The ability to save for oneself as a business owner, and help others save for themselves as employees, may even be seen as a progressive move that trends toward forward-thinking business models. Americans and workers everywhere, especially those who are sole proprietors and small-business owners, would be remiss not to consider the benefits of Keogh plans or some other retirement and investment funds to ensure they have the funds they need to live well in the years after they retire.

KNOWLEDGE MANAGEMENT

Knowledge management (often abbreviated to KM) refers to the strategies and tactics businesses use to document and share information necessary to run the business. KM strives

to capture information about the company which is often held by individuals and put it into a central repository where anyone in the company can readily access it as needed.

The use of KM in enterprises of all sizes continues to grow as companies realize the increasing importance of intellectual capital in the knowledge-based global economy. Knowledge is also considered a fundamental factor in enabling and support innovation. In the early twenty-first century, with corporations slashing payrolls and millions of baby boomers retiring, KM is seen as vital to retaining the know-how of experienced workers leaving the labor force (or simply leaving an individual company).

A company's internal knowledge provides a valuable competitive edge, particularly in those industries that rely on unique information, products, and processes. KM provides techniques for recording this knowledge and making it readily available through the organization.

The term "knowledge management" is also sometimes used to refer to the technology that archives and provides access to shared business information. There are a number of KM-related software packages available, such as document management or content management systems. However, KM actually refers to the process of managing knowledge rather than simply the underlying technology.

DEFINITIONS

Knowledge management has been practiced for centuries in a variety of settings. However, the formal concept did not gain wide use until the early 1990s, as corporations saw the need for a more formal approach to managing internal sources of key business knowledge. Early interest in KM is often attributed to the information technology field and concerns over the frequent failure rate of large computer systems projects, estimated as high as 80 percent. As IT firms (and later multinational corporations) tackled KM issues, academic research followed. By the end of the twentieth century, studies in a variety of disciplines on such topics as business general management, library sciences, and social networks had converged in the new field of knowledge management.

The multidisciplinary roots of knowledge management make it difficult to reach agreement on a universal definition of knowledge management. Ingi Runar Edvardsson, in a paper appearing in *Knowledge Management Research & Practice*, noted that most definitions have a similar focus, taking a "very practical approach . . . to how knowledge can contribute to organizational effectiveness." Edvardsson said KM typically refers to a "broad collection of organizational practices and approaches related to generating, capturing, and disseminating knowledge relevant to the organization's business."

According to Meridith Levinson, writing in *CIO Magazine*, "KM is the process through which organizations generate value from their intellectual and knowledge-based assets. Most often, generating value from such assets involves codifying what employees, partners and customers know, and sharing that information among employees, departments and even with other companies in an effort to devise best practices." In her article "Smaller-sized Companies Also Need Knowledge Management," Antoinette Hylton wrote that the KM process involves capturing a company's knowledge; organizing and storing that knowledge; and sharing and distributing the knowledge. The Microsoft Corporation defines KM even more simply: "The process of documenting and making available business-related knowledge."

The ultimate goal of KM is to capture and share knowledge currently held by employees at all levels, as well as vendors, customers, and other parties. After knowledge is gathered, it must be kept up to date with changes in business practices as well as in competitive, regulatory, technological, and human environments.

The discipline of KM recognizes two types of knowledge: explicit and tacit. Explicit knowledge includes information that is already written down, such as employee handbooks, business plans, patents, or customer lists. Explicit knowledge is usually already recorded in a central location and available to those who need it. Depending upon the sophistication of the company, explicit knowledge may already be archived, codified, or made available throughout the company via databases, intranets, and other group collaboration platforms.

The greater challenge in KM and the focus of most research and activity is tacit knowledge, which is usually not recorded nor easily shared with others. This is typically an individual's personal knowledge of how to do his or her job: the veteran employee who never writes anything down because "it's all in my head"; the sticky note on a computer terminal with the copy machine repairman's cell phone number; the data entry clerk who knows how to bypass a system glitch; a salesman's personal relationship with a prospect that helps him or her to know when and how to close the deal. Tacit knowledge combines personal experience with the data and rules preserved in explicit knowledge.

