more much more pre-9 a.m. and post-5 p.m. working hours are in our immediate futures." As this observation illustrates, the issue of business hours has two aspects: the time during which a business is open, and the amount of time employees must work.

Principal Determinants of Business Hours. Business owners point to several factors influencing which hours their business will be open. The nature of the business is the principal driving force. For example, a nightclub typically will be open late into the evening while, say, a bakery may open early in the morning and operate mainly during daylight hours. Companies seek to match their hours to their customers. It is interesting to note, however, that there is potential overlap; the same customers who leave the nightclub in the wee hours may be the first customers at the bakery when it opens for business in the morning.

Among many and continuously dynamic factors that impact working hours are the following:

- Nontraditional Lifestyles. Increasing numbers of customers, and especially retail customers, keep nontraditional work hours. Some work overtime, while others are employed on a part-time basis or work two or even three jobs to support their families. These potential customers will likely be lost to stores that do not keep extended hours. Moreover, some consumers simply prefer to shop late at night to avoid long checkout lines and hassles associated with busy store aisles and parking lots. The continuing and still-growing participation by women in the workforce has greatly contributed to the expansion of retail hours, as their primary shopping time has shifted from daytime hours to nighttime.
- Seasonal Considerations. Some businesses are highly seasonal in nature. Retail establishments based in regions that are largely dependent on tourist dollars, for example, often scale back their hours (or close entirely) during the off-season. Even businesses that are not seasonal in nature may opt to adjust their hours during certain times of the year like holidays or back-to-school time.

- Technology. The widespread availability of e-mail, fax machines, and cellular phones, along with the emergence of social media tools (mySpace, Facebook, Twitter, blogging) that are increasingly being used by corporations to facilitate their business operations, has greatly accelerated the pace of the entire commercial environment in the United States and around the world. These technological trappings have made it extremely easy for people and businesses to communicate with one another, no matter the time of day or geographic location.
- Competitive Pressures. Analysts point out that simple economics have played a large part in the surge in expanded business hours for many companies. "The ceaseless search for efficiencies and the high cost of adding capacity are compelling many small companies to squeeze more out of existing facilities by adding second and third shifts," wrote Dale Buss in a *Nation's Business* article titled "A Wake-Up Call for Companies."

Members of the business community agree that for many companies, hours of operation are likely to continue to expand, as demands for convenience on the part of both individual and corporate customers do not appear likely to abate any time soon. But small-business owners should make sure that they lay the appropriate groundwork for an expansion of operating hours before committing to it. Thorny issues will almost inevitably crop up, whether they take the form of logistical worries about restocking shelves in the presence of customers or difficulties in finding employees to work that fledgling second shift. The business owner who takes the time to study these issues in advance will be much better equipped to handle them in an effective fashion than the owner who tackles each issue as it rears its head.

FLEX TIME

A corollary to expanding business hours has been the rise in "flex time," a policy that permits employees to set their own hours of work within certain limits. According to a report from Georgetown University Law Center, titled *Workplace Flexibility 2010*, 28.9 percent of full-time, private-sector employees in the United States have flexible work schedules. Workers with the highest rates of flex time include those involved in financial activities (37.7%), professional and business services (37.6%), and information industries (34.9%). Workers with the lowest rates of flex time include employees working in construction (20.3%), manufacturing (24%), transportation and utilities (25.7%), and education and health services (25.6%). Flex time tends to increase in times of economic expansion and to contract in times of high unemployment, when economic and competitive conditions push companies to increase work hours and decrease worker flexibility.

CREATIVE ALTERNATIVES

According to a 2009 article in *BusinessWeek* from Matt Boyle, businesses across the United States are increasingly devising and deploying innovative work-hour schemes as alternatives to employee layoffs to help weather tough economic times. In addition to typical hiring freezes and salary cuts, some companies are taking advantage of state-run programs that enable businesses to reduce employee work hours while allowing those employees to receive the pay difference in unemployment benefits. Other companies are taking even more creative approaches that involve shifting employees into new roles. Steelmaker Nucor, for example, slashed the work hours for many of its hourly factory employees; however, on the days those employees are not on engaged on the factory floor, they are paid their base salary to perform maintenance services for the company or participate in company-sanctioned skills training. In Vermont, Rhino Foods lent fifteen of its factory workers to neighboring business Autumn Harp for a week to help handle a seasonal rush on that company's product; the employees were paid by Rhino, which invoiced its neighbor for the hours worked.

BUSINESS INCUBATORS

As the phrase implies, business incubators are programs intended to help small businesses get off the ground. They typically provide rental space and services such as administrative assistance, consulting, and referral to

fledgling operations. Incubator programs are managed by public and private agencies. According to the National Business Incubation Association (NBIA), in 2006, around 7,000 incubators were operating around the world; more than 1,400 of these were located in North America.

In its Web site article titled "The History of Business Incubation," NBIA names the Batavia Industrial Center (Batavia, New York) as the first incubator, founded in 1959. "But the concept of providing business assistance services to early-stage companies in shared facilities did not catch on with many communities until at least the late 1970s," NBIA reports. "In 1980, approximately 12 business incubators were operating in the United States all of them in the industrial Northeast, which had been hard hit by plant closures in the previous decade." Other important influences supporting wider acceptance were promotional efforts by the U.S. Small Business Administration during the 1980s, a program enacted by the Pennsylvania legislature in 1982, and the efforts of Control Data Corporation (Minneapolis) under the leadership of its founder, William Norris.

NBIA provides a profile of the incubator movement in 2006 on its Web site. Just over 90 percent of incubators are not-for-profit, the rest are for-profit entities hoping to benefit from start-up growth. More than half (54 %) have a mix of clients; 39 percent focus on technology businesses, 3 percent serve manufacturers, and 4 percent cater to service organizations, niche markets, or other types of businesses. Fifty-three percent of incubators draw clients from urban, 28 percent from rural, and 19 percent from suburban locations.

The sponsorship of incubators in 2006 was 31 percent economic development agencies, 21 percent government agencies, 20 percent academic institutions, 8 percent hybrids with more than one sponsor, 8 percent other, and 4 percent for-profit entities; 8 percent had no sponsor or host organization.

ADVANTAGES OF INCUBATORS

Given the myriad advantages associated with membership in an incubator program, small-business consultants often counsel their clients at least to investigate the possibility of securing a spot in one. Strengths of incubators include the following:

Shared Basic Operating Costs. Tenants in a business incubator share a wide range of overhead costs, including utilities, office equipment, computer services, conference rooms, laboratories, and receptionist services. In addition, basic rent costs are usually below normal for the region in which the fledgling business is operating, which allows entrepreneurs to realize additional savings. It is worth noting, however, that incubators do not allow tenants to remain in the program forever; most lease agreements at incubator facilities run for 3 years, with some programs offering one or two opportunities for 1-year renewal.

Consulting and Administrative Assistance. Incubator managers and staff members can often provide insightful advice and/or information on a broad spectrum of business issues, from marketing to financing business expansion. Small-business owners should remember that the people responsible for overseeing the incubator program are usually quite knowledgeable about various aspects of the business world. They are a resource that should be fully utilized.

Access to Capital. Many business incubators help entrepreneurs acquire capital by means of revolving loan and microloan funds, according to NBIA. They link businesses to investors by referral. They assist entrepreneurs in preparing presentations to venture capitalists, and assist companies in applying for loans. Start-ups are helped in raising capital merely by having been accepted by an incubator program, which acts as a qualifying filter; those who are accepted gain legitimacy in the business community.

Universality of Incubator Concept. One of the key advantages of incubators is that the concept works in communities of all shapes, sizes, demographic segments, and industries. In many cases, the incubator naturally takes on some of the characteristics of the community in which it is located. For example, rural-based incubators may launch companies based on the types of agriculture present in the area. Whether based in a small town in the Midwest or a large urban area on the West Coast, proponents of incubator programs contend that the small-business people in the community would know more about how to start and operate such businesses than major corporations that focus on mass production.

Comradeship of Fellow Entrepreneurs. Many small-business owners who have launched successful ventures from incubators cite the presence of fellow entrepreneurs as a key element in their success. They note that by gathering entrepreneurs together under one roof, incubators create a dynamic wherein business owners can: 1) provide encouragement to one another in their endeavors; 2) share information on business-related subjects; and 3) establish networks of communication that can serve them well for years to come.

FACTORS TO WEIGH IN CHOOSING AN INCUBATOR

Many incubators have been pivotal in nourishing small businesses to the point where they can make it on their own. But observers note that the programs are not foolproof. Some small businesses fail despite their membership in such programs; incubators themselves sometimes fold, crippled by any number of factors. Entrepreneurs, then, need to recognize that some incubators are better suited to meet their needs than others. Considerations to weigh when choosing an incubator include the following:

- Legitimacy. Is it a true incubator? Some office building owners falsely advertise themselves as incubators in order to lure tenants. Entrepreneurs need to study the details of each offer to determine whether such claims are legitimate.
- Length of Operation. How long has the incubator been around? Incubators take some time to establish their reputation in an area unless they are sponsored by a very high-profile corporation or a well-funded government agency.
- Incubator Leadership. Is the incubator managed by people with backgrounds in business, or by general college or agency administrators? Can the managers provide long-term business plans that show how they intend to guide the incubator to financial independence?
- Location. Does the incubator's setting adequately address the fledgling company's needs in terms of target market, transportation, competition, and future growth plans? Many analysts contend that entrepreneurs can learn a great deal about the fundamental quality of an incubator program simply by studying the program's leadership.
- Financing. Is the incubator's financial base a reliable one, or is it on shaky ground?

Entrepreneurs interested in exploring the incubator concept can request information from several sources, including the U.S. Small Business Administration, area economic development agencies, area educational institutions, or the National Business Incubation Association.

Would-be small-business owners should have a complete business plan in hand before applying for entrance into an incubator program. Most incubators maintain a stringent screening process to ensure that their resources are put to the best possible use.

INTERNET INCUBATORS

"Internet incubators a for-profit variant of the old-time government- or academic-supported not-for-profit entities are sprouting up like dandelions in summer," wrote Thea Singer in *Inc.*. As with traditional incubators, Internet versions provide dot-com start-ups with office space, business information and advice, financial assistance (either directly or by connecting them to potential sources of seed money), and management, accounting, and other infrastructure services. According to Internet incubators, these forms of assistance can provide entrepreneurs with essential tools to accelerate their all-important "speed-to-market" in the fast-paced Internet economy. The price of membership in an Internet incubator can be steep, however. In return for providing their various services and funding, incubators receive a percentage (anywhere from 5 to more than 50 percent) of the dot-com's equity.

Entrepreneurs who are considering membership in an Internet incubator should study the benefits and drawbacks closely before making a final decision. Potential other sources of funding and assistance should be explored, as well as the level of autonomy that is present in the program. In addition, entrepreneurs should examine whether their e-business is prepared to take advantage of the incubator's ability to accelerate the launch process. Analysts note that speed-to-market is of little benefit if a business does not have a complete, focused business plan in place. Finally, entrepreneurs need to weigh objectively whether increased speed-to-market is worth giving up a piece of the company.

INTERNALIZED BUSINESS INCUBATORS

Weary of mass defections of valuable employees who decide to launch entrepreneurial ventures of their own, some companies have established business incubators within their own corporate structures. In these programs, employees can use the company's resources (including their already established name and reputation) to build and promote their own new business ideas. "The company will provide the management guidance, infrastructure, and financial support to 'incubate' these ventures," explained David Cutbill in *Los Angeles Business Journal*. "The outcome is a clear win-win. Existing companies stem the hemorrhaging of top talent to Internet start-ups, while profiting from the high multiples investors are willing to pay for a share in Internet ventures.... And entrepreneurial employees get the challenge and the profits of creating their own 'companies' with little of the risk they would face on their own."

INCUBATOR INNOVATIONS

Two additional types of incubators have emerged on the scene since 2003. One is the social business incubator, which targets the tens of thousands of entrepreneurs who run double- or triple-bottom-line businesses those that

seek to create explicit social or environmental benefits. Advice from these incubators is tailored specifically to the unique needs of social entrepreneurs, which makes them great mentorship environments for socially focused businesses. However, social cause incubators are not a good fit for traditional companies that make only occasional donations to charitable causes; participants should be true cause-oriented enterprises. Examples of social business incubators include the Global Social Benefit Incubator at Santa Clara University and GoodCompany Ventures in Philadelphia.

The other type of emerging incubator is the long-distance incubator, which provides small businesses typically technology enterprises with assistance either partly or entirely online. Members get access to mentors and investors and have the opportunity to participate in on-site programs and online classes designed to build their skills in various areas of entrepreneurship, such as intellectual property, financial modeling, and business planning. The e-coaching component is a low-cost approach to potential high-value returns. It is intended to enhance the effectiveness of traditional training, mentoring, and consulting services by giving fledgling entrepreneurs a better understanding of preliminary business concepts and skills, and therefore a better chance for ultimate business success. There may be some equity obligations involved in joining a long-distance incubator, albeit to a lesser extent than other types of incubators like Internet incubators. Examples of long-distance incubators include the Founder Institute and Astia, which are both located in San Francisco.

BUSINESS INFORMATION SOURCES

Business information comes in general surveys, data, articles, books, references, search-engines, and internal records that a business can use to guide its planning, operations, and the evaluation of its activities. Such information also comes from friends, customers, associates, and vendors. Published sources may be daily newspapers; financial, trade, and association magazines; databases, government statistics, directories, technical manuals, and much else. In effect, since "information" is defined more by context than by content, business information is whatever information helps a business know its environment.

Business information is crucial for funding decisions, new product development and launches, investment decisions, entry into new markets, contract negotiations, incorporation, fund-raising, identifying suppliers and workers, and expansion decisions. Business research helps companies understand their competitors, their customers and clients, and the marketplace. This sort of data is vital when making any business-related decisions. Markets, products, services, and conditions change often and research helps business owners understand the changes they need to make to keep up with a different market and changing customer demands.

Business analysts cite two primary sources of business information: external information, in which documentation is made available to the public from a third party; and internal information, which consists of data created for the sole use of the company that produces it, such as personnel files, trade secrets, and minutes of board meetings.

EXTERNAL BUSINESS INFORMATION

External information comes in a variety of forms from printed material to broadcast reports to online dissemination.

Print Information. The category of print covers not only a vast array of books and periodicals but also includes newsletters and other subcategories. State and federal government reports also fit into this category; indeed, the U.S. Government Printing Office contains a wealth of information, and its products can be purchased by mail, telephone, and online.

Perhaps the most accessible documents in the print category are books and periodicals. Certainly business owners have a wide array of book titles to choose from, many of which find their way onto the shelves of public, business, and university libraries every year. In addition to books that provide general reference information on human resources management, start-up financing, product development, establishing a home-based business, and a plethora of other topics of interest to small-business owners, the publishing industry has seen a surge of books that tackle wider issues, such as balancing work and family life, establishing healthy personal interactions with co-workers and employees, the nature of entrepreneurial activity, and many others.

Many other small-business owners, meanwhile, get a considerable amount of their business information from print sources. As with books, entrepreneurs and established business owners (as well as corporate executives, human resource managers, and nearly every other category of person involved in business) can turn to a variety of periodical sources, each with its own target niche. Some magazines and newspapers, such as *Business Week* and the *Wall Street Journal* provide general interest coverage, while others (*Forbes*), *Fortune, Inc.*) emphasize subjects of interest to investors and executives in large firms. Still others most notably *Entrepreneur*, *Small Business Start-Ups*, and *Nation's Business* (the latter published by the U.S. Chamber of Commerce) publish information specifically targeted at small-business owners. These magazines which can typically be found online as well can provide entrepreneurs with helpful information on every aspect of operations, from creating a good business plan to determining which computer system is most appropriate for a particular enterprise.

Then there are the trade journals, an enormous subsection of print aimed at very select audiences. These trade journals, which typically provide narrow coverage of specific industries (journals targeted at owners of bakeries, amusement parks, real estate businesses, grocery stores, and a variety of other businesses can all be found), often contain valuable industry-specific information. Professional membership organizations, such as unions, chambers of commerce, and professional associations, also often publish and distribute relevant business information for members and entrepreneurs.

Another subcategory of the specialized print category is the material published through business research services and associations such as Commerce Clearing House, Freedonia Group, the Bureau of National Affairs, and Dun & Bradstreet. Business research companies such as these provide published reports targeted at specific companies. The companies conduct their own research and analyze and synthesize it in order to provide specific market research for businesses. Some business research companies even offer specialized research services, which allow companies to order customized research studies.

Finally, government agencies and educational institutions publish a wide variety of pamphlets, brochures, and newsletters on a range of issues of interest to small-business owners and would-be entrepreneurs. While government brochures and reports have long been a favored source of business information in some measure because many of these documents are available free of charge consultants indicate that valuable studies and reports compiled by educational institutions are often underutilized by large and small companies alike. In addition, think tanks and university research centers dedicated to business research are also often overlooked by business researchers. Nevertheless, research centers such as the Brookings Institution, the American Enterprise Institute (AEI), the Cato Institute, and the Economic Policy Institute are valuable sources of business information.

Television and Radio. This source of business information is perhaps the least helpful of the various external sources available to small-business owners. Programs devoted to general investment strategies and the changing fortunes of large companies can be found, of course, but the broad-based nature of broadcasting makes it difficult, if not impossible, to launch programs aimed at narrow niche audiences (like dental instrument manufacturers or accounting firms, for example).

Online Information. The ever-greater speed and scope of the Internet has turned the Web into the most powerful source of information for the small business. With appropriate subscription services like InfoTrac, even access to print sources is easier to achieve than actually searching newspapers or trade magazines. A number of services and Web sites have been developed specifically for business owners. Databases of Business to Business information, such as Work.com, offer solutions for businesses. Research portals such as bizjournals.com, bnet.com, and others allow businesses to seek relevant articles and resources from business sources. Search skills, of course,

must be developed, but the small-business owner can practice this art in the evenings when libraries and bookstores are closed.

Many of these databases offer information pertinent to the activities of business owners. As Ying Xu and Ken Ryan observed in *Business Forum*, the Internet includes data on demographics and markets, economics and business, finance and banking, international trade, foreign statistics, economic trends, investment information, and government regulations and laws. This information is provided by Internet news groups, online versions of newspapers and magazines, and trade associations. In addition, "many colleges, universities, libraries, research groups, and public bodies make information freely available to anyone with an Internet connection," stated Robert Fabian in *CMA The Management Accounting Magazine*. "Often, the motivation is to make information available to people within the institution. But it can be less costly to provide general access than to screen access." He also noted that "increasingly, governments are publishing information on the Internet and insisting that organizations they fund also publish on the Internet. It's a practical way to move towards open government, and does make information, which is paid for by the taxpayers, far more accessible to those taxpayers (and any others with Internet access). The range of available information is impressive."

CD-ROM Information. The CD-ROM as an information delivery system is fading due to competition from subscription-based online services. The growing speed of the Internet when accessed by cable or high-speed wireless has made large downloads from the Web less frustrating; at the same time, very rapid updates to the databases consulted are available to the user.

Social Networking Sites. Social networking has become another popular way for businesses to gather information. Social networking sites such as Twitter, MySpace, Facebook, and LinkedIn allow companies to get direct feedback from customers and learn about innovations in the industry as well as new products and announcements from competitors. Businesses can market their products using these sites, make company announcements, and follow or learn about customers and competitors. By the 2010s, many trade journals and business publications were also part of social networking sites, making it possible for business owners to get newer business information from their favorite sources in real time. Small-business owners are often especially attracted to social networking, since these resources are free.

OTHER SOURCES OF BUSINESS INFORMATION

External sources of business information can be invaluable in helping a small- business owner or entrepreneur determine appropriate courses of action and plan for the future. But researchers note that members of the business community often rely on personal contact for a great deal of their information.

"Common experience and the result of numerous research studies show quite clearly that managers, and indeed all seekers of information, frequently prefer personal and informal contacts and sources to published documents and formal sources generally," wrote David Kaye in *Management Decision*. ".The reasons are well understood. A knowledgeable friend or colleague will often provide, not only the facts requested, but also advice, encouragement, and moral support. He or she may be able to evaluate the information supplied, indicate the best choice where there are options, relate the information to the enquirer's needs and situation, and support the enquirer's action or decision."

Business analysts note, however, that companies that do rely exclusively on internal information sources run the risk of :1) remaining uninformed about important trends in the larger industry including new products and services and competitor moves until it is too late to respond effectively; and 2) receiving skewed information from employees whose goals and opinions may not exactly coincide with the best interests of the business. For small businesses, especially, relying only on internal information can be problematic. As Eileen G. Abels and Deborah P. Klein point out in their 2008 book, *Business Information: Needs and Strategies*, businesses are very much affected by external economies and often require multidisciplinary approaches to be successful. That is, understanding the financial market might be crucial for the successful loan application of an art gallery. The small business that ignores external information and resources does so at its own peril.

BUSINESS INFORMATION MANAGEMENT

One challenge that many companies have is managing business information from several resources and translating it into data that is useful for making business decisions. Many businesses rely on information management systems or even entire departments to store, manage, update, and analyze both internal and external business information. Some software vendors, such as IBM, have developed specific information management programs. There are also software-as-a-service (SaaS) vendors offering companies services and products to help manage business information.

BUSINESS INSURANCE

Business insurance is a risk management tool that enables businesses to transfer the risk of a loss to an insurance company. By paying a relatively small premium to the insurance company, the business can protect itself against the possibility of sustaining a much larger financial loss. All businesses need to insure against risks such as fire, theft, natural disaster, legal liability, automobile accidents, and the death or disability of key employees but it is especially important for small businesses. Oftentimes, the life savings of the small-business owner are tied up in the company, so the owner must take steps to protect his or her family from the financial consequences of events that could disrupt operations, reduce profits, or even cause the business to go bankrupt. Insurance can help a small business be successful by reducing the uncertainties under which it operates. It places the economic burden of risk elsewhere so that managers can focus their attention on running the business. In addition, the premiums paid for many types of insurance are considered tax deductible business expenses.

Many large corporations employ a full-time risk management expert to identify and develop strategies to deal with the risks faced by the firm, but small-business owners usually must assume responsibility for risk management themselves. Although it is possible to avoid, reduce, or assume some risks, very few companies can afford to protect themselves fully without purchasing insurance. Yet many small businesses are either underinsured or uninsured.

When developing an insurance policy with an insurance provider, it is important to note that most insurance policies have at least four parts: the declaration page, the insurance agreement, the conditions, and the exclusions. It is important to review all these parts carefully to understand what is and is not covered by an insurance policy. The declaration page will list the policyholder's name, the insurer's name, the insurance coverage, and the maximum amount the policyholder is insured for. The insurance agreement outlines the responsibilities of both the insurance provider and the policyholder. It is important to review this section carefully, since violating any conditions could affect insurance coverage. For example, most insurance providers require a business to report correctly any changes in a product to the insurance company. If this is not done and the company makes a claim against a loss, the insurance company could refuse to pay insurance money for the claim. The conditions section of a business insurance policy lists what is being covered and in what situations. The exclusions section of the policy lists what is not covered. This is also very important to review, since it lists losses that the insurance company will not pay for. If the exclusions section of a policy lists risks and losses that a company may face or is likely to face, the company may wish to change their policy or get supplementary insurance to cover these risks.

COMMON TYPES OF LOSSES AND INSURANCE

Small-business owners seeking insurance protection should first identify their companies' main areas of exposure to risk. A risk analysis survey or questionnaire, available through many insurance companies and agents, can be a useful tool in this process. Next, the business owner can evaluate the probability of each risk and determine the potential severity of the loss associated with it. Armed with this information, the owner can decide which risks to insure against and the amount of coverage needed. According to the Small Business Administration, the most common types of risks encountered by small businesses involve: property losses; legal liability for property, products, or services; the injury, illness, disability, or death of key employees; and the interruption of business operations and income due to the occurrence of these other losses. Each category of loss can be managed with a corresponding type of insurance.

Property. The types of property losses that can befall a small business include theft, physical damage, and loss of

use. Losses from theft can result from the criminal activity of outsiders, as in the case of burglary, or from the illegal activities of employees, including fraud, embezzlement, and forgery. Physical damage can occur due to fire, severe weather, accidents, or vandalism. Many types of physical property at a business can be affected, including office machines such as computers and telephones, fixtures such as lighting or carpets, machines, equipments, supplies, inventory, buildings, furniture, and other items. It is important for a business to ensure that all property is covered under an insurance policy so that in the event of serious damage no costs will have to be covered out of pocket. Companies renting or leasing office or company space still require property insurance. In fact, many lease agreements require specific levels of insurance on the part of the tenant.

In analyzing the risk of physical property damage, it is important for the small- business owner to consider the potential for damage to the contents of a building as well as to the structure itself. For example, a manufacturing company might lose expensive raw materials in a fire, a retail store might lose valuable inventory in a flood, and any type of business could lose important records to computer vandalism. Although loss of use of property usually results from another covered event, in some instances it can occur without actual physical damage to the property. For example, an office building may be closed for several days due to a gas leak, or a restaurant may be shut down by a health inspector for unsanitary practices.

In insuring against property losses, experts recommend that small-business owners purchase a comprehensive policy that will cover them against all risks, rather than just the ones specifically mentioned in the policy. Comprehensive property insurance policies help small-business owners avoid gaps in coverage and the expense of duplicating coverage. In addition, they usually allow for speedier settlements of claims. Still, additional insurance may be needed to cover adequately a specific calamity that is particularly likely in the business's geographic area such as a hurricane in Florida or an earthquake in California. Experts also recommend that business owners purchase a policy that covers the full replacement cost of materials and equipment in order to protect themselves against inflation.

Small businesses may be able to improve their property insurance rates by implementing a variety of safety measures and programs. For example, installing locks, alarm systems, sprinkler systems, and smoke vents may help lower premiums. In addition, some companies can improve their rates by joining a highly protected risk (HPR) classification that is preferred by insurers. The HPR designation is based on stringent property protection programs and involves routine compliance checks.

Legal Liability. A small business's legal liability usually comes in two forms: general liability and product liability. General liability covers business-related injuries to employees, customers, or vendors, on the company premises or off, that occur due to the company's negligence. General liability insurance, for example, covers the common slip and fall accidents in which a customer falls or becomes injured while on business property and then sues the company for damages. General liability is also important in the event that a car accident occurs on business premises. Victims in the car accident could sue the company for damages.

Product liability covers problems that occur due to defective merchandise or inadequately performed services. In both the manufacturing and retail sectors, a company is legally responsible for knowing if a product is defective. This responsibility lasts long after the product leaves the company's control. Indeed, a company that bases its legal defense for a faulty product on the fact that it met safety standards at the time it was sold may still be vulnerable to crippling financial judgments or penalties. Even in the service sector, the service provider may be held liable under certain circumstances for example, if a repair later causes an injury, or if a poorly prepared tax return leads to an IRS audit.

Whether the determination of the company's liability results from a court decision, a legal statute, or a violation of the terms of a contract, litigation can be time-consuming and expensive. Basic liability insurance is available to protect small businesses against the costs associated with these and other sources of liability. A comprehensive general liability policy, which is recommended for nearly every sort of business, covers accidents and injuries that may occur on the company's premises, or off the premises when they involve a company employee. Such policies generally cover the medical expenses, attorney fees, and court fees associated with the liability. These policies do not, however, cover product liability or automobile accidents.

A separate policy can cover product liability, though producers of some types of products such as children's toys or food products may find it difficult or expensive to obtain coverage. Companies offering higher risk services may also face challenges with business insurance. A company offering skydiving lessons, for example, will need to have excellent coverage in the event that a customer is injured. Many higher risk businesses, such as rock climbing facilities, ask customers to sign what are known as liability waivers. These waivers indicate that the customers agree that they hold the business innocent of any wrongdoing in the event of injury. The waivers basically are a way for customers to accept any risks of the service. Some companies believe that such waivers or

agreements mean that they do not require additional business insurance. However, in a court, a good attorney can usually have such agreements broken or thrown out, and the business may still be held liable. This is because laws limit how much people and businesses are able to escape liability. It is a good idea to have customers sign such waivers in a higher risk business, but companies should not rely solely on them to protect themselves against liability issues. Good coverage is needed as well.

Workers' Compensation. A special category of liability coverage pertains to workers' compensation. This type of insurance is mandatory in most states for every company with employees, and provides medical and disability coverage for all job-related injuries to employees, whether they occur on company property or not. A few states provide workers' compensation through state-run funds, and companies simply pay a mandatory premium per employee, depending on their line of business. Other states allow private insurers to compete for companies' workers' compensation dollars. Another option available to some businesses is self-insurance, in which the company creates a special reserve fund to use in case a workers' compensation claim is filed against it. In effect, these companies assume the risk themselves rather than transferring it to an insurer. A company's workers' compensation rates depend on its line of business and accident record. The best way to reduce rates is to reduce the risk of employee injuries by improving safety standards.

Company Vehicle. Company vehicles must be insured, just like vehicles that are intended for personal use. Automobile insurance is usually handled separately from other property and liability coverage. Experts recommend that business owners be sure to list all employees on the insurance policies for company vehicles. In order to determine needed coverage and obtain the most favorable rates, small businesses can consult an insurance watchdog agency. In addition, Fred Steingold's 2008 book, *Legal Forms for Starting and Running a Small Business*, recommends that businesses have coverage for noncompany company vehicles being used for work-related tasks by employees. In other words, businesses should be covered in the event that an employee injures someone while using his or her own car on company time.

Key Person Loss. Small businesses often depend on a few key people (owners, partners, managers, etc.) to keep operations running smoothly. Even though it is unpleasant to think about the possibility of a key employee becoming disabled or dying, it is important to prepare so that the business may survive and the tax implications may be minimized. In the case of a partnership, the business is formally dissolved when one partner dies. In the case of a corporation, the death of a major stockholder can throw the business into disarray. In the absence of a specific agreement, the person's estate or heirs may choose to vote the shares or sell them. This uncertainty could undermine the company's management, impair its credit, cause the flight of customers, and damage employee morale.

Small businesses can protect themselves against the loss of a key person in a number of ways. One is to institute a buy-sell agreement, which gives the surviving partner(s) or stockholders the right to purchase the deceased person's portion of the business. Another way a business can protect itself is by purchasing a key person insurance policy. This type of insurance can provide an ill or disabled person with a source of income, and can facilitate financial arrangements so that the business can continue operations in his or her absence. Partnership insurance basically involves each partner acting as beneficiary of a life insurance policy taken on the other partner. In this way, the surviving partner is protected against a financial loss when the business ends. Similarly, corporate plans can ensure the continuity of the business under the same management, and possibly fund a repurchase of stock, if a major stockholder dies.

Life and Health. Some experts claim that since the most valuable asset in many businesses is the employees, ensuring employee welfare is a vital form of coverage. Group life and health insurance are common methods companies use to provide for employee welfare. This type of coverage falls under the category of employee benefits, along with disability and retirement income. It can help small businesses compete with larger ones to attract and retain qualified employees. Life insurance is generally inexpensive and is often packaged with health insurance for a small additional fee. Specialized plans are available to provide survivors with income upon an employee's death. Other plans can protect the firm against financial losses due to the death or disability of a key employee. It is important to note, however, that when the company is named as beneficiary of a life insurance policy taken on an employee, the cost is not tax deductible for the business.

Two basic health insurance options are fee-for-service arrangements and managed care plans. In a fee-for-service arrangement, employees can go to the hospital or doctor of their choice. The plan reimburses costs at a set rate for example, the insurance company might pay 80 percent and the company or employee might pay 20 percent for all services rendered. This type of plan declined in popularity during the 1990s in favor of managed care plans. These plans, the most common of which are run by Health Maintenance Organizations (HMOs) and Preferred Provider Organizations (PPOs), require participants to use an approved network of doctors and hospitals. They pay the health care providers a predetermined price for each covered service. The employee may have a deductible

and a small co-pay amount. It is important to note that a company that employs more than twenty people and provides group health insurance to its employees is obliged to offer an employee who leaves the company the option to continue that coverage for a certain period of time at his or her own expense under the terms of the Consolidated Omnibus Budget Reconciliation Act (COBRA).

Business Interruption. Though property, liability, and other types of insurance can provide businesses with protection against specific risks, most policies do not cover the indirect costs associated with losses. When a small business suffers a loss, as in the case of property damage in a fire, it may be forced to shut down for some time or move to a temporary location. A typical property damage policy will cover the cost to repair or replace buildings and equipment, but it will not cover the loss of income the business is likely to experience during its downtime. The business thus may be forced to tap cash reserves in order to pay expenses that continue such as taxes, salaries, and loan payments even when the company has no income. In addition, the company may face extra expenses in a crisis, such as employee overtime or rent on a temporary location. Business interruption insurance provides a company with the difference between its normal income and its income during a forced shutdown. The prior year's records or tax returns are usually used to determine the payment amount.

Malpractice Insurance. In addition to the types of insurance listed above, some professionals and businesses may require malpractice insurance to guard against malpractice lawsuits. In general, law professionals, dental professionals, and health care professionals are most affected by these lawsuits and need coverage. Malpractice occurs when a customer or client alleges professional negligence resulting in personal injury.

Business Opportunity Plans. A wide variety of specialized insurance packages that cover a custom combination of risks are available to small businesses. One popular option is a Business Opportunity Plan or BOP, which acts as a starting point for many small businesses that require insurance. A BOP provides basic property coverage for computers and other office equipment, plus liability protection for work-related accidents. In some cases, a BOP might also include business interruption coverage that will maintain the company's income stream for up to a year if a catastrophe disrupts business. Many BOPs also offer optional coverage against power failures and mechanical breakdowns, liability for workplace practices (including discrimination, sexual harassment, and compliance with the Americans with Disabilities Act), professional liability, and other risks.

Many people who work out of their homes assume that their homeowner's insurance will cover them against property and liability losses. But in reality, a typical homeowner's policy is not sufficient to cover business equipment and liability. In fact, many homeowner insurance policies limit the amount paid for the loss of electronic equipment to $2,500, and will not cover the business's liability if a client trips and falls on the property. Additional protection is required, although it may be possible to add a rider to the homeowner's policy for business equipment and liability. Some homeowner insurance policies in fact are voided or limited if a homeowner opens a business in the home, so entrepreneurs will want to speak to their insurance providers before opening up a new business.

E-Commerce Insurance. The Internet has emerged as a major business tool for companies large and small. This has led some insurers to introduce policies that protect businesses in the event that their Internet presence is disrupted by hackers or other problems. Hacker attacks, known as "denial of service" among insurance professionals, are a particular cause of concern for companies that rely exclusively on Internet sales. "The business interruption portion of an e-commerce insurance policy usually will cover the cost of sending consultants to the company to help stop the attack and determine how to prevent future attacks," stated Rose-Robin Lamb in *LI Business News*. "It also covers loss of income for the time that an e-commerce site was down and unable to accept business."

PROFESSIONAL ASSISTANCE WITH INSURANCE NEEDS

A small-business owner involved in risk management should: 1) identify the risks faced by the company; 2) seek ways to reduce or eliminate the risks; 3) decide which risks the business can assume; 4) determine which risks should be transferred to an insurance company; and 5) shop around for the best insurance coverage for the money. Obtaining the assistance of a professional insurance agent with all of these steps is highly recommended. To gain the most benefit from a relationship with an insurance agent or broker, experts recommend that business owners write down their needs and expectations ahead of time, avoid withholding information, check the credentials of the agents and their firms, obtain competitive bids, and keep careful records of coverages and losses.

It is important to note the difference between an insurance agent and an insurance broker. Insurance agents either work independently, or, more often, represent one company. They can help a business find the best bargains and services, but only at the company they work for. Insurance brokers generally represent several insurance companies and may select among the offerings of a variety of different

insurance companies. They may be able to offer expertise on the regulations that apply in the small business's home state and tailor a policy to meet the unique needs of a particular business.

Many large insurance companies have also begun to focus on the needs of small businesses. These companies offer the advantage of being able to provide legal assistance with liability claims, rehabilitation programs for injured workers, and inspection of facilities for safety. Experts recommend that a small-business owner select an insurance professional who offers experience working with small businesses, a knowledge of the particular industry, and an ability to provide needed coverage at a competitive price. Fred Steingold's 2008 book, *Legal Forms for Starting and Running a Small Business*, recommends that company owners develop a good relationship with a trusted insurance professional, as this professional is often able to provide personalized advice and suggestions. Steingold notes that insurance coverage is often complex, and a trusted insurance professional can help ensure that a business does not overlook an important area of coverage.

Other helpful hints for small-business owners include covering the largest area of exposure first, then adding other coverage as the budget permits; selecting the largest affordable deductible in order to save money on premiums; and reviewing costs and coverages periodically or whenever the company's location or situation changes. Steven D. Strauss recommends in his 2008 book, *The Small Business Bible*, that small-business owners save on insurance costs by taking the largest deductibles they can afford. A deductible is the amount the company pays out of pocket and therefore represents the amount of money the insurance company does not have to pay in the event of a claim. A larger deductible often means a lower premium, although small businesses need to ensure that they would be able to afford their deductible easily in the event of an emergency. Strauss also recommends that companies make insurance more affordable by selecting a sensible payment plan. Depending on the specific business involved, companies may find it easier to make insurance payments quarterly, yearly, or monthly, for example.

Experts also warn small-business owners against self-insurance. This refers to the practice of establishing emergency funds rather than taking out actual insurance policies. Although it may be tempting simply to keep some funds in reserve in case problems occur, the pool of funds needed to provide adequate coverage is well beyond the capacity of most small businesses. In contrast, insurance premiums are relatively small, and their cost is often offset by a tax deduction.

Experts recommend that businesses review their insurance needs and coverage at least once a year to determine whether coverage is still adequate. It is also a good habit to thoroughly document, photograph, and videotape business premises, assets, and inventory. This way, if a company has to make a claim, it has evidence of business assets and property. It is a good idea to store videos and photos taken for insurance purposes in a secure site away from the main business site. This way, if offices or company property is destroyed, the evidence of the company holdings will be safe. If a business has especially valuable assets and property, it is advisable to get an independent appraiser to ensure that the full value for these items can be recompensed in the event that they are stolen or damaged.

BUSINESS INTERRUPTION INSURANCE

Most businesses lose money in the event of a business interruption. Larger companies can lose tens of thousands or even millions of dollars a day. While smaller businesses may lose less, they can still face serious consequences in the event of a business interruption. A small business may be the sole source of revenue or income for a business owner. Even a short business interruption could push a small business close to bankruptcy.

Business interruption insurance protects against this eventuality. Business interruption insurance compensates a business for certain specified categories of costs in the event of catastrophic events. Three categories that may be covered are: 1) profits that would have been realized if the disaster had not occurred; 2) operating expenses that must be paid despite inability to operate; and 3) expenses

incurred because business operations had to be moved while damaged original premises were restored for use. This type of protection is also known as business income protection, profit protection, and out-of-business coverage. Freestanding business interruption policies are rarely sold. They tend to be provisions that are part of property insurance policies and "business owners policies" (BOPs).

WHAT IS COVERED

Interruption insurance clauses are not uniform. Clauses that trigger coverage may be limited by category and further delimited within the category. Excluded categories may include public unrest or riots; water damage or flooding; firestorms, tornadoes, or simply "storm damage"; earthquakes; and war and terrorist acts. The business owner is well-advised to review such clauses to ensure that he or she is covered. Exclusions may be present because the business is located in an area such as a flood plain or in some location where annual firestorms are common. Coverage for such events, of course, will tend to be costly.

In the modern electronic environment, interruptions in Internet services or hacker attacks may interrupt or severely damage a business that depends significantly on Web trade or, for instance, is involved in software development for others. Such businesses should be especially careful to ensure that disruptions from such sources are covered.

RECORD KEEPING AND SECURITY

In many cases a business must have good records to collect on such a policy. It may have to prove, for instance, that it has actually earned profits, at a particular level, in the year preceding the catastrophic event; it may similarly have to document its operating expenses. If records are burned or destroyed in a flood, collection of amounts due may be problematical. For this reason, those purchasing business interruption insurance should implement policies to keep copies of records at locations other than the main business site. These records should be updated at least once or twice a year so that they are current. Carol Schroeder, writing in *Gifts & Decorative Accessories*, described a minimum policy: "[A] backup copy of your computer files should routinely be stored off-site.... Those who keep records on paper should keep copies at home, or store them safely elsewhere. You may also want to take photos of your shop's exterior and interior in case you ever file a claim."

KEEPING COVERAGE UP TO DATE

Insurance policies tend to be forgotten after they are purchased; they will cover the business status as it was at the time of purchase but in the meantime the business may grow. Schroeder provides another example: " [I]f you wrote the policy when your inventory was valued at $100,000, you may not be fully covered if you have $200,000 in stock. Also find out if the coverage for your furniture, fixtures, and building (if you own it) reflect[s] their current value." In addition to considering coverage, companies will want to consider the extent of coverage. A business will want to periodically review its insurance policy to ensure that the company is covered for the amount of time it would take to reopen the business.

OTHER RELATED COVERAGE

Business interruption insurance can also provide a small business with income protection in the event an accident or injury causes the disability of an owner or key employee. This type of policy is usually combined with basic individual disability coverage. Basic disability benefits generally begin 1 month to 1 year after the onset of the disability, can last between 2 years and the remainder of the person's life, and pay between 60 and 70 percent of the individual's usual income during the period when he or she is unable to work. Though this type of policy is important to help an owner or key employee cover living expenses, additional benefits in the form of a business interruption insurance policy are often needed to keep the business running in his or her absence.

Most business interruption coverage will allow a business to cover payroll expenses and basic business expenses while a business is not operational after a loss. This is vital, as it allows a company to keep employees and to pay operational costs such as utility bills and lease or mortgage payments while the business is not generating any revenue to pay for these expenses.

Yet another type of insurance that fits into this category is called *extra expense insurance*. Such insurance, sometimes used in lieu of business interruption insurance, reimburses a business owner for special expenses incurred, over and above normal operating costs, to keep a business from shutting down during a period of recovery from a disaster. Quite simply, this coverage acknowledges that businesses that are faced with disaster or interruption of business face additional expenses, above and beyond what a business would have to pay were it operational. For example, after a fire, a business may need to print ads, advising customers when a business will reopen. The business may also need to move operations to a new, temporary site while repairs take place. These extra costs are covered by extra expense insurance. In many cases, extra expense insurance allows a business to continue to function and prevents a business from being forced into bankruptcy.

CONTINUITY PROGRAMS

Small-business experts urge entrepreneurs to research their options in the realm of business interruption insurance and

select the one that works best for them. But they also caution small-business owners that such policies, while extremely valuable in terms of preserving the financial viability of an enterprise, are often not, in and of themselves, sufficient to keep a business afloat during difficult times. Business interruption insurance should be only one element in an overall "business continuity" program. These programs, which can be developed in conjunction with many insurers, seek to address all company functionalities in the event of a business interruption. Their principal aim is to help the company resume operations in as timely and efficient a manner as possible. Interruption insurance is usually the cornerstone of such programs, but it is hardly the only element. Business continuity programs also seek to minimize a company's financial and operational vulnerabilities and protect its customer base, work force, and assets in the event of an interruption. They also help companies adopt training programs and preventive policies to minimize the likelihood of a business interruption in the first place.

In addition to business interruption insurance, companies should have a business interruption emergency plan. James Stephenson and Rich Mintzer, authors of the 2008 *Ultimate Homebased Business Handbook*, advise businesses to develop a plan to help minimize business losses. They note that most insurance does not begin until 48 hours after the initial disaster, so it is important for businesses to be prepared to cover costs for this period. As well, they advise that businesses can often save money and potentially the company by being prepared to move to another location quickly. For example, businesses that have a company at a physical address and online may wish to focus on online sales after a fire or other emergency affects the physical location. Online businesses may be flexible enough to move to new servers if careful backups have been kept. Even a company that operates entirely out of a bricks-and-mortar location may be able to sell or work out of a new location while waiting for an original business location to reopen. Keeping a business operational minimizes losses, maintains employees and customers, and increases the chances that a business will be able to reopen after a catastrophe.

BUSINESS MODELS

A business model is a tool for addressing the basic question of how an enterprise will make money. Models are typically devised before launching new businesses, providing a roadmap for operations as well as a document for raising venture capital. However, they can also be applied to existing enterprises to help managers analyze current and proposed changes in tactics and strategies. An innovative business model that disrupts the current environment can provide a substantial competitive advantage for an enterprise.

While the term "business model" is commonly used in business circles and mass media, there are a number of ways to define the term. According to *Small Business Management: Launching and Growing Entrepreneurial Ventures* by Justin G. Longenecker and associates, a business model "describes a group of shared behaviors, characteristics and goals that a firm follows in a particular business situation. More simply, a business model is the operational design that allows an enterprise to sustain itself." In *Managing the Digital Enterprise*, Michael Rappa stated, "In the most basic sense, a business model is the method of doing business by which a company can sustain itself that is, generate revenue. The business model spells out how a company makes money by specifying where it is positioned in the value chain." The common thread of these and other, more complex definitions is that the model demonstrates how a business will generate revenues and become profitable.

CHARACTERISTICS OF BUSINESS MODELS

A business model incorporates such considerations as entrepreneurship, finance, marketing, strategy, and operations. The model can be as simple as a farmer selling his goods on the side of the road to consumers, or as intricate as a television broadcasting company that sustains itself indirectly from advertising, cable television service fees, and online rights payments.

Regardless of complexity, most approaches to business modeling share several common characteristics. A basic

business model needs at least to address the customer value proposition (how the product or service solves a problem or addresses a need); what makes the company's offerings different from others in the marketplace; pricing; and how the business will win over new customers.

In their frequently cited paper, *The Role of the Business Model in Capturing Value from Innovation*, Henry Chesbrough and Richard Rosenbloom listed six common themes of most business models:

- Value proposition, which describes problems facing a customer or potential benefits; how the company's products and services address the opportunity; and how the customer values the company's offerings.
- Market segment, identifying the group (or groups) of potential customers the business will target.
- Value chain structure, which identifies where the business falls within the value chain (a network of business activities) and how the company extracts the value it adds within the chain.
- Revenue generation and margins, which includes the source(s) of revenue, cost structure, and expected profits.
- Position in the value network, which includes competitors and complementary players.
- Competitive strategy, detailing how the business expects to create and maintain a competitive advantage.

To help businesses develop a business model, a variety of templates are available to ensure that all the factors needed to construct a business model are present during the planning process. These models can operate at a high level or drill down into details about the value proposition, company infrastructure, customer profiles, finances, and other considerations. Most templates deal with such business operations as marketing, production, administration, human resources, accounting, and payroll. The templates lay out the essential questions to be asked and the information to be gathered in order to create a business plan that outlines the proposed structure of a new business or a profile of an existing enterprise (often accompanied by proposed changes in the model).

TYPES OF BUSINESS MODELS

For some companies, following an existing business model is the most logical path to success. For others,particularly technology start-ups and online enterprises, a new model may be required to generate profits. In some cases, an innovative business model itself provides the competitive advantage rather than the service or product. Regardless of complexity, the business model must outline how the company expects to generate revenue and remain in business.

The simplest model represents a company that produces services or goods that it sells directly to customers. Another early business model is the shopkeeper: a retailer who buys merchandise from a wholesaler and then sells it to his or her own customers. The "razor and blades" model gets its name from Gillette, which makes most of its money on replacement blades for its shavers.

In *Managing the Digital Enterprise*, Rappa lists a number of other model types in the online world, although his list applies equally to bricks-and-mortar businesses as well. The major models are:

- Brokerage, the market-makers who bring buyers and sellers together. Brokers usually make their money from commissions or transaction fees.
- Advertising, where an outside party pays a television broadcaster or a Web site to carry its promotional messages.
- Infomediary, a business that sells data about its customers to marketers.
- Merchant, which includes wholesale and retail sellers of goods and services through physical stores, catalogs, or Web sites.
- Manufacturer direct, where the manufacturer sells or leases its product directly to the consumer using a physical or online distribution channel.
- Affiliate, which relies on driving leads or sales to an outside site run by an affiliate company in return for a fee.
- Subscription, where users pay a periodic fee for access to a product or service.
- Utility, or "pay as you go." While subscribers pay a set fee regardless of how often they use a service, the utility model relies on the actual amount of service used by a given client.
- Community, where belonging to a club or virtual group with others can bring revenues from a combination of sources, including subscriptions, product sales, or contributions to a nonprofit.

Other types of models in the nonvirtual environment include the manufacturing business; manufacturing distributor; assembly business; assembly distributor; retail store; and nonprofit venture.

Different types of businesses may also feature models specific to their industries or platforms. For example, in *Five Business Models for Social Media Startups*, Jun Loayza notes that early Internet businesses simply focused on how they would generate traffic, rather than how they would

turn those visitors into a revenue stream. With the online world maturing, entrepreneurs (and their financial backers) have turned to more fully developed business models. The subscription and affiliate models are common in the social media space, along with:

- Freemium, which offers a basic service for free alongside premium services for fee-paying members.
- Advertising. When sites sell ads against their own traffic, more visitors bring more revenues. Also, owners who can provide demographic information about that traffic can command higher fees from the advertisers.
- Virtual goods, where users buy items such as weapons or upgrades to use in an online game.

EXAMPLES OF BUSINESS MODELS

Other than the initial funding stage, business models typically generate the most attention when a company runs into trouble or becomes enormously successful. A "disruptive" business model often gains credit when a company grows to dominate its industry (such as Wal-Mart). The troubles of a struggling enterprise may be blamed on an out-of-date or inflexible business plan, such as Blockbuster Video, which was slow to react to online rentals, digital movie distribution methods, and DVD kiosks.

Southwest Airlines is often cited as a company whose unique strategy and innovative business plan brought it success while most legacy carriers fought for survival. Southwest operates under a "low cost leadership" strategy that focuses on customer service, employee satisfaction, and convenience. Southwest flies point-to-point routes rather than following the traditional hub-and-spoke approach; relies on fuel hedging; emphasizes quick gate turnarounds; and takes other steps to cut costs without sacrificing the passenger's experience.

An enterprise that continues to struggle with an outdated business model is the U.S. Postal Service. A 2010 study by the service stated its earlier assumption that mail volumes would always grow "has proven false." Such forces as the rise in electronic communications, competition from overnight shipping, high labor costs, and the mandate of universal service led officials to call for "bold changes to the business model." The *Washington Post* reported that the three outside consulting firms brought in to recommend improvements at the Postal Service found that its business model is so poor that it could not be privatized. The consultants proposed more than fifty changes. However, postal officials face an uphill fight getting some of those modifications approved because of political opposition in the U.S. Congress.

Sometimes a company that was once a leader finds itself playing catch up. Amazon revolutionized the book industry by using the Internet to sell directly to customers, disrupting the brick-and-mortar bookstore business. Then Amazon introduced the Kindle, a device to provide electronic books to consumers that eliminated the high cost of printing and binding. (The *Washington Post* reported that the Kindle illustrates the opposite approach to the Gillette strategy. Amazon provides the Kindle at a relative high cost yet sells book content for less than it pays publishers for those rights.) However, the introduction of Apple's iPad is providing innovative competition for Amazon. The iPad provides a book-reading platform along with gaming and music applications. Apple is also using a different business model for book sales that provides more benefits to publishers.

Other examples of innovative business models include:

- When Xerox was unable to find partners to market its copying machines, the company developed a new business model. It leased copiers to customers for low fees, but charged extra fees for heavy usage. Companies that tried the copiers quickly adopted the new technology, and the Xerox copier became a staple in offices around the world.
- eBay started as a small auction site for collectibles and has grown into a major retailer for a wide range of products. In the 2010s, eBay offers more fixed price goods than items sold through auctions. eBay has also moved into luxury items. For example, eBay now partners with major New York fashion houses to sell exclusive apparel online. CEO John Donahoe told *Women's Wear Daily* the move offers "incredible value and selection for fashion shoppers" as well as creating "new business models and channels of distribution for apparel brands and retailers."
- The growth of $1 pizza outlets in New York City relies on a business model that calls for low prices but high volumes of customers.
- Newspapers and magazines continue to test a variety of business models to help them recoup subscription and advertising revenues lost to a variety of online content providers.

FLEXIBLE, ADAPTIVE MODELS

Business models provide a critical tool for launching, running, and improving an enterprise. For companies to remain competitive, their business models must be flexible and continually adapted to changing environments. Anthony J. Mayo, Nita Nohria, and Mark Rennella, the authors of *Entrepreneurs, Managers, and Leaders: What the Airline Industry Can Teach Us About Leadership*, maintain that managers who work for a long period of time under one business model are often slow to react to outside

changes, choosing to reinforce the existing model when new approaches are required. Managers often choose to ignore the threat of a competitor's disruptive business model, or they react slowly or ineffectually. When existing industry leaders cling to outdated business models, the authors add, they provide opportunities for other companies to grow and prosper often at the established companies' expense.

BUSINESS NAME

A business name is any name, other than that of the owner, under which a company conducts business. One of the first decisions entrepreneurs must make when starting a new business involves coming up with an appropriate and marketable business name. Although some entrepreneurs simply conduct business under their own names, most opt to create a distinctive business name that provides a good fit with the aims of their companies. The emergence of Internet commerce with its attendant need for participating businesses to choose effective domain names is another wrinkle in this realm. However, it is important for entrepreneurs to choose business and domain names that will not be confused with those of other businesses or infringe on their rights.

There are in fact two types of business names: trade names and trademarks. According to the 2007 book *Trademark: Legal Care For Your Business and Product Name*, by Stephen Elias and Richard Stim, a trade name refers to the formal name of a business. However, the name a business uses to promote its products is a trademark. For small businesses, these names may be the same, but for larger companies, they are often different. For example, the trade name "Arm and Hammer" is the name of a company. However, when people refer to "Arm and Hammer Baking Soda," they are using a trademark.

The procedures that businesses use to register and protect their names depend to a large extent on the way that they are organized. Entrepreneurs organizing as a corporation, limited liability company, or limited partnership are creating a distinct entity when they form their businesses. The entity comes into existence through filing a charter with the state in which the entity will operate. At this point, the state checks to see if the name chosen for the new business will be "confusingly similar" to that of an entity already registered in the state. Even if the state gives the business clearance to use the name, that does not necessarily mean that no other business is using or can use it. A similar business may be using the name in another state, for example. Corporations, it should be noted, are usually required to register their name with a state department of corporations, secretary of state, or a corporations commissioner. Requirements vary slightly by state. Unless a business is incorporated in Nevada, Wyoming, or Maine, it must include an abbreviation or word indicating its corporate status.

A sole proprietorship or partnership may be using the name in the home state; such entities need not register the name with the state. To avoid this situation, entrepreneurs can check a variety of databases that include the names used by a wide range of entities. These databases are accessible at many business libraries; most attorneys have access to them as well. Some private investigators also offer business name

services, in which the investigators run a thorough check for any similar business names across the country and around the world. This is especially useful for a company hoping to have a global presence someday.

DOING BUSINESS AS

Although sole proprietorships and partnerships are not usually required to file charters with the state in which they operate, they are subject to certain rules if they plan to do business under any name other than the owner's own. The procedures for registering a "fictitious name" for a sole proprietorship or partnership vary by state. In some cases, the small-business owner simply fills out a form known as a "doing business as" form or DBA available at its city or county offices, has the form notarized, and pays a registration fee ranging from $10 to $100. In other cases, the small-business owner is required to print a legal notice announcing the fictitious name in a local newspaper. Perhaps the easiest way for the owner of a sole proprietorship or partnership to determine the appropriate procedure is to call his or her bank and inquire whether it requires registration of the business name to open a commercial account. It is important to note that corporations, as distinct entities, do not have to file a DBA unless they plan to do business under a name other than the corporate name for some reason. The documents of incorporation and the charter filed with the state serve the same purpose as a DBA.

Businesses can protect their names in a number of different ways. One option involves filing the name, along with any associated logo or slogan, with the trademark (or servicemark in the case of a service business) registry of any state in which it will do business. Although the protection is limited because state registration can be preempted by federal registration it does provide valuable evidence of prior use of the name in that state. Federal registration with the U.S. Patent Office is the strongest protection available for a business name. Federal registration prevents any person or business from using the name in the future within a relevant class of goods. However, people or businesses that have established rights through prior use of the name are usually allowed to continue to use it. Federal protection for a business name is generally difficult to obtain. It will ordinarily be denied if the name is already in use or if it is deemed too generic applying to a class of goods rather than a specific product. In most cases, however, small businesses can obtain a comfortable level of protection by registering their names according to the procedures set forth by their home state.

PICKING THE RIGHT MONIKER

Choosing a business name is usually a rather complex process. In addition to ensuing that a business name is unique, businesses often want to ensure that a business name is available as a dot-com domain. In today's business world, in fact, many companies check to see whether a business name domain is available before deciding on a business name. They purchase the domain and only then register their business name. Since business names are such an important item for branding and marketing, having a domain URL that is also the company name is important.

In addition, companies often must ensure that their business name projects the right brand image. Businesses hoping to seem professional may use business owner names as well as a designation. Smaller businesses sometimes use a play on words in their business name. The aim with all business names is to create a memorable and favorable impression on a customer.

Successful business names are short and easy to remember. Many offer a clue as to the purpose or industry of a business. In addition, some states have specific rules about business names. Some states, for example, require that all business names for corporations use English words and Roman characters only. Many states also have regulations against misleading names which suggest a different purpose than a company actually has. These laws are meant to ensure, for example, that a party line service cannot name itself as a "health company."

BUSINESS PLAN

Most business plans produced each year are prepared by operating elements of corporations. These plans contribute to a broader corporate strategic or long-range plan which may itself never be widely disseminated. Plans may be elaborate and detailed or may be little more than projections of revenues and estimates of costs ("the budget").

Management experts strongly urge every business to prepare an annual business plan, but small businesses rarely do so except under certain circumstances. By their very nature, small businesses tend to be in touch with their markets. Their two or three principals interact constantly; they are always, in a sense, planning. As well, small

businesses have fewer resources to expend on formalities. But small businesses also prepare plans when selling the business or when they seek funding be that at start-up or when trying to obtain second-tier financing. These plans are, if anything, more complete than annual corporate plans. In addition to the usual content, they will contain a thorough description of the business (rarely included in corporate plans) and also argue that the management team, which is presented in the plan complete with resumes of individuals, is well-suited to achieve the goals of the enterprise. For many smaller businesses, a business plan is needed when speaking with a lender or when trying to attract investors. In these cases, the business plan shows that a small business is poised for success.

Aside from these differences, all business plans have the same general content. They discuss the environment, they formulate objectives based on changes in the environment, they lay out alternative actions and the chosen strategy, they estimate outcomes by forecasting revenues, costs, and returns; they specify capital expenditures that will be necessary; finally, they lay out benchmarks over time to measure progress toward achievement of the goals. Most formal business plans have the same structure: a cover or title page, summary, table of contents, statement (a mission statement or statement of a specific problem the business plan is to address), a description of the company, business successes or accomplishments, advertising or marketing strategy, income or sales forecast, cash flow forecast, loss forecast, financial plan, trends and problems affecting the business, employee plan, business and staffing plan, job descriptions, future goals and plans, supporting graphs, and documents. Informal business plans may be much shorter and may not include these elements.

It is well to remember that most business plans are written with the intention of seeking funding from top management, a bank, the Small Business Administration, a rich individual, or a venture capitalist. Business plans, therefore, are documents intended to persuade. For this reason, plans focus on important issues and leave out what might be called "boiler plate." The boiler plate is present, but usually only in the budget details. Business plans are also very important in terms of financing because, as Maali H. Ashamalla, John N. Orife, and Ivan Abel note in a 2008 article in *Journal of Small Business and Entrepreneurship*, business plans are often the first contact a company has with possible investors and financiers. Therefore, business plans tend to build a brand identity and tend to be in some manner marketing tools aimed at fundraising.

While financing is one of the most often-cited reasons for developing a business plan, it is not the only one. Some businesses create business plans because some landlords require such a plan in order to offer a lease. Many businesses create business plans in order to understand their businesses better. In fact, Mike P. McKeever, in his 2008 book, *How to Write a Business Plan*, notes that between 35 and 40 percent of entrepreneurs do not have an accurate idea of how money flows through their business. The business plan, therefore, can be a way for businesses to explain themselves back to business owners and employees. For corporations, shareholders will sometimes request business plans to make voting or investment decisions. Smaller companies which are not incorporated will sometimes create business plans to solve problems or make business decisions. A business plan, many experts agree, can also be a company road to success, explaining to the company what must be done to reach a specific level of success.

PLAN DEVELOPMENT

There are several factors involved in the development of a business plan. These include environmental assessment; formulating objectives; evaluating alternatives and making choices; budgeting and implementation; and benchmarking.

Environmental Assessment. Business planning, like all planning, is an attempt to deal with change. Elements of the business likely to operate much as they did the year before do not need special focus. Business planning therefore begins with an assessment of the environment: the market itself and trends in that market, the competition the business faces and what competitors might do; changes in the supply chain on which the business depends, including technology; changes in the distribution channel by means of which the business sends its product to the customer; and finally changes in the business itself, including its products, labor, housing, and so on. Sometimes changes in the legal structure are an important issue. The focus of the planning is on *change* and how change produces opportunities or threats. The environmental assessment results in a few important issues that should be addressed by the plan. Change is a constant; some issues, therefore, should always emerge.

A new business intending to enter a market will, of course, focus on features of the market poorly served by existing suppliers, features of the company's own products that differentiate it, innovations in distribution it intends to exploit, and so on. In such a situation, an important part of the environmental assessment is the business itself and how it will fit into the environment.

Formulating Objectives. The "issues" that emerge from the environmental assessment are next translated into objectives. A nursery might discover that its revenues are threatened by the repaving of the urban artery on which it sits. It might therefore set its objectives at minimum to matching its last year's sales. The producer of an attractive composting system may discover that price hikes to its

popular system will be resisted by its wholesalers. The producer may plan to roll back its price hike.

Broad objectives may be imposed from above. The corporate goal, for instance, may be to increase return on investment (ROI) by minimally 2 percent. This case illustrates the manner in which the "environment" may be an internal factor namely the parent corporation itself.

Some business professionals note that the very process of writing a business plan sometimes clarifies and solidifies business objectives. Insofar as business plans require writers to closely look at a business and how it functions, goals and company plans may organically flow from this analysis stage. As well, as Maali H. Ashamalla, John N. Orife, and Ivan Abel noted in a 2008 article in *Journal of Small Business and Entrepreneurship*, the process of writing down business objectives has been linked to an increased success rate in achieving those goals. Therefore, by clarifying and codifying plans and goals in business plans, companies increase the chances that those objectives will be met.

Evaluating Alternatives and Making Choices. Once the environment has been evaluated and objectives have been formulated, alternative actions will be considered to reach the objective. The nursery, for instance, may consider substantially increasing advertising, providing deep discounts to attract customers despite traffic delays, or setting up auxiliary "tent sales" in parking lots, by special arrangements, to give its customers easier access elsewhere. The compost system producer may look at cutting costs through reengineering, changed materials, or a new painting system. The corporate element reaching for higher ROI may look at its inventory levels and seek ways to reduce these by "just in time" procurement and by speeding up collection of payables, both of which would lift ROI.

All such choices imply variable costs and benefits that must be calculated and compared; they have further intangible costs which have to be assessed. The optimum alternatives are selected for implementation.

In the very nature of things, alternative actions may fall into any of the known categories of business and often into several at the same time: marketing, sales, distribution, warehousing, engineering, patents, production, procurement, distribution, finance, law, personnel, and so on. Manuals and books on the subject tend to focus on major activities, but in practice everything is always on the table.

Budgeting and Implementation. By the time actions to be taken have been decided, the basic planning is virtually done. But business planning tends to be an iterative activity. In the next phase, budgeting, plans are more fully developed. All costs are calculated and revenue forecasts are refined. Quite frequently, in this process, new discoveries are made. If necessary, the process is repeated and actions are modified. Such might be the case, for instance, if the compost system producer discovers that its new painting system will take much longer to install and therefore it must use some other route to cut costs.

Benchmarking. The final step in the business plan is to establish benchmarks by which achievement of the objectives can be measured internally as well as by the source of funding. Benchmarks are often a combination of financial goals by quarter and particular achievements such as, for instance, leasing parking lot space for the nursery's "tent sales." Clear benchmarks, business experts agree, increase success rates by clarifying larger business goals into smaller, manageable steps. However, in order for benchmarks to be reached, it is important for business plans to be reviewed. Simply writing a business plan is not enough. Many business professionals recommend regular reviews of such plans and a review of goals met.

BUSINESS PLANS AND PLANNING DOCUMENTS

Every business operates under a plan: the absence of a plan is itself a kind of plan. In the small business environment plans tend to be informal: they arise from periodic discussions between the principals and are understood as a kind of consensus in which all individuals involved will be aware of the important issues and expectations. Active planning tends to take place when change is perceived and "something must be done." The transition to formal planning tends to evolve with increasing size when management realizes that formal communication of intentions will be beneficial and necessary to obtain everyone's cooperation. At first such plans may be in the form of memoranda with the subject "The Year Ahead." They may take the form of a Mission Statement that, in part, specifies goals and broadly outlines the means to their achievement. Later such plans will become ever more structured.

Planning documents come in two forms. One is the "business plan" entrepreneurs use to obtain funding. The other is the "annual plan" that business elements submit to the next level of management for approval. Annual plans may take the form of budget requests with minimal descriptive text or they may be structured documents with "required" rubrics such as "competitive analysis" and "human resources." In many corporations, the planning process is highly structured; planning staff may distribute spreadsheet templates in which budgets must be elaborated and outlines which must be filled in with appropriate text.

The ideal business plan, whether written or merely "understood" will be: 1) comprehensive, covering all relevant aspects of the business; 2) structured around changes in the internal and external environment; 3) realistic rather than promotional or defensive in nature; thus it will

attempt to document facts; 4) analytical in that it presents alternatives each of which is weighted; and 5) within the competence of the planner to implement and control.

BUSINESS PLANNING

Business planning in the modern sense has a fairly long history. Henry Mintzberg, in *The Rise and Fall of Strategic Planning* pointed out that business planning with modern characteristics (10-year horizon, 5-year reviews) was practiced in the French mining industry as early as the nineteenth century. The current form took hold in the United States in the 1950s as an extension of budgeting processes. It became and remains a major corporate activity.

With the twenty-first century under way, corporate planning (also known as long-range planning and strategic planning) may become transformed beyond recognition. Resistance to it became visible in the early 1990s. Peter Drucker, the renowned management guru, wrote in 1992 in the *Wall Street Journal*: "Uncertainty in the economy, society, politics has become so great as to render futile, if not counterproductive, the kind of planning most companies still practice: forecasting based on probabilities." Since then the chorus of critics has grown louder and uncertainty has increased as concerns about terrorism, the environment, health epidemics, natural disasters, and resource shortages has gained momentum. At the same time the electronics age has greatly increased the speed of communications while the Internet has created a vast, global theater of activity. Despite these signs of a changing "planning culture," formal planning is still practiced in many if not all major corporations.

WHAT IS BUSINESS PLANNING?

A corporate plan may be a simple statement of objectives along with the intended methods to achieve them, or it may be a very extensive planning process a formal planning cycle in which every element of the corporation routinely takes part.

An example of the first category might be a simple statement such as the following: "Increase market share by 30 percent within 5 years by acquiring and integrating two of our smaller competitors, increase our own sales by exploiting the cost advantages of the triploid valve, and divest our holdings in toys and children's furniture by spinning them off."

Much more common are formal plans built from the bottom up by the synthesis of projections and plans produced by the operating element (divisions, wholly-owned subsidiaries). In these cases the corporate expression of objectives will tend to be more abstract and financial (e.g., a projected growth rate for revenues, profits, and return on investment). Communication of such financial goals to the operating elements may kick off the process. Each business manager then attempts to make his or her contribution to the corporate objective.

The fundamental elements of formal planning are: 1) corporate goals to be met; 2) projections of earnings, costs, and returns; 3) actions to be carried out in light of opportunities and barriers (e.g., competition); and 4) a fixed time horizon. In most corporate environments, plans are for the next 12 months but will have projections out 5, 10, or even 15 years. Time horizons in retail industries are typically much shorter: a long-range plan may be a year; the operational plan may be for the next quarter. The corporate budget, including not just cost projections but every aspect of future financial outcomes, is the skeletal framework of the corporate plan. The *numbers* are used to measure the performance of operational managers; the stock price is used as the way to judge top management.

The complex planning process is by far the most common. It has become deeply institutionalized. The planning cycle is usually referred to tongue-in-cheek as the "silly season." In many corporations a substantial bureaucratic structure, "the planning staff," has developed which runs the exercise, coordinates inputs from operating elements, and synthesizes the evolving plan in successive waves. A major drawback of formal planning is that operating units benefit by promising as little as possible to make it easier to *meet plan.* Top management objectives are to incentivize operating units to *stretch* themselves as much as possible. Conflicts are inherent in the process. In recent decades, accelerating change has made it more difficult to predict

accurately what will happen 6 months out, much less a year out. Planning structures have grown very large, ritualized, and rigid. At the same time information systems have improved to such an extent that constant adjustment to the environment is somewhat easier. "Rolling" budgets are becoming more popular and resistance to fixed long-range budgets is stiffening. All of these factors are playing a role in the foreseeable transformation of business planning in the years ahead.

PROS AND CONS OF BUSINESS PLANNING

As Henry Mintzberg pointed out in his 1994 book, nothing ever really happens without planning; we cannot even make a sandwich without "looking ahead" a little. He wrote that as far back as the late 1960s the business community could no longer come up with a single coherent definition of what "planning" and "long-range forecasting" meant. These phrases had taken on their own special meanings in every corporation.

It appears, therefore, that business planning in the modern sense is a technique of management in which routine planning (which goes with any kind of activity) is carried out *consciously*, formally, and with the deliberate projection of *measurable* outcomes based on a fixed future date.

At the time when this management technique came into widespread use (the 1950s and 1960s), it was well-adapted to business conditions generally. In many industries long time horizons are required to build new capacity. For example, in process industries like power, chemicals, and petroleum, long-range planning remains unquestionably superior to "doing what comes naturally." Even in industries where change has accelerated, a periodic, formal look ahead provides valuable insights. Well-conceived future goals always clarify current decisions. The principal benefit of formal business planning is therefore unlikely to be altered by changes in the environment. Looking ahead is good; looking ahead with concentration and some effort to understand a wide variety of forces that impinge upon a company' actions is even better. What is likely to change is the frequency with which this will be done and the methods used to arrive at the plans.

The primary negatives associated with modern business planning (the annual cycle) arise chiefly from three factors: 1) the bureaucratization of the process and the resulting high costs associated with it; 2) uncertainty brought about by rapid change; and 3) performance evaluation issues which, many claim, stifle innovation and result in unproductive gamesmanship. To this list some add a fourth issue: namely that the planning process poorly matches the quarterly stock market cycle. Such observers advocate a 3-month rolling planning cycle which matches plans to quarterly reports; such reports influence stock analysts who, in turn, influence stock price.

FORECASTING UNCERTAINTIES

Forecasting the future is the very essence of modern business planning. It provides the measurements that justify the planning effort. The operating manager planning for his or her unit makes the best possible projections about future costs, sales, capital needs, and returns. Some of these will be relatively easy to document. Others will be mere guesses. But after a plan has been approved, these forecasts tend to be transformed into something much more solid than they actually are: they turn into numbers which will determine promotions, bonuses, even the future of a job.

In times of rapid change, ability to forecast far ahead becomes more difficult. Pressures increase, therefore, to shorten the time horizon. An unforeseen flu epidemic, terrorist action, or natural disaster, for example, may severely restrict travel, soften demand, and disrupt supplies. Consider the economic blow dealt to businesses across the country in the wake of Hurricane Katrina in late 2005. Whereas in the 1960s a competing retailer may have had to find and furnish retail outlets and establish warehouse distribution sites, in the twenty-first century he or she may enter the market suddenly with Internet distribution and a flurry of publicity. In a global market where much specialized labor is outsourced, international conflicts, well beyond a manager's control, can instantly put labor resources out of reach without much warning. Not surprisingly, therefore, pressures are now mounting to replace long-range planning with rolling budgets adjusted monthly or quarterly after brief assessments of changes in the environment.

PERFORMANCE TIED TO ANNUAL PLANS

In today's ever more uncertain business environment, the concepts of trust, empowerment, flexibility, and small, innovative frontline teams capable of rapid adaptation have become popular approaches for gaining a competitive edge. The Planning Group, a major management advisory group, has established the Beyond Budgeting Round Table (BBRT) of which fifty-eight major corporations are members as of 2010. David Marginson and Stuart Ogden wrote in *Financial Management, (UK)*, citing BBRT sources, that the necessary conditions of trust and empowerment in today's organizations "are not possible with budgets still in place, because the entire system perpetuates central command and control." Innovation is vital for economic survival. But "budgeting stifles trust and empowerment, according to its critics, which in turn stifles innovation."

Rapid changes in plans and flexible responses to competitive pressure or to take advantage of suddenly

appearing opportunities are very difficult if individual managers' performances are measured based on formal plans. Long-range plans, out of time-phase with the rhythm of current events, are viewed as obsolete in today's environment. In addition to this emerging factual situation, *gaming* the system by carefully adjusting projections so that they can be met in order to achieve bonuses, stock options, or other benefits has weakened the originally rational structure of formal business planning.

THE BOOTSTRAP BUSINESS PLAN

For entrepreneurs in the start-up phase of a business, a type of business plan called a bootstrap plan may be appropriate. A bootstrap plan is an informal initial business plan that represents the first step in an evolving business planning process. According to Entrepreneur.com business plans coach Tim Berry, important elements of a bootstrap business plan include the following:

- Strategy. Ponder it, define it, and share it. Focus on what the company does well and on the people who truly care about what the company do well. Bullet points and pictures will suffice.
- Schedule. Establish a regular time, such as a monthly meeting, to review plan results.
- Sales Forecast. Divide sales into components, like units, price per unit, and cost per unit. The unit can be anything time, trips, services. Remember that forecasts are almost always wrong, so focus on simply accounting for the key elements. Review them later to discover where, how, and in which direction the forecasts went wrong; then use the information to steer the business in the desired direction. Small-business writer Tiare Rath also suggests that small business owners develop three different sales forecasts: One as a best-case scenario, another as a worst-case scenario, and a third that is in-between.
- Tasks. Break goals and objectives into specific tasks with set schedules and clear assignment of responsibility. Make sure all involved know the milestones and who is charged with which tasks.
- Expense Budget. An expense budget is much like a sales forecast, except that the owner, rather than customers, controls it.
- Cash Plan. Once the sales forecast and expense budget are set, the owner needs to add in buying assets, paying liabilities, and flow of sales on credit. The cash plan is the most critical part of the plan numbers.

Unlike a classic, formal business plan, the bootstrap business plan is not intended to be used as a sales document to support investment or to back a loan application. A bootstrap plan is for internal use only. As such, it does not need to include an executive summary, company history, management descriptions, or an exit strategy. However, it is still important to manage the plan, keep it relevant, and adjust it as needed.

SUMMARY

Business planning, in some form, is here to stay. Highly evolved and complex planning cycles are in use in most corporations. In many sectors that are somewhat immune to rapid changes in the business environment often for structural reasons such as the long lead time necessary to plan and build a power plant, for instance the established form of planning (the annual cycle) will continue to be used as a major management technique. Elsewhere signs are present that business planning will undergo a radical change soon. The annual cycle is already being abandoned by some. The new style of planning will most likely introduce much shorter time horizons, more fluid budgetary methods, and a restructuring of managerial rewards to provide incentives for flexibility and innovation.

BUSINESS PROCESS REENGINEERING

"Reengineering" as a business term was first used in the early 1990s. Most commentators cite publication of a 1993 book by consultants Michael Hammer and James

Champy, titled *Reengineering the Corporation*, as the important moment when reengineering became a movement. The book was reissued in 2003. "Reengineering" functionally resembles planned change and what has traditionally been called "reorganization," but, in its beginnings, it came with a definite flavor of "starting from scratch," "blank slate," and "from the ground up." Its promoters advocated radical approaches, used terms like "the big bang," and generally rendered the process of reengineering in revolutionary terminology whereas the word itself suggested the rational approach of "engineering."

Functionally, reengineering calls for rediscovering the objectives of a business, diagnosing ills and discovering new paths to the objectives, as well as the design of a process and then its implementation. It is supposed to transform not only what is done but *how* it is done, thus changing the corporate culture. Bloated, sloppy, slow, unresponsive, expensive, unfocused organizations are supposed to become lean, quick, effective, responsive, competitive, agile, and concentrated. Since it could be applied to corporations as a whole or specific processes within the business (purchasing, marketing, production, etc.) it came to be called Business Process Reengineering and abbreviated BPR.

Reengineering came at a time when many other waves of managerial technique had already crashed on the rocky shores of corporate bureaucracy. Thus it was labeled a fad immediately by some but embraced by others. It had its predecessors and competitors in such concepts or techniques as zero-based budgeting (another from-the-ground-up approach), intrapreneuring, visioning, de-massing, and de-layering. Much older management approaches tied more directly to operational practices were embedded in the reengineering methodology or used in its implementation, including total quality management (TQM), continuous improvement, and the Toyota-led concept of the "lean corporation" based on just-in-time deliveries, effective operational clustering, and cross-training of employees. It is sometimes associated with Six Sigma, a Motorola-invented but GE-popularized quality control objective.

By the middle of the first decade of the twenty-first century, reengineering had largely lost its dramatic language and radical character. It has become a generic label for making change in organizations. The practice has spread beyond the business sector and is being attempted by nonprofits and governmental entities as well usually the sign of an aging and possibly fading enthusiasm. Since reengineering in contrast, for instance, to statistical quality control is not based on a clearly specifiable operational methodology, it is relatively easy to label any reorganization or attempt at reform as reengineering. For this reason reengineering has also become associated with large restructurings in industry leading to mass layoffs, offshorings, and outsourcings which has tarnished its image.

THE SMALL BUSINESS PERSPECTIVE

While small business is as prone to fall into decay as large, the small business embrace of major corporate movements has always been cautious and selective if for no other reason than the absence of the means and time to engage in too much introspection. Rodney McAdam, writing in the *International Small Business Journal*, confirmed this in a study of small and medium enterprises (SMEs). "Existing methodologies [of reengineering]," McAdam wrote, "mainly assume a large organization setting with large-scale resources dedicated to bringing about the large-scale reengineering changes. The paucity of studies in SMEs is surprising given the current and anticipated future market challenges in the SME environment that increase pressure for organizational realignment and responsiveness and market agility." After studying the literature, McAdam concluded: "The analysis indicates that the taxonomy and nomenclature of reengineering, as defined by large organization-based studies, has not translated into SMEs, who use much more general terminology."

McAdam's conclusion, put into plain words, is that small businesses engage in similar activities but tend to use practical (what McAdam calls "phenomenological") rather than theoretical ("positivistic") approaches. As McAdam observes, the small business does not use reengineering phraseology but does engage in activities of occasionally radical adaptation. This, of course, is very much in line with small business practice when it comes to trendy innovations. A small business tends to pick and choose what will work in its own environment.

Reduced to the "phenomenological" level, reengineering translates into fixing things that do not seem to work. When the analysis of the problem shows that fairly drastic changes are necessary and these changes are made effectively results can often be dramatic and the experience occasionally wrenching. The very features of small business its size; closer contact with employees, suppliers, and the market; and small business's more limited resources tend to bring problems to the fore sooner. It is less likely for problems to become deeply institutionalized and to acquire large constituencies. For this reason, in usual practice, small business is also likely to take action sooner, more incrementally, and with less drama one reason, perhaps, why McAdam encountered a "paucity of studies." Perhaps small business is, as so very often, ahead of the curve or immune to the disease.

BPR IN THE PUBLIC SECTOR

The Department of Defense uses a Business Enterprise Architecture as the framework for its business process engineering. The Office of Business Transformation, a subsector of the U.S. armed forces, oversees this BPR by focusing on four major factors.

- Reviewing BPR. Such reviews are mandatory for military BPR under the Clinger-Cohen Act of 1996. In 2010 the BPR Review for the Department of Defense decided to add on several new processes that would require a more diverse and expansive certification process, hence the need for mandatory reviews on a regular basis.
- Utilizing commercial resource planning solutions that are typically available to consumers on the commercial market. Making use of these applications, the armed forces are able to streamline the processes they use to stay ahead of the curve and maintain a high level of efficiency while avoiding mismanagement of information and processes.
- Extending the existing architecture of the business enterprise. The goal here is to incorporate the Six Sigma methodologies into the existing end-to-end business processes to increase efficiency.
- Teaching and spreading the word among involved workers and officers about new nomenclature and the standards they define. Members of the Department of Defense and the armed forces involved in business process reengineering must be aware of what is being accomplished and how it is being done. Without the foundation of new vocabulary they will not be able to do this.

Reengineering has grown, morphed, and evolved to meet the ever-changing demands of businesses and other ventures in both the public and private sectors. This trend will no doubt continue throughout the 2010s.

BUSINESS PROPOSALS

A business proposal is a written document sent to a prospective client in order to obtain a specific job. Proposals may be solicited or unsolicited. A client may simply request a proposal on a project in the course of a sales call by saying: "That sounds interesting. Why don't you send me a proposal on that?" In other cases the proposal may be a formal solicitation, usually called an RFP (request for proposal). RFPs are almost always in document form. They specify the product or service to be provided, the qualifications sought, and the deadline for submission. Solicited proposals mean that the client has already decided to make a purchase; only the selection of a vendor remains to be done. An unsolicited proposal, by contrast, is often a sales presentation dressed in another cloak one that is specifically aimed at a well-defined and limited activity. An example of an unsolicited proposal is the submission of the outline of a book to a publisher arguing the popularity of the subject, the novelty of the approach, and the merits of the author.

Business proposals must be distinguished from *estimates.* In many fields where small business is active, an estimate serves the same purpose as a proposal. It is the document that clinches the sale of a roofing or a paving job or a monthly housecleaning service. But when estimates are used, the qualifications of the seller and his or her method of accomplishing the job are established by other means typically by an interview or sales call. Sometimes the seller is assumed to fit the job because the business already enjoys a good reputation. Proposals, on the other hand, usually involve complex or unusual one-time services like landscaping a park, surveying a market, or building a refinery. In these cases the approach to the job, the design, the implementation, the schedule, and even the aesthetics require more than simply a monetary estimate.

Many service businesses operate entirely on the basis of proposals. In other types of businesses a proposal is sometimes required, sometimes not. In highly technical fields, the proposal may be filled with dry listings of engineering specifications and process details. But it is vital to remember that proposals are always, first and foremost, *sales documents.*

ELEMENTS OF THE BUSINESS PROPOSAL

In most industries proposals have a well-defined format specific to the field. Examples might be providing electrical wiring services to a major high-rise or pouring foundations for a suburban development. In such cases the bidder should first obtain old proposals and follow the structure typically used by the trade in that market. In professions such as architecture and landscaping a visual presentation, sometimes even a model, is central to the sale. The same holds for an advertising proposal. In these three areas there are others as well the actual presentation usually takes place at a meeting. Any document is supplemental and tends to summarize the presentation with additional "boiler plate" information such as administrative details.

What follows here is a discussion of more generalized proposals, usually associated with studies, surveys, or service activities (e.g., protective services for a warehouse complex). In such proposals the following general structure applies.

All proposals have at least two distinct pieces: a cover letter and the proposal document itself. Sometimes one or more appendices may be provided with charts, graphs, photographs, maps, and so on. Brief proposals, sometimes known as "letter proposals," combine the first two pieces into a single submission that is usually a maximum of six to eight pages. A simple Internet search provides a host of sample proposals that can be used as templates. However, not all examples are equal, so the business owner should be sure the proposal covers the basic elements outlined below.

The *cover letter* serves as a transmittal document. Many bidders also use the cover letter to provide the essence of the proposal in very abbreviated form, highlight the bidder's qualifications, name the price, and ask for the order.

The *proposal document* usually has the following structure:

- Title Page. This part typically includes the name of the person who prepares the proposal, the name of the company, the name of the person or company to whom the proposal is submitted, and the date of submission.
- Table of Contents. While usually not necessary for shorter proposals, these are sometimes used for complex formal proposals. In cases where different departments of the client will separately review parts of the document, the table of contents is a helpful means of rapidly guiding the reader to such topics as Electrical, Structural, Heating & Cooling (in a building project), or Food Services, Music, Entertainment, Transportation Services (in a project to organize a festival).
- Executive Summary. A summary may be included here or may be conveyed in the cover letter.
- Statement of the Problem/Issue/Job. This section rephrases the client's objectives and goals as interpreted by the bidder. Including this restatement of the issue is valuable in showing the client that the bidder understands the issue correctly.
- Approach. In this section the bidder summarizes his or her proposed approach to solving the client's problem or carrying out the necessary task. The proposed approach is often the key to winning the job if the price is right because it shows unique means, modes of thought, or techniques; why they will solve the problem; and why they are superior to alternatives. The section need not be detailed details are left to the Methodology section but it presents the strategic elements of the proposal and argues in their favor.
- Methodology. This section develops in some detail how the Approach will be carried out. Level of detail should be just sufficient to convey to the client convincingly what will happen without becoming entangled in minutiae.
- Bidder's Qualifications. This section presents documentation as to why the bidder should be chosen on the basis of qualifications, past history, and successful accomplishment of similar jobs in the past.
- Schedule and Benchmarks. Major elements of the job are here displayed against a time line. If necessary, specific benchmarks are identified to indicate successful accomplishment of intermediate objectives.
- Cost Proposal, Payment Schedules, and Legal Matters. The bidder concludes by presenting the price in as much detail as required in the RFP. It is always wise to pinpoint specifically when the bidder expects to obtain partial payments as the work proceeds. If legal matters are involved, they can be placed here. If they are lengthy, they may merit a section of their own.

SUCCESSFUL PROPOSALS

Above all, successful proposals are what clients describe as "responsive," meaning that the bidder has done his or her homework, is thoroughly familiar with the client's needs and aspirations, and has carefully responded to all aspects of an RFP. Responsiveness is ultimately much more important, all else being equal, than the visual appeal of the presentation or even the fluidity of its writing. A beautiful and well-written proposal that misses or ignores key elements of the client's project will lose to a dull proposal that is otherwise responsive. Writing in the *Los Angeles Business Journal*, Sharon Berman noted that "Doing your homework and making the required preparations can make all the difference. This is especially important in light of the enormous time and effort required to craft a professional

proposal." Meeting with key decision-makers ahead of time and asking probing questions to determine exactly what they are looking for is minimum preparation. Competitive price, however, is invariably the final determinant between equal contenders.

RFP: TO SUBMIT OR NOT?

Business proposals can be a lifeline of commerce for many small enterprises, but they can also be a drain on a company's cash and resources. It is important to decide which RFPs to pursue and just as importantly which ones to pass up. It is helpful for businesses to establish set qualifications beforehand to help narrow the RFP field. Determining which types of projects and companies fit the desired target market ahead of time can eliminate a lot of guesswork and effort spent in the wrong direction. If an RFP fits the target market, the next step is to assess potential participation based on the following:

- Budget. Before making the decision to submit a business proposal, determine how much the contract will be worth; weigh the time and costs of proposal submission against the potential revenue gain and contract term.
- Timing. Compiling all the necessary elements of a business proposal requires a substantial time commitment. Consider the time requirements and the RFP deadline so as not to overextend.
- Competition. The size of the bidding pool will greatly influence the odds of success. An open bid on the Internet with hundreds of competing companies may be less attractive than a competition among a handful of local entrepreneurs.
- Skills Match. Take an unbiased look at the skill set of the business and realistically evaluate whether it meets the true needs of the requesting organization.
- Bid Implications. Consider whether the project will add to the business portfolio and help to bring in more clients in the future. If not, rethink.
- Administrative Information. Review the administrative details of the RFP and be wary of vague information, which may indicate a weak or unorganized RFP team and potential headaches down the road.

RFI VERSUS RFP

It is important to note that a Request for Information (RFI) is not the same as an RFP. According to Suki Mhay and Calum Coburn from *The Negotiation Experts*, "An RFI is a solicitation sent to a broad base of potential suppliers for the purpose of conditioning, gathering information, preparing for an RFP or RFQ [Request for Quotation], developing strategy, or building a database" about suppliers, trends, pricing, competition, strategies, and products and services in the marketplace. Responding to an RFI, therefore, is not likely to bring in new business immediately, if ever.

BUSINESS TRAVEL

Business travel is a significant expense for companies of all shapes and sizes. Indeed, business observers cite travel costs as one of the largest cost categories for many companies, sometimes close to payroll, data processing, and other expense-heavy functions. Given these realities, business surveys often cite cost containment as the single most important element of travel management.

Certainly, several American industries rely on business travelers for their continued existence. But while business travel is commonly associated with huge corporations, many small businesses rely on the practice as well to make sales, keep in contact with vendors, market their products or services, and keep up with industry trends (via trade shows, conventions, etc.). Indeed, intelligent choices in the realm of business travel can be a major boon to small businesses hoping to curb spending without sacrificing in other business areas.

With this in mind, business consultants urge companies to implement written policies on all aspects of business travel, including spending limits on lodging, meals, entertainment, and transportation. Businesses are also urged to establish a person or department responsible for coordination of travel needs and to consolidate their travel needs with one agency. By implementing such steps, companies can register savings in a number of areas while still attending to their basic business needs.

HOTELS

Several factors are typically taken into account when a hotel is selected for business travel. Convenience of location (proximity to client, field office, or airport), quality of room, and quality of service are all major considerations. But price is often the paramount consideration, especially if other elements of the hotel location, quality, etc. are acceptable.

Small businesses can pursue a couple of different strategies to cut down on lodging expenses. Writing in *Nation's Business*, Peter Weaver noted that "you can sometimes cut one-half off quoted room rates by getting your reservations through a hotel broker. Hotels often designate 10 to 15 percent of their rooms to be sold by brokers at deeply discounted rates because these specialized travel companies can guarantee the hotels business in the low season and can bring in new customers all year. . . . Hotel brokers generally find the biggest discounts among the largest chains in major metropolitan areas and resort spots. But you can often get even lower rates by staying at budget hotels." In addition, surveys and studies indicate that small-business owners are often able to cut their lodging expenses by negotiating discounts of as much as 30 percent if they provide a large volume of business to a particular hotel. Finally, business travelers should keep in mind that many airlines will pay for overnight lodging in the event of a flight cancellation or major delay (more than four hours) if they receive a request for such assistance.

AIR TRAVEL

Small businesses can save huge amounts of money on airfare if they are able to plan trips in advance. This is not always possible, of course, and there may be instances in which the company may simply have to bite the bullet and pay full price for a short-notice trip. As one travel expert admitted to *Nation's Business*, "You always pay top dollar to the airlines by making your plans, or changing them, at the last minute." But experts claim that companies can cut as much as 50 percent of their airline expenses through judicious timing of out-of-town meeting dates. Tuesdays and Wednesdays are cited as particularly good travel days for obtaining discount fares. Savings can also be realized by choosing midday or evening flights rather than morning flights. However, statistics indicate that morning flights are less likely to be delayed or canceled than afternoon or evening flights.

Other tactics that can be used by small businesses to cut their air travel expenses include the following: 1) if a company's business requires regular travel (a minimum of forty flights a month on the same airline) between the same two cities, it may be able to secure a "city-pair" discount of up to 10 percent; 2) business travelers who choose flights that include stops in a carrier's hub city can sometimes secure discounts; 3) some airports have greater levels of competition some metropolitan areas of the eastern United States support two airports within an hour's drive of one another resulting in a greater likelihood of discounted fares compared to more isolated airports; 4) smaller, budget airlines may offer better fares (and service) than the giants of the industry; and 5) frequent-flier points can sometimes be utilized to register significant savings.

In addition to cost considerations, convenience is another important factor to consider when planning a business flight. To this end, usage of electronic ticketing increased dramatically in the twenty-first century. "E-ticketing" is popular with airlines because it enables them to register savings in ticket distribution and handling and simplifies their accounting procedures. It is popular with travelers because it enables them to go straight to the boarding gate, bypassing long lines at the ticket counter. Electronic tickets are identical to paper tickets in practical terms, as they provide each user with a reservation and a seat assignment. Airlines require photo ID before they will hand over a boarding pass, so it is necessary to have one on hand when going the e-ticket route.

Finally, savvy business travelers can take easy steps to increase their chances for a comfortable and successful flight. For example, early check-in enables travelers to ask for seats in emergency exit rows, which have considerably more leg room than do the rows in the rest of the cabin. And frequent-flier status generally confers preferential treatment in several areas, including likelihood of receiving upgrades or new flights in the event of cancellation.

CAR RENTALS

As with other aspects of business travel, advance planning in securing car rentals can help reduce costs, sometimes by significant amounts. In addition to making advance reservations, business travelers should use discount coupons from travel agents, membership organizations, or airline frequent-flyer clubs when securing a rental car.

TRAVEL AGENTS

According to the American Society of Travel Agents (ASTA), in the "Frequently Asked Questions" section on its Web site, long before airlines were hard hit by the events following the terrorist attacks of September 11, 2001, airlines began capping or reducing commissions paid to travel agents. The process began in 1995. In March 2002 U.S. carriers eliminated commissions altogether. As a consequence, travel agencies which, up to that point provided a service largely paid for by the airlines began to charge fees for services to customers in order to stay in business. Fees increased from around $13 per airline ticket in 2001 to $ 36.78 per ticket by 2007.

The industry is also undergoing major restructuring, with many agents becoming specialists in destinations or specific kinds of travel. In the late 1990s agents sold 80 percent of all domestic and 90 percent of all international airline tickets; in 2004, according to ASTA, they sold 50 percent of all airline tickets (and 30 percent of all hotels and 25 percent of all rental cars). So how are the remaining tickets sold? Largely those sales are via online purchase. The Internet has helped transform the travel industry, dramatically increasing the scope of an individual's research, planning, and booking capabilities. However, an independent Internet search often requires a great deal of time and some basic industry knowledge in order to find the right combination of convenience and cost. The Internet cannot replace the expertise, guidance, and personal service of a travel agent.

TRAVEL DEDUCTIONS

Provided that the business representative incurs his or her travel costs while engaged in "company business," many costs of business travel can be deducted. Travel deductions are permitted for the cost of transportation, whether by automobile, train, bus, or plane; lodging; meals; and other miscellaneous costs such as baggage fees, facsimile calls, dry cleaning, tips, and public transportation (bus service, taxicab service). Business travelers should note, however, that these miscellaneous deductions are only permitted if the person in question stays overnight and has hard copy receipts.

Deduction rules for travel to foreign countries are somewhat more complicated, especially for self-employed business owners and major shareholders of small corporations. While many deductions still apply, the Internal Revenue Service does have some additional stipulations; contact the agency for more information.

TRAVEL ALTERNATIVES

Technology offers excellent alternatives to costly travel for cost-conscious entrepreneurs. It enables small businesses to make presentations, collaborate on documents, and conduct meetings using telephone lines, cable modems, and the Internet, allowing them to conduct necessary business without leaving the office. Consider these three options:

- Telephone Conferencing. This is the most cost-effective option when multiple people from various locations need to communicate but do not need to see each other to be effective.
- Web Conferencing. This option requires the use of a computer with Internet access and a phone line. It enables participants to talk with each other (through the audio of teleconferencing) and share documents online using the Internet. Usually a Web hosting service provides exclusive access to a dedicated site for a given period of time for the parties to conduct their business. Some services offer online discussion threads, chat options, and interactive whiteboards to facilitate interaction.
- Combination Services. Some companies offer products that combine the capabilities of teleconferencing, Web conferencing, and video. For example, Sorenson Vision Inc.'s EnVision enables face-to-face communication over the Internet and phone lines via a camera that connects to a computer. Individuals are able to hear each other, see each other, and collaborate in real-time on shared documents. However, in order for the system to work all participants must have the necessary hardware and software on their systems.

BUSINESS-TO-BUSINESS

"Business-to-business," as a phrase together with abbreviations like B-to-B and B2B arose in the 1990s in the context of the Internet to divide Web-based commerce into two categories: business-to-business and business-to-consumer. The second category, abbreviated B-to-C or B2C, involves consumer purchasing on the Internet and is the type of transaction most commonly associated with electronic commerce. Amazon.com, initially a book seller, and eBay, the auction house, take a business-to-consumer form and are almost emblematic of e-commerce in general. Most people do not know, however, that the overwhelming majority of commercial electronic transactions on the Web and the money-flows they represent are business-to-business transactions. In fact, electronic sales predate the appearance of the Internet by decades. They were based, and to some extent continue to be based, on large computers and leased, high-speed, proprietary cable connections. A typical old-fashioned electronic connection between businesses was that between a manufacturer and a distributor (or dealer) with a proprietary computer linkage used to order product and replacement parts and track credits and debits for account billings. With the rise of the Internet and its high-speed capabilities, business rapidly embraced the new medium well ahead of consumers.

The expansion of the Internet produced and to some extent retains a heady sense of excitement that helped the new phrase "business-to-business" take root. However, business-to-business relationships are as old as business itself but used to be known by different names, such as "industrial sales" and "industry-to-industry." B-to-B has come to be applied to any and all transactions between corporations, even if the Internet does not play a significant, or indeed any, role. This seems to irk the people who first coined and deployed the phrase to designate a newly evolving phase of business communications new because the visual interface of the Web provided additional resources for business. Formal definitions of B-to-B thus strongly emphasize the *electronic* aspects of the interactions and their associated sophistication. But the genie is out of the bottle, and the phrase now serves a much more general purpose.

Narrowly conceived, B-to-B involves one or more of the following:

1. Formal, contractual arrangements to do business over the Internet. An example of this might be an electronic relationship between a bank and several of its industrial customers in which all manner of financial transactions take place in automated form.
2. Software and systems specifically designed to serve such business relationships. For full-fledged B2B, data transfer must be safe and private. Such systems therefore feature Web Authorization and Control (WAC) and have features that enable parties to exchange technical information and conduct online negotiations.
3. Electronic catalogs and displays accessible only to qualifying industrial shoppers. An example of this is a supplier of sophisticated components who gives catalog access to established customers who, using the displays, can get very detailed technical data. Amazon.com, which is B-to-C, provides an analog here, since it allows customers to "look inside" a book and examine some of its content and index.
4. Systems that automate the actual distribution function. This enables the buyer to trigger shipments automatically to designated locations based on automatic inventory levels; the automated ordering then triggers automatic payment orders based on similarly automated price look-ups and discount calculations.
5. Advanced computerized lead generation by Web searches based on customer profiles sometimes involving Web crawlers software routines that "crawl" the Web and automatically collect information on site contents. Using one such technique, for example, as reported by Brian Quinton in *Direct*, a marketer ordered a crawling survey looking for "the presence of Secure Socket Layer (SSL) transaction security." SSL is only present when a site uses credit cards and thus sells to customers. The marketer's crawlers, therefore, were identifying potential *business* customers the target of the marketer's search.

More broadly conceived, B-to-B is simply a category identifying both electronic and conventional interactions between commercial/industrial buyers and business sellers.

B TO B DOMINATES ELECTRONIC COMMERCE

The U.S. Census Bureau has adopted both B-to-B and B-to-C as terms under which it collects data. The Bureau uses the traditional meaning but highlights those portions of business taking place by electronic and other forms of commerce.

As reported by the Census Bureau for 2007, the total value of shipments, sales, or revenues for B-to-B and B-to-C were almost equal, $11,088 billion and $10,759 billion, respectively. But the *electronic*component of this number greatly favored B-to-B. In 2007 business-to-business electronic commerce was $3,082 billion (27.7 % of total B-to-B) and electronic business-to-consumer sales were $251 billion (2.3 % of B-to-C). The dominance of B-to-B may be put another way: it represented 92.5 percent of all e-commerce transactions.

Electronically conducted business-to-business transactions broke down further as follows in 2007: direct

manufacturing sales represented 60.2 percent of total B-to-B e-transactions; merchant wholesale activities, which include manufacturers' branches and branch offices, represented 39.8 percent. In the B-to-C category, the much smaller electronic volume broke down into retail sales (50.6 %) and selected services deliveries (49.4 %). The growth rate in e-commerce between 2006 and 2007 was significantly lower for business-to-business at 11.6 percent than for business-to-consumer at 19.0 percent, even though overall growth rates were similar at 5.2 percent and 4.9 percent, respectively. The figures suggest that e-commerce is better developed in the B-to-B category, which has less noise and trumpeting than the consumer sector because it has long been engaged in electronic forms of distribution and is thus more mature. Indeed, business migration to the Internet often takes the relatively simple form of transitioning an electronic system from leased cable to the public network.

The chief reasons for B-to-B dominance of electronic sales is that industrial sales tend to be technical, contracts tend to be longer term, and deliveries are typically routine and continuing. For these reasons arrangements are well-suited to computerization; many of these arrangements were made pre-Web in order to exploit the advantages of automation and speed. The rise of the Internet in turn enlarged the capacity for this type of transaction. It provided a common system for exchanging visual data and a very widespread network by means of which even quite small businesses could be brought into electronic systems as buyers, sellers, or both.

According to the U.S. Census Bureau, some 70 percent of all manufacturers' electronic shipments fell into six categories in 2007. In order of importance they were transportation equipment, chemical products, food products, petroleum and coal products, computer and electronic products, and machinery products. Merchant wholesalers, including manufacturer's sales branches and offices, accounted for approximately 90 percent of the total sales of the wholesale trade in 2007. Three industry groups dominated the sector: motor vehicles and automotive equipment; professional and commercial equipment and supplies; and grocery and related products.

DOING BUSINESS B TO B

Ignoring for the moment the fact that all businesses tend to *buy* from other businesses, in the sales category most small businesses either serve consumers directly through retail operations or service businesses or they are and have always been in B-to-B. Some, of course, will have both kinds of customers.

The chief difference between these markets tends to lie in the size of the transaction and in the characteristics of the sales effort. B-to-B transactions are typically larger and therefore entail proportionally less administrative work per transaction; the sales effort, however, will tend to be more complicated and costly: business sales frequently require selling to multiple levels of a customer simultaneously, (e.g., to management in order to gain recognition, to engineering departments to determine technical specifications, and then to purchasers in order to negotiate the price). Business sales can be costly in that they frequently require the preparation of written proposals. On the whole, business buyers are more demanding technically, exert more pressure on price, and are almost never moved by emotions or to purchase impulsively.

Businesses can be very good customers for the small operation indeed, sometimes, too good. Depending on the size of the small business, it may put itself in danger by having too few business customers. Many small businesses can often get more than enough business from a single corporate buyer to carry their business. This sometimes happens when a company is formed by former employees to serve that employer as outside suppliers: the owners have great advantages by knowing the customer inside and out. But yielding to this strategy exposes them to the risk of serious problems if the "big" client fails, changes its internal arrangements, or one of its influential buyers takes a dislike to the seller. For these reasons, ideally, the small business will strive to balance its income so that the "big" client is balanced by others.

The small business engaged in B-to-B will be able to enter the electronic forms of that type of commerce almost seamlessly, sometimes, because the buyer will be as interested in buying electronically as the seller may be to sell. And once such a system is established with one customer's assistance, it may be expandable to others. Businesses that chose and integrate their B-to-B e-commerce applications wisely will win several key advantages. According to a study published in the *International Journal of Electronic Business*, the most significant advantages for a business are increased productivity, improved quality of products and services, competitive advantage, sales and revenue growth, and to a lesser extent cost reductions.

BUILDING THE B TO B BRAND

The Harvard School of Business has identified five characteristics of leading B-to-B global brands. Companies do not need to be global superstars in order to take advantage of these proven approaches. Small businesses engaged in business-to-business relationships can certainly apply these concepts to their own operations in an effort to enhance their B2B success. The key characteristics are:

- The CEO is the brand cheerleader and has the full support of the Chief Marketing Officer.
- The CEO recognizes that building brand reputation decreases commercial risk, insulates the company in a

crisis, and provides a common purpose to unify all stakeholders.

- Branding efforts are centered on a single, global corporate brand rather than individual product brands.
- The return on marketing expenditures is measured rigorously by the engineers and finance staff who run the B2B enterprise.
- Company Web sites and other marketing communication materials are coordinated to present a consistent face and message to stakeholders.

BUSINESS-TO-BUSINESS MARKETING

The current abbreviations commonly applied to business-to-business transactions, B2B or B-to-B, are closely associated with Internet activities. But the underlying reality is very old (businesses have always sold to other businesses) and, significantly, electronic transactions between enterprises predate the emergence of the World Wide Web by many decades. Long before the Internet's appearance B-to-B commerce by electronic means operated, and still operates, by privately maintained electronic data interchange (EDI) channels. For this reason, B-to-B electronic commerce was approximately twelve times greater than the more popularly recognized business-to-consumer e-trade in 2007. Most of the heavy B-to-B commerce began over private channels, but new and emerging business-to-business electronic transactions are coming to rely on the Internet.

MARKETING AND SALES

Marketing in the modern sense covers a vast range of activities, including advertising, public relations, promotion, all types of sales, and aspects of distribution including specialties within this field such as market research, strategy, and planning. In those corporations predominantly engaged in selling to the consumer, marketing and sales are typically separate functions, but with sales subordinated to and managed by the more prestigious marketing function. Marketing thus represents the overall strategic, intelligence, and communications function whereas sales are detail-oriented implementations obeying and carrying out a general marketing strategy.

The chief difference between business-to-business and business-to-consumer marketing is that the roles of marketing and sales are largely reversed. A business dealing with another business relies much less on image-based forms of mass persuasion and heavily on technical and commercial communications, product demonstrations, and cultivation of relationships through industrial channels. The basic reason for this is that B-to-B sales are in their very nature much more influenced by price, product performance, timely and reliable deliveries, and effective and swift services than by perceptions or emotions. Image marketing in B-to-B plays a definite but subordinate role; occasionally it uses mass media, but generally the message is channeled through magazines, journals, and newspapers (such as *Barron's* or the *Wall Street Journal*) intended to reach decision makers in business.

Virtually all businesses selling to the ultimate consumer also sell to the "channel," namely distributors and retailers. Thus their sales have a multi-tiered aspect. In these situations the broad marketing aimed at the ultimate consumer is, of course, of great interest to the business buyer, too. The retailer is much more likely to stock a heavily and effectively advertised consumer product for which the producer also provides lucrative incentives for joint advertising at the local level than to stock a brand with low recognition value. In such contexts marketing in the traditional sense also plays a major role in selling to the business customer.

CATEGORIES OF RELATIONSHIPS

Business-to-business sales activities differ by the nature of the relationship. Sales categories take three major forms: industry specialists, institutional generalists, and channel-sales specialists. Most businesses belong predominantly to one type of distribution.

Industry Specialists. A business may typically sell all of its products or services to participants in the same narrowly defined industry or activity. Classical examples are defense contractors who rarely sell anything except to the U.S. Department of Defense or other such entities abroad with federal government approval. Process engineering firms are likely to be concentrated in the petrochemicals industries; their job is to build refineries and chemical plants. Such firms occasionally also build, for example, power plants for utilities and compressor stations for pipelines. Major categories, like autos, produce an array of suppliers that work exclusively for the category. For example, golf cart producers sell principally to golf courses.

A subgrouping of the specialist category is formed by companies that sell to a narrow category within a single industry. Specialized equipment companies serving medicine or laboratory research fall into this category selling only to certain kinds of hospitals or clinics, for example.

Institutional Generalists. At the other extreme are businesses that sell products to every kind of business and similar institutions and to virtually every element of such client operations. Examples are office supply producers, manufacturers of file cabinets, and makers of office furniture. Advertising agencies and public relations firms may be similarly in the generalist category, but many will develop special clienteles. Subsets of this generalist category are producers who sell to one sector in preference to others. Examples include tool makers or steel producers who sell to virtually all manufacturers but very rarely to wholesalers, retailers, or financial companies.

Yet another but narrower generalist category is the producer who, by the nature of its product or services, deals exclusively with a well-defined department but one almost always present in a business or an institution. Payroll or health insurance companies are examples in that their clients are finance departments or human resources functions. Most large computer companies deal with information system departments even when selling stand-alone computers.

Channel-Sales Specialists. All companies that use a multi-tier distribution channel concentrate their selling effort (but not necessarily their marketing efforts) on distributors specializing in their products. The actual selling may take place at annual or seasonal meetings at which the company hosts its distributors, makes presentations, and uses 2 or 3 days to negotiate orders with the distributors. When distributors must be added or changed, the company often engages in a complex process of recruitment to line up the right candidate. In some industries (e.g., recreational boat sales) dealings are made directly with the retail channel. Automotive companies deal directly with dealers through intermediate, company-owned "zone" administrations.

Other Variants. The three broad categories outlined do not present an exhaustive description. All kinds of variants and specializations exist and, of course, within large companies different divisions may use different methods to reach their markets. Some producers also deliberately target only large, mid-sized, or small business clients using the broad approaches outlined.

These categorizations illustrate the rather extensive specializations that characterize B-to-B marketing. The single-buyer company faces quite a different challenge than the company selling to virtually everyone. But the defense contractor, selling only to the Department of Defense, must also cultivate relations with other political decision makers to maintain its reputation and visibility. A single client does not mean a single relationship. Many narrowly defined product or systems sales are heavily technical, with both buyers and sellers being mid-level technical people who interact internally with their own managements over time to make a project happen. In major acquisitions, like the production of a new power plant, interactions at the highest executive levels are as necessary as the bidding process that takes place at the technical level. But a company selling office supplies typically operates at a low level with clerical people or purchasing departments.

VENUES AND METHODS

Business-to-business marketing and sales take all the forms used in business-to-consumer sales, not least catalog sales commonly used for many types of technical components as well as such standard products as office supplies and furniture. Highly differentiated sales organizations are common.

Businesses of all sizes use their own sales forces organized in many different ways: from headquarters, from branch locations, and as separate sales divisions. The use of manufacturer's representatives independent sales organizations is exclusive to B-to-B. In multi-tier marketing the sales function is mediated by distributors and retailers between the producer and the consumer.

Important venues in business-to-business marketing are conventions and trade shows where a company may participate in two different forms. The company may have its display booth and show off its own equipment, and its representatives may also participate as speakers or presenters in technical sessions. Such appearances, while in content and form far removed from what is conventionally viewed as marketing, are in effect valuable means of reaching potential business customers with information of use to this clientele. Conventions are also opportunities for companies to gain visibility from attendees by hosting entertainment events and hospitality suites and by providing services like shuttles or organizing tours. Such activities build goodwill.

Not least, businesses engage in conventional forms of marketing by advertising. When ads appear in industry journals and technical publications, their basic purpose is to promote the company's products and services to business buyers. When a company runs ads in the mass media, however, its objective may be to reach actual and potential investors. It is engaging in what is labeled "institutional advertising" with the simple aim to make its name visible to the public.

Perhaps surprisingly, social media are rapidly emerging as effective avenues for B2B marketing. Social media encompass online technologies and practices used by individuals or organizations to share opinions, perspectives, ideas, and experiences with others. Social media utilize text and images (blogs are a prime example) as well as audio and video (podcasts and vlogs are popular forms). As a channel, social media serve as a valuable tool for marketers who, at a minimum, should be involved in the social communities and networks in which their customers participate. Social media enable businesses to share their expertise and knowledge with key influencers in their target markets, tap into consumer wisdom, facilitate customer-to-customer interaction, and engage prospects through "customer evangelism."

According to a survey of business-to-business technology leaders by KnowledgeStorm, 69 percent of B-to-B buyers used social networks to bolster their business networking and development efforts. In 2009 the leading social media initiatives among North American B-to-B marketers were: 1) maintaining company-related accounts or profiles; 2) microblogging using sites such as Twitter; 3) monitoring company and competitor mentions on social sites and networks; and 4) participating in discussions on third-party sites.

BASIC ELEMENTS OF B TO B MARKETING

The most important characteristics of business-to-business marketing are: 1) building relationships; 2) candid technical interactions; 3) intensive commercial negotiations; and 4) close attention to after-sale services.

Individual transactions between businesses are typically larger as measured in dollars and fewer in number than in business-to-consumer sales. The contract or sale is more difficult to get, but once a relationship is established successfully, repeat business is almost guaranteed if performance is acceptable the seller being helped by the buyer's desire to avoid the time, effort, and occasionally the hassle required to find a new supplier. For this reason, establishing and building a good relationship with a business client is vital. Ideally it will be established at all levels of the client with its leaders, its management, and also with the working level using the product. Unhappiness at any of these levels can jeopardize the relationship. Periodic efforts to touch base with all of these levels are an important aspect of marketing. Both marketing and sales take a direct form face-to-face rather than by advertising. Advertising is used as a reminder of a relationship maintained by other means.

Technical interactions are ideally open and candid. The business client will always discover flaws or shortcomings in the product and is usually also able to accommodate awkward features if all else works well. The seller is wise both to discuss difficulties openly and yet not to overstate them. Such approaches are, of course, just as beneficial in *all* sales but businesses tend to be more distant and engage in more "games" with ordinary off-the-street clients than with the industrial buyer who is typically much more knowledgeable and less moved by emotions. A converse of this general rule is that the business owner encountering a game-playing industrial buyer should be prepared to decline to do business with that buyer. The relationship must be two-way. The client who behaves in bureaucratic ways is a special problem for the B-to-B seller. Such behavior can sometimes be exploited and sometimes neutralized by developing better relationships with higher levels.

The very openness ideal in reaching agreement on the product itself makes commercial negotiations difficult. Business buyers tend to be hard customers generally; they will tend to know or be in a position to guess the real costs of the seller. They may also be under management pressure to push prices down. In price negotiations, therefore, games tend to be played unless a good relationship exists and the buyer is not under severe pressure. Effective, flexible, and open dealing is best. The buyer must sometimes yield but should do so while openly stating that this particular easing of the price is for this case only, in order to accommodate the buyer *this time*, and not to set a precedent. Living up to this assertion later, by refusing to continue to sell at the low price, is, of course, part of keeping the deal going.

Business-to-business sales have a tendency sometimes never to close because "this is wrong" or "that is wrong." The seller must be prepared to service the product. Too much after-sale service, amounting to extra services, can be avoided in the future by negotiating more stringent contract terms. But under the usual circumstances, the business buyer calls only when something is really wrong. In that case swift and effective corrective action is the right response to maintain the relationship and, in effect, to sell the next contract.

Business-to-business often can be the best kind of business for any kind of company, large or small. Large transactions, low cost of selling, a reliable market, and often an attractive price are inherent aspects of this type of transaction. The biggest danger of B-to-B for the small business is to become reliant on one or two clients for which it is just

a small supplier. Business-to-business is best practiced by the small business through cultivation of several such customers so that the favor or disfavor of no *one* customer will threaten the company's survival.

BUSINESS TO BUSINESS TRENDS

In the 2010s, trends in the small business B2B arena include: inbound marketing, which uses strategies and techniques to draw appropriate prospects and clients toward the business rather than aggressively pursuing them; organic search engine traffic versus less effective pay-per-click advertising; and search-engine-optimized press releases, which drive more targeted potential customers to the business site at a fraction of the cost of paid search advertising.

BUSINESS-TO-CONSUMER

"Business-to-Consumer," usually abbreviated B2C, is a phrase that has become attached to electronic business activities that focus on *retail* transactions rather than activities conducted between two businesses; the latter, business-to-business, is called B2B. These uses appeared along with Internet commerce in the 1990s and have been current since then. The usage has expanded so that, by the 2010s, B2C is also used as a handy abbreviation in talking about retail trade where electronics is just one component of the transaction and other cases where simply "retail trade" is meant. Combined forms are also referred to by other catchy phrases such as "bricks-and-clicks," "click-and-mortar," and "clicks-and-bricks." These terms refer to retail experiences in which consumers use both online and physical store presences for their purchases. For example, a customers may buy online and pick up their purchase at a store.

SIZE AND PRODUCTS

Although retail activity on the Internet is by far the best known new business model of the Information Age, it is a rather small proportion of total electronic commerce. The U.S. Census Bureau began collecting and tabulating data on electronic commerce in 1999, with the first comprehensive tabulations available for 2000. The data capture all economic exchanges for major economic sectors whether they take place over the Internet or by means of privately maintained electronic data interchange (EDI) channels.

The 2007 U.S. Census Bureau's E-commerce "E-Stats" report was released on May 28, 2009. According to this report, electronic commerce sales increased 18.4 percent between 2002 and 2007. E-commerce accounted for only 3.2 percent ($127 billion) of total retail sales. In 2006 electronic commerce accounted for just 2.8 percent ($107 billion) of total sales. The U.S. Census Bureau found that B2C sales increased 4.9 percent between 2006 and 2007 while B2C e-commerce grew by 19 percent. The share of B2C business in overall electronic commerce grew by 7.1 percent in 2006 and by 7.5 percent in 2007. The unadjusted numbers of 2008 electronic commerce sales also show an upward trend. According to the U.S. Census Bureau, electronic B2C sales accounted for $132.4 billion in sales in 2008. This amounts to 3.4 percent of total retail sales for the year.

In light of the rather extensive publicity regarding Internet business activity, these results may appear surprising. But the reasons for this lie in the fact that business-to-business electronic transactions predate the rise of the Internet by many decades; they were already massive when the Internet appeared; and businesses were also first in exploiting the Internet for B-to-B trading.

According to a U.S. Census Bureau report released in 2009, B2C volume was, nevertheless, a respectable $127 billion in 2007 and represented an annual gain of 18.4 percent over the pervious year. In fact, the U.S. Census Bureau noted that electronic retail B2C commerce has been marked by rapid growth since 2002. Between 2002 and 2007, B2C electronic sales averaged a yearly growth rate of 23.1 percent. During that same period, total retail sales saw an annual average growth rate of only 5 percent.

Electronic Retail. As reported by the Census Bureau, and using the Bureau's industrial categories, B2C retail sales in 2007 were dominated by Nonstore Retailers and Motor Vehicles and Parts Dealers. In 2007, Nonstore Retailers accounted for 73 percent of total electronic sales, accounting for some $73 billion in sales. Motor Vehicles and Parts Dealers accounted for $24 billion in sales, or 19 percent of total e-sales in the B2C sector. The Nonstore Retailers sales were dominated by Electronic Shopping and Mail Order Houses. This category includes mail order businesses, catalog businesses, online retail businesses operating only via the Internet, and the electronic sales segments of businesses that also have a physical presence in retail stores.

According to Census Bureau figures released in 2009, consumers were buying an array of goods through B2C electronic commerce in 2007. Clothing and Accessories accounted for about $14 billion worth of sales that year. Computer Hardware saw electronic sales of $11 billion. However, Music and Videos as well as Electronics and Appliances were the real winners of electronic commerce in 2007, each with 74 percent of all sales of these products occurring online. More consumers chose to purchase these products online than through traditional retail outlets.

Electronic Services. Within the services categories delivered by electronic means, all of which the Census Bureau classifies as B2C, the biggest categories, arranged by share of total e-services delivered, were Travel Arrangements and Reservation Services (23 percent of total e-services) and the Publishing Industry and Stock Transactions (which together accounted for 22 percent of service sales). In total, service-based B2C electronic sales accounted for $124 billion in 2007. This was an increase of 19.7 percent when compared with 2006 numbers. In 2006 revenues from electronic sales accounted for 1.6 percent of total revenues in the industries selected by the Census Bureau for review. By 2007 1.8 percent of revenues for these service industries were garnered through the online B2C experience.

TYPES OF B2C

In his 2009 book, *Contemporary Marketing*, David L. Kurtz identifies two types of B2C Web sites: those that provide information and those that sell directly to the consumer. Electronic commerce Web sites selling directly to the consumer include Web sites such as Amazon.com. B2C Web sites offering information include many car manufacturer Web sites; these sites provide the consumer with information and request that consumers visit a physical location (a car dealership) to complete the actual transaction.

Many B2C Web sites and electronic retailers are larger companies (such as Amazon.com) or branches of larger traditional "bricks-and-mortar,"businesses. Many B2C websites, however, are established by small businesses some of which are pure B2Cs serving niche markets very effectively.

THE FUTURE

The future of B2C appears to be bright. As the 2009 U.S. Census Bureau report on electronic commerce showed, B2C electronic sales have been growing rapidly as a percentage of overall retail sales in the country. This type of commerce appears likely to continue growing simply because it is a convenient form of purchasing. More and more, electronic sales are a big part of the B2C picture, with many companies now equating B2C with online transactions.

As B2C expressions grow, so does their sophistication. Many marketing experts have been working to create more interactive experiences for consumers in order to make consumers feel more comfortable with the B2C online retail experience. Marketers and web designers regularly use online chats, multimedia, podcasts, video, and other techniques to bridge the gap between "bricks-and-mortar," businesses (where consumers can see and touch products before buying) and the virtual B2C experiences. Web site owners and designers are also becoming more savvy about engaging consumer emotions in order to encourage B2C experiences. Car manufacturers, for example, allow consumers virtually to "build" their own cars before visiting a dealership in order to build excitement about the product and encourage the eventual purchase. These trends are likely to continue during the 2010s.

BUYING AN EXISTING BUSINESS

There are essentially two methods of owning a business: starting and developing one's own business and purchasing an existing business. Buying a business can include acquiring some or all of the following: customer base, brand identity, business base, stocks, intellectual property, patents, business properties, inventory, employee contracts or workers, existing work and client contracts, and current debt loads. What is included is usually determined in the negotiating stage of the purchase procedure. Buying a business is a complex business transaction which requires legal skill, market knowledge, research skills, and marketing acumen.

Most businesses are purchased by companies as a means of diversification or expansion. In these situations, several of the ingredients of success are usually present: the business has good reasons for the acquisition, it has experience in the industry to be entered through long contact, it has skilled people to evaluate acquisition candidates, it has the means to make the purchase in cash or through contact with funding sources, and it has the ability to run the purchased business. Nevertheless, many acquisitions flounder.

Some businesses are purchased by a single buyer interested in acquiring businesses. The prospective buyer may be a wealthy individual with many years of business experience but presently no corporate base. Such an individual is functionally equivalent to a company in means and in experience. Buying an existing business is also, finally, one of the alternatives available to the would-be entrepreneur. He or she faces the same decision manufacturers call the "make or buy" decision: Is it better to make this product or buy it from someone else? To make something from scratch usually takes longer but offers opportunities to shape the product exactly as the builder intends it to function. To buy the product usually gets the buyer to the starting line much faster but limits his or her choice to a preexisting design.

The individual entering business must keep in mind that buying a business is not a way to avoid initial fund-raising chores. A person lacking funds but wishing to buy an existing business must also project the business into the future, have a plan, and undergo the process of raising funds. Books exist that boldly promise to teach the entrepreneur how to buy a business with not a penny down but few people actually have the persuasive powers or profiles of experience to make that sort of thing happen. Buying rather than building a business is a decision to be reached *after* the funding effort has at least been started and looks reasonably promising.

FINANCING

Before a business or individual can begin to purchase a company, financing must be secured or at least prearranged to the point where the seller and buyer can be assured that the seller has enough money to purchase. According to attorney Fred S. Steingold, author of the 2007 book, *The Complete Guide to Buying a Business*, there are two ways that buyers can pay for a business: through a lump sum payment purchase or through an installment purchase. In the lump sum payment, buyers secure loans or use savings or other forms of financing in order to pay the entire purchasing price of the business outright. In an installment purchase, which is the more common way to buy a business, buyers pay a down payment of between 20 and 25 percent and gradually make payments until the entire purchase price of the business has been paid.

Whether purchasing through an installment purchase or lump sum purchase, buyers must usually produce a significant amount of money in order to buy a business. There are many ways to raise the funds needed. Depending on the sum required for a purchase and a buyer's financial standing, a buyer may use some combination of the following to buy a business: personal savings, retirement savings, home equity, credit cards or lines of credit, and loans. Most buyers need to rely at least in part on business loans in order to pay for a business purchase. Banks and hard money lenders offer lending products for these specific purposes, but some buyers prefer to borrow from friends, family, and business associates, sometimes drawing up contracts which give investors or friends a part of profits or other advantages in exchange for an interest-free or low-interest loan. Another option for buyers is to work with a team of investors in order to raise funds. In this situation, a group of purchasers will pay for and buy the business.

Whether the buyer and seller ultimately agree to an installment sale, a leveraged buyout, a stock exchange, or an earn-out to transfer ownership of the company, the sale cannot proceed if the buyer is unable to secure adequate financing. In many cases, buyers will be searching for funds and negotiating funds during the entire purchase process.

Most small businesses are acquired by buyers who finance a considerable portion of the purchase price themselves. Even so, the buyer must still make sure that he or she has enough money to make a down payment and cover the business's capital requirements. Sometimes, then, buyers are forced to secure financing from outside sources. The level of this will depend on the buyer's personal investment. Lenders or investors like to see the buyer deeply committed before they come to the table with pen in hand.

Lending institutions such as banks and consumer finance companies are more open to borrowers involved in purchasing larger companies, but even in these instances, the institutions often ask buyers to put up the company's

inventory, machinery, real estate, and accounts receivable as collateral. Sensible buyers in need of outside financing will make certain that they approach potential lenders with a comprehensive and well-considered loan proposal (including a good business plan). Thus the entrepreneur is unlikely to avoid that task even when buying an existing business.

KEY ELEMENTS

Once the funding issues are resolved sufficiently to turn the entrepreneur into an actual buyer, meaning that at least a portion of the down payment is in hand, the key elements of buying a business are: 1) formulation of clear objectives (homework); 2) search and contact; 3) evaluation of the target (sometimes called due-diligence); and 4) negotiation and purchase.

These elements are frequently iterated in an actual acquisition program, meaning that failure to close deals and the learning that has taken place while getting to an unsatisfactory result will cause the entrepreneur to rethink the process, sometimes from the beginning. Initial homework consists of exploring the industry or specialty that looks most suitable to the talents and experience of the buyer. A part of that homework is to learn the going price for different types of enterprises. That, in turn, may cause changes and even require additional fund-raising efforts. A search for candidates may reveal that not too many businesses are available or available in the right locations, that prices may be high or most candidates in trouble. Evaluation of businesses after contact may generate wrong assumptions about the real returns possible. Negotiations may fail. Buying a company is almost always a learning process unless the buyer is very experienced (perhaps even working in the business already), the business to be purchased and its ownership are well known (possibly in the extended family), and everything is easily negotiated because of previous relationships.

Objectives. A buyer's earlier experience (business or vocational) usually sets the stage for formulating goals. Buyers rarely set out to buy into altogether unknown industries, but they may not know the business at its highest levels. For example, a person may know a business from an operational but not from a marketing point of view or the reverse. Some kind of homework is usually involved. Buyers must carefully consider their interests, their level of commitment, their knowledge, and what they can bring to a business. Deciding what type of business to buy is a deeply personal and complex decision. In his 2008 book, *Starting a Business from Home*, Colin Barrow recommends writing out a mission statement for one's future company. Other experts recommend writing out a list of goals or attributes to look for in a company. Writing out business objectives can help buyers clarify the ideal attributes of their ideal business. This can be a good starting point when looking for a business.

Search. Sellers of businesses will advertise themselves or engage the services of a business broker. Finding candidates is thus similar to recruiting employees. Sources of leads are newspaper ads, the Internet, or brokers who also advertise themselves. Well-developed Internet resources usually enable a buyer to locate businesses within a state or zip code zone further subdivided by type of business and even asset-size categories (see, for example, www.bizbuysell.com). Substantial searching around is, of course, implied but many resources available to buyers provide a great deal of information on what is available, what asking prices are, and where the nearest targets are located. Searching can be handed to a broker who will then call or e-mail the buyer with suggestions.

Evaluation. Once contact has been established with a candidate, a process of mutual exploration begins, usually with a visit to the candidate's place of business where, following a tour of the place, preliminary discussions begin. The motivations of buyers and sellers are essentially the same. Each wishes to establish the qualifications of the other and the buyer must therefore be prepared to give as much as he or she gets, namely to display his or her abilities to buy the business. If the buyer has no business identity, the seller will usually ask for references and not make financial disclosures beyond those advertised until the buyer's status and net worth have been carefully checked. In the normal course of events, several contacts will take place before the buyer can obtain information sufficient to study the targeted business closely. Evaluation of a business is central to price negotiations later and must be carried out with care and diligence in order to avoid legal and financial problems later.

The evaluation of a business can be divided into four clusters: the seller's history and motivations, legal matters affecting the operation, the financial status of the business, and the condition and prospects of the business in its market (its products, services, and future). The buyer, of course, will want to know the history of the business, how it came about, how it developed, and why the seller is now willing to sell. A common reason for the sale of a small business is the age of the seller: he or she wishes to retire and does not have children or relatives willing to take over. A business is also often for sale because it is being spun off from a larger operation because it no longer fits. In some cases, businesses are sold because they are not profitable, and owners wish to get rid of them, offering someone new a chance to turn the company around. Why a company no longer fits or is not profitable becomes a matter of interest to the buyer who is, above all, interested in discovering weaknesses in the business.

Legal matters concern pending lawsuits or regulatory problems, some of which may have to be dealt with by the new owner. Leases and other long-term legal obligations are usually reviewed in this context ideally with the help of the buyer's own legal advisor. Buyers may also want to look for liens against business property, tax debts, and other issues as well.

Financial evaluation is based on the thorough review of the company's books its balance sheet and income statement going back at least 5 years or to the beginning of the business, whichever is earlier. Ideally, again, audited financial returns are best or, if the seller is unwilling to pay for an audit, tax filings with the IRS can be used for a separate view of finances. Sole proprietorships and partnerships do not have stock and therefore sales of the businesses are always based on assets; the level of attention to assets will therefore depend on their character and value. Depending on the situation, the buyer may wish to undertake an inventory of assets at his or her own expense or to engage the services of an appraiser. If the buyer does not know how to run a thorough check of a business, many private investigators offer due diligence services which carefully run background checks, asset searches, and other investigations of a business and report to the buyer all pertinent findings. Normally the books of a well-run business will accurately reflect asset values. If the business is poorly run, the offered price can hedge against risks.

Most careful buyers will use the company's financial data to develop an alternative valuation of the business using discounted cash flow analysis. Such valuation typically involves projecting operating results of the business out in time, which requires a good grasp of the company's products, processes, and likely futures sales and profits in an evolving market the last category of evaluation. The value of the business as calculated using such analysis is then compared to the asking price. If the two values are reasonably close, an agreement is likely. If far apart, negotiations need to ensue or the buyer may elect to stop discussions.

Finally, the buyer must strive to understand the business thoroughly enough to have confidence to run it in the future. From an internal perspective, this means a good grasp of how the company is run internally, who its suppliers are, how processes run and above all, the state and morale of the employees. Looked at from the outside, the buyer must understand the company's distribution channel(s), major customers or categories of customers, the market itself, and forces that impact on that market. In fact, direct contact with the customers of the company being sold is highly advisable being, in effect, an early effort of marketing to the buyer's future customers. Some businesses operate in very tricky environments. An example may be an environmental services provider whose business absolutely demands strict government enforcement to underpin sales. In such a case, careful examination of regulatory trends and their easing or tightening in good and bad economic times may reveal hidden weaknesses in a business. This broad analysis, delving deeply into details that invite a closer look, is invaluable in making projections into the future.

Negotiations and Purchase. Assuming that the evaluation has produced satisfactory results, negotiations may become necessary to resolve remaining open issues. These can take many forms and may deal with just about any aspect of the business, from the handling of certain liabilities to employment contracts for key employees or executives. Eventually a purchase agreement will be drawn up, usually involving legal professionals, and the purchase finalized with signatures and transfers of funds.

Closings are generally done either by means of an escrow settlement or through the services of an attorney who performs settlement. In an escrow settlement, the money to be deposited, the bill of sale, and other relevant documents are placed with a neutral third party known as an escrow agent until all conditions of sale have been met. After that, the escrow agent disburses the held documents and funds in accordance with the terms of the contract.

If an attorney performs settlement, meanwhile, he or she acting on behalf of both buyer or seller, or for the buyer draws up a contract and acts as an escrow agent until all stipulated conditions of sale have been met. Whereas escrow settlements do not require the buyer and the seller to get together to sign the final documents, attorney-performed settlements do include this step.

Several documents are required to complete the transaction between business seller and business buyer. The purchase and sale agreement is the most important of these, but other documents often used in closings include the escrow agreement; bill of sale; promissory note; security agreement; settlement sheet; financing statement; and employment agreement. Some buyers and sellers also sign a noncompete agreement, which ensures that the seller will not immediately open or start a similar business, taking customers away from the buyer. The exact documentation needed for a sale depends on the business, the purchasing agreement, and the buyer and seller needs in a situation. A more complex business, in which employees will be retained and intellectual property will change hands, may require more documentation. Correct documentation ensures that everyone knows what is being purchased, by whom, and for how much. Documentation also protects both seller and buyer from sudden changes or legal action.

C

C CORPORATION

When a small business incorporates, it is automatically a C corporation, also called a regular corporation. This in contrast to the S Corporation, which is taxed under Chapter 1, Subchapter S of the Internal Revenue Code. The most basic characteristic of the C corporation is that it is legally viewed as an individual entity, separate from its owners, who are now shareholders. This means that when the corporation is sued, shareholders are only liable to the extent of their investments in the corporation. Their personal assets are not on the line, as they would be if the business was a partnership or sole proprietorship. Any debts that the corporation may acquire are also viewed as the corporation's responsibility. In other words, once the business is incorporated, shareholders are protected by the corporate veil, or limited liability.

Because the corporation is a separate entity, it is viewed as an individual taxpayer by the Internal Revenue Service (IRS). As a result, corporations are subject to double taxation, which means that the profits are taxed once on the corporate level and a second time when they are distributed as dividends to the shareholders. If a business is eligible, it may elect S corporation status upon incorporating to avoid this negative characteristic of C corporations.

Becoming a C Corporation is usually not a very involved process for a business. A company usually needs to complete some additional tax forms and paperwork. For most businesses, IRS Form 8832, Entity Classification Election, is required. In some cases, a business may have to file two different tax returns. However, it is important to note that while becoming a C Corporation is simple, losing that status is difficult. In general, a company that has become a C Corporation cannot return to S Corporation for 5 years. If a small business realizes only after the fact that C Corporation status has too many disadvantages, it may not be able simply to turn back the clock.

ADVANTAGES

For a small business there are several advantages of incorporating. These advantages include limited liability; ease of raising capital; ability to attract high-quality employees; fringe benefits; and continuance of existence.

Limited Liability. Most small businesses that consider incorporating do so for the limited liability that corporate status affords. The greatest fear of the sole proprietor or partner that his or her life's savings could be jeopardized by a lawsuit against his or her business or by sudden overwhelming debts disappears once the business becomes a corporation. Although the shareholders are liable up to the amount they have invested in the corporation, their personal assets cannot be touched. Rather than purchase expensive liability insurance, then, many small-business owners choose to incorporate to protect themselves.

Raising Capital. It can be much easier for a corporation to raise capital than it is for a partnership or sole proprietorship, because the corporation has stocks to sell. Investors can be lured with the prospect of dividends if the corporation makes a profit, avoiding the necessity of taking out loans and paying high interest rates in order to secure capital. In addition, a C Corporation, unlike an S Corporation, can offer preferred stock classes. This means that C Corporations can offer special stocks which give investors voting privileges, for example. This, too, can help

encourage investors to buy into the company. However, from a banker's perspective, a newly formed corporation is a more risky loan applicant than an individual with a home and other assets. A corporation, therefore, generally relies on investors rather than business loans for money.

Attracting Top-Notch Employees. Corporations may find it easier to attract the best employees, who may be lured by stock options and fringe benefits. C Corporations, for example, can write off new company cars and have these cars used by employees for work-related purposes. According to Constance E. Bagley and Craig E. Dauchy, authors of the 2008 book *The Entrepreneur's Guide to Business Law,* C Corporations may have an easier time recruiting new employees by offering stock, since stocks are an easier option for employees to understand than some the benefits offered by different types of businesses.

Fringe Benefits. One advantage C corporations have over unincorporated businesses and S corporations is that they may deduct fringe benefits (such as group term life insurance, health and disability insurance, death benefits payments to $5,000, and employee medical expenses not paid by insurance) from their taxes as a business expense. In addition, shareholder-employees are exempt from paying taxes on the fringe benefits they receive. Even some personal assets owned by business owners may be tax deductible to some extent. For example, if a company owner or employee owns his or her own vehicle and uses that car for business-related tasks, under a C Corporation, part of the car expenses can be deductible if the owner maintains a clear record of personal and work-related car usage. To be eligible for this tax break the corporation must not design a plan that benefits only the shareholders/owners. A good portion of the employees (usually 70 percent) must also be able to take advantage of the benefits. For many small businesses, providing fringe benefits for all employees is too expensive, so in these cases the tax break is not a particular advantage.

Continuance of Existence. Transfer of stock or death of an owner does not alter the corporation, which exists perpetually, regardless of owners, until it is dissolved. While this is usually considered an advantage, Fred Steingold argues in his 2008 book, *The Legal Guide for Starting and Running a Small Business* that, in reality, "You don't need to incorporate to ensure that your business will continue after your death. A sole proprietor can use a living trust or will to transfer the business to his or her heirs, and partners frequently have insurance-funded buyout agreements that allow the remaining partners to continue the business." As well, partners can transfer their ownership in a business through their wills.

DISADVANTAGES

The disadvantages of incorporating include double taxation; bureaucracy and expense; and rules governing dividend distribution.

Double Taxation. After they deduct all business expenses, such as salaries, fringe benefits, and interest payments, C corporations pay a tax on their profits at the corporate level. If any of those profits are then distributed as dividends to the shareholders, those individuals must also pay a tax on the money when they file their personal tax returns. For companies that expect to reinvest much of the profits back into the business, double taxation may not affect them enough to be a serious drawback. Also, in 2009, federal corporate taxes began at 15 percent while higher income level personal taxes were 35 percent. Therefore, it is possible to pay a larger amount of personal tax and pay a smaller amount twice with federal corporate tax. Depending on a person's personal financial situation and the profits of the business, double taxation may not have as significant an impact.

For small businesses, however, double taxation can be a considerable drawback. For example, if a small corporation earns $1000 and is taxed at 33 percent, after taxes, its profits are $670. If those profits leave the corporation in the form of dividends, a dividend tax rate is charged. Assuming a dividend tax rate of 20 percent, that is an additional $134 gone through taxation, leaving the owner with a net of $536. In contrast, with an S corporation, there is a single tax. Small-business profits are reported on the individual tax return. Even if a person is in a higher tax bracket, such as 40 percent for that same $1,000 that person will only pay $400 in taxes, leaving him or her with $600. In some states, the taxation issue is even more important because there is only a corporate tax and no personal state income tax, making the double taxation even more costly for smaller businesses.

In the case of the small business, most if not all of the company's profits are used to pay salaries and fringe benefits, which are deductible, and double taxation may be avoided because no money is left over for distributing dividends. Also, for the small business, S corporation structures may mean smaller taxes. For very small businesses, S corporation profits are included in personal tax returns of company owners. In C corporations, the personal profits and business profits are kept strictly separate. For many small-business owners, better tax advantages are possible with the S Corporation structure.

Bureaucracy and Expense. Corporations are governed by state and federal statutes. In order to abide by all of the sometimes complex regulations related to C corporations, it is often necessary to hire lawyers and accountants to assist with tax preparation. Regular stockholder and

board of directors meetings must be held and detailed minutes of those meetings must be kept. All of the actions taken by a corporation are to be approved by its directors and this necessity can reduce a company's ability to take quick action on pressing matters. Another difference between a sole proprietor and a C corporation that imposes a bureaucratic burden arises if and when a corporation wishes to bring a case in small claims court. The corporation is required to be represented by a lawyer, whereas sole proprietors or partners can represent themselves. In addition, if the corporation does interstate business, it is subject to taxes in other states.

Rules Governing Dividend Distribution. A corporation's profits are divided on the basis of stockholdings, whereas a partnership may divide its profits on the basis of capital investment or employment in the firm. In other words, if a stockholder owns 10 percent of the corporation's stock, she may only receive 10 percent of the profits. However, if that same person was a partner in an unincorporated firm to which she had contributed 10 percent of the company's capital, she might be eligible to receive more than 10 percent of the business's profits if such an agreement had been made with the other partners. Strict rules, though, govern the way corporations divide their profits, even to the point, in some states, of determining how much can be distributed in dividends. Usually, all past operations must be paid for before a dividend can be declared by the corporation's directors. If this is not done, and the corporation's financial stability is put in jeopardy by the payment of dividends, the directors can, in most states, be held personally liable to creditors.

STRUCTURE OF A CORPORATION

In small businesses, the owners often hold more than one or all of the following positions, which are required of all corporations:

- Shareholders: They own the company's stock and are responsible for electing the directors, amending the bylaws and articles of incorporation, and approving major actions taken by the corporation, such as mergers and the sale of corporate assets. They alone are allowed to dissolve the corporation. In cases where a C Corporation sells stock and offers it to investors as well as employees, shareholders will generally have additional benefits. For example, if a company liquidates or dissolves, investors will be repaid first.
- Directors: They manage the corporation and are responsible for issuing stock, electing officers, and making the corporation's major decisions.
- Officers: The corporation must have a president, secretary, and treasurer. These officers are responsible for making the day-to-day decisions that govern the corporation's operation.
- Employees: They receive a salary in return for their work for the corporation.

FINANCING A CORPORATION

Financing the operations of a corporation may involve selling stock (equity financing), taking out loans (debt financing), or reinvesting profits for growth.

Equity. This is cash, property, or services exchanged for stock in the company. Generally, each stock is equivalent to one dollar of investment. If the small-business owner is planning to exchange property to the corporation for stock, then a tax advisor should be consulted; if the property has appreciated, taxes may be due on the exchange.

Debt. This is money lent by banks or shareholders. In the former case, a personal guarantee by the corporation's principals is usually required, which makes an exception to the limited liability rule. The owner of a corporation who personally guarantees a loan is also personally responsible for paying it back if the corporation goes under. This may mean that the owner's personal assets are used as collateral or may be at risk in the event of financial trouble. Many corporations have preferred to fund the corporation with shareholder money in exchange for promissory notes because unlike dividends, the repayment of debts is not taxable. The IRS monitors such debt closely, though, to make sure it is not excessive and that adequate interest is paid. It should be noted that the interest accrued on money borrowed is taxable when paid to the lender.

PAYING C CORPORATION TAXES

After the C corporation deducts all business expenses, such as salaries, fringe benefits, and interest payments, it pays a tax on its profits at the corporate level. Then dividends may be distributed to the shareholders who must pay a tax on the money when they file their personal tax returns. In the case of the small business, though, double taxation may not be a consideration, because most, if not all of the company's profits are reinvested in the business or go to pay salaries and fringe benefits, which are deductible, and no money is left over for distributing dividends.

To avoid double taxation, corporations sometimes pay their shareholder-employees higher salaries instead of distributing income as dividends. The IRS, however, watches out for such tax avoidance measures and often audits corporations, claiming that executive salaries are not "reasonable" compensation. To prevent this charge, then, the corporation should consider the duties performed, the experience and special abilities of the employee, and

how much other corporations pay for similar positions before determining "reasonable" compensation. A corporation should keep salaries somewhat consistent over time as fluctuating salaries high salaries in high-earning years and low salaries in lean years will attract a review of salary payments by the IRS. A charge might be made, for example, that the high salary payments were in fact dividend payments.

However, according to the 2009 edition of Fred Steingold's book, *Legal Guide for Starting & Running a Small Business*, it can be perfectly legitimate for corporations to deduct employee salaries as legitimate business expenses. This is especially efficient in C Corporations which are small one-person businesses in which one owner earns all the income of a corporation and owns all coporation stock. According to Steingold, another useful way that corporations deal with taxes is income splitting. This involves leaving some profit in the company in order to grow the business. The first $50,000 invested in this manner will usually yield a lower tax rate than if it were distributed as dividends.

RUNNING A CORPORATION

Once a small business has been incorporated, the day-to-day management of business affairs should not be that much different than it was beforehand. It is important, though, that the business is treated like a corporation. The courts have been known on occasion to overlook a business's corporate status and find the shareholders/owners liable because the business was run as if it were still a sole proprietorship or partnership. Although this is rare, it is a risk. Simply filing the articles of incorporation does not guarantee limited liability. In order to maintain corporate status in the law's eyes, these guidelines should be followed:

Act Like a Corporation. Before doing business, stock certificates should be issued to all stockholders, and a corporate record book should be established to hold the articles of incorporation, records of stock holdings, the corporation's bylaws, and the minutes of board and shareholder meetings. In addition, such meetings should be held regularly (once a year is the minimum requirement). In this way, the corporation can record all important actions taken and show that such actions were approved by a vote. It is also important to treat the corporation like the separate entity it is by keeping personal and corporate accounts separate. Whereas a small-business owner may have previously used one account to pay the company's accounts and personal expenses, as a corporate shareholder, he now needs to receive a regular salary from the corporation, deposit it in a separate account, and pay his personal expenses from that account. In all respects, the corporation and owner must be treated as distinct individuals.

Act Like a Corporate Officer. When the corporation's owner signs her name to checks, contracts, or correspondence for the corporation, she must always indicate that she is the president to show that she is not acting on her own but as an agent of the corporation.

Adequate Capital Investment and Insurance Coverage. It is important to protect the corporation against failure due to debts and lawsuits. In other words, simply trying to protect the owners' assets by becoming a corporation and neglecting to fortify the business can be viewed as reason to disregard a business's corporate status in a lawsuit. Therefore, enough capital should be invested in the corporation to handle all business activities. Likewise, if business activities pose a risk to employees or customers and reasonably priced insurance is available to protect against such risks, such coverage should be secured.

THE FUTURE OF THE C CORPORATION

After the economic difficulties of 2009, and expected tax hikes in 2011, many small businesses in 2010 considered C Corporation status, according to *BusinessWeek* magazine. Traditionally, many small businesses are structured as S corporations and do not seek C corporation status. However, C corporation may become more attractive to small businesses as the economy changes and as different tax laws come into effect. When taxes increase, many small businesses consider becoming C corporations to prevent being placed in a higher tax bracket.

CAPITAL

Capital is the money or wealth needed to produce goods and services. In the most basic terms, it is money or an asset that can be exchanged for money. All businesses must have capital in order to purchase assets and maintain their operations. Business capital comes in two main forms: debt and equity. Debt refers to loans and other types of credit that must be repaid in the future, usually with interest. Equity, on the other hand, generally does not involve a direct obligation to repay the funds. Instead, equity investors receive an ownership position in the company which usually takes the form of stock, and thus the term "stock equity."

The capital formation process describes the various means through which capital is transferred from people who save money to businesses that require funds. Such transfers may take place directly, meaning that a business sells its stocks or bonds directly to savers who provide the business with capital in exchange. Transfers of capital may also take place indirectly through an investment banking house or through a financial intermediary, such as a bank, mutual fund, or insurance company. In the case of an indirect transfer using an investment bank, the business sells securities to the bank, which in turn sells them to clients who wish to invest their funds. In other words, the capital simply flows through the investment bank. In the case of an indirect transfer using a financial intermediary, however, a new form of capital is actually created. The intermediary bank or mutual fund receives capital from savers and issues its own securities in exchange. Then the intermediary uses the capital to purchase stocks or bonds from businesses.

THE COST OF CAPITAL

"Capital is a necessary factor of production and, like any other factor, it has a cost," according to Eugene F. Brigham in his book *Fundamentals of Financial Management.* In the case of debt capital, the cost is the interest rate that the firm must pay in order to borrow funds. For equity capital, the cost is the returns that must be paid to investors in the form of dividends and capital gains. Since the amount of capital available is often limited, it is allocated among various businesses on the basis of price. According to Brigham, "the federal government has agencies which help individuals or groups, as stipulated by Congress, to obtain credit on favorable terms. Among those eligible for this kind of assistance are small businesses, certain minorities, and firms willing to build plants in areas with high unemployment."

Despite these federal government programs, the cost of capital for small businesses tends to be higher than it is for large, established businesses. Given the higher risk involved, both debt and equity providers charge a higher price for their funds. "A number of researchers have observed that portfolios of small-firm stocks have earned consistently higher average returns than those of large-firm stocks; this is called the 'small-firm effect,'" Brigham wrote. "In reality, it is bad news for the small firm; what the small-firm effect means is that the capital market demands higher returns on stocks of small firms than on otherwise similar stocks of large firms. Therefore, the cost of equity capital is higher for small firms." The cost of capital for a company is "a weighted average of the returns that investors expect from the various debt and equity securities issued by the firm," according to Richard A. Brealey and Stewart C. Myers in their book *Principles of Corporate Finance.*

In addition to these challenges, many small businesses are not eager to sell stocks because they do not wish to lose control, especially voting rights within their own firm. Then, too, small-company stock is not as recognizable as the stock of more established companies on the market, so that many smaller companies have trouble selling stock or face lower prices for their stock than expected.

CAPITAL STRUCTURE

Since capital is expensive for small businesses, it is particularly important for small-business owners to determine a target capital structure for their firms. The capital structure concerns the proportion of capital that is obtained through debt and that obtained through equity. There are trade-offs involved: using debt capital increases the risk associated with the firm's earnings, which tends to decrease the firm's stock prices. At the same time, however, debt can lead to a higher expected rate of return, which tends to increase a firm's stock price. As Brigham explained, "The optimal capital structure is the one that strikes a balance between risk and return and thereby maximizes the price of the stock and simultaneously minimizes the cost of capital." In their 2009 book, *Contemporary Financial Management,* R. Charles Moyer, James R. McGuigan, and William J. Kretlow advised small-business owners to calculate also their optimal capital budget, which is determined by comparing a business's cost of capital schedule to forecasted project returns.

Capital structure decisions depend upon several factors. One is the firm's business risk the risk pertaining to the line of business in which the company is involved.

Firms in risky industries, such as high technology, have lower optimal debt levels than other firms. Another factor in determining capital structure involves a firm's tax position. Since the interest paid on debt is tax deductible, using debt tends to be more advantageous for companies that are subject to a high tax rate and are not able to shelter much of their income from taxation.

A third important factor is a firm's financial flexibility, or its ability to raise capital under less than ideal conditions. Companies that are able to maintain a strong balance sheet will generally be able to obtain funds under more reasonable terms than other companies during an economic downturn. Brigham recommended that all firms maintain a reserve borrowing capacity to protect themselves for the future. In general, companies that tend to have stable sales levels, assets that make good collateral for loans, and a high growth rate can use debt more heavily than other companies. On the other hand, companies that have conservative management, high profitability, or poor credit ratings may wish to rely on equity capital instead.

SOURCES OF CAPITAL

There are two sources of capital that small businesses can obtain: debt capital and equity capital.

Debt Capital. Small businesses can obtain debt capital from a number of different sources. These sources can be broken down into two general categories: private and public sources. Private sources of debt financing include friends and relatives, banks, credit unions, consumer finance companies, commercial finance companies, trade credit, insurance companies, factor companies, and leasing companies. Some banks have special forms of capital funding for businesses. Called working line of capital, these accounts help small businesses generate the revenues they need to start their business. Public sources of debt financing include a number of loan programs provided by the state and federal governments to support small businesses.

Types of debt financing available to small businesses included private placement of bonds, convertible debentures, industrial development bonds, leveraged buyouts, and, by far the most common type of debt financing, a regular loan. Loans can be classified as long-term (with a maturity longer than 1 year), short-term (with a maturity shorter than 2 years), or a credit line (for more immediate borrowing needs). They can be endorsed by cosigners, guaranteed by the government, or secured by collateral such as real estate, accounts receivable, inventory, savings, life insurance, stocks and bonds, or the item purchased with the loan.

When evaluating a small business for a loan, lenders like to see a 2-year operating history, a stable management group, a desirable niche in the industry, a growth in market share, a strong cash flow, and an ability to obtain short-term financing from other sources as a supplement to the loan. Most lenders will require a small-business owner to prepare a loan proposal or complete a loan application. The lender will then evaluate the request by considering a variety of factors. For example, the lender will examine the small business's credit rating and look for evidence of its ability to repay the loan, in the form of past earnings or income projections. The lender will also inquire into the amount of equity in the business, as well as whether management has sufficient experience and competence to run the business effectively. Finally, the lender will try to ascertain whether the small business can provide a reasonable amount of collateral to secure the loan.

In 2010, a growing number of small businesses were raising start-up capital through 401(k) plans. Business owners who had already worked in an industry for several years had robust retirement savings which could be converted into capital. Retirement savings and personal savings can be converted into stock or simply used to fund the business initially. This type of capital fund-raising, like any form of generating capital, can be risky for the new small business. According to the U.S. Small Business Administration, only about one in two new small businesses will last for 5 years or more. Equifax reported that between the third quarter of 2008 and the third quarter of 2009, small businesses filing for bankruptcy increased by 44 percent. Businesses that lose capital through bankruptcy or business loss must often repay debts with limited sources of income. Businesses that have borrowed heavily to generate start-up capital are often faced with huge debts when the businesses collapse. This is one reason why lenders are wary about offering capital or loans to new small businesses.

Equity Capital. Equity capital can be secured from a wide variety of sources. Some possible sources of equity financing include the entrepreneur's friends and family, private investors (from the family physician to groups of local business owners to wealthy entrepreneurs known as "angels"), employees, customers and suppliers, former employees, venture capital firms, investment banking firms, insurance companies, large corporations, and government-backed Small Business Investment Corporations (SBICs).

There are two primary methods that small businesses use to obtain equity financing: the private placement of stock with investors or venture capital firms; and public stock offerings. Private placement is simpler and more common for young companies or start-up firms. Although the private placement of stock still involves compliance with several federal and state securities laws, it does not require formal registration with the Securities and Exchange Commission. The main requirements for

private placement of stock are that the company cannot advertise the offering and must make the transaction directly with the purchaser.

Venture capital firms are businesses or partnerships consisting of corporations, family members, or pools of investors. These firms invest in companies that are small or struggling and therefore in need of capital. In exchange for providing capital, venture capital firms receive a share in the profits of a business or equity positions in company. However, venture capital firms are usually quite cautious and do not invest in small businesses that are likely to remain small. They look for businesses with the potential for exponential growth.

In terms of cost, public stock offerings entail a lengthy and expensive registration process. In fact, as R. Charles Moyer, James R. McGuigan, and William J. Kretlow point out in their 2009 book, *Financial Management*, small companies may pay issuance costs which reach or exceed 20 percent for their common stock sales, pushing the cost of their capital higher. As a result, public stock offerings are generally a better option for mature companies than for start-up firms. Nonetheless, public stock offerings may offer advantages in terms of maintaining control of a small business by spreading ownership over a diverse group of investors rather than concentrating it in the hands of a venture capital firm.

CAPITAL GAIN/LOSS

A capital gain or loss results from the sale, trade, or exchange of a capital asset. Simply stated, when the resulting transaction nets an amount lower than the original purchase value of the capital asset, a capital loss occurs. When the resulting transaction nets an amount greater than the original value at purchase, a capital gain occurs. Capital gains and losses can either be short-term (when the transaction is completed within 1 year) or long-term (when the transaction is completed in more than 1 year). The period is determined from the day after acquisition of the asset to the day of its disposal. Capital gain/loss is a concept that affects small-business owners in a number of ways from the decisions they must make regarding their personal property and investments to the attractiveness of their businesses to outside investors. The factors relevant to capital gain/loss are the capital asset, the transactional event, and time.

The subject of capital gain/loss is the source of debate among analysts and in government and economic circles generally. The current philosophy centers on the benefits and efficiencies of capital accumulation and utilization. To encourage capital formation and investment, the federal tax codes tax capital gains at lower rates than ordinary income. In January 2010, during his State of the Union Address, President Barack Obama proposed helping small businesses by allocating $30 billion of the money Wall Street banks had repaid from what they received in the 2008 federal bailout and using it to encourage community banks to provide small businesses with credit. He also proposed a tax credit for small businesses that hired new workers or raised wages. Obama also said that he wanted to eliminate all capital gains taxes on small-business investment and give a tax incentive for all businesses, large and small, to invest in new plants and equipment.

The removal of capital gains taxes is meant to stimulate the economy at a time when severe recession and job loss created severe stress on the economy. With small businesses paying less in capital gains taxes, they are free, in theory, to hire more workers and invest more in their companies, creating more jobs and stimulating the economy. Tax rate changes which lowered capital gains taxes in the past were based on the theory that a lower capital gains tax would encourage people to sell stock and other assets. This, in turn, is expected to increase the federal government's tax revenues. Many believe that lower capital gains tax rates have a beneficial effect on investments in small businesses. Such investments tend to provide investors with income via an appreciation in stock price (which is taxed as a capital gain) rather than via dividends (which are taxed as ordinary income).

After President Obama's speech, some states followed suit by reducing their own capital gains taxes for 2010. In

February 2010, Minnesota Governor Tim Pawlenty announced his own plans to reduce capital gains tax rates by offering a capital gains tax exclusion for specific investors and investments made specifically for smaller businesses.

CAPITAL ASSETS

Everything one owns for personal use, pleasure, or investment is a capital asset. This includes: securities; a residence; household furnishings; a personal car; coin and stamp collections; gems and jewelry; and precious metals. Since property held for personal use is considered a capital asset, the sale or exchange of that property at a price above its purchase price, or basis, results in a capital gain, which is taxable. If one incurs a loss on that property from a sale or exchange, however, the loss cannot be taken as a tax deduction unless it resulted from a personal casualty loss, such as fire, flood, tornado, or hurricane. Other types of property and investments also have some irregularities in their treatment as capital gains or losses for tax purposes.

Investment Property, Collectibles, Precious Metals, and Gems. All investment property is also considered a capital asset. Therefore, any gain or loss is generally a capital gain or loss, but only when it is realized that is, upon completion of the sales transaction. For example, a person who owns stock in a growing technology company may see the price of that stock appreciate considerably over time. For a gain to be realized, however, the investor must actually sell shares at a market price higher than the original purchase price (or lower, in the case of a capital loss). Section 1244 of the federal revenue code treats losses on certain small business stocks differently. If a loss is realized, the investor can deduct the amount as an ordinary loss, while he or she must report any gain as a capital gain.

Sale of a Home. The sale of a personal residence enjoys special tax treatment in order to minimize the impact of long-term inflation. For most people, a residence is the largest asset they own. While some appreciation is expected, residences are not primarily used as investment vehicles. Inflation may cause the value of a home to increase substantially while the constant-dollar value may increase very little. In addition, the growth in family size may encourage a family to step up to a larger home. To minimize the impact of inflation and to subsidize the purchase of new homes, the tax code does not require reporting a capital gain if the individual purchases a more expensive house within two years. In addition, individuals are entitled to exclude for tax purposes up to $250,000 and married couples up to $500,000 of capital gains from the sale of a home, provided they have lived in the home as a principal residence in 2 out of the previous 5 years. Under changes made by The Housing Assistance Tax Act of 2008, the amount of capital gains taxes which can be excluded depends on how long the property was used as a homeowner's primary residence.

DETERMINING THE BASIS

Capital gain/loss is calculated on the cost basis, which is the amount of cash and debt obligation used to pay for a property, along with the fair market value of other property or services the purchaser provided in the transaction. The purchase price of a property may also include the following charges and fees, which are added to the basis to arrive at the adjusted basis:

1. Sales tax
2. Freight charges
3. Installment and testing fees
4. Excise taxes
5. Legal and accounting fees that are capitalized rather than expensed
6. Revenue stamps
7. Recording fees
8. Real estate taxes where applicable
9. Settlement fees in real estate transactions

The basis may be increased by the value of capital improvements, assessments for site improvements (such as the public infrastructure), and the restoration of damaged property. A basis is reduced by transactional events that recoup part of the original purchase price through tax savings, tax credits, and other transactions. These include depreciation, nontaxable corporate distributions, various environmental and energy credits, reimbursed casualty or theft losses, and the sale of an easement. After adjusting the basis for these various factors, the individual subtracts the adjusted basis from the net proceeds of the sale to determine capital gain/loss.

NET GAIN OR LOSS

To calculate the net gain/loss, the individual first determines the long-term gain/loss and short-term gain/loss separately. The net short-term gain/loss is the difference between short-term gains and short-term losses. Likewise, net long-term gain/loss is the difference between long-term gains and losses. If the individual's total capital gain is more than the total capital loss, the excess is taxable generally at the same rate as the ordinary income. However, the part of the capital gain which is the same amount as the net capital gain is taxed only at the capital gains tax rate, a maximum of 15 percent (5 percent for those whose income tax rate is either 10 or 15 percent). If the individual's capital losses are more than the total capital gains, the excess is deductible up to $3,000 per

year from ordinary income. The remaining loss is carried forward and deducted at a rate up to $3,000 a year until the entire capital loss is written off.

CAPITAL STRUCTURE

Capital structure is a term that describes the proportion of a company's capital, or operating money, that is obtained through debt versus the proportion obtained through equity. Debt includes loans and other types of credit that must be repaid in the future, usually with interest.

Bank loans, a major source of debt equity, started drying up after the recession that began in 2008. The U.S. Treasury states that twenty-two of the largest banks that received money from the Emergency Economic Stabilization Act in 2008 reduced their small-business lending by roughly $12 billion during that year. Various government actions, most notably the American Recovery and Reinvestment Act (ARRA) of 2009, have attempted to increase the amount of funding banks are lending to small businesses.

In contrast to debt financing, equity financing does not involve a direct obligation to repay the funds. Instead, equity investors become part-owners and partners in the business, and thus earn a return on their investment as well as exercising some degree of control over how the business is run.

Venture capital is one of the more popular forms of equity financing. The late 1990s and most of the 2000s saw a great deal of venture capital backing start-ups. However, by 2009, after the financial crisis, things began to shift. In 2009, venture capitalists invested 37 percent less money than they had in 2008. During this time investment by venture capitalists was the lowest it had been since PricewaterhouseCoopers began tracking it in 1995. The last quarter of 2009 saw a slight increase in venture investment, which some attributed to an improving economy.

Since capital is expensive for small businesses, it is particularly important for small- business owners to determine a target capital structure for their firms. Capital structure decisions are complex ones that involve weighing a variety of factors. In general, companies that tend to have stable sales levels, assets that make good collateral for loans, and a high growth rate can use debt more heavily than other companies. On the other hand, companies that have conservative management, high profitability, or poor credit ratings may wish to rely on equity capital instead.

ADVANTAGES AND DISADVANTAGES OF FINANCING OPTIONS

Both debt and equity financing offer small businesses a number of advantages and disadvantages. The key for small-business owners is to evaluate their company's particular situation and determine its optimal capital structure. An optimal capital structure is one that strikes a balance between risk and return and maximizes the price of the stock while simultaneously minimizing the cost of capital.

Advantages of Debt Financing. The primary advantage of debt financing is that it allows the founders to retain ownership and control of the company. In contrast to equity financing, debt financing allows an entrepreneur to make key strategic decisions and also to keep and reinvest more company profits. Another advantage of debt financing is that it provides small-business owners with a greater degree of financial freedom than equity financing. Debt obligations are limited to the loan repayment period, after which the lender has no further claim on the business, whereas an equity investor's claim does not end until his or her stock is sold. Debt financing is also easy to administer, as it generally lacks the complex reporting requirements that accompany some forms of

equity financing. Finally, debt financing tends to be less expensive for small businesses over the long term than equity financing. Over the short term, however, debt financing is far more expensive.

Disadvantages of Debt Financing. The main disadvantage of debt financing is that it requires a small business to make regular monthly payments of principal and interest. Very young companies often experience shortages in cash flow that may make such regular payments difficult, and most lenders provide severe penalties for late or missed payments. Another disadvantage associated with debt financing is that its availability is often limited to established businesses. Since lenders primarily seek security for their funds, it can be difficult for unproven businesses to obtain loans without a personal guarantee from one of the principals in the business.

Advantages of Equity Financing. The main advantage of equity financing for small businesses, which are likely to struggle with cash flow initially, is that there is no obligation to repay the money. Equity financing is also easier to acquire than debt financing for early-stage or start-up businesses. Equity investors seek growth opportunities, so they are often willing to take a chance on a good idea. But debt financiers seek security, so they usually require the business to have some sort of track record before they will consider making a loan. Another advantage of equity financing is that investors often prove to be good sources of advice and contacts for small-business owners.

Disadvantages of Equity Financing. The main disadvantage of equity financing is that the founders must give up some control of the business. If investors have different ideas about the company's strategic direction or day-to-day operations, they can pose problems for the entrepreneur. In addition, some sales of equity, such as initial public offerings, can be very complex and expensive to administer. Such equity financing may require complicated legal filings and a great deal of paperwork to comply with various regulations. For many small businesses, therefore, equity financing may necessitate enlisting the help of attorneys and accountants.

CAREER AND FAMILY

Over the past several decades, American society has undergone significant changes in its attitudes toward balancing work and family life. These attitudes have been influenced by changing demographics; a dramatic increase in the percentage of women who choose to work in nonhousehold-related areas; rising costs in the realm of housing, transportation, clothing, and food; changing societal and personal priorities; and a host of other factors.

The recession that began in 2008 caused a sharp rise in unemployment rates. While these difficult financial times have been extremely rough on many families, there is a silver lining. Many unemployed fathers are now spending more time with their kids while they look for work. Fathers who used to leave in the morning and come home at night are now directly involved with the day-to-day operations of family life. In some cases, these men are seeking new careers that will allow them flexible schedules and more time at home.

In the early twenty-first century, employers and employees are grappling with the challenges of balancing career and family obligations and desires in a more visible way than ever before. This concern with the issue of career/family balance is reflected in the barrage of media attention that accompanies any small trend in this area. Among the trends documented in numerous articles in newspapers and magazines are such things as an increase in the number of professional women leaving work to

become full-time mothers. The general society-wide movement toward simplification of life is another such trend, typically characterized by an increased emphasis on family happiness and growth at the expense of career development.

In her 2009 book *The Comeback*, Emma Keller tells the story of seven women who left their careers to become full-time mothers and then, some time later, returned to the workforce. The stories of these women are important because they show that it may be possible to have it all, just not all at the same time. The résumeégap that full-time motherhood leaves is no longer the career derailer that it once was, as employers are becoming more receptive to the idea of women with children returning to work.

The debate over what constitutes an appropriate balance between family and career is livelier than ever. For example, proponents of attitudes that are typically characterized as "family-friendly" laud the decisions of those who choose less time-consuming careers or institute flexible work rules to increase family time. Others, though, resent the assumption that is sometimes made that people who are ambitious and driven in their chosen profession, and thus spend significant amounts of time involved in such endeavors, must have their priorities the wrong way round. For example, Joseph Nocera wrote in *Fortune* that "without question, it's unhealthy to be so consumed by work that the kids feel abandoned. But there is also something unhealthy about so sanctifying family time that we diminish the importance of work. Yet that is precisely the judgment our culture now renders on a regular basis." Nocera went on to critique the widespread assumption that "no matter what's going on at the office, it can't be more important than coaching your kid's basketball team. Well, sometimes it isn't, and sometimes it is. Sometimes other people's jobs are at stake, or a crisis has to be averted. Sometimes you need to accomplish something in your work for the sheer satisfaction of it, and sometimes that means staying late or working on weekends. Why should it be such a sin to admit this out loud?"

For the small-business owner, achieving a reasonable balance between work and family obligations can be a particularly daunting task. The challenge of striking this appropriate balance can be especially acute for women entrepreneurs, who, despite tremendous changes in societal acceptance of their right to make their mark in the business world, still face disapproval in some quarters for making such a choice.

For both men and women, the demands of establishing and maintaining a profitable business are numerous and time-consuming in most instances. After all, it is the entrepreneur who is ultimately responsible for realizing his or her vision of the business, and who has typically invested a great deal of time, thought, and energy into nourishing that vision. The entrepreneur or small-business owner is often the chief decision maker within the business, and is frequently the primary producer of the company's goods and/or services as well. This latter element is particularly true of smaller businesses, whether the enterprise is concerned with silk screening, freelance writing, portrait photography, carpentry, or some other area of endeavor.

Life partners and children, of course, have needs as well. Successful entrepreneurs and family counselors alike warn that people who establish a profitable business are likely to find that their success is hollow if their relationship with a spouse or child is irreparably damaged in the process. Balancing home and career can be a bit like a juggling act, and if a person tries to juggle too many balls at once, one of the balls is likely to fall. Deciding on goals and setting priorities is essential for all small-business owners.

Finally, small-business owners have to recognize that the career/family issue is one that impacts employees as well. Indeed, "family-friendly" policies have proliferated in many industries in recent years, as various sectors respond to general societal perceptions that the work/family balance had become unevenly weighted toward work over the past few decades. In many cases, it has become essential for small-business owners to recognize the changing expectations of their employees in this area.

FAMILY LEAVE LEGISLATION

In an attempt to address some of the difficulties that employees were having in balancing work and family, legislation was passed in 1993. The Family and Medical Leave Act (FMLA), covers all employers with fifty employees or more. Those employers must grant an eligible employee up to a total of 12 workweeks of unpaid leave during any 12-month period for one or more of the following reasons:

- The birth and care of the newborn child of the employee
- Placement with the employee of a son or daughter for adoption or foster care
- The care for an immediate family member (spouse, child, or parent) with a serious health condition
- Inability to work because of a serious health condition

An amendment to the FMLA became effective on January 16, 2009. The law now permits a spouse, son, daughter, parent, or next of kin of any member of the armed forces to take up to 26 workweeks of unpaid leave to care for a family member in need.

The FMLA has had wide acceptance. According to a 2000 survey carried out by the U.S. Bureau of Labor, 84 percent of employers found that the benefits of providing family or medical leave offset or outweighed the costs.

HELPING EMPLOYEES ESTABLISH AN APPROPRIATE WORK/FAMILY BALANCE

Increasingly, small businesses have shown an interest in helping their work forces manage the challenges of addressing both work and family obligations. Their ability to do so is dictated somewhat by financial health, workload, competitive pressures, and a host of other factors, but many small-business owners have come to the conclusion that workplaces that insist on long hours from their employees may be sacrificing long-term health for short-term gains. "Many experts in the field of management have argued that family-responsive policies and programs will be necessary to attract and retain needed employees and to build competitive advantages," wrote Teresa Joyce Covin and Christina C. Brush in *Review of Business*. "Research also suggests that conflicts between work and family are related to decreased productivity, lost work time, job dissatisfaction, increased health risks for employed parents, poorer performance of the parenting role, absenteeism, poor morale, reduced life satisfaction, and depression. While work-family conflict is commonly viewed as a woman's problem, more companies are beginning to recognize that both men and women feel the impact of work-family conflicts."

There are several steps that small-business owners can take to help employees manage their obligations both in the office and at home. "A number of external, structural innovations help people immeasurably in balancing work and family," stated Deborah Lee in her book, *Having It All/Having Enough: How to Create a Career/Family Balance that Works for You*. These include "flexible work schedule, the availability of part-time work that is taken seriously and is respected by employers, the option of working at home or bringing a child to work. However, these options won't help much unless people also adjust their attitudes about work and unless employers adjust their expectations about what people can produce. A part-time schedule doesn't help if it contains a full-time equivalent workload or penalties such as loss of health benefits or loss of advancement opportunities." Of course, some small-business owners contend that a person who takes on a part-time schedule does not warrant the same consideration for advancement as does a full-time employee, and that providing health benefits to all part-time employees puts the business at an unacceptable competitive disadvantage. Each individual business faces challenges and considerations that are unique; thus, each business owner has to decide for himself or herself what family-friendly policies (and attitudes) can be put in place.

BALANCING WORK AND FAMILY IN HOME BASED BUSINESSES

Owners of home-based businesses face unique challenges in the realm of achieving a desired work/family balance. Whereas small-business owners who commute to their place of business every day are usually freed from child-rearing responsibilities for the duration of their time there, entrepreneurs who work out of their home often have to devise methods in which they can both attend to the needs of their business and provide adequate attention to their children. Researchers and home-based business owners tout several steps that can be taken to assist entrepreneurs in meeting these twin challenges.

- Establish a family-friendly business. This sounds simple, but in reality all home-based businesses are not created equal. Some may provide a parent with significant freedom in structuring business around his or her children's schedule, while others may not provide nearly the same level of flexibility.
- Communicate with spouse and/or others. Establishing and maintaining a home-based business requires changes in the routines of all family members, not just the entrepreneur. Changes in travel schedules, household chore allocation, and other areas of family life may all need to be made. The key to making sure that such changes are made with a minimum of disruption or resentment is open, honest communication.
- Make maximum use of free time. Home-based entrepreneurs can dramatically increase their productivity and keep a lid on feelings of frustration by scheduling demanding and important work obligations for times when child supervision obligations are minimal. Nap times, preschool sessions, and extracurricular programs can all provide parents with valuable windows of opportunity to attend to vital work-related matters.
- Prioritize and establish a daily schedule. Business owners who work out of their home should avoid falling into a routine in which tasks both family- and work-related are addressed in a haphazard, "as they come up" fashion. Instead, they should try to establish a daily or weekly schedule. Work discipline can be difficult to maintain at home even without children; their presence further compounds the challenge.
- Establish an office area that is physically removed from the rest of the house. People who attempt to take care of work while situated in the heart of a child's play area are apt to experience high levels of frustration. Instead, home-based entrepreneurs should consider establishing an office in a separate area that includes all necessary equipment to conduct

business. Moreover, children should be taught to respect the importance of that area. Another option which may be more popular with parents of toddlers and young children is to create a "child-friendly" office with a corner that is set aside for their needs.

- Communicate the importance of the work to children. In *How to Raise a Family and a Career Under One Roof* Lisa Roberts noted that home-based entrepreneurs should make a special effort to educate their children about the importance of the work they are doing. She counseled parents to "share your victories, challenges and rewards as often as possible. If your children feel like they're a part of what you're doing, they'll be much more supportive than if they see your business as something that's just taking you away from them."
- Enjoy family. Many home-based business owners may try to spend greater time with their spouse or children, yet find themselves feeling frustrated with the demands on time and energy that family members inevitably make during the course of every day. Counselors urge home-based entrepreneurs not to lose sight of why they made the decision to operate out of the home in the first place.

Overall, experts stress that owning a business is not something to take lightly. It requires planning to achieve an appropriate balance between work and family that all interested parties can live with. "Make time for family," Michelle Prather wrote in *Entrepreneur*. "Acknowledge you're taking them on the wildest ride of their lives. Find a mentor to help you through the tough times. Know your limits. Know that unhealthy relationships will worsen, and solid ones could waver."

CAREER PLANNING AND CHANGING

According to the U.S. Department of Labor, those born between 1957 and 1964 (the end of the baby boom generation) held 10.2 jobs on average during their first twenty years in the work force. Changing jobs is more frequently necessary in recent periods than in earlier eras. People therefore either do or should spend more time planning flexible careers. The greater dynamism in the labor market is due to many factors. Increases in productivity have been mirrored by downsizing of production and service forces. Modern means of data handling and communications have changed the manner in which sales and administrative work are done. U.S. companies have also begun employing workers in other countries, such as India and Mexico, to reduce costs or boost profit. Parallel with the growth of many new employment benefits have come increased costs which many corporations have begun to shed by transferring labor from full-time employees (who get various benefits) to independent contractors, temporary employees, and outsourced laborers (who do not). In a 2010 article for the *Boston Globe*, Drake Bennett points out that the U.S. Government Accountability Office estimates that nearly one-third of the workforce consists of contingent workers. Contingent workers are those who work temporary, on-call, contract, or freelance jobs. Many people face new careers abruptly and involuntarily. The economic downturn that begin in 2008 forced many companies

to downsize and left the United States with a 10 percent unemployment rate at the end of 2009.

At the same time, and parallel with these broad trends, the educational attainment of individuals entering the work force is much higher. The workforce is not only better trained but much better informed. The same dynamics that cause contractions in many traditional industries create opportunities in emerging fields. When individuals see opportunities that draw them they change careers voluntarily. They are drawn by greener pastures and shimmering rainbows.

Changing jobs is most stressful for those who must do so involuntarily. Richard Ream, writing in *Information Today*, counseled such people as follows: "Careers are linear in foresight but circuitous in hindsight, and chance favors the prepared mind. What you need as you plan yours is to sustain curiosity, optimism, flexibility, and open-mindedness."

In his 2009 book *The Job-Hunter's Survival Guide*, Richard Bolles corrects the myth of the dream job. A dream job is not a job that involves little work but lots of money, that is, a one-size-fits-all job. A dream job is a job where the work "flows from, and has an essential connection to, who you are." Bolles advises job-hunters to research themselves to discover what their dream job is. He recommends that people focus on themselves first, and then focus on the job market.