The goal in KM is converting tacit knowledge into explicit knowledge, thus formalizing the company's intellectual capital. The term "intellectual capital" indicates that a firm's unique knowledge can be a valuable asset. KM uses a variety of techniques to accomplish this goal, including:

- Recording interviews with key employees, customers, regulators, and other parties.
- Holding group discussions to uncover additional information, such as interdependencies within and between departments.

- "Shadowing," a technique where less experienced employees observe veteran staff members to understand their activities.
- Documenting and archiving the documented information gained.
- Organizing the information into meaningful patterns and cross-referencing it, transforming that data into knowledge.
- Making the knowledge available for later retrieval.
- Updating changes in the knowledge so it remains up to date.

The system for storing and retrieving the accumulated knowledge of a company is called a knowledgebase. The knowledgebase can be a complex set of databases at a multinational corporation; a wiki-type intranet site at a medium-sized company that employees can update; or simply a handwritten notebook for a small business. Regardless of its format, the knowledgebase forms the basis of future efficiency, growth, and innovation for an enterprise. As Hylton wrote, "Often an organization's most valuable knowledge resides not in explicit forms such as documents, database records, and Web pages, but in employees' experience and know-how."

KM RESEARCH ON SMALL BUSINESS

Early in the emergence of knowledge management, much of the research focused on the role of KM among large corporations, particularly on the mechanics of how to gather and retrieve explicit knowledge. However, with the emerging global economy and the key role that small and medium-sized enterprises (SMEs) are playing in knowledge-based industries, more academic and trade organization work now focuses on smaller firms.

For example, a study by Kerstin Fink and Christian Plodder for the *Journal of Enterprise Information Management* noted the "success and growth of SMEs depend on how well they manage the knowledge of their knowledge workers." The paper also pointed out that SMEs face more budget constraints than large corporations, challenging SMEs to find more efficient methods to reach their KM goals. Similarly, Kostas Metaxiotis wrote in another paper for the same journal that in the emerging global economy, "the future of enterprises will essentially be determined by their ability to use knowledge wisely." Metaxiotis calls knowledge "a precious global resource."

Many studies find the usage of KM techniques by small and medium-sized enterprises growing in recent years. For example, Edvardsson's paper for *Knowledge Management Research & Practice* found continuing growth by SMEs in Iceland. Some 24 percent of firms there had a KM program during the study period, with another 12.7 percent implementing such programs. Most of those firms had invested in general technology but few were obtaining advanced technologies directly related to KM. "The most common ways to share tacit knowledge in Icelandic firms are to encourage face-to-face communication, arrange knowledge conferences, and share learning histories," Edvardsson wrote. The firms surveyed reported such benefits as better customer service, higher employee skills, and better retention of staff. Another paper, in *Knowledge Management Review*, found a link between better KM practices and small-business growth at Canadian and Australian companies. A study in the *Competitiveness Review* of small businesses in west Texas determined these firms showed "increasing interest in implementing knowledge management processes," with more companies adopting KM "as part of their overall strategy."

While these and other studies found while the use of KM in small and medium-sized businesses is on the rise, many more companies have not yet embraced the approach. Even companies that are enthusiastic about KM may not be spending enough time or money capturing and storing knowledge held by employees, colleagues, and other parties, researchers found.

SMALL BUSINESS APPLICATIONS

Many small businesses could benefit from some form of knowledge management system. However, the amount of time, capital, and effort to be invested in building and maintaining a KM system can vary greatly depending on the size of the company, the type of industry it operates, and how technologically advanced the firm is.