ALTERNATIVES

Persons facing involuntary changes in making a living typically follow one or more activities which represent the available options: 1) they attempt to find another, similar job in the same or related industry or sector doing essentially what they have done before; 2) they make use of a secondary skill or previous experience to change industry/sector; 3) they return to school to acquire a new or enhanced set of skills drawn either by inclination or by studying the job market; 4) they choose to obtain work in the same or related specialty as a self-employed person; this is often relatively easy for some sometimes even with the old employer; or, 5) they opt to start a business of their own.

To some extent, more than one of these five alternatives may be pursued at the same time. Thus a person may get another job but, anticipating further problems, may stay in an exploratory posture, enroll in some courses of study, and engage in a serious reassessment of his or her career path. A self-employed person may decide, after a while, that with a little more effort, investment from friends, and joining with a friend or two, the "self-employment" may be turned into a small business.

When these activities are undertaken with a certain heightened consciousness, the search for "what to do next" may evolve into career planning and, sometimes, a change in careers.

THE ELEMENTS OF A PLAN

Like any planning activity, in business as in personal life, a change in careers begins with: 1) environmental assessment, internal and external; 2) goal setting; 3) evaluation of alternatives; 4) cost assessment; and 5) implementation.

The *environmental assessment* must begin with a list of the person's skills and the extent to which these are certifiable (through degrees or experience). High levels of skill in an activity the person hates are useless. Therefore the assessment should focus on a combination of skills and personal inclination. This effort should result in a listing of activities, jobs, or involvements the career planner would be happy and able to do. This is the "internal" part of the environmental survey. The next step is study of the labor market for activities that match the person's profile. *Goal setting* is the consequence of this initial match of internal resources and external opportunities. Experts in the field suggest that the person should "enlist expert counsel." Thus John Lees wrote in *Personnel Today*: "Seek advice from senior colleagues or a mentor to help you create an action plan and clarify your performance objectives. This will help you keep focused and motivated."

Evaluation of alternatives may involve studying companies to interview, curricula to pursue in school, or even looking at potential sites for starting up a store. At this point the career seeker is only *evaluating* choices, not making decisions. Each alternative will have a monetary, time, and possibly also an emotional cost. *Cost assessment* follows. Here the career seeker may be required to make hard choices. He or she may accept 2 years' of study and a low income, meanwhile, from a part-time job, in order to achieve the highest goal or an immediate job campaign to get a start at a lower level quickly. Whatever the choice, success will depend on consciously carrying out the last step, *implementation*.

Career planning requires self-knowledge, honesty, and systematic work. Perhaps the most important aspect of a career change not listed above is drive. As Jessica Jarvis pointed out in her article in *Personnel Today*, research carried out by the Chartered Institute of Personnel Development "shows [that] it is critical to be proactive in your career. The single most important factor in getting to the top . . . , the research found, was personal drive and ambition."

CONTINUOUS CAREER PLANNING

Statistics on the number of businesses there are in the United States each year provide an interesting glimpse into trends in the American economy. Data from the

U.S. Census Bureau's economic sector shows that the number of single-person firms grew rapidly between 1997 and 2003, at a rate of 21 percent. This was 6 percent higher than the growth rate for all firms and more than twice as high as the growth rate for all firms with three or more employees. Additional information available from the Internal Revenue Service (IRS) indicates the continued strength of this trend. According to IRS data, in 2008 there were over 23 million sole proprietors who filed tax returns. To put that in context, the number of self-employed sole proprietors is greater than the total number of government employees at all levels (federal, state, and local). The revenue generated by these sole proprietors was $1.3 trillion in 2007, about a tenth of the gross domestic product (GDP).

People are clearly working on their own in greater numbers and in many cases they are establishing single-person businesses in which to do so. The very meaning of "career" for most people is changing from being a single more or less continuous activity to a succession of different activities in a rapidly changing environment. Career planning, therefore, will for most forward-looking individuals become a continuous activity repeated at regular intervals.

CASH CONVERSION CYCLE

The cash conversion cycle (CCC) is a key measurement of small business liquidity. The cash conversion cycle is the number of days between paying for raw materials or goods to be resold and receiving the cash from the sale of the goods either made from that raw material or purchased for resale. The cash conversion cycle measures the time between outlay of cash and the cash recovery. The cycle is a measure of the time that funds are tied up in the cycle. The CCC measure illustrates how quickly a company can convert its products into cash through sales. The shorter the cycle, the more working capital a business generates, and the less it has to borrow.

Effective management of the cash conversion cycle is imperative for small-business owners. Indeed, the CCC is cited by economists and business consultants as one of the truest measures of a business's health, particularly during periods of growth. Other often used ratios and measures of a company's activity may not provide advance notice of a cash flow problem as well as the CCC. For example, the current and quick ratios are popular with companies and their bankers. However, in a period when collections have slowed, asset turns have become sluggish, and vendors have not extended terms beyond previously agreed limits a clearly worrisome combination the current ratio would probably look good. At the same time, the quick ratio may even show improvement or remain steady, even though the company is actually in substantial need of working capital. This happens because of the balance-sheet-oriented limitations of current and quick ratios. These often used ratios do not work well on a company going through a period of rapid and dynamic change.

Instead of the potentially misleading measurements mentioned above, small-business owners should consider using the cash conversion cycle, which provides a more accurate reading of working capital pressure on cash flow. The objective is to keep the CCC as low as possible. During periods of growth, the goal should be to strive to maintain a constant CCC. Unless inventory, credit, or vendor policies change, rapid growth should not cause the CCC to increase. The ease with which this ratio can be calculated makes it an even more attractive measure for tracking a business's operations and managing cash flow.

The cash conversion cycle can also be used by investors in an evaluation of the health of a company. For example, Home Depot's CCC was 46 days in 2006, compared to 47 days in 2005, indicating that the company was doing a better job of converting its expenditures back into cash. This information, combined with other fundamentals, can aid in determining investment choices. As *Motley Fool,* an online investment advice Web site, puts it: "you can watch these cycles closely on a company-to-company basis, since

they might warn of weakening business fundamentals that don't show up elsewhere."

Cash conversion cycles for small businesses are predicated on four central factors: 1) the number of days it takes customers to pay what they owe; 2) the number of days it takes the business to make its product (or complete its service); 3) the number of days the product (or service) sits in inventory before it is sold; and 4) the length of time that the small business has to pay its vendors. The following formulas may be used to determine these factors:

- Accounts receivable days. Divide the receivables balance by the last 12 months' sales, then multiply the result by 365 (the number of days in a year).
- Inventory days. Take the inventory balance, divide it by the last 12 months' cost of goods sold, and then multiply the result by 365.
- Accounts payable days. Take the company's payables balance, divide it by the last 12 months' cost of goods sold, and then multiply the resulting figure by 365.

Once a small-business owner has these figures in hand, he or she can determine the company's cash conversion cycle by adding the receivable days to the production and inventory days and then subtracting the payables days. That will render the number of days a company's cash is tied up and is the first step in calculating how much money the company will want to secure for its revolving line of credit.

Because a low cash conversion cycle means a business has to borrow less to cover its operational costs, reducing the CCC which is always important becomes even more important when financing is difficult to come by. The 2008 2009 credit crisis reduced the availability of credit lines and new financing for many businesses, particularly small businesses, putting businesses that relied on revolving credit lines in jeopardy. The viability of a small business during economic downturns, particularly those accompanied by disruptions in financial markets, depends crucially on achieving and maintaining a low CCC.

CASH FLOW STATEMENT

A cash flow statement is a financial report that describes the sources of a company's cash and how that cash was spent over a specified time period. It does not include noncash items such as depreciation. This makes it useful for determining the short-term viability of a company, particularly its ability to pay bills. Because the management of cash flow is so crucial for businesses and small businesses in particular, most analysts recommend that an entrepreneur study a cash flow statement at least every quarter.

The cash flow statement is similar to the income statement in that it records a company's performance over a specified period of time. The difference between the two is that the income statement also takes into account some noncash accounting items such as depreciation. The cash flow statement strips away all of this and shows exactly how much actual money the company has generated. Cash flow statements show how companies have performed in managing inflows and outflows of cash. Such statements provide a sharper picture of a company's ability to pay creditors and finance growth.

It is possible for a company that is shown to be profitable according to accounting standards to go under if there isn't enough cash on hand to pay bills. Comparing amount of cash generated to outstanding debt, known as the "operating cash flow ratio," illustrates the company's ability to service its loans and interest payments. If a slight drop in a company's quarterly cash flow would jeopardize its ability to make loan payments, that company is in a riskier position than one with less net income but a stronger cash flow level.

The global financial crises that began in 2008 affected the cash flow of many companies. Loss of revenue combined with increased debt in some cases meant that companies did not have enough cash in their pockets or in their cash-flow statements. This, coupled with banks reining in loan offers and reducing caps on existing loans, added to the challenges faced by small-business owners. The sobering fact is that loans are harder to get in a stressed economy, and at the same time, businesses need them more than ever.

Unlike the many ways in which reported earnings can be presented, there is little a company can do to manipulate its cash situation. Barring any outright fraud, the cash flow statement tells the whole story. The company either has cash or it does not. Analysts will look closely at the cash flow statement of any company in order to understand its overall health.

PARTS OF THE CASH FLOW STATEMENT

Cash flow statements classify cash receipts and payments according to whether they stem from operating, investing, or financing activities. A cash flow statement is divided into sections corresponding to these same three functional areas within the business:

- **Cash from Operations** - cash generated from day-to-day business operations.
- **Cash from Investing** - cash used for investing in assets, as well as the proceeds from the sale of other businesses, equipment, or other long-term assets.
- **Cash from Financing** - cash paid or received from issuing and borrowing of funds. This section also includes dividends paid (although it is sometimes listed under cash from operations).
- **Net Increase or Decrease in Cash** - increases in cash from previous year will be written normally, and decreases in cash are typically written in (brackets).

Although cash flow statements may vary slightly, they all present data in the four sections listed here.

CLASSIFICATIONS OF CASH RECEIPTS AND PAYMENTS

Cash from Financing. At the beginning of a company's life cycle, a person or group has an idea for a new company. The initial money comes from the owners or is borrowed by them. This is how the new company is "financed." The money that owners put into the company is classified as a financing activity. Generally, any item that would be classified on the balance sheet as either a long-term liability or an equity would be a candidate for classification as a financing activity.

Cash from Investing. The owners or managers of the business use the initial funds to buy equipment or other assets they need to run the business. In other words, they invest it. The purchase of property, plant, equipment, and other productive assets is classified as an investing activity. Sometimes a company has enough cash of its own that it can lend money to another enterprise. This, too, would be classified as an investing activity. Generally, any item that would be classified on the balance sheet as a long-term asset would be a candidate for classification as an investing activity.

Cash from Operations. Now the company can start doing business. It has procured the funds and purchased the equipment and other assets it needs to operate. It starts to sell merchandise or services and make payments for rent, supplies, taxes, and all of the other costs of doing business. All of the cash inflows and outflows associated with doing the work for which the company was established would be classified as an operating activity. In general, if an activity appears on the company's income statement, it is a candidate for the operating section of the cash flow statement.

METHODS OF PREPARING THE CASH FLOW STATEMENT

In November 1987 the Financial Accounting Standards Board (FASB) issued a "Statement of Financial Accounting Standards" which required businesses to issue a statement of cash flow rather than a statement of changes in financial position. There are two methods for preparing and presenting this statement: the direct method and the indirect method. The two methods of reporting affect the presentation of the operating section only. The investing and financing sections are presented in the same way regardless of presentation methods. The FASB periodically updates its accounting standards. Beginning in 2009, changes to the *FASB Accounting Standards Codification* are communicated through an Accounting Standards Update (ASU). Updates are also available online at the FASB Web site.

Direct Method. The direct method, also called the income statement method, reports major classes of operating cash receipts and payments. Using this method of preparing a cash statement starts with money received and then subtracts money spent, to calculate net cash flow. Depreciation is excluded altogether because, although it is an expense that affects net profits, it is not money spent or received.

Indirect Method. This method, also called the reconciliation method, focuses on net income and the net cash flow from operations. Using this method one starts with net income, adds back depreciation, then calculates changes in balance sheet items. The end result is the same net cash flow produced by the direct method. The indirect method adds depreciation into the equation because it started with net profits, from which depreciation was subtracted as an expense.

Regardless of whether the direct or the indirect method is used, the operating section of the cash flow statement ends with net cash provided (used) by

operating activities. This is the most important line item on the cash flow statement. A company has to generate enough cash from operations to sustain its business activity. If a company continually needs to borrow or obtain additional investor capitalization to survive, the company's long-term existence is in jeopardy.

FINANCING AND INVESTING SECTIONS

The cash flows, in and out, resulting from financing and investing activities are listed in the same way whether the direct or indirect method of presentation is employed.

Cash Flows from Investing. The major line items in this section of the cash flow statement are as follows:

- Capital Expenditures. This figure represents money spent on items that last a long time, such as property, plant, and equipment. When capital spending increases, it often means the company is expanding.
- Investment Proceeds. Companies will often take some of their excess cash and invest it in an effort to get a better return than they could in a savings account or money market fund. This figure shows how much the company has made or lost on these investments.
- Purchases or Sales of Businesses. This figure includes any money the company made from buying or selling subsidiary businesses and will sometimes appear in the cash flows from operating activities section, rather than here.

Cash Flows from Financing. The major line items in this section of the cash flow statement include such things as:

- Dividends Paid. This figure is the total dollar amount the company paid out in dividends over the specified time period.
- Issuance/Purchase of Common Stock. This is an important number because it indicates how a company is financing its activities. New, rapidly growing companies will often issue new stock and dilute the value of existing shares in so doing. This practice does, however, give a company cash for expansion. Later, when the company is more established, it will be in a position to buy back its own stock and in this way increase the value of existing shares.
- Issuance/Repayments of Debt. This number shows whether the company has borrowed money during the period or repaid money it previously borrowed. Borrowing is the main alternative to issuing stock as a way for companies to raise capital.

The cash flow statement is one of the financial statements that all publicly traded companies must file with the Securities and Exchange Commission (SEC). The SEC requires that all forms be filed electronically through their Web site (www.sec.gov/edgar.shtml). These statement are then made available to the public and can be viewed by stockholders or potential investors. The cash flow statement in particular offers managers, investors, lenders, and suppliers of a company insight into how well it is meeting its short-term obligations, regardless of whether or not the company is generating income.

CASH MANAGEMENT

Cash management is a broad term that refers to the collection, concentration, and disbursement of cash. The goal is to manage the cash balances of an enterprise in such a way as to maximize the availability of cash not invested in fixed assets or inventories and to do so in such a way as to avoid the risk of insolvency. Factors monitored as a part of cash management include a company's level of liquidity, its management of cash balances, and its short-term investment strategies.

In some ways, managing cash flow is the most important job of business managers. If at any time a company fails to pay an obligation when it is due because of a lack of cash, the company is insolvent. Insolvency is the primary reason firms go bankrupt. Obviously, the prospect of such a dire consequence should compel companies to manage their cash with care. Moreover, efficient cash management means more than just preventing bankruptcy. It improves the profitability and reduces the risk to which the firm is exposed.

A 2010 press release by the Aberdeen Group discussed their research on how the global financial crisis has affected many businesses' ability to manage cash flow. The greatest effect concerned the way cash flow is managed during challenging economic times. Nasreen Quibra, an analyst at Aberdeen Group, noted that "contrary to the classic approach ... companies are not delaying payment as long as possible." Instead, they are promptly paying their invoices to take advantage of early payment discounts and to avoid late payment fees. Based on these assumptions, it can be argued that holding on to cash is no longer always the most profitable option.

Cash management is particularly important for new and growing businesses. Cash flow can be a problem even when a small business has numerous clients, offers a product superior to that offered by its competitors, and enjoys a sterling reputation in its industry. Companies suffering from cash flow problems have no margin of safety in case of unanticipated expenses. They also may experience trouble in finding the funds for innovation or expansion. (It is, somewhat ironically, easier to borrow money when a person has money.) Finally, poor cash flow makes it difficult to hire and retain good employees.

In his 2008 book *The Small Business Start-Up Kit*, Peri Pakroo emphasizes the importance of a cash flow projection. A cash flow projection will analyze whether the money coming into the business from sales, loans, or investments will come in quickly enough to cover the company's outgoing costs. According to Pakroo, it is important to remember that having the money at the right time is nearly as important as having the money at all.

It is only natural that major business expenses are incurred in the production of goods or the provision of services. In most cases, a business incurs such expenses before the corresponding payment is received from customers. In addition, employee salaries and other expenses drain considerable funds from most businesses. These factors make effective cash management an essential part of any business's financial planning. Cash is the lifeblood of a business. Managing it efficiently is essential for success.

When cash is received in exchange for products or services rendered, many small business owners, intent on growing their company and tamping down debt, spend most or all of these funds. But while such priorities are laudable, they should leave room for businesses to absorb lean financial times down the line. The key to successful cash management, therefore, lies in tabulating realistic projections, monitoring collections and disbursements, establishing effective billing and collection measures, and adhering to budgetary restrictions.

CASH COLLECTION AND DISBURSEMENT

Cash collection systems aim to reduce the time it takes to collect the cash that is owed to a firm. Some of the sources of time delays are mail float, processing float, and bank float. Obviously, an envelope mailed by a customer containing payment to a supplier firm does not arrive at its destination instantly. Likewise, the payment is not processed and deposited into a bank account the moment it is received by the supplier firm. And finally, when the payment is deposited in the bank account, oftentimes the bank does not make the funds available immediately. These three "floats" are time delays that add up quickly, and they can force struggling or new firms to find other sources of cash to pay their bills.

Cash management attempts, among other things, to decrease the length and impact of these "float" periods. A collection receipt point closer to the customer perhaps with an outside third-party vendor to receive, process, and deposit the payment (check) is one way to speed up the collection. The effectiveness of this method depends on the location of the customer; the size and schedule of its payments; the firm's method of collecting payments; the costs of processing payments; the time delays involved for mail, processing, and banking; and the prevailing interest rate that can be earned on excess funds. The most important element in ensuring good cash flow from customers, however, is establishing strong billing and collection practices.

Once the money has been collected, most firms then proceed to concentrate the cash into one center. The rationale for such a move is to have complete control of the cash and to provide greater investment opportunities with larger sums of money available as surplus. There are numerous mechanisms that can be employed to concentrate the cash, such as wire transfers, automated clearinghouse (ACH) transfers, and checks. The trade-off is between cost and time.

Another aspect of cash management is knowing a company's optimal cash balance. There are a number of methods that try to determine this magical cash balance, which is the precise amount needed to minimize costs yet provide adequate liquidity to ensure bills are paid on time (hopefully with something left over for emergency purposes). One of the first steps in managing the cash balance is measuring liquidity, or the amount of money on hand to meet current obligations. There are numerous

ways to measure this, including: the cash to total assets ratio, the current ratio (current assets divided by current liabilities), the quick ratio (current assets less inventory, divided by current liabilities), and the net liquid balance (cash plus marketable securities less short-term notes payable, divided by total assets). The higher the number generated by the liquidity measure, the greater the liquidity and vice versa. However, there is a trade-off between liquidity and profitability which discourages firms from having excessive liquidity.

CASH MANAGEMENT IN TROUBLED TIMES

Many small businesses experience cash flow difficulties, especially during their first years of operation. But entrepreneurs and managers can take steps to minimize the impact of such problems and help maintain the continued viability of the business. Suggested steps to address temporary cash flow problems include:

- Create a *realistic* cash flow budget that charts finances for both the short term (30-60 days) and longer term (1-2 years).
- Redouble efforts to collect outstanding payments owed to the company. "Bill promptly and accurately," counseled the *Journal of Accountancy.* "The faster you mail an invoice, the faster you will be paid.... If deliveries do not automatically trigger an invoice, establish a set billing schedule, preferably weekly." Businesses should also include a payment due date.
- Offer small discounts for prompt payment.
- Consider compromising on some billing disputes with clients. Small-business owners are understandably reluctant to consider this step, but in certain cases, obtaining *some* cash even if your company is not at fault in the dispute for products sold or services rendered may be required to pay basic expenses.
- Closely monitor and prioritize all cash disbursements.
- Contact creditors (vendors, lenders, landlords) and attempt to negotiate mutually satisfactory arrangements that will enable the business to weather its cash shortage (provided it is a temporary one). In some cases, a company may be able to arrange better payment terms from suppliers or banks. "Better credit terms translate into borrowing money interest-free," states the *Journal of Accountancy.*
- Liquidate superfluous inventory.
- Assess other areas where operational expenses may be cut without permanently disabling the business, such as payroll or nonstrategic goods and/or services with small profit margins.

CENSUS DATA

The U.S. Constitution (Article I, Section 2) mandates that a census ("enumeration") of the population be conducted at 10-year intervals. The first census took place in 1790; U.S. marshals went door to door to get the count. To streamline and speed up the process, Congress established a census office within the Department of the Interior in 1880 for that year's census; it was staffed by professionals for the first time rather than U.S. marshals' agents. In 1902 Congress created a permanent Census Office in the Department of Commerce and Labor. When the Department of Labor split from this department in 1913, the Bureau of the Census stayed in the Department of Commerce. As an element of the Department of Commerce, the Bureau of the Census was also charged by Congress to conduct the Economic Census which takes place at 5-year intervals (years ending in 2 and 7). Commerce tracks the economy as a whole and publishes the gross domestic product (GDP) data at quarterly intervals.

After Congress created the Department of Labor (DOL), the DOL established its own extensive statistical element, the Bureau of Labor Statistics (BLS). BLS tracks labor issues, compensation, and pricing, and publishes such widely cited economic measurements as the consumer price index (CPI) and the unemployment rate. Other federal departments have developed substantial, formal statistical organizations as well, among them notably the departments of Agriculture, Education, Energy,

Interior, Justice, Health and Human Services, and Transportation. Statistics in some form are available from virtually all other federal agencies as well, but these are somewhat less formally managed and offered and may be more difficult for the small-business owner to find.

Federal statistics are the most complete and comprehensive sources of data available to the small business at the right price: free. Some costs are involved for the publication itself (which may take the form of a printed book, pamphlet, CD, or computer tape), but no payment is required for the substantial work that goes into every survey. Virtually all published data are available for the nation as a whole, for states, for counties, and (for the population census) down to the census tract level, an area of a few blocks. Data are reasonably current, and the Census Bureau frequently updates its Web site with current information and relevant statistics. For example, in November 2009, the Census issued a report about homes with cell phones, and in January 2010, the Census Web site added statistics on the Haitian popultion after news coverage of a devastating earthquake in Haiti raised public awareness about the plight of the Haitian people. The Bureau of the Census (as well as BLS) conduct a partial survey between official census years to provide more up-to-date population data based on extrapolations from smaller samples.

CONTROVERSIES ABOUT CENSUS METHODOLOGY

Although it is common for the Census Bureau and the BLS, among others, to use statistical methods to extrapolate data for years between official Census collection, controversy has surrounded the question of using such methods to conduct the actual Census. For the 1990 Census, the Census relied heavily on mail-in surveys, yet there were significant problems identified with this tally. The Census Bureau officially recorded 248,709,873 people, but other evidence from other surveys and demographic analyses suggested that the population was probably closer to 253 million. Sampling experts pointed out that those who were not counted were mostly children, minorities, and poor residents of both rural and urban areas. Barbara Everitt Bryant, Director of the Census Bureau during the 1990 count, stated, "Coming out of the 1990 census, we recognized that you can"t count everyone by direct enumeration."

As the 2000 Census approached, the Census Bureau proposed using statistical sampling methods to correct the results of the conventional count with the results of a large sample survey of the population. According to Tommy Wright, then the chief of the Census Bureau"s statistical research division, "The plan will help lead to a result that includes more of the overall population, especially for certain subpopulations, and it will help to control costs."

The sample-correcting plan for Census 2000 was halted in January 1999, when the Supreme Court ruled against the use of statistical sampling to count the population for purposes of determining Congressional representation. However, the Court did uphold a law mandating the use of a statistically adjusted count for other purposes, including the distribution of $180 billion in federal funds. Census 2000 was conducted with a traditional counting method, though many experts in statistics remained in favor of the use of sampling to correct for typical undercounting problems.

The controversy over the use of sampling methods arose again in 2008, shortly after the election of Democrat Barack Obama as the new U.S. president. Critics of the conventional counting method employed by the Census in the past advocated the use of sampling to correct the undercount of hard-to-reach populations, which are often minorities living in urban areas who tend to vote most strongly for Democrats. Some Republican lawmakers were concerned that the Obama administration had plans to politicize the Census by using sampling methods to adjust the Census in favor of Democrats. President Obama allayed these fears when he appointed Robert Groves as Director of the Census Bureau in May 2009. Testifying at his confirmation hearing before the Senate, Groves ruled out the use of statistical sampling in the 2010 count. The Census 2010 Web site unequivocally stated, " We will not use statistical methods to adjust the count for the 2010 Census."

USEFULNESS OF DATA TO SMALL BUSINESSES

Many advertising, architectural, consulting, economic research, educational, engineering, market research, polling, surveying, and training organizations are small businesses themselves. For this community of users, census data and other statistical data supplied by other agencies are often a major input to or the very raw material of the work product that they create. Such businesses, of course, make sure that they understand the data sources, the many intricate problems of data and how to work around them, and, of course, where to get the required information and in what format.

A small business in some other field may, however, with relatively low investment in learning, begin to use census data in assessing its market and competition. A starting point might be the Census Bureau's annual County Business Patterns (CBP) series. The CBP provides data at the county, metropolitan, or zip code level on a number of establishments by industry, employment, and payroll data. Several years' worth of data are usually available so that comparisons can be made year to year. The most recent data will be 3 years old. Using his or her

own county, town, or zip code, the business owner can rapidly get a feel for the competition, the average number of people such businesses employ, and what employees are paid on average. The only requirement is that the owner must know the numerical code for his or her business. Industries are classified using the North American Industry Classification System (NAICS). Getting data on a company's NAICS code, and downloading data on a particular industry, can be easily done on the Internet. Internet "fluency," however, is a requirement. The alternative to online searching is to obtain data on paper from the nearest large public library with a department for federal documents.

LIMITATIONS

The business seeking information about another company or range of companies *by name* will discover that census data hide any and all information that may reveal the particular operational numbers for a single business. Thus if a zip code has only *one* participant in a NAICS industry, the County Business Patterns, for instance, will "hide" the results in a higher NAICS code rather than let the public know how many employees ABC, Inc. has and what it pays them. Federal data are most useful for discovering broader trends in markets, prices, employment, output, and purchasing. Specific company-level intelligence may also be available, but only if the company is publicly traded and falls under the regulation of the Securities and Exchange Commission (SEC). In such a case, the small business can obtain the filings of that company with the SEC.

Many people encountering federal data for the first time also complain that "the statistics are old." Indeed, it takes substantial effort and time to collect statistics from millions of businesses or individuals, to process these data, and then to make them available in printed or electronic forms. Thus 3- or 4-year-old federal data are "fresh," indeed the most up-to-date available anywhere. Whenever more recent data are cited, they are based on extrapolations and estimates, not genuine *enumeration* such as the Constitution requires.

CERTIFIED LENDERS

Certified lenders are banking institutions that qualify for inclusion in a streamlined lending program maintained by the Small Business Administration (SBA). Certified lenders are institutions that have been heavily involved in regular SBA loan-guaranty processing and have met other criteria stipulated by the SBA for participation in the Certified Lender Program (CLP). Certified lenders are given partial authority to approve. The SBA expects CLP lenders to perform a complete loan analysis; in return, the SBA promises a 3-day turnaround. The SBA still makes the final credit and eligibility decision but, by completing a credit review instead of an conducting an independent analysis, the SBA can offer faster loan decisions. The SBA Web site points out the advantages of this system: "The key aspect of CLP is the greater utilization of the credit knowledge of the lender's loan officers to shorten SBA's loan processing time."

The CLP is only one of many loan programs sponsored by the SBA. Sources vary on how extensive the CLP is within the SBA. According to some sources, between 4 and 10 percent of all SBA loans are made through the CLP. The Minority Business Development Agency of the U.S. Department of Commerce claims that certified lenders account for one-third of the loans that are guaranteed by the SBA. According to *Entrepreneur*, there were about 850 lenders participating in the Certified Lender Program in 2009.

A lending institution can become a part of the SBA's Certified Lender Program (CLP) in one of two ways: 1) It may make a request to an SBA field office for consideration for the program; or 2) An SBA field office may nominate the lender without prompting from the institution. SBA district directors approve and renew a lender's status as part of the CLP. Primary considerations in determining whether the lender will qualify include:

- Whether the applicant has the ability to process, close, service, and liquidate loans.

- Whether the applicant has a good performance history with the SBA (i.e., has it submitted complete and accurate loan guarantee application packages in the past?).
- Whether the applicant has an acceptable SBA purchase rate.
- Whether the applicant seems able to work amicably with the local SBA office.

If a lending institution has its application for inclusion in the CLP turned down, it may make an appeal to the SBA's Associate Administrator for Financial Assistance (AA/FA), whose decision is final.

According to the Small Business Administration, the AA/FA may suspend or revoke CLP status upon written notice providing the reasons are given at least 10 business days prior to the effective date of the suspension or revocation. Lending institutions may lose their status for a variety of reasons, including a poor loan performance record; failure to make the required number of loans; violations of applicable statutes, regulations, or published SBA policies.

Similar to certified lenders are preferred lenders. Banks that qualify as preferred lenders are among the best SBA lenders and enjoy full delegation of lending authority in exchange for a 75 percent rate of guaranty. In other words, they do not have to run an SBA loan past the SBA before approving it. This lending authority has to be renewed every 2 years, and the lender's portfolio is examined by the SBA on an annual basis. Preferred lenders are also required to employ two SBA-trained loan officers. There are about 450 preferred lenders. Sources agree that preferred loans accounts for about 20 percent of all SBA loans.

A wide range of small-business financing experts recommend using either a certified or preferred lender to seek an SBA loan. As *Entrepreneur* points out, "The SBA-guarantee process is tricky at best, and you want a lender who has been through it more than once." Certified and preferred lenders can be found on the SBA Web site or through local SBA offices.

The economic stimulus efforts pushed by the administration of President Barack Obama resulted in a sharp increase in government-backed small-business loans. With the 2009 passage of the American Recovery and Reinvestment Act, the SBA received an additional $730 million in funds to help stimulate small-business lending. To boost lending further, the SBA waived loan fees for borrowers and raised loan guarantees for banks.

CERTIFIED PUBLIC ACCOUNTANTS

Certified public accountants (CPAs) provide a broad range of financial services to small businesses. These services include preparation of financial statements and tax returns, providing advice on various aspects of business, such as operations and management, and assisting in the development and installation of effective accounting systems.

Unlike large corporate enterprises, small-business owners may not need continuous accounting services. Still, small-business owners need to ensure that their enterprise operates in accordance with the complexities of modern finance, and that they have an informed understanding of the business's financial health in order to ensure that they can make sound business decisions. Many entrepreneurs and business owners turn to CPAs for help in these areas. For a small business, financial mismanagement can spell failure; choosing and using the services of a CPA are critical to business success.

QUALIFICATIONS

The CPA has a comprehensive educational background. Each candidate must attend a 4-year program in accounting at an accredited institution. A CPA must also pass a standard test for competency in the field. The CPA exam covers four main areas: Law and Professional Responsibility; Auditing Procedures; Accounting and Reporting (taxation and accounting); and Financial Accounting and Reporting. This exam is administered in every state by a state board of accounting.

Individual state boards also set up state regulations for professional licensing standards. This often means that CPAs are required to have professional experience. Each state has requirements that are peculiar to the state, and regulatory efforts are continuous. In 2005, for instance, the Katrina hurricane and the devastation it

caused produced changes in CPA practices in Louisiana; in Michigan, new rules were instituted requiring that CPAs submit past work product for peer review in order to have their licenses renewed. In 2008 Washington state legislators approved a bill aimed at improving interstate mobility for CPAs. Many other states have also passed laws allowing CPAs more easily to conduct business for clients in other states. The International Qualifications Appraisal Board (IQAB) serves to screen CPAs holding credentials from other countries; business owners should be aware that IQAB has ruled that accounting bodies in some countries, such as the Australian Society of Certified Practicing Accountants and the Association of Chartered Certified Accountants in the United Kingdom, are not equivalent to American licensing programs. This is especially important since some CPA firms based in the United States have begun outsourcing work to other countries in an effort to cut costs. A small business wishing to keep up-to-date with current practice can do so by contacting its state board and/or the IQAB.

There are several organizations for CPAs which also provide information and educate the public on the role of the CPA. The major national organization is the American Institute of Certified Public Accountants (AICPA). Its goals are to provide members with resources and information and to promote public awareness about the profession. The AICPA sets a code of professional standards which serve as guidelines for CPAs in conduct and professional responsibility.

SERVICES

CPAs provide financial services to the general public which can encompass both private citizens and business enterprises rather than to one single company. They can act individually or as members of a public accounting firm. CPAs may provide service in one or more areas in which they have been trained, including the following:

- Financial Planning. A CPA may analyze assets, income, and spending in order to give a person a clear picture of his or her financial status. This can be done on an individual basis (retirement planning or investment planning) or on the business level (preparation of pension plans and business investments).
- Tax Preparation. A CPA can be a valuable resource to entrepreneurs seeking help in unraveling various tax codes and their impact on business. This function includes areas such as tax regulation compliance, consultation, and planning and representation.
- Management Advisory Services. Small-business owners may need advice on anything from how to file for a business loan to the preparation of a budget. A CPA can assist business owners in preparing financial statements, budgets, strategic planning, and other financial advice.
- Accounting and Auditing. This involves verification of a company's accounting processes, documentation, and data to be certain they conform to accounting principles. In this function, the CPA makes sure that financial statements are in order.

CPAs often specialize in specific areas of the accounting practice, such as auditing and accounting, tax law, or management advisory. They may also specialize in certain industry areas, such as retail, health care, or restaurant businesses.

ENTREPRENEURS AND THE CPA

Entrepreneurs seeking a CPA should look for the following:

- Reasonable Prices. Most CPAs charge competitive rates, but it makes sense to check pricing to be sure that the CPA an entrepreneur is considering is not charging rates exorbitantly higher than his or her competitors. It is always advisable to request a letter from the firm or individual CPA that explicitly states the CPA's fee or billing rate. This letter may also specify the billing and payment methods.
- Good Reputation. Does the CPA come well recommended? Integrity is something people discuss when talking about people who work with financial information. Listening to other business owners can provide valuable information in making choices. In addition, trade associations, local business resource centers, and business organizations (such as a local chamber of commerce) are also potentially valuable sources of information when selecting a CPA. As business owners narrow the field of candidates, they should ask for the names of other businesses the CPA serves and follow up with those references.
- Quality and Timeliness of Service. A CPA who does not deliver quality services in a prompt and reliable fashion is of little use to a small business. "Although it seems that all CPAs are similar, they don't all provide the same level of service," noted Thomas Murray in *LI Business News*. "And while price is a factor in any business decision, your choice should be primarily based upon the added value you receive from your relationship with your CPA."
- Flexibility and Adaptability. Can the CPA's business or firm fit your needs? Some CPAs provide only auditing or tax services, while others offer a host of financial planning, retirement, pension, and other

services. A business owner should choose a CPA which can continue to be of service as the needs of the business change.

- Communicate. Business owners should be prepared to outline all the services that they believe they will need from their CPA. In some instances, a CPA may realize that the business owner is asking for a scope of services or a level of specialization that he or she cannot provide. If these obstacles can be identified early, both the entrepreneur and the accountant can save themselves a great deal of time and pursue other business opportunities.

Once a CPA has been selected, entrepreneurs should prepare to do some footwork to make the relationship a valuable one. The business owner should be prepared to keep accurate records, including invoices, payments, and amounts spent on business-related expenses. A little bookkeeping goes a long way to improving the service a CPA can provide.

One alternative a small-business owner may wish to consider is the use of accounting software such as QuickBooks by Intuit. Many small-business owners find such software to be an affordable alternative to hiring a CPA, though the owner must be willing to learn how to use the software. The majority of small-business owners choose a software solution for their accounting needs, and over 90 percent of the market is controlled by QuickBooks. Rather than simply replacing CPAs, however, Intuit has worked to include the expertise of accounting professionals in ways that benefit small- business owners. Many CPAs even offer services as advisors for QuickBooks users. Intuit also provides resources for small-business owners to locate an accounting professional for advice and special services that are beyond the scope of their software.

CHAMBERS OF COMMERCE

A chamber of commerce is a voluntary association whose membership is comprised of companies, civic leaders, and individual business people. Its members seek to promote the interests of business, typically in a broad-based way. Chambers of commerce exist on municipal, state, regional, national, and international levels. Today, chambers of commerce sometimes called boards of trade or commercial associations can be found in most of the world's industrialized countries.

In the United States, the first chamber of commerce was created in 1768 in New York City. Its stated objectives encompassed "encouraging commerce, supporting industry, adjusting disputes relative to trade and navigation, and producing such laws and regulations as may be found necessary for the benefit of trade in general." Soon other chambers of commerce formed in other major cities. Arising in quick succession during the nineteenth century, chambers of commerce spread throughout the land and today number in the thousands.

LOCAL CHAMBERS OF COMMERCE

At the local level, chambers of commerce strive to develop and publicize business opportunities in their communities, as well as work for the betterment of local schools and other community institutions. Local chambers of commerce offer a range of programs and services to their members, including information and advice on timely business matters, opportunities for networking, and a variety of publications. Local chambers of commerce also provide their members with numerous forums task forces, committees, special events, and so on in which to express their specific views and concerns, whether pertaining to the challenges facing small businesses or to the issues surrounding international commerce. Depending on their geographic settings, local chambers of commerce can be small or large in terms of their membership and scope of activities.

NATIONAL LEVEL

At the national level, chambers of commerce function as a unified voice for their affiliates. The U.S. Chamber of Commerce, for example, counts individual companies, affiliate chambers of commerce, and trade and professional

associations among its members. Through them, it represents more than three million business organizations and individuals. Members include business of all sizes, from the Fortune 500 companies to home-based, one-person operations. In fact, 96 percent of the U.S. Chamber of Commerce's membership is made up of companies with fewer than 100 employees.

Founded as a national federation in 1912 and headquartered in Washington, D.C., the national chamber was instrumental in persuading the federal government to institute a national budget and in gaining passage of the Federal Reserve Act of 1913. The chamber' chief aims are to stop perceived overregulation; push down business taxes; improve labor relations; increase production; develop new markets; provide more jobs; raise educational levels; build better cities; and keep organized business strong and increasingly effective.

To carry out its mission, the national chamber maintains a large staff that engages in a broad spectrum of activities, ranging from informing and counseling its members on key government developments to conducting policy studies and issuing reports, bulletins, booklets, and periodicals. In addition, the national chamber maintains a vigorous stance in making its policies and members' viewpoints known to federal agency personnel, members of Congress, and other public officials. Augmenting the national chamber are four regional offices and fifty foreign-based American chambers of commerce.

Historically, the U.S. Chamber of Commerce has lobbied against legislation that, from a business owner's perspective, might negatively affect the success and profitability of American businesses. This includes proposals to increase the minimum wage, as well as legislation such as the Employee Free Choice Act, which would make it easier for employees to form and join unions. In 2009 the U.S. Chamber of Commerce was the subject of controversy related to the issue of global climate change. The chamber lobbied against the American Clean Energy and Security Act of 2009 (ACES), which sets a national limit on the amount of greenhouse gases produced by American businesses and calls for a gradual reduction in that total amount over the course of three decades. Representatives of the chamber argued that the bill would result in much higher costs to businesses that rely upon fossil fuels. The organization also supported the view that global climate change remains an unproven theory.

The ACES bill was passed by the U.S. House of Representatives in June 2009, and in the months that followed, several corporations ended their memberships with the U.S. Chamber of Commerce, citing the organization's stance on climate change as the reason. Among the companies that left the chamber were Apple Inc. and Pacific Gas & Electric. The Nike Corporation gave up a position on the chamber's board of directors over the issue, but remained a member of the organization. Despite the controversy, according to a 2010 Harris Interactive poll, the U.S. Chamber of Commerce remains one of the most respected lobbying organizations in Washington.

INTERNATIONAL LEVEL

At the global level is the International Chamber of Commerce, founded in 1920. This organization constitutes an international federation of business organizations and individuals and as such serves as a powerful voice for business interests worldwide. It holds the highest-ranking status afforded to organizations the United Nations calls on in a consultative capacity. It also operates a prominent court of arbitration to settle international business disputes; utilizes teams of experts to formulate solutions to problems in such areas as communications, law, and financial relations; and issues a quarterly publication titled *World Trade*. Headquartered in Paris, the International Chamber of Commerce functions as a vital mechanism for articulating global business concerns to world opinion leaders and the public at large.

Junior chambers of commerce, known as the Jaycees, also originated in the 1920s. These associations, evolving from the larger chamber of commerce movement, are composed of young business people in their twenties and thirties. Prevalent throughout the United States and in many other countries as well, junior chambers of commerce principally devote their energies to projects of community improvement.

CHARITABLE GIVING

Many small-business owners engage in charitable giving, either as private individuals or in their corporate capacity. This charitable giving can take many forms, including

sponsorship of local charitable events, donations of excess inventory, and sustained philanthropy in one or more areas through the establishment of a formal foundation or council. Whatever form the charitable giving takes, experts and entrepreneurs agree that such activity can have a beneficial impact on the company as well as the charities and institutions it supports.

Tough economic times, such as the recession that began in 2008, severely impact charitable contributions to those in need at a time when they are needed most. According to a 2009 report by the Giving USA Foundation, 2008 donations decreased for two-thirds of all public charities when compared to the previous year. Still, as a 2010 article at *BusinessWeek.com* suggests, "strategic giving" can be a vital way of improving a company's image to consumers and increasing brand awareness.

CONTRIBUTIONS OF GOODS AND SERVICES

Charitable giving by small businesses most often takes the form of contributions of goods and, less often, services. Indeed, many companies have made donations of obsolete, excess, erroneously packaged, or slow-moving inventory. The bottom-line advantages of such donations are considerable for small companies. "Not only can you get rid of that inventory and free up warehouse space, but you also can get a hefty tax deduction often, more than your production costs and at the same time help a not-for-profit organization," wrote Marsha Bertrand in *Nation's Business.* Indeed, some companies that donate goods to charitable causes can reap tax deductions that equal the cost of producing those goods plus half the difference between that cost and the fair market value of those goods. The amount of the deduction for which companies are eligible will vary with their legal status. Partnerships, S corporations, and sole proprietorships will only be able to claim deductions amounting to the production cost of the donated goods. But for C corporations, the deduction can be two times the production cost.

Bertrand and others point out, however, that the donated goods will entitle businesses to a deduction only if they meet requirements laid out in the Internal Revenue Service's tax code. For instance, the donor business will qualify for a deduction only if it hands over its goods to a qualified nonprofit organization. Moreover, products that are donated must be targeted at helping disadvantaged or otherwise legitimate groups, such as children, the needy, and people who are ill. Finally, donated goods must be handed over unconditionally; the donor business is not allowed to receive compensation in any form for its largess. Despite these restrictions, analysts and companies that have established charitable giving programs agree that making such donations can have a potent positive impact for the participating business.

In addition to the tax deduction and the reduced inventory-carrying costs, companies realize tremendous public relations benefits from corporate giving. According to the "Cone Corporate Citizenship Study" conducted by Boston-based Cone Inc., eight in ten Americans say corporate support of causes helps earn their loyalty to a business. C. J. Prince explains in an *Entrepreneur* article on the subject that to many entrepreneurs focused "on keeping costs down and milking every cash-flow dollar, corporate giving sounds like a luxury they just can't afford. But in today's competitive environment, corporate charitable programs and partnerships may be the cheapest strategic competitive edge you can get not to mention the satisfaction they can bring."

Many businesses that choose to direct their excess inventory toward philanthropic targets have come to realize that there are a number of agencies that can help them in this task. In addition to nonprofit organizations themselves, which typically try to make the donation process as easy as possible for donor companies, companies interested in handing over goods can enlist the help of organizations known as exchanges. These organizations serve as middlemen, accepting products from companies and then distributing them to various deserving charitable groups. "In addition to finding an outlet for your goods, exchanges supply you with the proper tax documentation, handle distribution, and ensure that the recipient qualifies under the tax code," stated Bertrand.

ORGANIZED GIVING IN SMALL FAMILY ENTERPRISES

Business experts agree that charitable giving is an activity that, when considered by small family-owned businesses, is particularly rife with both opportunities and challenges. The chief pitfall of charitable giving by members of family businesses is lack of communication. All too often each member of a family involved in a business writes out checks to charities of his or her choosing. One may donate to the cancer society, another to the arts, and a third to yet a different worthy nonprofit. When the donations are tallied up a lack of direction and consistency in support is often the result. Analysts encourage owners of family businesses to organize their charitable giving in a cohesive way that can benefit both deserving nonprofit organizations and the business itself.

Organizing a Strategy for Philanthropic Giving. There is no one organized giving plan that all family-owned businesses should adhere to. Indeed, small and mid-sized family businesses utilize a broad range of charitable

strategies, many of which are tremendously effective despite their differences in emphasis, direction, and execution. But most successful giving programs share a common characteristic that is also a hallmark of success in the business arena: proper research and planning. Family businesses seeking to establish a program of charitable giving need to recognize that such policies are predicated on three major issues choice of charities, size of donations, and the vehicle that will be used to execute donations.

Choice of Charity or Charities. Some family businesses choose to provide financial support only to causes that are personally important to family members, regardless of their influence on the business or industry in which the family is involved. Other families, meanwhile, may choose to steer their charitable giving toward areas that also impact the family business. A publisher who supports literacy causes, for example, can publicize that connection and boost its public image. A paper manufacturer that supports environmental and deforestation causes may, likewise, create goodwill in the community.

Of course, many families will discover that agreeing on the primary recipients of a charitable giving program is no easy matter. Some family members may be enthusiastic supporters of a nonprofit organization, only to find to their dismay that other members are lukewarm or even hostile to that organization's goals and mission. In such instances, consultants urge individuals not to adopt an intransigent position or engage in "tit-for-tat" negotiations in which approval of a charity is withheld until family members agree to provide financial support to a cause of which they may not be enamored. There are plenty of charities to which everyone should be able to agree to donate. In instances where disagreements break down along generational lines, another option is to create a 3- to 5-year plan in which the causes favored by one generation give way over time to those favored by the next generation.

Donations to global relief efforts, such as those that arose following the 2010 earthquake in Haiti, are subject to special conditions that should be thoroughly researched before any donations are made. For example, donations to foreign organizations generally cannot be deducted when filing federal income tax returns. Be sure to donate through an organization based in the United States; resources such as the United States Agency for International Development (USAID) can provide guidance on American charitable organizations aimed at helping with global relief efforts. Many such organizations accept donations through text messages; it is important to keep copies of phone bills that list any such donations, since they may qualify as documented proof of the donation. Charitable gifts to emergency relief efforts may also qualify for early deduction on a prior year's tax return; for example, individuals and businesses that contributed to Haiti earthquake relief in early 2010 were able to claim the donation on 2009 tax returns instead of waiting a full year to receive the tax deduction. However, these are special circumstances that require approval from federal lawmakers. Be sure to research the specifics of any global relief effort before contributing.

Deciding How Much to Give. The size of charitable donations that family-owned businesses give is, of course, directly linked to the size and fortunes of the family business. A family-owned lumber business with several locations and a host of reliable corporate clients is obviously going to be able to make larger donations, if it is so inclined, than are the owners of a single sporting goods store. But no matter what the sum total of donations is, family members should make sure that they arrive at the total together and in an informed fashion. That is, organized giving totals should be arrived at with an eye toward the business's current financial standing and its future business plans and prospects. A company poised on the brink of a major expansion effort, for example, may adopt a more modest strategy of organized giving than would a mature business that requires less reinvestment.

Another consideration that members of family-owned businesses need to weigh is their allocation of time to charities. Certain individuals may be enthusiastic supporters of a charity, giving considerable amounts of time and talent to the organization in order to advance its work. Such selflessness is laudable, but it can also give rise to resentments among fellow family members if they begin to feel they are taking on an unfair share of the company's workload as a result. For this reason, family members should make sure that they communicate the needs of the business as well as the charity to one another through regular meetings. Of course, sometimes a business may find that extensive involvement in charitable work can also pay dividends for the company. A hands-on involvement in charitable work demonstrates a tangible commitment to the cause while also allowing for networking with others in the business community.

Choosing a Vehicle for Giving. Many a family-owned business has chosen to establish a philanthropic foundation to guide its charitable activities. This is especially true of families that own larger businesses that can afford to make donations of considerable size. If a company intends to donate a very large sum, more than $250,000, there are advantages to setting up a foundation, which is a legal entity recognized under state law and by the IRS as a nonprofit corporation. Such foundations are subject to complex rules. Nonetheless, contributions to the foundation are generally tax-deductible, whether they are made by family members or by non-family members who support the foundation's goals.

Before committing to a foundation, however, small-business owners should consider the various restrictions that apply (foundations are required by law to distribute a minimum of 5 percent of their net worth to charities every year, for example) and the legal and accounting fees associated with running it.

Another option that some small businesses pursue is the formation of a charitable council. Like individuals, the council can give tax-deductible donations to charities. However, councils are not recognized by or accountable to the IRS and as a result contributors do not receive a tax break on any direct contributions to the council's funds.

CHILD-CARE

Child-care has emerged as an important issue for both employers and employees in recent decades. The statistics are telling. In a publication by the Maternal and Child Health Bureau (part of the Health Resources and Services Administration of the U.S. Department of Health and Human Services), titled *2007 National Survey of Children"s Health*, 54.2 percent of survey respondents with children aged up to five stated that their child or children received 10 or more hours of care from a care provider other than immediate family. A follow-up report, *Child Health USA 2008 2009*, states, "In 2007, 71.0 percent of women with children under 18 years of age were in the labor force (either employed or looking for work) and 67.8 percent were employed." This represents a 10 percent increase in the number of working mothers when compared to data collected by the same organization in 2003. Parents in the United States are working outside the home in greater numbers than ever before and the issue of how best to bring up the next generation is one that touches everyone.

As early as the mid-1990s a U.S. Department of Labor study observed that "America has become a society in which everyone is expected to work including women with young children. But many of society's institutions were designed during an era of male breadwinners and female homemakers. What is needed is a ... reform of the institutions and policies that govern the workplace to ensure that women can participate fully in the economy and that men and women have the time and resources to invest in their children." Researchers, child-care experts, and working parents have been heartened by the success that some businesses have experienced in their efforts to assist their employees in this area, but the consensus remains that many child-care arrangements are inadequate for working parents.

This problem is even more acute for single parents who do not have partners who can carry the child-care load in emergency situations. It is also more prevalent in certain industries; studies indicate that working women in professional occupations (typified by high levels of education and salary) are two or three times more likely to receive child-care benefits from their employers than are women who work in service, production, and agricultural occupations.

CHILD CARE POLICIES IN THE WORKPLACE

Child-care problems have repercussions for employers as well as employees. Analysts have pointed out that problems with child-care can be a significant drain on worker productivity, and in some cases can even result in the permanent loss of valued employees. According to some experts, small businesses are particularly vulnerable to such losses, since they often do not have the financial resources to install the on-site child-care centers that have proven beneficial to some larger companies in addressing this issue. But observers contend that small business enterprises have a variety of options at their disposal to help their employees deal with the child-care issue.

Of course, the first priority for working parents is ensuring that their children are placed in a child-care environment that protects them and attends to their

physical and emotional needs. Working parents may have different family situations and child-care needs but they all voice the same concerns. Parents want their children to be in a safe environment, shielded from the potential dangers and abuses about which they hear so much in the media. When parents believe their children are safe and secure in another person's care, they feel a sense of relief and are able to attend to other matters more fully.

While safety is the paramount concern in selecting a child-care provider, parents also look at other tangible quality factors like cleanliness, licensing, staff certification, and curriculum. Many parents expect the day care environment in which they leave their children to be an enriching environment as well, one in which the children learn. Unfortunately, the state of professional child-care in the United States all too often leaves much to be desired. As David Whitman remarked in *U.S. News & World Report*, "the warped dynamic of the child-care market is all too plain: There are too many parents chasing too few day-care openings in settings where there is too much turnover of providers who receive too little training and pay." This state of affairs naturally serves to further exacerbate the concerns of working parents seeking to juggle home and office responsibilities.

INTERGENERATIONAL CARE

Changing demographics in the United States have also created a situation wherein increasing numbers of working people find themselves dividing their time, energy, and financial resources between two sets of care demands. On one end are small children, while on the other can be found elderly parents. This phenomenon has given rise to the still modest but growing success of "intergenerational care" centers, in which working parents who also have obligations to care for their own elderly parents can place both categories of dependents in a single facility, where they will be cared for. Most experts expect that, given the continued rise in participation by women in the work place and the track record of success enjoyed by intergenerational care programs in hospitals, nursing homes, and child-care centers the concept of intergenerational care will continue to increase in popularity in the business world. In fact, some studies indicate that demographic trends practically ensure the continued growth of intergenerational care facilities.

Given all of these considerations, observers believe that businesses looking to provide some measure of child-care assistance to their employees will factor the elder care issue into their analysis of options with increasing frequency. "Companies that aren't doing anything at all probably could not envision doing on-site intergenerational care, or even elder care," admitted one executive whose company opened an intergenerational care facility for its employees in an interview with *HR Focus*. "But we're finding that companies that are either planning or thinking about on-site child-care now are rethinking their space [to accommodate elder care in the future]."

BENEFITS OF CHILD CARE FOR EMPLOYERS

Discussions of child-care nearly always center on the desired benefits of such programs for working parents and their children. But some analysts believe that employers can also reap significant benefits from good child-care arrangements. This accounts for the steady growth in the percentage of companies that offer some manner of child-care assistance to their employees. According to the 2009 Employee Benefits Survey of the U.S. Bureau of Labor Statistics, approximately 10 percent of civilian employees were eligible to receive full or partial compensation for child- care expenses.

This increase in child-care assistance can be directly traced to concerns that employees who are grappling with child-care issues are less productive than those who are unencumbered. These workers spend sometimes large amounts of company time on the issue (for example, calling about possible providers and checking on the well-being of sick children), may fall victim to tardiness, and typically miss several days of work each year due to child-care situations. Indeed, studies conducted in the early 1990s indicated that 1 out of 3 sick days taken by a working parent is actually due to child-related illnesses that preclude the child's presence at school or his or her usual day-care provider, and that other child-care problems can siphon off another 7 or 8 days of employee attendance on an annual basis.

Some businesses, meanwhile, allow parents to bring their children to work with them occasionally when child-care plans fall through. In some business environments, this may not result in dramatic reductions in productivity, but in other settings such as office environments this can result in significant productivity downturns for both the parent (who has to divide his or her time between work and child supervision) and co-workers, who are often distracted by the presence of the youngster. Finally, some businesses permanently lose valuable workers who decide, after having a child, that the expense and hassles associated with day care make returning to the workplace a questionable strategy.

Given the above factors, many experts believe that small and large businesses alike should investigate ways in which they can help their employees secure acceptable child-care arrangements. By doing so, they may well reap increased benefits in the realm of worker productivity. In addition, they are likely to find that having a program of child-care assistance in place can be a tremendous boon in recruiting efforts, and that child-care provisions can help

companies retain employees who might otherwise stay at home or leave for a competitor that offers meaningful child-care benefits.

Finally, companies may find that providing child-care programs to workers is not nearly as expensive as they believed, since the provision of child-care assistance is tax-deductible to employers. From a company standpoint, assisting employees with their child-care needs is good business. A well-administered child-care program can save a company more money than any other employee benefit. It allows a company to recruit employees more effectively, to reduce turnover and absenteeism, and to increase the productivity of employees.

RESEARCHING EMPLOYEES' CHILD CARE NEEDS

Prior to settling on a methodology by which to help working parents in their employ, businesses should first do some research to learn which alternatives will do the best job of meeting the needs of both the company and its workers. The first step in establishing a sound child-care plan is to determine what a company's goals are, what type of corporate culture exists, and how much money it is willing to spend. A child-care plan that does not adequately integrate these considerations will almost certainly perform inadequately or fail. In addition, small-business owners should make sure that child-care is a pressing issue before investing time and money into finding solutions for it. "Make sure that you have a problem in the first place," wrote Dayton Fandray in *Workforce*. "And if you find that a problem exists, measure its dimensions in terms that you can quantify before you try to fix it."

Employers should consider disseminating a questionnaire or find some other means of assessing the needs and desires of their work force. In addition, business owners and managers should take a good look at the demographic makeup of their employee roster. After all, a company that employs relatively few people under the age of fifty is far less likely to need a comprehensive child-care assistance plan than is a business that employs large numbers of women under the age of thirty-five. "Ask how many would be involved in some kind of child-care arrangement, the ages of their children and their current arrangements for having those children taken care of," one management consultant told *Nation's Business*. Employee impressions of various child-care options and the amounts they are willing to contribute to employer-assisted child-care programs should also be solicited.

From there, businesses should investigate the community in which they operate. By checking out what programs the surrounding communities already have to offer, as well as determining both the resources and barriers to starting new ones, a company can be sure not to overlook existing services. Taking advantage of existing services and possibly subsidizing those services is a more economical solution than trying to start from scratch. Finally, companies should try to find ways of accurately evaluating return on investment in their child-care policies. This return on investment can take many forms, from increased loyalty and productivity to growth in employee retention rates.

CHILD CARE AS A SMALL BUSINESS OPPORTUNITY

Another important aspect of child-care is the opportunity it provides to entrepreneurs looking to start a new small business. Start-up and overhead costs are relatively low, since many child-care businesses operate out of the owner's home. In addition, the 2009 American Recovery and Reinvestment Act allocated $2 billion for investment in child-care and development, potentially making it easier for child-care businesses to obtain loans and grants. As with any small business, it is important to survey the needs of the community and learn about the licenses and accommodations required to operate a child-care business; these laws can differ from state to state. The National Child Care Information and Technical Assistance Center provides resources for anyone looking to start a child-care business.

CHILD CARE ASSISTANCE OPTIONS FOR SMALL BUSINESSES

In the past, business enterprises have associated child-care almost exclusively in terms of on-site centers, which have been viewed as excessively expensive to build and operate. But proponents of such facilities contend that those opinions are based partly on misconceptions. In addition, child-care experts and business consultants alike point to several other options that may be viable for employers, including those of small size. These options include company consortiums, outside referral services, salary reduction plans, and reimbursement plans.

On-Site Facilities. Providing on-site child-care facilities is the most expensive option for businesses. It requires significant up-front costs and in some cases increased operating costs in such areas as payroll (states have various guidelines on the necessary qualifications of day care facility managers/professionals, which may necessitate hiring new personnel), utilities, and liability insurance (although companies in some areas may be able to avoid increases in this area). But this option also usually provides the greatest peace of mind to employees, who can visit their children during lunch and other breaks, and dramatically reduces logistics complications that workers

face with off-site facilities (routine drop-offs and pick-ups, picking up kids who are sick). Moreover, the presence of an on-site day care facility is a terrific attraction to prospective employees. And as mentioned above, the expense of establishing an on-site facility can be deducted from taxes. Understandably, however, most of these types of arrangements have been established by larger companies with healthy bottom lines rather than smaller businesses with more modest assets.

Consortiums. Consortiums are among the most popular child-care alternatives for small businesses with limited resources that nonetheless want to assist their workers in securing good care for their youngsters.

In these programs, several small companies in a geographic region pool their resources to support an off-site day care center that is operated by a qualified day care provider. By combining resources, companies can realize significant cost savings while also meeting the child-care needs of their employees. They simply pay for a certain number of slots and make the openings available to their employees (unused slots are usually made available to parents who are employed outside the consortium).

Outside Referrals. Companies that pursue this option contract with an outside agency to provide their employees with community day care information. This information includes rates, locations, and openings at various licensed facilities. This "information clearinghouse" approach is obviously the least expensive option for businesses, but it may also be the least satisfactory for parents who must still research these various options.

Salary Reduction and Reimbursement Plans. A favorite of business owners, who like its minimal expense, salary reduction plans call for the establishment of a flexible spending account that permits employees to reduce their pretax incomes by a specified amount and place that money in an account that is used to reimburse them for child-care expenses. Reimbursement plans, meanwhile, call for tax-deductible payments that are either paid directly to the child-care provider or to the working parents by the company.

In addition to these child-care assistance options, business owners can institute other policies that can have a beneficial impact on their employees' ability to balance work and family responsibilities. Flextime, job sharing, work-at-home options, and extended maternity or paternity leaves have all been touted as policies that can be helpful to working parents.

CHILDREN'S ONLINE PRIVACY PROTECTION ACT (COPPA)

The Children's Online Privacy Protection Act (COPPA) is a U.S. federal law designed to limit the collection and use of personal information about children by the operators of Internet services and Web sites. Passed by the U.S. Congress in 1998, the law took effect in April 2000. It is administered and enforced by the Federal Trade Commission (FTC). COPPA is "the first U.S. privacy law written for the Internet," Melissa Campanelli wrote in *Entrepreneur.* "It was written specifically for Internet marketers that operate Web sites visited by children under the age of 13

and collect personal information from those kids. Its purpose is to regulate that collection."

The FTC conducted a survey of 212 Web sites in 1998 and found that 89 percent of them collected personal information from children. Of those that collected data from children, 46 percent did not disclose this fact or explain how the information was used. The law was intended to address this potential problem by requiring Web sites and other online services directed toward children under the age of thirteen as well as general audience sites that collect personal information from children to obtain verifiable consent from the children's parents. "Its stated purpose is to protect children from micro-targeting by advertisers and to minimize the potential for contact with dangerous individuals through chat rooms, e-mail, and bulletin boards by involving parents in kids' online activities," Monica Rogers explained in *Crain's Chicago Business*

Since its inception, the federal government has worked to inform parents about COPPA and the protections available for American children using the Internet. The Federal Trade Commission (FTC) has created a simple way for parents to voice concern over Web sites that they feel are in violation of the COPPA privacy requirements; complaints can be filed online or by phone. A single concerned parent can result in a review of any business's Web site content and practices, regardless of the size or intended customer base of the business. For this reason, it is important to understand the safeguards and standards put into place by COPPA.

REQUIREMENTS OF COPPA

COPPA applies to a variety of Web sites and services with content that may appeal to children. "In determining whether a Web site is directed toward children, the FTC will consider, among other things, the site's content, language, advertising and intended audience, as well as the use of child-oriented graphics or features," Antony Marks and Keith Klein noted in the *Los Angeles Business Journal*.

But the law also affects general interest sites that collect information from children, whether the site's operators intend to do so or not. "The arm of COPPA is very long because it also applies to general audience Web sites that have actual knowledge that they are collecting personal information from children," Robert Carson Godbey wrote in *Hawaii Business*. "You can easily, and inadvertently, fall into this category. If you invite browsers of your Web site to submit individually identifiable information which can include name, address, e-mail address, hobbies, interests, information collected through cookies, basically anything that can be individually identified to the person responding, for a variety of reasons, and that information includes age then you may have 'actual knowledge' that you have collected personal information from children if anyone under 13 responds to your invitation."

COPPA requires the operators of these types of Web sites to include a clearly written privacy notice on their home page and anywhere on their site where user data are collected. The privacy policy must reveal who is collecting and maintaining the information children supply to the Web site and provide information about how to contact them; explain how the children's personal information will be used; and state whether it will be made available to third parties. In addition, COPPA requires Web site operators to obtain "verifiable parental consent" in advance of collecting or using personal information from children. Even when parental consent has been granted once, the site operators must seek consent again any time they make changes in their privacy policies. Exceptions to COPPA's parental consent requirements are allowed for the collection of e-mail addresses in order to seek consent, protect the safety of a child, or respond to a child's one-time request (provided that the e-mail address is deleted immediately afterwards).

The FTC rules cite several acceptable methods for Web site operators to verify parental consent, including a signed form sent via fax or regular mail, a credit card number provided online, calls made on a toll-free telephone staffed by trained personnel, and e-mail accompanied by a digital signature or password. The method used by a certain Web site depends on the type of information collected from children and the way it is used. For example, e-mail consent is acceptable for Web sites that collect personal information only for internal purposes, like marketing to a child based on his or her preferences. Stricter methods are required when the information is made available to third parties.

COPPA COMPLIANCE

The FTC applies penalties for noncompliance ranging up to $11,000 per incident. Although the financial penalty is stiff, a business that failed to comply with the law would likely suffer even worse consequences as a result of negative publicity. After all, who would want their Web site to be known as one that put children at risk? Unfortunately, COPPA compliance can be complicated. "The goals of COPPA are no doubt admirable. The implementation, however, can be daunting," Godbey noted. "The difficulty comes from the requirement of 'verifiable consent' from a parent... How do you obtain verifiable parental consent? How do you verify parental consent in an online environment where the children probably know more about the family computer than their parents do?"

Many online businesses have also complained that COPPA compliance is expensive. According to Campanelli, some of the major costs of compliance include employing staff to compose and maintain the online

privacy policy statements, hiring attorneys to review the policies, and coordinating the collection and secure storage of parental consent forms. Experts estimate that these costs would amount to between 50 cents and 3 dollars per child interaction, or up to $100,000 per year, for a medium-sized Web site. Faced with these potential costs, some sites were forced to limit access to children over the age of thirteen. Other sites like the popular United Kingdom-based site for the "Thomas the Tank Engine" series of books and toys decided to eliminate their e-mail and chat room features because they could not afford to comply with COPPA.

In response to complaints from Web site operators about the cost of compliance, the FTC noted that COPPA was not intended to block kids' access to information on the Internet. Instead, the law's objective is to involve parents in the decision about whether to release children's personal information. Lawmakers argue that children under thirteen are not sophisticated enough to make such decisions on their own.

Like all Internet laws, COPPA is somewhat difficult to enforce. For example, tech-savvy youngsters may find ways to forge parental consent. Some entrepreneurs resent the restrictions imposed by COPPA, arguing that the government should not become involved in regulating the Internet. "One of the beauties of the Internet is that an entrepreneur can begin his or her business with minimal investment and regulatory scrutiny," Campanelli noted. Some Web site owners argue that regulation increases costs for small business owners. But other operators of small Web sites for children believe it is their responsibility to protect their users' privacy, even though it can be expensive. "If you're going to play in the kids' arena, you've got to offer safety, even if it costs," Alison Pohn, marketing director for a children's Web site, told Rogers. "If you operate a school or a camp, you invest in having the safest playground equipment and the best lifeguard at the pool. This is no different."

The complex nature of COPPA compliance has led to the creation of businesses aimed specifically at assisting other businesses with creating COPPA-compliant Web sites. For example, online privacy enterprise TRUSTe has created its own Children's Privacy Seal to signify Web sites that are COPPA compliant. The penalties for those who fail to ensure the privacy of children can be substantial; the children's social networking Web site imbee.com settled with the Federal Trade Commission over alleged COPPA violations in 2008, agreeing to pay over $100,000 in penalties. When developing any new Web site that collects personal information, a small-business owner should weigh the cost of paying a compliance specialist against the potential penalties that could arise from a poorly planned Web site design.

In any case, it is important for small-business owners involved in online commerce to be aware of the provisions of COPPA. The full text of the Children's Online Privacy Protection Act is available on the FTC Web site, at www.ftc.gov. In addition, the Direct Marketing Association (DMA) offers a guide to COPPA compliance and a "privacy policy generator" that walks users through the process of creating a compliant policy. Both are available on the DMA Web site, at www.the-dma.org/library/privacy.

CLOSELY HELD CORPORATIONS

Closely held firms are those in which a small group of shareholders control the operating and managerial policies of the firm. A large number of businesses in the United States are closely held. These firms differ from

most publicly traded firms, in which ownership is widely disbursed and the firm is administered by professional managers. In closely held firms, managers are often the owners of the company as well. Another key characteristic of many closely held firms is that they operate in one state and are sold or traded once, usually, rather than multiple times, as is more common in publicly traded companies. According to a report published in 2008 by researchers at the University of North Carolina at Wilmington, many closely held firms tend to be smaller companies focusing on a niche market.

Many closely held firms are also family businesses, although this is not true of all closely held firms. Family businesses may be defined as those companies where the link between the family and the business has a mutual influence on company policy and on the interests and objectives of the family. Families control the operating policies at many large, publicly traded companies. In many of these firms, families remain dominant by holding senior management positions, seats on the board, and preferential voting privileges even though their shareholdings are significantly less than 50 percent.

VALUATION ISSUES

One of the major concerns associated with closely held firms is the determination of their value. This uncertainty is largely due to the fact that shares of a closely held business are owned by a small number of stockholders, and often by members of a family. Since there is no established market for the shares, it is difficult to establish the value of the shares in an estate or gift tax situation.

Other issues also make valuing closely held firms challenging. Many of these companies have limited liquidity, for example, which makes them difficult to evaluate in traditional business terms. In addition, many closely held firms follow different decision-making procedures than publicly shared companies. That is, since the owners are also the managers in these firms and since public shareholders often do not need to be consulted about company decisions, managers/owners can often base policies and decisions on personal interests or preferences, not on shareholder standards. This often means that documentation and policies must be changed or translated into terms that third parties or other companies can understand before a closely held firm can be evaluated.

In preparing a valuation report, the Internal Revenue Service has established a set of major guidelines to follow. According to the IRS, the proper estimate of value should be based on the price at which a property would change hands between a willing buyer and a willing seller, with neither party under any compulsion to buy or sell and with all relevant facts available to both parties (the fair market value standard). The IRS provides valuation criteria for closely held businesses that are generally accepted by appraisers and the courts. The criteria include the history of the business, economic outlook, book value, earning capacity, dividend-paying capacity, goodwill and other intangibles, past sales of company stock, and stock of comparable businesses. Evaluating closely held companies often poses more challenges as these companies may have significant value that is hard to determine. Also, their structures and decision making in the past may be based on family preferences and ideas rather than on traditional business ideas. In some cases, even paperwork at these companies is harder to evaluate since it does not meet standards set in the wider business world.

Without a marketplace that reflects the price arrived at by both buyer and seller, the security prices of a closely held firm must be set by calculation, comparison, and the use of financial ratios. Valuation techniques that have evolved fall into three principal categories: 1) market (price-earnings) methods; 2) cash flow methods; and 3) book value (balance sheet) methods. Another area of concern when addressing valuation issues is the notion of discounts for minority interests and lack of marketability.

BUY/SELL AGREEMENTS

It is important to have detailed plans and procedures for the sale or transfer of stock at the time of the death, disability, or retirement of a shareholder in a closely held firm. Without such procedures, the departure of one major shareholder could also signal the end of a business. In small family businesses, especially, the departure of one employee, often a family member, can create severe upset in an organization. Buy/sell agreements, also known as Shareholder Agreements, spell out the terms governing sale of company stock to an outsider and thus protect control of the company. In many instances, these agreements allow co-owners to buy out heirs or other shareholders in the event of death or disability. In order to be considered valid for estate tax purposes, a stock buy/sell agreement must meet several conditions, including a "full and adequate consideration" provision. Life insurance is often used to provide the funds to purchase the shares of a closely held company if one of the owners dies.

There are two basic types of buy/sell agreements: cross-purchase agreements and redemption agreements. With a cross-purchase agreement, one owner separately purchases a policy on the other owner (or owners). With a redemption agreement, the corporation is obligated to redeem the stock at a price set in the agreement if any of the business owners dies. Typically, the buy/sell agreements are funded with life insurance; the life insurance proceeds provide the necessary funds for the purchase of the business.

The prolonged disability of a principal can also present serious difficulties for closely held firms. A long-term disability buy/sell agreement can provide a cushion to protect the disabled principal's interests during recovery. The first step in implementing such an agreement is to determine how long the company should be without the disabled partner's services before a buyout is activated. It is recommended that an actual buyout of ownership interest be postponed at least 12 months but not more than 24 months after the infirmity occurs.

CLUSTERS

Clusters are geographic concentrations of interconnected companies or institutions that manufacture products or deliver services to a particular field or industry. Clusters arise because they increase the productivity with which companies within their sphere can compete. Clusters typically include companies in the same industry or technology area that share infrastructure, suppliers, and distribution networks. Supporting firms that provide components, support services, and raw materials come together with like-minded firms in related industries to develop joint solutions and combine resources to take advantage of market opportunities. These are groups of related businesses and organizations sometimes direct competitors, but more often operating in a complementary manner. They may comprise more than just one industry and a true cluster is more than just a supplier-producer-buyer model.

An economic cluster, or several clusters, serves as the driving force in most regional economies. Examples include Detroit's auto industry concentration, computer chip production in California's Silicon Valley, London's financial sector, the Napa Valley's wine production, and Hollywood's movie production industry. Because clusters are a vibrant economic force, the development and upgrading of clusters is an important economic development objective for governments and other organizations involved in regional economic development efforts.

The clustering concept was popularized by Harvard Business School professor Michael Porter in his 2000 essay "Locations, Clusters, and Company Strategy." Porter's techniques teach communities to analyze their existing business and industrial bases and build their economic development on those strengths. From the identified clusters in an area, the next step is to develop a marketing plan for industry. Porter's work was preceded by the work of the English economist Alfred Marshall (1842 1924), who created the concepts of "industrial atmospheres" and "industrial districts." Theo J. A. Roelandt and Pim den Hertog have also contributed to the idea of the cluster.

By developing a massive database of companies, county by county, Porter's research statistically grouped businesses together in clusters. A strong cluster will include the suppliers of raw materials and the distributors, as well as the primary producers. It will also include specialized services in finance, marketing, packaging, education, and more, including specialized trade associations. In general, the broader the base of related businesses, the better for the cluster, for that often reflects the specialization that comes with concentrated resources.

Related firms and industries have tended to locate in close geographical proximity for a number of reasons. Marshall was one of the first economists to identify the benefits of spatial clustering. These benefits include: the existence of a pooled market for specialized workers; the provision of specialized inputs from suppliers and service providers; and the rapid flow of business-related knowledge among firms, which results in technological spillovers. It may be difficult to predict where clusters will emerge, but once established their growth is predictable due to the benefits gained from the strategy and the economies of scale produced. A variety of terms are synonymous to a cluster; these include co-location, industrial districts, and innovative milieus.

In his 2008 article, Saeed Parto divides clusters into two varieties: horizontally-integrated clusters and vertically-integrated clusters. Companies and firms joined in a cluster by their seller and buyer relationships are considered to be vertically-integrated clusters. Horizontally-integrated clusters refer to groups of companies that use similar workers, skills, and technologies, or have the same market for their services or products.

BENEFITS OF CLUSTERING

A well-developed concentration of related business spurs three important activities: increased productivity (through specialized inputs, access to information, synergies, and access to public goods), more rapid innovation (through cooperative research and competitive striving), and new business formation (filling in niches and expanding the boundaries of the cluster map).

Clusters are always changing. They respond to the constant shifting of the marketplace. They usually begin through entrepreneurship. Silicon Valley is a relatively new cluster of computer-related industries; in the past, Detroit was the same for automobiles. Nothing sparks productive innovation better than having a competitor across the street. Clusters encourage competition by placing compeititors close together, but they also encourage collaboration, and many businesses in the same cluster may share a labor base, natural resources, and other local resources. This combination of collaboration and competition may promote innovation and may strengthen both businesses and the cluster itself as a whole.

Clustering helps cities and counties direct their economic development and recruiting efforts. It also encourages communities to refocus efforts on existing industries. Communities understand that the best way to expand their own economies and those of the surrounding region is to support a cluster of firms rather than to try to attract companies one at a time to an area. Chambers of Commerce, business incubators, and some universities work with companies to develop clusters and synergies in business communities.

Strong domestic clusters also help attract foreign investment. If clusters are leading centers for their industries, they will attract all the key players from both home and abroad. Some experts also believe that strong domestic clusters can help local economies withstand competition from foreign companies.

For small and developing businesses, locating in a cluster near competitors and related industries may aid the firm in faster growth, recognition, and status within the market. Economies of scale can be gained by group purchasing within the cluster. There can be discussions among cluster members about their unique competitive advantages and future challenges. Linked supply chain networks can naturally be created within a tightly linked cluster. Informal day-to-day contact with similar companies is also important, and physical proximity is not always required to be a cluster. Many firms, including retailers and publishers, can be grouped together by sharing an Internet site.

Clusters may also be well equipped to withstand economic challenges and market changes, since these models vary from the basic factory model. That is, clusters are specialized but also flexible. The cluster as a whole can survive much more readily than individual businesses, regardless of market conditions. Clusters allow an industry to focus on quality and larger market success.

Potential Downside of Clusters. A concentrated industrial base has one potential downside if the concentration is oriented too closely to a single industry. A community that has reaped the benefits of a cluster for a long period of time may also find it very difficult to adjust during a time of downturn for the industry central to their cluster. The difficulties being experienced in and around Detroit, Michigan, in the twenty-first century is an example of this phenomenon. The decline of the American automobile manufacturing industry has had a profound impact on metropolitan Detroit and its surroundings, areas that have consistently had the highest unemployment rates in the country during the first decade of the new century. In 2009, Chrysler Group LLC and GM declared bankruptcy, and by 2010, most of what had been the area's automotive cluster was controlled by persons outside the area and outside the industry.

Some diversity within an industrial concentration is therefore desirable. The most promising clusters are those that include more than a single industry because diversity provides the flexibility necessary to change with evolving market trends and broader economic transitions.

Although Porter and others assert the benefits of clusters, other analysts argue that large corporations are more likely to succeed long-term than clusters. A number of academics among them William Lazonick, Richard Florida, Michael Kenny, and Alfred D. Chandler have asserted that large corporations contribute more to innovation and local economics thanks to a larger market share and greater resources and capital.

A CLUSTER EXAMPLE: "THE CARPET CAPITAL OF THE WORLD"

The city of Dalton, Georgia, located between Atlanta, Georgia, and Chattanooga, Tennessee, is unrivaled in its production of carpet. According to the Dalton-Whitfield Chamber of Commerce, 80 percent of the carpet in the United States is supplied by the industry located within a 65-mile radius of Dalton. This same area supplies about 2 billion square yards of carpet each year. In their book

about the industry, Randall L. Patton and David B. Parker note that Dalton has evolved in much the same way as California's Silicon Valley, through a rapid expansion of new firms started by entrepreneurs and through cooperation among owners, mills, and local government. It was only after World War II that the carpet industry came to be identified with this region. Entrepreneurs developed a new tufting technology and captured the carpet industry previously dominated by woven-wool carpet manufacturers in the Northeast.

A CLUSTERING MODEL IN PROGRESS

Porter applied his work in industry clusters and economic analysis to the community that includes the carpet cluster. His data is available at the county level and organizes businesses into some fifty industry clusters producing nonlocal goods and services. Many familiar businesses are excluded. Fast-food restaurants, automobile dealers, and newspapers, for instance, are spread rather evenly across the country, for they serve basically local customers.

Porter also helped the city of Chattanooga to perform a cluster analysis. To implement a regional growth initiative, the city appointed two groups: a steering committee of twenty-five members, including prominent business and government leaders, to provide guidance and policy direction; and a core team of business and academic leaders to research local conditions and manage cluster team meetings. The region for study was based on geographic features, political boundaries, local sentiments, economic strengths, and even commuting patterns. For each cluster, a "location quotient" was developed and defined as the cluster's strength there compared to what might be expected if that industry were spread evenly across the country.

The "Textiles and Floor Coverings Cluster," centered in Dalton but with related businesses elsewhere in the region, was by far the strongest cluster. The carpeting businesses also accounted for most of the strength in the second strongest cluster, "Construction Materials." Three additional clusters emerged: "Confectionery and Baked Goods," "Tourism and Hospitality," and "Medical Devices and Health Services."

Leaders in each field, and others from lists generated by Standard Industry Classification code numbers, were invited to become part of the cluster team and attend a series of meetings over four weeks. The agenda for the teams included a discussion of conditions in the cluster; issues holding the cluster back; opportunities for creating better inputs, sharper demand, and high-quality related institutions; and problems with regulation, the labor pool, and the physical infrastructure. The meetings also included a discussion of what cluster team members could do about these issues; what types of legislation or change in processes could make the cluster better; cooperative efforts toward applied research; and ways to attract complementary businesses to the region.

The immediate goal was a plan for action that went well beyond analysis. The ultimate goal was to accomplish change. The core or "diamond" of the cluster included: factor input conditions (labor, capital, resources, etc.); demand conditions (nature of the home market, including any special conditions or expertise locally); related and supporting industries (from service industries to trade associations); and context for firm strategy and rivalry (the level of entrepreneurship, and tradition of united actions). The team in Chattanooga learned that concentrated competition leads to greater prosperity, and a company's best strategy is not to try to do all things but to focus on its cluster. There was also a more general appreciation that the cluster process could, indeed, lead to more and better-paying jobs and that a strong cluster would enhance the general economic situation for its members.

CODE OF ETHICS

A code of ethics issued by a business is a particular kind of policy statement. A properly framed code is, in effect, a form of legislation within the company binding on its employees, with specific sanctions for violation of the code. If such sanctions are absent, the code is just a list of pieties. The most severe sanction is usually dismissal unless a crime has been committed. Codes of ethics usually concern proper conduct and outline what behaviors are expected from employees. For this reason, codes of ethics are sometimes called codes of conduct. Codes of ethics vary widely from company to company. In some organizations, they are extensive documents concerning social responsibility. In others, they are short documents outlining basic ethics ideas and philosophies. Elsewhere, they are detailed documents outlining conduct rules and punishments.

Business ethics emerged as a specialty in the 1960s in the wake of the "social responsibility" movement embraced by some large corporations; that movement itself was stimulated by rising public interest in consumerism and the environment. An important distinction exists between law and ethics. Obeying the law is the minimum level of ethical conduct enforced in society; ethical behavior includes more than simply legal behavior. It is unethical to lie, for instance; but lying is against the law only under certain limited circumstances: lying under oath is perjury. Business ethics, and the codes that formally define it, always include elements that go beyond strict legality; they demand adherence to a *higher* standard.

Codes of ethics have changed over time. In the 1980s, codes of conduct tended to stress employee conduct or any conduct which might affect profits. These codes tended to emphasize any conflict of interest issues. In the early twenty-first century, codes of ethics are more likely to include clauses about environmental concerns and employee safety.

Codes of ethics are not just arbitrary business decisions. There are laws which govern these rules. For example, legislation passed in 2002, the Sarbanes-Oxley Act ("SOX"), requires that corporations whose stock is traded under the provisions of the Securities Exchange Act of 1934 must publish their codes of ethics, if these exist, and also publish any changes to these codes as they are made. This requirement has given corporations strong incentives to formulate codes of ethics in order to win investor confidence. Most small businesses, of course, are not regulated by the Securities and Exchange Commission (SEC) because they do not issue publicly traded stock; thus they are not affected by SOX.

Perhaps the best-known code of ethics in history is the Hippocratic Oath taken by all doctors. Contrary to common belief, that oath does not include the phrase "First, do no harm." The actual language, in the third paragraph of the classical version, states: "I will apply dietetic measures for the benefit of the sick according to my ability and judgment; I will keep them from harm and injustice." According to *Bartlett's Familiar Quotations*, the more famous phrase comes from Hippocrates' *Epidemics*: "As to diseases make a habit of two things to help, or at least, to do no harm."

THE DOCUMENT

A code of ethics is a formal document rather than merely an "understanding," a consensus, "unwritten rule," or just an aspect of "corporate culture." It is at minimum a published document. In many organizations employees are also required to sign a statement to the effect that they have read and understood it. In some corporate cultures, employees are asked to read and sign a company's code of conduct once a year. Variations on this theme exist. In very large corporations or corporations reacting to recent scandals, sometimes only corporate officers or only financial officers are required to sign. In other cases multiple codes of ethics may exist that are tailor-made to functions including purchasing, sales, and accounting.

Codes of ethics are free-standing expressions of corporate will even when they are published as chapters or sections in a document which may contain a mission statement, a listing of corporate values, and general policies relating to operations.

CONTENT

Codes typically divide into four distinct elements: 1) an introduction or preamble; 2) a statement of purposes and values; 3) specific rules of conduct which may be subdivided in various ways; and 4) implementation of the code, which will define administrative processes, reporting, and sanctions.

Introduction: Management Sponsorship. The introduction or preamble to a code of ethics ideally carries a statement by the top-ranked officer of the corporation

indicating his or her personal commitment to and backing of the code. Experts on and scholars of business ethics never fail to underline the importance of top management leadership. Writers such as Glenn A. Lambert emphasize that corporate leaders must take an active part in making codes of ethics a part of corporate culture, something which often includes leading by example. Codes of ethics published only as a formality, possibly in the context of some rumors of scandals, carry little weight with employees unless tangible signs of corporate commitment are given. The preamble of a code of ethics provides an opportunity for sending such a signal.

Purposes and Values. The leading section of the code typically provides an abbreviated mission statement followed by values. This section states what the company is all about, what it does, why it exists. Ideally, the code will state practical financial objectives as well as less precise social and professional aspirations. The statement of values, similarly, will begin with narrowly defined statements and expand on these. Obeying all pertinent laws and regulations may be the initial value; adherence to higher ethical values will be spelled out next. Corporations engaged in some professional specialty (engineering, medicine, law, etc.) may explicitly refer to professional standards and standard-setting bodies.

Rules of Conduct. Rules of conduct are typically subdivided. The Institute of Business Ethics (IBE), a London-based organization, provides a list easily adaptable by a small business formulating its own code. IBE divides the central presentation into codes of conduct adopted by the business toward its employees, customers, shareholders and other funding agents, suppliers, and then the wider society. In the subsection dealing with employees, an effective code will be further subdivided into the corporation's conduct toward employees and, separately, conduct expected from its employees.

In the language of business, the groups named above constitute the "stakeholders," those who have a stake in the well-being (and also in the ethical behavior) of the business. These groups typically define all those with whom the corporation has an interaction. In many cases, all depending on the range and activities of the corporation, other areas will get special emphasis. Thus rules of conduct may be spelled out in relation to the physical environment; ethnic, gender, and race relations; realms such a law and justice or medical practice. Codes of ethics may also specifically address areas of difficulty such as campaign contributions or compliance with specific laws. Examples of such rules are provided by FindLaw for Small Business, of instance, relating to antitrust statutes.

Within subdivisions, the code may specify categories of problems such as conflicts of interest; taking or offering bribes, gifts, or favors; rules relating to information such as disclosures, withholding data, insider trading, and so forth; preferential treatment, discrimination; interpersonal relations including sexual harassment; resolving quality versus cost conflicts; and potentially endlessly more issues. Well-executed codes of ethics will be concise, as brief as possible, yet will contain vivid examples to make each point as clear as possible.

A good code of ethics, in other words, contains not just abstract ideas of ethical behavior, but also practical guidelines explaining how employees can achieve this behavior. Good codes of conduct also include detailed contexts that explain how and why a certain code will be implemented in a company as well as the benefits a company hopes to achieve from its code of ethics. Finally, a good code of ethics is detailed. It includes detailed information on how employees are expected to handle personal conduct, interaction with customers and suppliers, interactions with clients from other cultures, and issues surrounding gifts, as well as any other issues which might arise for a specific company. To be a living document and not just a paper on the wall, a code of ethics must not be so large as to be unreadable, but should be precise enough to offer employees tangible advice and guidance in actual work situations.

Implementation, Reporting, and Sanctions. The final section of a code will deal with administrative implementation of the code and sanctions against code violations. The simplest code will require reporting of code infractions up the management chain, including what action to take if the next level up fails to take action. In larger organizations an office or function may be expressly charged with handling code violations. Ombudsmen may be named. Sanctions will be spelled out and their administration defined, including a transparent process for establishing facts, the issuance of warnings, requirements for counseling or reeducation, consequences of repeat offences, on up to discharge or even, if appropriate, litigation.

For obvious reasons, a code of ethics without sanctions and a rational process for its implementation will be viewed by employees as merely a gesture without "teeth." Conversely, the business owner must be alert to the fact that *ethical* violations are not necessarily *legal infringements*; therefore sanctions such as firing an employee may be problematical unless the business has an "employment at will" hiring and firing policy and its exercise is backed by state and federal law under the circumstances.

ETHICS CODES AND SMALL BUSINESS

One of the advantages of small business is that it can avoid what are sometimes time-consuming upheavals in the business world. By any measure, traditional or modern, ethics is

an important issue. Studies have found that up to 75 percent of polled companies in the United States have codes of ethics. In a 2008 study published in the *Journal of Business Ethics* by Han Donker, Deborah Poff, and Saif Zahir, researchers found a positive correlation between business performance and corporate ethics. Companies with a strong ethics manifest or philosophy, demonstrated often by a code of ethics, were more successful and had more to offer their employees, management, employees, shareholders, and even their larger community. Ethics is clearly important not just for internal business operations but for the overall health and functioning of the corporation or business.

At the same time, the preoccupation with codes of ethics is producing very large documents, sometimes reaching the length of books. Does this interest mean that a small business must formulate its own code of ethics? While small businesses are not obligated to do so by law, studies such as those published in the *Journal of Business Ethics* suggest that there may be business benefits in creating a code of ethics.

To publish such a code is relatively easy. Many hundreds of sample codes are available on the Internet, many of them specifically designed for the small business. The small-business owner can easily write a one-page code and distribute it to employees if he or she sees the need for this. Many small businesses have found it useful in the past to publish policy statements that deal with personnel policy, including business hours, vacations, accrual of personal time, and so forth. A code of ethics along the same lines may be easy to produce and serve an important purpose: to underline the owner's commitment to ethical behavior. It is also possible to write separate codes of ethics for different departments or for different audiences. One code might be for new employees getting familiar with a company while another might be for shareholders. Many companies create codes of ethics after a crisis, but creating a new code before a crisis occurs or when a new management team enters a business can produce better results.

Many small businesses of ten to twenty employees operate more like families. Ethical behavior is part of the culture as it is in a family. In such situations the sudden appearance of a code of ethics may be rather jarring. Discussion of the matter in a staff meeting may serve the purpose better: to alert employees to this issue and what is happening "out there."

COLLATERAL

Collateral is an item of value that is pledged to guarantee repayment of a loan. Collateral items are generally of significant value property and equipment are often used as collateral, for example but the range varies considerably, depending on the lending institution and variables in the borrower's situation. The value of collateral is not based on the market value. It is discounted to take into account the value that would be lost if the assets had to be liquidated in order to pay off the bank loan.

A business that has a long history of profitable operations may be able to obtain an unsecured loan, or a loan without collateral. A new or a small business wishing to expand is almost always going to be asked to secure a loan with collateral. Unlike unsecured loans, in which a borrower is able to get a loan solely on the strength of its credit reputation, secured loans require borrowing companies to put up at least a portion of their assets as additional assurance that the loan will be repaid. Failure to repay the loan means that the bank can legally repossess and sell the items identified as collateral. Many start-up businesses turn to collateral-based loans to get their start. For small businesses, another advantage of using collateral for loans is that secured loans guaranteed by collateral are often more affordable and feature lower interest rates than loans with no such guarantees.

TYPES OF COLLATERAL

Many different types of collateral arrangements can be made by companies, whether they are experiencing a

financial crunch or making plans for expansion. Common types of collateral include the following:

Purchase Money Security Interest (PMSI). Also known as a chattel mortgage, this option allows the borrower to secure a loan by borrowing against the value of the equipment being purchased. This type of loan is beneficial to the lender because creditors who have a loan secured via PMSI usually have priority if the loan is defaulted or the creditor goes bankrupt. As a result, many companies are willing to offer this sort of secured financing, sometimes through a security interest. Interest on loans secured with this type of collateral often have competitive rates since the lender is not risking very much.

Real Estate. Businesses that utilize real estate usually a personal residence as collateral are generally requesting long-term loans of significant size (the company has plenty of other collateral options for smaller loans). The size of the loan under this arrangement is predicated in large measure on the market and foreclosure value of the property, as well as the amount of insurance coverage that the company has taken out on it. Many small businesses have a mortgage loan to pay for their business property, however. In this instance, the property may not qualify for use as collateral on a new loan since the mortgage loan uses the property as collateral. Some small businesses also lease space. This also disqualifies them from using this real estate as collateral for a loan.

Endorser. Under this form of collateral, a company secures a loan by convincing another person to sign a note that backs up the promises of the borrower. "This endorser is then liable for the note," stated Mark Van Note in *ABC's of Borrowing.* "If the borrower fails to pay, the bank expects the endorser to pay. Sometimes the endorser may also be asked to pledge assets." A guarantor loan security is similar to the endorser arrangement, except that the guarantor is not required to post collateral.

Warehouse Receipts. Another option for borrowers is to put up a portion of their warehouse commodities as collateral. Van Note explained that with warehouse receipts, "the receipt is usually delivered directly to the bank and shows that the merchandise has either been placed in a public warehouse or has been left on your premises under the control of one of your employees who is bonded. Such loans are generally made on staple or standard merchandise that can be readily marketed. The typical loan is for a percentage of the cost of the merchandise." Warehouse receipts are a good option for many product-based businesses because commodities are readily available for use as collateral, even if a business has few other assets. Lenders are usually very willing to consider this form of collateral since commodities are easily liquidated in the event of a defaulted loan. Warehouse receipts have been used by generations of businesses to secure loans.

Display Merchandise. This method of borrowing, which is also sometimes referred to as "floor planning," is similar to warehouse inventory. Under this plan, display merchandise such as furniture, automobiles, boats, large appliances, and electronic equipment can be used as collateral to secure loans.

Inventory. This encompasses all the various assets (merchandise, property, equipment, etc.) owned by the borrowing business that could be liquidated to repay the loan.

Accounts Receivable. "Many banks lend money against accounts receivable; in effect, counting on your customers to pay your loan," explained Van Note. "The bank may take accounts receivable on a notification or nonnotification plan. Under the notification plan, the purchaser of the goods is informed by the bank that the account has been assigned and is asked to make payments directly to the bank. Under the nonnotification plan, customers continue to pay you and you pay the bank." Under this collateral agreement, lenders sometimes advance up to 80 percent of the value of the receivables once the goods are shipped. Typically, a lender will buy or advance 70 to 80 percent of a company's accounts receivable balance and in turn assess a finance charge or "discount" on the total amount of the receivable. That discount is usually between 4 and 5 percent.

Savings accounts and certificates of deposit.
Stocks and bonds. Publicly held companies have the option of offering stocks and bonds within the company as security. This is a more common option with larger corporations rather than with smaller businesses.

Life insurance. Some lenders are willing to accept the cash value of a life insurance policy as collateral on a loan.

A study of companies going into bankruptcy found that most companies have, on average, about 70 percent of assets secured with collateral, suggesting that collateral guaranteed loans are far more popular with businesses. In many cases, collateral is not an issue except at the time of loan application and again if the company goes into bankruptcy or defaults on a loan. In these circumstances, trustees or lenders may repossess and sell collateral to recoup the money lost on their loans.

Small businesses applying for loans often find that lenders are quite conservative when evaluating the value of collateral. This is because lenders only count a small percentage of the total current value of collateral, allowing for changes in the value of the asset. "Loan-to-value

ratio" is the term used to describe the difference between the actual value of an asset being used for collateral and the value assigned to that item by the lender for the purpose of evaluating that item as collateral.

Small businesses often find that they have another challenge when securing collateral for a business loan: the amount of collateral they are often able to offer lenders is quite small, especially after the loan-to-value ratio is considered. Small businesses often require a loan at the start up of their business, when they have the least amount of assets. For this reason, small businesses are often required to offer lenders a personal guarantee for the loan. This means that business owners must use their personal collateral as collateral for the business loan, even if their business is an limited liability company LLC or has been incorporated. A personal guarantee is often the right choice when a business cannot produce substantial amounts of collateral to secure initial business loans.

COLLEGIATE ENTREPRENEURIAL ORGANIZATIONS

Collegiate entrepreneurial organizations (CEOs) are groups comprised of students, primarily from graduate-level business schools. CEOs exist to educate student members about small business matters, such as running a start-up and obtaining financing. They hold meetings, sponsor speakers and educational events, and serve as a storehouse of information on entrepreneurial matters. Their primary goal is to develop and support creative and competent entrepreneurs across industries and the world. They also serve as an important source for networking between prospective entrepreneurs. According to Eric Hansen in *Entrepreneurship: Theory and Practice*, the growth of an entrepreneurial enterprise is dependent on these types of relationships. Many CEOs are affiliated with the Collegiate Entrepreneurs' Organization, which describes itself as "the premier student entrepreneurship network" in North America. The group holds conferences each year, sponsors contests, and raises awareness about CEOs in colleges. College students, however, can form their own CEOs without affiliation with this group.

The first Collegiate Entrepreneurs' Organization was launched in 1997. It grew out of a meeting of entrepreneur-minded business students in 1983. At that initial meeting, University of Illinois at Chicago professor Gerry Hills met with Verne Harnish and Fran Jabara, who were planning to create the Association of Collegiate Entrepreneurs (ACE). That meeting allowed a 1984 conference to take place.

The 1984 conference in Chicago attracted approximately 400 students from forty-five different colleges and universities. At the time, there were few offerings for students interested in entrepreneurship and networking, and the conference filled a need. Students continued to meet and hold conferences to learn more. By 1985 the conference became known as the Collegiate Entrepreneurs of the Midwest. Hills was interested in creating a more inclusive organization that would include students and schools from across the country and from around the world. The outcome was the founding of the Collegiate Entrepreneurs' Organization.

CEOs provide entrepreneurial students with a wide variety of resources to support their own start-up. These include opportunities to meet with business executives, information support, and in some cases, financial support. A number of CEOs offer mentoring opportunities as well. Many collegiate entrepreneurial organizations, such as the Berkeley Solutions Group, work hand in hand with the business school itself to provide opportunities for students to put their education to work in summer internship programs. In 2010 there were CEOs associated with more than 160 colleges and universities across the country. The Collegiate Entrepreneurs' Organization, the group that works with these CEOs, hopes eventually to have collegiate entrepreneurial organizations in more than 400 colleges.

Participants in collegiate entrepreneurial organizations at top business school programs are heavily recruited by leading companies. However, some entrepreneurial organizations seek to place MBA students with start-up companies. Depending on the organization, the interns may help to improve a company's information systems, investigate new markets and sales channels, or develop business plans.

In addition to these services provided to student entrepreneurs, many collegiate entrepreneurial organizations provide consulting services to small businesses and non-profit organizations unable to afford the fees of a professional consultant. MBA students primarily provide the services. A small business taking advantage of these services has the benefit of both a no- or low-cost consultation as well as the latest research on business management. Students may work alone or in groups to assist the small business with such tasks as feasibility studies, strategy recommendations, market research programs, competitive profiling, and the development of an operational structure, to name just a few tasks. In most cases, this support is offered during the academic year, with internship programs providing additional service or overlap where needed. While some CEOs charge nothing for services, others charge a nominal fee. In 2010, for example, Berkeley Solutions Group charged about $50 per hour for consultant services.

The Collegiate Entrepreneurs' Organization (www.c-e-o.org) serves as a national organization for many university entrepreneurial groups and can be used as a starting point to research some of these organizations. Further information on these groups can frequently be found on the Web site of a university's business school. Each year, the Collegiate Entrepreneurs' Organization also holds a conference for CEOs and students. More than 1,600 students and business faculty attend the event, where students are given the opportunity to listen to keynote speakers and network. Businesses may also find CEOs through this conference or through the Web site of the Collegiate Entrepreneur' Organization. Many CEOs also network through social networking Web sites such as Facebook and MySpace.

COMMUNICATION SYSTEMS

Communication systems are the various processes, both formal and informal, by which information is passed between the managers and employees within a business, or between the business itself and outsiders. Communication whether written, verbal, nonverbal, visual, or electronic has a significant impact on the way business is conducted. The basic process of communication begins when a fact or idea is observed by one person. That person (the sender) may decide to translate the observation into a message, and then transmit the message through some communication medium to another person (the receiver). The receiver then must interpret the message and provide feedback to the sender indicating that the message has been understood and appropriate action taken.

The goal of any form of communication is to promote complete understanding of a message. But breakdowns in communication can occur at any step in the process. Business managers need to understand and eliminate the common obstacles that prevent effective communication. Some of the causes of communication problems in business settings include:

- A lack of basic language skills
- Differing expectations and perceptions on the part of senders and receivers
- Selectivity or the tendency for individuals to pick and choose what they retain when they receive a message from another person
- Distractions such as ringing telephones, scheduled meetings, and unfinished reports

According to Herta A. Murphy and Herbert W. Hildebrandt in their book *Effective Business Communications*, good communication should be complete, concise, clear, concrete, correct, considerate, and courteous. More specifically, this means that communication should answer

basic questions like who, what, when, where; be relevant and not overly wordy; focus on the receiver and his or her interests; use specific facts and figures and active verbs; use a conversational tone for readability; include examples and visual aids when needed; be tactful and good-natured; and be accurate and nondiscriminatory.

Unclear, inaccurate, or inconsiderate business communication can waste valuable time, alienate employees or customers, and destroy goodwill toward management or the overall business. In fact, according to a study by the National Commission on Writing, titled *Writing: A Ticket to Work... Or a Ticket Out*, "it appears that remedial deficiencies in writing may cost American firms as much as $3.1 billion annually." Because of the information age, the importance of communicating clearly has grown and the emphasis on written communication increased. In his *New York Times* article, "The Fine Art of Getting it Down on Paper, Fast," Brent Staples explains how the change to an information age economy has increased the need for good writing skills: "Companies once covered for poor writers by surrounding them with people who could translate their thoughts onto paper. But this strategy has proved less practical in the bottom-line-driven information age, which requires more high-quality writing from more categories of employees than ever before. Instead of covering for nonwriters, companies are increasingly looking for ways to screen them out at the door."

HISTORY OF BUSINESS COMMUNICATIONS

In the early years of corporate America, business managers operated on a strict basis of top-down communications. Whatever the boss or owner of the company said was the law. In most cases, strategies for doing everything from selling products to dealing with employees would be discussed behind closed doors. Once those decisions were made by managers, lower-level employees were expected to put them into effect. Employees had little input; they did as they were told or found work elsewhere. Such management attitudes, particularly when they applied to worker safety issues in such places as coal and steel mines, led to the growth of labor unions. If nothing else, unions had the power in many cases to slow or shut down production until management listened to the demands of the workers.

In reaction to union demands, corporations eventually set up communication systems where rank--and-file members could speak their minds through union representatives. Although the unions provided the impetus for corporate managers to implement such systems, managers eventually realized that employees could have meaningful input into solving company problems. When presented with the opportunity to contribute, many employees jumped at the chance. This sort of feedback came to be called bottom-up communication.

In today's business environment, most corporations encourage employees to take an active role in the company. Employees who notice ways to improve production are encouraged, and usually rewarded, for passing those ideas on to managers. Employees who submit ideas that withstand intense study can be rewarded with a percentage of the savings to the company. Employees who are harassed on the job are strongly encouraged to report such harassment as far up the chain of management as necessary to stop it. Regular employee meetings are held where the lowest-level employee can stand up and ask the highest-level manager a direct question with the full expectation that a direct answer will be offered in return.

Business managers have also developed a method of monitoring how the company is running while meeting employees halfway. Sometimes called "management by walking around," this method of communication calls for top managers to get out of their offices and see what is happening at the level where the work is performed. Instead of simply reading reports from subordinates, business owners visit factories or service centers, observe employees on the job, and ask their opinions. Although the practice is both praised and denigrated regularly by business management experts, this form of communications does serve to keep the boss in touch.

COMMUNICATION MEDIA

There are two main media used for communication: written and oral. Nonverbal communications are also an element of communication systems. Each of these types of communication is described below.

Written Communication. Written communication is the most common form of business communication and more so because of the information age, which has seen the development of ever more sophisticated electronic communications tools. It is essential for small- business owners and managers to develop effective written communication skills and to encourage the same in all of its employees. The information age has altered the ways in which people communicate and placed an increasing emphasis on written versus oral communications.

The ever-increasing use of computers and computer networks to organize and transmit information means the need for competent writing skills is rising. Dr. Craig Hogan, a former university professor who now heads an online school for business writing, receives hundreds of inquiries each month from managers and executives requesting help with improving their own and their employees' writing skills. Dr. Hogan explains, in a *New York Times* article by Sam Dillon titled "What Corporate

America Can't Build: A Sentence,'' that millions of people previously not required to do a lot of writing on the job are now expected to write frequently and rapidly. According to Dr. Hogan, many of them are not up to the task. ''E-mail is a party to which English teachers have not been invited. It has companies tearing their hair out.'' Survey results from the National Commission on Writing study back up this assessment. The study found that a third of employees in the nation's ''blue chip'' companies write poorly and are in need of remedial writing instruction.

The most basic principles of written communication are similar to those for overall communication. Experts within the growing industry of remedial writing agree that there are five minimal requirements for good writing. They are:

1. Know your audience
2. Keep sentences short and simple
3. Avoid jargon and cliches
4. Distinguish between facts and opinions
5. Always double-check spelling, grammar, and punctuation

The key is, of course, to convey meaning in as accurate and concise a manner as possible. People do not read business memoranda for the pleasure of reading. They do so in order to receive instructions or information upon which to base decisions or take action. Therefore, highly literary prose is not desirable in business writing. Overly formal prose may also be counterproductive by seeming standoffish or simply wordy. A style of writing that is too informal can also convey an unintended message, namely that the subject matter is not serious or not taken seriously by the sender. A straightforward, courteous tone is usually the best choice but one that may not come naturally without practice.

Business correspondence should start with an outright statement about the purpose of the message and should be followed with simple and clear details in support of the purpose. The recipients of correspondence need information in order to act appropriately. They also need reasons that convince them to act or think in the way the sender intends. If the message conveys its meaning with clear arguments that identify reasons and provide evidence it should achieve that goal.

Special concern should be taken in all external correspondence since it reflects on the business as a whole. For example, letters intended to persuade somebody to either invest in a project or purchase from a company have a special organization. According to Murphy and Hildebrandt, they should: 1) attract favorable attention from the reader; 2) arouse interest; 3) convince the reader and create desire; and 4) describe the action the reader should take. When the purpose of the letter is to make a sale, it is also important to include facts about the product and a clear central selling point. Above all, it is important that any type of written communication that originates from a business create or enhance goodwill.

Oral Communication. Small-business owners and managers are frequently called upon to make presentations, conduct interviews, or lead meetings, so oral communication skills are another important area for development. Presentations might be made to employees for training purposes, or to potential customers for sales purposes. In either case, good presentation techniques can generate interest and create confidence. Interviewing skills might be needed for hiring new employees, conducting performance appraisals, or doing market research. Meetings or conferences can be important tools for relating to employees or to interested parties outside of the organization in order to solve problems or set goals.

The same principles that apply to other forms of oral communication also apply to telephone calling. It is important to plan business calls by determining the purpose, considering the audience (including the best time to call), and deciding the ideas to be included and the questions to be asked. When answering the telephone in a business setting, it is important to answer promptly and to state your name and department in a clear, pleasant voice. Communication over the telephone can create impressions that are vital to small-business success.

COMMUNICATIONS TECHNOLOGIES

Advances in technology over the last 25 years have dramatically changed the way in which business communications take place. In fact, in many ways communication technologies have changed the way in which business is done. The expanded use of electronic mail, handheld electronic devices, and the Internet generally have enabled businesses to more easily move work from one location to another, establish remote and/or mobile offices, and even create virtual offices. For instance many virtual teams communicate solely through e-mail, video conferencing, and IMs, or instant messaging. IMs are particularly useful since they allow co-workers to keep in touch online instantly and share ideas and work between a host of employees. They can also be addressed to a group and they can be sent to either a computer or a cell phone, which is an obvious advantage.

New communication technology has also speeded up the turnaround time for decision making and blurred the line between work hours and personal hours. All of these developments challenge companies to adapt to a

faster business environment. This is both an opportunity for companies to become more productive and efficient and a test of their adaptability.

Although changes in electronic communication technology are occurring at a phenomenal pace, they are not radical changes in the basic forms of communication. They are, rather, enhancements to traditional communication techniques. These technologies have made two basic enhancements in how we can communicate.

Mobility and Reach. Wireless and cellular technology have greatly expanded the places from which we can communicate and the distance over which we communicate easily. A manager on the way to work anywhere in the United States can easily call and chat with a colleague or supplier in Singapore as she makes her way home in the evening there.

Speed and Power. High-speed fiber optic phone lines and reasonably priced high-speed satellite transmissions have created a situation in which it is as easy to transfer large data files from one department to another in a single building as it is to transfer those files to a location anywhere in the world.

Both of these enhancements to communications have influenced how business is done. The ease with which colleagues can stay in touch with one another is helpful in coordinating a company's activities. Staying in close contact with suppliers is also beneficial.

Internal Communications. Intranets, or internal organizational computer networks, have become the media of choice for most companies when it comes to keeping employees informed. The company intranet can be used like an electronic bulletin board and when paired with e-mail and other electronic modes of communication can serve to disseminate information quickly and efficiently.

Since an intranet may be used to easily connect people working in various locations, it can help to establish or maintain a sense of community in an organization that is geographically dispersed. In fact, intranets make it possible for groups of people to work together closely in what is known commonly as a virtual office. Many small service businesses are started as virtual offices in which each person within the group works at his or her own home or place of choosing. What unites the group are two things: a common goal and a computer network of some sort through which information and software tools are shared.

External Communications. The growth of the Internet has made it essential for a business to have an online presence, simple though it may be. On a simple Internet Web site a company can provide potential customers, clients, employees, and investors with contact information and a picture of the company. For those wishing to use the Internet as a sales and marketing vehicle, a more sophisticated (and expensive) site can be developed. Often called e-commerce Web sites, these sites are used for advertising, displaying merchandise, taking and processing orders, tracking orders, and performing many customer service tasks.

Small businesses may have a unique opportunity for benefiting from a Web presence. The outreach that is possible through a well-marketed Web site is much greater than would be possible through any other media at a similar cost. According to some analysts, for businesses one of the most powerful aspects of an interactive medium like the Internet is the ability to develop a true two-way conversation with clients and customers. The Internet is a powerful communications tool and one that businesses of all sizes use regularly.

Having presences on external social networks such as Facebook, Plaxo, and LinkedIn have been deemed very important to businesses. In an article posted at BNet, author Jake Swearingen cites the findings of William Baker, a professor of marketing at San Diego State University. According to a survey Baker undertook of 1,600 executives, it was determined that companies that have a significant presence on social networks had a 24 percent higher score on innovation than firms that did not use social networks. This free method of promotion can pave the way to success for small businesses.

However, critiques of using public networks point out that confidential information might be posted accidently with anyone able to access it. In response to this issue, other systems are now in place that address this problem. In an article in the *Economist* titled "A World of Connections" it is noted that new methods of social networking are constantly being developed specifically for the corporate world and will ultimately be a boon to business. Among the most talked about services is Yammer, a corporate version of Twitter, and Chatter, a social-networking service that was developed by Salesforce.com.

The difference between these corporate-styled versions is that they can be used behind a corporate firewall so the confidential information posted on them will not be available to just anyone and yet information can be disseminated throughout a company instantly. This often increases productivity since people have access to information that they might not otherwise have and can use it to develop new products and ideas for company improvements.

THE IMPORTANCE OF GOOD COMMUNICATION

All forms of communication, even the lack of it, can have a significant impact on business dealings. A stiffly worded, official-sounding memo to employees telling

them not to talk to the press about impending litigation could be interpreted as admitting that the company did something wrong. Management's repeated "no comments" to employees and the press on a rumored merger may launch dozens of informal discussions about company suitors, how much the company will sell for, and how many employees will be laid off.

In order to avoid the negative effects of such scenarios, small-business owners should make it a practice to communicate as much and as openly as possible. They should think twice before eliminating the company newsletter as a cost-saving measure, keep electronic bulletin boards up-to-date, and hold meetings in which employees can ask questions of management. In addition, they should develop their skills so that all business communications are easily understandable. Management terms and jargon, stiff or flowery language may contribute to the impression among employees that management is talking down to them. It is also helpful to obtain and analyze feedback. Asking employees if they feel informed or not and what would make them feel more informed about the company can open valuable channels of communication.

COMMUNITY DEVELOPMENT CORPORATIONS

Community development corporations (CDCs) are locally based nonprofit organizations that work to help the residents of impoverished areas to improve their quality of life. Such organizations exist in virtually every major urban area of the United States. CDCs provide residents with a variety of different benefits, including housing, day care for children, nursing home care for the elderly, employment opportunities, job training, and health care facilities. Some CDCs act as part-owners of vital businesses within their neighborhoods, like supermarkets and shopping centers, while others assist residents in starting their own small businesses.

"Community development corporations function somewhat like private developers but are governed by the community," Gustav Spohn explained in an article for the *San Diego Business Journal.* "Their boards of directors are typically composed of community residents together with experts who advise them on the technical aspects of fund-raising and development projects. They depend heavily on government and private philanthropic funds, which in turn leverage financing from banks and other investors. Their goal is not to turn a profit but to generate economic renewal in poor communities."

In the early 1990s, CDCs were being dismissed as small-time players unable to make a real contribution to solving urban problems. Banks were rarely willing to provide them with financing or any other assistance. But a few years later the situation had changed. According to Spohn, writing in 1997, CDCs had come to be viewed as "key components of public strategies to fight poverty in cities across the country,". That trend continued into the twenty-first century. Nearly every major bank in the country became actively involved in community development in at least one city. According to an industry survey completed by Community-Wealth.Org, a project of the Democracy Collaborative at the University of Maryland, there were more than 4,600 CDCs in the United States in 2005. The survey also showed that the CDCs created some 75,000 jobs during the period between 1998 and 2005.

Some cities actively encourage businesses to support CDCs. Philadelphia, for example, has put in place a Development Tax Credit Program allowing businesses who commit to the support of a CDC for 10 years a complete tax write off. According to an article by Athena D. Merritt for the *Philadelphia Business Journal* in June 2009, the change in the city's Development Tax Credit Program was expected to loosen the requirements for businesses by allowing two or more to join together and share the required $100,000 per year support. Both businesses would then receive the tax credit. Merritt wrote that the reason for the change in policy was the existence of a number of businesses that were interested in supporting CDCs but could not manage the $100,000 commitment on their own.

Although CDCs have had a positive impact on the fight to reclaim urban neighborhoods, they are still the subject of some skepticism. Critics believe that CDCs cannot operate on a large enough scale to overcome a 40-year lack of investment in many inner cities. Others believe that community improvement efforts in impoverished neighborhoods are pointless, claiming that residents will simply choose to leave as soon as they are able to raise their incomes to a certain level. Finally, some people worry that CDCs which receive major funding from the federal government through the Community Development Block Grant and other programs will not be able to remain effective in the face of inevitable budget cuts.

In his article, Spohn outlined some of the functions of a successful CDC. First, it must make local residents feel that they have an investment in the neighborhood. Second, it must serve a mediating role between the differing interests of various neighborhood groups. Third, it must not polarize the interests of the community and the interests of government and outside private-sector institutions. Finally, it must continually battle the forces that act to return the inner cities to a state of disorder. Overall, CDCs can have a significant impact on the communities they serve. "Nationally there's a feeling that nothing can work in the cities they have no hope that there's nothing the society can do," Roland Anglin of the Ford Foundation told Spohn. "It's not true. There is a movement there. There is a structure there in inner cities. There is a strategy that can help."

But CDCs do not always escape criticism and even scandal in spite of their mission to help others. One of the largest CDCs, the Association of Community Organizations for Reform, referred to commonly by its acronym ACORN, came under scrutiny after a 2009 film was made of two of its employees assisting a man and woman who were seeking advice on how to set up a prostitution ring and evade the Internal Revenue Service (IRS). The film, made by two conservative activists who posed as a pimp and a prostitute, purportedly showed the employees advising the pair on how to portray their company and fool the IRS and to obtain government grants.

Although ACORN officials said that the pair had attempted unsuccessfully to do the same thing in other ACORN offices and called the film "false and defamatory and an attempt at 'gotcha journalism'," the incident was the subject of major publicity. It followed earlier incidents in which ACORN workers were accused of voter registration fraud in Florida and other states by Republican groups. All of these incidents resulted in the end to all federal funding for ACORN and a decision by President Barack Obama not to enlist its services in conducting the federal census. Thousands of other CDCs, of course, continue to do their laudable work with positive results and outside of the glare of negative publicity.

COMMUNITY RELATIONS

The phrase "community relations," narrowly understood, simply describes a company's interactions with the community in which it resides. The use of this phrase by businesses, the media, and students of business, however, almost always signifies something more than ordinary relationships and includes voluntary actions that either are (or can be interpreted as) done just for the good of the community. This produces ambiguities and conflicts. A strictly "free market" view of business defines a company as working for its stockholders under law; any charitable work or contributions are thus shorting what stockholders are due. A more modern view, which arose in the 1960s under the rubric of "social responsibility," defines corporations as involved in, indeed responsible for, achieving social goods over and above profits. Ambiguity also arises from the fact that many businesses are small and, in effect, the extensions of one or two individuals who are viewed as autonomous persons while large corporations are collectives managed by hired functionaries. Two definitions of community relations are thus equally correct. One defines community relations as the corporation's unforced contributions to the community. The other makes community relations a branch of public relations a form of communications.

A SPECTRUM OF ACTIVITIES

"Community relations" may be the consequence of a generous corporate culture in which relations just happen to be helpful. Thus a company may have acquired a good reputation because it is always ready to help when asked in different ways through people, money, or providing equipment. Managers at all levels understand in advance that this is sanctioned and approved. It is a corporate tradition, the way that things are done.

In another company, community relations may take a much more publicly visible form. The company will be proactively generous. It may sponsor an annual festival, for instance; it may be the chief support of a famous hospital or research center; or it may be well known for lending executives to civic causes or for taking a leadership role in fund-raising activities for the community theater or orchestra. Such behavior is often the long, institutionalized shadow of a famous founder who set such activities going. They are still pursued with energy, at high cost, with a high level of public recognition. In the very nature of things, it is always difficult, in such cases, to distinguish "generosity" from "corporate pride.

Some argue, however, that supporting community activities is a thing of the past and companies are instead looking for opportunities to join with organizations that will help drive their business forward. These companies know the value of being aligned with a good cause, and letting the public know about it as well. In her article in *onPhilanthropy*, Maureen Flynn quotes David Shiffman, of Media Vest, regarding consumers and their perception of brands: "Consumers see brands in a different light . . . they will make decisions based on what a company is doing." What companies want to do is have their brand name tied to a very worthy cause. According to data from the 2009 Edelman Good Purpose survey, 64 percent of consumers said that they expect brands to support a good cause and 67 percent said they would switch brands if a similar brand supported a good cause.

A 2008 Cone Cause Evolution Study found that this is true. Consumers, it reported, are both more aware of and more receptive to cause-related messages from businesses than ever before. "Consumers want to feel a connection to the issue and the nonprofit while fulfilling their personal needs," said Alison DaSilva, executive vice president, knowledge leadership and insights at Cone. "While this is a tall order for companies, it provides great opportunity for continued innovation and business growth."

Yet another form that community relations takes is that of a communications program the purpose of which is to improve or maintain a company's reputation at least cost. The underlying idea is that good community relations are good for business, but the community must be "educated" to the values the company brings to it. Under such a program, the company publicizes information about its activities. If it expands, it presents adding jobs in a favorable light. If it closes an operation, it presents its out-placement and employee counseling activities in the most favorable light. Anything even remotely associated with the community is interpreted as a contribution whether it is or not. The driving force in these cases is "perception," and the philosophical underpinning is that "perception is reality."

Community relations may also take a proactive form as a defensive strategy. Thus companies sometimes engage in or even initiate program activities, exploited to the maximum by using public relations, in order to counter a single unfavorable event or a chronic problem. A major fire blamed on poor supervision may be the triggering event; the chronic problem may be the production of toxic wastes or a strong odor that occasionally rises from its factory.

This description clearly shows that community relations is a conscious expression of corporate will and that the motives behind it become visible to the public over time. The more free the activity is the less it is necessitated by unfavorable events the more the community will value it; similarly, the less credit the company seeks, the more credit it will get.

JUSTIFICATIONS AND MOTIVATIONS

Commenting on a survey of 255 business executives, the Boston College Center for Corporate Community Relations stated in a 2000 press release: "Half of manufacturing executives say corporate citizenship will become more important in the next three to five years and 95 percent agree that a positive reputation in the community will help them achieve business objectives." That prediction proved to be true, based on a 2009 survey of more than 300 companies about their community involvement programs. The survey found that 62.1 percent maintained or increased budget levels for their community involvement projects. The survey also found that most companies prefer to donate money rather than employees' time. About a third of the companies that were surveyed reported that they donated from $1 to $10 million a year.

While employees do participate in community projects, the level of involvement is lower than what might be expected. According to Allison Lee, the author of a report about the survey, "30.3 percent of survey respondents reported that their companies have more than 30 percent employee participation, and 45.3 [percent] have 15 percent or less participating in volunteering programs."

The survey also found that while corporate headquarters may develop the strategies for community involvement, in over 50 percent of the companies the program was implemented on a local level. The survey also noted that companies struggle with how to demonstrate "measurable social impact from their initiatives in the communities where they operate."

COMP TIME

Comp Time, or Compensatory Time, is an alternate way of rewarding overtime work. Instead of paying an hourly employee time-and-a-half for work done over the time allotted in the normal work week, employers would allow an hour and a half of time off for each hour of overtime worked. This time could be used in emergencies, or scheduled for personal use. Comp time should not be confused with "flextime." Flextime allows employees to schedule their regular working hours in a way that accommodates their personal preferences and family commitments. Comp time strictly refers to compensation for overtime work.

Federal legislation, embodied in the Fair Labor Standards Act of 1938 (FLSA) governs the compensation of hourly employees. Under FLSA employees are assigned to either "exempt" or "nonexempt" status, that is, those who are exempt from the requirements of FLSA and those who are not. Nonexempt employees are paid by the hour, exempt employees receive a salary. FLSA mandates that nonexempt employees be paid at the rate of 1.5 times the hourly wage for every hour over 40 worked in a week. Nonexempts must be paid in dollars for their overtime and cannot receive compensatory time instead. In 1978 Congress passed the Federal Employees Flexible and Compressed Work Schedules Act. This enabled the federal government to pay its employees comp time instead of overtime pay. In 1985 this provision was extended to state and local employees as well at the employee's option. In 2000 the Supreme Court ruled (in *Christensen v. Harris County* that local government can compel employees to take accumulated comp time rather than take it at any time of their choosing. FLSA, however, continues to require overtime compensation in dollars for private sector hourly workers.

Since that time a major effort began in Congress to amend the FLSA to liberalize comp time rules for private sector hourly workers. The effort has thus far failed because of opposition from labor unions and their allies. One event in this process was the withdrawal in 2003 of H.R. 1119, the House of Representatives' bill called "Comp-Time Reform Bill" for lack of votes.

THE DEBATE OVER COMP TIME

The movement to pass comp time legislation has been led primarily by Republicans, who argue that comp time will provide employees with greater freedom to schedule their work around family commitments. Supporters also contend that broadening use of comp time into the private sector will give a financial boost to businesses. But opposition is strong from the Democratic Party and labor unions. Primary reasons for contesting the use of comp time are questions over the actual scheduling of time off, and whether employees will be free to choose either comp time or payment in return for overtime work. Those opposing legislation suggest that employees in practice will not be allowed to freely schedule the use of their comp time but will be restricted by employers. This would result in an option much less valuable to employees, limiting the prospect of "emergency" time, and restricting time off at certain points during the year. Concerns have also been expressed over possible pressure from businesses on employees to accept comp time over monetary compensation for overtime work, and whether voluntary overtime could be offered only in exchange for comp time. Finally, unions object to proposed comp time arrangements in which hours do not count toward pension benefits.

ALTERNATIVES

There are alternatives to comp time and overtime that may be possible if the state in which a business is located has no restrictions on the length of work day. For instance, an employee could work 10 hours a day for 4 days and then have 3 days off to avoid paying overtime. However, some states, including California, Colorado, and Connecticut, restrict the number of hours an employee can work during one day.

COMP TIME IN SMALL BUSINESSES

Some business experts believe that employers who do not offer large benefits packages, significant vacation time, or paid time off should seriously consider offering comp time as a kind of perk for employees. These observers contend that comp time can be a sensitive (and economical) way of rewarding employees for extra help at crunch times, especially since many workers have come to value time off even more than increased pay.

But small businesses, which may not be in a position to offer employees elaborate benefits, may also not be able to support a comp time system. Whether the system is regimented or informal, the small business may not be able to afford the lost productivity and additional paperwork involved in keeping track of comp time accrued and taken. There may also arise scheduling problems, especially for very small businesses that rely on only a few employees for their entire function. If a business is necessarily inflexible when it comes to scheduling time off, comp time may not be a valid alternative to regular overtime compensation.

BE SURE TO FOLLOW THE LAW

Whatever else a company does, it should make sure it follows the federal laws regarding overtime. Employees can sue if they feel they have been cheated of their proper pay. Take for instance the 2009 suit against the production company of the popular television show *American Idol*, which was sued by employees who said they were cheated of overtime and incorrectly classified as "exempt." In a *Reuters* story, attorney Jonathan Biddle is quoted as saying that the employees were "grossly underpaid, worked 24/7 and receive no rest or meal breaks and no health coverage.rdquo; He went on to say that the "company systematically overworked employees without paying the required overtime, falsified time cards and denied staffers meals and rest periods." With this case in mind, it is better for companies to err on the side of being overly careful about the matter of overtime, comp time, and who is and who is not "exempt."

COMPETITIVE ANALYSIS

Small businesses keep track of the competition. In large corporations the activity is formalized. Operating managers within large companies usually conduct competitive analysis as part of preparing annual plans. Competitive analysis may also involve elaborate brand studies from time to time; some industries practice reverse-engineering to discover how a competitor's technology or software works. Indeed, competitive analysis can reach a staggeringly high level of sophistication. However, as many sectors of the U.S. economy illustrate, high sophistication may not be sufficient to save an industry from competitive impacts. Both small and large businesses must go beyond analysis and do something to protect their operations. As Peter Drucker, the late management guru, never tired of pointing out, effective business practice and sophisticated business practice do not necessarily mean the same thing.

THE CONTEXT OF ANALYSIS

Key aspects of competitive analysis are when to do it and what to look at. Consultants, writers, and business schools uniformly urge that competitive analysis must be routine much as dentists urge flossing daily. In the usual environment of small business, concentrated competitive analysis tends to start after a triggering event produces awareness of trouble the actual or looming loss of sales. Until then, the tracking of competition will be low-key and routine. Once early signs of trouble appear, analysis begins with looking for causes. These may be complex. "Competition" may take many different forms. The following list identifies some of the things to look at:

- *Direct Competition.* This may take several forms. A known competitor may have initiated changes in pricing, product, or services. One or more new competitors may have appeared and are bidding prices down. A new buyer in the client's organization may have shifted contracts to his or her favored suppliers. Finally, the customer may have decided to make the product or to do the job in-house.
- *Indirect Competition.* A new technology or class of products may have appeared functionally matching what this business sells. In the modern technology-driven market, for instance, television, VCRs, DVDs, DVRs, and the Internet have all transformed the movie business.
- *Market Contraction.* Recessionary forces may be pressuring the customer so that he or she is simply not buying a product which may be in the highly discretionary category.
- *Self-inflicted Wounds.* A business may sometimes overlook that *it* is causing customers to shift their business elsewhere because of unwarranted price hikes, deteriorating service, aging technology, and countless other reasons.

The list reveals that competitive analysis is in a way indistinguishable from effective management, which means keeping in close touch with the market and all those factors that influence it. Competitors need to be known and watched attentively. It is important to keep oneself informed of the internal affairs and plans of a commercial or institutional customer. Trends need watching; products and services must be kept up to date; and fallback positions must be prepared if the economy can deprive a business of its core earnings. All this must be done continuously and with the right level of intensity. For the small business, formal competitive analysis may be a luxury, but the activities that enter into it must be carried out.

THE PROCESS ITSELF

A publication by the U.S. Small Business Administration titled "Competitive Analysis" provides an excellent list of fundamentals. SBA suggests that small businesses answer six questions: 1) Who are your five nearest direct competitors? 2) Who are your indirect competitors? 3) Is their business growing, steady, or declining? 4) What can you learn from their operations or from their advertising? 5) What are their strengths and weaknesses? and 6) How does their product or service differ from yours?

Many of the questions posed by SBA are very difficult to answer. Appropriately the agency suggests a process which is well adapted to the operation of a small business. SBA recommends that owners establish and keep files on competitors and that they review these from time to time. Precise answers may never be available to all the questions, but a general pattern will emerge. It is important consciously to make time for looking at what data are available by way of feeding one's awareness.

Important sources for information recommended by SBA are the following:

- Internet searches on appropriate topics.
- Visits to competitors' Web sites.
- Personal visits to competitors' locations.
- Customers. "Your sales staff," SBA says, "is in regular contact with customers and prospects, as is your competition. Learn what your customers and prospects are saying about your competitors."
- Competitors' ads.

- Speeches and presentations. "Attend speeches or presentations made by representatives of your competitors."
- Trade show displays.
- Written sources such as trade publications, newspapers, industry surveys, and computer databases.

COMPETITION CAN BE YOUR FRIEND

According to Buck Shapiro, competition can help someone's development as a businessperson. "No other factor brings about the accelerated and complete development of our business acumen than competition," wrote Shapiro in his article, "Skillfully and Effectively Dealing With Competition.".

Similarly, according to Joann Mansell, a business coach at Kaizen Coaching, competition can help to grow a business. " Large competitors can help you to promote your market. If industry leaders start promoting a product it can help create a market for yours as long as you tell customers you also offer that product or service," Mansell wrote. Mansell also advised forming alliances with competitors, offering up the example of owners of bed-and-breakfasts (B&B) forming a marketing coalition so they could afford a better Web site and other advertising to compete against the larger hotels. By working as a group, these B&Bs broke into a market that they could not afford to do individually.

COMPETITIVE BIDS

In many sectors of industry and almost invariably in government, procurement of goods and services takes place by competitive bidding. Vendors are solicited to present a proposal to meet the specifications published by the buyer. Such solicitations are referred to as requests for proposal (RFPs) or requests for quote (RFQs). Sellers present their bids in written form either routinely or, if the job bid is of some complexity, after discussions with the buyer. In many instances purchasing is from a pre-approved list of vendors; vendors get on these lists by answering requests for qualifications. In yet other instances, particularly in connection with preferential purchasing from women-owned or minority-owned enterprises, a frequently complicated bureaucratic process must first be followed to get on the list of qualified bidders; similar processes are involved in procurements under the federal government's small-business set-aside programs.

Bidding is common practice in selling at retail in some sectors, especially construction services. Roof replacements, new windows, new gutters, and siding are often sold to the homeowner directly in a competitive environment by presenting quotes. The careful buyer will obtain at least three bids before selecting the supplier.

People who start up small businesses in one of the sectors that uses competitive bidding tend to have prior experience of the process acquired as employees or managers while working for someone else in the industry. Occasionally, however, small-business owners who sell in other ways may have opportunities to garner sales by competitive bidding as well. This tends to happen when the buyer is a large institution calling on a retail vendor. An example might be a rental business receiving a solicitation from an event organizer for massive stocks of chairs, tables, and tents. The owner may also come across an advertised solicitation which happens to fit the company's capabilities. The bidding process may be quite easy to discern from the solicitation. In other cases the small business may have to educate itself to what are frequently complicated procurement cultures. Resources for learning, however, are available. The U.S. Small Business Administration (SBA), for instance, is an excellent resource for learning how to bid for government contracts.

MAJOR ELEMENTS OF THE PROCESS

There are several clearly defined steps for buyers and sellers to follow in a bidding process.

For the Buyer. From the viewpoint of the buyer, competitive bidding is a way to identify the best supplier based on a combination of qualifications, history of achievement, timeliness, responsiveness, and cost. All things equal, the

low bidder will get the job, but all things are rarely equal. The buyer's process will consist of: 1) finding qualified bidders; 2) preparing a concise but complete RFP; 3) publishing the solicitation; 4) evaluating the proposals received, which may involve interviews with bidders; and 5) selecting the winner and notifying the losers.

Precisely because evaluating proposals can be time-consuming, especially when proposals are for some unusual program and are complex, buyers frequently begin with a formal qualification under which vendors are invited to submit packages defining their experience, personnel, and history of performance. The buyer then selects from among those submitting packages vendors it will invite to bid on a job. In more routine situations, the buyer will tend to develop a list of trusted suppliers and will only ask those people to bid. In such a situation the solicitation is sent directly and is not published. Evaluation of proposals is often difficult unless the job is well-defined and standard. A research study may require original approaches, and the buyer must choose from among often equally innovative methodologies. To resolve such issues, the buyer may invite leading bidders to make presentations as well. Often proposals are "unresponsive," meaning that the bidder has failed evidently to grasp the buyer's full intentions. When many bidders are unresponsive, the fault may lie in the RFP itself: it may have been poorly constructed. In a well-managed buying process, both winners and losers are notified of the buyer's final decision. This decision may follow additional discussions with the tentative winner to work out final problems.

Buyers are looking for bidders who have internalized the buyer's problems, are responsive to special issues in the RFP, match their capabilities closely to elements of the job, show that they have the capacity to do the job on time, and are neither "greedy" nor "trying to buy the job." The last phrase is a red flag. It means that the vendor may be "too hungry" and is bidding too low and may later fail to perform.

For the Seller. The seller does no business until it has been invited to bid and has been selected as a winner. The seller's tasks are: 1) presolicitation sales activities; 2) getting qualified; 3) reviewing the RFP in light of all available intelligence; 4) deciding to bid or not to bid; 5) being fully responsive to the proposal; 6) differentiating its offer from competitors; 6) accurately to estimate cost; and 7) effectively sell the job in the postquote period.

The effective seller routinely calls on the buyer and makes itself fully aware of the buyer's plans, culture, and ways of doing business. In most company-to-company or company-to-agency transactions, known sellers tend to win jobs not necessarily because they are best qualified but because they are most knowledgeable about the buyer's needs. Sales activity works in the other direction too. The buyer will get to know the seller, and getting qualified will therefore be easier.

Successful sellers will frequently decline to bid a job because, based on their knowledge of themselves, of the client, sometimes of the buyer's budget, they judge in advance that they have a low probability of winning. Skills in making such decisions grow with experience. Some buyers always shift business to certain sellers; in the jargon of the trade, the "contracts are wired." These buyers may cultivate vendors they do not intend to buy from but still need in order to have "three bids." Skillful sellers know how to assess buyers and to act accordingly. Deciding *not* to bid is sometimes as useful for profitability as to bid and win.

It is the seller's responsibility to understand the RFP fully and, if need be, to seek clarifications before bidding. Such interaction may produce valuable information and also indicate the seller's seriousness to the buyer. Buyers value responsive bidding. Sellers, similarly, need to know exactly what the buyer wants in order properly to price the proposal. All else being equal, the most unique proposal will win the contract. In many cases involving standard services or goods, original methodology may be impossible to present, but unusual ways of delivering services or providing backup may differentiate the seller from other bidders. Cost is of primary importance. However, a high-priced proposal may sometimes win the contract if the work is unique, the methodology recognizably superior, or the seller's qualifications unusual. Sometimes the real sale is made in interviews and presentations *after* the proposal has been presented. The seller should be prepared to make a strong follow-up if so requested.

SMALL BUSINESS SET ASIDES

The Small Business Administration, on its Web page "Selling to the Government," states that by law, federal agencies are required to establish contracting goals, such that 23 percent of all government buys are intended to go to small businesses. In addition, contract goals are established for women-owned small businesses, firms located in HUBZones and service-disabled veteran-owned businesses. These government-wide goals, which are not always achieved, are 5 percent, 3 percent and 3 percent, respectively. They are important because federal agencies have a statutory obligation to consider small businesses for procurement opportunities.

A HUBZone is a "Historically Underutilized Business Zone" as established in the Small Business Reauthorization Act of 1997 and subsequently amended by the Small Business Reauthorization Act of 2000. A HUBZone defines small businesses operating from areas that are characterized by minimal government contracting. As such,

the most basic criteria for a small business to qualify as a HUBZone enterprise is that it must be physically located in an area designated as a HUBZone. The owners and employees of the business must also achieve the recommended percentage threshold of residence in the identified HUBZone. The application procedures and qualification criteria for HUBZone enterprises can be found at https://eweb1sp.sba.gov/hubzone/internet/index.cfm.

Small business set-asides are established under Part 19 of the Federal Acquisition Regulations. Contracts under $2,500 are not eligible. Most small business set-asides relate to contracts between $2,500 and $100,000. Such contracts are *intended* to be performed by small business organizations provided that government procurement officers have a reasonable expectation of getting bids from two or more qualified bidders. At their option, in order to meet federal contracting goals, procurement officers may also set aside larger contracts under the same rules. There are additional provisions whereby small businesses can participate in large contracts as subcontractors.

Participation in such programs will require substantial study and preparation for a small business not as yet engaged in federal procurement. Small business enterprises can enhance access to federal contracting opportunities through careful selection and determination of their prolific small business designations. This is because contract award procedures for bids involve visiting of sites and checking of records by federal procurement and contracting authorities. Indeed, proper and procedural set-aside designation of a small business goes a long way in determining the success of the business in competitive bidding. It may well be a way to develop new business opportunities or to increase sales. An excellent starting point for research is the SBA Web site.

FEDERAL CONTRACTING OPPORTUNITIES FOR SMALL BUSINESS ENTERPRISES

Federal procurements in the United States are guided by the North American Industrial Classification System (NAICS). Small-business owners can therefore determine their eligibility on the basis of their revenue levels. Small business enterprises interested in soliciting for federal contracts must have Central Contractor Registration (CCR) in tandem with the NAICS code that is applicable to the procurement procedure. The CCR registration can be accessed at www.ccr.gov.

In July 2009 the U.S. Senate amended the Small Business Act through the Small Business Innovation Research (SBIR) and Small Business Technology Transfer (STTR) Reauthorization Act of 2009. This act promotes the adoption of enhanced innovation, research, and technology in small business enterprises all the way to 2017. According to information contained in the Opencongress.org Web site, the main provisions of the SBIR/STTR Reauthorization Act of 2009 include:

- The setting up of an SBA-maintained technology office to oversee, report, and coordinate public database functions in tandem with the SBA administrators' responsibilities.
- Increase in the number of federal agencies participating in the SBIR and STTR programs by 0.1 percent annually from the 2011 financial year to the 2020 financial.
- Introduction of an extramural budget for enhanced SBIR research programs.The expansion of awards levels for individual small businesses from $100,000 to $150,000 for Phase I participation levels.
- The expansion of awards levels for individual small businesses from $750,000 to $1,000,000 for Phase II participation levels.
- The adjustment of allocations for STTR set-aside programs by 0.3 percent to 6 percent through biannual increments of 0.1 percent between 2011 and 2015.
- The provision of flexibility for small businesses to receive subsequent SBIR contract awards from different federal agencies subject to relevance and similarities of the awards.
- The requirement that agencies and major contractors at the federal level optimize the allocation of the third phase of technology awards related to technology, incorporating single source awards as well as recipients of SBIR and STTR responsible for developing the technology.
- The requirements that all federal agencies involved in the SBIR and STTR programs encourage applications submissions for energy, transport, security, or water supply-related projects.
- The requirement that the selection processes for project awards of SBIR/STTR programs be done competitively and on merit.

COMPUTER APPLICATIONS

According to The History of Computing Project, the prototype of the first microcomputer was introduced by the aptly named Micro Computer Inc., Los Angeles, in 1968. ARPANET, a defense contractors' information exchange and the precursor of the Internet was born a year later. Commercial microcomputers (Apple, Commodore, Tandy, Sinclair, and Texas Instruments) appeared in 1977. Apple Computer introduced the first graphical interface with the Macintosh; Microsoft followed with the first version of Windows in 1985. The Internet evolved from ARPANET over a period of 18 years and, by 1987, it was a worldwide network. By 1990 it was beginning to appear in small businesses, usually in text mode. The first well-known microcomputer software applications were the VisiCalc spreadsheet and the word processors Applewriter and WordStar, all dating to the period from 1978 to 1979.

A few small businesses used computers before the micros appeared, but primarily in professional applications rather than as business tools. Minicomputers like the Honeywell (used in engineering) and the Wang (a dedicated word processor much used by law firms and here and there by a successful author) were in the small business price range. Since then the three related strands of computing hardware, software, and networks have produced something of an avalanche of change in business administration and communications, every year bringing changes.

The first decade of the twenty-first century was marked by accelerated development of advanced professional software programs. Leading software vendors regularly created interactive, integrative, animated, and customizable software programs for use in almost all professional spheres. Small business enterprises can take advantage of advanced professional software programs to enhance the virtual interactive capacity of their businesses.

Changes in computing and related software applications have also permeated devices such as smartphones and netbooks. The increased use of mobile communications gadgets such as mobile phones has seen the development of appropriate professional software programs that enable end-users to access, author, and edit different applications across different platforms and gadgets. Such professional software programs facilitate wireless Internet access as well as access to email and business contacts. Blackberry Professional Software is one such software program that is widely used in business applications. Aggressive, tactical, and strategic small business entrepreneurs interested in frequent updates on the ongoing developments in training and certification for computer software programs can obtain more information at the www.computer.org Web site.

In the traditional areas of office computing, the emerging issues of the twenty first century are: 1) centralization and decentralization: should the information technology (IT) staff have more or less control? 2) renewal or adaptation: should aging applications be brought up to date or should the business intelligently integrate old and new and save money? and 3) Web-related expansion and exploitation.

Small business has taken an active part both in the use and provision of computer applications. Once computers became affordable, they have been widely deployed in small business and, whether stand-alone or networked, have provided much the same administrative support service they do in larger enterprises. Small businesses have also participated actively in providing computer services, the production of custom software, the writing of such software for their own operations, in consulting with clients and systems integration, and in Web-consulting and Web-page design and development. By the very nature of the small business environment, small operations have found it easy to adapt and to respond rapidly to change in what was a dynamic environment.

CATEGORIES OF APPLICATIONS

Categories of computer applications include operating systems, office applications, professional software, and business communications and outreach.

Operating Systems. All computers run under the control of operating system software (OS) designed for the hardware platform. The OS provides the basic environment in which everything takes place. Windows is the most widely used OS on small computers followed by the

Apple's Mac OS; only a small minority of small computers run on Unix, developed in 1969 at Bell Laboratories, or its derivates, for example, LINUX. The choice of operating systems in small businesses is often driven by the type of work done and the operating systems used by clients. Many operations based on the graphic arts use Macintosh computers; in other cases the need to exchange data with clients easily may dictate choice of the OS. All else being equal, small businesses will tend to use the most cost-effective system in-house, typically a Windows-based or a Macintosh system.

Office Applications. Word processing for written communications, spreadsheets for analysis, databases for inventory control, bookkeeping software for accounting, and software for tax preparation have become reasonably priced for even small businesses that have only one computer. Payroll software has now emerged for smaller operations too, sometimes freestanding and sometimes as extensions of popular bookkeeping packages. In the first decade of the twenty-first century, most small businesses were computerized and, in addition, enjoyed data management at levels of sophistication unimaginable in the mid-1990s.

Professional Software. Computer-assisted software development, design, and manufacturing systems (CAS, CAD, and CAM) are perhaps the best-known examples of professional software. Such systems, however, are also available for just about any professional activity that is based on symbol manipulation, data storage, and data processing. The Apple Macintosh, an early entrant into the graphical environment, continues to dominate graphic arts operations. Computer-based page design and typesetting packages have become affordable and are widely used in the small organization. Virtually all medical practices use computer-based patient scheduling and billing systems; the goal of completely automated and digitalized patient record keeping, however, is still in the future; systems are being installed here and there but are not yet widely used.

Business Communications and Outreach. The introduction of computer faxes and especially e-mail systems has revolutionized the way that businesses communicate with one another and employees interact within the company. Long-distance telephone costs and postage costs are saved in the process, and faster communications also speed up decision making. Of greatest importance, perhaps, for the small business is its ability to communicate with potential customers through its own Web site. Web-based marketing is very widespread.

FACTORS TO WEIGH WHEN CONSIDERING NEW COMPUTER APPLICATIONS

Many small-business owners have embraced computers as tools in doing business, and have done so early enough so that at present, in many places, hardware and applications both are becoming old. Amanda Kooser, writing in *Entrepreneur*, summed up the situation as follows: "A recent report by the Business Performance Management Forum took a look at this neglected issue [obsolete programs]. They surveyed a cross section of businesses and found more than 70 percent of respondents were convinced there were redundant, deficient or obsolete applications being maintained and supported on their networks. Forty percent estimated unwanted programs consumed more than 10 percent of their IT budgets. That can add up to a lot of unnecessary costs." Kooser recommended that companies conduct disciplined IT audits followed by systematic culling of old technology and its replacement with more modern software.

Another view is taken by Joe Tedesco, writing in *Database*. The title of the article signals the strategy: "Out With The Old? Not So Fast." Tedesco asked: "Is it time, simply, to buy new stuff? Again?" He went on to spell out the downside: "Investing anew in software is not an especially appealing option, for a variety of reasons. How can [companies] leverage proven tools for new challenges such as increased functionality, heightened security and better data and subject-matter management? More and more companies are finding new value in the software already in use in their organizations."

Despite conflicting views, peer pressure and anxiety often influence buyers, not least small business buyers. In an article for *Fortune*, Joel Dreyfuss wrote: "If you don't have the latest and (always) greatest software and hardware on your business computers, your vendors and employees can make you feel that you're just one step away from quill pens and parchment. The truth is that most small businesses, and consumers for that matter, get cajoled into upgrades that give them more headaches than benefits."

Dreyfuss suggested that small-business owners have employees figure out the cost of installation, debugging, and training associated with new computer equipment before consenting to a purchase.

Another factor for small-business owners to keep in mind is that a variety of computer applications are available online over the Internet. A number of companies have established small-business portals on the Internet to give companies access to software and services, such as payroll processing, legal services, online banking, or assistance in building a Web site for E-commerce. In addition, application service providers (ASPs) offer companies the

opportunity to test and use software over the Internet without having to purchase it. These options may eventually reduce the cost and improve the accessibility of computer applications for small businesses.

The pressure for commercial computer systems and software paved the way for the development of alternative computer software application solutions in the form of open source software, such as Java, by Sun Micro Systems, and JavaScript, by Netscape. Open Source software has been effective in the process of eliminating monopolies in the software management services, thereby leading to increased competition and enhanced service quality. Moreover, according to the Open Source Software (www.opensource.com) Web site, the consultative relationship between software developers and clients during the different phases of open source software development harness all appropriate cost control measures to the desired standards.

Computer software and application programs are definitely important tools for implementing effective marketing and customer relationship strategies in small-scale business enterprises. In a journal article titled "Knowledge Integration in Data Mining Using Decision Tables: Case Studies in Churn Prediction," E. C. Lima, C. Mues, and B. Baesens observed that the development of customer relationship models has gained increased significance in business enterprises because of the need for achieving sustained customer value. As such, the authors acknowledged the complexities associated with the creation, interpretation, and implementation of effective customer relationship models. The unceasing development of automated, simulative, innovative, and integrative software programs and applications will continue to facilitate the adoption of advanced information technology tools in small business enterprises.

COMPUTER CRIMES

DEFINITIONS

The U.S. Department of Justice (DOJ), in its manual on computer crime, defines such crime as "any violations of criminal law that involve a knowledge of computer technology for their perpetration, investigation, or prosecution." In its elaborations on the subject, DOJ divides computer crime into three categories: 1) crimes in which computer hardware, peripherals, and software are the target of a crime; the criminal is obtaining these objects illegally; 2) crimes in which the computer is the immediate "subject" or "victim" of a crime, meaning that the crime consists of attacks on a computer or a system, the destruction or disrupting of which is the damage caused; and 3) crimes in which computers and related systems are the means or "instrument" by which ordinary crimes are committed, such as theft of identities, data, or money or the distribution of child pornography.

Computer Crime: Narrow Focus The second of DOJ's categories is the one most people associate with computer crime and also with "computer annoyance" in the form of "spam." These disruptions began innocently enough. The first virus, known as Elk Clone, was written by Rich Skrenta as a boy in the ninth grade around 1982. The virus resided on an Apple II disk and, on the fiftieth booting of the computer with that disk, displayed a little poem, titled "Elk Cloner: the program with a personality,"

which included the lines: *It will get on all your disks / It will infiltrate your chips / Yes it's Cloner!.*

Viruses have since differentiated into other categories. Major forms and definitions are listed below as outlined by Ryan P. Wallace and associates writing in *American Criminal Law Review*:

- *Viruses.* These are programs that modify other computer programs so that they carry out functions intended by the creator of the virus. The Melissa Virus, for example (March 1999), disrupted e-mail service around the world.
- *Worms.* Worms have the functionality of viruses but spread by human action by way of the Internet, hitchhiking on mail.
- *Trojan horses.* As their name implies, these intruders pretend to be innocent programs. Users are persuaded to install something innocent-seeming on their computer. The Trojan horse then activates a more destructive program embedded in the innocent code.
- *Logic bombs.* These are destructive programs activated by some event or a specific date or time. Elk Cloner fit this category because it activated its message on the fiftieth booting of a disk. The same concept is used legally by companies that distribute time-limited samples of their software. The software disables itself after the passage, say, of 30 or 60 days.
- *Sniffers.* These are legitimate programs used to monitor and analyze networks. They can be deployed in a criminal fashion to steal passwords, credit card information, identities, or to spy on network activity.
- *Macroviruses.* These are also common in the computer world. In the book titled *E-Business and E-Commerce Management: Strategy Implementation and Practice*, Dave Chaffey defines macroviruses as worms which "piggyback on documents created by office applications such as Microsoft Word and Microsoft Excel, and which spread over to other documents each time they are opened."
- *Distributed denial of service attacks.* Such attacks are directed at Web sites by illegitimately causing multiple computers to send barrages of connection requests to the target site, thus causing it to crash.

The "Hacker." The term "hacker" came to be applied to computer hobbyists who spent their spare time creating video games and other basic computer programs. The term acquired negative connotations in the 1980s when computer experts illegally accessed several high-profile databanks. Databases at the Los Alamos National Laboratory (a center of nuclear weapons research) and the Sloan-Kettering Cancer Center in New York City were among their targets. Access to systems by telephone linkage from any computer increased such attacks. Over time, the "hacker" label came to be applied to programmers and disseminators of viruses. The public perception of hackers continues to be that of a lone expert with a taste for mischief. But "hacking" has come to encompass a wide range of computer crimes motivated by financial gain. Indeed, the vital information kept in computers has made them a target for corporate espionage, fraud, and embezzlement efforts. With the growing sophistication in computer security programs and law enforcement efforts has come the insight that many apparent "hacker" attacks come from well-informed insiders intent on spoil or, occasionally, on vengeance. Hacking incidences can be reduced through regular renewal of passwords and use of firewalls.

Spam. Since the spread of the Internet, "spam" has acquired the meaning of "unsolicited e-mail." Spam came under relatively mild regulation with the passage of the Controllingire the Assault of Non-Solicited Pornography and Marketing Act, also officially called the CAN-SPAM Act of 2003 (Public Law 108-197). It became effective in December 2003 and took effect on January 1, 2004. The act requires that senders of unsolicited commercial e-mail label their messages, but Congress did not require a standard labeling language. Such messages are required to carry instructions on how to opt out of receiving such mail; the senders must also provide their actual physical address. Misleading headers and titles are prohibited. Congress authorized the Federal Trade Commission to establish a "do-not-mail" registry but did not require that FTC do so. CAN-SPAM also prevents states from outlawing commercial e-mail or to require their own labeling.

In effect, based on the provisions of CAN-SPAM, spam is not a computer crime unless, according to U.S. Code, Title 18, No. 1037, violation is committed "in furtherance of any felony under the laws of the United States or of any State." Despite its legal status, spam is both a major annoyance and extracts a cost. In an Internet article titled *How much does SPAM Cost you? Google will Calculate*, Robert McMillan quoted a 2007 Nucleus Research Report which revealed that the cost of spam to U.S. companies averaged $712 per employee annually. McMillan based his estimations on the Google calculator, which confirms that "an employee spending 16 seconds on 21 spam messages would cost a company $31,000 annually." Therefore, it is estimated that U.S. companies spend up to $70 billion per year in lost productivity.

Phishing. Phishing has also emerged as a constant threat to Internet security. Phishing is used by online criminals to steal the identities of unsuspecting victims and use the identities to commit fraud such as withdrawing money from bank accounts. Phishing usually takes the form of

spam e-mails which deceive recipients into believing (for example) that they have won a lottery or are entitled to money from an inheritance. As such, the recipients are directed to e-mail back their identification and credit card details, at which point, the phisher gains access to the classified information of these individuals. The phishers are then able to access the bank account and other details of their victims to commit fraud as they wish.

INCIDENCE AND COSTS

There have been several major surveys of the incidence and costs of computer crime for companies.

The FBI Survey. As reported by the Federal Bureau of Investigation in its *2005 FBI Computer Crime Survey*, 64.1 percent of 2,066 companies surveyed reported some kind of computer crime incident in 2005 resulting in financial loss; all told, 5,389 incidents were reported. Small businesses were well represented in the survey: more than half of the respondents (51.2 %) had a range of ten to ninety-nine employees. Responding organizations experienced 2.75 incidents on average. Half of the respondents had one to four incidents, 19 percent had twenty or more incidents, the rest fell in between. Large organizations tended to have the most incidents.

The total cost of incidents reported by this group of companies was $31.7 million. The largest losses, amounting to $12 million, were associated with viruses, worms, and Trojan horses. The next three categories, in order, were thefts of laptops, desktops, and personal digital assistants ($3.5 million); financial fraud ($3.2 million); and network intrusion ($2.6 million). The smallest category, with a cost of $52,500, was Web site defacement.

As already stated, slightly over 64 percent experienced financial losses. The FBI extrapolated this result to the nation as a whole but intentionally made its assumptions conservative. The agency assumed that only 20 percent of a total population of thirteen million companies would have experienced losses, rather than 64 percent, as in its sample. The downward shift was in part based on the likelihood that respondents to the FBI survey may have done so because they were more aware of problems through experience. But the FBI also recognized that actual victimization rate may have been much higher than the 20 percent assumed. In any case, the conservative assumption used produced a total loss for the nation of $67.2 billion in 2005.

The CSI/FBI Survey. The Computer Security Institute (CSI) describes itself as "the world's leading membership organization specifically dedicated to serving and training the information, computer and network security professional." With FBI cooperation, CSI has been conducting the *CSI/FBI Computer Crime and Security Survey* every year. It is both a smaller and a larger survey than the FBI survey summarized above in that it looks at fewer but larger organizations. In 2008 CSI surveyed 522 organizations; these included governmental entities and universities as well as businesses. (Only 23 percent of survey respondents were organizations with 99 or fewer employees.) According to the CSI Report, financial fraud was the most expensive type of incident, averaging $463,100, followed by "bot" computers (autonomous computers running malicious software) within organizational networks, at an average of $345,600. The other key categories of incidents identified by the CSI Report were proprietary information loss, and loss of confidential data of employees, which recorded average losses of $241,000 and $268,000 respectively.

Only 27 percent of respondents reported incidents to law enforcement agencies, a relatively static level experienced between 2006 and 2007. The principal reasons given for not reporting incidents was that such information, reaching the public, would hurt stock price or aid competitors. Based on the survey results, "inside jobs" are as frequent as attacks by hackers or criminals from the outside.

SECURITY MEASURES

Computer security is concerned with preventing information stored in or used by computers from being altered, stolen, or used to commit crimes. The field includes the protection of electronic funds transfers, proprietary information (product designs, client lists, etc.), computer programs, and other communications, as well as the prevention of computer viruses. It can be difficult to place a dollar value on these assets, especially when such factors as potential loss of reputation or liability issues are considered. In some cases (e.g., military and hospital applications) there is a potential for loss of life due to misplaced or destroyed data; this cannot be adequately conveyed by risk analysis formulas.

The question most companies face is not whether to practice computer security measures but how much time and effort to invest. Fortunately, companies looking to protect themselves from computer crime can choose from a broad range of security options. Some of these measures are specifically designed to counter internal threats, while others are shaped to stop outside dangers. Some are relatively inexpensive to put in place, while others require significant outlays of money. But many security experts believe that the single greatest defense that any business can bring to bear is simply a mindset in which issues of security are of paramount concern.

Protection from Internal Threats. Whereas big corporations typically have entire departments devoted to computer system management, small businesses often do not have such a luxury. But commonsense measures that can be taken by managers and system administrators to minimize the danger of internal tampering with computer systems include the following:

- Notify employees that their use of the company's personal computers, computer networks, and Internet connections will be monitored. Then do it.
- Physical access to computers can be limited in various ways, including imposition of passwords; magnetic card readers; and biometrics, which verify the user's identity through matching patterns in hand geometry, signature or keystroke dynamics, neural networks (the pattern of nerves in the face), DNA fingerprinting, retinal imaging, or voice recognition. More traditional site control methods such as sign-in logs and security badges can also be useful.
- Classify information based on its importance, assigning security clearances to employees as needed.
- Eliminate nonessential modems that could be used to transmit information.
- Monitor activities of employees who keep nontraditional hours at the office.
- Make certain that the company's hiring process includes extensive background checks, especially in cases where the employee would be handling sensitive information.
- Stress the importance of confidential passwords to employees.

Protection from External Threats. Small businesses also need to protect their systems against outside attack. Firewalls may be expensive but may be worth the cost. The single greatest scourge from the outside are viruses of one kind or another. Business owners can do much to minimize this threat by heeding the following basic steps:

- Install and use antivirus software programs that scan PCs, computer networks, CD-ROMs, tape drives, diskettes, and Internet material, and destroy viruses when found.
- Update antivirus programs on a regular basis.
- Ensure that all individual computers are equipped with antivirus programs.
- Forbid employees from putting programs on their office computers without company approval.
- Make sure that the company has a regular policy of backing up (copying) important files and storing them in a safe place, so that the impact of corrupted files is minimized. Having a source of clean (i.e., uninfected by viruses) backup copies for data files and programs is as important as it is elementary.

A variety of sources exist to assist small-business owners with virus protection and Internet security measures. For example, several Web sites provide free virus warnings and downloadable antivirus patches for Web browsers. These sites include www.symantec.com and www.ciac.org. The CSI provides annual surveys on security breaches at www.gocsi.com. Another useful resource is the National Computer Security Association (www.ncsa.com), which provides tips on Internet security for business owners and supplies definitions of high-tech terms.

Employee monitoring can be enhanced through the use of advanced software programs such as scanner software and filter software. Scanner software has distinct capabilities for identifying sent or received e-mail contents as well as the Web pages that are accessed by individuals. Filter software, on the other hand, is programmed to detect and block access to any unauthorized activities or content specified by the Web administrator. For example, small business organizations can employ the use of Websense (www.websense.com) in the detection and blocking of unauthorized employee activities such as music downloads, instant messaging, or media streaming.

Small businesses seeking to establish Internet security policies and procedures might begin by contacting the Computer Emergency Response Team (CERT). This U.S. government organization, formed in 1988, works with the Internet community to raise awareness of security issues and organize the response to security threats. The CERT Web site (www.cert.org) posts the latest security alerts and also provides security-related documents, tools, and training seminars. Finally, CERT offers 24-hour technical assistance in the event of Internet security breaches. Small-business owners who contact CERT about a security problem will be asked to provide their company's Internet address, the computer models affected, the types of operating systems and software used, and the security measures that were in place.

The use of an externally managed e-mail service can go a long way in limiting the number of spam e-mails getting through to an organization. Third-party companies which provide external e-mail management services scan all organizational emails and sift e-mails before dispatching them to the intended destinations. External e-mail management services are generally credited for being more effective than internal antivirus software in terms of promptness and expertise in responding to virus threats. Message Labs (www.messagelabs.com) is one example of a company that runs external e-mail management services. The company scans millions of e-mails a day from more than 21,000 large companies and small businesses globally.

According to statistics contained in the company's Web site, the number of e-mails scanned daily by Message Lab rose from 1 million in 2002 to 8.5 million in 2009.

Cyber insurance has also emerged as a remedy for managing risks posed by cyber crimes. The concept involves the transfer of residual risks to insurance companies upon the implementation of all other appropriate cyber security measures in an organization. Like any other insurance policiy, the insured party remits agreed amounts of monthly premiums to the insurer. The insured party stands to gain compensation in the event of occurrence of any computer crimes subject to the insured risks. Cyber insurance therefore provides a platform for small business enterprises to pursue long-term measures for computer, data, and information security.

HARDWARE THEFT

Although computer viruses and theft of information pose the greatest financial threats to large organizations, loss of hardware by simple thievery is the second-ranking loss category for small business. Commonsense measures such as supervising entrances and locking up easily transported equipment at night are obvious enough. Many laptops are lost to thieves-of-opportunity who, standing in an unattended lobby, see a laptop on a desk while distant laughter is heard from an office birthday party.

Business travelers, of course, must keep a close eye on their notebook and laptop computers. The allure of such portables is so great that thieves sometimes work in teams to get their hands on them. Airports and hotels are favorite haunts of thieves. Security experts counsel travelers to be especially vigilant in high-traffic areas, to carry computer serial numbers separately from the hardware, and to consider installing locks, alarms, or tracking software.

COMPUTER-AIDED DESIGN (CAD) AND COMPUTER-AIDED MANUFACTURING (CAM)

Computer-aided design (CAD) involves creating computer models defined by geometrical parameters. These models typically appear on a computer monitor as a three-dimensional representation of a part or a system of parts, which can be readily altered by changing relevant parameters. CAD systems enable designers to view objects under a wide variety of representations and to test these objects by simulating real-world conditions.

Computer-aided manufacturing (CAM) uses geometrical design data to control automated machinery. CAM systems are associated with computer numerical control (CNC) or direct numerical control (DNC) systems. These systems differ from older forms of numerical control (NC) in that geometrical data are encoded mechanically. Since both CAD and CAM use computer-based methods for encoding geometrical data, it is possible for the processes of design and manufacture to be highly integrated. Computer-aided design and manufacturing systems are commonly referred to as CAD/CAM.

THE ORIGINS OF CAD/CAM

CAD had its origins in three separate sources, which also serve to highlight the basic operations that CAD systems provide. The first source of CAD resulted from attempts to automate the drafting process. These developments were pioneered by the General Motors Research Laboratories in the early 1960s. One of the important time-saving advantages of computer modeling over traditional drafting methods is that the former can be quickly corrected or manipulated by changing a model's parameters. The second source of CAD was in the testing of designs by simulation. The use of computer modeling to test products was pioneered by high-tech industries like aerospace and semiconductors. The third source of CAD development resulted from efforts to facilitate the flow from the design process to the manufacturing process using numerical control (NC) technologies, which enjoyed widespread use in many applications by the mid-1960s. It was this source that resulted in the linkage between CAD and CAM. One of the most important trends in CAD/CAM technologies is the ever-tighter integration between the design and manufacturing stages of CAD/CAM-based production processes.

The development of CAD and CAM and particularly the linkage between the two overcame traditional NC shortcomings in expense, ease of use, and speed by enabling the design and manufacture of a part to be undertaken using the same system of encoding geometrical data. This innovation greatly shortened the period between design and manufacture and greatly expanded the scope of production processes for which automated machinery could be economically used. Just as important, CAD/CAM gave the designer much more direct control over the production process, creating the possibility of completely integrated design and manufacturing processes.

The rapid growth in the use of CAD/CAM technologies after the early 1970s was made possible by the development of mass-produced silicon chips and the microprocessor, resulting in more readily affordable computers. As the price of computers continued to decline and their processing power improved, the use of CAD/CAM broadened from large firms using large-scale mass production techniques to firms of all sizes. The scope of operations to which CAD/CAM was applied broadened as well. In addition to parts-shaping by traditional machine tool processes such as stamping, drilling, milling, and grinding, CAD/CAM has come to be used by firms involved in producing consumer electronics, electronic components, molded plastics, and a host of other products. Computers are also used to control a number of manufacturing processes (such as chemical processing) that are not strictly defined as CAM because the control data are not based on geometrical parameters.

Using CAD, it is possible to simulate in three dimensions the movement of a part through a production process. This process can simulate feed rates, angles and speeds of machine tools, the position of part-holding clamps, as well as range and other constraints limiting the operations of a machine. The continuing development of the simulation of various manufacturing processes is one of the key means by which CAD and CAM systems are becoming increasingly integrated. CAD/CAM systems also facilitate communication among those involved in design, manufacturing, and other processes. This is of particular importance when one firm contracts another to either design or produce a component.

ADVANTAGES AND DISADVANTAGES

Modeling with CAD systems offers a number of advantages over traditional drafting methods that use rulers, squares, and compasses. For example, designs can be altered without erasing and redrawing. CAD systems also offer "zoom" features analogous to a camera lens, whereby a designer can magnify certain elements of a model to facilitate inspection. Computer models are typically three-dimensional and can be rotated on any axis, much as one could rotate an actual three-dimensional model in one's hand, enabling the designer to gain a fuller sense of the object. CAD systems also lend themselves to modeling cutaway drawings, in which the internal shape of a part is revealed, and to illustrating the spatial relationships among a system of parts. CAD also contributes significantly to cost and time reduction in product development processes, from the initial design stages to the prototype and the final preferred product.

To understand CAD it is also useful to understand what CAD cannot do. CAD systems have no means of comprehending real-world concepts, such as the nature of the object being designed or the function that object will serve. CAD systems function by their capacity to codify geometrical concepts. Thus the design process using CAD involves transferring a designer's idea into a formal geometrical model.

Other limitations to CAD are being addressed by research and development in the field of expert systems. This field is derived from research done in artificial intelligence (AI). One example of an expert system involves incorporating information about the nature of materials their weight, tensile strength, flexibility, and so on into CAD software. By including this and other information, the CAD system could then "know" what an expert engineer knows when that engineer creates a design. The system could then mimic the engineer's thought pattern and actually "create" more of the design. Expert systems might involve the implementation of more abstract principles, such as the nature of gravity and friction, or the function and relation of commonly

used parts, such as levers or nuts and bolts. Expert systems might also come to change the way data are stored and retrieved in CAD/CAM systems, supplanting the hierarchical system with one that offers greater flexibility. Such futuristic concepts, however, are all highly dependent on the ability to analyze human decision processes and to translate these into mechanical equivalents if possible.

One of the key areas of development in CAD technologies is the simulation of performance. Among the most common types of simulation are testing for response to stress and modeling the process by which a part might be manufactured or the dynamic relationships among a system of parts. In stress tests, model surfaces are shown by a grid or mesh, that distort as the part comes under simulated physical or thermal stress. Dynamics tests function as a complement or substitute for building working prototypes. The ease with which a part's specifications can be changed facilitates the development of optimal dynamic efficiencies, both as regards the functioning of a system of parts and the manufacture of any given part. Simulation is also used in electronic design automation, in which simulated flow of current through a circuit enables the rapid testing of various component configurations.

The processes of design and manufacture are, in some sense, conceptually separable. Yet the design process must be undertaken with an understanding of the nature of the production process. It is necessary, for example, for a designer to know the properties of the materials with which the part might be built, the various techniques by which the part might be shaped, and the scale of production that is economically viable. The conceptual overlap between design and manufacture is suggestive of the potential benefits of CAD and CAM and the reason they are generally considered together as a system.

COMPUTER AIDED MANUFACTURING SOFTWARE

The development of CAM software has simplified manufacturing practices across different sectors of small businesses including fashion, gaming, entertainment, theater, toy production, food production, and construction. For example, three-dimensional CAM software is usually incorporated in prototyping processes such as stereo lithography, which involves the use of lasers for liquid polymer solidification. Stereo lithography is a progressively repetitive process that uses lasers to gradually build three-dimensional solid printouts from liquefied polymers. Such technological procedures provide room for prototyping of functional models in a timely and cost-saving manner and definitely boost both small-scale and mass production processes.

THE CASE FOR CAS/CAM

Another abbreviation inspired by the ubiquitous presence of CAD/CAM in the manufacturing sector is CAS/CAM. This phrase stands for Computer-Aided Selling/Computer-Aided Marketing software. In the case of CAS/CAM, the core of such technologies is integration of work flows and application of proven rules to a repeating process.

COMPUTERS AND COMPUTER SYSTEMS

A computer is a programmable device that can automatically perform a sequence of calculations or other operations on data once programmed for the task. It can store, retrieve, and process data according to internal instructions. A computer may be either digital, analog, or hybrid, although most in operation today are digital. Digital computers express variables as numbers, usually

in the binary system. They are used for general purposes, whereas analog computers are built for specific tasks, typically scientific or technical. The term "computer" is usually synonymous with digital computer, and computers for business are exclusively digital.

ELEMENTS OF THE COMPUTER SYSTEM

The core, computing part of a computer is its central processing unit (CPU), or processor. It comprises an arithmetic-logic unit to carry out calculations, main memory to temporarily store data for processing, and a control unit to control the transfer of data between memory, input and output sources, and the arithmetic-logic unit. A computer is not fully functional without various peripheral devices, however. These are typically connected to a computer through cables, although some may be built into the same unit with the CPU. These include devices for the input of data, such as keyboards, mice, trackballs, scanners, light pens, modems, magnetic strip card readers, and microphones, as well as items for the output of data, such as monitors, printers, plotters, loudspeakers, earphones, and modems. In addition to these input/output devices, other types of peripherals include computer data storage devices for auxiliary memory storage, where data is saved even when the computer is turned off.

Finally, for a digital computer to function automatically, it requires programs, or sets of instructions written in computer-readable code. To be distinguished from the physical or hardware components of a computer, programs are collectively referred to as software.

A computer *system*, therefore, is a computer combined with peripheral equipment and software so that it can perform desired functions. Often the terms "computer" and "computer system" are used interchangeably, especially when peripheral devices are built into the same unit as the computer or when a system is sold and installed as a package. The term "computer system," however, may also refer to a configuration of hardware and software designed for a specific purpose, such as a manufacturing control system, a library automation system, or an accounting system. Or it may refer to a network of multiple computers linked together so that they can share software, data, and peripheral equipment.

Computers tend to be categorized by size and power, although advancements in computers' processing power have blurred the distinctions between traditional categories.

Open Systems, Today, most computer systems are "open,"which means that they are compatible with computer hardware and software from different manufacturers. In the past, all components of a computer system originated from the same manufacturer. There were no industry-wide standards. As a result, printers, monitors, and other peripheral equipment from one manufacturer would not operate when matched with the computer of another manufacturer. More significantly, software could only run on the specific computer brand for which it was designed. Today, however, "open systems," wherein various equipment from different manufacturers can be matched together, are common. Open systems are especially popular among small-business owners because they allow enterprises to upgrade or expand their computer systems more easily and cheaply. Open systems provide business owners with more buying options, enable them to minimize expenses of employee retraining on new systems, and give them greater freedom to share computer files with outside clients or vendors.

Networking. Computers on a network are physically linked by cables and use network software in conjunction with the operating system software. Depending on the hardware and software used, different types of computers may be put on the same network. This may involve computers of different sizes such as mainframes, midranges, and microcomputers or computers and peripherals of different manufacturers, which the trend toward open systems has facilitated. Local area networks (LANs) link computers within a limited geographical area, while wide area networks (WANs) connect computers in different geographic regions. Networks may have various architectures which determine whether computers on the network can act independently. A commonly used system architecture is client-server, whereby a server computer is designated as the one storing and processing data and is accessed by multiple users each at a client computer.

LANs have transformed how employees within an organization use computers. In organizations where employees formerly accessed midrange computers through "dumb" terminals, these employees now typically have more capabilities. These users have their own personal computers at their desks, but are still able to access needed data from a midrange or other server through the network.

BUSINESS USAGE OF COMPUTERS

Computers are used in government, industry, nonprofit and nongovernmental organizations, and in the home, but their impact has been greatest in business and industry. The competitive nature of business has created demands for continuous advances in computer technology and systems design. Meanwhile, the declining prices of computer systems and their increasing power and utility has led more and more enterprises to invest in computer systems for an ever-widening range of business functions. Today, computers are used to process data in all aspects of a business enterprise: product design and development, manufacturing, inventory control and distribution, quality control, sales and marketing, service data, accounting, and personnel management. They are also used in businesses of

all sizes and in all industry segments, including manufacturing, wholesale, retail, services, mining, agriculture, transportation, and communications.

The common business uses of a computer system are database management, financial management and accounting, and word processing. Companies use database management systems to keep track of changing information in databases on such subjects as clients, vendors, employees, inventory, supplies, product orders, and service requests. Financial and accounting systems are used for a variety of mathematical calculations on large volumes of numeric data, whether in the basic functions of financial service companies or in the accounting activities of firms. Computers equipped with spreadsheet or database management software, meanwhile, are used by accounts payable, accounts receivable, and payroll departments to process and tabulate financial data and analyze their cash flow situations. Word processing is ubiquitous and is used to create a wide range of documents. Finally, computer-savvy small-business owners may maintain their own Web sites.

Databases may also be used to help make strategic decisions through the use of software based on artificial intelligence. A database system may include in addition to records and statistics of products, services, and clients information about past human experience within a specific field. This is referred to as a knowledge base. Examples of expert system usage include business forecasting activities such as investment analysis, financial planning, insurance underwriting, and fraud risk prediction. Expert systems are also used in activities associated with regulatory compliance, contract bidding, complex production control, customer support, and training.

COMPUTERS AND THE WEB

The advent of the Internet led to the emergence of electronic commerce (e-commerce), effectively transforming the speed, accuracy, and convenience of computer-based business transactions. The use of intranets and extranets has particularly gained momentum in small business enterprises given the convenience with which a business can exclusively transact business with its core stakeholders without exposing sensitive information in the Internet. User names and passwords are used to limit access to sensitive information of a business enterprise. Whereas intranets limit information access to people within a business organization (such as the management team and employees), extranets extend information access to core stakeholders such as customers or suppliers.

Intranet applications are useful in the pursuit for shortened life cycles for products, cost reduction through expanded productivity, and virtual information distribution. Extranet applications equally portend great benefits by way of securing and facilitating business to business (B2B) transactions and communication processes. Extranets are particularly suitable for processing orders and distributing products in the supply chain processes of business enterprises. Dell is one example of a company which has successfully explored and optimized the use of extranets to harness supply chain management processes.

WORKFORCE NEEDS

Whether introducing a new computer system or making changes to an existing system, businesses inevitably change the ways in which their employees work, and this factor must be taken into consideration. "It is not unusual to experience some resistance from employees who are reluctant to accept departure from the status quo," wrote Richard Hensley in *Cincinnati Business Courier*. "Such resistance can often be greatly reduced by involving the affected employees in the development of, or modification to, the system. They can provide practical information on what works well within the current system and what doesn't. Once the changes have been implemented, establish a training program and support structure for all users. This will maximize the benefits of the system and better equip employees to achieve the results expected from the change." In addition, companies need to make sure that computer technology is distributed in an intelligent fashion. Computers should be allocated according to need, not ranking.

CONFERENCES, EXHIBITS, AND TRADE SHOWS

A trade show is an event where companies that are involved in a certain industry gather to exhibit their products, learn about current trends in their industry, and gain knowledge about their competitors. A trade show might also be called a conference or an exhibit, but the underlying concept behind all these events is the same. Trade shows provide opportunities for selling, reinforcing existing business relationships, and launching new products. These events can range in size from small regional shows featuring fewer than two dozen participants to massive national shows, which may draw hundreds of exhibitors and tens of thousands of visitors over a period of several days to a week.

During the 1990s, business analysts, consultants, and participants alike debated whether the surge in electronic commerce and Internet purchasing options might soon render the trade show an irrelevant relic of a bygone business era. But after a slowdown in growth from 2001 to 2003 due to a decline in travel following the terrorist attacks on September 11, 2001, and a general economic slowdown the trade show industry has grown steadily. These trade shows accounted for more than $100 billion in annual direct spending and attracted nearly 125 million individuals in 2004. In 2008 Forrester Research conducted a survey of marketing professionals in which all respondents admitted to spending more on large trade-sponsored events and trade shows than any other category in their marketing budget. Further, 27 percent of respondents reported that they would increase spending on trade shows in 2008 in light of the recession (only 22 percent reported an expected decrease). "In many industries, the trade show has become a must-seize marketing opportunity," stated *Business Week.* "It's a time to meet prospective customers, get valuable feedback on your product or service, and close sales."