In a paper titled "Building a Knowledgebase", the Microsoft Corporation maintained that not every SME needs to implement a KM project. Good candidates for KM include companies that provide information; have unique technologies or processes; or have a few key staff members who possess critical information required to run the business. However, business owners who work alone or in a trade are less likely to need KM tools, the report continued. Even a small business with a handful of employees can probably implement KM with a written handbook or a document stored on a PC.

Levinson, in her article for *CIO Magazine*, noted that even smaller companies can reap numerous benefits by implementing a KM process. "A creative approach to KM can result in improved efficiency, higher productivity and increased revenues in practically any business function," Levinson stated. Specific benefits listed include:

- More innovation through free exchange of ideas.
- Better customer service response times.
- Higher revenues by quicker time to market.

- Improved retention of employees.
- Cost savings through more efficient operations.

The report also suggested starting with smaller projects to begin implementing KM. Levinson advised companies to be sure their employees are on board before the initiative begins, as their participation is critical to success. She also noted that not all information is valuable knowledge, so business owners should be prepared to wade through a "data deluge" while seeking the important information to retain.

In "Smaller-sized Companies Also Need Knowledge Management," Hylton noted that KM software companies typically focus on larger corporations when developing and marketing their systems. Most systems consultants also favor larger corporations over providing services to SMEs. Although some systems are available that small businesses can use, she added, smaller enterprises may not have the financial resources and personnel to tackle a KM project.

Despite these challenges, Hylton continued, "The smaller-sized company also needs to capture and intelligently exploit its knowledge." Hylton encouraged smaller businesses to follow the lead of large corporations with KM processes that:

- Organize their businesses around customers or clients.
- Formalize knowledge now held by staff members.
- Centralize the knowledge that exists across the business, such as on PCs, paper files and "in the heads of employees."
- Capture the knowledge of veteran employees before they leave the company for new opportunities.
- Reduce the learning curve for new employees.
- Identify an inventory of intellectual capital to ensure businesses get the most return from its assets.

"Business intelligence practitioners worldwide generally agree that in this knowledge-driven global economy, knowledge itself is a commodity that offers the only sustainable competitive edge," Hylton added. She also said there is "no foreseeable movement away from the knowledge-driven economy, so very few of those companies that do not place knowledge management high on their business agenda will live to tell the tale."

While small businesses may face challenges implementing and maintaining a knowledge management system, owners are encouraged to put at least some procedures in place to preserve and maintain the intellectual capital that is key to their growth and continued survival in the constantly evolving global economy.

LABOR SURPLUS AREA

Labor surplus areas (LSAs) are government-designated regions such as towns and counties that have experienced severe unemployment for a period of 24 months or more while the rest of the nation (within the same 24 months) has had an average unemployment that is a minimum of 20 percent lower. These areas are designated by the government in a yearly survey. The survey that is conducted will not be representative statistically of that fiscal year but will give an overall picture of where labor surpluses were generally 1 to 3 years prior. By using the recent past to predict the near future, more accurate concessions can be made for given geographical areas. The Labor Surplus Area regions receive benefits linked to federal procurement policies aimed at reducing unemployment.

Technically speaking, and as defined by the U.S. Department of Labor (DOL), an area is first defined as a ‘‘civil jurisdictions’’ and such a jurisdiction has a surplus of labor ‘‘when its average unemployment rate is at least 20 percent above the average unemployment rate for all states (including the District of Columbia and Puerto Rico) during the previous two calendar years. During periods of high national unemployment, the 20 percent ratio is disregarded and an area is classified as a labor surplus area if its unemployment rate during the previous two calendar years was 10 percent or more.’’ In turn, for purposes of this definition, ‘‘civil jurisdictions’’ are defined as cities with a population of at least 25,000; all counties also fall under the definition. In four states (Michigan, New Jersey, New York, and Pennsylvania) townships also qualify if they have 25,000 people or more. Finally, in Connecticut, Massachusetts, Puerto Rico, and Rhode Island ‘‘towns’’ are included because counties have little or no governmental functions. The DOL points out that data are collected based on the narrower definition of ‘‘city’’ or ‘‘town’’ rather than metropolitan area. This permits more precise targeting of preference. Thus a large metro area with a poor core and rich suburbs would have its inner city designated not its opulent ‘‘burbs.’’