The continued vitality of trade show exhibitions provides small businesses with excellent opportunities to stand on equal footing with far larger competitors. For small companies with limited marketing budgets, trade shows can serve as an economical and effective pathway to new clients and increased industry visibility. Moreover, trade shows provide entrepreneurs and their small-business managers with priceless opportunities to gather information about industry innovations and competitor products and services.

PREPARING FOR A SUCCESSFUL TRADE SHOW EXHIBIT

Once a small-business owner has decided to attend a specific trade show, there are steps that he or she can take to ensure that it is a successful and profitable endeavor. Of course, shows will vary in content, character, and tone from industry to industry, but for the most part, these guidelines can be followed no matter what field a small business is in.

Set specific and measurable goals. Perhaps the most important first step to take is to approach the show with enthusiasm and treat it as a sales opportunity and not a money drain. To take advantage of the opportunity, set specific goals. If the purpose of the show is to gather leads, then set a number in advance that would make the show a success for the company. Compare actual leads gathered to that target number to gauge whether the show was worthwhile.

Experts also recommend listing three strong objectives before deciding to exhibit at any show. Colin Green, managing director of Best of Show, suggests that "You have to be specific 'I want so many leads' or 'I want to be sure that so many people got my branding' so you have the measurement. You also have to be realistic, and accountable for you and your staff as well."

Publicize the company's involvement. According to the Trade Show Bureau, 45 percent of trade show attendees are drawn to a company's exhibit as the direct result of a personal invitation (via direct mail, e-mail, or telephone), trade journal publicity, or preshow advertising. A trade show is worthless unless prospective customers visit the booth, and the best way to ensure that those visits occur is to make them aware of the company's location on the floor. Indeed, industry surveys indicate that about 75 percent of all trade show attendees make out their schedules in advance of arrival. This is an important step, then, so companies should make sure that they allocate sufficient funds for marketing needs.

Prepare personnel. Staffers manning trade show booths should be personable, well-informed, and well-trained to demonstrate and sell the product or service. Conduct a preshow meeting with all key personnel who will be a part of the show, from employees who will spend their time at the booth to the shipper who will send company products to the show and be responsible for setup. Let each person know what is expected of him or her at the show, and make sure that they know about all pertinent facets of the effort, from the location of promotional brochures to products that should be highlighted. Other assignments, like observation of competitor's booths and materials or breaking down the booth at the end of the show, may be assigned to specific people.

SUCCESSFUL EXHIBITING

"Getting attention on a crowded show floor isn't easy for a newcomer," admitted *Business Week.* "However, you can create a respectable-looking booth inexpensively without being tacky: Buy good quality, three-sided skirts for your tables and portable banner stands for signage, and make

flyers on your computer to set on plastic literature racks. Don't clutter the space with lots of giveaways, but do hand out your business card and a small gift with your logo and phone number on it to qualified leads."

There are two types of booths to set up at a show, with different sales techniques needed for each. One is designed to make sales at the show, so salespeople should be trained in "one interview selling" quickly identifying a customer's needs and selling him or her the product to meet that need. At such a booth, it is common to have smaller and less expensive items on display and for sale at the show. Larger and more expensive items can be sold at show and delivered later. All sales at the show should be at a discount over the regular list price, at least 20 percent. If sales are the goal, be prepared to deal with cash, credit cards, and checks.

The other kind of booth is more informational and less sales-oriented. It is primarily designed to meet people, to demonstrate a presence in the industry, to promote customer relations, or to generate new business leads. It can also serve as an excellent meeting point for people who might invest in a company or join in a partnership. Since the focus of this type of booth is not sales, the booth personnel should approach their role differently than that of pure salesperson.

In the booth itself, try to have at least two people on duty at all times so that visitors receive a healthy measure of personal attention. Arrange the booth to maximize flow of traffic, for overcrowded booths will lead many potential visitors to pass on by. Booth staff should not hover over visitors. Instead, they should encourage browsing and be attentive to signals of interest in products or services from visitors. Make sure everyone who will be manning the booth understands the rules of etiquette at trade shows. There should be no eating or drinking in the booth, and no smoking. Do not spend time talking to the other salespeople in the booth. Assume friendly body posture and look receptive to questions.

POST EXHIBITION FOLLOW UP

Small businesses that maintain a quality presence at a trade show are likely to obtain a number of business leads during the show's duration. Yet many companies never follow up on these leads. According to the Trade Show Bureau, as many as 83 percent of exhibitors do not engage in any sort of organized post-exhibition marketing to trade show visitors. This is a terrible oversight that blunts much of the business potential of trade shows. With this in mind, trade show experts offer a variety of tips to make sure that small-business owners make the most of their trade show experiences:

- Allocate money wisely. Many analysts believe that businesses should devote at least one-third of their total trade show budgets to post-exhibition follow-up.
- Separate hot leads from those that seemed lukewarm or ambivalent and concentrate on those.
- Use a lead sheet to collect information on prospective customers who visit the booth.
- If applicable, send new leads back to the home office every night.
- Make sure that salespeople follow up on a lead within 1 or 2 weeks after the show; time is often of the essence in these cases.
- Do not gather more leads than can be followed up. Analysts contend that many businesses owners or representatives that gather a surplus of leads at trade shows are likely to break promises made (sending literature, following up with an answer to a question, etc.) at the show, which will reflect badly on the company.
- Do what was promised immediately. If representatives promise leads a catalog or sample, make sure the sample is sent promptly while it is still fresh in their mind.

Experts recommend making the follow-up simple and easy to manage. For example, send leads an e-mail thanking them for visiting the booth, and then add them to the company's mailing and contact management system. Rhonda Abrams in *USA Today* suggested that if the first follow-up contact is not made within 48 hours of a return to the office, it is unlikely ever to be completed. It is also recommended that a person follow up again after several days or weeks of no contact, since many individuals who were at the show may have a backlog of work upon their return and may not be able to respond to the initial call.

CONSOLIDATED OMNIBUS BUDGET RECONCILIATION ACT (COBRA)

The Consolidated Omnibus Budget Reconciliation Act (COBRA), first enacted in 1985 and revised in 1999, is a federal law that requires most employers to provide continuing health insurance coverage to employees and their dependents who are no longer eligible for the company's health insurance program. Employees can lose eligibility for coverage by terminating their employment, reducing their working hours, becoming eligible for Medicare, or in a number of other ways. Under the terms of COBRA, all businesses that employ more than twenty people and offer a group health insurance plan must give employees the option of continuing coverage at their own expense for a limited period of time when they lose eligibility for company-provided benefits. In addition, many states have their own laws regarding continuation coverage, some of which apply to smaller businesses and to benefits in addition to health insurance.

COBRA and similar health insurance continuation laws affect small businesses in two ways. First, many entrepreneurs start their own businesses after leaving their jobs with larger companies. These entrepreneurs may wish to take advantage of continuation coverage for themselves and their dependents until they are able to arrange their own health insurance plans. Second, many small-business owners must comply with COBRA or other applicable state laws and offer continuation coverage to their employees. Although workers must pay the actual cost of the insurance themselves, the administration of COBRA can be time-consuming and expensive for businesses. There are severe financial penalties for noncompliance, including a fine of $100 per day for failure to notify an employee of his or her COBRA rights, or even the revocation of a company's tax deduction for its group health insurance plan. Employers can also be held liable for damages, including workers' medical costs and legal fees. As a result, many companies outsource the activities associated with COBRA compliance to experienced independent administrators and management programs. For a business with fifty employees, such services are estimated to cost around $1,000 per year.

COBRA SPECIFICS

COBRA applies to nearly all businesses that have more than twenty employees and offer a group health care plan. The only exceptions are churches, church-related, tax-exempt organizations, and some federal employees. Companies that are subject to COBRA are required to offer continuation coverage to all "qualified beneficiaries," a category which includes employees, spouses, dependents, and retirees who were covered under the company's group health insurance plan up until they lost eligibility for coverage through a "qualifying event." Companies are not required to offer COBRA benefits to those employees who were not eligible for or declined to participate in the group health plan, or who were eligible for Medicare benefits.

The qualifying events that activate COBRA provisions include a voluntary or involuntary termination of employment, a reduction in hours from full to part-time, a failure to return to work after taking family or medical leave, a call for active military duty, or the bankruptcy of the business. An employee's spouse or dependents can qualify for COBRA benefits provided they were covered by the company's group health plan upon the employee's death, the couple's separation or divorce, or a dependent's change in eligibility status (i.e., a child reaches an age at which he or she no longer qualifies for coverage under the employee's insurance). The company may deny COBRA coverage to an employee who was involuntarily terminated from employment due to willful, job-related misconduct. But since these cases often end up in federal court, the company should weigh the expense of court costs against the expense of providing continuation coverage.

When a qualifying event occurs and COBRA is triggered, the company is required to offer a qualified beneficiary the option to continue coverage under all health care plans, medical spending accounts, dental, vision, and hearing plans, prescription drug programs, substance abuse plans, and mental health programs that are offered to regular employees. However, the company is not required to offer continuation coverage for life insurance, disability insurance, retirement plans, or vacation plans. Under normal circumstances, COBRA coverage lasts a maximum of 18 months. This time limit is extended to 29 months for dependents, or in cases where the employee becomes disabled. If the employee qualifies for COBRA for a reason other than termination of employment or reduction of hours, or experiences a second qualifying event during the regular COBRA coverage period, the time limit may be extended to 36 months.

The employee pays 100 percent of the costs of health insurance coverage under COBRA, plus a 2 percent surcharge to help the employer cover administrative expenses. The employer is entitled to terminate coverage if payments are late, but must allow at least a 30-day grace period. This time lag may pose a problem for some small businesses, since most insurance companies require payment for COBRA coverage in advance.

Notifications. Another component of COBRA involves communication with affected employees. A company is required to explain the right to continue benefits to each employee when they first join the company group health insurance plan, and again when a qualifying event occurs. When an employee qualifies for COBRA, the company has 30 days [changed to 90 days in 2004, see below] to notify the insurance company of that person's eligibility, and the insurance company then has 14 days to provide the employee with information regarding the costs and benefits of his or her health care continuation coverage. The employee has 60 days to decide whether he or she wants to continue coverage. If the decision is made to continue, the coverage is retroactive to the time of the qualifying event so that no lapses occur.

THE 1999 REVISION OF COBRA REGULATIONS

On February 3, 1999, the Internal Revenue Service (IRS) issued a set of revised and updated guidelines for the administration of COBRA. These new regulations took effect on January 1, 2000, meaning that they applied to all qualifying events occurring on or after that date. Although the new guidelines themselves required some interpretation, many tax and human resources professionals claimed that the rules would ultimately clarify and simplify several aspects of COBRA administration for businesses. Some of the major changes to COBRA are outlined below:

- The new regulations specifically address how COBRA applies to employers and employees when a company is involved in a merger or acquisition. The two companies involved in the transaction are allowed to determine who is responsible for the seller's COBRA liability by contract. If no other arrangements are made, the buyer will assume liability for COBRA coverage if it also assumes the acquisition's health care plan. If the seller terminates all of its health care plans prior to the date of the sale, however, the buyer may avoid COBRA liability.
- The new guidelines prevent employers from terminating a qualified employee's COBRA benefits because of other health care coverage the employee had before electing COBRA. However, the employer can terminate COBRA coverage early if the employee fails to pay premiums on time or becomes covered under another group health care plan or Medicare, or if the employer terminates all of its group health care plans.
- The IRS rules give employers more flexibility in determining how many health care plans they offer under COBRA. Previously, each separate benefit plan (i.e., dental, eye care, or prescription drug benefits) had to be offered separately to employees eligible for COBRA. Under the new guidelines, employers can combine all of their health care benefits into one group plan and offer employees an all-or-nothing package of benefits under COBRA.
- The 1999 guidelines limit the application of COBRA to employees covered by flexible spending accounts (FSA) for health care. For employees who maintain an FSA, employers only have to offer COBRA coverage during the year of the qualifying event. In addition, employers are not required to offer COBRA coverage if the amount an employee could receive under the FSA exceeds the amount he or she would pay for COBRA coverage for the same time period.
- The new regulations eliminate the requirement that employers offer "core coverage" as a separate option for COBRA-eligible employees. Previously, employers who provided an extensive health care benefit package were required to allow employees to elect to continue only the major medical portion, or core coverage, under COBRA, and opt out of additional coverage, like prescription drugs or dental care. Now employees may be required to elect to receive either all the coverage in a plan or no coverage at all.
- The revised guidelines also clarified an employer's responsibility under the law when an employee who wants COBRA coverage moves to a new geographic area outside the normal boundaries of the group health care plan. If the company's group health care plan is region-specific, the employer is only required to provide COBRA coverage if there are other employees covered in the new geographic region. Employers are not required to make alternative coverage available if none exists in that region.
- Finally, the new rules clarified the small-employer exception to COBRA. Under normal circumstances, COBRA does not apply to companies with fewer than twenty employees. However, it does apply in cases where a company with fewer than twenty employees pools its health care benefits in a multiple-employer plan under which another company has greater than twenty employees. The revised regulations also stated that employers cannot terminate COBRA coverage for existing beneficiaries because the number of employees later drops below twenty.

2004 NOTIFICATION RULES CHANGES

Some significant changes to the implementation of COBRA took place on May 26, 2004, with the issuance by the U.S. Department of Labor of its revised rule implementing notification requirements under the law. The information was published in the Federal Register of that date, as "29 CFR Part 2590, Health Care Continuation Coverage; Final Rule." DOL introduced this rule change on May 28, 2003, in order to update notification requirements. The main change introduced by this regulation was to extend by 30 days (from 60 to 90) the time available for an employer to notify an employee of his or her COBRA rights after the employee was enrolled in a group health program.

COBRA AND THE AMERICAN RECOVERY AND REINVESTMENT ACT OF 2009

The American Recovery and Reinvestment Act of 2009 (ARRA), an economic stimulus bill, was crafted to address the economic crisis that hit the United States in 2008. ARRA brought with it new provisions that were designed to enable employers to manage the costs of health coverage for the high number of employees who lost their jobs involuntarily due to the economic crisis. Signed into law on February 17, 2009, ARRA reduced the COBRA premiums to 35 percent for individuals who qualify, with the provider of the coverage receiving the remaining 65 percent through tax credit reimbursements. Only individuals earning less than $125,000 annually and couples earning less than $250,000 per year are considered elegible for the subsidized premium rates. Employers were therefore expected to ascertain eligibility of status for employees as provided for by the COBRA ongoing coverage.

ARRA AND TEMPORARY EXTENSION ACT OF 2010

Additional amendments were made to ARRA in March 2010 through the Temporary Extension Act of 2010 which extended the provisions of ARRA for tax credits on health benefits premiums defined under COBRA. The temporary amendments revised the expiry date for ARRA from December 31, 2009, to March 31, 2009. According to details contained in the U.S. Department of Labor Web site, the Temporary Extension Act tagged individual qualifications to events that constitute involuntary termination of covered employments occurring between September 1, 2008, and March 31, 2010.

As the constant revisions illustrate, compliance with COBRA and the various state laws governing health insurance continuation can be a tricky and expensive process.

CONSTRUCTION

Many successful small businesses decide to expand their operations either by purchasing, leasing, or building a new facility. In some instances, the business in question relocates its entire operation to the new facility. In other cases, the business may use the new facility to house excess inventory, maintain equipment, relieve office overcrowding, or open a new store.

The decision to construct a business premises may be prompted by a strategic goal like achieving distinctive competencies or gaining an edge in competitive advantage. In the book titled *Strategic Management: An Integrated*

Approach, Charles Hill and Gareth Jones defined distinctive competencies as the specific strengths of a firm that enable it to lower operational costs and enhance competitive advantage. As such, the construction of one's own business premises eases the capital and operational resource constraints on the business in the long term.

For those companies that decide to expand via new construction, the experience can be an unsettling one. In fact, relatively few start-up businesses choose construction as their mode of entry due to the higher costs associated with it and the greater length of time involved from the breaking ground stage to the day when the establishment opens its doors for business. Established small and mid-sized businesses are likely to be in a better position financially to launch a new construction project. Such firms have a proven track record, which can help them with financing, and already-productive operations that bring in revenue that can be used to defray the costs of construction.

A full assessment of the advantages and disadvantages of new construction should be undertaken before any decision is made to build new. Designing and building a new facility has the advantage of providing a company with exactly the space and arrangements to meet its needs. The obvious disadvantages are the delay in occupancy while land acquisition, design work, and building are going on, and the cost of overruns, common in large projects. Oversight responsibilities are essential but can also be very time-consuming and distract from the primary business of a company.

Certainly, there are risks associated with construction. But for small- and mid-sized business owners that choose this method of expansion and growth and plan wisely before, during, and after the construction phase it can also mark the beginning of a bright new chapter in the company's history. A well-designed and well-built property can allow a company to generate additional revenue, reduce expenses, and increase efficiency.

SECURING A BUILDING CONTRACTOR

Some sources of potential building contractors include professional association databases, referrals from architects or fellow small-business owners, and a competitive bidding process. "It is important to find a contractor that can build in your specific industry, whether it's a restaurant, health care facility, industrial plant, or technology center," Amanda Strickland wrote in the *Dallas Business Journal.* "Contractors tend to have niches."

A small-business owner seeking to secure a good building contractor should concentrate on three factors:

- The contractor's reputation in the community.
- The financial condition of the contractor.
- The status of currently uncompleted jobs by the contractor.

There are many warning signs to watch for when assessing potential contractors. Is the contractor known for subcontracting out large percentages of the total construction work? Does the contractor have a history of clashes with subcontractors? How long has the contractor done business in the area? What percentage of jobs does the contractor complete on schedule? Does his or her previous work experience adequately match the sort of renovation or construction needed? Does the contractor have a backlog of projects that could hurt his or her ability to meet a deadline? What sort of references can be provided? The answers to all of these questions can be either reassuring or cause for further investigation. In either case, the key is to make sure they are asked.

One way in which small-business owners can learn the answers to some of these questions is by requiring bidding contractors to submit a surety bond, which is basically a three-party contract between the contractor, the project owner, and the underwriting surety company. Surety companies will make an extensive review of the construction company before issuing such a bond. In addition, if the contractor signs the bond, he is basically guaranteeing his ability to complete the project on which he is bidding.

MONITORING THE CONSTRUCTION PROCESS

After the bidding process is completed and the building contract awarded, the successful contractor should be asked to provide a performance bond. Such a bond guarantees that the project's contractual provisions will be carried out. In addition, a payment bond should be secured which certifies that suppliers and subcontractors will be paid. Ensuring that the contractor and all of his subcontractors have adequate insurance (workers' compensation, general and umbrella liability, equipment, builders' risk, etc.) to address problems is another key to attaining peace of mind for the small-business owner.

Finally, the project owner needs to make sure that he or she continuously monitors the performance of the contractor. Indeed, it is always important to demand frequent updates on the progress of the construction project relative to the work breakdown of the project. This will ensure that the budgeted costs and allocated time for the construction are adhered to so as to avoid additional costs and unnecessary delays. Equally, small-business entrepreneurs should always make adequate reference to existing state and federal laws to avoid legal complications and liabilities with contractors as well as state and federal authorities.

USE OF INFORMATION TECHNOLOGY IN CONSTRUCTION

Small-business entrepreneurs can enhance efficiency in the construction process by using relevant information technology software such as Microsoft project planning software (MS Project). The use of MS Project significantly improves the process of monitoring progress, estimating construction resources, and determining the schedules for different phases of the construction. The construction process also stands to be boosted by the graphically formatted information processed through the MS Project. Gantt charts and program evaluation review technique (PERT) are some of the visual tools of project planning that are accessible through such software.

In addition, the pursuit of green building initiatives such as the use of renewable energy and environmentally friendly construction materials in a construction project may earn tax cuts and other benefits for a small business enterprise.

CONSTRUCTIVE DISCHARGE

"Constructive discharge" is a legal doctrine originating in labor disputes going back to the 1930s. The originator of the doctrine was the National Labor Relations Board (NLRB) which was attempting to deal with situations in which employers forced employees to resign by creating intolerable working conditions, usually because the employees were engaged in union activities. The first use of the phrase was in an NLRB case in 1938 called *In re Sterling Corset Co.*, 9 N.L.R.B. 858, 865. The doctrine has been frequently applied in cases brought under Title VII of the Civil Rights Act of 1964, initially in racial discrimination contexts. In recent decades constructive discharge has figured as a doctrine in dealing with sexual harassment cases.

Unemployment compensation is paid to employees only when the employee is discharged involuntarily for no fault of his or her own or if the employee resigns but with a qualifying cause. An employee who simply resigns without a qualifying cause is not eligible; neither is an employee discharged for misconduct. Constructive discharge because of an intolerable working environment is one of the qualifying causes, along with illness and other causes. An employee who quits because of sexual harassment or other hostile conditions is constructively discharged; he or she may be found to be eligible for unemployment benefits and will have the right to sue the company for wrongful termination as well although in this case, the employee took the action on his or her own initiative.

LEGAL HISTORY

In the case of constructive discharge for sexual harassment, the direct involvement of the employer, and thus the employer's liability, has been clarified in three Supreme Court judgments rendered in 1998 and 2004. The issue arises because sexual harassment is seen to arise from the personal desires of the harassing party. Unlike the cases arising from an employer's desire to keep unions

out, sexual harassment carries no benefit for the employer. Thus the question arises: if one or more supervisors engage in sexual harassment of an employee, is the employer as such liable for such activity?

The courts, relying on long-established law, had held that if a supervisor uses his powers as an agent of the corporation in attempts to get sexual favors, the mere use of such powers by a supervisor automatically involves the employer in the harassment because those powers are delegated. Thus if a supervisor uses assignments, demotions, promotions, hiring or threat of discharge, and similar means in connection with sexual harassment, the employer is also implicated. But what if the sexual harassment "stands alone," as it were, and does not involve "employment actions"?

Faragher/Ellerth. Two such cases were decided by the Supreme Court in 1998. In one (*Faragher v. Boca Raton*) plaintiff Beth Ann Faragher sued the City of Boca Raton. She had resigned as a lifeguard in protest at the sexual harassment of two supervisors (Bill Terry and David Silverman) who had created a hostile environment by inappropriate touching and by making lewd remarks. The District Court agreed with Faragher, but the Eleventh Circuit Court reversed the District Court's decision, arguing that the two supervisors were just acting on their own, not as agents of the city. No "employment actions" were involved, in other words.

In the second case, with very similar facts, the District Court and the appellate court reached diametrically opposed conclusions. In this case (*Burlington Industries, Inc. v. Ellerth*) Kimberly Ellerth quit a job as a sales employee after claiming to have endured constant sexual harassment by a single supervisor (Ted Slowik). Ellerth claimed that Slowik had on three occasions made remarks which she interpreted as threats that he would deny her certain job benefits. But this did not actually happen. In fact she was promoted. At the same time, she never filed a complaint against the supervisor although she knew that her employer, Burlington Industries, had a policy against sexual harassment. The District Court ruled against Ellerth; the Seventh Circuit Court reversed the ruling but in a confusing manner. Eight separate opinions were rendered which did not result in a clear rationale for reversing the lower court.

The Supreme Court accepted these cases in an effort to make order and reached conclusions later referred to as *Faragher/Ellerth*. The Court held in essence that: 1) the employer was strictly liable for a supervisor's actions if the action culminated in a tangible employment action, such as discharge, demotion, or undesirable reassignment; 2) in the absence of such a direct linkage, the employee may sue the employer anyway, but the employer has a right to a defense on the basis of having responsibly attempted to prevent such conduct; and 3) that the actions of the employee in using or not using available internal channels of reporting abuses should be part of the consideration.

Pennsylvania State Police v. Suders. Another case in this legal history was the Supreme Court judgment in the case of *Pennsylvania State Police v. Suders* decided in 2004 (hereafter *Suders*). The nature of this case was to draw the lines sharper than they had been drawn in *Faragher/Ellerth*.

The case involved Nancy Sue Suders who, while working for the Pennsylvania State Police (PSP), was subjected to sexual harassment by three supervisors (Eric D. Easton, William D. Baker, and Eric B. Prendergast). Suders talked to the PSP Equal Employment Opportunity Officer, Virginia Smith-Elliott. Smith-Elliott told Suders to file a complaint but did not provide her with the form necessary to file the complaint.

In this case the District Court ruled in favor of the PSP without trial on the grounds that Suders had failed to file a compliant and therefore, under the *Faragher/Ellerth* precedent, Suders' hostile work environment claim was untenable as a matter of law. The appeals court in this case, the Third Circuit Court, sent the case back for trial on the grounds that issues of material fact existed about the effectiveness of PSP's program to deal with sexual harassment. The court also held that if Suders proved constructive discharge, that alone would constitute an employment action and would deprive PSP of a defense under *Faragher/Ellerth*.

The Supreme Court, under *Suders*, agreed with the Third Circuit that the case should be tried. However, the Supreme Court also held that PSP nonetheless had a right to an affirmative defense unless the plaintiff quit "in reasonable response to an adverse action officially changing her employment status or situation, e.g., a humiliating demotion, extreme cut in pay, or transfer to a position in which she would face unbearable working conditions."

The upshot of *Suders* therefore was that sexual harassment as such suffices as grounds for constructive discharge, whether or not the employee makes use of complaint procedures that may be in place. On the other hand, the employer has a right to an affirmative defense unless the employee quit after employment actions such as those named above. If such actions were shown to have taken place, the employer is strictly liable.

IMPLICATIONS FOR SMALL BUSINESS

The evolving doctrine of constructive discharge makes it clear that reasonable policies and their active enforcement will go a long way toward avoiding the creation of hostile

environments and lawsuits that may result from them. Small-business owners have the advantage of being closer to their employees than the management of large firms. The disadvantage in small businesses arises from the same cause: informality. Ideally a small business will have:

- A clear policy on sexual harassment signed by every employee. The policy should outline the procedure for filing a complaint and should include at least two names with telephone numbers: the individual who is to receive complaints and a second individual who may be contacted if no action is taken by the first; the second person, ideally, will be outside the company and an objective third party.
- Periodic scheduled discussions of this policy, ideally led by top management people to give it weight.
- A watchful management attitude and close supervision especially in situations where individuals are isolated.
- A personnel review procedure in which the subject is raised by the reviewing manager.
- An action plan for dealing with complaints, for establishing facts, and for resolving the issues, ideally involving a third party if possible outside the company.

Cautious small business entrepreneurs will seek to acquaint themselves with the state and federal employment laws. Some resources on U.S. employment laws can be accessed at the Web sites of the Equal Employment Opportunity Commission (www.eeoc.gov) and the Department of Labor (www.dol.gov). The Employment at Will Doctrine is also a very helpful reference resource. Discrimination, unwarranted punishments, and hostility toward employees should be avoided at all costs to avoid costly court cases with employees.

CONSULTANTS

A consultant is an individual who possesses special knowledge or skills and provides that expertise to a client for a fee. Consultants help all sorts of businesses find and implement solutions to a wide variety of problems, including those related to business start-up, marketing, manufacturing, strategy, organization structure, environmental compliance, health and safety, technology, and communications. Some consultants are self-employed, independent contractors who offer specialized skills in a certain field; other consultants work for large consulting firms, such as Anderson Consulting or Gemini Consulting, that offer expertise in a wide range of business areas; and still other consultants hail from academia.

The consulting industry has grown rapidly since its origins in the 1960s. Several factors have contributed to this increase. First, as a result of the trend toward corporate downsizing, many companies have found that they lack the internal manpower to complete all necessary tasks. Second, the complexity of today's business climate as a result of deregulation, globalization, and technology advancements has outpaced many companies' levels of expertise. Business management consulting services enable small business enterprises to streamline their operations so as to cut down on costs and optimize on value creation. Consultancy firms draw on their expertise to identify wasteful business processes and operations and identify appropriate investment strategies that suit the prevailing market demands. Consultants also provide a way for companies to get special projects done without adding employees to the payroll.

Consultancy gained more prominence following the global economic crisis of 2008 and 2009. Business confidence was drastically eroded in the small-business sector, a situation that prompted many small-business owners to seek

guidance from consultancy firms. As a result, the business consultancy sector experienced positive growth while providing recovery advice to businesses affected by the economic crisis.

According to the U.S. Bureau of Labor Statistics, the core sectors of technical, scientific, and business management consulting services are experiencing the fastest growth rates in the early 2010s. The high growth rates in these consulting categories are attributable to the services the consulting firms provide with regards to managing expenses, assets, and financial planning.

The decision to hire a consultant is not one that a small business should take lightly. Consultants can be very expensive, although their expertise can prove invaluable. The small-business owner must first decide whether the situation facing the company requires the input of a consultant. If it does, advance preparation should be done to ensure a successful consulting experience. The small-business owner will then be ready to find and negotiate a contract with the right consultant. An important part of this process is understanding the ways in which consultants charge for their services. Hopefully, after completing the consulting process, the small business will emerge with a successfully implemented solution to its problem.

DECIDING WHETHER TO USE A CONSULTANT

In deciding whether to hire a consultant, the small-business owner should consider the nature of the problem, the reasons why internal resources cannot be used to solve it, and the possible advantages a consultant could offer. In her article "Do's and Don'ts of Hiring Consultants," Joan Adams described several situations in which a consultant's services are likely to be required. "You want to call a consultant when you feel like your business is 'stuck.' Your revenues are flat or growing very slowly. Your costs are growing at a faster rate than revenue.... Something isn't working but you don't quite know what it is or what to do about it." A small business should not hire a consultant simply in order to have someone else implement unpopular decisions.

MAKING THE CONSULTING EXPERIENCE WORK

Once the decision has been made to enlist the help of a consultant, there are several steps the small-business owner can take in advance to increase the likelihood that the consulting experience will be successful. First and foremost, the company's managers should define the problem they need the consultant to address. Using probing questions to go beyond superficial symptoms to underlying causes, the managers should attempt to state the problem in writing. Next, they should define the expected results of the consulting experience. The objectives the managers come up with should be clear, realistic, and measurable.

Another important step in preparing for a successful consulting experience is to communicate with employees. The small-business owner should explain the problem fully and honestly, in as positive terms as possible, and ask employees for their understanding and cooperation. When employees feel surprised or threatened, they may hamper the consultant's efforts by withholding information or not providing honest opinions. It is also helpful to gather all important company documents relating to the problem in order to make them available to the consultant. The consultant's job will be easier if he or she has ample information about both the company and the problem at hand.

Once the consulting project begins, there are several other steps a small-business owner can take to help ensure its success. For example, it is important to manage the project from the top in order to give it the visibility and priority it deserves. The small-business owner should appoint a liaison to assist the consultant in gathering information, and should receive regular progress reports about the project. In the implementation stage, the small-business owner should adequately staff the project and empower those involved to make any necessary changes.

HOW TO SELECT A CONSULTANT

Selecting the right consultant for the company and the type of problem at hand is a vital part of the process. The first step is to assemble a list of candidates by getting recommendations from people in the same line of business or contacting consulting associations or consultant brokers that represent the same industry. Trade and professional journals are also a source of potential consulting firms and a place where such firms advertise. Several library reference books, such as Thomson Gale's *Consultants and Consulting Organizations Directory*, provide contact information for consultants in a variety of fields. It is important to avoid selecting a consultant based upon a current management fad; instead, the decision should be based upon the company's particular needs.

The next step is to determine, based on the nature of the problem, what type of consultant is needed. An advisory consultant analyzes the problem and turns recommendations over to the client, but is not involved in implementation of the solution. In contrast, an operational consultant remains on hand to assist the client in proper implementation, or in some cases handles the implementation without the client's assistance. Part-time consultants are generally employed full time within their field of expertise marketing, for example but also offer their services to other companies on the side. They usually charge less money than full-time consultants, but they also cannot devote their undivided time and energy to the client.

Process consultants are skills-oriented generalists. With expertise in one or more technical areas, these consultants can apply their skills to any industry or organization. In contrast, functional consultants apply their skills to a particular environment. For example, a hospital facilities planner would concentrate on consulting to hospitals, rather than to other types of businesses that require facilities planning. Another distinction between consultants is based on the size of their operation. Consultants can work for large firms, small firms, or even independently. Large firms offer greater resources, but also have higher overhead and thus charge higher fees. Small firms or independent consultants may offer more attentive service but may not have access to the precise type of talent that is required. Finally, consultants can be academically or commercially based. In general, academic consultants may be most helpful with problems requiring research or a background in theory, while commercial consultants may be able to offer more practical experience.

Once a small-business owner has determined what type of consultant would be best suited to handle the company's problem and assembled a list of candidates, the next step is to interview the candidates. Some of the traits to consider include experience with the company or industry, availability, knowledge of the problem at hand, communication skills, flexibility, and compatibility. Since consultants are usually required to work within the corporate culture, often in times of crisis, it is important that their style is compatible with that of the firm.

After discussing the problem in detail with the leading candidates, the small-business owner may opt to ask each consultant to submit a written proposal to aid in the selection process. In some cases, the contents of these proposals may convince the small-business owner that the problem could be better handled using in-house resources. After deciding to hire a specific consultant, the small-business owner should ask that consultant to draw up a contract, or at least a formal letter, confirming their arrangements. It is important to note that the contract should be based on negotiations between the two parties, so the small-business owner may wish to add, delete, or clarify the information included. There are several peripheral issues that the small-business owner may want to address in the contract, including the consultant's proposed methods of handling conflicts of interest, subcontractors, insurance/liability, expenses, confidentiality, and nonperformance.

WEB CONSULTANTS

The growth in Internet applications for businesses has created a simultaneous growth in the number of e-commerce and Web consultants. Many of the same general guidelines that apply to choosing a traditional business consultant also apply to choosing a Web consultant. As Tara Teichgraeber wrote in an article for the *Dallas Business Journal*, the first step in selecting a Web consultant is deciding what goals the company hopes to achieve by establishing a presence on the Internet. For example, some companies want to set up an interactive online store in order to sell products or services over the Internet, while others may just want a basic Web site to enhance the company's image. "Deciding what a consultant should do helps narrow down a candidate with similar experience and proven success, as well as helps the business owner stick to a financial plan," Teichgraeber noted.

Many different types of Web consultants exist, each offering various types of services and charging widely disparate fees. "In hiring a consultant, you can choose from among independent site developers, Web design shops, technology consulting firms, traditional advertising and public relations agencies, and interactive agencies," Reid Goldsborough explained in an article for *Link-Up*. "A Web consultant can build you a Web site from scratch or enhance an existing one. Costs are all over the place, from several hundred dollars for a simple site consisting of a few pages, to a million dollars or more for an e-commerce site with product databases that are easily updated, a search engine, animated product demonstrations, secure online transactions, and audio and video enhancements."

HOW CONSULTANTS CHARGE CLIENTS

Most consultants use the same basic formula to determine the fees charged for their services, but clients are asked to pay these fees in a wide variety of ways. All consultants' fees are based on a daily billing rate, which reflects the value they place on one day's labor plus expected overhead expenses. In some cases, this daily billing rate multiplied by the amount of time the consultant spends on the project is the amount the company actually pays. But other consultants may estimate the amount of time needed and quote the client a fixed fee. Other consultants may provide a bracket quotation, or a range within which the total fee will fall. Another way in which consultants charge clients is a monthly retainer, which covers all the necessary services for that month. Finally, some consultants especially in high-technology fields charge on the basis of the company's performance, linking payments to measurable outcomes.

THE CONSULTING PROCESS

The consulting process begins when the client company decides to enlist the services of a consultant. The consultant then analyzes the company's problem and provides recommendations about how to fix it. Small-business owners should avoid the temptation blindly to follow a consultant's recommendations; instead, they should seek to understand the diagnosis and be prepared to negotiate any necessary

changes. The consulting process should not be mysterious or unusual, but rather a mutually beneficial business arrangement between consultant and client. Finally, after implementing the consultant's recommendations, the client company should formally evaluate the success of the consulting experience so that those lessons can be applied to future problems.

CONSULTING

Consulting is the business of providing advice to clients for a fee in order to help them solve problems within a certain area of business. Consulting services are provided by consultants, a majority of whom have gained their expertise from previous employment. Some consultants work for large consulting firms, such as Accenture or Bain & Company, that offer expertise in a wide range of business areas; other consultants hail from academia and assist companies with problems relating to research or theory; others are self-employed, independent contractors who offer specialized skills in a specific area of expertise. For example, a former stockbroker might become a financial consultant, a former employee in a nonprofit organization might open a business as a fund-raising consultant, and an accountant might become a tax consultant.

Expertise alone, however, does not make someone a consultant. To be a consultant requires applying that expertise to practical problem solving. Consulting requires the application of marketing skills and the ability to establish job contacts. Personality also plays a role in consulting success. Many experts advise those looking to hire a consultant to trust their instincts about personality. Joan Adams, in an article titled "Do's and Don'ts of Hiring a Consultant" writes: "Go with your gut. The starting point for selection is you really have to like, respect and trust this person or it just won't work.... Change is tough. I don't care how brilliant a consultant is it is not going to work if you don't like the person."

Consultants constitute a growing number of the self-employed. This growth began in the early 1990s, when the trend toward corporate downsizing left many skilled professionals without jobs. Many of these "downsized" professionals began to do consulting work. Those who succeeded in building viable consulting businesses earned as much if not more than they did in their former employment.

The successful consultants are usually those who find a market niche for themselves through research, intensive marketing, and locale. Charging the right fee and avoiding falling into the trap of "free" consulting requires business sense. Consulting fees can vary from almost nothing to thousands of dollars per assignment, depending on the assignment, market conditions, and the standard rate for that type of work.

Since most consultants are self-employed professionals, consulting can often involve inconsistent workflow, long hours, and a high level of stress. Consultants must study their fields of expertise continuously to keep abreast of developments. While competition is great, there are only a few large consulting firms. Most are smaller businesses that focus on a rising trend, such as online business, environmental concerns, and international contacts.

CONSULTING DEVELOPMENT

After its rise in popularity in the 1980 and 1990s, consulting went through several phases and eventually broke out into multiple facets or fads. These fads tended to drift away

from core business principles and often went by names such as "Business Process Reengineering." This habit of following trends continued for several years, with consultants focusing on eco-friendly business practices for companies that wanted to improve their "green" image and life management consultants who worked with different worker generations to incorporate fitness, family raising, and healthy habits into the workplace.

As new technologies have allowed more integrated forms of business, consultants have also developed concentrations in e-commerce and digital management. In 2008, however, consultancies began to swing back to basic business practices. Instead of specializing in esoteric areas, the large consulting firms focused on areas like business start-up procedures, profitability analysis, and growth potential. These fundamentals appealed to a wider variety of organizations, including small businesses.

However, new trends are still emerging. One of the more popular new trends in business consulting is organization hierarchy and theory, which considers the core structures of a company and how they change based on technology and markets. One example is the growth of diamond hierarchies. Since the industrial age, most large companies have formed into pyramid hierarchies where a few senior management and executive positions direct an increasingly large workforce, with the most positions found at the bottom of the pyramid in the simplest jobs. Today, however, improved automation, increased use of technology, and most importantly leadership-based education trends have led to the formation of diamond hierarchies. In these structures, few workers are hired in the base positions of the company because fewer employees are needed and fewer people are interested in those jobs. Concentration is instead placed toward the middle of the structure, in mid-level management positions and other jobs with relatively little supervision. This creates a diamond hierarchy instead of the traditional pyramid shape.

A diamond hierarchy responds better to different management techniques and hiring tactics than a pyramid hierarchy, and some organizations can struggle with the change. Management consultants bridge the gap and help companies understand the new diamond structure and how trends in employment are changing.

TYPES OF CONSULTANTS

Consultants help businesses find and implement solutions, including those related to business start-up, marketing, manufacturing, strategy, organization structure, environmental compliance, health and safety, technology, and communications. In addition to size of the operation and field of specialty, consultants can be categorized by relationship to the client. An advisory consultant makes only recommendations, while an operational consultant can assist the business in implementation.

Part-time consultants offer services in addition to their full-time job and typically focus on more simple consultations with lower fees. Process consultants are skills-oriented generalists. With expertise in one or more technical areas, these consultants can apply their skills to any industry or organization. In contrast, functional consultants apply their skills to a particular environment; for example, a hospital facilities planner would concentrate on consulting to hospitals.

ESTABLISHING A CONSULTING BUSINESS

There are several elements involved in setting up a consulting business. These include start-up, setting fees, marketing, evaluating opportunities, and developing proposals and contracts.

Start-Up. An entrepreneur starting up a consulting business should begin with an honest assessment of skills. The aspiring consultant should identify both content skills the technical expertise that clients will be willing to pay for and process skills, the qualities that would enable someone to run a successful consulting business. Some of the more important process skills include communication, problem solving, and interpersonal skills. In addition, independent consultants must have the ability to manage, market, and grow their own businesses.

There are also Master of Business Adminstration (MBA) programs that focus on management consulting and are an excellent resource for enterprising consultants. An MBA in consulting can help consultants enter established business hierarchies where companies hire few entry-level or inexperienced people, but focus instead on those with educational qualifications such as an MBA. This opens opportunities for the consultant in many large organizations.

Setting Fees. To avoid confusion, each service the consultant performs should have a clearly defined fee. But deciding how much to charge for various services can be a challenge for a new consultant. The first step should be examining the costs relating to the consulting business itself. In addition to direct costs, the consultant must also consider indirect overhead expenses associated with running the business. After correctly gauging both direct and indirect costs, the consultant should develop a fee structure that covers these costs and allows for both market rates and revenue. Some new consultants might use their previous salary as a starting point, or the salary of a comparable position.

The fee structures that consultants use depend on how they work. Consultants who spend time training and evaluating businesses are likely to charge by the hour. Others may offer a consultant package at a certain rate for a short-term service. Some consultants are paid with a monthly retainer, or on some type of success contingency set down in the consultant's contract.

Marketing. In-depth marketing strategies are common among consultants. Strategies include direct marketing, such as telemarketing, and indirect marketing. The value of consultants' services depends largely on their own experience and the details of the services that they offer. Marketing focuses on explanations of techniques and methods, and enumeration of successful results produced for previous clients. Previous clients can also provide excellent marketing opportunities in their own right, building a consultant's reputation and widening his or her potential market through word of mouth.

Consultancies may use direct mailers or brochures to advertise, although online marketing is more popular. Web-based marketing allows a competent consultant to provide detailed information about services and fees while also displaying experience and success stories in easy-to-read formats.

Indirect marketing techniques, while less likely to lead to immediate client relationships, are invaluable in helping new consultants increase their name recognition and credibility over the long term. Giving seminars, speaking before groups, joining professional associations, and writing articles or books are all good ways for consultants to build their reputations as sought-after experts in a given field. Another important means of publicizing a new business is through news releases, which can be sent to local media or trade journals to announce client relationships, successful projects, upcoming seminars, or other important happenings related to the business.

Evaluating Consulting Opportunities. New consultants may be tempted to jump at any business opportunity that comes along. A new consultant should, however, gather information about the client in order to make an informed decision about pursuing a consulting opportunity. This process, called qualifying the client, involves considering the nature, scope, and urgency of the project, as well as the client's budget. It is also helpful to learn the client's desired outcomes and decision-making process and find out if the client has used consultants in the past.

Consultants also go over the difficulties the company is experiencing and what type of solutions it is looking for. This includes any obstacles to the success of the project, such as legal issues or funding difficulties. A face-to-face interview and a formal request for proposal are the two main tools companies use in selecting consultants. Consultants can use these tools as a way to find out more about their clients, as well.

Proposals and Contracts. Proposals are an important part of the consulting business. Sometimes proposals serve to introduce consultants and their services to prospective clients, while other times proposals serve to finalize the arrangements between a consultant and a client. Prospective clients may request a formal proposal in order to compare several possible consultants, make decisions related to budgets or scheduling, or simply to collect ideas about how to solve a particular problem using in-house resources. Most experienced consultants try to discern the motives of potential clients ahead of time in order to avoid committing excessive time and resources to "free consulting."

Prior to submitting a proposal, a consultant needs to gather information about the company and its goals from both interviews and outside sources. Proposals include a description of the client's needs, the services the consultant is offering to meet those needs, and the consultation process from beginning to end. This divides the proposal into an introduction, a methodology section, and a time/cost section. The introduction provides an overview of the proposal and should be used to demonstrate the consultant's understanding of the client's needs and desired outcomes. The methodology section is the main part of the proposal and specifies the actions the consultant plans to take in order to provide a focused solution to the client's problem. It may also be helpful for the consultant to mention any unique services or expertise he or she can offer, in order to differentiate the proposal from those submitted by other consultants. The timing and cost section provides a realistic and specific fee structure and schedule for completion of the project. In addition, the consultant may wish to outline what effect, if any, the consulting process will have on the client's internal resources.

Proposals should be written in a conversational tone, without excessive use of technical jargon, and with the prospective client's needs in mind. The consultant may benefit from keeping in touch with the client while writing the proposal, as this helps avoid misunderstandings or incomplete information. If the consultant receives the assignment, the proposal then serves as the basis for a formal contract. Although some clients may simply sign the proposal to authorize the consultant to begin work, many consultants prefer to clarify the arrangements in a separate document. At a minimum, the contract should outline the scope of the project, the consultant's fees, and the proposed time frame. There are several other issues that the consultant may wish to address, including

conflicts of interest, subcontractors, insurance/liability, expenses, confidentiality, and cancellation.

CONSULTANTS FOR SMALL BUSINESSES

Small businesses seeking a consultant should analyze their own operations and decide what areas they want consultants to focus on. Many small businesses find information technology (IT) consultants useful, since the variety of technology solutions can be confusing for start-up companies, and implementation can be challenging without a staff member with IT experience. IT consultants can recommend specific data and security solutions, and may even set up systems for the small business.

Small businesses may also be especially interested in the newer wave of cost-cutting consultants, who examine businesses for any efficiency problems that may be a source of profit loss. The consultants recommend changes and produce reports on how much the business can save with the proper strategy, a plan that may save struggling companies.

When meeting with consultants, small businesses should ask a variety of questions to gauge their effectiveness. Good consultants will be flexible, able to produce alternative solutions, and keep careful track of costs for the business. Owners should make sure their consultant is communicative, easy to reach, and has proper credentials. Many different certification programs are available across the United States for consultants, including membership to the Association of Independent Consultants. Some certifications hold more weight than others, and conscientious business owners should inspect consultant references and background before hiring.

If a small business is interested in hiring a consultant, it should create an RFP or Request for Proposal form. This is an official document asking the consultant for an estimate, and it should detail the specific areas which the consultant will be examining, the type of solutions the business is expecting, a timeline for the work, and a budget. Templates for different RFPs can be found online and elsewhere. The proposal itself should follow a similar structure, but include a more detailed rubric for what measures of success will determine when the solution is completed. Cancellation terms and accountability details are also common for contract proposals.

CONSUMER ADVOCACY

Consumer advocacy refers to actions taken by individuals or groups to promote and protect the interests of the buying public. Historically, consumer advocates have assumed a somewhat adversarial role in exposing unfair business practices or unsafe products that threaten the welfare of the general public. Consumer advocates use tactics like publicity, boycotts, letter-writing campaigns, critical Web sites, and lawsuits to raise awareness of issues affecting consumers and to counteract the financial and political power of the organizations they target. Since even large businesses can be visibly wounded when their mistreatment of consumers or other constituencies arouses the ire of consumer advocacy organizations, it should be obvious to small-business owners that they can ill afford to engage in business practices that might draw the attention of consumer advocates.

Periods of vocal consumer advocacy around the turn of the twentieth century and in the late 1960s have left a legacy of federal legislation and agencies intended to protect consumers in the United States. The rights of consumers have

expanded to include product safety, the legitimacy of advertising claims, the satisfactory resolution of grievances, and a say in government decisions. In the early days of industry, companies could afford to ignore consumers' wishes because there was so much demand for their goods and services. As a result, they were often able to command high prices for products of poor quality. The earliest consumer advocates to point out such abuses were called "muckrakers," and their revelations of underhanded business practices spurred the creation of several federal agencies and a flurry of legislation designed to curb some of the most serious abuses. At the same time, increased competition began to provide consumers with more choices among a variety of products of higher quality. Still, some notable cases of corporations neglecting the public welfare for their own gain continued, and corporate influence in American politics enabled many businesses to resist calls for reform in advertising, worker or consumer safety, and pollution control.

This situation led to the consumer movement of the 1960s. One of the country's most outspoken and controversial consumer advocates, lawyer Ralph Nader, came to the forefront during this time. Nader's effective and well-publicized denunciations of the American automobile industry included class-action lawsuits and calls for recalls of allegedly defective products, and many of his actions served as a tactical model for future advocacy organizations.

The efforts of Nader and other activists led to the formation of several federal agencies designed to protect consumer interests. The U.S. Office of Consumer Affairs, created in 1971, investigates and resolves consumer complaints, conducts consumer surveys, and disseminates product information to the public. The Consumer Product Safety Commission, formed in 1972, sets national standards for product safety and testing procedures, coordinates product recalls, and ensures that companies respond to valid consumer complaints. Many other government agencies have responsibilities that include the safety of consumers, among their many responsibilities. They include such agencies as the Federal Communications Commission (FCC), the Food and Drug Administration (FDA), the Federal Aviation Administration (FAA), the U.S. Department of Agriculture (USDA), and the Federal Trade Commission (FTC). Some state-level agencies are also involved in the regulation of products and services in order to assure the safety of the public. The Better Business Bureau is an organization strongly involved in monitoring safety issues related to business activity.

The Consumer Federation of America is the largest consumer advocacy group in the United States, consisting in 2010 of about 300 member organizations representing more than fifty million people. The International Organization of Consumers Unions, based in the Netherlands, actively promotes consumer interests on a global scale. In the late 1990s, the widespread networking of home computers advanced consumer advocacy by making it easier for citizens to gather information and make their views known. Indeed, by the end of the twentieth century, the Internet had emerged as an important weapon in the arsenal of consumer advocates. Its usefulness as a vehicle for spreading consumer information quickly and widely has made it one of the primary means by which public interest advocates mobilize opposition to corporate policies.

In the twenty-first century, the fast pace of globalization has transformed consumer advocacy to include issues of environmental conservation. Concerns over climate change and global warming affect how consumers make their choices for a wide range of products and services. Consumer advocacy organizations have intensified the demands to have manufacturing industries pursue environmentally friendly production strategies such as renewable energy green production. The United Nations Climate Change Conference, held in Copenhagen in December 2009, provided a platform for consumer organizations and advocates to set the record straight on the expected green initiatives in the industrial, production, and service sectors, with particular regard to energy consumption in industries, gas emissions in the transport and communication sectors, and use of chemicals in agricultural production.

The incorporation of multimedia components and Web 2.0 tools in leading Web browsers, servers, and search engines such as Google, Microsoft Internet Explorer, and Mozilla Firefox has simplified networking among consumers and consumer advocacy organizations worldwide. Web 2.0 tools enable consumer advocacy organizations to share information conveniently through blogs, Web casts, video conferencing, instant messaging, voice over internet protocol (VoIP), Usenet newsgroups, e-mail listings, telnets, and bit torrents. Powerful cellular networks supported by 3G and online video and audio streaming as well as the online video channel provided by YouTube have provided cost-effective outreach channels for consumer advocacy campaigns. As such, the advancements of information technology have enhanced the capacity of consumers and consumer advocacy organizations to identify and raise urgent warnings on any concerns or grievances regarding products and services. For example, soon after Toyota announced recalls on various vehicles in early 2010, multiple Web sites devoted exclusively to this issue could be found by doing a simple Web search.

CONSUMER PRICE INDEX (CPI)

The Consumer Price Index (CPI), sometimes called the cost-of-living index, measures the average change in prices that typical American wage earners pay for basic goods and services, such as food, clothing, shelter, transportation, and medical care. It is expressed as a percentage of the cost of the same goods and services in a base period. For example, using the years 1982 to 1984 as a base period with a value of 100, the CPI for 2009 was 213.2, meaning that prices had increased by an average of 113.2 percent over time. The CPI is the most widely watched and used measure of the U.S. inflation rate, so it is closely monitored by government policymakers and by individuals whose wages vary with the purchasing power of money. The practice of indexing wages to the CPI is known as a cost-of-living adjustment (COLA). The term "cost of living" is often applied to the numerical result of the CPI. Loosely defined, it refers to the average cost to an individual of purchasing the various goods and services needed to maintain a reasonable living standard.

The U.S. Bureau of Labor Statistics (BLS) began calculating the CPI in 1913, and over the years it has become an important economic statistic. The CPI is calculated monthly and is usually reported within the first two weeks of the following month. To calculate the CPS, 7,000 families around the nation are surveyed by the BLS. These families provide quarterly information about their spending for 2 years. During the same 2 years, a different set of 7,000 families provides the BLS with lists of everything they buy during specific 2-week periods. This gives BLS information about frequently purchased items, which include food and personal care products. When the 2-year period is completed, the BLS has 28,000 weekly diaries and 60,000 quarterly interviews about the spending habits of Americans. Using this data, the BLS is able to rank the importance of the more than 200 item categories in the CPI index structure. The BLS also contacts about 25,000 retail businesses in eighty-seven major metropolitan areas to obtain prices for 90,000 items. All of this information is combined in the CPI, which represents the average price of a "market basket" of goods and services.

With the CPI, Americans are able to show how much prices have changed throughout the years. The Federal Reserve Bank of Minneapolis provided a telling example on its Web site, showing that the price of attending a movie has increased much faster than most goods and services. In the example, the bank said that going to movies had a $0.25 pricetag in 1950. Based on the CPI, the following shows how to calculate the cost in a given year.

- 1950 CPI = 24.1
- 2009 CPI = 213.2
- 1950 movie cost = $0.25

Therefore:

- 2009 price = 1950 price ÷ (2009 CPI ÷ 1950 CPI)
- 2009 price = $2.21 = $0.25 × (213.2 ÷ 24.1)
- 2009 price = $2.21

This CPI calculation shows, in fact, that movie prices in Minneapolis have gone up much more quickly than the CPI. The bank reported that a full-price movie at a Minneapolis theater costs roughly $8. If the price of movies were rising at the same pace as the CPI, the movies would only cost $2.21.

The selection of items in the basket cannot be held absolutely fixed for a very long period, of course, since the mix of items people buy changes over time. For example, the weight on tobacco in the CPI basket has

fallen over the years as the number of smokers in the population has fallen. Personal computers were not part of the CPI in the 1970s but are a part of the basket today. To address these changes in purchasing patterns the BLS tries to incorporate any new developments in the market by changing 20 percent of the retail outlets and items in its survey every year on a rotating basis.

A separate CPI is calculated for different income levels, geographical areas, and types of goods and services. For example, the CPI-U is calculated for all urban households, which includes the majority of the U.S. population. In contrast, the CPI-W measures average price increases for Americans who derive their primary income as wage earners or clerical workers. The BLS also publishes a CPI for each of seven major categories of items: food and beverages, housing, apparel, transportation, medical care, entertainment, and other goods and services. In addition, it compiles individual indexes for 200 different items and combined indexes for 120 smaller categories of items. Separate CPI measurements are also released for four major geographical regions of the United States Northeast, North Central, South, and West as well as many large metropolitan areas.

The CPI influences the American economy in several ways. A high annual percentage increase in the CPI reflects a high rate of inflation. The Federal Reserve Board, which controls the nation's money supply, often reacts to such increases by raising interest rates. This makes it more expensive for individuals and businesses to borrow money, which usually slows spending, encourages saving, and helps to curb inflation in the economy. The CPI also determines the percentage of annual increase or decrease in income for many Americans. For example, COLA formulas based on the CPI are built into many employment contracts. The federal government also uses the CPI to adjust Social Security and disability benefits, to determine the income level at which people become eligible for assistance, and to establish tax brackets. In addition, the CPI is often used to compare prices for certain goods within a set of years, and to calculate constant dollar values for two points in time.

A decrease in the disposable income of small-business owners is the indirect impact of rising prices, as measured by the CPI. If these owners are forced to spend more of their income on essential items, they have less money available for other items. When small businesses finance their expansion and cash flow requirements from their own savings, their reduction in disposable income means less money is available for investing in the business or helping to ride out adverse business periods; higher interest rates make it harder to borrow money. These factors make small businesses relatively more vulnerable than other type of businesses to adverse price changes.

Economists have argued whether the CPI overstates or understates inflation, and whether it is an appropriate proxy for inflation. Some economists believe that the CPI overstates actual increases in the cost of living by 1 percent or more annually. They generally attribute the discrepancy to some combination of the following four factors: improvements in the quality of goods; the introduction of new goods; substitution by consumers of different goods or retail outlets; and the difficulty of measuring the prices consumers actually pay for goods.

It's interesting to note that in June 2009, the BLS reported that the CPI fell 1.3 percent during the year. This drop marked the largest year-over-year decline since 1950. The government said that falling energy prices were the reason for the decline. A decline in consumer prices often leads to fears of deflation but *CNN* reported that this report had a quieting effect on Americans, many of whom were worried about short-term inflation.

CONSUMER PRODUCT SAFETY COMMISSION (CPSC)

The Consumer Product Safety Commission (CPSC) was established in 1972 with the passage of the Consumer Product Safety Act. The primary responsibility of the CPSC is to protect the public from unreasonable risks of injury that could occur during the use of consumer products. The CPSC also promotes the evaluation of consumer products for potential hazards, establishes uniform safety standards for consumer products, eases conflicting state and local

regulations concerned with consumer safety, works to recall hazardous products from the marketplace, and selectively conducts research on potentially hazardous products. The CPSC promotes the development of voluntary safety standards and under certain circumstances has the authority to issue and enforce standards and ban unsafe products. In all its activities the CPSC strives to work closely with private consumer groups, industry, the media, and agencies of various state and local governments.

The CPSC consists of five commissioners, each appointed by the president of the United States with the advice and consent of Congress. One of the commissioners is appointed chairman. The CPSC is headquartered in Bethesda, Maryland, with regional offices in Chicago, New York, and San Francisco, and field offices in various cities across the country. The CPSC also maintains a toll-free Consumer Product Safety Hotline (1-800-638-CPSC) and can be e-mailed at: hazard@cpsc.gov.

Although the CPSC is an independent federal regulatory agency, it does not have jurisdiction over all consumer products. Safety standards for trucks, automobiles, and motorcycles are set by the U.S. Department of Transportation; standards for drugs and cosmetics are handled by the U.S. Food and Drug Administration (FDA); and standards for alcohol, tobacco, and firearms fall under the authority of the U.S. Bureau of Alcohol,Tobacco, Firearms, and Explosives. Nevertheless, thousands of consumer products are regulated by the CPSC.

CONSUMER SAFETY LEGISLATIVE HISTORY

Early federal consumer safety legislation dealt primarily with foods, drugs, and cosmetics. The Federal Food and Drugs Act of 1906 (also known as the Wiley Pure Food and Drug Act) forbade the adulteration and fraudulent misbranding of foods and drugs sold through interstate commerce. Other early consumer legislation included the Meat Inspection Act of 1907 (amended in 1967 by the Wholesome Meat Act). In 1933 legislation was introduced to strengthen the Federal Food and Drugs Act of 1906. This legislation mandated the standardized labeling of food products, required that manufacturers prove drugs are safe for the purpose for which they are sold, and established a premarket clearance procedure for new drug products. Many drug companies opposed this bill; they were joined by much of the nation's print media, which feared the loss of corporate advertising revenue. After a 5-year battle in Congress, however, the bill was passed in 1938 as the Food, Drug, and Cosmetic Act. Amendments to the bill in 1962 established biennial factory inspections, disclosure through labeling of dangerous side effects, FDA approval of all new drugs, FDA power to remove dangerous drugs from the market, and the requirement that a manufacturer prove that its drugs are not only safe but also effective for their stated purpose.

The scope of federal consumer safety legislation broadened throughout the 1950s and 1960s. The Flammable Fabrics Act of 1953 established safety standards for fabrics used in clothing. The Refrigerator Safety Act of 1956 required that refrigerator doors have inside release mechanisms. The 1962 National Traffic and Motor Vehicle Safety Act established federal jurisdiction over motor vehicle safety, while the 1965 Federal Cigarette Labeling and Advertising Act required the famous "Caution: Cigarette Smoking May Be Hazardous to Your Health" label. Other pre-1972 consumer product safety legislation included the Radiation Control for Health and Safety Act of 1968, which dealt with radiation emission levels of electronic products, and the Poison Prevention Packaging Act of 1970, which established packaging standards to protect children from potentially hazardous substances.

In 1967 the National Commission on Product Safety was established. It was believed at that time that federal consumer safety legislation was ineffective because it took a piecemeal approach, targeting only specific products for regulation. Supporters of the commission contended that the government needed to establish legislative authority over broad categories of potentially hazardous goods and products. The National Commission on Product Safety was charged with identifying these broad categories of potentially hazardous goods and evaluating existing legal and voluntary methods for securing consumer product safety. The commission subsequently found that "the exposure of consumers to unreasonable product hazards is excessive by any standards of measurement." The commission also asserted that even though consumers must take some responsibility for their own safety, industry must also assume responsibility for the design and manufacturing of safe consumer products.

On the basis of their inquiry the commission recommended the creation of an independent federal regulatory agency and a presidential appointee to the commission to serve as a consumer advocate before the new agency. The commission also recommended that the new agency have the authority to issue safety regulations and standards. Thus, the Consumer Product Safety Commission was created in 1972.

HISTORY OF CPSC

During its first decades, limited by budgetary realities, the CPSC was slow to establish a significant and active role in regulating consumer safety nationwide. In the twenty-first century, however, the CPSC has emerged as a more visible and vigorous protector of public safety. In 2004, for example, the agency (armed with a budget of $59.6 million) issued more than 350 product recalls, including recalls of

more than 30 million toys that were deemed to be a potential health hazard to children. That same year it levied approximately ten times the amount of fines on companies that it had assessed a decade earlier. And *Manufacturing News* reported that the CPSC has dramatically cut its customer complaint response time. In 2004, for example, its average response time was less than 6 days. In the late 1980s, by contrast, the agency's typical response time was nearly 50 days. In 2004 the CPSC also launched initiatives designed to address the explosion in e-commerce. The most visible of these efforts is Operation SOS Safe Online Shopping, in which agency representatives investigate unsafe and/or illegal consumer goods that are made available over the Internet.

The CPSC also made it easier for small businesses to comply with the regulations with the establishment of a Small Business Ombudsman in 2004. This provided small companies with a single point of contact for obtaining information and assistance.

The Consumer Product Safety Improvement Act. In August 2008 President George W. Bush signed the Consumer Product Safety Improvement Act (CPSIA) into law, marking the biggest changes to consumer product safety rules since 1972 when the commission was established. Impetus for the bill's passage was due in part to accounts of imported food and toys from China that contained harmful chemicals. As part of the bill, the budget of the CPSC was increased from $80 million in 2008 to $136 million in 2014. The new law also contained many new requirements, such as the provision that all items sold for use by children under twelve must be tested by an independent party for lead and phthalates. (Phthalates are chemicals used to make plastics more pliable.) Many of the new requirements have not been enacted, however, due to complaints from many businesses, large and small, that the amount of new testing required would be so costly as to run them out of business. Instead, as of 2010, the CPSC is investigating the financial impact in order to come up with a solution that would ensure safety while not proving too financially arduous.

CONTINGENT WORKFORCE

A contingent workforce comprises individuals who are not full-time employees of the company by which they are contracted. Sometimes referred to as a temporary workforce, a contingent workforce is used by a company with rapidly changing needs due to restructuring or reengineering. It allows a company to keep a solid base of skilled workers without having to offer them permanent employment only to terminate their positions when the company' needs change. Between the early 1980s and 1990, contingent employment grew more than ten times faster than the growth of permanent employment positions. Contingent work may include part-time, home-based, and contracted work.

USING A CONTINGENT WORKFORCE

Utilizing a contingent workforce can help a company on many levels. First, it allows companies to keep the same core group of employees (known alternatively as a fixed workforce) and hire temporary employees as a job requires, reducing labor costs. Companies that rely on highly skilled workers, particularly in the technology field, benefit from temporary employees who will work for less than those from large agencies that demand much higher salaries. A contingent workforce is often more motivated than a fixed workforce due to the pursuit of permanent employment with a company, which results in better and faster production. It allows companies to respond quickly to changing markets, to sample prospective permanent employees, and to limit the expenses associated with permanent positions.

Instead of seeking to provide further training and education to permanent employees in order to keep them up to speed, companies are able to pare down the instruction for a contingent workforce. Whereas in the past, a company would need to expend time and money bringing a worker up to speed on new technology and innovation, a member of the contingent workforce needs only to be taught a comparatively narrow skill set. The range of knowledge imparted to the temporary workforce is much

more limited and specific to one job, which can prevent the contracted individual from taking his or her skills to a different company offering higher pay.

CONSIDERATIONS FOR EMPLOYEES

For temporary employees, being a part of the contingent workforce has drawbacks in addition to benefits. Employment security, for instance, can cause an individual to join the contingent workforce in a fluctuating economy when permanent employment is scarce. Temporary employees often enjoy the benefit of a flexible work schedule, decent pay, and résumé building. Those who work through an agency can also enjoy the benefits enjoyed by most permanent positions, including health insurance and paid vacation time. However, such employees may have to deal with periods of unemployment in between working, and may not be guaranteed the level of pay that a full-time employee would receive. Limited opportunities for training or advancement may exist, causing such employees to remain contingent for long periods of time while permanent workers move up in terms of pay and position.

The composition of the contingent workforce has changed over the past few decades. In the past, temporary workers tended to be those who were paid less even in permanent positions women, minorities, and those without college degrees. These weaker positions in the labor force have given way to much better positions. Instead of technical and clerical blue-collar positions, employees of all types have been able to find jobs as part of the contingent workforce.

Whether a contingent workforce is beneficial or detrimental to the employee and employer changes from company to company. However, the explosive growth of the contingent workforce demonstrates that it is a vital part of the new U.S. economy. Temporary, contracted, and home-based work have emerged as permanent fixtures in the digital age.

CONTRACTS

A contract is a legally enforceable promise. Contracts are vital to society because they facilitate cooperation and trust. Rather than relying on fear of reprisal or the hope of reciprocity to get others to meet their obligations, people can enlist others to pursue common purposes by submitting to contracts that are backed by impartial authority. Without contracts and their supporting institutions, promises would be much more vulnerable to ill will, misunderstanding, forgetfulness, and other human flaws. Indeed, contracts allow people who have never even met to reach agreements, such as lending/borrowing money to buy a house, that they would never consider making outside of a legal framework. Discussed below are characteristics and types of contracts.

CONTRACT ELEMENTS

As a legally enforceable promise, a contract differs from a simple verbal promise in that either party may ask the state to force the other party to honor its promise. To distinguish contracts from other types of promises and agreements, courts have established basic elements that are necessary for a contract to exist. A contract may be legally defined as a voluntary, legal, written agreement made by persons with the proper capacity. It should include: 1) an offer; 2) an acceptance; and 3) consideration, or an exchange of value. There are legal exceptions to most of these conditions, and all of them are subject to interpretation in the courts. Furthermore, some contracts do not meet these requirements, such as implied contracts and those created under promissory estoppel, both of which are discussed later.

Contracts not entered into voluntarily are voidable. For example, a company might tell a supplier that it was considering ending their business relationship if, within the next 10 minutes, the supplier does not sign a contract to provide materials at a certain cost. If the supplier signed the agreement, it might be able to convince the courts that it did so under duress or undue influence, and therefore was not bound by its terms. In general, contracts created under duress, undue influence, fraud, and misrepresentation are voidable by the injured party.

Contracts are also void if they involve a promise that is illegal or violates public policy. For instance, a contract regarding the sale of illegal drugs is unenforceable. Likewise, contracts that are legal but are not in the public interest may be rendered null. For example, a contract in which a company requires a customer to pay an extremely high rate of interest on borrowed funds could be deemed invalid by the courts. Similarly, a retail company that required an employee to sign an agreement that he would never work for another retailer would likely not be able to

enforce the contract because it had unreasonable restrictions or imposed undue hardship on the worker.

Contracts do not have to be written to be enforceable in court. In fact, most oral contracts are legally enforceable. However, they are obviously much more difficult to prove. Furthermore, most states have adopted "statutes of frauds" which specify certain types of contracts that must be in writing. Examples of contracts that typically fall under the statues of frauds include agreements related to the sale of real estate, contracts for the sale of goods above $500, and contracts in which one person agrees to perform the obligation of another person. Such contracts need not be overly long or involved. In fact, a simple memo or receipt may satisfy all legal requirements. There are exceptions in this area, however. For instance, when one party will suffer serious losses as a result of reliance on an oral agreement, the statute of frauds may be waived (see promissory estoppel below).

An otherwise acceptable contract may also be voided if one (or both) of the parties making the agreement does not have the mental or legal capacity to do so. Obviously, a mentally retarded individual or a child could not be bound by a contract. But a contract signed by a person exceeding his authority to make an agreement may also be voided.

In addition to being voluntary, legal, written, and made by persons with proper capacity, contracts usually must possess three basic components: an offer, an acceptance, and consideration. An offer is a promise to perform an act conditioned on a return promise of performance by another party. It is recognized by a specific proposal communicated to another party. Once a legal offer has been made, the offering party is bound to its terms if the other party accepts. Therefore, the offering party must clearly indicate whether the proposal is an offer or some other communique, such as an invitation to negotiate. The offering party, however, may stipulate certain terms of acceptance, such as time limits, and even withdraw the offer before the other party accepts.

Acceptance, the second basic requirement for the existence of a contract, is legally defined as "a manifestation of assent to the terms [of the offer] made by the offeree in the manner invited or required by the offeror." As with offers and offerors, the courts look for an intent to contract on the part of the acceptor. The difference is that the offeror may stipulate terms of acceptance with which the other party must comply. If the offeree attempts to change the terms of the offer in any way, a rejection is implied and the response is considered a counteroffer, which the original offeror may reject or counter. As with most rules regarding contracts, exceptions exist. For example, the Uniform Commercial Code includes a "Battle of the Forms" provision whereby an offeree may imply acceptance under certain circumstances even if it changes or alters the offer.

Even if an offer is accepted, it must be consummated by consideration for a legally enforceable contract to exist. Consideration entails doing something that a person was not previously bound to do outside of the agreement. In other words, promisees must pay the price (consideration) that they agreed to pay the promisor in order to gain the right to enforce the promisor's obligation.

The requirement of consideration serves an important purpose. It protects the promisor from being liable for granting, or relying on, gratuitous promises. For example, suppose that a person told her roommate that she would always pay the entire rent for their apartment. If she later changed her mind, she could not be held liable for the rent because she had neither asked for, nor received, anything in exchange for the promise. Had the other roommate promised to clean the apartment in exchange for the roommate's promise to pay the rent, an enforceable contract would exist (assuming other requirements were met).

CONTRACT TYPES

The two primary categories of contracts are "unilateral" and "bilateral." In a unilateral contract only one party promises something. For instance, if a car dealer tells a customer, "I will give you that car if you give me $15,000," he has made an offer for a unilateral contract the contract will only be created if the customer accepts the offer by paying the $15,000. If the dealer says, "I will promise to give you the car if you promise to pay me $15,000," a bilateral contract has been proposed because both parties must make a promise. The concept of unilateral contracts is important because it has been used by courts to hold a party liable for a promise even when consideration was not given by the other party. For instance, an employer may be liable for providing pension benefits that it promised to an employee, even if the worker gave no promise and did nothing in return.

Contracts may also be classified as "express" or "implied." Express contracts are those in which both parties have explicitly stated the terms of their bargain, either orally or in writing, at the time that the contract was created. In contrast, implied contracts result from surrounding facts and circumstances that suggest an agreement. For instance, when a person takes a car to a repair shop he expects the shop to exercise reasonable care and good faith in fixing the car and charging for repairs. Likewise, the shop expects the customer to pay for its services. Although no formal agreement is created, an implied contract exists.

In addition to express and implied contracts are "quasi-contracts," which arise from unique circumstances. Quasi-contracts are obligations imposed by law to avoid injustice. For instance, suppose that a man hires a woman to paint his house. By accident, she paints the wrong house. The owner of the house knows that she is painting it by mistake but, happy to have a free paint job,

says nothing. The painter would likely be able to collect something from the homeowner because he knowingly was "unjustly enriched" at her expense. Had she painted his house while he was on vacation, he would be under no obligation to her.

Contracts may also be categorized as valid, unenforceable, voidable, and void. Valid contracts are simply those that meet all legal requirements. Unenforceable contracts are those that meet the basic requirements but fail to fulfill some other law. For instance, if a state has special requirements for contracts related to lending money, failure to comply could make the contract unenforceable. Voidable contracts occur when one or both parties have a legal right to cancel their obligations. A contract entered into under duress, for example, would be voidable at the request of the injured party. Void contracts are those that fail to meet basic criteria, and are therefore not contracts at all. An illegal contract, for example, is void.

A separate type of contract, and one which overtly exemplifies the trend away from strict interpretation and toward fairness, is created by promissory estoppel. Under the theory of promissory estoppel, a party can rely on a promise made by another party despite the nonexistence of a formal, or even implied, contract. Promissory estoppel can be evoked if allowing a promisor to claim freedom from liability because of a lack of consideration (or some other contractual element) would result in injustice. Suppose that a business owner promised an employee that he would eventually give her the business if she worked there until he (the owner) retired. Then, after 20 years of faithful service by the employee, the owner decides to give the business to his son-in-law. The owner could be "estopped" from claiming in court that a true contract did not exist, because the worker relied on the owner's promise.

CONTRACTS AND SMALL BUSINESSES

Contracts are a necessary part of all sorts of small business transactions office and equipment leases, bank loan agreements, employment contracts, independent contractor agreements, supplier and customer contracts, agreements for professional services, and product warranties, to name a few. Even the process of writing a contract can be helpful, because it forces the parties to think through contingencies and decide in advance how to handle them. Small-business owners should thus be careful of the standard legal terminology that appears in some types of contracts. It is important to understand and agree with all aspects of a contract before signing it. A good rule to apply is that contracts above a certain amount that amount to be set by the business owner should be reviewed by the business owner's own law firm. The cost may well be worth it.

In the development of contracts for people who are often most affected by small businesses clients, employees, and subcontractors small-business owners must clearly define roles. A small-business owner shows his professionalism when providing contracts for clients. By communicating all expectations with fine attention to detail, the small-business owner has a useful tool the contract to help ensure positive client relationships and prevent possible misunderstandings.

Employee contracts can be put into practice at any time to spell out expectations. In considering the information to include in the contract, small-business owners should ask themselves several questions:

- What things should employees do every day? (Expectations about attendance and dress are addressed here.)
- Will the employee have information that could prove detrimental to the business if shared outside the organization?
- How will staff members communicate across the company?
- What other things should a new employee know about the company?

The information provided by answering these questions should be a large part of the contract, handbook, or other vehicle given to and signed by the employee to show agreement and acknowledgement.

Finally, subcontractors often provide services to small businesses. A simple contract that details the expectations for both the small-business owner and the subcontractor is recommended. What the contractor will do, how he will report to both the small-business owner and the client, how the contractor will be paid, and how he will interact with clients are all key pieces of information that should be included in the subcontractor contract.

The contract does not have to be a difficult and time-consuming ordeal for the small-business owner. Sample contracts that cover agreements with clients, employees, and subcontractors are provided on many Web sites: FindLegalForms.com and FindLaw.com are two.

CONTRACTS IN THE DIGITAL AGE

As the Internet has matured, all sizes of businesses have begun to use different types of "Internet contracts." These are agreements reached between parties over the Internet. According to Jonathan Frieden writing for *E-Commerce Law*, "The enforceability of Internet contracts is governed by the well-established legal principles which apply to traditional written contracts.".

There are three categories that encompass almost all Internet contracts. The court treats each of these agreements slightly differently. The license agreements found in commercial software product packaging are *shrink-wrap agreements.* Users online are notified that by continuing to use the site, they are agreeing to the site's terms and

conditions. If proper notice is given to Web site users, the courts will uphold these agreements.

Users of commercial Web sites are sometimes prompted to read a series of terms and conditions that govern site usage. Under these *click-wrap agreements*, the user is asked to show that he agrees to the terms by clicking a button or a hyperlink displaying "I agree." The user must take this action before making a purchase or obtaining the service offered by the Web site. The court is likely to hold up these contracts.

Without agreement by the Web visitor, *browse-wrap agreements* attempt to require users to follow specific terms and conditions while visiting the site. The user neither has to view the requirements of the so-called agreement nor indicate his acceptance of the terms. The courts have been reluctant to enforce these agreements.

COOPERATIVE ADVERTISING

Cooperative advertising is the sharing of costs for locally placed advertising between a retailer or wholesaler and a manufacturer. Many manufacturers have a set amount of cooperative advertising funds available per year, distributed as opportunities for collaboration arise. Manufacturers report, however, that much of this money goes unspent, as relatively few retailers and wholesalers pursue cooperative agreements.

Cooperative advertising can be a very powerful tool for the small-business owner, especially one with limited means to support the kind of advertising campaign which can be vital to the survival and success of a business enterprise. The added funds from such a cooperative agreement can improve the quality of advertising or broaden the scope of its distribution. It can create important links between products and the small wholesaler or retailer who handles the product for the manufacturer. Above all, it can attract customers loyal to a certain product to a vendor whose name had not before been associated with that product.

Cooperative advertising can take many forms, as Gail Smith explained in *Industrial Distribution*: "There are many devices with which a manufacturer can assist a distributor in product promotion, including product flyers, catalog and trade magazine ads, direct mail flyers and direct mail campaigns, electronic data for CD-ROM, trade show booth materials for customer appreciation/open house or sports events, and giveaway items, such as clothing, mugs, or sports gear. Any one or combination of the above, used with a marketing program, can effectively assist a distributor with making their customer base aware of a product."

Consumer media attention continues to shift online, where marketers and advertisers are better able to target their customers. Given this trend, cooperative advertisers are looking for ways to leverage the Internet. For example, a company that sells MP3 players can use its Web site to learn about the preferences of their customers and potential customers. The manufacturer can then better target its brand messages. In a digital co-op program, the manufacturer could then partner with an electronic retailer to help supplement its brand message in a way that increases sales. Ultimately, manufacturers and retailers who combine their advertising efforts are able to make better quality media buys and increase the return on their investments.

BUSINESS NICHES AND COOPERATIVE ADVERTISING

Any small business that deals with the products of a major manufacturer (tennis shoes, perfume, ice cream, propane, computers, etc.) and engages in national as opposed to local advertising can benefit from cooperative advertising ventures. These terms can be deceptive, because frequently national advertising is done through local media. But clear differences between local and national advertising do exist.

Local advertising refers strictly to the advertisement of local shops and services that are not available nationwide or over large regional areas. Small businesses that would

engage solely in local advertising, for example, would be small groceries and specialty stores, or small service providers which are not linked to any national chain, such as a local dry cleaner.

National advertising, on the other hand, is advertising that focuses on nationally recognized and available goods and services. Most brand-name items would fall into this category: automobiles and machinery, designer clothes and jewelry, some services. But the actual advertisements are likely to be run only locally, to draw attention to the local provider of these national goods and services the small dealership, for example, which sells John Deere tractors. It is with this type of advertising that the small-business owner can seek a cooperative agreement with a national manufacturer.

BENEFITS OF COOPERATIVE ADVERTISING

The biggest benefit of cooperative advertising for small-business owners, of course, is that such arrangements can dramatically cut advertising costs. Manufacturers will sometimes provide anywhere from 50 to 100 percent of the cost of placing local ads. These corporate advertising dollars can make it possible for small businesses to establish a far stronger presence in the community than would otherwise be possible.

Another benefit that sometimes results from such agreements is valuable creative and media-buying guidance. Some large manufacturers will provide help for the small-business owner in refining the look and message of the advertisement and in effectively placing the ad in a mutually beneficial way.

Finally, cooperative advertising can lend an air of legitimacy to small business enterprises. Small companies that are able to link their name with that of a nationally recognized product or service should work hard to maintain such ties, particularly if the product or service in question already has strong user loyalty.

Cooperative advertising also benefits manufacturers and service providers. Enlisting small-business allies diminishes the cost of advertising for these larger companies, especially if they encourage cooperative advertising arrangements in several communities. In addition, just as local businesses can benefit from associations with established national corporations, these large manufacturers and service providers may also enjoy benefits associated with having their products or services aligned with leading businesses in a given community. For example, a designer brand of clothing may benefit from cooperative advertising with an exclusive neighborhood boutique: the personality of the shop itself will reflect positively on the product.

DRAWBACKS TO COOPERATIVE ADVERTISING

The small-business owner must be careful that he or she completely understands the commitment involved when seeking a cooperative advertising agreement. Many manufacturers demand a certain style of advertising, or a high level of quality that may be difficult to achieve with a limited budget. There may be hidden requirements which must be met, or limits on the kind of advertising which can be funded by manufacturers' dollars. The specific demands involved in an advertising cooperation will vary widely between manufacturers; business consultants recommend that small-business owners consult an attorney before signing any such agreements.

COOPERATIVES

A cooperative in its simplest sense is formed when individuals organize together around a common, usually economic, goal. For business purposes, a cooperative refers to the creation of a nonprofit enterprise for the benefit of those individuals using its services. According to statistics gathered by the National Cooperative Business Association in 2005, roughly 120 million Americans belong to one of the 72,000 cooperative establishments. Of these cooperatives, 30,000 credit unions make up the largest segment. Other types of goods and services that can be provided by working under cooperative principles include agricultural products, utilities, child-care/preschools, insurance, health care, legal services, food, equipment, and employment services.

THE ROCHDALE PRINCIPLES

The modern cooperative dates back to 1844, when the Rochdale Equitable Pioneers Society was established in Great Britain. According to the National Rural Electric Collective Association, the Rochdale Principles are still followed by every cooperative business. First is the principle of a voluntary and open membership. Cooperatives are open to all individuals who are able to use their services and are willing to accept the responsibilities of membership.

The next principle is that of a democratic organization, operated by its members. The board of directors is comprised of members and is accountable to them. Members actively participate in the co-op by developing policy and making decisions. In a primary cooperative, each member has one vote. Other cooperatives are organized in a different but democratic manner. Members also contribute equally to the economic capital of the cooperative. Part, if not all, of the capital becomes the common property of the collective. Surpluses can be used for development of the organization, as reserves, to benefit members according to their use of or contributions to the cooperative, or to support other member-approved works.

A cooperative is autonomous and independent from other organizations. If it enters into a working relationship with another organization, the arrangement must "ensure the democratic control" of its members and maintain the independence of the organization. Cooperatives provide training and education to members and employees of the organization in order for them to contribute effectively to the cooperative. They also provide information on the benefits of cooperation to the public. Cooperatives work with other cooperatives in order to strengthen the cooperative movement locally and abroad. Although cooperatives exist for the benefit of their members, they work toward the sustainable development of their communities in accordance with membership policies.

The basic operating principles used by cooperatives are simple. The member-owners share equally in the control of their cooperative. They meet on a regular basis, closely monitor the business using a variety of tools, and elect a board of directors from among themselves. The board in turn hires managers to oversee the daily affairs of the cooperative in a way that serves the members' interests. The initial capital for a cooperative comes from membership investment. After the cooperative's costs are covered and money is designated for operations and improvements to the cooperative, the remaining surplus or profit (in a for-profit enterprise) is returned to the membership. For a small business, membership in a cooperative may provide greater purchasing power or access to a wider distribution of goods or services than the business would have on its own.

A related concept is that of a collective. A collective is comprised of a group of individuals pooling together their intellectual and financial resources in order to operate a business enterprise for their mutual benefit. Frequently, members have no specific job but rather contribute to projects if they have free time or specific strengths to add to a job. Members of the collective share equally in any monies left over after paying bills. This alternative method of working has lately found favor with creative businesses such as advertising and design groups. Collectives may remain intact or be of a more fluid nature with members joining and dropping out regularly.

CONSUMERS' COOPERATIVES

Cooperatives may be consumer-owned, producer-owned, or worker-owned. A consumers' cooperative is one in which individuals combine their buying power, usually for the purchase and wholesale or retail distribution of agricultural or other products. Cost savings are achieved by buying directly from the producer or farmer. A form of commonly known consumers' cooperative is a food or grocery cooperative. Membership is open to anyone, with goods sold at market price to members and nonmembers alike, with any surplus over expenses going back to members. According to Aliza Earnshaw in *Business Journal Portland*, "[Food] co-ops must pay out at least 20 percent of the surplus in cash, but may reinvest 80 percent in the business for the good of members." The benefits to members of this reinvestment may include reduced prices, a larger store, or extra services.

Management of the food co-op works with members to determine these benefits. Some members may desire a discount when purchasing their goods. Other co-ops may use a patronage system in which members receive dividends at the end of the year, based on how much they have purchased at the co-op. This method keeps members involved and also helps to ensure the viability of the cooperative.

A credit union is a cooperative financial institution, which is owned and controlled by the consumer members who use its services. Typically, credit unions serve groups who share something in common, such as where they work, live, or go to church. They are closely regulated, with deposits insured by the National Credit Union Share Insurance Fund. Unlike banks and savings-and-loans, they are not-for-profit enterprises.

A utility cooperative, such as an electric cooperative, is another consumer-owned cooperative. They are private, independent utilities established to provide electric, natural gas, or telephone service at-cost to their member-owners who are primarily in rural areas. Many utility cooperatives are also involved in community development projects.

Another type of consumers' cooperative is a preschool or child-care cooperative. The most common type of cooperative preschool is the parent-based one in which parents come together to provide care and schooling for their children. Newer versions of cooperative preschools may be initiated by a business or group of businesses. In this case, a business may provide a space, initial capital, and assistance to a child-care program but gives ownership and operation responsibilities to the parents/employees who use it.

Likewise, a business consortium comprised of businesses or organizations form a cooperative to be operated and owned by their collective employee groups. Organizations generate the dollars needed to fund the program initially, provide space for the program, and possibly hire a management group. The board of directors for the consortium cooperative preschool consists of both parent-members as well as representatives of the business or sponsoring organizations.

PRODUCERS' COOPERATIVES

A producers' cooperative is typically operated by farmers, producers of goods, or small businesses. Farmers and producers organize cooperatives in order to process and market their goods as well as to acquire credit, equipment, and production supplies. This provides them with greater economies of scale. For example, members of an agricultural cooperative, such as a dairy cooperative, will combine their efforts in order to purchase equipment and supplies at a discount, process their milk products in a combined fashion, and then market and distribute those products as a group. Unlike a collective farm, however, a member of an agricultural cooperative retains the ownership rights to his or her land. Similarly, small businesses can organize cooperatives to provide their membership with supplies or common services at a reduced rate. Craftspeople frequently come together in the form of a cooperative in order to purchase supplies inexpensively and then to sell their goods to a larger market.

Just as nonmembers may take advantage of the benefits of consumers' cooperatives such as food co-ops, producers' cooperatives such as small businesses may employ nonmembers. However, according to John Murray in *Review of Social Economy* studies done on the use of nonmember labor within a producers' cooperative show this generally has a negative impact on the cooperative, such as reduced productivity. It may also spur the evolution of the cooperative into a more conventional form of business "in which the owners [are] employers rather than employees."

BUYING COOPERATIVES

A buyers' cooperative is an association of businesses that gather together so that they may obtain economies of scale by combining their purchasing power and negotiating wholesale prices as a group. Claude Solnik describes the benefits of buying cooperatives in his article in the *Long Island Business News*: "Whether they're small or large operations, in the electronics industry or in health care, education or government, many managers reduce costs through joining a good, old-fashioned buying cooperative.... A big reason that smaller outfits join these cooperatives is that they save them some real money." Small businesses that join a buying cooperative are able to get the same pricing on merchandise from vendors as larger retails or "big box" stores. Better service on delivery and exchanges as well as greater selection are also benefits touted by co-op members. In an era of proliferating big-box stores buying cooperatives are gaining popularity among small- and mid-size retail organizations.

Housing Cooperatives. In a housing cooperative there are two owners, the cooperative corporation and the corporation's owners, known as tenant-stockholders. The tenant-stockholders own not the housing units, but the cooperative corporation. The corporation owns or leases the housing development, which includes the land, the actual housing units, and common areas. By owning stock, the tenant stockholders receive the right to live in one of the units, which may be a single house or may be part of a multiunit apartment complex. In 2010, there were more than 1 million units of cooperative housing throughout the United States,the majority of them located in major urban areas.