DOL issues an annual list of such areas; the list is published in the *Federal Register*. For FY 2010, the reference period under consideration was January 2007 through December 2008. In that period, the national average unemployment rate was 5.3 percent, including Puerto Rico. Jurisdictions with 6.3 percent unemployment or higher qualified.

Two federal executive orders make use of these designations. One is Executive Order 12073, Federal Procurement in Labor Surplus Areas, and the second is Executive Order 10582, Implementing the Buy American Act. Both create preferences for employers located in such areas when the employers bid for federal contracts. Typically state governments further publicize the labor surplus areas designated in their states, alerting employers there to the opportunities now available, minimally for 1 year, usually for longer periods (because economic conditions in these areas rarely just bounce back). The recession of 2008 and 2009 left many people unemployed; for example, in 2008, Rhode Island unemployment rose to 8.8 percent, the highest for the state since 1992. By the first quarter of 2010 this figure had risen to 12.7 percent. Many other states experienced very high unemployment which resulted in more LSAs, including Michigan (14.3% unemployment), Nevada (13.0%), South Carolina

(12.6%), California (12.5%). The lowest unemployment rates in January 2010 were North Dakota, South Dakota, and Nebraska.

Other federal programs also use the designation to modify the distribution of their services in such areas. For example, food stamp distribution rules are eased in LSAs so that food stamps and cash assistance are available for longer periods under U.S. Department of Agriculture rules than in other areas.

The term "Labor Surplus Area" itself predates its use as a governmental designation and meant precisely what the three words signify, but without the official numerical qualifications namely that an area has more labor, with the implied proviso of "appropriately qualified," than it needs. Another implication of the phrase is that an employer will find it easier and more economical to staff a new operation in such an area than in another one. The wider use of the term has lost its currency in recent decades in part because it has been preempted by government usage.

Business usage of the term evolved in another direction, namely to express the opposite condition by talking about a "tight labor market," indicating *low* unemployment in a market with high-skilled employees and in consequence high salary or wage demands and difficulty staffing. In the modern employment climate, specialization of the workforce, including its educational qualifications and exposure to new technology, has become primary. States and localities, therefore, in pursuing new business, stress an educated, skilled workforce, not simply the availability of lots of people.

updated by Diaz, Anaxos

LABOR UNIONS AND SMALL BUSINESS

Whereas the labor movement had its origins in the rise of the industrial revolution beginning around 1750, small business is ancient, its twin origins being family farms and craftsmen's shops of ancient times. Craft guilds, which formed during medieval times, were central to the bourgeoisie of early market towns; they, in part, inspired labor associations in years to come. Although later the interests of small business and unions diverged, the first strike in the United States took place in New York City in 1741 when bakers rebelled against price-setting by the municipal authorities and stopped baking in an act of protest. Union timelines cite the 1741 bakers' strike but scholarly opinion is divided about whether it really belongs there, because the bakers' strike was by small-business owners against "the public sector" (not then called that, of course) rather than by labor against capital.

Careless use of language by many pundits and observers classifies small business as just another battalion in the army of capitalism, although the monumental work of the French scholar Fernand Braudel (1902 1985), *Civilization and Capitalism*(1979) draws distinctions which leave small business out. Small businesses, of course, sometimes behave in the worst kind of capitalist ways (one thinks of highly exploitive sweatshops) but in the overwhelming majority of small business enterprises the relationship between owners and workers is close, and sometimes the two are members of the same family; the scale is such that blatant exploitation is not even a temptation. Small businesses are also much more vulnerable; an extended strike against them will put them out of business. Primarily for these reasons, the labor unions and small businesses have had little effective contact. To be sure, some small businesses are unionized, but they represent (as best as one can discover) a tiny minority of such enterprises.

The history of unionized labor shows that severe downturns in economic activity, such as the recession of 2008 and 2009, hurt labor temporarily because these financial fallouts cause layoffs across nearly every industry. Equally, long periods of expansion have caused labor unions to go into decline. This is generally caused by a sudden influx of consumer activity; those who have been without work for many months will work for lower wages than unionized workers and therefore get hired faster. Union membership stood at a peak of 19.4 million members in 1972 but had declined to 8.25 million by 2005. Membership as a percentage of the work force stood at 29.8 percent in 1962 but had declined to 12.5 percent by 2005. Just 5 years later, the 2010 "Union Members Summary," reported that union members made up 12.3 percent (16.9 million) of all wage earners and salaried workers in 2009; this was only a minor change from 2008 when union members made up 12.4 percent of the overall workforce.

By 2009 the private sector included 7.4 million union workers (7.2 percent of the overall private sector workforce). In 2009 43.3 percent of all unionized workers in the public sector worked for local government; this number included teachers, fire fighters, police officers, and other public sector workers.

In 2009 the fields of education, training, and library occupations represented the industries with the highest rates of unionization at 38.1 percent. Finance and related services had the lowest rate of unionization at 1.8 percent, while 14.5 percent of construction and manufacturing labor was unionized. In wholesale and retail (where the highest proportion of small businesses operate) the rate was 5.8 percent in 2009. In professional and business services, another important small business sector, the rate was 2.8 percent. These percentages and statistics will change more dramatically in shorter periods, even quarter by quarter, depending on economic climate, especially in the small business sector.

For cost/benefit reasons unions have tended in the past to target large operations, unless unusual grievances caused unusual organizing activity. One example is the case of the union workers employed by Republic Doors and Windows. In 2008 these workers staged a sit-in at their factory when they were fired without being paid on less than 4 days' notice. While it was their employer who had fired them, it was Bank of America a much larger company (and banking institution) that was withholding their final paychecks. According to an article in the *New York Times* by Monica Davey, "Workers also pointedly blamed Bank of America, a lender to Republic Windows, saying the bank had prevented the company from paying them what they were owed, particularly for vacation time accrued." Then president-elect Barack Obama sided with the union workers of Local 1110 of the United Electrical, Radio and Machine Workers of America. Obama noted, "The workers who are asking for the benefits and payments that they have earned & I think they're absolutely right and understand that what's happening to them is reflective of what's happening across this economy." The sit-in occupation of the Republic Windows factory was successful and the union workers got their compensation as well as other benefits they were owed, including unpaid vacation pay and sick days.

LABOR LAW

The six most important pieces of legislation governing business-labor relations are the National Labor Relations Act of 1935 (NLRA), the Labor Management Relations Act of 1947 (LMRA), the Fair Labor Standards Act of 1938 (FLSA), the Labor-Management Reporting and Disclosure Act of 1959 (LMRDA), the Civil Rights Act of 1964, and the Occupational Safety and Health Act of 1970.

The National Labor Relations Act, which created the National Labor Relations Board (NLRB), gives employees the right to organize and bargain collectively with their employers. In essence, it gives them the right to unionize. It also confers legal protection on employees who try to organize their fellow workers into a union, but also protects nonunion employees from being forced or otherwise coerced into joining a labor organization or engaging in collective bargaining. The act ensures that employees can choose their own representatives for the purpose of collective bargaining, establishes procedures for secret ballot elections, and defines unfair labor practices, to which both employers and unions are subject. This law is also known as the Wagner Act in honor of New York senator Robert Wagner (1877 1953).