WORKERS' COOPERATIVES

A worker-owned cooperative is a business that is commonly owned and managed by its workers. By organizing a business as a cooperative, the owner/employees make the initial investment in the enterprise, work for its success, and reap any benefits. They also share in the risks of the business. Another method of developing a worker-owned cooperative is when a labor union purchases a failing or failed privately owned business and operates it using the principles of cooperation. Some types of businesses which are often owned and controlled by their employees include restaurants, manufacturing and distribution enterprises, and taxi companies.

INTERNET NOMENCLATURE

In 2000, the National Cooperative Business Association (NCBA) successfully lobbied the Internet Corporation for Assigned Names and Numbers to create a new top-level Internet domain .coop exclusively for cooperatives. Launched in January 2002, .coop is placed at the end of web addresses similar to .com and .org. The goal of .coop one of only seven new domains approved is to differentiate cooperatives from other organizations on the Web.

COOPERATIVE TRENDS

People interested in cooperatives in the United States have copied a model provided by the Spain-based Mondragon Corporation. Mondragon' goals are similar to other cooperatives, It provides its members with support for planning, research, and funding for new businesses. Mondragon distributes profits in an exact, democratic way, with a percentage of its income used as seed money for new cooperatives. Mondragon gives the money to regional nonprofits or pools larger sums of money for universities and research centers. Each individual cooperative in the Mondragon family gains long-term benefits from the financial assets of the whole.

One U.S. cooperative modeled after Mondragon is the Arizmendi Association of Cooperatives. Arizmendi is the coordinating organization for a number of worker-owned bakeries in the San Francisco Bay Area. The bakeries look to the Arizmendi Association for guidance on financial and legal services, as well as organizational and facilitation training. The association also provides mediation and conflict resolution assistance to the bakeries in its network. Outside its network, Arizmendi works to establish relationships with other cooperatives to gain mutual support and to educate the larger community about co-ops. In an article by Melanie Bowden, titled "Altruism in Action: The Arizmendi Association of Cooperatives," a California Center for Cooperative Development board member commented on the Arizmendi Association's success: "We found that successful projects grow from filling a niche in a community, duplicating other co-ops that were working, and being part of a larger cooperative network."

COPYRIGHT

Copyright is a kind of protection offered by the laws of the United States to the authors of "original works of authorship," including literary, musical, dramatic, artistic, and other intellectual works. Copyright law thus protects a wide variety of creative compositions, including books, magazine articles, songs (both lyrics and music), plays (and any accompanying music), choreography, photographs, drawings, sculptures, and films and other audiovisual works. This protection is extended to both published and unpublished works. Copyright experts note that the definition of "intellectual works" should be interpreted quite broadly in this regard. For example, computer software programs can be registered as "literary works," and maps and architectural blueprints can be registered as "pictorial, graphic, and sculptural works."

Once the author or creator of an intellectual work secures a copyright for that work, he or she has exclusive rights to do whatever he or she wishes with it. The owner can reproduce and/or distribute copies of it for sale; transfer ownership via sale, lease, rental, or lending; prepare derivative works based on the copyrighted work; or provide public displays or performances of the work.

Several categories of material are generally not eligible for copyright protection. These include ideas, methods, concepts, principles, titles, names, slogans, familiar symbols or designs, listings of ingredients or contents, coloring, and variations of typographic ornamentation. Other material not eligible for copyright include works consisting entirely of information that is common property and contains no original authorship (standard calendars, height and weight charts, tables taken from public documents) and works that, in the words of the Copyright Office, "have not been fixed in a tangible form of expression." Examples of the latter include improvisational performances or choreographic works that have not been written or recorded.

CORNERSTONES OF COPYRIGHT LAW

The basic philosophy underlying American copyright law can be found in Article 1, Section 8 of the Constitution, which stipulates that "Congress shall have Power . . . To

promote the Progress of Science and useful Arts, by securing for limited Times to Authors and Inventors the exclusive Right to their respective Writings and Discoveries.'' The sentiments embodied in this proclamation were given added legal heft in 1909 and 1976, years that saw major copyright legislation become law.

A major change in American copyright law came in the late 1970s, as Congress passed new laws addressing the length and character of copyright protection. As a result of that legislation, which took effect on January 1, 1978, all works created on or after that date automatically receive legal protection from the moment of their creation (before then a work did not receive copyright protection until it had been published or registered with the Copyright Office). The new legislation expanded the duration of copyright protection as well. It provided authors with legal protection that ordinarily lasts for the entire life of the author, plus an additional 70 years after the author's death. In the case of ''joint works'' (works created by two or more authors under circumstances that were not ''for hire''), the copyright protection lasts for 70 years after the last surviving author's death. For works made for hire, anonymous works, and pseudonymous works (unless the author's identity is revealed in Copyright Office records), the copyright on the work in question last for 95 years from publication or 120 years from creation, whichever is shorter. Creative works that came into being prior to January 1, 1978, but had not yet been published or registered by that date are given similar protection under the terms of the statute.

Copyright protection is somewhat different for works originally created and published or registered prior to January 1, 1978. For such works authors could secure copyright protection for 28 years, with an option to renew that protection for another 67 years as the initial term expired. The new copyright law extended the length of that second term from 28 years to 67 years, thus making pre-1978 works eligible for a total of 95 years of copyright protection. In addition, a 1992 amendment to the Copyright Act of 1976 automatically extended the term of copyrights obtained from January 1, 1964, through December 31, 1977, to the full renewal limit of 67 years.

American copyright law underwent another change in 1989, when copyright notices on copyrighted material become optional. Prior to March 1, 1989, copyright notices had been mandatory on all published works; any works not carrying a copyright notice risked loss of copyright protection. After March 1, 1989, however, that notice was no longer required although it was still highly recommended because works created after that date were automatically copyrighted the moment they were presented in a fixed form (generally print, audio, or video).

Notice is not required legally but may be useful practically. Kelly James-Enger, writing in *The Writer*, advised as follows: ''To get the most protection from the copyright law . . . you have to register your work with the U.S. Library of Congress. Properly registered, you're entitled to statutory monetary damages and attorney's fees if you prevail in a copyright infringement lawsuit; if you haven't registered, you'll have to prove not only that your copyright was infringed, but that you lost a certain amount of money as a result.'' James-Enger suggests that writers begin researching copyright online at www.loc.gov/copyright.

Another significant piece of legislation impacting copyright protection was signed into law by President Bill Clinton in October 1998. This legislation, called the Digital Millennium Copyright Act, included a number of significant provisions, including the following:

- Made it illegal to circumvent anti-piracy measures in commercial software.
- Outlawed the manufacture, sale, or distribution of devices used illegally to copy software.
- Placed limits on the copyright infringement liability of Internet service providers who transmit information over the Internet (although the Act also called for ISPs to remove materials that infringe on legitimate copyright claims).
- Limits liabilities of nonprofit institutions of higher learning for acts of copyright infringement committed by students or faculty.
- Requires payment of licensing fees to record companies for ''webcasting.''

Despite the changes that have taken place in American copyright rules over the past 200 years, in many respects copyright protection has always been and continues to be fairly simple. If an artist creates something and records that creation in a tangible manner, the artist owns it. The exceptions are materials in the public domain and others' right to ''fair use.''

Public Domain. Once the term of a copyright (or a patent) expires, it is said to become a part of the ''public domain.'' In essence, this means that it becomes community property. Anyone may use it. Photographs, magazine articles, and books are among the most common ''public domain'' materials used today.

Another potentially valuable source of public domain material is works produced by the U.S. government. While state and local governments often copyright their documents, reports, and other publications, the federal government does not do so.

''Fair Use.'' Section 107 of the U.S. Copyright Act, in one paragraph that embeds a list of four items, describes ''fair use'' as follows:

"Notwithstanding the provisions of sections 106 and 106A [dealing with copyright itself], the fair use of a copyrighted work, including such use by reproduction in copies or phonorecords or by any other means specified by that section, for purposes such as criticism, comment, news reporting, teaching (including multiple copies for classroom use), scholarship, or research, is not an infringement of copyright. In determining whether the use made of a work in any particular case is a fair use the factors to be considered shall include

1. "the purpose and character of the use, including whether such use is of a commercial nature or is for nonprofit educational purposes;
2. "the nature of the copyrighted work;
3. "the amount and substantiality of the portion used in relation to the copyrighted work as a whole; and
4. "the effect of the use upon the potential market for or value of the copyrighted work.

"The fact that a work is unpublished shall not itself bar a finding of fair use if such finding is made upon consideration of all the above factors."

The language of the law clearly leaves matters somewhat ambiguous, but the intent is not that difficult to discern. The law wishes to give reviewers and scholars the right to quote small portions of the work, teachers and researchers the right to use the work in actual practice, while protecting the income of the copyright holder.

Freelancers and small businesses using copyrighted material will sensibly protect themselves against lawsuits by quoting copyrighted materials very sparingly and in the contexts specified by the law itself. If large parts of the publication or the musical composition or whatever other form the object takes are needed, the user should make the necessary efforts to obtain formal permission and pay whatever fees the copyright owner charges.

WORK FOR HIRE AND COPYRIGHT

In situations where a work a software program, an essay, a mural, an advertising design, or another intellectual work has been produced for someone who is working for someone else, the copyright for the work may belong to the person or business that arranged to have the work done, rather than the creator of the work itself. Such arrangements are known as work for hire. Copyright law defines "work for hire" as either: 1) a work prepared by an employee within the scope of his or her employment; or 2) a work specially ordered or commissioned for use as a contribution to a collective work, as a part of a motion picture or other audiovisual work, as a translation, as a supplementary work, as a compilation, as an instructional text, as a test, as answer material for a test, or as an atlas, provided that the parties involved expressly agree in a written contract signed by both of them that the work shall be considered a work made for hire. Indeed, contracts that specifically define copyright ownership for work performed are essential, especially for small-business owners who contract work out to freelancers.

COPYRIGHT NOTICE

Although attaching a formal notice of copyright to a work is no longer required by law (it was required prior to March 1, 1989), it is still a good idea. "Use of the notice is recommended because it informs the public that the work is protected by copyright, identifies the copyright owner, and shows the year of first publication," stated the Copyright Office. "Furthermore, in the event that a work is infringed, if the work carries a proper notice, the court will not allow a defendant to claim 'innocent infringement' that is, that he or she did not realize that the work is protected. (A successful innocent infringement claim may result in a reduction in damages that the copyright owner would otherwise receive.)"

According to the Copyright Office, forms of notice vary for different kinds of intellectual works. For books, articles, sheet music, architectural plans, designs, and other kinds of "visually perceptible" works, copyright notice should contain all of the following three elements:

1. The copyright symbol (the letter "C" in a circle) or the word "Copyright," or the abbreviation "Copr."
2. The year of first publication of the work (in cases where the work is a compilation or derivation that incorporates previously published material, the year date of first publication of the compilation or derivation is acceptable). The year date may be omitted in instances where a pictorial, graphic, or sculptural work, with accompany text (if any) is reproduced in or on greeting cards, postcards, stationery, jewelry, dolls, toys, or any useful article.
3. The name of the owner of copyright in the work, or an abbreviation by which the name can be recognized, or a generally known alternative designation of the owner.

For works that are fixed through audio means cassette tapes, CDs, "books-on-tape," etc. the requirements for copyright notice are somewhat different. Copyright notice for these types of works should contain all of the following:

1. The sound recording copyright symbol (the letter "P" in a circle).
2. The year of first publication of the sound recording.

3. The name of the owner of copyright in the sound recording, or an abbreviation by which the name can be recognized, or a generally known alternative designation of the owner. In addition, if the producer of the recording is named on the label or containers of the work, and if no other name appears in conjunction with the notice, the producer's name shall be considered a part of the notice.

Notice of copyright can also be extended to unpublished works. Finally, when affixing notice of copyright to intellectual works of any kind, it is important to make sure that the notice is plainly visible.

COPYRIGHT REGISTRATION

Registration of copyrighted material may be made at any time during the life of the copyright. It is no longer required under American copyright law, but there are advantages associated with taking such a step.

- Registration establishes a public record of the copyright claim
- Certificates of registration are required if the copyright owner wants to file an infringement suit
- Registration establishes *prima facie* evidence in court of the validity of the copyright and of the facts stated in the certificate in instances where the registration is made within 5 years of original publication
- Registrations made within 3 months of the work's publication or prior to any infringement of the work entitle the copyright owner to statutory damages and coverage of attorney's fees in court; otherwise, only an award of actual damages and profits is available to the copyright holder
- Registration gives the copyright owner additional protection against the importation of infringing copies

To register a copyright, the Copyright Office must receive a properly completed application form, a nonrefundable filing fee for each work that is being registered, and a nonreturnable copy of the work that is being registered. There are variations to the above rules depending on the kind of work that is being registered, so registration seekers should contact the Office beforehand to get a full rundown on what is required for their particular work. The Copyright Office uses a variety of forms for the various intellectual works that people register; copyright owners need to make sure that they use the correct one. Form TX, for example, covers published and unpublished nondramatic literary works such as board game instructions, computer programs, and books, while Form VA is intended for use in registering published and unpublished visual works such as photographs, sculptures, and architectural designs.

All applications and materials related to copyright registration should be addressed to the Registrar of Copyrights, Copyright Office, Library of Congress, 101 Independence Avenue, S.E., Washington, DC 20559-6000. The Copyright Office also maintains a Web site at lcweb.loc.gov/copyright/.

INTERNATIONAL COPYRIGHT PROTECTION

As the Copyright Office itself admits, "there is no such thing as an 'international copyright' that will automatically protect an author's writings throughout the entire world. Protection against unauthorized use in a particular country depends, basically, on the national laws of that country. However, most countries do offer protection to foreign works under certain conditions, and these conditions have been greatly simplified by international copyright treaties and conventions."

The two major copyright treaties to which the United States belongs are the Universal Copyright Convention (UCC) and the Berne Convention for the Protection of Literary and Artistic Works. The United States was actually a founding member of the UCC, which came into being in September 1955. Under the rules of the UCC, a work by a citizen or resident of a member nation or a work first published in a member nation may claim protection.

The Berne Convention, meanwhile, was first established more than a century ago, in 1886. The central feature of the Berne Convention is the automatic copyright protection that it extends to all citizens of member nations. If a country is a signatory to the Berne Convention, it must extend to nationals of other member nations the same copyright protection and copyright restrictions afforded to its own citizens. The United States joined the Berne Convention which is regarded as the wellspring of most other national and international copyright regulations in 1989, becoming its 77th member. The United States has also entered into international copyright agreements enacted by the World Intellectual Property Organization (WIPO).

COPYRIGHT LAW AND THE INTERNET

The emergence of electronic commerce and digital technology triggered a fundamental reevaluation of U.S. copyright law in the 1990s. The Copyright Office has firmly supported the rights of companies to limit access to their Internet content, and the government has passed laws that make it illegal for Internet users to negate copyright protection mechanisms meant to protect Internet

content. To clarify, copyright protects writings, artwork, photographs, and other authored materials on Web sites. However, copyright law does not protect domain names. This is managed by the Internet Corporation for Assigned Names and Numbers (ICANN). Libraries, universities, research institutions, and other critics have charged that the Copyright Office position will unduly impede fair-use access to content in its zeal to protect owners of copyrighted material on the Internet.

Companies are focusing on how to protect electronic copyrighted material from illegal distribution. They are doing so through a variety of schemes collectively known as Digital Rights Management (DRM). These content control measures include: locking access to content through encryption schemes, plug-ins, and new markup languages. Other options include the traditional "honor system," in which permissions and payments are provided by the Copyright Clearance Center or other similar entities. Prosecution of copyright violators is another option.

The Copyright Office's response to growing Internet use is not limited to policymaking. The Copyright Office underwent a "major reengineering" in 2007. As part of the office makeover, it introduced an electronic system for processing copyright applications. The electronic Copyright Office, or eCO, gives users the ability register copyrights online. It also offers "preregistration" for unpublished works that have a history of infringement before being distributed commercially. The eCO eases the registration process for published works with lower processing fees, accelerated processing time, and the ability for users to take advantage of online tracking and 24/7 access.

Marybeth Peters, the Register of Copyrights, said in summer 2009, "more than 50 percent of copyright claims are now being submitted through eCO." If the government could encourage more people to file electronically, Peters continued, "the total annual savings for filers and the government will be tremendous, and filers will get their registration certificates more quickly the waiting time to receive certificates is much shorter for users of eCO than for those who submit paper applications."

Despite these actions by the copyright office to make filing easier and faster, artists, writers, and actors continue to battle the way in which copyright laws are interpreted for works published on the Internet. In 2007 a federal court ruled that a music file was not considered a "performance" and was therefore not copyright protected. However, that same year the recording industry won a fight against illegal music downloading when a Minnesota woman was ordered to pay $222,000 in damages for sharing copyrighted music online. Sales of recorded music have suffered due to the Internet because many people download music for free rather then paying for recordings in stores. As a result, royalties paid to the performing artists have dropped.

Similarly, actors and writers have complained that they are not fairly compensated for their work that is distributed on DVD or on the Internet. Members of the Writers Guild of America went on strike for 100 days in late 2007. When the strike ended in February 2008, the writers signed a 3-year contract that assured them payment from revenue generated when their creative works are distributed on the Internet.

This dispute was not an isolated event. In 2010, creative artists and performers writers, actors, and composers argued that they were losing compensation for their Web-distributed works. They urged Congress to change copyright laws so that their downloaded music be considered a public performance that earns them royalties. Industry experts say that if the law were changed, composers could potentially earn nearly $100 million in additional annual royalty payments as Internet usage grows.

Artists making parodies or "mashups" are also fighting copyright battles. (In creating mashups, artists combine and change digital works that already exist.) These artists use copyrighted works to create their material and employ a "fair use" argument to justify that usage. However, artists with a large amount of copyrighted work say that the fair use argument is being overused.

COPYRIGHT OFFICE

In August 2009, the Copyright Office changed some of its fees based on regulations issued by the office. The cost of registering electronically was lowered to $35. With the lower cost, the Copyright Office hoped to encourage more people to take advantage of online filing. A thorough list for registration, recordation, and other services offered through the Copyright Office can be found at http://www.copyright.gov/docs/fees.html. The fees fall short of making the Copyright Office self-supporting; it relies on assistance from the Library of Congress general budget to fulfill its many obligations.

CORPORATE CULTURE

Corporate culture refers to the shared values, attitudes, standards, and beliefs that characterize members of an organization and define its nature. Corporate culture is rooted in an organization's goals, strategies, structure, and approaches to labor, customers, investors, and the greater community. As such, it is an essential component in any business's ultimate success or failure. Closely related concepts are corporate ethics (which formally state the company's values) and corporate image (which is the public perception of the corporate culture). The concept is somewhat complex, abstract, and difficult to grasp. A good way to define it is by indirection. The Hagberg Consulting Group does just that on its Web page on the subject. HCG suggests five questions that, if answered, get at the essence of a company' culture:

- What ten words would you use to describe your company?
- Around here what's really important?
- Around here who gets promoted?
- Around here what behaviors get rewarded?
- Around here who fits in and who doesn't?

As these questions suggest, every company has a culture but not all cultures (or aspects of them) help a company reach its goals. The questions also suggest that companies may have a "real culture," which can be identified by answering these questions, and another culture which may sound better but may not be the true one.

EMERGENCE AND CHARACTERISTICS

The concept of corporate culture emerged as a consciously cultivated reality in the 1960s alongside related developments such as the social responsibility movement itself the consequence of environmentalism, consumerism, and public hostility to multinationals. Awareness of corporate culture was undoubtedly also a consequence of growth, not least expansion overseas where corporations found themselves competing in other national cultures. The competition between the United States and Japan, with its unique corporate culture, was yet another influence. So was the rise to prominence of management gurus, the dean of whom was Peter Drucker. As corporations became aware of themselves as actors on the social scene, corporate culture became yet another aspect of the business to watch and to evaluate alongside the "hard" measures of assets, revenues, profits, and shareholder return.

Corporate culture, by definition, affects a firm's operations. It is also, by definition, something that flows from management downward and outward. In many corporations, the "culture" was set very early on by the charismatic activity and leadership of a founder. But as major tendencies become deeply institutionalized, corporate culture also becomes an institutional habit that newcomers acquire. In actual practice "reinventing" the corporation from the top down, therefore, is difficult to achieve, takes time, and happens only under strong leadership.

Observers and analysts of the phenomenon tend to subdivide culture into its various expressions related either to major constituencies (employees and workers, customers, vendors, government, the community) or to methods or styles of operation (cautious, conservative, risk-taking, aggressive, innovative). A corporate culture may also, by overstepping certain bounds, become suicidal as the case of Enron Corporation, the energy trader that filed for bankruptcy in 2001, illustrates. In the Enron culture an aggressive, creative, high-risk style led to fraud and

ultimate collapse. Analysis is helpful in understanding how a corporate culture expresses itself in specific areas. However, the concept is social and cultural, as the phrase itself implies. It does not lend itself to reorganization by a rearrangement of standard building blocks.

The corporate culture of a company might seem like a hard concept to gauge while seeking a job. However, Dr. Randall S. Hansen, the founder of Quintessential Careers, says the culture of a company affects all aspects of a job, including scheduling, office environment, attire, and the employees' personal office spaces. Employee interactions and corporate perks are also culturally driven. While it is difficult to know a culture before taking a job, Hansen suggests reviewing the company's Web site for clues. Also, by arriving early for an interview and observing employee interactions, prospective employees may be able to pick up on some corporate culture clues. Finally, Hansen recommends asking questions about the culture at the interview.

CULTURE IN SMALL BUSINESSES

Culture can be a particularly important consideration for small businesses. A healthy company culture may increase employees' commitment and productivity, while an unhealthy culture may inhibit a company's growth or even contribute to business failure. Many entrepreneurs, when they first start a new business, quite naturally tend to take on a great deal of responsibility themselves. As the company grows and adds employees, however, the authoritarian management style that the business owner used successfully in a very small company can become detrimental. Instead of attempting to retain control over all aspects of the business, the small-business owner should, as consultant Morty Lefcoe told *Nation's Business*, strive to "get everybody else in the organization to do your job, while you create an environment so that they can do it."

In a healthy culture, employees view themselves as part of a team and gain satisfaction from helping the overall company succeed. When employees sense that they are contributing to a successful group effort, their level of commitment and productivity, and thus the quality of the company's products or services, are likely to improve. In contrast, employees in an unhealthy culture tend to view themselves as individuals, distinct from the company, and focus upon their own needs. They only perform the most basic requirements of their jobs, and their main and perhaps only motivation is their paycheck.

Since every company is different, there are many ways to develop a culture that works. Following are several main principles that small-business owners should consider in order to create a healthy corporate culture:

Prevailing corporate culture begins at the top. Entrepreneurs need to explain and share their vision of the company's future with their workers. "Let your vision for the company become their vision for the company," stated John O'Malley in his article "How to Create a Winning Corporate Culture." He goes on to say that "a company without a vision is reactive in nature, and its management is seldom confident addressing competitive threats and stepping into the future." In addition, small-business owners should be aware that their own behavior and attitudes set the standard for the entire workforce. Small-business owners who set poor examples in areas such as lifestyle, dedication to quality, business or personal ethics, and dealings with others (customers, vendors, and employees) will almost certainly find their companies defined by such characteristics.

Treat all employees equally. Entrepreneurs should treat all employees equally. This does not mean that business owners cannot bestow extra rewards on workers who excel, but it does mean that interactions with all employees should be based on a foundation of respect for them. One particular pitfall in this area for many small-business owners is nepotism. Many small businesses are family-owned and operated. But bloodlines should be irrelevant in daily operations. "Successful . . . businesses constantly place 'you are no different' expectations on family members they employ," noted O'Malley. Failure to treat everyone equally "quickly undermines employees' morale . . . . Showing favoritism in the workplace is like swimming with sharks you are destined to get bitten."

Hiring decisions should reflect desired corporate culture. The wise small-business owner will hire workers who will treat clients and fellow employees well and dedicate themselves to mastering the tasks for which they are responsible. After all, "good attitude" is an essential component of any healthy corporate culture. But entrepreneurs and their managers also need to make sure that hiring decisions are not based upon ethnic, racial, or gender issues. Besides, businesses typically benefit from having a diverse workforce rather than one that is overly homogeneous.

Two-way communication is essential. Small-business owners who discuss problems realistically with their workforce and enlist employees' help in solving them will likely be rewarded with a healthy internal environment. This can be an important asset, for once a participatory and engaging culture has been established, it can help propel a small business ahead of its competition.

Small businesses often experience growing pains, and the original employees work hard to protect and maintain the integrity of a small company culture. Niraj Shah and Steven Conine, who founded CSN Stores, an online retailer with more than 500 employees, decided that an open office space would help the company retain its fun and open culture. As Grace L. Williams reported in the *Wall Street Journal*, the office space of CSN Stores has no

walls, cubicles, or private offices. and all employees regardless of their level have an open door to senior leaders. Said Shah, "The primary reason for this is really around communication." But Shah added that the set-up also makes organizational sense; the open layout maximizes the number of people who can fit in one space, and makes it easy to grow and rearrange quickly.

Small-business owners should be aware that problems with the corporate culture can play a major role in business failures. When employees only perform the tasks necessary to their own jobs, rather than putting out extra effort on behalf of the overall business, productivity declines and growth comes to a halt. Unfortunately, many entrepreneurs tend to ignore the developing cultures within their businesses until it is too late to make needed changes.

In an article for *Entrepreneur*, Robert McGarvey outlined some warning signs of trouble with the company culture, including: increased turnover; difficulty in hiring talented people; employees arriving at work and leaving for home right on time; low attendance at company events; a lack of honest communication and understanding of the company mission; an "us-versus-them" mentality between employees and management; and declining quality and customer satisfaction. A small business exhibiting one or more of these warning signs should consider whether the problems stem from the company culture. If so, the small-business owner should take steps to improve the culture, including reaffirming the company's mission and goals and establishing a more open relationship with employees.

Finally, technology has enabled people across great distances to work together. But experts say collaboration will fail if company leaders do not embrace cultures that support new types of working arrangements. *WebWorkerDaily* noted that, in addition to alternative work schedules, a company's culture must promote knowledge sharing across the organization and offer technical and job-specific training.

CORPORATE IMAGE

"Corporate image" was once advertising jargon but is today a common phrase referring to a company's reputation. The "image" is what the public is supposed to *see* when the corporation is mentioned. The ordinary man and woman on the street usually have a wry view of public relations, advertising, hype, hoopla, and therefore also of corporate image and this often for good reasons. But a good corporate image is a genuine asset; it translates into dollars at the counter and higher stock valuation.

The concept is usually associated with large corporations, but small businesses also have a corporate image even if neither their owners nor customers think of it that way. In the absence of active efforts, corporate image "simply happens": it is how a company is perceived. Management, however, may actively attempt to shape the image by communications, brand selection and promotion, use of symbols, and by publicizing its actions. Corporations trying to shape their image are analogous to individuals who will dress appropriately, cultivate courteous manners, and choose their words carefully in order to come across as competent, likeable, and reliable. In the personal as in the corporate case, the image should match reality. When it does not, the consequence will be the opposite of the one intended.

THE ELEMENTS OF IMAGE

A corporate image is, of course, the sum total of impressions left by the company's many actions. In many instances a brief, casual act by an employee can either lift or damage the corporate image in the eyes of a single customer or caller on the phone. But the overall image is a composite of many thousands of impressions and facts. The major elements are: 1) the core business and financial performance of the company; 2) the reputation and performance of

its brands ("brand equity"); 3) its reputation for innovation or technological prowess, usually based on concrete events; 4) its policies toward its salaried employees and workers; 5) its external relations with customers, stockholders, and the community; and 6) the perceived trends in the markets in which it operates as seen by the public. Sometimes a charismatic leader becomes so widely known that he or she adds a personal luster to the company.

Image versus Images. Only in the best of cases does a corporation enjoy a *single* reputation. Different publics may have different views of the corporation depending on their different interests. A company's brand image may be very good but its reputation among suppliers poor because it bargains very hard, pays late, and shows no loyalty to vendors. A company may be highly regarded on Wall Street but may be disliked on the Main Streets of cities where it has closed plants. A company may be valued for providing very low prices yet disliked for its employment practices or indifferent environmental performance. It is much more likely that a small business will have an all-around reputation for excellence than that a very large conglomerate will merit all-around praise. Smallness has its advantages.

At the Core: Business Performance The single most important factor in the corporate image is a company's core business performance; performance, by definition, includes financial results. A growing, profitable corporation with a steady earnings history will, for these reasons alone, please its customers, investors, and the community in which it operates. A profitable company that, nevertheless, exhibits huge gyrations in earnings will fare worse: its earnings and dividends will be unpredictable; it will have layoffs; its stock will fluctuate; its vendors will be more uneasy; its employees nervous. When a business fails in its core function, its reputation collapses also. Enron Corp., an energy trader, had a stellar reputation as the seventh largest corporation measured in revenues. It fell into bankruptcy almost abruptly on December 2, 2001; the Justice Department began to investigate it for fraud. Suddenly every aspect of the company that had been admired and lauded its audacity, energy, profitability, innovativeness, entrepreneurial spirit, and so on took on opposite and negative connotations. The core business had failed; Enron's reputation imploded. No amount of corporate image polishing could have saved Enron's reputation after that.

MEASURING THE CORPORATE IMAGE

Corporations evaluate their image, much as politicians do, by survey. They employ the methodology of marketing surveys used both in polling and in support of advertising. The investigators select appropriate samples of the public and interview them; telephone surveys are the most common. They use statistical methods of extrapolation to project from the sample what the public as a whole (or selected publics) think. Corporations, of course, also rely on the much "harder" measures such as sales and stock performance. Surveys of the corporate image are sometimes motivated by sagging sales and a miserable press.

The theory of the corporate image holds that, all things equal, a well-informed public will help a company achieve higher sales and profits, whereas a forgetful or poorly informed public may come to hold negative impressions about the company and may ultimately shift more of its patronage toward competitors.

Images, of course, change over time. A campaign launched by Toyota Motor North America, Inc. in 2005 illustrated measurement and a response to it. As reported by Jamie LaReau in *Automotive News*, "Toyota periodically surveys U.S. consumers' perceptions of the automaker. The surveys suggested [that] Americans' awareness of Toyota's U.S. presence had declined since 2000 . . . even as the company was building and expanding plants." The company launched a print and TV program to highlight the company's contributions to the U.S. economy.

But Toyota experienced harsher image problems in early 2010, when millions of the carmaker's most popular cars were recalled because of acceleration problems and other defects. According to Japan-based Waseda University Marketing Professor Kenneth Grossberg, quoted by Malcom Foster in his article, "Problems at Toyota Latest to Taint Japan's Corporate Image," the recall is a "terrible blow for Toyota because its identity is linked so closely to quality and the company seemed slow to recognize the problems." To try to restore its image, Toyota staged a media blitz, with executives appearing on major news shows and full-page advertisements running in major newspapers.

WORDS AND ACTION

The first Toyota example is a case in which the company felt it needed to communicate ("words") something about its investments ("action") in the United States. A company in crisis communications mode must tell the public how it intends to fix the problems with its cars (words) and then do it (actions). Ideally, words and actions are always closely linked in building or repairing the corporate image, but to achieve a close alignment of words and deeds is often difficult in practice.

Whether the objective is to make the most of a good thing or to turn around an adverse situation, good management practice will ensure that action is accomplished before the words are spoken. A case of that sort is presented by the

Rite Aid chain store. The company went through a financial scandal in the late 1990s; its former chief executive and others were convicted and jailed. A new management team first turned the chain around before, as reported in *Chain Drug Review* it launched a campaign to tell the world that "the turnaround is complete and we are a stable, healthy company focusing on growth," as *Chain Drug Review* quotes Karen Rugen, Rite Aid's senior vice president of communications and public affairs, a newcomer to the company.

ATTENTION TO DETAIL

The management of the corporate image also involves management of the more mundane side of image, the corporation's logo, its brand images, the look and feel of its retail outlets, its offices, signage, even its stationery and the look of its calling cards. Good management implies ensuring that all spokespersons for the company say the same thing in the same way for a consistent message. Furthermore, in pays attention to consistent self-presentation in the look of its facilities.

SMALL BUSINESS AND CORPORATE IMAGE

Every small business will have the equivalent of a corporate image because it will have a reputation among its employees, customers, vendors, neighbors, and the government agencies with which it deals. The first action of the owner, in choosing the name of the enterprise, is an exercise in building a corporate image. The process continues in many ways: in the choice of brand names to be used, the location of leased space, office decorations and/or store equipment selected, the company's Web site design if the business has an Internet presence, its sales literature, and so on. As the business begins to operate, it will build its visibility in its market by outward symbols, including the quality of its products or services; the knowledge, skill, and friendliness of its employees; its promptness in paying bills; and its effectiveness in mounting promotions.

By their very nature, small businesses tend to be closer to all of their constituencies. As a consequence, the business will enjoy rapid feedback from the public when it makes mistakes or has some bad luck. If that should happen, the small business, like the major corporation, will engage in the actions followed by words which will be necessary to recover losses or make the most of unusual success.

USING THE INTERNET TO ENHANCE CORPORATE IMAGE

The Internet is a key part of a company-s image. A corporate Web site is often the first contact with potential customers; it is another asset to consider in order to enhance the corporate image. The Web site design should be consistent with the rest of the marketing materials, and the company should be able to deliver on all services it offers via the Web: customer service, product delivery and quality, and other requests.

The role of social media in corporate image creation continues to grow. According to a 2009 Deloitte survey, 74 percent of employees in the United States agree that social media can be damaging to a company's reputation. That same survey found that nearly one-third of U.S. companies use social networking to build their brand and enhance their image. Companies successfully using social media to promote their image are knowledgeable about technologies, and what their competitors, partners, and consumers are doing and saying. They also have a well-thought-out strategy for their own blog, microblog, and social networking pages, as well as a solid crisis communication plan.

These tips would serve Kryptonite Locks well, as is shown by Ishmael Vasquez's article, "Search Engine Reputation Management: Kryptonite Locks Case Study." When blogger and marketing director for Blue Fountain Media Ahlan Keser went online to buy a lock for his new bike, he searched the company. Instead of going to the Kryptonite site, he found several links that demonstrated how to pick a Kryptonite lock. "I skipped right past the official Kryptonite website which was the only website I had planned to visit. Instead, I visited the other, much more interesting results." Keser did not buy a Kryptonite lock for his bike after finding this information. "If you have something that can damage your corporate image on Google, you have to take swift action and correct the situation. It has to be very accessible to everyone (e.g., on your homepage) and you have to respond to questions quickly and honestly. Evaluate the complaint and correct the problem, even if it will cost you money in the process," advised Vasquez.

CORPORATE LOGO

A logotype, commonly referred to as a logo, is a graphical symbol created for an individual company or product. It is designed to be a distinctive and easily recognizable symbol. Logos often include a special typeface or font used to spell out the company name or initials. They also tend to include specific colors and graphical shapes. Corporate logos appear on a wide range of materials distributed or maintained by companies, including store signs, business cards, company Web sites, major equipment, stationery, marketing materials, packaging, uniforms, and so forth. Effective company logos have been cited as important elements in corporate image-building efforts. Conversely, many marketing experts believe that poorly conceived or unattractive logos can have a negative impact on a business's appeal and hence, its performance in the marketplace.

As small-business owners and CEOs of major multinational firms alike are aware, corporate image is an important factor in business success. Companies that are thought of as innovative, smart, or stable in the marketplace have achieved that status in part because of the way in which they present themselves to clients and competitors alike. Corporate logos are one of the tools that businesses have at their disposal in shaping that image. As Anne McGregor Parsons argued in *Colorado Business Magazine*, corporate logos are potentially valuable visual symbols because they can express both the personality and the mission of a company.

ISSUES IN CORPORATE LOGO CREATION

Business consultants, entrepreneurs, and designers who specialize in logo creation all agree that several factors have to be weighed when creating a logo for a company:

1. Desired Image. This is far and away the most important consideration, and it can be of even greater importance to business start-ups that may not have the financial wherewithal to recover from early slips in logo choice and other marketing areas. Entrepreneurs seeking to make or update a logo, then, should make sure that specific business objectives, target markets, and competitor image are all factored into the logo's creation. For example, a new microbrewery would probably be more inclined to go with a creative, bold logo that features a stylized image of its product than would an independent insurance agency, which would place greater value on logo characteristics that connote stability and trustworthiness.
2. Industry. Many companies sport logos that reflect the industry in which they operate. Providing such associations often makes it easier to attract prime customers.
3. Cost. Creating a logo, or updating an existing logo, "can be an expensive proposition," wrote Parsons, "affecting a company's entire range of visual communications from business cards to truck fleets." Opinions vary about the financial emphasis that start-ups and established small businesses should place on logos and slogans. Some analysts believe that entrepreneurs sometimes devote too much energy and money to creating a distinctive logo at the expense of addressing basic financial and operational needs. Other consultants and experienced small-business owners, however, believe that a visually interesting logo can not only attract much needed attention to fledgling businesses, but can also present businesses with opportunities to make additional sales, by making available clothing, gear, and other merchandise in which the logo is prominently featured. This phenomenon has been most evident on the national stage, as athletic shoe manufacturers and professional sports teams have proven quite adept at selling such wares to customers, but it can also be seen with local logos that are deemed trendy by young consumers.
4. Impact on Current Customers. Owners of established businesses who are considering changing their logo should weigh the potential negative impact that such a switch could have on existing clients or customers. As Raymond Snoddy observed in *Marketing*, redesigning familiar corporate logos can be

disturbing to customers who have established a certain comfort level with the old logo.

5. Longevity. Entrepreneurs should beware of using logos that are overly reliant on passing fads or marketing gimmicks. "Communications cost a lot of money for a company, so they need to have the greatest longevity that they can," one logo designer told *Colorado Business Magazine*. "That's why we try to focus on timeless, classic design [when making logos],leaving the trendier things to the more short-term tactical type of advertising media." Another designer agreed, remarking that a logo "must stand the test of time."
6. Distinctive. Experts urge business owners not to use gimmicky logos, but they also tout the benefits of logos that are unique in some fashion. Not only do such logos enjoy a certain level of legal protection from infringement, they also catch the eye of the customer.
7. Flexible. Logo designs should be made so that they can be used on a wide variety of promotional materials, from billboards and the sides of trucks to letterheads and shirt insignias.

Corporate Logos and the Internet. In the Internet age, some research has been done on what sort of logos are most effective on company Web sites. In a 2003 report for *Corporate Communications: An International Journal*, researchers investigated the response of Internet users to complex corporate e-logos. Surprisingly, they found that people liked complicated Internet logo designs. "A complex e-logo may enhance the perceptions of a firm as being creative and professional," researchers said.

Another factor in logo design, beginning in 2003, was Web 2.0. According to Web expert Scott Allen, Web 2.0 is simply a method of "designing sites that are more interactive, have better functionality, are dynamic (vs. the static sites of the 90's), and build user community when possible."

Many graphic artists have provided input on how a Web 2.0 corporate logo should look. They say that these logos often have many different shades and varieties of bright colors. Like the researchers of the 2003 logo study, graphic artists in 2008, such as Krishna Kriszha, said that Web 2.0 logos should have three-dimensional effects; designers should take advantage of shadows and create surfaces that look shiny, reflective, or textured.

CORPORATE SOCIAL RESPONSIBILITY

Corporate social responsibility (CSR) refers to the concept that businesses have larger social obligations that extend beyond making a profit. Also known as corporate citizenship, sustainable development, and similar terms, CSR calls for companies of all sizes to be more transparent about how their business practices affect the environment, employees, consumers, and members of the general public.

While the term originated in the 1970s, debate continues over exactly what a corporation's responsibilities are and how open they should be about disclosing those practices to the public. Supporters feel CSR programs ensure that companies "do the right thing," while critics dismiss them as mere public relations campaigns that aim to avoid tougher government regulation. Annual lists that rank the "most ethical" companies or the "most responsible" corporations continue to grow, yet there are differences of opinion over whether those rankings have significance. Some studies show that being a responsible corporate citizen is linked to better than average financial performance while providing a number of business and social benefits. However, other reviews find little or no correlation between CSR and the bottom line.

DEFINITIONS

There are a number of ways to define corporate social responsibility, with most having several key concepts in common. One idea is to make a company more transparent, so that it shares information with the general public about how it conducts business. This would enable the impacts of those activities on the global community to be measured. Another common thread is to consider the impact of a business on its stakeholders, not just management and investors, but employees, members of society in general, and even the environment. CSR theories sometimes refer to a triple bottom line: people, planet, and profits. CSR practices are generally voluntary, although some countries are beginning to implement requirements for CSR disclosures.

The World Business Council for Sustainable Development (WBCSD) a global association of 200 companies, defined corporate social responsibility as "the continuing commitment by business to contribute to economic development while improving the quality of life of the workforce and their communities as well as of the community and social at large." WBCSD added, "Acting in a socially responsible manner is more than just an ethical duty for a company, but is something that actually has a bottom line payoff."

The corporate social responsibility initiative at Harvard University defined CSR strategically. "Corporate social responsibility encompasses not only what companies do with their profits, but also how they make them," the initiative stated. "It goes beyond philanthropy and compliance, and addresses how companies manage their economic, social, and environmental impacts, as well as their relationships in all key spheres of influence: the workplace, the marketplace, the supply chain, the community, and the public policy realm."

In *Value Based Management with Corporate Social Responsibilitly*, John D. Martin, William J. Petty, and James B. Wallace maintain that corporations need to measure the value they are adding in order to maximize a corporation's long-term worth in the market. "What CSR brings to VBM [value based management] is the simple but powerful notion that, for any firm to be successful in creating wealth, all of those who have a stake in the business must receive their share of the economic pie," the authors stated. "Furthermore, by using an adaptation of the balanced scorecard toolkit, the needs of all these groups can be recognized and incorporated into the firm's managerial process for measuring and evaluating its relationships with all important constituencies." CSR is more than a moral obligation, they added, and "provides a process for structuring win-win agreements by the different constituencies (stakeholders) in sharing the value. We believe it is not about being altruistic. It is what works."

With CSR growing in importance among corporations and so many definitions in use, in 2005 the International Organization of Standards (ISO) began developing a common standard to provide social responsibility guidelines. "The need for organizations in both public and private sectors to behave in a socially responsible way is becoming a generalized requirement of society," ISO stated. With opinions ranging from strict legislation to "complete freedom," the group said, "We are looking for a golden middle way that promotes respect and responsibility based on known reference documents without stifling creativity and development."

EXAMPLES OF CSR IN MODERN COMPANIES

As there are few formal guidelines or regulations governing corporate social responsibility, companies implement the concept in a variety of ways. The differences span industries, markets, and nationalities. Large corporations also implement CSR differently from small and medium sized companies.

For some companies, CSR is an integral part of their corporate mission and culture. For example, Starbucks Coffee publishes an annual "global responsibility report" that details "the progress we've made in the areas of ethical sourcing, environmental stewardship and community involvement." The report, which is available on the Starbucks Web site, includes details on fair trade coffee practices, health care, human rights, menu labeling, supplier conduct, and the company's policy on corporate political expenditures.

Another example is Seventh Generation, which supplies personal care and household items designed to ensure the health of consumers and the environment. The company issues a "corporate consciousness report" that aims to bring transparency to the company's social impact. According to the *Baylor Business Review Age*, President Jeffrey Hollender sees CSR as the foundation for Seventh Generation's business success, and he hopes to influence other executives to follow the same path.

While Starbucks and Seventh Generation are relatively new companies which were founded around socially responsible missions, older and larger corporations have taken a variety of approaches to integrating CSR into their existing structures. Some have added executives with titles such as "vice president of corporate social responsibility" or "director of CSR" to oversee their initiatives. Others add sections to their annual reports, Web sites, and corporate communications packages that spell out various CSR-related activities. Shareholders are also more frequently pressuring corporations to be more forthcoming, such as a recent proposal for Duke Energy to fully disclose its expenditures on climate legislation lobbying.

During the recession of 2008 and 2009, a number of companies cut their CSR budgets, which called into question how committed those corporations are to maintaining their roles as good corporate citizens during tough times. However, the *Economist* reported that many CSR budgets include corporate philanthropy, so it can be difficult to quantify how many reductions actually occurred.

Corporations have also been accused of simply recasting existing programs as CSR initiatives. Companies regularly send out press releases touting their environmentally friendly products and services, their progress in energy efficiency, or their role in "Earth Day" or "World Water Day." In fact, *Advertising Age* reported that some companies are simply following the latest trend by sponsoring socially responsible campaigns that have little to do with their corporate mission. "Just as consumers quickly saw through the rampant green-washing of the past decade, brand beware," *Advertising Age* wrote. "They'll see through your cause-washing too."

CSR RANKING LISTS

One of the more visible signs of CSR is the growing number of corporate social responsibility rankings announced each year by a variety of organizations. The *Christian Science Monitor* noted that those lists include the "Global 100" from Corporate Knight; the "100 Best Corporate Citizens" by Corporate Responsibility Magazine; and the "Most Ethical Companies" by the Ethisphere Institute.

Ethisphere stated on its Web site that the World's Most Ethical Companies (WME) designation "recognizes companies that truly go beyond making statements about doing business 'ethically' and translate those words into action. WME honorees demonstrate real and sustained ethical leadership within their industries." The companies on the 2010 "Top 100" list include Starbucks, Nike, General Electric, and grocery chains Trader Joe's and Whole Foods Market.

PROS AND CONS OF CSR

There is a continuing debate about whether there is a link between corporate social responsibility and financial success. The debate dates back to the earliest days of the CSR movement with a 1970 article by economist Milton Friedman in the *New York Times Magazine* titled, "The Only Social Responsibility of Business Is to Increase Its Profits." Friedman characterized popular talk that business should develop a social conscience as "preaching pure and unadulterated socialism." He argued that only human beings have responsibility not corporations. Friedman maintained market mechanisms "are the appropriate way to determine the allocation of scarce resources to alternative uses."

Over time, a consensus has evolved beyond Friedman's position to embrace the concept that corporations have social, ethical, and moral responsibilities in addition to the need to make a profit. Today the disagreement is over whether CSR has any effect on the bottom line. *Harvard Business Review* reported that sustainability is generally seen as a key driver of innovation. The publication's study of thirty large corporations found lower costs, added revenues, and new business opportunities attributed to CSR. However, "Many companies are convinced that the more environment-friendly they become, the more the effort will erode their competitiveness. They believe it will add to costs and will not deliver immediate financial benefits." The report added that that position "simply is not true."

A research paper in the *Journal of Business Ethics* found that CSR programs help connect consumers to brands and companies. The paper, titled "The Role of Identity Salience in the Effects of Corporate Social Responsibility on Consumer Behavior," studied the influence of CSR practices on consumer behavior. The authors wrote, "Results demonstrate that CSR initiatives are linked to stronger loyalty both because the consumer develops a more positive company evaluation and because one identifies more strongly with the company."

However, other studies come to differing conclusions. In "Corporate Social Responsibility and Financial Performance: the 'Virtuous Circle' Revisited" in the *Review of Quantitative Finance and Accounting*, Edward Nelling and Elizabeth Webb found the "relationship between CSR and financial performance is much weaker than previously thought. We also find little evidence of causality between financial performance and narrower measures of social performance that focus on stakeholder management." The study's results suggest "strong stock market performance leads to greater firm investment in aspects of CSR devoted to employee relations, but that CSR activities do not affect financial performance."

A report in *Forbes* magazine titled "CSR Doesn't Pay" came to a similar conclusion. David Vogel wrote that firms with both superior and poor CSR records have done well financially, and others in both categories have also performed poorly. Vogel, a business professor at the University of California-Berkeley, also found that investment funds with socially responsible portfolios returned results about the same as other mutual funds. The report noted that most consumers are not concerned with CSR issues, and that it can be difficult accurately to distinguish good corporate citizens from irresponsible companies.

Christopher Flavell, in his article, "Responsibility Is Still Good for Business" for the *Washington Post*, also found that ambiguous standards make it difficult to define corporate responsibility precisely. When corporate philanthropy is added to the equation, the effects of charitable donations can overshadow other "bad"

corporate behavior, Flavell wrote. He also reported that an online screening tool that ranks socially responsible companies found that CSR had little effect on falling stock prices during the economic downturn from early 2008 through early 2009.

However, Flavell found that regardless of the accuracy of rankings or the financial impact of CSR, corporate social responsibility remains important to the corporate and consumer worlds. He noted that even companies with poor CSR rankings are working to improve their status. Similarly, a report in the *Economist* stated than even when some CSR budgets were cut during the recession, companies did not abandon the programs entirely because they saw them as key to winning consumers, reducing costs, recruiting talent, and restoring public confidence in the free-enterprise system.

While CSR programs have drawn criticism, they are likely to continue as a feature of modern corporate life. With continuing pressure from consumer advocates, "green" lobbyists, and regulators, corporations are expected to continue expanding their social responsibility initiatives for the foreseeable future.

CORPORATE SPONSORSHIP

Corporate sponsorship is a form of advertising in which companies pay to be associated with certain events. When the sponsorship of a nonprofit or charitable event is involved, the sponsorship activity is often referred to as event marketing or cause marketing. According to *Forbes* magazine, many companies look for sponsorship opportunities in order to be linked with "do-gooder organizations." As such, corporate sponsorships grew rapidly during the late 1990s and the first part of the twenty-first century. During that time, spending for corporate sponsorships rose much faster than advertising spending. However, in 2009 North American companies spent less year-over-year on corporate sponsorship, mostly because of the flagging economy.

Most of the sponsors of large events are, of course, large companies. However, part of the increase in corporate sponsorship worldwide is attributed to the number of small- and medium-sized firms that are becoming involved. Not long ago, only large entities could afford to sponsor large events as a way of building goodwill and

boosting revenue. But in today's business environment, small companies have embraced sponsorship of everything from local softball and volleyball teams to festivals, fairs, and park cleanups as an effective means of increasing their visibility in their home community. Many of these kinds of sponsorships enable small companies to increase their public profile in a relatively cost-effective manner.

A company can benefit in many ways from sponsorship. *Nation's Business* contributor Harvey Meyer touts a wide range of potential benefits: "[Sponsorships] can enhance a company's image and visibility; differentiate the company from competitors; help develop closer relationships with current and prospective customers; showcase products and services; unload obsolete inventory; and allow the company to compete more effectively against bigger firms that have much larger advertising budgets. In addition, tickets to sponsored events can be used as incentives for employees, vendors, and customers and to promote worker loyalty. And proponents say that if sponsorships are well-conceived and strategic, they can boost sales both long-term and short-term as they improve the community through the events they support."

In an article that discusses trends in corporate sponsorship titled "Why Sponsors Sponsor," Jim Karrh lists the four criteria that not-for-profit fund-raisers expect to be used by most companies in assessing the request to become involved as a sponsor. The four criteria are as follows:

- Relevance. The cause must be relevant to the company's products or service.
- Branding Fit. There must be a good fit with the overall company brand.
- Mission Alignment. The partnership must align with a company's mission.
- Business Result. The company must believe it can achieve some measurable business result through the partnership.

In addition to the advertising and promotional aspects of corporate sponsorship, it also provides benefits in the realm of community relations. A comprehensive, ongoing community relations program including event sponsorship can help virtually any organization achieve visibility as a good community citizen. Organizations are recognized as good community citizens when they support programs that improve the quality of life in their community, including crime prevention, employment, environmental programs, cleanup and beautification, recycling, and restoration. Some other examples of ongoing programs might include scholarship programs, urban renewal projects, performing arts programs, social and educational programs, children's activities, community organizations, and construction projects. These kinds of sponsorships also referred to as "cause-related marketing" may also be linked to national or even international social causes. For example, a kayak manufacturer who donates a percentage of its boat sales directly to a national river conservation organization not only supports a worthwhile cause, but also creates an effective marketing tool for itself.

Good community relations programs give employees a reason to be proud of the company, which increases loyalty and may help to reduce labor and production costs. Furthermore, a company with happy employees and a good reputation in the community is likely to attract highly qualified new employees. A small company may also generate new business through the contacts and leads it generates in its community relations activities. Such contacts might also make it easier for the company to obtain financing for expansion, find promising new locations, or gain favorable treatment in terms of taxes, ordinances, or utilities. Good community relations can also be beneficial in times of crisis, such as a fire or a plant closing, by rallying the community around the affected business.

Event sponsorship, in particular, is an attractive option because it provides a business with access to various audiences, including employees, business decision makers, and government regulators as well as consumers. It can be an especially good marketing tool for companies that participate in international trade, because sponsorship transcends language and cultural barriers. Many marketers feel that corporate sponsorship is superior to other methods because it allows for an immediate customer response to new product offerings. Events provide business managers with an opportunity to come face-to-face with their customers. They also provide customers with an opportunity to try a company's products out firsthand. By comparison, marketing research tools like focus groups can be expensive and may not target the right people, while market questionnaires or surveys generally do not give potential customers a chance to try the product.

Corporate sponsorship also provides marketers with a unique opportunity to position their products in the marketplace. With corporate sponsorship unlike conventional marketing techniques the company, the product, and the event or cause being sponsored tend to become linked in consumers' minds. By sponsoring an event or funding the broadcast of an event, a sponsor is able to gain visibility while simultaneously creating an association between itself and the event's values. The event generates the audience while projecting values associated with the activities of the event. Each sponsorship vehicle has certain associated images in the consumer's mind that transfer to the sponsor.

Given this tendency for consumers to associate sponsors with events, it is important for sponsoring companies to choose events that fit well with the image of their products. Indeed, small businesses should not associate themselves with any cause or event without first undertaking a serious examination of the potential drawbacks of a sponsorship opportunity. For example, effective sponsorships often require active participation on the part of companies and segments of their workforces. In addition, some companies shy away from sponsorship because of fears that they will be exposed to litigation or bothered by organizers of other events. Finally, affiliation with a community event that is poorly organized or violates local standards of good taste can be quite costly to a small business. With this in mind, small-business owners should always undertake a background check on events or organizations they are considering sponsoring. Talking with current and past sponsors is one good way to learn more about the event from someone other than its promoters. It is worth noting that the growing popularity of corporate sponsorship has spurred many market research firms to aid businesses in the selection, implementation, and evaluation of sponsorship opportunities. But these services may be prohibitively expensive for smaller companies.

Even when there is a good fit between sponsor and event, it is still vital for a company to promote the event and its involvement in order to gain benefits. After all, sponsorship is a form of advertising, even when it is of a nonprofit venture or charitable event. Possible ways to promote events sponsorship include billboards, print and broadcast advertisements, and direct mail. Sponsoring companies may also find it helpful to issue press releases about the event to the media, as well as to contribute articles and editorials to publications that reach the target audience. Marketers of consumer products may also engage in joint promotions with retailers, such as coupons and tie-ins.

The fees involved in event marketing can range from a few hundred dollars to hundreds of thousands of dollars, depending on the scale of the event and the level of the sponsor's involvement. In addition to the cost of staging the event itself, there are also associated advertising, publicity, and administrative costs to consider. Many small businesses choose to begin as a co-sponsor of an existing event, which allows them to take advantage of the other sponsors' experience. It may also be possible for a small business to underwrite a new event and share advertising costs with a co-sponsor. Some businesses find it difficult to justify the expense of corporate sponsorship because it can be difficult to gauge the results in monetary terms. But it is often possible to conduct before-and-after interviews with attendees of the event, or to give away coupons and then track redemption rates. Some businesses also attempt to gauge the success of an event by providing a toll-free telephone number for attendees to call for more information about their products or services.

AMBUSH MARKETING

The benefits provided by corporate sponsorship can be decreased significantly by competitive tactics known as "ambush marketing," which occurs when competitors take steps to deflect an event audience's attention away from the sponsor and toward themselves. Ambush marketing tactics include sponsoring the media coverage of an event rather than the event itself, sponsoring a subcategory of an event, sponsoring individual athletes or teams involved in an event, or planning advertising to coincide with the event. Although the practice is considered unethical by paid sponsors and event owners, others consider it a normal part of competitive advertising.

There are several preemptive measures corporate sponsors can take to reduce the chances of being hit with ambush marketing. Sponsor companies should try to anticipate competitive promotions and establish those specific rights with the event owner, identify related avenues for promotion and block them, and seek legal remedies when their sponsorship rights are infringed upon. But perhaps the most effective way for sponsor companies to reduce the effectiveness of ambush marketing tactics is to promote their involvement effectively.

THE FUTURE OF CORPORATE SPONSORSHIPS

As Americans and the rest of the world move forward with new technologies, corporate sponsorship is also changing. For example, consider the recording industry, a market that has been forever changed by the growth in popularity of digital music. Large music labels, slow to adapt to the new technology, have been hard hit by diminished CD sales, resulting in smaller marketing budgets for music labels. To compensate for the loss of marketing revenue, corporate sponsorships, once shunned by bands, now trail only live shows as revenue generators for artists. In fact, an IEG sponsorship report, quoted by Kristen Schweizer in her article for *Bloomberg.com*, stated that "North America-based companies alone will spend a record $1.08 billion on music sponsorships [in 2009], 8 percent more than in 2007." Schweizer also mentioned that corporate sponsors typically use the artist's music in their commercials and often will spend millions of dollars advertising on television and other media.

In another changing industry, energy producers are attracting corporate sponsors. Companies are providing up-front financing for small wind farms in exchange for naming rights. For example, as reported by Claudia H. Deutsch in the *New York Times*, in 2008 John Deere Wind Energy sealed a deal with Steelcase, a large furniture company in Michigan. Steelcase agreed to buy the West Texas-based wind farm's entire output of renewable energy credits. It also agreed to pay John Deere for the right to

name the facility. The name and the purchase of energy credits fitted with the Steelcase history, mission, and "Green Giant" branding campaign. Ted G. Rose, vice president for business development for Renewable Choice Energy, who helped arranged the deal between Deere and Steelcase, predicted that naming rights for wind farms would catch on: "This is a new business model, and it could attract any brand that wants to be linked with sustainability."

COST CONTROL AND REDUCTION

Cost control and reduction refers to the efforts business managers make to monitor, evaluate, and trim expenditures. These efforts might be part of a formal, company-wide program or might be informal in nature and limited to a single individual or department.

For small businesses, cost control is a particularly important area of focus, as they often have limited amounts of time and money. In a small business the focus is typically on selling and servicing the customer. This leaves the task of purchasing slightly sidetracked. Even seemingly insignificant expenditures,for items like office supplies, telephone bills, Internet access, or overnight delivery services, can add up for small businesses. On the plus side, reducing these minor expenditures can often provide sources of cost savings.

PLANNING AND CONTROL

Cost control refers to management's effort to influence the actions of individuals who are responsible for performing tasks, incurring costs, and generating revenues. First managers plan the way they want people to perform; then they implement procedures to determine whether actual performance complies with these plans. Thus, the process involves not simply recording and monitoring cost data, but also analyzing that information to make sure cost goals are achieved. However, cost control is not solely a management function. Any personnel who incur costs because of their roles at the company should be active in the cost control process.

Cost control is a continuous process that begins with the annual budget. As the fiscal year progresses, management compares actual results to those projected in the budget and incorporates the lessons learned from its evaluation of current operations. Through the budget process and accounting controls, management establishes overall company objectives, defines the centers of responsibility, determines specific objectives for each responsibility center, and designs procedures and standards for reporting and evaluation.

A budget segments the business into its components, or centers, where the responsible party initiates and controls action. These centers can be physical locations or logical divisions of the company's operations. *Responsibility centers* represent applicable organizational units, functions, departments, and divisions. Generally a single individual heads the responsibility center exercising substantial, if not complete, control over the activities of people or processes within the center, as well as the results of their activity. *Cost centers* are accountable only for expenses. *Revenue centers* primarily generate revenues. *Profit centers* accept responsibility for both revenues and expenses. The use of responsibility centers allows management to design control reports and pinpoint accountability. A budget also sets standards to indicate the level of activity expected from each responsible person or decision unit, and the amount of resources that a responsible party should use in achieving that level of activity.

The planning process, then, provides for two types of control mechanisms: feedforward, which provides a basis for control at the point of action (the decision point); and feedback, which provides a basis for measuring the effectiveness of control after implementation. Management's role is to feedforward a futuristic vision of where the company is going and how it is to get there, and to make clear decisions coordinating and directing employee activities. Management also oversees development of procedures to collect, record, and evaluate feedback.

CONTROL REPORTS

Control reports are informational reports that tell management about a company's activities. Control reports are typically for internal use, so management directs the accounting department to develop tailor-made reporting formats. Accounting provides management with a format designed to detect variations that need investigating. In addition, management also refers to conventional reports such as the income statement and balance sheet, and to external reports on the general economy and the specific industry. Some companies use standard reports from their accounting software packages or customize those reports to their specific needs.

Control reports need to provide an adequate amount of information so management may determine the reasons for any cost variances from the original budget. A good control report highlights significant information by focusing management's attention on those items in which actual performance significantly differs from the standard.

Managers perform effectively when they attain the goals and objectives set by the budget. With respect to profits, managers succeed by the degree to which revenues continually exceed expenses. In applying the following simple formula, Net Profit = Revenue − Expenses, managers realize that they exercise more control over expenses than they do over revenues. While they cannot predict the timing and volume of actual sales, they can determine the utilization rate of most resources; that is, they can influence the cost side. Hence, the evaluation of management's performance and the company's operations is cost control.

STANDARDS

For cost control purposes, a budget provides standard costs. As management constructs budgets, it lays out a road map to guide its efforts. It states a number of assumptions about the relationships and interaction among the economy, market dynamics, the abilities of its sales force, and its capacity to provide the proper quantity and quality of products demanded. An examination of the details of the budget calculations and assumptions reveals that management expects operations to produce the required amount of units within a certain cost range. Management bases its expectations and projections on the best historical and current information, as well as its best business judgment.

For example, when calculating budget expenses, management's review of the historic and current data may strongly suggest that the production of 1,000 units of a certain luxury item will cost $100,000, or $100 per unit. In addition, management might determine that the sales force will expend about $80,000 to sell the 1,000 units. This is a sales expenditure of $80 per unit. With total expenditures of $180, management sets the selling price of $500 for this luxury item. After the close of a month, management compares the actual results of that month to the standard costs to determine the degree and direction of any variance. The purpose for analyzing variances is to identify areas where costs need containment.

In the above illustration, accounting indicates to management that the sales force sold 100 units for a gross revenue of $50,000. Accounting's data also show that the sales force spent $7,000 that month, and that production incurred $12,000 in expenses. While revenue was on target, actual sales expense came in less than projected, with a per unit cost of $70. This is a *favorable* variance. But production expenses registered an *unfavorable* variance since actual expenditures exceeded the projected. The company produced units at $120 per item, $20 more than projected. This variance of 20 percent significantly differs from the standard costs of $100 and would likely cause management to take corrective action. As part of the control function, management compares actual performance to predetermined standards and makes changes when necessary to correct variances from the standards. The preparation of budgets and control reports, and the resulting analysis of variances from performance standards, give managers an idea of where to focus their attention to achieve cost reductions.

COST CUTTING FOR SMALL BUSINESSES

A variety of techniques can be employed to help a small business cut its costs. One method is hiring an outside analyst or consultant. These individuals may be independent consultants or accountants who analyze costs as a special service to their clients. They generally undertake an in-depth, objective review of a company's expenditures and make recommendations about where costs can be better controlled or reduced. Some expense-reduction analysts charge a basic, up-front fee, while others collect a percentage of the savings that result from their work. Still others contract with specific vendors and then pool the orders of their client companies to obtain a discount. Some of the potential benefits of using a consultant include saving time for the small-business owner, raising awareness of costs in the company, and negotiating more favorable contracts with vendors and suppliers.

There are many steps that a small business can take relatively quickly to start it down the path of cost reduction. These include such things as printing or photocopying on both sides of the paper whenever possible. Securing supplies to which employees have access, like locking the office supply cabinet, will better track usage of these items. Canceling insurance policies on unused equipment and vehicles is another way to eliminate unnecessary costs. Personnel costs are also worthy of a close look, such as determining whether there is an appropriate ratio of supervisors to employees or of customer service representatives to clients. Inventory cost control is also critical for businesses that create products rather than provide services. Management should determine how much inventory to carry to meet customer needs while constraining capital costs. Many accounting software packages contain tools to help quantify this decision.

Establishing a regular cost-cutting program can be done by setting aside time to review several months' worth of checks and invoices and making a detailed list of all monthly expenses. Then, the company can decide upon a few areas that might benefit from comparison shopping for better prices. The company's budget should be the starting point for tracking whether expenses are in line with expectations, with frequent reviews of key performance areas on an ongoing basis. If the small-business owner is not inclined to undertake the comparison shopping personally, a responsible employee can be assigned to the task.

Effective cost-cutting strategies should address variable costs first. Variable costs such as raw materials, labor, advertising, office expenses, and inventory are directly related to business activities. It is generally easier and less disruptive to the business when managers tackle variable expenses rather than such fixed costs as utilities, rent, and insurance. Determining which products or services are cost-effective can also help managers pinpoint which areas need cost control attention.

Despite the importance of cost control to small businesses, and the potential for cost savings, cost reduction alone cannot guarantee success. For cost cutting to be effective, the sales and revenue end of the business must be healthy. "Only the most exceptional leaders of the most exceptional companies avoid getting sucked into a period of heady growth followed by desperate cutbacks," Alan Mitchell wrote in *Management Today*. "These companies have learned the hard way that cost cutting alone doesn't guarantee customer preference."

Mitchell went on to explain that every business reaches a point in its growth when management recognizes a need to cut costs, usually in the face of a crisis. "Over time, you get a cost cutting culture," consultant Paul Taffinder told Mitchell. "Once you have, the types of people who are good at building things creating new values, new products, new services are driven out of the business because it is unpleasant for them to work there. Then, once a boom time arrives again, the organization piles on capacity but doesn't solve the problem of creating innovative potential. It has to hire talented new people again." Many companies repeat this process of inefficient growth several times.

The effective implementation of a cost control and reduction program takes planning and time. It should be seen as a continuous process and one that will need ongoing attention. Instead of blindly trying to cut costs in the face of a crisis, Mitchell recommended that managers embrace cost cutting as a strategic issue and approach the task from a marketing perspective. "If you are going to talk about waste, you need to define what value is, because the opposite of waste is value," business school professor Dan Jones told Mitchell. "And you can only define value from the end customer's perspective. If you can really do this if you really know what it is that doesn't add value to the customer then you can start asking 'How can we get rid of that?' Otherwise, we are just saying 'Let's cut costs.'"

COST SHARING

Cost sharing is a process wherein two or more entities work together to secure savings that one alone would be unable to obtain. Such partnerships may be pursued in order to realize any number of business objectives, such as increased marketplace exposure or access to technology, and expanded market reach. However, cost savings are usually a central component of these arrangements. Cost-sharing partnerships can be implemented in many different operating areas, from marketing to transportation to research and development. It is a favorite tool of many start-ups, freelancers, and small business enterprises with limited financial resources.

A business can enter cost-sharing partnerships with other businesses, with its own employees, and with its clients and customers. Each of these cost-sharing types is outlined below.

COST SHARING BUSINESS TO BUSINESS

Traditionally, the meaning of cost-sharing partnerships has been an arrangement in which one or more businesses partner to secure savings of some kind. Relatively few cost-sharing arrangements have been implemented for the manufacture of goods or execution of services. Instead, the majority of cost-sharing plans are in the area of marketing and advertising. "Today's direct marketing partnerships achieve impressive cost-benefit results," stated Myron Gould in *Direct Marketing*. He cited three primary advantages associated with cost-sharing partnerships in this operational area:

- They enable marketers to address the competitive challenges of the rising cost of traditional direct marketing essentials, such as postage and paper.
- They help marketers reduce direct mail expenses because costs are shared.
- Their effectiveness is enhanced by the development of technology tools and media outlet alternatives.

Gould cited the latter factor as particularly important for businesses seeking to engage in effective cost-sharing. "Computers have transformed [the marketing] industry and given birth to partnership opportunities. Today's computer-driven partnerships empower us to target qualified recipients and segment lists as never before. Many of our alternative direct marketing programs have traditionally taken a broadcast approach reaching broadly defined segments. Now, partnerships offer qualified segmentation, targeting narrower, clearly defined lifestyle and demographic segments. Technical advances in imprinting and inserting also offer enhanced ability to customize the package and the offer." Cost sharing is also an economical alternative for expanding into newer marketing approaches, such as social media, digital advertising, and other Web-based campaigns.

Finding a Cost-Sharing Partner. "There are no rules, standards, or boundaries that should restrict your vision when seeking a partner. Rather, shared goals should guide your 'vision quest,'" wrote Gould. "Partnerships can be formed in the profit and nonprofit sectors, in the same or different industries, within different divisions of the same company, and in similar market segments/demographics in non-competitive industries."

Many small-business owners seek out allies specifically to save money on operating costs. This is a perfectly legitimate course of action, but entrepreneurs should make certain that the final agreement is a fair one that explicitly details the terms of the agreement. Indeed, written partnership agreements that define each partner's spending obligations should be insisted on. In addition to discussing cost-sharing matters, these documents can also provide details on agreed-upon procedures and work flow, parameters for responsibilities, and mechanisms to measure results both during and after the project. As Gould observed, carefully crafted proposals "will help you mitigate concerns about loss of control and structuring the partnership for mutual benefit. When a partnership fulfills the consumers' needs with a new, exciting, or value-added offer or program, risks are minimized for all involved."

In addition to ensuring that cost-sharing agreements are sufficiently documented, small-business owners should weigh possible other benefits associated with partner alternatives when making their decision. Gould noted, for example, that a larger company might be able to provide a small business with valuable access to technology and training, while a smaller business might be blessed with a much-coveted contemporary market image. Ideally, a small-business owner will be able to find a partner who not only can help him or her secure savings in one or more aspects of business operations but also provide additional benefits.

One area of particular interest to small businesses is the concept of sharing office space. Shared space is particularly attractive for professionals who need to see clients or patients, such as lawyers, doctors, and financial consultants. Dividing office overhead, reception staff expenses, and other costs among two or more professionals can be an economical approach for professionals who need a physical presence. It is also an attractive alternative for those who spend little time in their office, such as sales representatives and real estate agents. Another concept which grew in popularity during the recession of 2008 and 2009, was co-working, a less formal and more flexible approach in which a large group of people share a large work space at

random times. Co-working facilities may provide little more than a chair, a desktop and a place to plug in a laptop computer. Freelancers, entrepreneurs, and others can benefit from using a workspace outside their homes for occasional meetings, networking, or simply to establish boundaries between their personal and professional lives.

Cost-Sharing Arrangements and the Internal Revenue Service. The Internal Revenue Service (IRS) maintains certain rules concerning how cost-sharing agreements within business groups should allocate costs. The IRS defines a cost-sharing arrangement as an agreement under which costs to develop intangibles are shared in proportion to reasonably anticipated benefits that each entity will reap. Such arrangements must include two or more participants; provide a method to calculate each controlled participant's share of intangible development costs, based on factors that can reasonably be expected to reflect each participant's share of anticipated benefits; provide for adjustments to the controlled participant's shares of intangible development costs to account for changes in economic conditions and the business operations and practices of the participants; and be recorded in an up-to-date document that provides detailed information on specifics of the arrangement.

The IRS established a "safe harbor" for actual benefits that diverge from estimates, but only if the difference is less than 20 percent. In allocating intangible development costs under a cost-sharing agreement, it is necessary to project the participant's share of anticipated benefits. That share is then compared to the participant's allocated share of the total costs. If these shares are not equal, the IRS has the authority to adjust accordingly. Benefits include additional income generated and costs saved by the use of the intangible.

COST SHARING WITH EMPLOYEES

In the early twenty-first century, annual increases in the cost of health care benefits have created a situation in which many companies feel forced to pass along a greater and greater portion of health insurance costs to employees. This cost shifting is referred to in the business world as health care cost sharing. In an attempt to reduce the cost of employee benefits, many companies have begun to increase the percentage of premium costs that must be paid by the employee. This is often done by increasing the amount of co-pays that employees are asked to pay for doctor visits and prescription drugs. It may also be done by an outright increase in the percentage of the premium paid directly by the employee for his or her coverage. Either way, it is a cost-sharing measure that reduces a company's costs by passing them on to employees. Some small businesses have dropped their employee health care plans as a way to reduce costs, while others have kept their plans in force by implementing cost-sharing plans. Numerous studies indicate that increased cost sharing by patients reduce how often they use health care services.

COST SHARING WITH CUSTOMERS

The increasing use of self-serve arrangements in retail establishments, financial institutions, and government agencies represents the rising popularity of cost-sharing measures that share costs with customers. In order to be effective these arrangements must be seen by the customer to be beneficial in some way, at least in their early stages. The customer may be offered a reduced price for booking his or her own airline ticket, or for assembling a piece of furniture. A customer may save time by using a self check-out lane and feel that this compensates for the effort. The tools offered a customer for performing these self-service tasks are also important. They must be easy to use. "If the interface is confusing, people are not going to stand there and figure it out. They're just gone," explained Francie Mendelsohn, president of Summit Research Associates, in a *CIO Magazine* article. If the transaction is made easy and the customer is convinced that he or she is receiving value equal to or greater than the effort expended, cost-sharing partnerships with customers can be a means for companies to save.

COST-BENEFIT ANALYSIS

Cost-benefit analysis is the process of evaluating a planned action by determining the net value it will have for the company. Basically, a cost-benefit analysis finds, quantifies, and adds all the positive factors. These are the benefits. Then it identifies, quantifies, and subtracts all the negatives the costs. The difference between the two indicates whether the planned action is advisable. While some companies are willing to proceed with a project when the margin between costs and benefits is small, others will only pursue actions where benefits are considerably more than the expected costs. The key to doing a successful cost-benefit analysis is making sure to include all the costs and benefits, and then properly quantify them. This is the fundamental assessment behind virtually every business decision, due to the simple fact that business owners and managers do not want to spend money unless the benefits that derive from the expenditure are expected to exceed the costs. As companies increasingly seek to cut costs and improve productivity, cost-benefit analysis has become a valuable tool for evaluating a wide range of business opportunities, such as major purchases, organizational changes, and expansions.

Some examples of the types of business decisions that may be facilitated by cost-benefit analysis include whether to add employees, introduce a new technology, purchase equipment, change vendors, implement new procedures, outsource certain functions, and remodel or relocate facilities. In evaluating such opportunities, managers can justify their decisions by applying cost-benefit analysis. This type of analysis can identify the hard dollar savings (actual, quantitative savings), soft dollar savings (from such things as management time or facility space), and cost avoidance (the elimination of a future cost, like overtime or equipment leasing) associated with the opportunity.

Although its name seems simple, there can be a degree of complexity and subjectivity to the actual implementation of cost-benefit analysis. Not all costs and benefits are obvious upon initial assessment. Take, for example, a situation in which a company is trying to decide if it should make or buy a certain subcomponent of a larger assembly it manufactures. A quick review of the accounting numbers may suggest that the cost to manufacture the component, at $5 per piece, can easily be beaten by an outside vendor who will sell it to the company for only $4. But there are several other factors that need to be considered and quantified (if possible):

1. When production of a subcomponent is contracted to an outside vendor, the company's own factory will be used less, and therefore its fixed overhead costs have fewer components over which to spread its fixed overhead costs. As a result, other parts it continues to manufacture may show an increase in costs, consuming some or even all of the apparent gain.
2. The labor force may be concerned about outsourcing of work to which they feel entitled. Resulting morale problems and labor unrest could quickly cost the company far more than it expected to save.
3. The consequences of a loss of control over the subcomponent must be weighed. Once the part is outsourced, the company no longer has direct control over the quality, timeliness, or reliability of the product delivered.
4. On the other hand, unforeseen benefits may be attained. For example, the newly freed factory space may be deployed in a more productive manner, enabling the company to make more of the main assembly or even another product altogether.

This list illustrates the ripple effect that occurs in response to changes made in a real business setting. The cost-benefit analyst needs to be cognizant of the subtle interactions of other events with the action under consideration in order fully to evaluate its impact. In fact, accuracy in quantifying the costs and benefits in this sort of analysis is essential in producing information useful for the decision-making process. The analyst also needs to make sure he or she has considered all the potential costs throughout the business cycle, including marketing, advertising, travel, software, hardware, additional support staff, and other costs that extend beyond the basic process of manufacturing a product or providing a service.

The time value of money is a central concept in doing a cost-benefit analysis. An amount of money received today has greater value than getting that same amount of money in the future. Compensating for this difference between the present value and the future value of money is essential if a cost-benefit analysis is accurately to quantify the costs and benefits of the action being studied.

Capital budgeting is essentially a cost-benefit analysis that extends the evaluation of costs and benefits into a longer time frame and therefore places greater emphasis on considerations of the time value of money. When the inputs and outputs related to a capital expenditure are quantified by year, they can then be discounted to present value to determine the net present value of the opportunity at the time of the decision.

A formal cost-benefit analysis is a multi-step process which includes a preliminary survey, a feasibility study, and a final report. At the conclusion of each step, the party responsible for performing the analysis can decide whether continuing on to the next step is warranted. The preliminary survey is an initial evaluation that involves gathering information on both the opportunity and the existing situation. The feasibility study involves completing the information gathering as needed and evaluating the data to gauge the short- and long-term impact of the opportunity. Finally, the formal cost-benefit analysis report should provide decision makers with all the pertinent information they need to take appropriate action on the opportunity. It should include an executive summary and introduction; information about the scope, purpose, and methodology of the study; recommendations, along with factual justification; and factors concerning implementation.

Many small businesses also use a less formal approach to cost-benefit analysis to address less complex decisions. Approaches can be as simple as writing down the pros and cons of a proposal in two columns on a sheet of paper, assigning expected costs or benefits to each factor, and totaling them at the bottom of the page. More advanced approaches are available through software packages, online templates, and other tools available online for little or no cost.

Cost-benefit analysis is a decision support method used to help answer questions that often start with "what if" or "should we." It is a mathematical method to measure the benefits of a course of action. It is a powerful tool that can be used to analyze thoroughly the likely net effect to a business of buying new equipment, expanding into a new service area, or outsourcing a task now handled internally. Feeling confident that the benefits derived from an action taken will outweigh the costs of implementing that action makes the decision to proceed much easier.

While cost-benefit analysis is a useful tool, it generally only addresses the financial aspects of a proposed undertaking. Other factors include how the planned action affects stakeholders such as owners, management, employees, vendors and customers; whether it fits within a company's overall strategy; the impact of changing technology; and various risk factors surrounding the concept. For more complex proposals, small-business owners should consider putting together a comprehensive case that addresses the financial aspects of a decision as well as other considerations that are more difficult to quantify.

COSTS

Costs are the necessary expenditures that must be made in order to run a business. Every factor of production has an associated cost. The cost of labor, for example, used in the production of goods and services is measured in terms of wages and benefits. The cost of a fixed asset used in production is measured in terms of depreciation. The cost of capital used to purchase fixed assets is measured in terms of the interest expense associated with raising the capital.

Businesses of all sizes are vitally interested in measuring their costs. Many types of costs are observable and easily quantifiable. In such cases there is a direct relationship between cost of input and quantity of output. Other types of costs must be estimated or allocated. That is, the relationship between costs of input and units of output may not be directly observable or quantifiable. In the delivery of professional services, for example, the quality of the output is usually more significant than the quantity, and output cannot simply be measured in terms of the number of patients treated or students taught. In such instances where qualitative factors play an important role in measuring output, there is no direct relationship between costs incurred and output achieved. For all these types of costs,

business owners and managers must continually track and monitor costs to keep them under control.

DIFFERENT WAYS TO CATEGORIZE COSTS

Costs can have different relationships to output. Costs also are used in different business applications, such as financial accounting, cost accounting, budgeting, capital budgeting, and valuation. Consequently, there are different ways of categorizing costs according to their relationship to output as well as according to the context in which they are used. Following this summary of the different types of costs are some examples of how costs are used in different business applications.

Fixed and Variable Costs. The two basic types of costs incurred by businesses are fixed and variable. Fixed costs do not vary with output, while variable costs do. Fixed costs are sometimes called overhead costs. They are incurred whether a firm manufactures 100 widgets or 1,000 widgets. In preparing a budget, fixed costs may include rent, utilities, depreciation, and supervisors' salaries. Manufacturing overhead may include such items as property taxes and insurance. These fixed costs remain constant in spite of changes in output.

Variable costs, on the other hand, fluctuate in direct proportion to changes in output. In a production facility, labor and material costs are usually variable costs that increase as the volume of production increases. It takes more labor and material to produce more output, so the cost of labor and material varies in direct proportion to the volume of output. More spending on marketing, advertising, and sales efforts bring more income as well as higher costs. Increased revenues often result in higher payroll and income taxes, employee insurance costs, and retirement plan contributions.

For many companies in the service sector, the traditional division of costs into fixed and variable may not work. Typically, variable costs have been defined primarily as labor and materials. However, in a service industry labor is often salaried by contract or by managerial policy and thus does not fluctuate with production. In this case, it is a fixed and not a variable cost for these companies. A service company is also likely to use temporary or contract workers to respond to fluctuating work flows, in which case labor becomes a variable cost. For example, adding more customer service representatives often increases costs for personal computers, network capacity, telephone lines, and office furniture. There is no hard and firm rule about what category (fixed or variable) is appropriate for particular costs. The cost of office paper in one company, for example, may be an overhead or fixed cost since the paper is used in the administrative offices for administrative tasks. For another company, that same office paper may well be a variable cost because the business produces printing as a service to other businesses. Each business must determine based on its own uses whether an expense is a fixed or variable cost to the business.

In addition to variable and fixed costs, some costs are considered mixed. That is, they contain elements of fixed and variable costs. In some cases the cost of supervision and inspection are considered mixed costs.

Direct and Indirect Costs. Direct costs are similar to variable costs. They can be directly attributed to the production of output. The system of valuing inventories, called direct costing, is also known as variable costing. Under this accounting system only those costs that vary directly with the volume of production are charged to products as they are manufactured. The value of inventory is the sum of direct material, direct labor, and all variable manufacturing costs.

Indirect costs, on the other hand, are similar to fixed costs. They are not directly related to the volume of output. Indirect costs in a manufacturing plant may include supervisors' salaries, indirect labor, factory supplies used, taxes, utilities, depreciation on building and equipment, factory rent, tools expense, and patent expense. These indirect costs are sometimes referred to as manufacturing overhead.

Under the accounting system known as full costing or absorption costing, all of the indirect costs in manufacturing overhead as well as direct costs are included in determining the cost of inventory. They are considered part of the cost of the products being manufactured.

Product and Period Costs. The concepts of product and period costs are similar to direct and indirect costs. Product costs are those that the firm's accounting system associates directly with output and that are used to value inventory. Period costs are charged as expenses to the current period. Under direct costing, period costs are not viewed as costs of the products being manufactured, so they are not associated with valuing inventories.

If the firm uses a full cost accounting system, however, all manufacturing costs, including fixed manufacturing overhead costs and variable costs, become product costs. They are considered part of the cost of manufacturing and are charged against inventory.

Other Types of Costs. There are some other basic types of costs, and these are presented below as they are used in different accounting systems.

Controllable and Uncontrollable Costs. In budgeting it is useful to identify controllable and uncontrollable costs. This simply means that managers with

budgetary responsibility should not be held accountable for costs they cannot control.

Out-of-pocket and Sunk Costs. Financial managers often use the concepts of out-of-pocket costs and sunk costs when evaluating the financial merits of specific proposals. Out-of-pocket costs are those that require the use of current resources, usually cash. Sunk costs have already been incurred. In evaluating whether or not to increase production, for example, financial managers may take into account the sunk costs associated with tools and machinery as well as the out-of-pocket costs associated with adding more material and labor.

Incremental and Opportunity Costs. Financial planning efforts utilize the concepts of incremental and opportunity costs. Incremental costs are those associated with switching from one level of activity or course of action to another. Incremental costs represent the difference between two alternatives. Opportunity costs represent the sacrifice that is made when the means of production are used for one task rather than another, or when capital is used for one investment rather than another. Nothing can be produced or invested without incurring an opportunity cost. By making one investment or production decision using limited resources, one necessarily forgoes the opportunity to use those resources for a different purpose. Consequently, opportunity costs are not usually factored into investment and production decisions involving resource allocation.

Imputed Costs. Also of use to financial planners are imputed costs. These are costs that are not actually incurred but are associated with internal transactions. When work in process is transferred from one department to another within an organization, a method of transfer pricing may be needed for budgetary reasons. Although there is no actual purchase or sale of goods and materials, the receiving department may be charged with imputed costs for the work it has received. When a company rents itself a building that it could have rented to an outside party, the rent may be considered an imputed cost.

BUSINESS APPLICATIONS USE DIFFERENT TYPES OF COSTS

Costs as a business concept are useful in measuring performance and determining profitability. What follows are brief discussions of some business applications in which costs play an important role.

Financial Accounting. One of the major objectives of financial accounting is to determine the periodic income of the business. In manufacturing firms a major component of the income statement is the cost of goods sold (COGS). COGS is that part of the cost of inventory that can be considered an expense of the period because the goods were sold. It appears as an expense on the firm's periodic income statement. COGS is calculated as beginning inventory plus net purchases minus ending inventory.

Depreciation is another cost that becomes a periodic expense on the income statement. Every asset is initially valued at its cost. Accountants charge the cost of the asset to depreciation expense over the useful life of the asset. This cost allocation approach attempts to match costs with revenues and is more reliable than attempting to periodically determine the fair market value of the asset.

In financial accounting, costs represent assets rather than expenses. Costs only become expenses when they are charged against current income. Costs may be allocated as expenses against income over time, as in the case of depreciation, or they may be charged as expenses when revenues are generated, as in the case of COGS.

Cost Accounting. Cost accounting, also sometimes known as management accounting, provides appropriate cost information for budgeting systems and management decision making. Using the principles of general accounting, cost accounting records and determines costs associated with various functions of the business. These data are used by management to improve operations and make them more efficient, economical, and profitable.

Two major systems can be used to record the costs of manufactured products. They are known as job costing and process costing. A job cost system, or job order cost system, collects costs for each physically identifiable job or batch of work as it moves through the manufacturing facility and disregards the accounting period in which the work is done. With a process cost system, on the other hand, costs are collected for all of the products worked on during a specific accounting period. Unit costs are then determined by dividing the total costs by the number of units worked on during the period. Process cost systems are most appropriate for continuous operations, when like products are produced, or when several departments cooperate and participate in one or more operations. Job costing, on the other hand, is used when labor is a chief element of cost, when diversified lines or unlike products are manufactured, or when products are built to customer specifications.

When costs are easily observable and quantifiable, cost standards are usually developed. Also known as engineered standards, they are developed for each physical input at each step of the production process. At that point an engineered cost per unit of production can be determined. By documenting variable costs and fairly allocating fixed costs to different departments, a cost accounting system can provide management with the accountability and cost controls it needs to improve operations.

Budgeting Systems. Budgeting systems rely on accurate cost accounting systems. Using cost data collected by the business's cost accounting system, budgets can be developed for each department at different levels of output. Different units within the business can be designated cost centers, profit centers, or departments. Budgets are then used as a management tool to measure performance, among other things. Performance is measured by the extent to which actual figures deviate from budgeted amounts.

In using budgets as measures of performance, it is important to distinguish between controllable and uncontrollable costs. Managers should not be held accountable for costs they cannot control. In the short run, fixed costs can rarely be controlled. Consequently, a typical budget statement will show sales revenue as forecast and the variable costs associated with that level of production. The difference between sales revenue and variable costs is the contribution margin. Fixed costs are then deducted from the contribution margin to obtain a figure for operating income. Managers and departments are then evaluated on the basis of costs and those elements of production they are expected to control.

Cost of Capital. Capital budgeting and other business decisions, such as lease-buy decisions, bond refunding, and working capital policies, require estimates of a company's cost of capital. Capital budgeting decisions revolve around deciding whether to purchase a particular capital asset. Such decisions are based on a cost-benefit analysis, an estimate of the net present value of future revenues that would be generated by a particular capital asset. An important factor in such decisions is the company's cost of capital.

Cost of capital is a percentage that represents the interest rate the company would pay for the funds being raised. Each capital component debt, equity, and retained earnings has its own cost. Each type of debt or equity also has a different cost. While a particular purchase or project may be funded by only one kind of capital, companies are likely to use a weighted average cost of capital when making financial decisions. Such practice takes into account the fact that the company is an ongoing concern that will need to raise capital at different rates in the future as well as at the present rate.