The Labor Management Relations Act, known as the Taft-Hartley Act, amended the NLRB in ways that are generally thought to benefit business owners and management. It forbade businesses from launching unwarranted or sudden lockouts of union employees but also imposed restrictions on some union activities in the areas of organizing, picketing, striking, and other activities. It also outlawed the "closed shop" (which required that employers hire only union members) and gave the government the power to obtain injunctions against strikes that "will imperil the national health or safety" if they take place or continue.

The implications of the Labor Management Relations Act are still important in keeping lines of communication open. As Hinda Sterling writes in her 2010 article, "Analysis: Labor-Management Partnership 2.0," for *Government Executive*, "Labor and management officials must develop a shared understanding of what their partnership is trying to accomplish. For example, they could define partnership broadly as using stakeholder involvement and cooperative problem-solving to influence the agency's direction and decisions that affect employees' work environment. Each side should integrate their priorities, such as accountability, which usually ranks high for management, and empowerment, typically a union bargaining imperative."

The Fair Labor Standards Act, also known as the Wage-Hour Act, established the minimum wage for hourly employees and mandatory overtime pay for work in excess of 40 hours a week. This is the law that created the "exempt" and "nonexempt" employee categories, the former being salaried employees who are *not subject* to FLSA and are therefore "exempt" and hourly workers who *are* subject to the law and therefore "nonexempt." All states also have minimum wage rules; where the state minimum wage is higher than the federal, employers must pay the state-set rate.

The Labor-Management Reporting and Disclosure Act, also known as the Landrum-Griffin Act, was in large measure shaped to regulate the internal affairs of unions

and to provide additional safeguards to ensure that the rules laid out in the Labor Management Relations Act of 1947 were adhered to.

The Civil Rights Act of 1964 prohibited employers from discriminating in their hiring practices on the basis of race, religious beliefs, gender, or natural origin later also by age.

The Occupational Safety and Health Act of 1970 created the Occupational Safety and Health Administration (OSHA). It established guidelines and regulations to make workplaces safer and healthier for employees. "Each employer shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his [or her] employees," read one portion of the act.

ORGANIZING EFFORTS AND THE SMALL BUSINESS OWNER

Joshua Kurlantzik, writing in *Entrepreneur* has pointed out that in the twenty-first century unions turned organizing activities toward white-collar and service employees. These jobs are more difficult to move abroad; at the same time, employees were frightened by waves of layoffs and outsourcings and were more prone to seek security. Evidence of such activities is anecdotal, on the whole, and it is difficult to determine whether it constitutes a trend toward (re-)unionization or a rearguard action by labor as it continues to lose membership. Nonetheless, small businesses of the larger size, anyway, may in fact encounter union organizing efforts. At the first sign of such activity in the community, the owner owes it to him- or herself to become familiar with the duties and rights involved.

Under current rules, a union must initially garner sufficient interest from a business's employees (30 percent of the work force is a rule of thumb), before it can petition the National Labor Relations Board for an election by secret ballot to determine whether the workforce will join the union in question; if the interest level is 50 percent or higher, union recognition may be granted without an election.

During an organizing campaign, the owner of a business must safeguard him- or herself from engaging in activities normally held to be unfair practices contrary to workers' rights to organize. These include, among others:

- Polling employees about their attitudes toward the proposed union.
- Suggesting that a union victory will spell a loss of employment or benefits.
- Once an election agreement has been reached, withholding employees' names and addresses from union organizers.
- Lobbying against the union in visits to employees' homes.
- Setting uneven rules for solicitation at the company for those for and against unionizations.
- Favoritism toward antiunion employees.
- Discrimination against pro-union workers.

Dealing with Election Outcomes. Once the NLRB-supervised election has been held, the small-business owner is confronted with one of two outcomes. The business may carry the day but then will face disappointed employees who had hoped for unionization. Also, the matter may not be over. The union may apply for a nullification of the results (based on allegations of unfair labor practices, etc.) or simply regroup and make another attempt later.

If the union wins the vote, the small-business owner has four choices. He or she can take one of several actions:

- Charge the union with unfair labor practices and attempt to have the election results annulled.
- Sell the business and leave the problems to the new owner.
- Go out of business.
- Recognize the union and enter into collective bargaining arrangements in good faith.

The collective bargaining agreement is basically a contract between the business and the union that explicitly states how workplace issues between management and employees will be handled.

LIVING WITH THE UNION

Small businesses do not necessarily suffer from operating in the same markets where unions exist, even prominently. As Sarah Klein put it, writing for *Crain's Chicago Business,* "A union is supposed to be bad for business. Conventional wisdom holds that unions drive up costs and create a more contentious workplace. But labor relations are just another business problem; look hard enough and you'll find entrepreneurs who've figured a way to make it work in their favor." Klein offers four cases of successful "cohabitation." In the first case a restaurant experienced a 12 percent increase in the base pay of wait staff but discovered that its turnover rate significantly declined. In a second case a printing shop became unionized and saw its costs rise in consequence, but then discovered a new business serving insurance and money-management firms that required the "union label" on all of their printed goods. In the third case, a unionized parking operation found that an increase in hourly pay of $2 also purchased management help from the union in the form of employee training, reduced pilferage, and lobbying help in keeping down parking

garage taxes. In the final case, a specialized cleaning company discovered that unionization, which cost between $20 and $50 per hour more, resulted in incentives for workers to get better training, which the company translated into higher sales.

LAYAWAY

Layaway is a payment method that enables consumers to purchase items by making installment payments over time. The item remains with the seller until the final disbursement is paid; then the consumer can take the product home. The majority of layaway programs charge no interest and do not require a credit history, although many tack on a small fee typically about $5 and require that all payments be made within a specified time period. If a customer fails to make the necessary payments, many retailers offer a refund or store credit minus a cancellation fee and the item is placed back into circulation for sale.

The concept of layaway was introduced in the nineteenth century and enjoyed wide popularity over the years. It served as a lifeline for consumers struggling through the Great Depression in the 1930s, when unemployment rates approached 25 percent and ready cash was scarce. Layaway remained popular until the 1980s, when relaxed banking regulations enabled financial institutions to increase interest rates on unpaid credit card balances. As a result, banks began issuing credit cards to just about anyone. Consumers preferred the ability instantly to take home their purchase rather than waiting until after the final layaway payment. Retailers also embraced the credit card craze because it allowed them to realize revenue immediately, reduce time and costs associated with managing extended customer accounts, and eliminate the need for storage space required to house layaway merchandise. Consequently, layaway began to fade as an attractive payment option.

According to business solutions supplier Jesta I.S., credit card use quickly spun out of control, with average household debt soaring to 114 percent of household income by 2005. By 2008 Chapter 7 bankruptcy filings had jumped a staggering 47 percent from the year before. Credit-strapped consumers responded by slashing their retail spending, and sellers suffered their worst declines in decades. The situation sparked a resurgence in layaway programs.

Several of the big-name national retailers who utilize layaway TJK Companies (parent company of TJ Maxx and Marshalls), Burlington Coat Factory, and Sears Holdings Corporation (Sears, Kmart) said that demand for layaway is stronger than it has been in years. Consumer demand surged so much at Kmart that the company took the unconventional step of positioning its layaway program as the centerpiece of its national 2008 holiday advertising campaign.

ONLINE OUTSOURCING FOR LAYAWAY

Brick-and-mortar operations are not alone in embracing the layaway concept. Several layaway Web sites emerged on the scene around 2004 and 2005 as retail offshoots or independent outsourcing enterprises. Since then, most have reported big increases in business. One company called eLayaway, which offers automated layaway-payment processing for customers and retailers, experienced a tenfold membership leap from 7,500 to 75,000 during 2008. The Tallahassee, Florida-based company does not handle merchandise; it offers payment systems for some 1,200 retailers. The company explains: "For a 1.9 percent

transaction fee, consumers can set up an online schedule that automatically withdraws payments from their accounts. The fee includes the cost of shipping the item to the customer when the payments are complete." The company also offers layaway options for nontraditional purchases, such as travel and medical procedures, as part of its layaway outsourcing services.