Other Applications. Costs are sometimes used in the valuation of assets that are being bought or sold. Buyers and sellers may agree that the value of an asset can be determined by estimating the costs associated with building or creating an asset that could perform similar functions and provide similar benefits as the existing asset. Using the cost approach to value an asset contrasts with the income approach, which attempts to identify the present value of the revenues the asset is expected to generate.

Finally, costs are used in making pricing decisions. Manufacturing firms refer to the ratio between prices and costs as their markup, which represents the difference between the selling price and the direct cost of the goods being sold. For retailers and wholesalers, the gross margin is the difference between their invoice cost and their selling price. While costs form the basis for pricing decisions, they are only a starting point, with market conditions and other factors usually determining the most profitable price.

Some or all of these cost considerations also come into play when an entrepreneur is considering starting a business. While formal approaches are not necessary in the early planning stages, it can be helpful to make a list of all the anticipated costs of starting a business and running it for at least 12 months. One should also consider whether all these costs are essential or whether some can be deferred, such as the choice between renting office space or working out of the home. Projecting start-up costs can help the new business owner make sure he or she has enough capital or access to capital to keep the business going during the early days.

COUPONS

Coupons are certificates that provide consumers with discounts on goods or services when they are redeemed with retailers or manufacturers. Offered mainly by retailers and manufacturers as sales promotion tools to accomplish specific sales and marketing goals, they are popular with small-business owners because they are relatively inexpensive to disseminate and because of their historical effectiveness. Consumers are attracted to coupons because they offer immediate value and savings. While a flood of coupon offers, commonly known as "coupon clutter," resulted in falling redemption rates for many years, tough economic times in 2009 brought renewed interest in coupons. There was a 27 percent increase in coupon use in 2009, according to a survey by promotional tracking firm Inmar.

Advantages and Disadvantages. Like other sales promotion tools, coupons have their advantages as well as their problems. On the plus side, they have the advantage of passing along savings directly to consumers, as opposed to trade allowances given to retailers by producers. Consumers perceive coupons as a temporary special offer rather than a price reduction, so the withdrawal of coupons usually does not have an adverse effect on sales. In addition, coupons often create added traffic for retailers, who have the option of doubling or even tripling the value of manufacturers' coupons at their own expense to create even more store traffic. Moreover, retailers often receive additional compensation from manufacturers for handling the coupons.

Critics of coupon-oriented sales promotions argue that coupon clutter has dramatically reduced their effectiveness. They question whether coupons actually generate incremental business from new users, pointing out that the increased quantity of distributed coupons has been paralleled by falling redemption rates. In addition, excessive coupon distribution also increases the likelihood of fraud and misredemption. Coupons that are issued for established brands, say critics, tend to be redeemed primarily by loyal users who would have purchased the product without a coupon.

Coupon Objectives. Coupons may be issued to serve a variety of different strategic marketing objectives. One use is to encourage consumers to try new products; coupons have historically been fairly efficient at getting consumers to try new products by reducing the risk of trying something new. Coupons are also issued to convert trial users into regular customers, such as when a product sample includes a cents-off coupon. In addition, coupons can be used to convince consumers to make purchases of new sizes, flavors, or forms of an established product.

Other objectives served by issuing coupons include building retail distribution and support, moving out-of-balance inventories, targeting different markets, cushioning price increases, and enhancing other promotional efforts with coupon add-ons. Coupons are frequently used by manufacturers because of competitive pressure. When used offensively against the competition, coupons are issued to get users of a competitive product to try a new brand. When used defensively, manufacturers provide coupons to current users to keep them from purchasing a competing brand. Companies also use coupons to steer consumers away from low-cost and generic products.

Coupon Distribution. There are several ways in which small businesses can distribute coupons, including direct mail, in-store promotion, print media, online, and via cell phones. Because of its targeted distribution, coupons sent by direct mail historically offer higher redemption rates than coupons distributed by print media.

Perhaps the most popular coupon distribution method for small businesses is the coupon mailer. This is a strategy wherein a group of retail businesses in a community sends out a mailing of individual coupons together; consumers within the community thus receive a variety of coupons for area businesses in one envelope. Sometimes the mailing will consist of an actual booklet of coupons for participating businesses, but most are sent out in loose-leaf fashion. Many communities have businesses that specialize in putting such coupon mailers together. These companies charge a fee for their production and distribution services.

During the twenty-first century, the Internet has grown as a distribution network for coupons and similar promotional pieces. According to Jeanette Best, writing in *Brandweek*, "The Internet is making this a possibility by transforming the way coupons are distributed and opening a new world for marketers to communicate with consumers in a highly interactive way. Smart marketers need to take note and be aware of the advantages and benefits of using online coupons." Individual companies are using the Internet for coupon distribution as well. A company may post coupons on its Web site or it may send coupons directly to customers who are already signed up to receive an e-newsletter. The coupons are usually redeemable through online purchases or by printing a copy of the coupon and bringing it along when shopping at a retail outlet.

"Digital coupons" distributed through e-mail, cell phones, social media sites, and RSS feeds have also grown in popularity. Businesses are increasingly turning to digital advertising over traditional media because of its ability to target customers and potential customers more precisely, as well as the reduced costs associated with eliminating printing expenses. Mobile coupons, which are typically

discount codes contained in a text message sent to a cell phone or similar device, have also become quite popular. Some coupons contain bar codes that can be scanned at the register. These digital coupons can be sent directly from a retailer or can be accessed through aggregation sites and applications that provide a stream of money-saving offers tailored to individual customers' preferences.

CREDIT

Credit is a transaction between two parties in which one, acting as creditor or lender, supplies the other, the debtor or borrower, with money, goods, services, or securities in return for the promise of future payment. As a financial transaction, credit is the purchase of the present use of money with the promise to pay in the future according to a prearranged schedule and at a specified cost defined by the interest rate. In modern economies, the use of credit is pervasive and the volume enormous. Electronic transfer technology moves vast amounts of capital instantaneously around the globe irrespective of geopolitical demarcations. For this reason, markets have globalized and grown in a manner not possible in the past. Online transactions process in seconds, and online vendors turn profits immediately rather than waiting on checks by using Internet shopping carts and PayPal.

In a production economy, credit bridges the time gap between the commencement of production and the final sale of goods in the marketplace. In order to pay labor and secure materials from vendors, the producer secures a constant source of credit to fund production expenses, that is, working capital. The promise or expectation of continued economic growth motivates the producer to expand production facilities, increase labor, and purchase additional materials. These create a need for long-term financing.

To accumulate adequate reserves from which to lend large sums of money, banks and insurance companies act as intermediaries between those with excess reserves and those in need of financing. These institutions collect excess money (short-term assets) through deposits and redirect it through loans into capital (long-term) assets.

REASONS FOR PURCHASING CREDIT

In a production economy, credit is widely available and extensively used. Because credit includes a promise to pay, the credit purchaser accepts a certain amount of financial and personal risk. Three strategies summarize the reasons for purchasing credit:

1. The lack of liquidity prevents profitable investments at advantageous times.
2. Favorable borrowing costs make it less expensive to borrow in the present than in the future. Borrowers may have expectations of rising rates, tight credit supplies, growing inflation, and decreasing economic activity. Conversely, profit expectations may be sufficiently favorable to justify present investments that require financing.
3. Tax incentives, which expense or deduct some interest costs, decrease the cost of borrowing and assist in capital formation.

USES FOR CREDIT

There are three major reasons why businesses borrow. The first and most common reason to borrow is to purchase assets. A loan to acquire assets may be for buying short-term, or current, assets such as inventory. This sort of loan will be repaid once the new inventory is sold to customers. The purchase of long-term or fixed assets also falls into this first category.

The second reason to borrow is to replace other types of credit. For example, if a business is already up and running, the owner may decide it is time to take out a bank loan to repay the money borrowed from a relative.

The third business reason for acquiring credit is to replace equity. The desire to buy out a partner who no longer wishes to be involved with a business may be a good reason to consider borrowing.

PROMISE TO PAY

The credit contract defines the terms of the agreement between lender and borrower. The terms of the contract delineate the borrower's obligation to repay the principal according to a schedule and at a specified cost or interest rate. The lender reserves the right to require collateral to secure a loan and to enforce payment through the courts. Many consumers and businesses were unable to keep their promise to pay in the midst of the 2008 crash of the economy, causing credit card companies and other lenders to suffer losses when borrowers could not meet their financial obligations due to job loss and a dramatic drop in consumer activity.

The lender may levy a small charge for originating or participating in a loan placement. This charge, measured in percentage points, covers administrative costs. This immediate cash infusion decreases the costs of the loan to the lender, thereby reducing the risk. The lender may also require the borrower to provide protection against nonpayment or default by securing insurance, by establishing a repayment fund, or by assigning collateral assets.

A promissory note is an unconditional written promise to pay money at a specified time or on demand. The maker of the note is primarily liable for settlement. No collateral is required. A lien agreement, however, holds property as security for payment of debt. A specific lien identifies a specific property, as in a mortgage. A general lien has no specific assignment.

CREDIT TERMS

The terms of the credit contract deal with the repayment schedule, interest rate, necessity of collateral, and debt retirement.

Repayment Schedules. Credit contracts vary in maturity. Short-term debt is from overnight to less than 1 year. Long-term debt is more than 1 year, up to 30 or 40 years. Payments may be required at the end of the contract or at set intervals, usually on a monthly basis. The payment is generally comprised of two parts: a portion of the outstanding principal and the interest costs. With the passage of time, the principal amount of the loan is amortized, or repaid little by little, until completely retired. As the principal balance diminishes, the interest on the remaining balance also declines. Interest on loans do not pay down the principal.

Revolving credit has no fixed date for retirement. The lender provides a maximum line of credit and expects monthly payment according to an amortization schedule. The borrower decides the degree to which to use the line of credit. The borrower may increase debt anytime the outstanding amount is below the maximum credit line. The borrower may retire the debt at will, or may continue a cycle of paying down and increasing the debt.

Interest Rates. Interest is the cost of purchasing the use of money, that is, borrowing. The interest rate charged by lending institutions must be sufficient to cover the lender's operating costs, administrative costs, and an acceptable rate of return. Interest rates may be fixed for the term of the loan, or adjusted to reflect changing market conditions. A credit contract may adjust rates daily, annually, or at intervals of 3, 5, and 10 years. In 2009 and early 2010, interest rates on credit cards went up significantly, even for those with good credit histories. Card issuers likely did this in response to the signing of the Credit Card Accountability, Responsibility, and Disclosure (CARD) Act of 2009 by President Barack Obama on May 22, 2009. The regulations within the bill went into effect on February 22, 2010.

Collateral. Assets pledged as security against a failure to repay a loan are known as collateral. Credit backed by collateral is secured. The asset purchased by the loan often serves as the only collateral. In other cases the borrower puts other assets, including cash, aside as collateral. Real estate or land serve as the collateral for securing mortgages.

Unsecured debt relies on the earning power of the borrower. A debenture is a written acknowledgment of a debt similar to a promissory note in that it is unsecured, relying only on the full faith and credit of the issuer. Corporations often issue debentures as bonds. With no collateral, these debentures are subordinate to mortgages.

A bond is a contract held in trust obligating a borrower to repay a sum of money. A debenture bond is unsecured, while a mortgage bond holds specific property in lien. A bond may contain safety measures to provide for repayment. An indenture is a legal document specifying the terms of a bond issue, including the principal, maturity date, interest rates, any qualifications and duties of the trustees, and the rights and obligations of the issuers and holders. Corporations and government entities issue bonds in a form attractive to both public and private investors.

Debt Retirement and Types of Credit. Debt retirement is the term used for the paying off of a debt. The credit contract defines the terms under which credit is issued and usually this contract also outlines how debt is to be retired or paid off. Different types of debt have different means of debt retirement.

Overnight funds are lent among banks to lift their reserves temporarily to mandated levels. A special commitment is a single purpose loan with a maturity of less than 1 year. Its purpose is to cover cash shortages resulting from a one-time increase in current assets, such as a special inventory purchase, an unexpected increase in accounts receivable, or a need for interim financing.

Trade credit is extended by a vendor who allows the purchaser up to 3 months to settle a bill. In the past it was common practice for vendors to discount trade bills by one or two percentage points as an incentive for quick payment. However, loan modification and debt settlement options that became especially popular in 2008 and 2009 allowed consumers and businesses to pay off their debt over several months or years without having to worry about lender harassment.

A seasonal line of credit of less than 1 year is used to finance inventory purchases or production. The successful sale of inventory repays the line of credit. A permanent working capital loan provides a business with financing from 1 to 5 years during times when cash flow from earnings does not coincide with the timing or volume of expenditures. Creditors expect future earnings to be sufficient to retire the loan.

Commercial papers are short-term, unsecured notes issued by corporations in a form that can be traded in the public money market. Commercial paper finances inventory and production needs. A letter of credit ("l/c") is a financing instrument that acts more like credit money than a loan. An l/c is used to facilitate a transaction, especially in trade, by guaranteeing payment at a future date. Unlike a loan, which invokes two primary parties, an l/c involves three parties: the bank, the customer, and the beneficiary. The bank issues, based on its own credibility, an l/c on behalf of its customer, promising to pay the beneficiary upon satisfactory completion of some predetermined conditions. A bank's acceptance is another short-term trade financing vehicle. A bank issues a time draft promising to pay on or after a future date on behalf of its customer. The bank rests its guarantee on the expectation that its customer will collect payment for goods previously sold.

Term loans finance the purchase of furniture, fixtures, vehicles, and plant and office equipment. Maturity generally runs more than 1 year and less than 5. A large equipment purchase may have longer terms, matched to its useful production life. Mortgage loans are used to purchase real estate and are secured by the asset itself. Mortgages generally run 10 to 40 years. When creditors provide a mortgage to finance the purchase of a property without retiring an existing mortgage, they wrap the new mortgage around the existing debt. The interest payment of the wraparound mortgage pays the debt service of the underlying mortgage.

Treasury bills are short-term debt instruments of the U.S. government issued weekly and on a discounted basis with the full face value due on maturity. T-bill maturities range from 91 to 359 days and are issued in denominations of $10,000. Treasury notes are intermediate-term debt instruments ranging in maturity from 1 to 10 years. Issued at par, full-face value, in denominations of $5,000 and $10,000, T-notes pay interest semiannually. Treasury bonds are long-term debt instruments. Issued at par values of $1,000 and up, T-bonds pay interest semiannually, and may have call dates (retirement) prior to maturity.

CREDIT WORTHINESS

The granting of credit depends on the confidence the lender has in the borrower's credit worthiness. Generally defined as a debtor's ability to pay, credit worthiness is one of many factors defining a lender's credit policies. Creditors and lenders utilize a number of financial tools to evaluate the credit worthiness of a potential borrower. Much of the evaluation relies on analyzing the borrower's balance sheet, cash flow statements, inventory turnover rates, debt structure, management performance, and market conditions. Creditors favor borrowers who generate net earnings in excess of debt obligations and contingencies that may arise. Following are some of the factors lenders consider when evaluating an individual or business that is seeking credit:

Credit worthiness. A history of trustworthiness, a moral character, and expectations of continued performance demonstrate a debtor's ability to pay. Creditors give more favorable terms to those with high credit ratings via lower point structures and interest costs. However, this does not mean that all lenders will cut out businesses or people who need credit and have less than favorable credit ratings. Through the use of higher interest rate loans like "no credit check loans" and asset loans that are based on an entity's hard assets, lenders are able to extend credit to those who have been hard hit in an economic crisis (such as the subprime mortgage crisis of 2008).

Reflecting a change in the idea of credit worthiness, in 2009 and 2010, more importance started to be placed on track records before a foreclosure, loan modification, or debt consolidation. Credit reports are still an important tool, but they are seen as part of credit worthiness rather than defining it completely. Among the hardest hit by the economic crisis of 2008, banks know that their business depends on securing enough loans to keep their doors open. This means they must measure credit worthiness in different and perhaps more progressive ways than they did prior to 2008.

Size of debt burden. Creditors seek borrowers whose earning power exceeds the demands of the payment schedule. The size of the debt is necessarily limited by the available resources. Creditors prefer to maintain a safe ratio of debt to capital.

Loan size. Creditors prefer large loans because the administrative costs decrease proportionately to the size of the loan. However, legal and practical limitations recognize the need to spread the risk either by making a larger number of loans, or by having other lenders participate. Participating lenders must have adequate resources

to entertain large loan applications. In addition, the borrower must have the capacity to ingest a large sum of money.

Frequency of borrowing. Customers who are frequent borrowers establish a reputation which directly impacts on their ability to secure debt at advantageous terms. A history of timely loan payments creates a positive credit picture whereas a history of slow payments will work against a borrower on later credit applications.

Length of commitment. Lenders accept additional risk as the time horizon increases. To cover some of the risk, lenders charge higher interest rates for longer term loans. High interest loans grew tremendously in popularity after 2008 because so many consumers were hit with foreclosures and layoffs. Poor credit left millions of Americans with no choice but to accept high interest loans and credit cards.

Social community considerations. Lenders may accept an unusual level of risk because of the social good resulting from the use of the loan. Examples might include banks participating in green homebuilding, outreach programs for those disadvantaged by natural disaster, eco-friendly ventures, firms that offer options in cost-effective online communication, and low-income housing projects.

INTEREST RATES AND RISK

Lenders use both subjective and objective guidelines to evaluate risk and to establish: a) a general rate structure reflective of market conditions; and b) borrower-specific terms based on individual credit analysis. To be profitable, lenders charge interest rates that cover perceived risks as well as the costs of doing business. The risks calculated into the interest rate include the following:

Opportunity cost risk. The lender fixes interest costs at a level sufficient to justify making a loan in the present rather than waiting for more advantageous terms in the future. The lender focuses on a desired rate of return rather than the credit worthiness of the borrower.

Credit risk or repayment risk. The borrower may not be able to make scheduled payments or repay the debt at all. The greater the credit risk, the higher the interest rate. Creditors charge lower interest rates to those with the highest credit ratings, and those who are the most able to pay. In other words, those least able to pay find themselves paying the highest rates.

Interest rate risk and prepayment risk. These risks arise when the payment or prepayment of outstanding debt does not match the terms and pricing of current debt, thus exposing the lender to a "mismatch" in the costs of doing business and the terms of lending.

Inflation risk. Inflation decreases the purchasing power of money. Lenders anticipate these losses with higher interest rates.

Currency risk. International trade and money markets may devalue the currency, decreasing its purchasing power abroad even during times of low inflationary expectations at home. Since currency devaluation heightens inflationary expectations in a global economy, interest rates rise.

FINANCIAL INTERMEDIATION

Financial intermediation is the process of channeling funds from financial sectors with excesses to those with deficiencies. The primary suppliers of funds are households, businesses, and governments. They are also the primary borrowers. Financial intermediaries, such as banks, finance companies, and insurance companies, collect excess funds from these sectors and redistribute them in the form of credit. Financial intermediaries accumulate reserves of funds through investment and savings instruments.

Banks provide savings and checking accounts, certificates of deposit, and other time accounts for customers willing to loan the bank their funds for the payment of interest. Insurance companies gather funds through various investments and through the collecting of premiums. Banks, finance, and insurance companies also raise cash by selling equity positions or borrowing money from private or public investors. Pension funds utilize available funds from participant contributions and from investment earnings. Federally sponsored credit intermediaries capitalize themselves in a manner similar to banks.

Financial intermediation provides an efficient and practical method of redistributing purchasing power to qualified borrowers. Banks aggregate many small deposits to finance a single family home mortgage, for example. Finance companies break large pools of cash down to sizes appropriate for the purchase of an automobile. The pooling of funds from many sources and the distribution of credit to a large number of creditors spreads the risks.

In essence, financial intermediaries are reducing risk by qualifying borrowers and directing funds into creditworthy situations. Furthermore, financial intermediation increases liquidity in the system, acting as a buffer against cash shortages resulting from unexpected increases in deposit withdrawals.

CREDIT SECURITIZATION

Credit securitization is one of the most recent and important developments in financing and capital formation; it has also been responsible for some of the most severe economic downturns in modern history. Securitization is, very basically, the process of pooling various categories of assets and creating securities that derive their value from the asset pool and income streams derived therefrom. However, securitization and the vehicles used to make it happen cannot be put in basic terms some of the vehicles used by banks like Lehman Brothers in the middle of the twenty-first century's first decade were so complex that not

even industry experts and veterans of the credit industry could comprehend them. No one would have considered at that time that the financial items created on Wall Street would lead to the U.S. government having to infuse nearly a trillion dollars into the very institutions that engaged in securitization. When institutions like Lehman Brothers, Bear Stearns, Morgan Stanley, and Goldman Sachs were no longer able to conceal the massive financial crisis they were in, the federal government stepped in to avert the disaster as much as was possible. Without the Emergency Economic Stabilization Act of 2008, more commonly known as the Wall Street Bailout, many believe the U.S. economy would have collapsed.

"Securitization is a complex series of financial transactions designed to maximize the cash flow and cash out options for loan originators," explains O. Max Gardner III in an article titled "Mortgage Securitization, Servicing, and Consumer Bankruptcy." "To securitize an asset, the loan originator creates a pool of financial assets.... It then uses one or more [special purpose vehicle] SPV corporations to convert the large pools of these mortgages into complex investment certificates, backed or securitized by valid liens on the transferred collateral. These certificates are then rated and offered for sale to asset capital investors, foreign investors and life insurance companies to name a few. The certificates are normally split into various types, each of which has pre-determined cash flow or equity positions in the underlying collateral."

In many instances the underlying debt is mortgages, secured by real estate, and guaranteed by an agency or insurance company. For example, an underwriter may place into securitization only mortgages guaranteed by the Veterans Administration of maturities no less than 20 years, with interest rates of not less than 9 percent, and with a cumulative principal (face) value of $10 million. The underwriter sells shares in this pool of mortgages to the public. In addition to mortgages, credit instruments securitized in this way include auto loans, credit card receivables, and trade receivables.

THE DANGERS OF SECURITIZATION

The practice of credit securitization is among the largest causes of the subprime mortgage crisis and the economic collapse of 2008. The assets pooled together in securities or other funds were backed by mortgages that were bound to fail. Subprime mortgages were granted to homebuyers who qualified when they should not have, and who therefore ended up in mortgages that would increase, sometimes exponentially, after the first 5 years (in most cases such as adjusted rate mortgages) of house payments. Investment and commercial banking of which securitization is a part became overleveraged due to a lack of regulations. In a February 2010 *Los Angeles Times* article, Tom Petruno wrote, "In the boom years, many of the convention's educational panels focused on how the business of bundling loans and other assets into securities had almost limitless global potential. That was when many big-money investors seemed to believe that the creation of the collateralized debt obligation rivaled the invention of the wheel."

Financial behemoth Lehman Brothers was perhaps the biggest player in the securitization collapse. While continuting to make money or so it seemed the Lehman Brothers balance sheet was deeply misleading because of poor practices in securitization. According to insider and former Lehman Brothers executive, Gary Kaminsky, the social atmosphere of the firm was largely to blame for so many investors and officers turning a blind eye. In an article for *CNBC*, Cadie Thompson noted Kaminsky' observation that making so much money had an addictive effect. Thompson also quotes Kaminsky's comment:, "Defining the duties of the board of directors, especially their role during a crisis, is key in preventing future financial catastrophes and is one aspect that needs to be considered as financial regulation moves forward." While some level of securitization can be a good way to move and grow money, when gone unchecked it can literally bring an economy as well as consumers and businesses to their knees.

CREDIT BUREAUS

A credit bureau is an agency that collects and sells information about the creditworthiness, or the ability to meet debt obligations, of individuals and companies. Consumer credit bureaus maintain and report on this information for individuals, while commercial credit bureaus collect and distribute this information for businesses. A synonym for a credit bureau is a credit reporting agency. Credit bureaus provide information to a number of clients, including merchants that extend credit to consumers and businesses that extend credit to other businesses. Credit bureaus may be private enterprises or may be operated as cooperatives by merchants in a particular geographic area. Users of the services typically pay either a fee based on their amount of usage or a flat membership charge.

Credit bureaus serve as a clearinghouse for credit history information. Credit grantors provide the bureaus with information about how credit customers pay their bills, and the bureaus assemble this information into a file on every consumer or business. Credit grantors can obtain credit reports about potential customers who wish to open accounts. There are over 1,000 local and regional consumer credit bureaus throughout the United States, and most are either owned or under contract with one of the nation's three major consumer credit reporting agencies: Trans Union, Equifax, and Experian.

The largest player in the commercial credit reporting business is Dun and Bradstreet Corporation. According to Elayne Robertson Demby in *Collections and Credit Risk,* Dun and Bradstreet maintains a database on roughly 60 million public and private businesses worldwide, including nearly 16 million American firms in 2009. But the rapid increase in e-commerce has changed the commercial credit reporting business in a number of ways. Customers have begun to demand information more quickly and in condensed, ready-to-use format, and a number of Internet-based credit bureaus have developed ways to meet these needs. Since 2008 many credit reporting Web sites have offered a way for consumers to check their own credit scores as frequently as they wish for a membership fee. Consumers should be cautious and read the fine print many of these online consumer credit reporting companies will charge other hidden fees and may continue to charge consumers even if they cancel memberships or opt out of the service in other ways. The 2009 Credit Card Act required those advertising free reports to ensure that consumers know the only place they can get a free credit report that abides by federal law is from AnnualCreditReport.com. Those looking for accurate and federally accepted credit reports should visit AnnualCreditReport.com or obtain information through one of the three major bureaus (Experian, Trans Union, and Equifax.) Some of the most popular online credit report providers, as of 2010, included FreeCreditReport.com, FreeScore.com, and for credit reports on businesses, SmartBusinessReports.com.

THE HISTORY OF CREDIT BUREAUS

Cooperative credit bureaus were known in some countries from the early 1860s, but the industry experienced rapid growth only after World War I. They were originally organized to facilitate the exchange of credit information among merchants. Until the arrival of credit bureaus, the very small amount of credit granted was based on the merchant's own knowledge of the customer.

The earliest credit bureaus just maintained lists of customers who were considered by the merchants to be poor risks. After World War I, however, the U.S. population became more mobile, and credit bureaus expanded to serve a wider audience of dispersed merchants. The bureaus filled a void by providing these merchants with information that could be used to make decisions about granting credit. The development of high-speed computing capacity has increased the data processing power of credit bureaus and made it possible to keep more updated information on individuals and businesses alike. Likewise, consumers or business owners can check their credit report online in seconds, and if they notice an error on their reports, they may file a dispute with bureaus online and receive communication via e-mail as to the progress of the dispute.

CONSUMER CREDIT BUREAUS TODAY

Consumer credit bureaus are important and growing because more than one billion credit cards are in use in the United States today. A similar number of consumer credit reports are issued annually in the United States. Two billion pieces of data are entered monthly into credit records. Each of the three major consumer credit reporting systems Equifax, Experian, and Trans Union maintains 190 million credit files, which are used by independent credit reporting agencies across the United States. Millions

of these files are known as "thin files," because they contain credit information about consumers who have little to no credit established. In 2009 and 2010, getting approved for a credit card became even more difficult, even for people and corporations with very good ratings. With millions maxing out credit cards and going over limits in the wake of the financial crisis that came to a head in 2008, millions of previously healthy "thick files" became toxic to the financial future of consumers and businesses alike.

The power of credit bureaus grew as they became the primary source through which a consumer's creditworthiness was judged. If an individual's credit information with a bureau was incorrect, he or she was at risk of being denied credit, insurance, or even employment based on the erroneous information. Worse yet, the individual may not have known why she was denied. The credit scoring systems used by credit bureaus was a closely held secret.

In the 1990s and the first decade of the twenty-first century, the country saw a rise in consumer fraud and in particular, identity theft. The victims of identity theft often find themselves struggling with credit bureaus to repair their credit scores in the wake of the crime. This effort is made more difficult by the secrecy of the credit scoring process. A flurry of state and federal legislation was passed, aimed at protecting the privacy of personal data while also granting consumers access to their own credit information. In late 2003 the Fair and Accurate Credit Transactions Act was passed. This law is designed to improve the quality of credit information and protect consumers from identity theft schemes. Some of the provisions of the law include:

- Giving Americans the right to their credit report free of charge every year. Consumers will be able to review a free report every year for unauthorized activity, including activity that might be the result of identity theft.
- Helping prevent identity theft by requiring merchants to leave all but the last five digits of a credit card number off store receipts.
- Creating a national system of fraud detection to make identity thieves more likely to be caught. Previously, victims would have to make phone calls to all of their credit card companies and three major credit rating agencies to alert them to the crime. Now consumers will only need to make one call to receive advice, set off a nationwide fraud alert, and protect their credit standing.
- Establishing a nationwide system of fraud alerts for consumers to place on their credit files. Credit reporting agencies that receive such alerts from customers will now be obliged to follow procedures to ensure that any future requests are by the true consumer, not an identity thief posing as the consumer.
- Requiring regulators to devise a list of red flag indicators of identity theft, drawn from the patterns and practices of identity thieves.
- Requiring lenders and credit agencies to take action before a victim even knows a crime has occurred. With oversight by bank regulators, the credit agencies will draw up a set of guidelines to identify patterns common to identity theft and develop methods to stop it.

Consumers should be especially careful to prevent identity theft Internet transactions are often not executed on secure servers or Internet connections, therefore, credit card numbers, addresses, birthdates, and other private data can easily be hacked into by online predators who will use this information to open accounts in the stolen name of a consumer or business. Those buying anything online should ensure the online merchant uses a secure connection. In addition, online shoppers should make sure they log off online accounts with vendors or Internet banking sites to avoid having their information "broadcast" to those who will use it illegally.

COMMERCIAL CREDIT BUREAUS

The Internet has created a number of changes in the commercial credit reporting business. Electronic commerce and online business-to-business (B2B) transactions have expanded the need for commercial credit checks to include small businesses and foreign firms. In the meantime, the instantaneous transfer of information over the Internet has caused client companies to expand their expectations about the manner in which they receive credit reports. "With more companies doing business with smaller firms and companies overseas, obtaining credit information on those businesses is more important today than ever," Demby noted. "Customers are demanding more information faster, and in a format that allows them to make rapid-fire decisions about whether or not to grant credit."

CREDIT BUREAUS UNDER FIRE

In their 2009 book, *The Rating Agencies and Their Credit Ratings: What They Are, How They Work, and Why They are Relevant*, Herwig and Patricia Langohr ask the reader to consider how reliable the bureaus are, why they should be trusted, and ultimately, what kind of credit they have in terms of reputation and trustworthiness and why.

The 2008 federal government bailout of the financial sector embittered many Americans. The palpable animosity was only intensified when consumers and businesses realized that the credit bureaus did not have any plans to make it easier for them to buy homes or cars, or get much needed loans to keep their ventures afloat. According to a January 2010 article by Tim Williams in the *American Chronicle*, "The biggest reason why our economy is still

floundering is because of the three credit bureaus' refusal to ease their criteria in established loan requirements. In fact, they have increased their requirements and have made it all but impossible for the majority of homeowners, entrepreneurs, and business to receive the capital needed for economic expansion." Williams called for either an end of credit bureaus or a change in how they score. While it is unlikely that credit bureaus will ever be eradicated, changes in how they determine scores is not at all inconceivable.

CREDIT CARD FINANCING

Increasing numbers of entrepreneurs have turned to credit cards to finance their business ventures. Often, these credit cards were originally secured for personal use, but credit card issuers target business owners for corporate cards as well. Credit cards are one resource available to small businesses with few other options to obtain start-up capital. An entrepreneur who already has a nonbusiness credit card may have no other choice but to use his or her personal line of credit during a banking crisis that freezes financial institutions, such as the economic crisis of 2008. Using personal credit cards is by no means a desirable method for financing a start-up in most economic environments. Most credit cards charge much higher interest rates than regular bank loans, making this form of financing a more costly option. In terms of using a credit card as a primary means of paying bills monthly, a credit card offers small businesses the administrative benefit of providing detailed records of all charges that may be easily transferred to an accounting process. All business credit card transactions made by employees and managers should be closely monitored. Receipts should also be kept and purchase orders created before purchases are made.

Studies indicate that use of credit cards for small-business purposes surged dramatically during the early twenty-first century. This was in spite of the fact that, before the February 2010 enactment of The Credit Card Accountability, Responsibility, and Disclosure Act, credit card rates went up, even for people and businesses with impeccable credit scores.

A February 2006 article published by *About, Inc.*, stated that two-thirds of small businesses used a credit card for expenses. Of these, 40 percent used business credit cards exclusively and the remaining 60 percent used a personal card for at least part of their credit card purchasing transactions. This represented a growing trend and one that has not been overlooked by credit card issuing companies.

In 2009, MSN journalist Liz Pulliam Weston asked Fair Isaac Corporation (FICO) to reveal information about how many points a credit score could drop based upon various credit actions, including making late payments and bankruptcy. Based on FICO's response Weston noted, "The higher your score, the more points you tend to lose from 'bad' actions. That's because the scoring formula is sensitive to any sign you're getting in over your head. Maxing out a credit card is considered one of those signs." For business owners with great credit, finding their business in a precarious financial situation could spiral into a personal credit crisis. Some may actually be better off filing a bankruptcy, because in the long run, the points shaved off a credit score may be less with one bankruptcy than with several maxed out cards, late payments, and one or more debt settlements, loan modifications, or foreclosures on a home or commercial space.

Credit-card issuers aggressively pursue small-business owners in the hopes of selling them on corporate credit cards. According to a *Wall Stree Journal* article that

discussed 2009 Visa profits, "For the quarter ended Dec. 31, Visa reported a profit of $763 million, or $1.02 a class A common share, compared with a profit of $574 million, or 74 cents per class A common share, a year earlier." This is testament to the fact that even in the midst of a recession which caused job loss and the closing of thousands of small businesses, credit card companies are still turning a profit. From the credit card companies' perspective, commercial accounts have several advantages over personal accounts. They include the standard use of annual fees with commercial credit card accounts, the opportunity to establish long-term relationships with commercial customers, and the proceeds they are able to make from extra fees for multiple cards on a single commercial account.

The reasons for the increase in credit card financing vary. Surely, the single biggest factor is the explosion in overall credit card use throughout the United States during the 1990s, when overall economic expansion surged. But there are other reasons for the growing use of credit cards by entrepreneurs. For one thing, many entrepreneurs contend that large banks habitually steer businesses that are looking for less than $10,000 to consumer loan departments. In addition, entrepreneurs commonly blame their use of credit cards on the reluctance of banks to provide loans. Moreover, using personal or corporate credit cards allows small-business owners to skirt the bureaucratic paperwork associated with obtaining loans from banks or the U.S. Small Business Administration (SBA). Also, stories of entrepreneurial success that started with the use of credit card financing were common in the late 1990s, providing further encouragement to business owners weighing whether to take the plunge. Finally, small-business owners who use credit cards to pay off business expenses can also use them to stretch their payment periods or earn significant points in frequent-flyer programs. With all of these incentives, however, many small-business owners and sole proprietors used credit cards only becuase they were forced to by their financial problems. Many of these business owners would never have considered using credit cards in the past for simple day-to-day operations. Yet, with so few banks offering loans in 2008 and 2009, and only a mild upswing in loans in early 2010, limited options left entrepreneurs with two choices: use personal or business credit cards and potentially max them out, or close shop indefinitely.

Using credit cards is a riskier-than-usual way to finance a company. Every month there is a huge bill instead of several smaller ones that can be juggled. Once a credit line is spent, one cannot pay bills and it is a very short trip from cash flow trouble to general weakness to bankruptcy. Entrepreneurs who have parlayed their credit cards into business success caution fellow business owners to pursue other financing options before turning to credit card financing. If credit card financing is the only or best alternative for getting the necessary money to start a business, there are ways in which to minimize the potential downside of this sort of expensive financing. The following credit card management techniques were discussed in an *About, Inc.* article of 2006 and an *MSN Money* article in 2009.

1. Apply with Those You Know: Small-business owners should always consider applying for a credit card at the financial institution they already use. Their banking relationship may aid with the approval process. When they need an extension of credit they will have a relationship established with their lender helping with credit applications over $100,000 not using automated scoring systems. Using a local bank is even better. In early 2010, President Obama urged consumers and small-business owners to support their local banking institutions to foster a win-win between local businesses across the financial sector and other industries. Many community banks offer Visa and Mastercard lines of credit for business entities such as limited liability companies and "Doing Business As" sole proprietors.
2. Limit Card Hopping: Signing up for multiple cards in an attempt to take advantage of deals can have a negative impact on a credit rating. It is also more difficult to manage many cards well. However, cutting up several credit cards and closing accounts will not improve a credit score. Most financial experts recommend keeping the oldest credit cards alive and well, and in the event of a financial crunch due to a drop in sales, always pay the older cards with longer histories first to maintain good ratings.
3. Use Grace Periods: The majority of small-business credit cards offers a 21-day grace period before payment must be made on purchases. Businesses can improve their cash flow using a credit card instead of checks. They need to be mindful of their business budget many business owners who used grace periods during the recession that began in 2007 found themselves still unable to pay credit card bills after grace periods were up. By 2009 hundreds of small businesses had closed or gone into bankruptcy because of financial dire straits caused by maxing out credit cards they could not repay.
4. Pay Online: When possible, small-business owners can save time and extra costs by paying a small-business credit card online rather than by teller at a branch or by mail. They can set up online billpay to make automatic payments from their bank, or make credit card payments while on business trips by using an iPhone, Palm, Android, or BlackBerry.
5. No Cash Advance: Reduce credit card fees and interest costs by not using the cash advance feature

on the card. Cash advances incur more fees and costs. When immediate funds are needed, it is best to use a business account debit.

6. Avoid Late Payments: Late fees and high interest rates quickly erode the merits of using a small-business credit card. It is advisable to pay off as much of a balance as possible each month. If possible, the entire balance should be paid each month this way there will be no interest on what was used over the past month.

USING CREDIT CARDS DURING ECONOMIC CRISIS: CAUTION IS KEY

In his 2009 book, *Supersize Your Small Business Profits!*, Frank T. Kasunic discussed the crucial importance of small-business owners keeping up with their balance sheets. Knowing what is owed, what assets are on hand, and what the business is netting is part-and-parcel of everyday small-business 101. But when business owners get comfortable, often they lose sight of bookkeeping. Kasunic also discussed what he called the "Great Recession of 2009." He urged business owners to lower overhead in any way possible. He also suggested that business owners take a good hard look at why they may need new capital. If the potential profit being projected is not realistic, taking out a loan or charging up cards will not only cause credit scores to hit the basement, it could also cause bankruptcy and kill the business venture.

CREDIT EVALUATION AND APPROVAL

Credit evaluation and approval is the process a business or an individual must go through to become eligible for a loan or to pay for goods and services over an extended period. It also refers to the process businesses or lenders undertake when evaluating a request for credit. Granting credit approval depends on the willingness of the creditor to lend money in the current economy and that same lender's assessment of the ability and willingness of the borrower to return the money or pay for the goods obtained plus interest in a timely fashion. Typically, small businesses must seek credit approval to obtain funds from lenders, investors, and vendors, and also grant credit approval to their customers. The typical overhead for a small-business owner will largely be determined upon which industry he or she is in, but some of the standard costs include credit card points of sale and the fees charged by credit companies, credit bureau fees, various forms of insurance, and rent or commercial real estate mortgages. All of these up-front costs require good credit for lenders to extend a line of credit approval will be contingent upon this in most cases. That said, due to the economic crisis which began in 2008, some lenders will consider bad credit loans, but this means business owners will pay a higher interest rate on their loans and will in most cases have to wait longer before they are given a credit increase or be considered for refinancing on loans.

EVALUATING CREDITWORTHINESS

In general, the granting of credit depends on the confidence the lender has in the borrower's creditworthiness. Creditworthiness which encompasses the borrower's ability and willingness to pay is one of many factors defining a lender's credit policies. Creditors and lenders utilize a number of financial tools to evaluate the creditworthiness of a

potential borrower. When both lender and borrower are businesses, much of the evaluation relies on analyzing the borrower's balance sheet, cash flow statements, inventory turnover rates, debt structure, management performance, and market conditions. Creditors favor borrowers who generate net earnings in excess of debt obligations and any contingencies that may arise. Following are some of the factors lenders consider when evaluating an individual or business that is seeking credit:

Creditworthiness. A history of trustworthiness, moral character, and expectations of continued performance demonstrate a debtor's ability to pay. Creditors give more favorable terms to those with high credit ratings via lower point structures and interest costs.

Size of debt burden. Creditors seek borrowers whose earning power exceeds the demands of the payment schedule. The size of the debt is necessarily limited by the available resources. Creditors prefer to maintain a safe ratio of debt to capital.

Loan size. Creditors prefer large loans because the administrative costs decrease proportionately to the size of the loan. However, legal and practical limitations recognize the need to spread the risk either by making a larger number of loans, or by having other lenders participate. Participating lenders must have adequate resources to entertain large loan applications. In addition, the borrower must have the capacity to ingest a large sum of money. The many mergers of large banks in 2008 and 2009 allowed lenders to have more capital on hand, but they also then faced the burden of so-called toxic assets. By 2010 banks began to lend with greater frequency, but in large measure this was caused by a well-known need to inject more money into the struggling economy.

Frequency of borrowing. Customers who are frequent borrowers establish a reputation which directly impacts on their ability to secure debt at advantageous terms.

Length of commitment. Lenders accept additional risk as the time horizon increases. To cover some of the risk, lenders charge higher interest rates for longer term loans.

Social and community considerations. Lenders may accept an unusual level of risk because of the social good resulting from the use of the loan. Examples might include banks participating in low-income housing projects, green homebuilding and other environmentally-conscious ventures, online businesses (creating convenience for consumers while lowering the use of fuel to get to a brick-and-mortar storefront), or business incubator programs.

OBTAINING CREDIT APPROVAL FROM LENDERS

Many small businesses must rely on loans or other forms of credit to finance day-to-day purchases or long-term investments in facilities and equipment. Credit is one of the foundations of the American economy, and small businesses often must obtain credit in order to compete. To establish credentials for any credit approval process, from short-term loans to equity funding, a small business needs to have a business plan and a good credit history and/or assets that can be used as collateral should they fail to pay off the loan. The company must be able to show that it can repay the loan at the established interest rate. It must also demonstrate that the outlook for its type of business supports planned future projects and the reasons for borrowing.

In applying for credit, small-business owners should realize that potential creditors whether banks, vendors, or investors will seek to evaluate both their ability and willingness to pay the amount owed. This means that the creditor will examine the character of the borrower as well as his or her ability to run a successful business. Creditors will also look at the size of the loan needed, the company's purpose in obtaining funds, and the means of repayment. Ideally, lenders evaluating a small business for credit approval like to see up-to-date books and business records, a large customer base, a history of prompt payment of obligations, and adequate insurance coverage. In addition, creditors are more likely to lend if the product or service of a company is innovative and progressive enough to capture the consumer eye, or if the company is able to offer a product or service more cheaply than their competitors, making them more popular among consumers.

The process of granting loans to businesses is regulated by the Federal Trade Commission (FTC) to ensure fairness and guarantee nondiscrimination and disclosure of all aspects of the process. The Small Business Administration (SBA) publishes a series of pamphlets and other information designed to assist businesses in obtaining loans. These publications advise businesses on a range of credit approval topics, including describing assets, preparing a business plan, and determining what questions to expect and how to prepare responses to those questions.

While it is true that small businesses need to be well organized before applying for credit, there needs to be some balance between small and large businesses generally the latter have much better chances at getting loans from banks, even if on paper they are in a worse financial condition. Small businesses have been considered for decades to be the backbone of the U.S. economy. For this reason, in his January 27, 2010, State of the Union Address, President Barack Obama introduced a policy that would create mandatory loan distribution amongst small and large businesses. In 2009 many of the financial institutions used money from the federal bailout (the Emergency Economic Stabilization Act of 2008) to purchase assets rather than make more loans to struggling businesses and start-ups. Obama's attempt at balancing loans and forcing lenders

to loan more was an effort to put more money back into the economy and to restore the strength of its backbone.

ASSET BASED LENDING: NEW OPTIONS FOR SMALL BUSINESS START UPS

From 2007 to 2009, the creditworthiness of many consumers and small-business owners decreased dramatically because of slowed consumer activity and a failing marketplace. Because of this, more and more lenders turned to offering lines of credit based on assets owned by a business rather than its credit score. Banks offering loans based entirely on the worth of a company's collateral spiked in 2009 and showed no signs of slowing in early 2010. According to the 2010 *Wall Street Journal* article "Asset-Based Lending Grows in Popularity," by Kyle Stock,"-Because asset-based lenders focus on collateral, rather than credit-worthiness, they do deals that more traditional lenders shy away from. Borrowers put up equipment, inventory, accounts-receivable and other liquid assets in exchange for the money." Stock goes adds that while these types of loans were generally only provided by a minority of lenders in the past, they will likely remain a staple method for extending credit to small and medium-sized businesses.

GRANTING CREDIT APPROVAL TO CUSTOMERS

Credit approval is also something that a small business is likely to provide for its customers, whether those customers are primarily individual consumers or other businesses. The process by which a small business grants credit to individuals is governed by a series of laws administered by the Federal Trade Commission that guarantee nondiscrimination and other benefits. These laws include the Equal Credit Opportunity Act, Fair Credit Reporting Act, Truth in Lending Act, Fair Debt Collection Practices Act, and Fair and Accurate Credit Transactions Act.

Experts recommend that small businesses develop credit policies that are consistent with overall company goals. In other words, a company's approach toward extending credit should be as conservative as its approach toward other business activities. While granting credit to customers can offer a small business a number of advantages, and in fact is a necessary arrangement for many types of business enterprises, it also involves risks. Some of the disadvantages of providing customers with credit include increasing the cost of operations and tying up capital that could be used elsewhere. There is also the risk of incurring losses due to nonpayment, and of eroding cash flow to an extent that requires borrowing. But granting credit does offer the advantage of creating a strong base of regular customers. In addition, credit applications provide important information about these customers that can be used in mailing lists, e-mail blasts, online newsletters, and promotional activity information via e-mail, text, or social networks such as Twitter or Facebook. In the retail trade, furthermore, credit purchasers have proven to be less concerned with prices and inclined to buy more goods at one time.

When developing credit policies, small businesses must consider the cost involved in granting credit and the impact allowing credit purchases will have on cash flow. Before beginning to grant credit to customers, companies need to be sure that they can maintain enough working capital to pay operating expenses while carrying accounts receivable. If a small business does decide to grant credit, it should not merely adopt the policies that are typical of its industry. Blindly using the same credit policies as competitors does not offer a small business any advantage and can even prove harmful if the company's situation is atypical. Instead, small businesses should develop a detailed credit policy that is compatible with their long-term goals.

The decision about whether to grant credit to a certain customer must be evaluated on a case-by-case basis. Each small business that grapples with this issue needs to gather and evaluate financial information, decide whether to grant credit and if so how much, and communicate the decision to the customer in a timely manner. At a minimum, the information gathered about a credit applicant should include the applicant' name and address, Social Security number (for individuals), bank and/or trade references, employment and income information (for individuals), and financial statements (for companies). The goal is to form an assessment of the character, reputation, financial situation, and collateral circumstances of the applicant.

Credit Programs for Business Customers. There are many avenues available to small businesses for gathering information about credit applicants. In the case of business customers, a small business's sales force can often collect trade references and financial statements from potential customers. The small business can also contact local attorneys to find out about liens, claims, or actions pending against the applicant, and can hire independent accountants to verify financial information. An analysis of a company's debts, assets, and investments can provide a solid picture of its creditworthiness, particularly when the data are compared to a composite of companies of similar size in similar industries. It is important to note that all information gathered in the credit approval process should be held strictly confidential.

Credit Programs for Individual Consumers. Consumer credit bureaus are a useful resource for small businesses in evaluating the credit worthiness of individual customers. These bureaus, Trans Union, Equifax, and Experian, maintain records of consumers' experiences with banks,

retailers, doctors, hospitals, finance companies, automobile dealers, and other commercial entities. The credit bureaus are able to provide this information in the form of a computerized credit report, often with a weighted score. These reports can be e-mailed or faxed to a business owner, and managers of accounts and credit applications can even check creditworthiness based on a credit report sent to their BlackBerry, Android, iPhone, Palm, or other handheld device. It is also important to note that credit granted to consumers is subject to the federal Truth in Lending Law, as well as a number of other federal statutes. Still, credit bureau reports do have some potential for error, so small businesses should not necessarily use them as the only source of consumer credit information; if it is warranted, a business owner or manager can run an online background check on an applicant for a nominal fee Internet background checks give information about individuals within mere moments.

Many small businesses, particularly in the retail trade, choose to participate in major credit card plans. Allowing customers to pay with credit cards offers businesses a number of advantages. Since most large retailers provide this service to customers, accepting credit cards helps small businesses compete for new customers and retain old ones. In addition, customers are often tempted to spend more when they do not have to pay cash. The convenience of credit card purchases may also attract new business from travelers who do not wish to carry large sums of cash. Finally, credit card programs enable small businesses to receive payment more quickly than they could with an individual credit account system. The main disadvantage to participating in credit card plans is cost, which may include card reading and verification machines, fees, and a percentage of sales, generally between 2 and 3 percent per transaction, although in some cases it may be as high as 5 percent. Credit cards also make it easier for customers to return merchandise or refuse to pay for items with which they are dissatisfied. Still, in this technological age, few small businesses (or large ones, for that matter) can afford to forsake membership in some sort of credit card plan.

Another common type of consumer credit is an installment plan, which is commonly offered by sellers of durable goods such as furniture or appliances. After credit approval, the customer makes a down payment and takes delivery of the merchandise, then makes monthly payments to pay off the balance. The down payment should always be large enough to make the purchaser feel like an owner rather than a renter, and the payments should be timed so that the item is paid off at a faster rate than it is likely to depreciate from use. The merchandise acts as collateral and can be repossessed in the case of nonpayment. Although installment plans can tie up a small business's capital for a relatively long period of time, it is possible to transfer such contracts to a sales finance company for cash. The onset of the 2008 economic collapse boosted the numbers of retailers that offered installment plans, especially those plans with "no credit, bad credit okay" caveats.

CREDIT HISTORY

A credit history is a record of an individual or company's past borrowing and repaying behavior. In the case of individuals, these records are collected and maintained by several large credit reporting agencies on behalf of companies that extend credit to consumers. These agencies gather and sell information about individual consumers, including whether a person pays his or her bills on time, has filed for bankruptcy or loan modification, has foreclosed on a home, or defaulted on home or car loans. Whenever a bank, retailer, car dealer, or other business needs to decide whether to extend credit to a certain individual, they can access that person's credit history through the reporting agencies. To obtain a line of credit,

a business or individual that wishes to start a business will need a good credit history. According to Ryan Barnes in a 2010 *Forbes* article, "Seven Tips For Tidying Up Your Credit Score," one of the best ways for a business or consumer to keep from going into the danger zone of a low credit score is to keep the oldest credit cards open and alive even if it means closing newer accounts to afford to keep up with payments on older cards.

The Fair Credit Reporting Act is the federal law that gives individuals the right to examine their credit histories. It is designed to promote accuracy, fairness, and privacy of information in the files of every consumer credit reporting agency. There are three major bureaus that report credit information for individuals: Trans Union, Equifax, and Experian. At an individual's request, these bureaus or agencies must provide the information in the individual credit file as well as a list of everyone who has recently requested the file. Individuals are entitled to one free report every twelve months upon request. Consumers who find inaccuracies on their credit history may file a consumer dispute verification with any or all of the three bureaus. Disputable items include a credit card that the consumer did not open that appears on his or her history, or a payment that appears late when the consumer has evidence that it was paid on time. Some items that appear on the credit history could be evidence of identity theft and should be reported to all three credit bureaus immediately.

It is important for both individuals and businesses to have a solid credit history and periodically to examine their credit reports to protect that credit history. For an individual, beginning to establish a credit history might entail opening a checking or savings account, applying for a credit card from a local department store, or taking out a small bank loan and making regular, on-time payments. A small business can obtain a favorable credit history in the same way. Credit issuers typically look at an individual or business's debt-to-income ratio to determine whether the borrower is a good or bad credit risk. In addition to a business's need to maintain good credit, according to *Tax Savvy for Small Business* by Frederick Daily, credit bureau fees were one of the most overlooked expenses for small businesses in 2008 and 2009.

USE OF THE CREDIT HISTORY BY EMPLOYERS

For an employer, reviewing a job applicant's credit report may be a helpful step in preemployment screening, retention, promotion, and even job reassignment. Every employer has the right to review the credit history of all job applicants, as long as they have obtained a signed release from the potential employee for this phase of the background check.

In the past, employers were only concerned with a potential employee's credit history if the employee would be handling money as part of the job. This is no longer strictly true. A person's credit report offers a company a way of verifying an applicant's name, address (both current and prior), birth date, and social security number. Credit reports provide a detailed history of payments, liabilities, and total debts and financial obligations as well. Howard Dvorkin explained to Chris Penttila in a 2003 *Entrepreneur* article, "Credit history says a lot about a person, including whether or not they would make a good employee.... People who have financial pressures are less productive than those who have none." But Dvorkin's point about credit history may not apply quite as much in the 2010s as it did in 2003. During harsh economic times, even the most financially responsible individuals may have to file for Chapter 13 bankruptcy for protection from predatory lenders who sold mortgages that consumers did not fully understand. Many consumers hit by the housing bubble and the mortgage crisis of 2008 and 2009 had to file for loan modification, go into foreclosure, or short sell their homes, and any of these options may have an extremely negative impact on credit history. Turning down everyone who experienced a bankruptcy or other financial protection in the post-mortgage crisis era could severely handicap employers looking for qualified candidates.

Human resource managers recommend that an employer look at credit troubles that arose from causes beyond a person's control differently from credit troubles that result from seemingly reckless spending. The former may be due to a layoff followed by medical bills, or to identity theft. Credit trouble caused by such events may not be held against potential hires if they can explain the circumstances and emphasize progress in paying the debts. The latter circumstances, however, may lead an employer to question a potential employee's overall judgment. The Fair Credit Reporting Act (FCRA), which regulates what bureaus can tell third parties, may not always hold bureaus to the standard of deleting very old or inaccurate information. For this reason, it is very important for consumers to check their credit report regularly getting turned down for a job simply because of inaccurate credit information or because of identity theft is avoidable.

Finally, if an applicant is rejected for employment based on his or her credit history, the prospective employer is required by law to notify the applicant of the denial and reasons, send the applicant a copy of his or her credit report and also send a summary of his or her rights under the Fair Credit Reporting Act. The applicant must also be given 60 days in which to dispute any inaccuracies in the credit report upon which the rejection of employment was made.

CREDIT HISTORY AND THE SMALL BUSINESS

According to a 2010 *BusinessCredit.com* article, "The landscape for almost all personal and business lending has changed dramatically. The meltdown of the mortgage markets and high default rates in business lending has made lenders return to underwriting basics." Small-business owners are encouraged to do anything they can to keep their credit score good, even if it means liquidating personal assets to keep up with creditors, or resorting to running the business from home if possible to lower overhead costs.

BAD CREDIT BUSINESS LOANS

While it may not be the ideal way to get a small business off the ground or out of trouble in order to stay open, many banks will entertain extending lines of credit to businesses with bad credit, or to those who wish to start a business with poor personal credit. In the first quarter of 2010, banks ready to start lending again used the bad credit loan as an option because so many businesses and consumers had poor credit. Not lending to these people and businesses would have cut out large potential profits for banks. Small-business owners who have had business or personal credit problems need to make sure that their personal credit is separate from their business credit. They can do this by applying and obtaining an Employer Identification Number (EIN) and by establishing a sole proprietorship, partnership, limited liability company (LLC), or corporation.

CRISIS MANAGEMENT

Crisis management is the task of creating and implementing a plan that can deal quickly with a crisis. Crises may be produced by a wide range of events, including natural disasters such as hurricanes, earthquakes, tornadoes, and floods. Terrorist attacks, power blackouts, workplace violence, cyber crimes, product tampering and recalls, bomb threats, and the unexpected death or illness of key leaders can also produce sudden crises. The speed with which a company, country, or other entity recovers after a crisis tomorrow depends upon the plans established today.

The first years of the twenty-first century provided many unsettling examples of crises that have affected large numbers of people, communities, and businesses. The Firestone tire recall of 2000, the terrorist attacks of September 11, 2001, the anthrax scare in the same year, the Northeast blackout of 2003, the devastating hurricanes that hit the Gulf Coast in the summer of 2005, the economic collapse of 2008, the earthquake in Haiti in 2010, and the Toyota "gas pedal" recall of 2010 all had wide impact. These events have focused the attention of leaders at all levels on the need to have a crisis management plan.

One commentator, writing for *PR News* in 2005, shortly after Hurricane Katrina slammed into the Gulf Coast, discussed the way in which this catastrophic incident caused public relations professionals to reassess their crisis management responsibilities. "For PR pros, dealing with the day-to-day challenge of trying to rehabilitate a company after a fit of corporate chicanery in the C-suite or of assuaging consumer concerns after launching what turns out to be a faulty product simply can't compare with dealing with the aftermath of what looks to be the worst natural disaster in U.S. history." Other turbulent events of the first decade of the twenty-first century have refocused national attention on the need for robust crisis management in organizations of all sizes.

CRISIS ABROAD: GLOBAL REACTION TO THE HAITI EARTHQUAKE OF 2010

Crises happens all over the world, and many times they can have a global impact that calls many nations to action. Perhaps the most poignant example of this was

the world's response to the earthquake that ravaged Haiti in January 2010. Within hours of the earthquake, people were sending cash to organizations such as Oxfam, Unicef, and the Red Cross to help Haitians recover.

Individuals were not alone in the speediness of their response. The European Union responded immediately, as did President Barack Obama and the United States. On January 13, 2010, Obama stated, "I have directed my administration to respond with swift and coordinated effort to save lives." He added, "The people of Haiti will get full support of the United States."

Crisis management by grass roots organization was at its best. Millions of people from every imaginable background came together and put their differences aside to serve Haiti any way they could. This crisis was managed with technology and social media playing a large part: by using Twitter, Flickr, YouTube, and Facebook, people gave and spread the message of need.

CREATING AND IMPLEMENTING A CRISIS MANAGEMENT PLAN

An effective crisis management plan incorporates emergency response, disaster recovery, contingency communications, business continuity, and a clear delineation of key personnel and their spheres of responsibility.

Assess the Threats. Risk assessment is a sophisticated area of expertise that can range from self-assessment to an extensive engineering study. The specific industry, size, and scope of a particular business will determine the organization's risk assessment needs. The first step is determining what kinds of emergencies might affect a particular company both internally and externally. Find out which natural disasters are most common in the region or regions of operations. Ideally, a list of threats is produced so that they may be categorized. Overall emergency plans will likely be useful in a number of different sorts of scenarios with only slight modification. When crisis management only addresses the short term, the result is a sense of immediate relief followed by a reality filled with reconstruction without a solid plan. In the case of the Emergency Economic Stabilization Act of 2008 (often known as the Wall Street Bailout) the federal government injected nearly a trillion dollars into failing private sector businesses without a long term or concrete plan. The result was that some corporations misused the money to pay high-level employees bonuses rather than putting the money back into the company coffers to rebuild what had been lost.

It is important to find out what community-level emergency procedures are in place for different sorts of incidents. Knowing the existing public safety protocols is key in coordinating rescue activities and evacuation plans. Local authorities are also a useful source of information about what actions to take and not take in the case of a biological, chemical, explosive, nuclear or radiological attack. Tenants in a commercial building or office/industrial complex may also wish to coordinate with the owners and/or managers of the facility so that company procedures work in tandem with the procedures in place for the larger entity. In the case of Haiti's 2010 earthquake, the country's already failing infrastructure meant that the authorities were unable even to begin the most short-term crisis management. As for the long-term implications, the rebuilding of homes, buildings, roads, and access to clean water would require crisis management planned by outside nations, including the United States, as well as billions of dollars from abroad to make the rebuilding of the nation possible.

Emergency Procedures. In any crisis that has the potential to take life, the physical well being and safety of all people is, of course, the first priority. One of the first questions in a crisis is whether to shelter in place or to evacuate. Guidelines should be established in advance to help make this decision quickly. For example, a fire is one situation in which there is no decision needed about whether to shelter in place or evacuate. Fires are the most common of all business disasters. A fire plan should be in place and practices with evacuation drills should be held periodically.

On the other hand, a tornado siren signals an emergency plan of another kind, in this case, again, no decision about whether to shelter in place or evacuate is necessary. Clearly, sheltering in place is the right decision when under threat of a tornado and provisions for a safe place in which to seek protection from such a storm should be in place and known to all employees.

A company's instructions for assisting disabled personnel, visitors, customers, and vendors in any emergency procedure should be a part of the crisis management plan. With the exception of disabled co-workers, for whom plans should be in place, these visitors will not know company procedures. Arrangements should be spelled out for assisting outsiders in the case of emergency.

Emergency Supplies. When preparing for emergency situations, it is usually best to think first about the basics of survival: fresh water, food, clean air, and warmth. For small businesses, it is a good idea to talk with everyone about what emergency supplies the company can feasibly provide, if any, and which ones individuals should consider keeping on hand. Encouraging everyone to have a basic emergency kit is wise. Such a kit need not contain more than bottled water and anything else the individual may need, like essential medications. A can of tuna fish and a candy bar would not be out of place in such a kit either.

At the company level, the following list of suggested items is provided by the U.S. Homeland Security Department on its Web site:

- Portable water kits vary in capacity, so individuals should determine what amount they are able to store comfortably and transport to other locations
- At least a 3-day supply of nonperishable food
- Battery-powered radio and extra batteries
- Flashlight and extra batteries
- First Aid kit
- Whistle to signal for help
- Dust or filter masks, readily available in hardware stores, which are rated based on how small a particle they filter
- Moist towelettes for sanitation
- Wrench or pliers to turn off utilities
- Can opener for food (if kit contains canned food)
- Plastic sheeting and duct tape to "seal the room"
- Garbage bags and plastic ties for personal sanitation

It is important to note that businesses that deploy BlackBerries or other handheld devices to employees should advise them that these devices are capable of calling 911 even when no bars are visible on the LED screen and the device is in "SOS" mode. Knowing this could save lives, especially in the event of a fire or other localized crisis that only affects one small area such as an office building.

Back-ups of Essential Information. A company's essential documents and information should be backed up as a part of normal business practice. Crisis management plans should include periodic inspection of these back-up procedures and verification that all essential information is being included in the normal back-up routine. Electronic data back-ups are a norm in today's business environment but any and all important paper documents too should be safeguarded in such a way that they could be recreated if necessary. The back-ups themselves need to be stored off-site.

Communications. The key in any crisis is communications. A contingency plan for working around the failure of communications infrastructure is important. Initially, it is important to have access phone numbers or e-mail addresses for all personnel. Preparing for several alternative methods for communicating with emergency personnel, co-workers, and the families of employees is recommended. In the post-crisis period it may be necessary to have similar information in a mobile format on insurance agents, vendors, suppliers, and bankers.

The Department of Homeland Security recommends providing all employees with a wallet-size card detailing instructions on how to get company information in an emergency situation. This is preemptive action that can prove very helpful. Such a card should include telephone numbers, Internet addresses and passwords, as well as a special out-of-town phone number that can be used to leave "I'm okay" messages, texts, or e-mails in case of a regionwide catastrophe. Ensure that established staff members know that they are responsible for communicating regularly with employees throughout the crisis.

In the case of severe dislocations, the continuity of a company may rest on its ability to effectively communicate with employees, suppliers, and customers during a relocation period.

Continuity Planning. Securing property and planning for business continuation is another responsibility of those in charge of crisis planning. In the case of machinery, equipment, and other physical property, a crisis management plan of action will depend on the type of threat anticipated. In the case of a hurricane, for example, some warning is available and therefore a crisis management plan should provide guidelines for what needs to be moved and to where, as well as what should be secured and how that is to be done. In situations where a threat can be anticipated, most insurance policies will require that an entity take some actions to try and mitigate the likely damage. Many property and business interruption insurance policies specifically state that the insured has an obligation to mitigate damage. Writing in *Business Insurance*, Judy Greenwald quotes an insurance company vice president who spoke about how he advises clients who call in a panic after a loss. He starts with the stark advice: forget you have insurance. "The best approach, in terms of ultimately submitting a successful business interruption policy claim, is to go ahead and make the best decisions possible to keep the business going."

In crisis situations for which no warning is available an earthquake, a chemical explosion nearby rapid implementation of a well-designed crisis management plan is the first step. Thereafter, most of the business continuity efforts are the same whether there was or was not warning about the original cause of the crisis. If a company is in a building that is one of the most sound structures in a given area, the crisis management plan may include details on how safely to house victims of a natural disaster who are left without shelter.

A crisis management plan that does not include planning for business continuity is incomplete. Once the initial crisis has been met, the plan should lay out a path to bringing the company back to full operations. Having thought through in advance what will be necessary if a company must relocate makes a difficult process easier.

The uncertainty surrounding post-crisis periods can be greatly diminished by having a detailed plan to follow.

In preparing the business continuity portion of a crisis management plan, it may be useful for small-business owners to use the following seven-point checklist to be sure that each broad area has been addressed.

1. Carefully assess how their company functions, both internally and externally, to determine which staff, materials, procedures, and equipment are absolutely necessary to keep the business operating.
2. Identify their suppliers, shippers, resources, and other businesses they must interact with on a daily basis. Develop relationships with more than one company to use in case their primary contractor cannot service their needs or supply essential materials. A disaster that shuts down a key supplier can be devastating to a business. Create a contact list for existing critical business contractors and others they plan to use in an emergency. This list should be kept with other important documents.
3. Plan what they will do if their building, plant, or store is not accessible. This type of planning is often referred to as a continuity of operations plan, or COOP, and includes all facets of the business.
4. Plan for payroll continuity.
5. Specify exactly who will be responsible for each area of the business.
6. Coordinate with others by meeting with businesses in their building or industrial complex. Talk with first responders, emergency managers, community organizations, and utility providers. Plan with suppliers, shippers, and others they regularly do business with. Share their plans and encourage other businesses to set in motion their own continuity planning and offer to help others.
7. Review and update their crisis management plan annually.

PUBLIC RELATIONS CRISIS

Threats to a company's public relations (PR) are a different sort of crisis. They may occur in conjunction with a broader crisis or may be the result of some non-life-threatening incident, like a boycott or accusations of the mismanagement of funds. An example of this would be the 2010 Toyota recall, which began with the recall of late model Camrys and other Toyota models due to accelerator pedal issues. Days later, this recall was followed up with a complete recall of all 2010 Prius models. In another testament to the power of social media and marketing online, Doug Frisbie, Toyota of USA's national marketing manager noted, "It's important to fully understand the issues" in reference to the fact that within hours of the second recall more than 500 questions had been posted online. Quoted in *AdWeek*, Frisbie added, "Our top priorities are, No. 1, to listen to consumers and No. 2, getting them the information they need." The plan was to use the Internet as a powerful tool to educate Toyota consumers on which cars were recalled and why, and to answer their questions.

In any case, planning for how best to manage the PR side of a crisis is an important part of the overall crisis management plan. Small businesses that are faced with public relations crises are far more likely to escape relatively unscathed if they can bring two weapons to bear: 1) a solid record as a good citizen: and 2) an already established crisis management strategy.

The most important factor in managing and resolving the public relations side of a crisis is communications. When a crisis does erupt, prompt and proactive communication should be a cornerstone of any business's crisis containment strategy. A single individual should be designated as the official spokesperson during a crisis if at all possible. By controlling the information that is released, a company can assure both a greater degree of accuracy and a consistent message. "Pick someone who is cool under pressure, credible, good on camera, and adept at presenting a positive image for your business," wrote Kim Gordon in an article for *Entrepreneur*.

In addition to the spokesperson's credibility, it is highly recommended that he or she attend media training in order to practice interview techniques. Small businesses should prepare positive messages about their operations that can be disseminated to media contacts in the event of a crisis. These messages may include any points the company wants the public to keep in mind during the negative publicity, such as an impressive safety or environmental record. When this step is not taken or a positive message is not disseminated, an already angry public can become downright hostile. Over the course of 2009 and 2010, Graco Strollers, Delta Cribs, Dorel Cribs, Stork Craft, and other makers of cribs and strollers experienced massive recalls of faulty products that had caused fatalities and injuries in infants and toddlers. Very little was heard from the makers of the products, and most of the information available about the recalls and what safety measures to take could be found on safety advocacy Web sites such as LegalView.info. In the case of Stork Craft, CEO Jim Moore's prepared statement did not even include an apology to parents a poor choice in terms of maintaining existing customers or growing a new customer base.

In order to ensure that a company's perspective is heard, it is vital that a company does all it can to make sure that its message is accurately presented to any media

providing coverage of the crisis. The media establish the perception of most companies and organizations and whether accurate or not, they must be dealt with. So, dealing with the media in an organized, aggressive, and timely fashion is essential if a company is to help mold the public perception of the issue.

Effective communication with media, then, is an essential element of any crisis management plan. But consultants offer other tips as well. Following are a list of other actions that small businesses should take when confronted with a crisis management situation:

1. Be open and honest with media and customers alike. Such a stance may well garner sympathy with customers and consumers, particularly if the crisis is one over which the company has little control, such as malicious product tampering.
2. React quickly. A company's actions in the early stages of a crisis will often determine how the media coverage portrays the company.
3. Utilize only one spokesperson. Consultants can cite countless instances in which companies faced with a business crisis compounded their problems by using multiple spokespeople who gave conflicting statements. A single, clear, and accurate story is best served up by a single spokesperson.
4. Be armed with the facts. Companies can hurt themselves terribly when they make public statements based on incomplete knowledge of events.
5. Stay on message. Engaging in speculation or in rambling discourses does not help a company's cause. Spokespeople should be candid without being unduly negative.
6. Do not lie or mislead the media, the public, or investigating agencies This may seem obvious but history shows that it is worth noting. The discovery of one single lie casts every statement that a company makes into doubt.
7. Establish and maintain contact with other important groups. Depending on the nature of the crisis, communication with employee, industry, and community groups can be a valuable part of a crisis response plan. Is the crisis likely to have an impact on the company's labor union or general work force? If so, a company should arrange a meeting with representatives so that they can be kept informed and ask questions, and so that the company can get its message across. Are a company's production processes arousing the ire of local civic or environmental groups (and the growing interest of local media)? Arranging a meeting in which they could register their concerns might relieve the situation somewhat (again, provided that the company shows a genuine interest in hearing them out and responding to legitimate concerns).

Advanced planning is important for all aspects of managing a business. But sometimes things will occur that cannot be reasonably anticipated. In these situations, the best public relations advice is to manage the situation ethically, with good grace, humility, and if appropriate, some degree of lightheartedness.

Establishing a flexible and fine-tuned crisis management plan is important for any organization. If nothing else, it will enable the leaders of such organizations to lead more easily during the most difficult of times. The anxiety and fear that arise during a crisis can best be combated by clarity, calm, and a plan of action. In an economic climate where multiple crises occur, such as the subprime mortgage crisis that combined with other factors contributed to massive housing foreclosures and job losses, everyone from small-business owners to large corporations and the government must step in to calm the public. Not taking steps to ease the general population can result in mass chaos, fear, and an anticipation of worse things to come. For these reasons, it is gravely important that well-constructed crisis management plans are in place. For businesses experiencing a crisis such as a recall, the most important aspects of crisis management are a public statement that includes explanation and an apology followed by accurate and timely updates via the media and company spokespersons.

CROSS-CULTURAL/ INTERNATIONAL COMMUNICATION

Business is not conducted in an identical fashion from culture to culture. Consequently, business relations are enhanced when managerial, sales, and technical personnel are trained to be aware of areas likely to create communication difficulties and conflict across cultures. Similarly, international communication is strengthened when businesspeople can anticipate areas of commonality. Finally, business in general is enhanced when people from different cultures find new approaches to old problems, creating solutions by combining cultural perspectives and learning to see issues from the viewpoint of others.

ETHNOCENTRISM

Problems in business communication conducted across cultures often arise when participants from one culture are unable to understand culturally determined differences in communication practices, traditions, and thought processing. At the most fundamental level, problems may occur when one or more of the people involved clings to an ethnocentric view of how to conduct business. Ethnocentrism is the belief that one's own cultural group is somehow innately superior to others.

It is easy to say that ethnocentrism only affects the bigoted or those ignorant of other cultures, and so is unlikely to be a major factor in one's own business communication. Yet difficulties due to a misunderstanding of elements in cross-cultural communication may affect even enlightened people. Ethnocentrism is deceptive precisely because members of any culture perceive their own behavior as logical, since that behavior works for them. People tend to accept the values of the culture around them as absolute values. Since each culture has its own set of values, often quite different from those values held in other cultures, the concept of proper and improper, foolish and wise, and even right and wrong become blurred. In international business, questions arise regarding what is proper by which culture's values, what is wise by which culture's view of the world, and what is right by whose standards.

China's emergence as the "factory for the world" has changed the social norms of business. What is proper in Western culture can be considered improper and even offensive by Chinese and other Asian standards. For example, something as simple as not using both hands to give and receive business cards at the beginning or end of a meeting can be perceived as disrespectful. In Chinese business culture, a business card is more than a place to list a name and position it is considered to be an important embodiment of the individual.

Since no one individual is likely to recognize the subtle forms of ethnocentrism that shape who he or she is, international business practitioners must be especially careful in conducting business communication across cultures. It is necessary to try to rise above culturally imbued ways of viewing the world. To do this, one needs to understand how the perception of a given message changes depending on the culturally determined viewpoint of those communicating.

FACTORS AFFECTING CROSS CULTURAL BUSINESS COMMUNICATION

The communication process in international business settings is filtered through a range of variables, each of which can color perceptions on the part of both parties. These include language, environment, technology, social organization, social history and mores, conceptions of authority, and nonverbal communication behavior. Finnish businessmen, for example, are known for being exceptionally quiet and stoic during meetings; this can be taken the wrong way by those who engage with Finns if they are not aware of this unique aspect of their business culture.

By assessing in advance the roles these variables play in business communication, one can improve one's ability to convey messages and conduct business with individuals in a wide range of cultures.

Language. Among the most often cited barriers to conflict-free cross-cultural business communication is the use of different languages. It is difficult to underestimate the importance that an understanding of linguistic differences plays in international business communication. Given this reality, business consultants counsel clients to take the necessary steps to enlist the services of a good translator. Language failures between cultures typically fall into three categories: 1) gross translation problems; 2) subtle distinctions from language to language; and 3) culturally-based variations among speakers of the same language.

Gross translation errors, though frequent, may be less likely to cause conflict between parties than other language difficulties. The nonsensical nature of many gross translation errors often raises warning flags that are hard to miss. The parties can then backtrack and revisit the communication area that prompted the error. Even if they are easily detected in most cases, however, gross translation errors waste time and wear on the patience of the parties involved. Additionally, for some, such errors imply a form of disrespect for the party into whose language the message is translated.

The subtle shadings that are often crucial to business negotiations are also weakened when the parties do not share a similar control of the same language. Indeed, misunderstandings may arise because of different dialects within the same language. When other parties with full control over the language assume that the nonnative speaker is also aware of such differences, conflict deriving from misunderstanding is likely.

Attitudes toward accents and dialects also create barriers in international business communication. The view that a particular accent suggests loyalty or familiarity to a nation or region is widespread in many languages. The use of Parisian French in Quebec, or Mexican Spanish in Spain, or subcontinental Indian English in the United States are all noticeable, and may suggest a lack of familiarity with the local culture, even if the user is fluent. More importantly, regional ties or tensions in such nations as Italy, France, or Germany among others can be suggested by the dialect a native speaker uses.

Finally, national prejudices and class distinctions are often reinforced through sociolinguistics the social patterning of language. For example, due to regional prejudice and racism certain accents in the United States associated with urban areas, rural regions, or minorities may reinforce negative stereotypes in areas like business ability, education level, or intelligence. Similarly, some cultures use sociolinguistics to differentiate one economic class from another. Thus, in England, distinct accents are associated with the aristocracy and the middle and lower classes. These distinctions are often unknown by foreigners.

Environment and Technology. The ways in which people use the resources available to them may vary considerably from culture to culture. Culturally ingrained biases regarding the natural and technological environment can create communication barriers.

Many environmental factors can have a heavy influence on the development and character of cultures. Indeed, climate, topography, population size and density, and the relative availability of natural resources all contribute to the history and current conditions of individual nations or regions. After all, notions of transportation and logistics, settlement, and territorial organization are affected by topography and climate. For example, a mountainous country with an abundance of natural waterways will almost certainly develop different dominant modes of transportation than a dry, landlocked region marked by relatively flat terrain. Whereas the first nation would undoubtedly develop water transportation methods, the latter would concentrate on roadways and railroads.

Population size and density and the availability of natural resources influence each nation's view of export or domestic markets as well. Nations with large domestic markets and plentiful natural resources, for example, are likely to view some industries quite differently than regions that have only one (or none) of those characteristics.

Some businesspeople fail to modify their cross-cultural communications to accommodate environmental differences because of inflexibility toward culturally learned views of technology. Indeed, cultures have widely divergent views of technology and its role in the world. In *control cultures* such as those in much of Europe and North America, technology is customarily viewed as an innately positive means for controlling the environment. In *subjugation cultures* such as those of central Africa and southwestern Asia, the existing environment is viewed as innately positive, and technology is viewed with some skepticism. In *harmonization cultures* such as those common in many Native American cultures and some East Asian nations, a balance is attempted between the use of technology and the existing environment. In these cultures, neither technology nor the environment are considered innately good, and members of such cultures see themselves as part of the environment in which they live, being neither subject to it nor master of it. Of course, it is dangerous to generalize about the guiding philosophies of societies as well. For example, while the United States may historically be viewed as a control culture that holds

that technology is a positive that improves society, there are certainly a sizable number of voices within that culture that do not subscribe to that point of view.

Social Organization and History. Social organization, as it affects the workplace, is often culturally determined. One must take care not to assume that the view held in one's own culture is universal on such issues as nepotism and kinship ties, educational values, class structure and social mobility, job status and economic stratification, religious ties, political affiliation, gender differences, racism and other prejudices, attitudes toward work, crisis management, and recreational or work institutions.

All of these areas have far-reaching implications for business practice. Choosing employees based on résumés, for example, is considered a primary means of selection in the United States, Canada, and much of northern Europe all nations with comparatively weak concepts of familial relationships and kinship ties. In these cultures, nepotism is seen as subjective and likely to protect less qualified workers through familial intervention. By contrast, it would seem anywhere from mildly to highly inappropriate to suggest to members of many Arabic, central African, Latin American, or southern European cultures to hire a stranger rather than a relative. For people in these cultures, nepotism both fulfills personal obligations and ensures a predictable level of trust and accountability. If a stranger appeared to be better qualified based on a superior résumé and a relatively brief interview, it would not necessarily affect that belief. Similarly, the nature of praise and employee motivation can be socially determined, for different cultures have settled upon a wide array of employee reward systems, each of which reflect the social histories and values of those cultures.

It is often difficult to rid business communication of a judgmental bias when social organization varies markedly. For example, those from the United States may find it difficult to remain neutral on cultural class structures that do not reflect American values of equality. For instance, the socially determined inferior role of women in much of the Islamic world, or of lower castes in India to name just two may puzzle or anger Western citizens. Nevertheless, if the Western businessperson cannot eliminate the attendant condemnation from his or her business communication, he or she cannot expect to function effectively in that society. An individual may personally believe that a country's social system is inefficient or incorrect. Nevertheless, in the way that individual conducts business on a daily basis, it is necessary to work within the restraints of that culture to succeed. One may choose not to do business with people from such a culture, but one cannot easily impose one's own values on them and expect to succeed in the business arena. It is important to remember that while some cultures may seem "behind the times," every country is on its own timeline; relaxing judgment of countries where the culture is dramatically different from one's own will help keep executives focused on the task at hand rather than on what matters less in the world of business. In addition, while some customs may be seen as odd or unusual, many nuances of many cultures have become embedded in the social structure they may seem unimportant or even strange to the nonnative, but they are as important to understand as how a company's stock is doing on the New York Stock Exchange.

A 2010 study published by Vantage Partners of 400 companies involved in offshoring (global) business revealed that the largest challenges in cross-cultural relations could be managed through understanding of the value that a foreign company brings to the overall good of the enterprise. Issues such as language and cultural barriers will always exist nonetheless, so proper communication before a negative confrontation occurs is key. Many times, companies that deal with providers or customers in varied regions do not address the changing needs or the difference in customs from one culture to another. The study revealed that handling one task at a time rather than trying to grapple with multiple facets of business dealings simultaneously will help businesses avoid overlooking both minor and major cultural and language barriers. The study found that 90 percent of customers and providers of products and services felt that culture was the largest hurdle to overcome when doing business abroad.

The social norms of a culture can seep into the business world. In 2010 Toyota's massive recall of Camrys and other late-model cars, as well as the recall of the 2010 Prius, may have well been avoided if the nature of Japanese business was more open. Evidence of problems with sticking accelerator pedals and other defects had been recognized by Toyota's president and other executives for more than a year, yet the company's leaders made no mention of it to U.S. safety organizations, including the National Highway Traffic Safety Administration. In the time that Toyota spokespersons remained silent, the death toll caused by the defects had already reached nineteen in the United States alone. Toyota president Akio Toyoda did not make his apology until many days after the defect was made public, but in Japan it is not necessarily customary to apologize or even go public with information that could harm the company's reputation. Therefore, actions that might upset Americans who expected a different response were in line with another society's behavioral norms.

Conceptions of Authority. Different cultures often view the distribution of authority in their society differently. Views of authority in a given society affect communication in the business environment significantly, since they shape the view of how a message will be received based on the relative status or rank of the message's sender to its receiver.

In other words, conceptions of authority influence the forms that managerial and other business communications take. In working with cultures such as Israel and Sweden, which have a relatively decentralized authority conception or small "power distance," one might anticipate greater acceptance of a participative communication management model than in cultures such as France and Belgium, which generally make less use of participative management models, relying instead on authority-based decision making.

Nonverbal Communication. Among the most markedly varying dimensions of intercultural communication is nonverbal behavior. Knowledge of a culture conveyed through what a person says represents only a portion of what that person has communicated. Indeed, body language, clothing choices, eye contact, touching behavior, and conceptions of personal space all communicate information, no matter what the culture. A prudent businessperson will take the time to learn what the prevailing attitudes are in such areas before conducting business in an unfamiliar culture (or with a representative of that culture). With the availability of information on the Internet and social media avenues such as LinkedIn that give executives the ability to network with people who understand cross-cultural business issues, businesspersons should not hesitate to inform themselves based on the real-life experiences of colleagues.

SMALL BUSINESS AND INTERNATIONAL COMMUNICATION

As business has turned more and more to an integrated world market to meet its needs, the difficulties of communicating at a global level have become increasingly widespread. Lack of understanding deriving from ethnocentrism or ignorance of culturally based assumptions erroneously believed to be universal can readily escalate to unproductive conflict among people of differing cultural orientation. This may occur on the domestic front as well. With the increasing numbers of immigrants to the United States, the resulting multicultural society leads to cultural diversity in the workplace. In combination with a growing emphasis on global markets and an interdependent and internationalized economy, the need for dealing with intercultural differences and cross-cultural communication barriers has grown.

Intercultural communication came to prominence in the mid-1970s when Americans serving in the Peace Corps came home better aware of cultural differences, wrote Tanya Mohn in the *New York Times*. While the military and foreign service had trained on intercultural communication for decades, the corporate world was relatively new to the concept. Even today, many small-business owners are unaware of available training resources and how they might help improve intercultural communication within their ranks. Such training might include cultural dining etiquette, business customs, and socializing.

Small-business owners and representatives face a sometimes dizzying array of communication considerations when they decide to move into the international arena or engage minorities as business owners, employees, or consumers in the United States. Most issues in cross-cultural communications can be satisfactorily addressed by: 1) respectfulness toward all people; 2) thinking before speaking; and 3) research on current business etiquette, cultural and customer sensitivities, current events, and relevant history.

Training is a key component of fostering improved intercultural communication in business. Many companies have found that online tools such as CultureWizard provide training at a fraction of the cost of in-person formal training. Such tools help Americans better understand their multiethnic co-workers and vice-versa. For instance, a British firm may lose a bid to an American company because its proposal is front-loaded with risks and failure costs. Americans view failure as a learning experience, while the British are culturally risk-averse, wrote Mohn.

Consultants and researchers agree that many differences between distinct functional cultures can be addressed through proactive policies that recognize that such differences exist and work to educate everyone about the legitimacy of each culture.

CROSS-FUNCTIONAL TEAMS

The most simple definition of cross-functional teams (or CFTs) is groups that are made up of people from different functional areas within a company marketing, engineering, sales, and human resources, for example. These teams take many forms, but they are most often set up as working groups that are designed to make decisions at a lower level than is customary in a given company. They can be either a company's primary form of organizational structure, or they can exist in addition to the company's main hierarchical structure. For the greater good of a corporation, CFTs may turn certain information from proprietary to open source the idea is to engender thought across groups that otherwise would not have a say in how a product or service is developed or delivered.

Cross-functional teams have become more popular for three primary reasons: they improve coordination and integration, span organizational boundaries, and reduce the production cycle time in new product development. Bringing people together from different disciplines and cultures can improve problem solving and lead to more thorough decision making. The teams foster a spirit of cooperation that can make it easier to achieve customer satisfaction and corporate goals at the same time.

Cross-functional teams are not new. Northwestern Mutual Life insurance company pioneered their use in the 1950s when the CEO of the company brought together people from the financial, investment, actuarial, and other departments to study the impact that computers would have on the business world. As a result of that first CFT, Northwestern was among the first companies in the country to create an information systems department that gave the company a large competitive advantage as computers became more widespread. Based on success stories like this one, CFTs slowly grew throughout the 1960s and 1970s before exploding in popularity in the 1980s when faster production time and increased organizational performance became critical in almost every industry.

Cross-functional teams are similar to conventional work teams, but they differ in several important ways. First, they are usually composed of members who have competing loyalties and obligations to their primary subunit within the company (for example, a marketing person serving on a cross-functional team has strong ties to his or her home department that may conflict with the role he or she is being asked to play on the CFT). Second, in companies where CFTs are being used on a part-time basis as opposed to a permanent organizational structure, they are often temporary groups organized for one important purpose, such as the rolling out of a new software package or handheld application which puts group members under considerable pressure. On these temporary teams, the early development of stable and effective group interaction is imperative. Finally, CFTs are often held to higher performance standards than conventional teams. Not only are they expected to perform a task or produce a product, they are also expected to reduce cycle time, create knowledge about the CFT process, and disseminate that knowledge throughout the organization.

For cross-functional teams to succeed, several factors have been identified that are imperative:

- Team members must be open-minded and highly motivated.
- Team members must come from the correct functional areas.
- A strong team leader with excellent communication skills and a position of authority is needed; he or she must be highly adaptable from one discipline to the next and must have an understanding of the culture of specific branches of a business or industry, including human resources, management, information technology (IT), marketing, Web development, and more.
- The team must have both the authority and the accountability to accomplish the mission it has been given.
- Management must provide adequate resources and support for the team, both moral and financial.
- Adequate communications must exist for some teams this may mean constant contact through handheld mediums that enable text and e-mail in addition to voice communication.

Without any one of these elements, any cross-functional team will be fighting an uphill battle to succeed.

CROSS FUNCTIONAL TEAMS AND NEW PRODUCT DEVELOPMENT

Many businesses have been able to use cross-functional teams to reduce the cycle time in new product development. As a result, CFTs have become a common tool in new product development at many companies, especially those in industries in which rapid change and innovation is the norm. CFTs have shown the flexibility to adapt to changing market needs and the ability to develop innovative products more quickly.

In the past, new product development invariably meant gathering data sequentially from a number of departments before a new product was given the green light. First, the idea would be conceptualized. Then, it would be handed off to the marketing department, which would conduct market research to see if the product was viable. The product might then be passed on to the sales department, which would be asked to create a sales estimate. From there, the idea would move on to engineering or manufacturing, which would determine the costs to produce the product. Finally, with all those numbers gathered over the course of months, or even years, the product would move to an executive committee, which would either approve or kill the project. By that time, market conditions sometimes had shifted sufficiently to render the product obsolete. In response to this problem, "rapid response" CFTs have been developed. In a chapter published by the Harvard Business School Press in February 2008, Behnam Tabrizi discussed these CFTs, which are teams assembled with a full understanding that moving fast is the chief objective. Rapid response cross-functional teams are generally assembled to expedite a transition within a company, or to expedite the transformation of a product to keep up with market changes.

Cross-functional teams eliminate the "throw it over the wall" mentality that passes a product off from department to department. Instead, a member of each of the above functional areas would have a representative on the new product team. Team members would learn of the new product at the same time and would begin working on estimates together. If part of the product could not be manufactured cheaply enough, the team member from that area could immediately sit down with the engineering rep and come up with a new production method. The two of them could then meet with the marketing and sales team members and discuss new ways to position the product on the market. The result, say proponents, is a vastly improved product that is manufactured and released to the market in far less time than was achieved using traditional methods. With the advent of virtual communication networks, members of a CFT do not even have to be in the same country, much less the same room. This makes it possible for teams to assemble even more rapidly and more conveniently. The end result is reaching the objectives set out for the team fast enough to maintain the competitive edge with companies in the same industry.

ESTABLISHING A CROSS FUNCTIONAL TEAM

There are several factors that need to be addressed in the formation of a CFT. These include setting goals, working with key stakeholders, and dealing with team conflict.

Set Goals. Clear goals for the team are essential for success. It is important to start with a general goal, such as improving quality, but more specific goals should be set almost immediately to give the group a common bond and to ensure that everyone is working together towards the goal. Goals are easier to establish if research has been conducted by someone in the organization before the team is convened. This allows the team to jump right into goal setting and problem solving without getting bogged down in background research.

When setting goals, it is important to clearly define the problem that needs to be solved, not the solution that needs to be achieved. If the desired solution is held up at the outcome, then the group's focus becomes too narrow the range of options is narrowed to fit that solution before the team even begins its work. Also, when setting goals, the team should determine if there are operating limits that it faces. For example, are there time or budget limitations that have to be considered? Are there some solutions that have been deemed undesirable by the company's officers? The team must recognize these limitations and work around them if it hopes to be successful in reaching its goal.

The final thing to do when goal setting is to be sure to identify key interdependencies on the team does one team member have to finish his or her part of the project before another team member can get started? It is essential to know these sequential steps before a team gets too deep into its project. Software as a service (SaaS) environments and applications can help to set goals and decide a sequence in which events should occur based on an objective. In the IT industry, software like Hewlett Packard's Agile Accelerator allows application development teams to keep their efforts streamlined and within budget parameters.

Work with Key Stakeholders. Stakeholders are those people who stand to benefit or lose from the work of the team. Every stakeholder should be represented on the team, and it is these stakeholders who can make or break the team. For example, if a key department head does not

believe that the team is needed, he or she can withhold his or her best employees from participating on the team, thus depriving it of resources. Or, that department head can choose to ignore the work of the team, conducting business as usual because the team threatens his or her traditional role in the company. It is up to the business ownership, management, and key CFT members to make all stakeholders understand the importance of the team and its purpose and priorities.

Customers, whether internal or external, are also stakeholders. Teams should spend the maximum allowable time interacting with customers to learn their needs and what outcomes they expect from the team. Some CFTs find it works best if one person is named to act as customer liaison because this makes it easier for customers to provide the team with feedback and it also allows the team to have one person go through training in client management skills. Other businesses have had success in letting customers either join the team or attend team meetings as an observer. Sending customer surveys through an e-mail database allows customers to have a voice and participate in the shaping of a new product or service. By taking just a few minutes of their day, consumers can answer a few simple questions in addition to making their own commentary. The results are sent back to the team leader via e-mail. A company blog or online press release allows consumers to respond to proposed changes in a product or service by way of Internet commentary which can be set up to send updates to team members whenever new comments are made.

When identifying all stakeholders, determine what level of representation each needs on the team. Some groups will need permanent members, others may only need to participate in certain areas of the project. Communicate with all stakeholders and anyone else in the company who is affected by the team's work. Do not spring surprises this will make people resistant to the work that the team is trying to achieve. Communication steps should be decided upon up front and planned as carefully as any other part of the project. Using a Twitter account which employees are following allows them to respond or "tweet" updates to other team members or stakeholders. Facebook groups allow group members to invite people into a forum where they can see updates on the progress of the team. For those companies who use Gmail, Google Buzz, released in February 2010, allows those connected through the Google network to communicate changes live on the Web rather than just via e-mail.

Deal with Team Conflict. CFTs often face regular conflict situations. This is especially true of cross-functional teams that are relatively new. When CFTs are first convened, there is a good chance that some of the members of the new team have bumped heads in the past when their functional areas clashed over a project. Additionally, some CFT members may think that their area of specialty is the most important on the team and thus assume an inflated sense of value to the team. Finally, since CFTs often bring together people who have vastly different ranks in the organizational hierarchy, there can be power plays by members who are high-ranking employees off the team but are actually less important stakeholders on the team. Those high-ranking team members may try to assert authority over the team in a situation when they should be deferring to lower-ranking team members. Business owners and managers should be aware, however, that important steps can be taken to manage and reduce conflict, including:

- Provide all team members with conflict resolution training. Conflicts can have value if managed properly, so improving team members' listening and consensus-building skills is necessary.
- Make sure that the company's human resources personnel are involved in the team-building process to help teach facilitation and group dynamics skills.
- Disregard the rank or perceived status of each group member and have standards in place that put value on what every team member brings to the CFT.
- Co-locate the team members. Putting team members together on an everyday basis strengthens communication and breaks down barriers. If this is not geographically possible, doing so virtually especially with the use of Webcams will allow members to feel more connected and literally have a better picture of who they are working with to meet group goals.

CROSS FUNCTIONAL TEAMS AND SMALL BUSINESS

Many people think that cross-functional teams are only successful in large companies. Conventional wisdom dictates that small companies are probably already operating cross-functionally out of necessity. The assumption is that the company is so small that people have to perform multiple tasks and work together with everyone else in the company. While that may be true in start-up operations, it is certainly not true of the majority of small businesses. Most small operations have to weigh the pros and cons just like their larger counterparts when deciding whether or not to use CFTs. Those that have chosen to adopt CFTs have been for the most part pleased with the results.

For example, *Getting Results* magazine documented the use of CFTs by Reprint Management Services of Lancaster, Pennsylvania, a small company with fewer than thirty employees. The owner of the business originally

arranged his company into functional units, but found that he had an odd assortment of employees left over who did not fit into any of the existing teams. As a result, he created a permanent cross-functional team to handle special projects at the company. The results were immediate and impressive. He claimed that as a result of adopting the cross-functional team concept:

- Employees in support roles were more concerned with profits and ways to increase sales. They realized that the more the company succeeded, the more they benefited directly.
- People communicated more openly and were more helpful to each other. There was a far greater sense of teamwork instead of each person looking out for number one.
- Employees' problem-solving skills improved dramatically, and it was easier to build consensus for a given solution.
- People were more likely to speak up and point out problems. Before the CFT, people were more likely to be passive and quiet, reasoning that the problem was not their responsibility.
- People recognized that there was strength in diversity that not everyone had to agree on an issue. They knew they were being understood, but that some people may still choose to disagree with them, and that such differences were acceptable.

Staff members have also benefited from the CFT arrangement. Employees familiar with CFTs understand the different processes that occur throughout the organization and understand the interrelationships between different functional areas. Instead of looking only at their one "silo" of operations, employees now see the big picture. Indeed, according to CFT supporters, participating employees often improve their interpersonal and problem-solving skills, which not only makes them better employees but also makes them more attractive in the job market should they choose to pursue other opportunities. Finally, proponents say that employees are less likely to become bored with their own job when they are given the opportunity to learn new skills on the CFT.

COMPENSATION AND CROSS FUNCTIONAL TEAMS

The overall goal of cross-functional teams is increased organizational profits through teamwork. As a result, companies have had to develop new compensation systems to reward members of cross-functional teams. One example of this is team incentive pay. Instead of individual merit increases, team members instead earn rewards based on overall team performance. The incentive pool is funded by increased profits and new business that are created as a result of using teams. The amount of compensation that can be earned in the team incentive model is actually far greater than that which can be obtained in the standard individual merit pay system.

Another system that has proven popular in organizations that utilize CFTs is called Pay for Applied Services (PAS). Under this system, employees who learn and apply new skills have their base pay increased. In addition, performance bonuses are available if their teams and the company perform better than expected.

PAS works this way: employees identify their "primary service," which is their basic job skill or title. This primary service determines the person's entry-level salary. A salary range is determined for all people who provide that primary service, ranging from entry-level to maximum based on experience and performance. Employees can increase their salary the traditional way, by gaining increases within their service range, or they can learn new services and qualify for bonuses or increases. In addition to individual increases, employees can earn team incentive bonuses that total up to 10 percent of base pay. Team incentives are paid out once per year.

DRAWBACKS TO CROSS FUNCTIONAL TEAMS

Cross-functional teams have become an integral part of the business landscape in many industries in recent years. But observers point out that their use can have unintended drawbacks if companies are not watchful.

For example, analysts note that CFTs can actually limit the professional growth of team members because they have a narrow focus in one area. As a result, some companies have had success by shaking things up periodically. After 2 years of serving on the same team, team members may become bored and feel that they are learning only about the clients or the business categories handled by their team. The solution? Team members should be rotated onto other teams periodically. This can help to prevent a sense of stagnation and help to keep the innovative aspects of the cross-functional team alive with new members.

Some companies try to hand off projects to CFTs that are simply too large in scope and are essentially doomed to failure from the start. Such large projects lack the focus needed for CFT success, and trying to make such a project work in that environment can sour an entire organization on using CFTs for other projects. Another sure pitfall is to establish a CFT without imposing either project deadlines or interim reporting deadlines. Without a sense of urgency to complete a project, the project will almost certainly stall and fail.

Converting employees to a new compensation system when CFTs are implemented can be difficult as well. When team incentives replace individual merit increases, team members often complain, even though more money can be earned in the team-based system. Employees often feel that they have little control over whether the company's profits actually increase; therefore they have no control over earning a raise. Additionally, many employees balk at giving up their own merit increase for the sake of the team. They may see the team plan as a way to demand more from teams than from individuals without giving anything back in return.

KNOWLEDGE TRANSFER AND WEBINARS: HOW CFT METHODOLOGIES EVOLVE

In March 2010, the American Productivity and Quality Center and the Clarion Group offered the free exchange of ideas on how to increase the productivity of teams through focus on priorities and responsibilities. Done virtually by way of Webinar (an interactive, Web-based seminar), companies were asked to participate and share what they felt were the pros and cons of team environments and what could be done to enhance their overall measurable results. Using the Webinar medium allowed people from all over the world to submit a few details about themselves and their company and industry, and then log in to contribute to the conversation. This method put CFTs to a test on a macro level literally making a team of teams and team leaders who can both complement and criticize the current methods used in cross-functional teams, as well as how they are designed, how participants are chosen, and how leaders of groups are picked.

Human performance is valued as much or more than the performance of machines or computers, even in a highly computerized and automated global market. The best of human efforts can be achieved through teamwork, especially when that team is comprised of multifaceted individuals from varying backgrounds. Trust is a major player in CFTs, and the success of any team depends on how well a group performs together. As with even the oldest business methods, CFTs are human driven and depend on mutual trust and respect in order to be effective.

CROSS-TRAINING

Cross-training involves teaching an employee who was hired to perform one job function the skills required to perform other job functions. In the world of sports, the benefits of cross- training are clear. By mixing different activities into a regular workout routine one can avoid overuse injuries, balance the development between muscle groups, and prevent boredom. The same may be said of cross-training in the workplace. Employees involved in cross-training programs become skilled at tasks outside the usual parameters of their jobs and thus become greater assets for the company while gaining knowledge and skills that benefit them personally. While automation and computerized methods for "getting things done" became all the rage at the beginning of the twenty-first century, nothing proved the importance of cross-training and versatility like the job losses sustained in 2008 through 2010 as a result of the economic crisis. The wider the range of an employee's skill set, the more likely he or she can avoid being laid off or out of work for long periods of time.

Many small businesses use cross-training practices regularly, although in a less formal manner than is usually written about in business journals. When an entrepreneur starts a business and makes those first hiring decisions, he or she will naturally look for candidates who appear to possess the flexibility to handle multiple and often unrelated jobs a welder, for example, who has taken college courses in engineering or a bookkeeper with interpersonal skills who is willing to help with human resource tasks. In a small business it is often the norm to wear more than one hat.

Cross-training programs are a way to organize more formally the process of getting employees prepared to do more than a single job. These programs offer a wide variety of benefits for businesses. For example, a well-designed program can help reduce costs, improve employee morale, reduce turnover, and increase productivity. It can also give a company greater scheduling flexibility, and may even lead to operational improvements. Perhaps the most important benefit that accrues to companies that implement cross-training programs, however, is greater job satisfaction among employees. Cross-training demonstrates that the company has faith in employees' abilities and wants to provide them with opportunities for career growth. In an age when companies are always trying to accomplish more work with fewer workers, anything that helps to motivate and retain employees can be worthwhile. Cross-trained employees usually feel that their jobs have been enriched, and they are often able to contribute more to a firm by coming up with creative solutions based on their knowledge of different company systems.

Another benefit of cross-training is increased workforce flexibility. The ability of cross-trained employees to fill in during absences, vacations, and peak demand periods can reduce the costs involved in hiring and training temporary workers or new employees. In addition, employees who have been cross-trained in the use of software as a service programs (SaaS) and virtual ways to attend work and meetings can work from home, reducing overhead cost for the company and the cost of commuting for the employee.

Cross-training programs may also improve the overall work atmosphere in a business, which may in turn improve the bottom line. Employees are a valuable asset in small businesses, which often must maintain only a bare bones staff in order to remain competitive. This makes it even more important to make maximum use of employees' skills and talents. Investing in on-the-job training shows all those involved that individual career growth is a valuable and necessary part of the company's overall growth. If employees believe they have the potential to improve within the company, they will be generally happier with their jobs and more willing to go the extra mile when needed. Employees will be more productive and feel more a part of the overall mission of the company. This usually leads to a high overall morale. An example of this is Wegman's Food Markets. Ranked third on *Fortune* magazine's "Top 100 Companies to Work For 2010," the company noted that it has never had a single layoff. Some attribute this to the company culture that highly values cross-training; employee flexibility is a major mission of the company, and it has kept employees, stakeholders, and executives in good standing even in the worst financial climates.

IMPLEMENTING A CROSS TRAINING PROGRAM

There are a number of decisions that a company must make before a cross-training program can get started. It is important, for example, to decide who will be eligible for training, whether the training will be mandatory or voluntary, whether it will be restricted within job classifications or open to other classifications, and whether it will be administered internally or externally. Prior to implementation, it might be helpful to set up a task force consisting of both management and employees to research the pros and cons of cross-training for the business, assess the feasibility of setting up a program, work out the implementation issues, and set up a realistic schedule for each position.

One of the first steps to setting up a cross-training program is having each different area or department draw up a list of functions and tasks that are necessary to its day-to-day operations. Then the various tasks can be prioritized to decide which should be included in the cross-training program. This helps match staff members to the tasks that need cross-training coverage. It is always important to have participating employees review the lists of functions and tasks. This way each can identify the functions and tasks they already know how to do, those they would like to learn, and those they would be willing to learn if necessary. Having their feedback allows the program manager to consider both competence and interest in the matching process.

Rather than simply training one employee to perform another one's job which would not really solve the problem if the first employee experienced a long absence it may be better to train several employees in various components of the first one's job so that they can all pitch in as needed. Training can take place through an on-the-job buddy system, or supervisors can be asked to conduct all the training. It is important to note that those selected as trainers may need to receive instruction in how to teach others. Finally, cross-trained employees must be given the time they need to absorb the new information. Their workload should be reduced both during the training and during later practice sessions so that they will not feel as if they are being penalized for participating in the program. It may

also be helpful to evaluate newly trained employees' progress on a regular basis.

SUCCESS FACTORS

One of the most important factors in the success of any cross-training initiative is gaining the full support of top management. To be truly dedicated to cross-training, the traditional idea of one job per person must be replaced with a broader definition. It is also vital to involve employees who are already performing the job in the training process. Making all those who will be impacted by a cross-training program feel included from the outset will help avoid fears that someone' job may be in jeopardy. It is extremely important to communicate to employees that cross-training is not a management scheme designed to eliminate jobs. These programs benefit both the company and the individuals involved and this fact must be emphasized when implementing such a program.

Creating a successful cross-training program is not necessarily easy, and small-business owners should expect to encounter some resistance from employees. One way to help ease acceptance of such a program is to address compensation issues ahead of time. Companies must be willing to compensate employees for increasing their skills. In some cases, instituting pay-for-skill or pay-for-knowledge programs may help encourage people to participate. It may also be helpful to promote people who learn new skills to a new grade in a graded-pay system, or to attach a dollar value to specific skills and then pay employees for the time they spend cross-training on a higher-paying skill. Employees must be made to feel that their efforts are being recognized for a cross-training program to be successful.

Another way to incentivize cross-training is to make it accessible and social. By making the training available from home, employees can use off time to train. By implementing an Internet portal where employees can interact, blog, and discuss with one another how their training is going, the process becomes communal and even entertaining. Using online social mediums where employees can comment on one another's progress is also a good way to get people excited about learning more.

"Microsoft Elevate America" began offering free online job training to the residents of Kentucky in January 2010. By using "Technology Training Vouchers," residents of Kentucky are able to get certified in a variety of fields to expand their potential and in many cases, give them a brand new skill to enhance existing education and experience. Kentucky was among the first of twenty states to be given a hand up from the Microsoft initiative after the huge numbers of layoffs produced by the economic crisis in 2008 and 2009.

POTENTIAL PROBLEMS

There are several potential pitfalls that companies need to avoid in order to implement a successful cross-training initiative. One of the major pitfalls is trying to establish a program without taking a systematic approach. Other potential pitfalls include failure to include employees in planning the program, trying to coerce the participation of reluctant employees, assuming that employees are familiar with the techniques needed to train others, penalizing employees who take part in cross-training by not reducing their workload accordingly, and not recognizing the value of new skills with appropriate changes in compensation.

In the "new global economy," which Thomas L. Friedman calls "flat" in his best-selling book *The World is Flat*, and again in his more poignant 2008 follow-up, *Hot, Flat, and Crowded*, people are encouraged to prepare for a future in which they will have many jobs and need to embrace "lifelong learning" rather than "lifelong employment." Cross-training certainly fits into this view of the future, especially with respect to a future that is greener and more sustainable.

CROWDSOURCING

Crowdsourcing is the business practice of using the collective intelligence of the public at large to help a company accomplish tasks. Essentially, a company puts out an open call for solutions to a given problem, question, or assignment that would traditionally be handled by in-house employees. Volunteers, amateurs, and experts from the public domain voluntarily answer the call; many do it for the personal challenge or satisfaction, but some seek and receive small monetary reward. In return the company benefits from the intelligence and expertise of a group that is often faster, wiser, more creative, and generally less expensive than any single individual or defined group tasked with the same job. Theoretically, this expanded "workforce" provides valuable insight about customer motivations and expectations that helps the company better design, develop, and target its products and services.

The term "crowdsourcing" was introduced in a Jeff Howe article that appeared in *Wired* magazine in June 2006. The article described crowdsourcing as a process of gathering large, dispersed, mostly autonomous groups of people together and using their spare time and knowledge to create something of value to a business. The concept is sometimes referred to as peer production, crowdcasting, open innovation, or mass collaboration, but the predominant terminology continues to be crowdsourcing. Contemporary lingo aside, the idea has been around for centuries. The Longitude Prize offered by the British government as part of a public contest to find a simple and effective method for determining a ship's longitude is an early example dating back to 1714. The *Oxford English Dictionary* is another well-known example of early crowdsourcing.

Today, computing technologies and open source software mean that companies can garner assistance from a virtually limitless pool of talent from around the world. Dell's IdeaStorm Web site serves as a simple, modern-day example. The site allows users to submit ideas for new products and improvements for existing offerings. As of September 2009, Dell had used 366 user-submitted suggestion and did not pay anything to the originators for the service.

TYPES OF CROWDSOURCING

Crowdsourcing is used in many ways by companies both large and small. In his book, *Crowdsourcing: Why the Power of the Crowd is Driving the Future of Business*, Jeff Howe explains that there are four types of crowdsourcing:

1. Collective Intelligence, which is based on the assumption that the masses are smarter than individuals. Some companies use this type of crowdsourcing to solicit comments about their business applications and vote on each others' suggestions. Companies must take the feedback seriously or risk losing credibility and customers.
2. Crowdcreation, which involves creative production of business materials such as logos, Web sites, brochures, and business cards. Threadless and 99 Designs are prime examples. They enable businesses in need of creative input to post an assignment and fee. Designers then submit their work for consideration and the winning design receives the fee. This approach generates a broad range of options from diverse sources while keeping costs to a minimum.
3. Voting, which is used to collect public opinion by asking for feedback on an existing product, service, or idea. TripAdvisor aggregates votes from travelers to help rate hotels and cruises. Businesses can use the information as free market research to help improve their offerings.
4. Crowdfunding, which refers to the public's willingness to finance projects they believe in. In PBS telethons, for example, the Public Broadcasting Service solicits public funding to support programming operations. Transparency and demonstrative results are necessary byproducts.

CROWDSOURCING IN PRACTICE

In her article in *Entrepreneur*, Emma Johnson quotes Stephen Benson, CEO of Innovation Exchange, a Toronto-based Web site that facilitates crowdsourcing for *Fortune* 500 companies. Benson says, "Crowdsourcing has created a level playing field, so small businesses no longer have to hire all the smart people, or have the most equipped labs or be leading edge in everything they do . . . Small organizations can now tap into talent they could not otherwise access and use that information to drive innovation." Eric Brantner, in his article, "5 Easy Ways to Use Crowdsourcing for Your Small Business," suggests the following ways in which small businesses can use crowdsourcing:

- Generate ideas for new and improved products. Social media offers an ideal means to get input about business offerings. Simply ask the company's followers on LinkedIn or Twitter to give their opinions, create an interactive Web site, or generate a blog discussion.

- Ask questions. No one is an expert on everything, so businesses can use crowdsourcing to find answers to questions. The Internet is full of experts who can provide insight and advice on subjects where expertise is needed, such as planning or marketing.
- Get inexpensive designs. Small businesses can get hundreds of design options from a wide range of providers without having to pay more than one set fee. This type of crowdsourcing is a valuable tool for small businesses on a tight budget.
- Determine the right price. When launching a new product or service, small businesses can use crowdsourcing to help set the right price. Just ask the public how much they would pay for the offering and use an average of the submitted price points as a starting point for more in-depth research.
- Spread the marketing message. Word of mouth is a potent marketing tool, even if it is actually conducted online. Blogs are invaluable here. Get the conversation started and put crowdsourcing to work for the business campaign.

In today's business environment, crowdsourcing offers small businesses a powerful means to help improve productivity and creativity, minimize costs and risks, and generate enthusiasm for the company and its offerings. Despite the benefits, business owners should keep in mind that crowds cannot be controlled or ignored. They require time, consideration, tolerance, acknowledgement, transparency, and sincerity.

CUSTOMER RELATIONSHIP MANAGEMENT

Customer Relationship Management (CRM) refers to the methodologies, software, networking, and other technical capabilities that companies use to manage their relationships with customers. At its heart, CRM is a passive sales tool. Companies use CRM to optimize information and streamline processes behind the scenes to improve the experience and results on the front end, which is the customer interaction. Customer Relationship Management tools help marketing departments identify the company's best customers, target marketing campaigns, and generate quality sales leads. They also provide other company employees with important information to help them understand and identify customer needs and effectively build relationships between the company, its customer base, and distribution partners.

Customer Relationship Management has its roots in the database marketing days of the 1980s, but it did not come into its own as a true relationship facilitation tool until the 1990s. At that time the CRM concept evolved from simply gathering data for company benefit to using the data to give back to customers in the form of gifts, incentives, and other means. Frequent flyer programs and bonus points from credit card purchases are two popular examples of how CRM is used to track spending patterns and reward consumers. The perks are designed to promote goodwill, generate loyalty, and increase sales.

In "The History of CRM Moving Beyond the Customer," Lucy Roberts reported that "Real Customer Relationship Management as it's thought of today really began in earnest in the early years of this century. As software companies began releasing newer, more advanced solutions that were customizable across industries, it became feasible to really use the information in a dynamic way. Instead of feeding information into a static database for future reference, CRM became a way to continuously update understanding of customer needs and behavior." The new CRM tools also helped improve understanding and cooperation between corporate departments and personnel so they could work together more easily to ensure customer satisfaction at every stage of the purchasing process,from order to delivery to post-purchase follow-up.

CRM FOR SMALL BUSINESS

According to a 2008 AMR Research analysis reported by Thomas Wailgum in *CIO*, the top three CRM software providers were SAP, Oracle, and Salesforce.com; Microsoft's CRM solution ranked eighth. Some of these players offer CRM solutions for businesses on a smaller-scale budget. These packages are designed specifically for small businesses and contain many of the key functionality offered in the larger CRM software suites but with a focus on the needs and limitations of smaller enterprises. They are available as traditional software as well as through Internet applications that arose at the beginning of the twenty-first century from the software-as-a-service concept to enable companies of all sizes to implement cost-effective CRM solutions. Regardless of the technology format, any CRM solution should include at a minimum data

tracking and integration, customer support and services, sales management tools, marketing automation, and analytics.

SOCIAL CRM

With traditional CRM, the driving need is to store, track, and report various customer data. A different need is driving the development of a new form of Customer Relationship Management known as Social CRM. Writing for IncTechnology.com, Brent Leary explained that Social CRM has emerged from "the need to attract the attention of those using the Internet to find answers to business challenges they are trying to overcome." It utilizes social media forums such as Twitter, YouTube, MySpace, and blogs to provide relevant and compelling content to draw the attention of Internet users who are searching for, or could benefit from, the products or services provided by the business.

Conversation is at the heart of a successful social CRM strategy. The key is presenting content in formats that make it easy for targeted users to find and utilize. The ultimate goal is to induce users to act, or more specifically *interact*, with the company. This interaction can take many forms, ranging from visits to the company's Web pages on social networking sites to posting comments on a blog. It is essential to recognize, however, that the conversation must be two-way. The business must embrace the online community and contribute to discussions in a meaningful and transparent manner in order to build a rapport and reputation within this influential customer segment.

An effective CRM strategy especially one that incorporates Social CRM can save the business valuable time, boost productivity, promote goodwill, build loyalty, and generate more sales.

CUSTOMER RETENTION

Customer retention refers to the percentage of customer relationships that, once established, a business is able to maintain on a long-term basis. Customer retention is a simple concept happy customers who feel important and are regularly communicated with in the right way will keep coming back. It is a major contributing factor in the net growth rate of businesses. For example, a company that increases its number of new customers by 20 percent in a year but retains only 85 percent of its existing customers will have a net growth rate of only 5 percent (20 percent increase less 15 percent decrease). But the company could triple that rate by retaining 95 percent of its clients.

Of course, growth is just one of the benefits that superior customer retention can offer a company. Increased profits are another. The cost of acquiring customers and putting them on the books generally exceeds by several times the annual cost of serving existing customers. So the longer customers are kept, the more years over which the initial cost of acquisition can be spread.

A variety of strategies are available to small-business owners seeking to improve their customer retention rates. The most basic tools for retaining customers are providing superior product and service quality. High-quality products and services minimize the problems experienced by customers and create goodwill toward the company, which in turn increases customers' resistance to competitors' overtures. However, it is important that small-business owners do not blindly seek to improve their customer retention rate. Instead, they must make sure that they are targeting and retaining the right customers the ones who generate high profits and clients who have been with the company for so long that losing them could cause financial strain or even tarnish a company's reputation. In short, customer retention should not be a stand-alone program but should be seen as part of an overall customer relations management.

The first step in establishing a customer retention program is to create a time line of a typical customer relationship, outlining all the key events and interactions that occur between the first contact with and the eventual loss of the customer. The next step is to analyze the company's trends in losing customers. Customer defections may be related to price increases or to a certain point in the relationship life cycle, among other variables. For example, many high-speed Internet providers and HD cable companies offer "too good to be true" deals for the first 12 months. When the customer's bill increases markedly in the thirteenth month, customer care representatives have to work extra hard to keep these customers on, often offering them another promotional deal, or a special on an Internet and cable bundle. In many cases, however, this is not enough, and consumers

with tight budgets are likely to hop from one provider to the next until they run out of promotions. Finally, small-business owners can use the information gathered to identify warning signs of customer loss and develop retention programs to counteract it.

STRATEGIES FOR RETAINING CUSTOMERS

One basic customer retention strategy available to small-business owners involves focusing on employee retention and satisfaction. A company with a high turnover rate may not be able to maintain strong personal relationships with its customers. Even if relationships are established, customers may decide to take their business to a new company when their contact person leaves. At the very least, high turnover creates a negative environment and reduces the quality of service provided to customers. In order to reduce turnover, it is important to provide employees with career development opportunities and high degrees of involvement in the business.

Another possible strategy for retaining customers involves institutionalizing customer relationships. Rather than just providing contact with individual employees, a small business can provide value to customers through the entire company. For example, it could send newsletters or provide training programs in order to become a source of information and education for customers. It may also be possible to establish membership cards or frequent-buyer programs as direct incentives for customer retention. Newsletters via e-mail are particularly effective. Small businesses can use Internet programs like Constant Contact to design, write, and send newsletters to an e-mail database. Inviting clients to give their Twitter handle will allow a small business to follow them on Twitter and allow the consumer to follow the company as well. Using this method, clients can always know about promotions and deals, and companies can see the trends changing within the demographics they serve.

Another way to retain customers is to be sensitive to their cultures. Many companies may not even acquire much less retain Spanish-speaking Latino customers, for example. This can be changed by doing something as simple as translating newsletters and offering Spanish-speaking phone agents to work in both customer service and customer retention departments. Hispanics make up the largest minority population in the United States, so catering to the needs of this demographic and retaining them as customers makes a great deal of sense.

While it is true that there are more Hispanics in the United States than ever before, there are many other cultures and races that deserve special care in customer retention. These groups will vary depending on location, so it is important to know what minority groups are in a company's backyard so they can be marketed to, acquired, and retained. By not offering a company message that can reach a broad spectrum of consumers, as well as a customer retention department that is equipped to handle a variety of customer types, a company can miss out on huge financial gains.

Some companies may be able to use electronic links to improve the service they provide to customers. For example, e-mail connections could be used to provide updates on the status of accounts, electronic order systems could be used to simplify reordering and reduce costs, and online services could be used to provide general information.

Other innovations in customer retention are Android, iPhone, and BlackBerry apps that allow customers to check in on accounts. In 2010 Mondial Assistance created an app to be used by automakers and other companies that wish to offer a number of customer retention services, including roadside assistance and the ability to renew product warranties by handheld device. The Direct Assist app by Mondial Assistance uses GPS to ensure that customers are getting help from the closest possible location to them.

AUTOMATED MARKETING AND CUSTOMER RETENTION

Some would argue that automated services like artificial phone operators could have been the death of customer retention. While it is true that most consumers detest being on hold or having to choose options from an automated system that may misunderstand every other word they say, there are other forms of automation that can be extremely helpful in customer retention.

Automated marketing is in fact a great way to retain customers and even have them refer family and friends to the business that uses this innovative method. More people watch soundbites of the news online rather than sit down to the nightly television news; consumers are busy and have short attention spans and little time to waste. Automated marketing is a direct response to this reality. By sending short SMS (text) or MMS (text with image or video) messages to handheld devices, a business can makeits entire existing client base aware of a sale or promotion, or remind individual customers that it is time to pay their bill or that they qualify for a special deal. All this is possible with a quick update, usually less than 100 to 150 words. Best of all, automated marketing systems once set up hardly need any human monitoring at all, making them perhaps one of the most user-friendly marketing and retention tools of the early twenty-first century.

Customer retention programs are particularly important in volatile industries those characterized by fluctuating prices and product values. In this situation, superior service may discourage but not prevent customer defections. Some strategies that may be useful to companies in volatile industries include providing stable prices over the customer life cycle, basing prices on the overall cost and

profitability of the customer relationship, and cross-selling additional products and services. All these strategies are intended to minimize the changes and problems customers experience, thus making them want to maintain the business relationship.

CUSTOMER SERVICE

The term "customer service" encompasses a variety of techniques used by businesses to ensure the satisfaction of a customer, from friendly and attentive staff to prompt response when confronted with product defects. Successful small-business owners often cite customer service as the factor most important in establishing and maintaining a prosperous company. A strong emphasis on customer service throughout a business will help to produce the sort of environment conducive to loyal customers. This is true for companies that sell to other businesses and to companies that sell to individual consumers.

The U.S. Small Business Administration Web site provides a variety of reports useful to small businesses. In one titled "Customer Service," the SBA summarizes the importance of customer service to the small business: "The growing significance of meeting or exceeding customer demands for quality service has special implications for small business. For it is in this arena that small companies can, in the least expensive way, set themselves apart from the competition."

DEVELOPING A CUSTOMER ORIENTED COMPANY CULTURE

In order to assure that there is a positive customer service attitude within every department or area of a company it is important to establish customer service goals for the company as a whole. Customers have contact with companies at many levels and at each they should meet courteous, friendly, and knowledgeable people willing to work with them. Customer service can be seen to be like a three-legged stool. The three legs of the stool are employees, sound practices, and training.

Employees. Many business observers contend that the most critical facet of ensuring good customer service lies in hiring personable and responsible employees. The use of preemployment screening tests can enhance the hiring procedure by helping employers measure the skills and characteristics needed for success in customer service jobs before hiring a new employee. There are a variety of valid tests available, and consistently hiring people who score highest on these tests will ensure that new hires will represent the business in a positive light. In addition, business owners are urged to make sure that they adequately inform potential employees of any customer relations obligations that they might have. This is typically accomplished through training programs.

Training. Employee training is an important component of customer service. Customer service principles should be put in writing, and it should be made clear that all employees are expected to be familiar with them and be prepared to live up to them. Small- business owners also need to recognize that customer service training should be extended to all employees who interact with clients, not just those in high-profile sales positions. Service

technicians, for example, often regularly interact with customers, but all too often they receive little or no customer service training. "More companies are asking their technicians to fill gaps in sales efforts and to repair communication breakdowns," noted Roberta Maynard in *Nation's Business.* "Some companies are cultivating their technicians' abilities to clarify customer needs and identify and capitalize on sales opportunities.... Some managers are giving technicians greater authority to do what it takes to keep customers happy, such as occasionally not charging for a service call or a part."

Sound Practices. Finally, businesses need to make sure that they work hard to ensure customer satisfaction on a daily basis. Customer service should be ingrained in the company, commented one entrepreneur in an interview with Michael Barrier in a *Nation's Business* article: "It has to be part of the organization's mission and vision, right from Day One. Then the rest tends to be simple it carries over to your products, your advertising, your staffing, and everything else."

INSTILLING CUSTOMER LOYALTY

Business experts cite several tangible steps that small-business owners can take to ensure that they provide top-notch service to their customers. These include:

- Build quality support systems. Companies armed with tangible, easily understood guidelines for establishing and maintaining quality customer service will go far toward satisfying clients.
- Communicate with customers. Communication with customers can often be accomplished more easily by smaller businesses than larger companies that are often slowed by layers of bureaucracy. Methods of communication can include telephone calls, postcards, newsletters, and surveys as well as face-to-face conversation. By keeping in touch with customers one is able to more quickly address problems that arise and anticipate some before they become serious. And while such steps are perhaps most helpful when dealing with regular customers, consultants counsel business owners who specialize in making big-ticket sales to try and maintain communications with their customers as well. Such customers may not make a purchase every month, noted Frederick F. Reichheld, author of *The Loyalty Effect*, but those purchases they do make carry a lot of weight. Reichheld notes that big-ticket purchases typically have a fair amount of service and financing associated with them, both of which provide small businesses with opportunities to nourish their relationship with the customer. In addition, consultants observe that communication with ex-customers can be helpful as well. "A defecting customer may offer a reason that points to a potentially serious problem [within your company]," wrote Barrier. In his 2008 book *The Small Business Bible*, Steven Strauss asserted that for every customer who complains, there are sixteen customers with a similar complaint who do not complain. It is essential to consider these complaints seriously and decide if there is a companywide problem that needs to be addressed.
- Communicate with front-line employees. Employees who are kept apprised of changes in company products and services are far more likely to be able to satisfy customers than those who are armed with outdated or incomplete information.
- Retain employees. Many customers establish a certain comfort level over time with individual employees a salesman, a project coordinator, for example and these relationships should be valued and nurtured by the small-business owner. "Each customer has special needs," observed Barrier, "and the longer that employee and customer work together, the more easily those needs can be met. Companies that want long-term relationships with their customers need equally healthy relationships with their employees. In particular, they must encourage employee involvement."
- Utilize technology that aids customer service. One example of this is choosing a voice mail system that make it easy for customers to contact the person or department that they wish to reach. Technology can also help small businesses gather information about their customers. Having an Internet presence is a vital part of owning a small business. A study done by the Yellow Pages Association and comScore found that local product and services searches grew 58 percent in 2008 to 15.7 billion searches, or over one-tenth of all Internet searches. Increasingly, potential customers will limit their search for these products and services to the Internet; without a strong online presence, a company will have a difficult time reaching these savvy customers. Maintaining and managing an online presence can be challenging, but it is tremendously important to modern business. Web sites such as Yelp, Yahoo! Local, and Citysearch offer customers a forum to praise and criticize local businesses. Monitoring these sites can help a business owner better understand what the company is doing right and what the company may be doing wrong.
- Cultivate an atmosphere of courtesy. Small gestures such as friendly smiles, use of the customer's first name, and minor favors can have a disproportionate impact on the way that a business is viewed.

"Remember that small kindnesses can carry a lot of weight," said Barrier.

- Address mistakes promptly and honorably. No business is infallible. Errors inevitably occur within any business framework, and sooner or later a customer is apt to be impacted. But business experts contend that in many instances, these incidents can actually help strengthen the bond between a company and its customers. "In the normal course of a business relationship, the depth of a vendor's commitment will not be put to the test," wrote Barrier, "but a serious mistake will reveal quickly just how trustworthy that vendor is."
- Avoid equating price with customer service. Many small businesses find it difficult to compete with larger, high-volume competitors in the realm of price, but most analysts insist that this reality should not be construed as a failure in the realm of customer service. Moreover, most experts indicate that many small businesses can triumph over price differences, provided that they are relatively minor, by putting an extra emphasis on service. "For some customers, of course, price is all that matters," admitted Barrier. "Those are customers you probably can live without."
- Create a user-friendly physical environment. Writing in *Entrepreneur* Jay Conrad Levinson counseled small-business owners to "design your company's physical layout for efficiency, clarity of signage, lighting, accessibility for the disabled and simplicity. Everything should be easy to find."

By crafting a customer service policy that combines the practices listed above, a company is likely to leave a positive impression with customers. Over time, the cumulative effect of this positive impression will build loyalty.

CUTTING TIES WITH BAD CUSTOMERS

Although smart entrepreneurs and business managers recognize that customer service is an important element in ensuring company success, it is a reality of life that a small percentage of customers are simply incapable of being satisfied with the service they receive. Small-business owners are generally averse to letting any customers go, but consultants contend that some clients can simply become more trouble than they are worth for any number of reasons. The solution to determining whether a business owner should sever ties with a problematic customer, observed *Nation's Business*, "may lie in defining the word 'customer' properly: Someone who costs you money isn't a customer but rather a liability."

In *Entrepreneur*, Jacquelyn Lynn listed several scenarios in which consultants recommend that small businesses consider ending their relationship with a troublesome client. Client attitudes and actions that should prompt an honest assessment include:

- Lack of respect or appreciation for the small-business owner's work.
- Excessive demands, either on company or individual staff members.
- Unreasonable expectations in terms of monetary arrangements for work or goods provided.
- Proclivity for imposing difficult or unrealistic deadlines.
- Tendency to pay bills late (or not at all).
- Treats company as a commodity that can be discarded as soon as it ceases to be useful to the client.

Lynn noted that, in some instances, honest communication with the client can salvage a deteriorating relationship, but this does not always work. "If your attempts to make the relationship a mutually productive one don't work," said Lynn, "it may be time to move on and focus on more profitable clients or prospective clients. Calculate what you will lose in gross revenue, and decide if your business can stand the financial hit." If the business is able to withstand the loss of revenue, move forward to terminate the relationship in a professional manner. If not, then the company's leadership needs to develop a strategy to expand existing business relationships or garner new clients so that the company can sever relations with the offending customer down the line.

DATA ENCRYPTION

Data encryption refers to the process of transforming electronic information into a scrambled form that can only be read by someone who knows how to translate the code. Encryption is not a new idea; it was used by Julius Caesar in the days of the Roman Empire to preserve secrecy in letters and messages. Encryption has played played a major role in many wars and in military circles generally; today, it is very important in the business world as well.

Encryption has turned electronic in modern times. It is the easiest and most practical method of protecting data stored, processed, or transmitted. It is commonly used to scramble the contents of contracts, sensitive documents, and personal messages sent over the Internet. More and more institutions, including small businesses with data to protect, also use encryption to protect data on their computer in-house.

HOW ENCRYPTION WORKS

Encryption comes from the science of cryptography, which involves the coding and decoding of messages in order to protect their contents. One of the most ancient forms of it is letter substitution thus, for instance, sending the next letter in the alphabet instead of the actual letter in the text. *Ifmmp xpsme* thus spells out *Hello world*.. In the electronic environment, every symbol has a numerical value expressible in binary notation. Thus the letter *A* is 01000001 and the letter *a* is 01100001. Humans cannot make out a vast stream of zeroes and ones, but it is child's play for a computer. Patterns of letters are therefore transformed before transmission by using an arbitrary key; the key may be used in arithmetic, logical, or other ways to make the underlying meaning inaccessible to anyone who does not know the key. The more binary digits the key has, the more difficult the code is to crack meaning that the longer it takes a computer system, attempting to break the code, to find the key by trial and error.

TYPES OF ENCRYPTION PROGRAMS

There are two main types of encryption programs, single key and public key.

Single Key. Single key encryption is also known as private key, secret key, or symmetric encryption. It means that the sender and the recipient of the data both hold the same key for translation. This single key is used both to code and to decode information exchanged between two parties. Since the same key is used to encrypt and decrypt messages, the parties involved must exchange the key secretly and keep it secure from outsiders. Private key encryption systems are usually faster than other types but they can be cumbersome when more than two parties need to exchange information.

Public Key. The second, and more commonly used, type of data encryption system is known as a public key system. This approach involves two separate keys: a public key for encoding information and a private key for decoding information. The public key can be held and used by any number of individuals and businesses, whereas only one party holds the private key. The system is particularly useful in electronic commerce: the merchant holds the private key and all customers have access to the public key. The public key can be posted on a Web page or stored in an easily accessible key repository. Public key encryption systems are widely available on the Internet and heavily used by large companies.

The best-known data encryption program is called RSA. It was developed in the late 1970s by three graduates of the Massachusetts Institute of Technology Ronald Rivest, Adi Shamir, and Leonard Adleman. In the first decade of the twenty-first century, there were more than a billion installations of RSA encryption programs on computer systems worldwide. RSA scrambles data based on the product of two prime numbers, each of which is 100 digits long. RSA is known as a public key encryption system because many people can use it to encode information, but only the person who holds the key (or knows the value of the two prime numbers) can decode it. RSA is embedded in hundreds of popular software products. It is also available on the Internet as a free download.

A number of other data encryption programs enjoy wide use as well. Examples include Pretty Good Privacy (PGP), which is considered easy to use; Secure Sockets Layer (SSL) now referred to as Transport Layer Security (TLS), which is used by many companies that process health care data or that accept online credit card orders; and Data Encryption Standard (DES), which was invented by IBM in the mid-1970s and was the U.S. government standard for security until 2002 when Advanced Encryption Standard (AES) officially became the new standard. Triple DES, an advanced version of DES, is still used in some areas of the U.S. government.

MOTIVATION FOR ENCRYPTION

Encryption systems cost money in the form of software and greater computer capacity. Processing of encrypted data in and out also adds time to all procedures. But the money is well spent. Betsy Spethmann, writing in 2005 for *Promo* magazine, reports that security breaches of systems holding customer data cost their owners on average $14 million per incident. In addition, once such breaches become known, the database owner typically loses at least 20 percent of its customers. The loss of troubled customers in large numbers is likely to increase. The National Conference of State Legislatures (NCSL) reported in December 2009 that forty-five U.S. states have passed laws requiring companies to notify employees or customers when their personal information has been compromised.

TRENDS IN ENCRYPTION PRACTICES

In the early twenty-first century, many corporations materially strengthened their defenses against the interception of transmitted data by encryption; they also fortified their information systems with ever better firewalls against intruders. Companies have also focused more on *internal* security. In many companies data are routinely encrypted before transmission to another site but remain in clear, unencrypted language on the computer itself, protected only by a system of passwords.

More and more companies in consequence are extending encryption to information backup. They are also exploring off-site storage of backup data on distant computers where they reside in encrypted form. Even such methods are not sufficient to protect data from individuals who, by the very nature of their jobs, have access to the sensitive data. Thus, at the boundaries of encryption other techniques of supervision and control must be devised to protect information.

Dave Raffo wrote in 2010 that, "Data backup security is a rapidly evolving if not rapidly adopted piece of the enterprise data storage world. It largely revolves around encryption, and has spread in the past few years from tape to host to disk, and is now an issue for the young cloud storage market." Cloud computing is the newest way for companies to manage, store, and secure data without the expense of additional hardware and software. Some experts question the security of cloud computing while others consider it the wave of the future. Carefully researching a potential cloud computing company before using it is one way to get the benefits of cloud computing with the least security risk.

As technology evolves, so will data encryption techniques. Staying up to date on the newest developments and being willing to adapt business's information storage systems as necessary is the only way to ensure that data will remain secure.

DATABASE ADMINISTRATION

Database administration is the maintenance of records of any type   for example, customer lists, vendor histories, or addresses. Database management involves transferring the contents of an electronic filing cabinet to an electronic file using computer software known as a database management system (DBMS). Accoring to *WiseGeek.com*, "As one of the oldest components associated with computers, the database management system, or DBMS, is a computer software program that is designed as the means of managing all databases that are currently installed on a system hard drive or network." The need for database administration now occupies nearly every corner of the business world. This need has led to the development of a multibillion dollar software industry and a thriving database administration consulting niche. Almost every company has records of one type or another to maintain, which means that almost every company is affected by DBMS in some way or another.

Databases can range in size from a few hundred addresses maintained on a user's hard drive to hundreds of terabytes of data maintained on massive servers. One of the benefits of using a database management system is that even if the data is vast and is stored on a remote mainframe, end-users throughout a company can all access the data from their desktop using computer networking technology. With the spread of wireless networking in the twenty-first century, employees can even access databases when not physically linked to the company's network. Reports that in the past had to be requested days or even weeks in advance and created by computer technicians can be generated in minutes by the average user.

The most common type of system is the relational database management system (RDBMS). An RDBMS sorts data into unique fields and allows users to retrieve that data by each field and by linking fields between related records. Relational databases can sort the fielded data any number of ways and generate reports in a matter of minutes. Data can often be output in any form the end-user desires. In addition, a RDBMS can serve as the front-end program that brings data together from several individual databases and produces data tables that combine the information from the various databases. Without an RDBMS, a database is a "flat-file" system   that is, one in which each database is self-contained in a single table. Only very small database systems use this method, and they sacrifice flexibility in the posing of queries and the sorting of data.

Database management technology is a rapidly advancing field, and relational databases are starting to be replaced by more sophisticated database management systems such as object-oriented database management systems (OODBMS) and object-relational database management systems (ORDBMS). The development of these new types of database systems was spurred in large part by the explosion of multimedia files during the first decade of the twenty-first century. During this period, companies realized that they had more than simple records to maintain   they had complicated files with sounds and images; they had brochures, photographs, time-series inputs, and 3-D coordinates   all of which could be more easily maintained if they were organized and stored in a database.

ORDBMS have become more popular because of the growing need to store disparate types of information. An example of the type of data that might be stored in an object-relation system is a human resources file on an employee. In the past, the database record might have only included text information about the employee, such as birth date, address, and starting date. With an object-relational system, the record could also include the employee's photo or voice sample. Or, a company could maintain geospatial information that would allow it to query the database to locate all customers who made more than $50,000 and lived within 10 miles of the company's location.

SELECTING A SYSTEM FOR A SMALL BUSINESS

Relational and object-oriented databases each have both strengths and weaknesses, and the weaknesses of one type is generally a strength of the other. For small-business owners who are considering purchasing a database management system, experts say that the first thing they need to do is determine what they hope to get out of the system   what type of reports they need, for example. Once the output is known, it is easier to know what type of database is needed,

what information will be gathered, and what fields will be created. It is a good idea to start small such as with a mailing list to get used to the software. Once the first database is mastered, it is easy to set up additional ones for order tracking, inventory, or other purposes.

Databases come in two general types: transactional and warehouse. Transactional databases are easier to build and are ideal for tracking simple things, such as the availability of a product or part. Warehouse databases collect company data of any type, such as sales histories or hiring statistics, and produce reports that can identify trends or group information in new and relevant ways. Small businesses use both types of databases.

Once small-business owners know what they hope to get out of a system and what type of database they will be building, they can move on to selecting the right software for the job. If they are computer savvy and experienced with personal computers, and the database is simple, they may be able to study the available software packages themselves and choose the one that best suits their company. If they are not, or they expect the job to be complex, it is best to locate a consultant in their area and work with him or her to select the system.

Database packages come in two general forms: desktop and server databases. Desktop databases such as Microsoft Access are inexpensive, user-friendly, and offer Web solutions. Server databases, such as Microsoft SQL Server, Oracle and IBM DB2, offer more comprehensive data management solutions. These database packages can manage large amounts of data efficiently and enable many users to access and update data simultaneously. They are, however, expensive and require a level of technical expertise not required by desktop databases.

The more basic the system a company can get away with, the better. It is simpler and less expensive to use an off-the-shelf desktop type system, but there are tradeoffs. If the company does not do business exactly the way that database is written, it might mean living with less power and flexibility.

MAINTAINING A DATABASE MANAGEMENT SYSTEM

There is one important fact about databases that some people seem to forget no matter how good the software is, no matter how expensive the computers are, they are only as good as the data that is put into them. Information must be loaded into the system via data entry work or some other form of input, and it is up to the business owner or manager of information systems to make sure that records are accurate and kept up to date.

Letting records slip from time to time may seem like a small thing, but especially for a small business enterprises, poor database maintenance can reflect poorly on the business and make clients think twice about doing business there. Database managers estimate that more than half of small businesses do not maintain their databases once they are created. Examples of the kinds of mistakes that can occur include failing to bill an account, mailing literature to someone who is deceased, or indicating that there is plenty of a particular product in stock when in fact the supply was exhausted weeks ago. Such situations can give rise to business disasters for owners of small businesses.

Writing in *Colorado Business Magazine*, Anne Kerven outlined some of the other common maintenance mistakes that are made:

- Collecting too much or too little data. Collecting too much information slows down the system, clutters screens with unnecessary fields, and inflates the costs of gathering data. Recording too little data can render the database worthless for compiling reports that can help the business grow; instead, money spent on inputting the little data that is there is wasted.
- Poorly conceived data fields. The most common mistake is putting too much information in one field the computer can only sort by field, not by what is in the field. The best rule of thumb is to put each unique record element ZIP code, phone number, fax number, address in its own searchable field.
- Using personal names as the key identifier of a record or as a link between records. Instead, it is better to use numbers, assigning a unique number to each record. Personal names cause problems when two or more people have the same name; additionally, if the name is not entered exactly the same way every time it is used as a link a middle initial is included in one instance and left out in another, for example the records will not link properly.
- Not checking the database. The integrity of the database should be checked at least once a month. Corrupted links or other problems can creep in over time. Utility programs are available for this function.
- Failure to back up information. All information should be backed up and stored in a separate location, preferably someplace that is fireproof and waterproof.
- Not setting strict standards. To ensure consistency, strict standards must be followed whenever data is input into the system. This is especially important if multiple departments will be adding data to the system.

- Failure to clean out the database. Periodically weeding out records that are inactive or no longer relevant is essential. If the company does not want to lose those records permanently, an archive database can be created and the records moved into that file.

COMMON USES OF DATABASE MANAGEMENT SYSTEMS

As discussed, database management systems store company information and allow users to retrieve that information easily. But what does that mean in the business world? How exactly are database management systems being put to use so that companies get the most bang for their buck? Currently, there are two primary uses of database managements systems: 1) data marts and data warehouses; and 2) the use of DBMS together with a company's Web site or intranet.

Data Marts and Data Warehouses. Data marts and data warehouses refer to the information repositories that companies create with their database management software. Data marts are simply smaller versions of data warehouses, storing information on a department-by-department basis. Data warehouses are huge, centralized databases that unify information across an entire company. These huge databases can be used to improve customer service, profitability measurement, and product sales. Wal-Mart, which has the world's largest data warehouse measured at over 500 terabytes, employs its massive data warehouse to improve operations, leveraging its massive volumes of data to give it a competitive advantage. Even at smaller scales, the use of data marts and data warehouses can yield useful guidance to managers and executives.

Data marts gained popularity before data warehouses. They were seen as a way for departments to achieve one of their main goals getting information into the hands of all their users quickly and at the same time. However, as DBMS technology improves and larger databases become possible, the flaws in using data marts are being exposed. Data marts do not unify data across an organization in fact, they can fragment it because every department might be doing things a little differently. Each department's data becomes an island that yields different answers to the same query.

That is not to say that data marts *cannot* work, however. They can, if they are built after a main data warehouse has been created. If the data marts are built first, then fragmented data held in uniquely structured databases that cannot be accessed by all employees are created.

Although there is some disagreement amongst experts some argue that it is better to start small with data marts and build up to the big data warehouse small-business owners are best advised to build the warehouse first. They should look at the types of information that are gathered in each department around the company and select the key data from each area, which can be used as the starting point for the warehouse. It is not advisable to try to build an all-purpose warehouse right from the start. A better strategy is just to do what makes sense, then add historical data and other information as time goes by. If information is simply gathered and stored with no allowance made for cross-departmental analysis, then the warehouse is useless. Those considering building a database should understand that if, upon examination, the current processes a company uses do not allow for such cross-departmental analysis, then fundamental changes will have to be made to those processes if the warehouse is to work. This is a significant point that too many managers or business owners do not understand when they decide to build a warehouse.

Small businesses also have to make sure that end-users from every department are actively involved in the design of the data warehouse. Without that type of feedback, the database may turn out to be useless because it does not store the right type of information, or it stores it in the wrong way. Those end-users involved in the design can learn how to use the system first and then serve as trainers in their department. Once the main warehouse is built, it then becomes easy for each department to build its own data marts by pulling out the fields from the main database that it needs.

The initial costs of building a data warehouse are high software, hardware, and consulting fees add up quickly. However, most businesses, from supermarkets to banks, are finding that having a data warehouse is a competitive necessity. One example of how data warehouses are being used is a practice called "data mining." Data mining is the technique of creating statistical and predictive models of the real world based on patterns that are discovered as a result of complex queries performed on the huge amounts of data stored in a warehouse.

When data mining is done right, it can produce amazing results, spotting trends before they happen or identifying new sales prospects, for instance. According to an *Information Week* report, the information technology (IT) staff at Wal-Mart's headquarters routinely mine the company's massive data warehouse to identify trends and improve operational efficiency, sometimes on an hourly basis. An example the company frequently cites comes from the day after Thanksgiving in 2003, when the company's East Coast stores were not meeting sales expectations for a computer-and-monitor special. It turned out that the computers and monitors were not being displayed together, so the posted special was not attracting the attention of potential buyer. Calls were made to stores across the country, and by mid-morning, sales were picking up significantly.

Data mining is not without its risks, however. When done incorrectly or applied by inexperienced IT and

marketing staff data mining can produce false correlations and generate misleading advice. Companies should not rely too heavily on data mining without ensuring that they are employing experienced professionals who fully understand the type of complex statistical analyses needed to perform data-mining tasks.

ONLINE DATABASE MANAGEMENT

Data warehouses started out as internal projects, but during the first decade of the twenty-first century, they were increasingly made external or at least partly external. Companies that need to gather data from customers and pass information down the line to business customers are finding it beneficial to make their data warehouse available over the Internet through the use of either HTML or Java-based client servers, or by making the company's own intranet accessible through the Internet via a secure server. An online catalogue that is searchable by Internet customers is an example of an HTML or Java client server. Companies are also increasingly making their data warehouses or some portion of them publicly available on the Internet to collect information about its online customers. If instead the goal is to pass information on to business customers, then the company can use password-protected pages to make the warehouse available to selected individuals.

When databases were first made available over the Internet during the 1990s, the limitations on connection speed and bandwidth made it possible for only basic queries to be run easily. In the twenty-first century, as a proliferation of servers rapidly expanded bandwidth and connection speeds increased with the spread of DSL and cable Internet, the situation changed rapidly. These advances, combined with the development of the technology of online analytical processing (OLAP), have made it possible for intricate queries of data to run smoothly with little or no delay noticed by the end-user.

There have always been risks and costs associated with making such huge amounts of data available over the Web, but technological advancements have reduced those risks and costs. Security is always a paramount issue, since opening data warehouses to users around the world means that internal systems are exposed to outside interference or hacking. However, the advances in data encryption that have taken place alongside other developments in IT technology make this less risky in the 2010s than it was at the beginning of the decade. A second issue is the drain on system resources that unlimited access to the data warehouses would cause. Popular databases visited and searched by large numbers of users need extremely powerful servers to keep up with demand by ensuring that the employees and clients of a company are not hindered by traffic generated by customers and other public users. Again, the costs associated with increasing server space have diminished and processing speeds have increased, turning what was once a prohibitive cost for small- and medium-sized businesses into a potentially affordable infrastructure investment.

DEBT COLLECTION

Debt collection is a deliberate attempt by a business to collect an obligation that has become past due. In normal transactions between two businesses, an invoice is rendered and payment is due within 30 days unless, by special arrangement, a more generous schedule of payments has been agreed upon. Retail customers usually pay cash at time of purchase or, as is common in medical practices, are billed for portions not covered by insurance; payment is due some reasonable time after billing, such as 5 days or a week. After these time periods have passed, the payment is past due. In

normal accounting practice, overdue payables are classified as 30-, 60-, and 90-day past due, and the accounting department routinely sends out "past-due" notices. Once an account is more than 90 days overdue, it becomes problematical and requires special action. In effect the buyer is now using the seller's money without compensation.

Debt collection, in another sense, may be the *main business* of a small enterprise; it may have been formed to collect money owed to others for a percentage of the debt owed. The small business, in yet another sense, may be the *subject* of debt collection activity, either because the business has been careless in paying bills or because the owner refuses to pay for a reason: perhaps the product shipped was deficient.

INHERENT CONFLICTS OF INTEREST

A business expends considerable resources contacting, courting, pleasing, and servicing its clientele. Under normal circumstances, the overwhelming majority of customers pay reasonably promptly so that the payment pattern will have the shape of a bell curve: a few prepay or pay early, the majority pay on time, a few persistently pay late. The very few who fall beyond this pattern may do so because of unusual circumstances. Real "deadbeats" are difficult initially to identify. For this reason most businesses, small or large, treat persistent late payers with much more courtesy than they deserve. Collecting receivables and paying payables are inherently in conflict. In many business-to-business situations, the customer may have a *policy* of paying late in order to show a better return on assets to its parent: it will be energetic in collecting, a laggard in paying. Debt collection, for this reason, is a difficult area of management for any business. The business, after all, *also* benefits from early collections and late payments. But if it is too aggressive collecting outstanding obligations, it may damage its standing with a valued customer.

ELEMENTS OF A GOOD COLLECTION SYSTEM

Whatever its size, a business should pursue collections using a consciously formulated policy with well-defined triggering milestones for actions and an intelligent review process to protect the company's overall posture. Even in a business where the owner is simultaneously chief administrator, salesperson, and accountant, the collection policy should be capable of being written down quickly and coherently. Long before collection begins, the company, of course, should have done its homework and established the customer's creditworthiness. Effective collection systems: 1) emphasize and highlight payment conditions in proposals and contracts; 2) kick in promptly; 3) have built-in flexibility and management review; 4) follow a systematic sequence of escalation; 5) are characterized by consistency and persistence; 6) match debtor's behavior to seller's behavior rationally; and 7) work toward definite closure within a preset timeframe.

Emphasis on Payment. Where at all possible, the business should strive to highlight payment terms in its proposals and contracts in such a manner that the buyer is aware of the seller's policies and its *emphasis* on being paid promptly. Michelle Dunn, an expert and popular writer on the subject, advocates that businesses should strive for written payment agreements. Even if a business cannot prevail in getting a particular contract clause, *trying* to do so may be remembered and may be helpful later. In his 2009 book *Legal Guide for Starting & Running a Small Business*, Fred Steingold suggests that each bill should include a request for the customer to contact the company if there is a problem with the product or service. This, Steingold writes, may help facilitate payment when a customer with a past-due account tries to argue that the product or service was faulty.

Timing. Experts in the field agree that acting promptly on overdue obligations is of primary importance. Michael Giusti, writing for *New Orleans CityBusiness*, gives this issue a memorable formulation: "Debt collectors tell clients [that] overdue bills are not like fine wine they only worsen with age." Citing Dave Duggins of the Duggins Law Firm in New Orleans, Giusti points out that "after an overdue account becomes 1 year old, the chances of collecting have all but evaporated." In a well-designed system, every overdue account will receive attention on a predefined trigger date; the action taken, however, may be governed by additional considerations.

Flexible Review. A sensible collection policy will recognize up front that knowledge of the customer is all-important both in selling and collecting. Therefore collection activity should be organized to pool information about a late- or nonpaying client to discover early what the situation "over there" may be like. Action, including the initial action, should have inputs from all those involved with the debtor. This process may uncover problems which, once fixed, will produce prompt payment and thus avoid unnecessary spinning of wheels.

Reviewing the problem in some detail and then, if indicated, working with the delinquent client may provide the business unexpected opportunities. The client may be going through a temporary problem in which the company can help, perhaps merely through patience. The contact involved in working with the client may create new bonds that, later, will benefit the company. Such effort may also yield partial payments as the customer shows his or her good faith. Flexibility is thus very

useful, all things equal. If the situation is hopeless, time can be saved. A rigid policy is never indicated unless the debt is too small to merit the effort required to turn corporate cartwheels in its resolution.

Systematic Sequence. As already indicated, most debtors will have received past-due billings before collection activity even begins, and even such billings, highlighting the amount of time a bill is overdue, have a built-in feature of escalation. Similarly, collection effort should proceed in stages that initially give the debtor a certain benefit of the doubt. These stages may involve letters, then calls, and finally visits or given other circumstances precisely the reverse of this sequence. Which style of escalation is best will be well known to the company.

A mature and businesslike approach is, of course, understood. Large outstanding obligations, especially those that significantly affect the seller, produce emotional situations in which, in unguarded moments, the management is inclined to threaten the debtor. If an action is threatened, it should have been considered carefully in advance. And management should be committed to follow through. If such commitment is lacking, silence is better.

Consistency and Persistence. Throughout the collection process, the debtor should clearly understand, at every stage in the process, that the business intends to get paid in full and now. For this to be credible, the seller, of course, must promptly take whatever steps are necessary to deal with the legitimate problems of the debtor and then immediately press for payment. As Michelle Dunn puts it in the title of her book, *Become the Squeaky Wheel.*

Matching the Debtor's Behavior. The business intent on collecting its debt must be disciplined and consistent enough to match its own behavior to that of the reluctant client. In many situations of unequal power (large debtor, small company) the business, for instance, will continue work on a contract (a study, a landscaping job) even though a partial payment is long overdue. But in situations of this sort, the business must stop working until it has been paid. This is often very painful to do. Similarly, the debtor should be refused any additional product until the matter of payment is settled. The conflict of interest between buyer and seller is here obvious and visible. All buyers would like to get something for nothing. The deep habit of pleasing the customer must sometimes be checked.

Closure. Sometimes a debt cannot be collected short of a lawsuit. And in many cases, the amount may not be large enough to merit litigation. A good collection policy will anticipate such situations and describe, in advance, how closure will be handled. Writing off the debt or turning the account over to a collection agency may be the options; having the debt hanging around may be a third option, but one that holds little promise of return while simply being there as a reminder of failure.

USING THIRD PARTIES

Outside collection agencies or the services of an attorney are the usual venues for collecting the money without doing it in-house. Key considerations in following either of these routes are the amount of the debt and its age. Collection agencies and attorneys generally take a percentage (usually one-third of the total amount) of the debt collected as payment for their services. Even with professional help, however, some debts will inevitably be impossible to collect due to bankruptcy, customers who move without notice ("skip"), or the high expense required to collect them. For more information on securing a professional collection agency, contact the Association of Credit and Collection Professionals, P.O. Box 390106, Minneapolis, MN 55439; Ph. (952) 926-6547 or visit their Web site at http://www.acainternational.org/.

Whatever combination of collection methods a business eventually chooses, the owner needs to remain aware of the limitations that state and federal laws place on debt collection under the Fair Debt Collection and Practices Act which governs collections from "natural persons," meaning individuals. For example, it is illegal to make continual phone calls, to use profane or threatening language, to threaten repossession when in fact the article cannot be repossessed, or to threaten to damage a customer's credit report or have his or her wages garnished. It is also illegal to discuss a customer's collection problem in public. In addition, businesses have to desist with collection efforts if the target declares bankruptcy. Given the thicket of legal issues that surround many aspects of collection, small-business owners should consult an attorney before initiating aggressive approaches to collect on delinquent accounts.

ELECTRONIC BILL PRESENTMENT AND PAYMENT

Electronic bill presentment and payment (EBPP) has revolutionized debt collection for large and small businesses alike. While EBPP was not instantly popular, largely due to concerns over Internet security and privacy, it has now become widely accepted in the business world. As business owners and consumers have become more at ease with online financial transactions, EBPP has become the preferred method for billing since it saves businesses time and money. According to some EBPP vendors, conversion to such systems can reduce many business's billing costs by 50 to 75 percent once electronic bill payment becomes the norm for companies and individual consumers. The potential for such savings has lead some companies to incentivize online payment. According to a 2010 article in the *Atlanta Business Chronicle,*

SunTrust, an Atlanta-based regional bank, offered monetary rewards to customers who make online payments. In 2009 T-Mobile tried a different approach, initiating a monthly fee to customers who would not switch to online bill pay. Though the fee has since been lifted, T-Mobile managed to convert a large number of customers to paperless billing.

There are various ways for small businesses to offer paperless billing. Some businesses post bills on their home page. Others outsource the billing process to a consolidator who maintains its own page for posting electronic billings. Yet others secure the services of vendors who use e-mail to send bills directly to customers. This method is favored by many, since it is characterized by immediacy and convenience for the customer.

DEBT FINANCING

A business can finance its operations either through equity or debt. *Equity* is cash paid into the business by investors; the business owner is usually one of these investors; investors receive a share of the company, in effect a percentage of it proportional to total investment paid in. The share or stock may appreciate in value in proportion to the increase in the business's net worth or it may evaporate to nothing at all if the business fails. Investors put cash into a company in the hope of stock appreciation and the yield of dividends which the business may (but need not) pay to the investor; dividends are a portion of the net profits of the business; if the business does not realize a profit, it cannot pay a dividend. The investor can get his or her investment back only by selling the share to someone else. In a privately held company, investors have less "liquidity" because the shares are not traded on the open market and a purchaser may be difficult to find. This is one reason why successful and rapidly growing small businesses are under pressure by stockholders to "go public" and thus to create an easy way for investors to cash out.

Debt financing, by contrast, is cash borrowed from a lender at a fixed rate of interest and with a predetermined maturity date. The principal must be paid back in full by the maturity date, but periodic repayments of principal may be part of the loan arrangement. Debt may take the form of a loan or the sale of bonds; the form itself does not change the principle of the transaction: the lender retains a right to the money lent and may demand it back under conditions specified in the borrowing arrangement.

Lending to a company is thus at least in theory more safe, but the amount the lender can realize in return is fixed to the principal and to the interest charged. Investment is more risky, but if the company is very successful, the upward potential for the investor may be very attractive; the downside is total loss of the investment.

DEBT/EQUITY RATIO

The character of a company's financing is expressed by its debt to equity ratio. Lenders like to see a low debt/equity ratio; it means that much more of the company's fortunes are based on investments, which in turn means that investors have a high level of confidence in the company. If the debt/equity ratio is high, it means that the business has borrowed a lot of money on a small base of investments. It is then said that the business is highly leveraged which in turn means that lenders are more exposed to potential problems than investors. These relationships ultimately highlight a certain ambiguity in the relations between lenders and investors: their aims are in conflict but also in mutual support. Investors like to use a small investment and leverage it into a lot of activity by borrowing; lenders like to lend a small amount secured by a large investment. In usual business practice these motivations result in a negotiated equilibrium which shifts this way and that based on market forces and performance.

CASH FLOW TO DEBT RATIO

The cash flow of a company in relation to its debt serves lenders as another way to measure whether or not to provide

debt financing to a business. A company's profitability, as measured on its books, may be better or worse than its cash generation. In calculating cash flow, only actual cash coming in and going out in a given period is used to calculate net cash available for servicing debt.

The sales of a company for a given period, for example, may be considerably higher than its cash receipts; the reason for this may simply be that the company's customers may paying late or may have favorable "stretched out" payment arrangements. Similarly, the costs of a company, as recorded on its books, may be lower than its actual cash payments in a period; the company, for instance, may be prepaying insurance for the next 6 months this month; its books will only show one sixth of that payment as cost but six times as much going out as cash. For these reasons, a company may be profitable based on its books but may be short on cash at any given time. Lenders therefore like to look at the amount of cash available to service the current portions of any new debt. If this amount is minimally 1.25 times the debt service required, the business is at least in the ballpark to receive a loan. The higher this ratio, the more inclined the lender will be to lend.

Rules of thumb along these lines are subject to adjustment based on the availability of money. The global financial crisis that began in 2008 led many banks to reassess the process for determining which businesses do and do not get loans. This created challenges for many small businesses that needed loans to keep their businesses running.

SOURCES OF DEBT FINANCING

Small businesses can obtain debt financing from a number of different sources. Private sources of debt financing include friends and relatives, banks, credit unions, consumer finance companies, commercial finance companies, trade credit, insurance companies, factor companies, and leasing companies. Public sources of debt financing include a number of loan programs provided by the state and federal governments to support small businesses.

Private Sources. Many entrepreneurs begin their enterprises by borrowing money from friends and relatives. Such individuals are more likely to provide flexible terms of repayment than banks or other lenders and may be more willing to invest in an unproven business idea, based upon their personal knowledge and relationship with the entrepreneur. A potential disadvantage is that friends and relatives may try to become involved in the management of the business. Business owners who wish to avoid such complications must use the same formal arrangements with relatives and friends as with more distant business associates.

Banks are the most obvious sources of borrowed funds. Commercial banks usually have more experience in making business loans than do regular savings banks. Credit unions are another common source of business loans; these financial institutions are intended to aid the members of a group, such as employees of a company or members of a labor union. Credit unions often provide funds more readily and under more favorable terms than banks. However, the size of the loan available may be relatively small.

Finance companies generally charge higher interest rates than banks and credit unions. Most loans obtained through finance companies are secured by a specific asset as collateral, and the lender can seize the asset if the small business defaults on the loan. Consumer finance companies make small loans against personal assets and provide an option for individuals with poor credit ratings. Commercial finance companies provide small businesses with loans for inventory and equipment purchases and are a good resource for manufacturing enterprises. Insurance companies often make commercial loans as a way of reinvesting their income. They usually provide payment terms and interest rates comparable to a commercial bank but require a business to have more assets available as collateral.

Trade credit is another common form of debt financing. Whenever a supplier allows a small business to delay payment on the products or services it purchases, the small business has obtained trade credit from that supplier. Trade credit is readily available to most small businesses, if not immediately then certainly after a few orders. But the payment terms may differ between suppliers. A small business's customers may also be interested in offering a form of trade credit for example, by paying in advance for delivery of products they will need on a future date in order to establish a good relationship with a new supplier.

Factor companies help small businesses to free up cash on a timely basis by purchasing their accounts receivable. Rather than waiting for customers to pay invoices, the small business can receive payment for sales immediately. Factor companies can either provide recourse financing, in which the small business is ultimately responsible if its customers do not pay, and nonrecourse financing, in which the factor company bears that risk. Although factor companies can be a useful source of funds for existing businesses, they are not an option for start-ups that do not have accounts receivable. Leasing companies can also help small businesses to free up cash by renting various types of equipment instead of making large capital expenditures to purchase it. Equipment leases usually involve only a small monthly payment, plus they may enable a small business to upgrade its equipment quickly and easily.

Entrepreneurs and owners of start-up businesses must almost always resort to personal debt in order to fund their enterprises. Some entrepreneurs choose to arrange their initial investment in the business as a loan, with a specific repayment period and interest rate. The entrepreneur then

uses the proceeds of the business to repay himself or herself over time. Other small-business owners borrow the cash value of their personal life insurance policies to provide funds for their business. These funds are usually available at a relatively low interest rate. Still others borrow money against the equity in their personal residences to cover business expenses. Mortgage loans can be risky: the home is used as collateral. Finally, some fledgling business people use personal credit cards fund their businesses. Credit card companies charge high interest rates, which increases the risk of piling up additional debt, but they can make cash available quickly.

Public Sources. The state and federal governments sponsor a wide variety of programs that provide funding to promote the formation and growth of small businesses. Many of these programs are handled by the Small Business Administration (SBA) and involve debt financing. The SBA helps small businesses obtain funds from banks and other lenders by guaranteeing loans up to $2 million, to a maximum of 75 to 90 percent of the loan value, for 2.75 percentage points above the prime lending rate. (However, loans smaller than $25,000 may have slightly higher percentage rates.) In order to qualify for an SBA- guaranteed loan, an entrepreneur must first be turned down for a loan through regular channels. The borrower then goes back to the lending institution to see if they can get the same loan if it were guaranteed by the SBA. He or she must also demonstrate good character and a reasonable ability to run a successful business and repay a loan. SBA-guaranteed loan funds can be used for business expansion or for purchases of inventory, equipment, and real estate. In addition to guaranteeing loans provided by other lenders, the SBA also offers loans for disaster assistance. The American Recovery and Reinvestment Act of 2009 (ARRA), which was designed to jump-start the economy after the global financial crisis, allowed the SBA temporarily to waive fees on loan applications and to guarantee nearly all loans at 90 percent of the total value. According to Robb Mandelbaum of the *New York Times*, the SBA increased its weekly lending volume by 75 percent from February 2009 to December 2009 largely due to the funds made available by the ARRA.

Small Business Investment Companies (SBICs) are government-backed firms that make direct loans or equity investments in small businesses. SBICs tend to be less risk-averse than banks, so funds are more likely to be available for start-up companies and small businesses. SBICs define a small business as one that has a net worth of less than $18 million. Another advantage is that SBICs are often able to provide technical assistance to small-business borrowers. The Economic Development Administration (EDA), a branch of the U.S. Department of Commerce, makes loans to small businesses that provide jobs in economically disadvantaged regions. Small businesses hoping to qualify for EDC loans must meet a number of conditions.

DECISION MAKING

Decision making is a vital component of small business success. Decisions based on a foundation of knowledge and sound reasoning can lead the company into long-term prosperity; conversely, decisions made on the basis of flawed logic, emotionalism, or incomplete information can quickly put a small business out of commission

(indeed, bad decisions can cripple even big, capital-rich corporations over time). All businesspeople recognize the painful necessity of choice. Furthermore, making these choices must be done in a timely fashion, for as most people recognize, indecision is in essence a choice in and of itself a choice to take no action. Ultimately, what drives business success is the quality of decisions and their implementation. Good decisions mean good business.

THE ELEMENTS OF DECISION MAKING

The concept of decision making has a long history; choosing among alternatives has always been a part of life. But sustained research attention to business decision making has developed only in the last few decades. Contemporary advances in the field include progress in such elements of decision making as the problem context; the processes of problem finding; problem solving (rationales; settings; scope and level; procedural and technical aids); outcome; and implementation.

The Problem Context. All decisions are about problems, and problems shape context at three levels. The *macrocontext* draws attention to global issues (exchange rates, for example), national concerns (the cultural orientations toward decision processes of different countries), and provincial and state laws and cultures within nations. The *mesocontext* attends to organizational cultures and structure. The *microcontext* addresses the immediate decision environment the organization's employees, board, or office.

Decision processes differ from company to company. But all companies need to take these three context levels into consideration when a decision needs to be made. Fortunately, economical ways to obtain this information are available and keep the cost of preparing for decisions from becoming prohibitive.

Problem Finding and Agenda Setting. An important difficulty in decision making is failure to act until one is too close to the decision point when information and options are greatly limited. Organizations usually work in a "reactive" mode. Problems are "found" only after the issue has begun to have a negative impact on the business. Nevertheless, processes of environmental scanning and strategic planning are designed to perform problem reconnaissance to alert business people to problems that will need attention down the line. Proactivity can be a great strength in decision making, but it requires a decision intelligence process that is absent from many organizations.

Moreover, problem identification is of limited use if the business is slow to heed or resolve the issue. Once a problem has been identified, information is needed about the exact nature of the problem and potential actions that can be taken to rectify it. Unfortunately, small- business owners and other key decision makers too often rely on information sources that "edit" the data either intentionally or unintentionally in misleading fashion. Information from business managers and other employees, vendors, and customers alike has to be regarded with a discerning eye.

Another kind of information gathering reflects the array and priority of solution preferences. What is selected as possible or not possible, acceptable or unacceptable, negotiable or nonnegotiable depends upon the culture of the firm itself and its environment. A third area of information gathering involves determining the possible scope and impact that the problem and its consequent decision might have. Knowledge about impact may alter the decision preferences. To some extent, knowledge about scope dictates who will need to be involved in the decision process.

Problem Solving. Problem solving also sometimes referred to as problem management can be divided into two parts process and decision. The process of problem solving is predicated on the existence of a system designed to address issues as they crop up. In many organizations, there does not seem to be any system. In such businesses, owners, executives, and managers are apparently content to operate with an ultimately fatalistic philosophy what happens, happens. Business experts contend that such an attitude is unacceptable, especially for smaller businesses that wish to expand, let alone survive. The second part of the problem management equation is the decision, or choice, itself. Several sets of elements need to be considered in looking at the decision process. One set refers to the rationales used for decisions. Others emphasize the setting, the scope and level of the decision, and the use of procedural and technical aids.

Rationales. Organizational decision makers have adopted a variety of styles in their decision-making processes. For example, some business leaders embrace processes wherein every conceivable response to an issue is examined before settling on a final response, while others adopt more flexible philosophies. The legitimacy of each style varies in accordance with individual business realities, including market competitiveness, business-owner personality, and acuteness of the problem.

Setttings. Certainly, some entrepreneurs/owners make business decisions without a significant amount of input or feedback from others. Home-based business owners without any employees, for example, are likely to take a far different approach to problem solving than will business owners who have dozens of employees and several distinct internal departments. The latter owners will be much more likely to include findings of meetings, task forces, and other information-gathering efforts in their decision-making process. Of course, even a business owner who has no partners or employees may find it useful to seek information from outside sources (accountants, fellow businesspeople, attorneys) before making

important business decisions. "Since the owner makes all the key decisions for the small business, he or she is responsible for its success or failure," wrote David Karlson in *Avoiding Mistakes in Your Small Business.* "Marketing and finance are two of several areas in which small-business owners frequently lack sufficient experience, since they previously worked as specialists for other people before they started their own businesses. As a result, they generally do not have the experience needed to make well-informed decisions in the areas with which they are unfamiliar. The demands of running and growing a small business will soon expose any Achilles heel in a president/owner. It is best for a business owner to find out weaknesses early, so he or she can develop expertise or get help in these areas."

Scope and Level. Attention must be paid to problem scope and organizational level. Problems of large scope need to be dealt with by top levels of the organization. Similarly, problems of smaller scope can be handled by lower levels of the organization. This is a failing of many organizations, large and small. Typically, top-level groups spend much too much time deciding low-level, low-impact problems, while issues of high importance and organizational impact linger on without being addressed or resolved.

Procedural and TechnicalAids. Leadership seminars and management training offer a traditional form of guidance in the decision-making process. During the past two decades, there has also been significant development of software programs that guide individuals or groups through the various elements of the decision-making process. These software packages are both general purpose and focused on a wide variety of operational areas, such as budgeting, marketing, and inventory control. According to a 2008 survey of decision-analysis software, reported by Daniel T. Maxwell in *OR/MS Today*, "the computational power and visualization capabilities supporting decision analysis software have increased by many orders of magnitude" over the past twenty years, making software-aided decision analysis accessible to a much larger range of users. The survey concludes, "distribution numbers for many of the more mature software packages have grown from hundreds of likely specialized professional users a decade ago to many thousands of users world-wide today."

Outcome. Whatever decision-making process is utilized, those involved in making the decision need to make sure that a response has actually been arrived at. All too often, meetings and other efforts to resolve outstanding business issues adjourn under an atmosphere of uncertainty. Participants in decision-making meetings are sometimes unsure about various facets of the decision made. Some participants, for example, may leave a meeting sunsure about how the agreed-upon response to a problem is going to be implemented, while others may not even be sure what the agreed-upon response is. Indeed, business researchers indicate that on many occasions, meeting participants depart with fundamentally different understandings of what took place. It is up to the small-business owner to make sure that all participants in the decision-making process fully understand all aspects of the final decision.

Implementation. The final step in the decision-making process is the implementation of the decision. This is an extremely important element of decision making; after all, the benefits associated with even the most intelligent decision can be severely compromised if implementation is slow or flawed.

FACTORS IN POOR DECISION MAKING

Several factors in flawed decision making are commonly cited by business experts, including the following: limited organizational capacity; limited information; the costliness of analysis; interdependencies between fact and value; the openness of the system(s) to be analyzed; and the diversity of forms on which business decisions actually arise. Moreover, time constraints, personal distractions, low levels of decision-making skill, conflict over business goals, and interpersonal factors can also have a deleterious impact on the decision-making capacities of a small (or large) business.

A second category of difficulties is captured in a number of common pitfalls of the decision procedure. One such pitfall is "decision avoidance psychosis," which occurs when organizations put off making decisions that need to be made until the very last minute. A second problem is decision randomness. This process was outlined in the famous paper called "A Garbage Can Model of Organizational Choice" by M. James Cohen, G. March, and J. Olsen. They argued that organizations have four roles or vectors within them: problem knowers (people who know the difficulties the organization faces); solution providers (people who can provide solutions but do not know the problems); resource controllers (people who do not know problems and do not have solutions but control the allocation of people and money in the organization); and a group of "decision makers looking for work" (or decision opportunities). For effective decision making, all these elements must be in the same room at the same time. In reality, most organizations combine them at random, as if tossing them into a garbage can.

Decision drift is another malady that can strike at a business with potentially crippling results. This term, also sometimes known as the Abilene Paradox in recognition of a famous model of this behavior, refers to group actions that take place under the impression that the action is the will of the majority, when in reality, there never really was a decision to take that action.

Decision coercion, also known as groupthink, is another very well known decision problem. In this flawed decision-making process, decisions are actually coerced by figures in power. This phenomenon can most commonly be seen in

instances where a business owner or top executive creates an atmosphere where objections or concerns about a decision favored by the owner/executive are muted because of fears about owner/executive reaction. A wide range of problems and poor decisions have been attributed to groupthink. In an article about the 2002 WorldCom scandal, author M. M. Scharff writes, " much of WorldCom's organizational structure and culture potentially contributed not only to the fraud but also to the length of time over which it occurred. In many ways, groupthink may help explain some of the issues and fraudulent activities at WorldCom as well as the pressures that were placed on employees extending the period over which the fraud occurred." Similar charges have been made about military and government decision making, indicating that groupthink is a problem in both business and government settings.

Battling groupthink is a mainstay of training and advice for business decision makers. Decision-making experts recommend a number of ways to avoid falling into the groupthink trap. One is to focus on the task at hand. Another is for the boss to encourage critical discussion of alternatives and hold off on his or her opinion until others have stated theirs. Yet another is to assign a member of the group the role of "devil's advocate" to challenge the ideas and decisions of others. In general, groupthink and other problems that can lead to poor decision making can be handled with a systematic approach to improving decision making.

IMPROVING DECISION MAKING

Business consultants and experts agree that small-business owners and managers can take several basic steps to improve the decision-making process at their establishments.

Improve the setting. Organizing better meetings (focused agenda, clear questions, current and detailed information, necessary personnel) can be a very helpful step in effective decision making. Avoid the garbage can; get the relevant people in the same room at the same time. Pay attention to planning and seek closure.

Use Logical Techniques. Decision making is a simple process when approached in a logical and purposeful manner. Small businesses that are able to perceive the problem, gather and present data, intelligently discuss the data, and implement the decision without succumbing to emotionalism are apt to make good decisions that will launch the firm on a prosperous course.

Evaluate decisions and decision-making patterns. Evaluation tends to focus the attention, and make individuals and teams more sensitive to what they are actually doing in their decision-making tasks. Evaluation is especially helpful in today's business environment because of the interdependency of individuals and departments in executing tasks and addressing goals.

Determine appropriate levels of decision making. Business enterprises need to make sure that operational decisions are being made at the right level. Keys to avoiding micromanagement and other decision-making pitfalls include: giving problems their proper level of importance and context; addressing problems in an appropriate time frame; and establishing and shifting decision criteria in accordance with business goals.

Although there is widespread agreement on recommendations such as these, decision experts also recognize there is no single formula that yields high-quality decisions. As Peter Shaw wrote in his 2008 book, *Making Difficult Decisions*, "At the heart of effective decision-making is balancing clarity and conviction. The natural starting point for different individuals will be at different points on this spectrum." Small- business owners need to tailor their decision-making process to their own individual needs and strengths, taking into account their own personal and professional experiences.

DECISION SUPPORT SYSTEMS

Broadly speaking, decision support systems are a set of manual or computer-based tools that assist in some decision-making activity. In today's business environment, however, decision support systems (DSS) are commonly understood to be computerized management information systems designed to help business owners, executives, and managers resolve complicated business problems. Good decision support systems can help businesspeople perform a wide variety of functions, including cash flow analysis, concept ranking, multi-stage forecasting, product performance improvement, and resource allocation analysis. Previously regarded as primarily a tool for big companies, DSS has come to be recognized as a potentially valuable tool for small business enterprises as well.

THE STRUCTURE OF DECISIONS

In order to discuss the support of decisions and what DSS tools can or should do, it is necessary to have a perspective on the nature of the decision process and the various requirements of supporting it. One way of looking at a decision is in terms of its key components. The first component is the data collected by a decision maker to be used in making the decision. The second is the process selected by the decision maker to combine this data. Finally, there is an evaluation or learning component that compares decisions and examines them to see if there is a need to change either the data being used or the process that combines the data. These components of a decision interact with the characteristics of the decision being made.

Structured Decisions. Many analysts categorize decisions according to the degree of structure involved in the decision-making activity. Business analysts describe a structured decision as one in which all three components of a decision   the data, process, and evaluation   are determined. Since structured decisions are made on a regular basis in business environments, it makes sense to place a comparatively rigid framework around the decision and the people making it.

Structured decision support systems may simply use a checklist or form to ensure that all necessary data are collected and that the decision-making process is not skewed by the absence of data. According to *Handbook on Decision Support Systems 1*, edited by Frada Burstein and Clyde W. Holsapple: "When issues relevant to making a decision are well understood, the decision tends to be structured. The alternatives from which the choice is made are clear cut, and each can be readily evaluated in light of the organization's purpose and goals." If the choice is also to support the procedural or process component of the decision, then it is quite possible to develop a program either as part of the checklist or form. In fact, it is also possible and desirable to develop computer programs that collect and combine the data, thus giving the process a high degree of consistency or structure. When there is a desire to make a decision more structured, the support system for that decision is designed to ensure consistency. Many firms that hire individuals without a great deal of experience provide them with detailed guidelines on their decision-making activities and support them by giving them little flexibility. One interesting consequence of making a decision more structured is that the liability for inappropriate decisions is shifted from individual decision makers to the larger company or organization.