LAYAWAY PROGRAM PARAMETERS

Businesses that want to develop layaway programs of their own should keep in mind that layaway programs are not suitable for every business. The type of operation plays an important role in determining suitability. For example, grocery stores tend to stock products with short shelf lives (fresh produce, dairy) that are not appropriate for extended payment schemes. Other types of businesses may need to impose restrictions to make layaway programs work. Theater tickets, for instance, may be offered for layaway but only within a timeframe prior to the performance to ensure that full payment is received before the curtain rises. Other important considerations include physical storage capacity, sufficient availability of personnel, and technical infrastructure.

Once the decision has been made to implement a layaway program, the small-business owner must determine the precise policies and procedures that will govern the program and write them out clearly. Businesses should:

- Determine which merchandise will be eligible for layaway. Consider price points and establish a cutoff line for offering layaway. There may be little benefit in offering layaway for a $10 item, but for items selling at $100 there may be some advantage.
- Set the amount of initial deposit. It could be a designated dollar figure or a percentage of the total purchase price.
- Establish the length of the layaway period. Some companies offer extended timeframes up to a year, while others require full payment within a few months or even weeks.
- Decide the frequency of payments within the layaway period. It is also important to have a policy about how to handle late payment and nonpayment, such as whether penalty fees will apply or if refunds will be issued.
- Determine whether transaction fees will be included as part of the layaway services, and if so the amount of those fees and when they will be paid.

Even the best layaway policies will falter without the resources to accommodate them. That is why it is essential to ensure inventory space for items on layaway. It helps in locating the merchandise quickly and preventing accidental resale of an item. Similarly it is imperative to have efficient and integrated processing systems that can accommodate multiple transaction types (e.g., making a layaway payment while purchasing a new item outright), real-time tracking of order status and physical merchandise, and on-demand customer and financial reporting. At the same time, personnel must be available and equipped to manage each part of the layaway process in order for it to run seamlessly and achieve optimal results for both the customer and the business.

LAYAWAY PROGRAM SUCCESS

There are several steps businesses can take to diminish the risk of problems arising from a layaway program. An attorney should review the final policy and forms to be sure they meet federal and state regulations and fully protect the interests of the business. Clear communication with the customer is also essential, so the business must obtain complete contact information and to spell out the terms of the layaway payment plan, supported by written documentation. It is important that the layaway item is described in detail and that the consumer receives a receipt for each payment made; a copy should be kept for business records. The customer should sign off when the item is picked up.

Businesses can use the repeat touch points with customers the multiple interactions between the business and consumer throughout the layaway process to encourage larger orders and repeat purchases. Consumers get the convenience of installment payments without having to use a credit card, and businesses generate good will and potentially more revenue.

LAYOFFS, DOWNSIZING, AND OUTSOURCING

A "layoff" is an action by an employer to terminate employees for lack of work. The term connotes that the termination is temporary but it may well become permanent. A "downsizing" simply means releasing employees because the operation no longer needs them; reorganization or restructuring of the institution has eliminated jobs. An "RIF," which stands for "reduction in force," is an old and rather straightforward term, its most likely source being governmental and military changes in employment: both actually take place from time to time. Other additions to this terminology are "outsourcing" or "off-shoring," meaning that the work is being transferred to another organization either domestically or overseas.

The recession that began in 2008 triggered a great number of layoffs. According to *CNN Money,* "Initial jobless claims from mass layoffs totaled more than 2.1 million in 2008, up from about 1.6 million in 2007, and the highest figure in six years. The largest number of layoffs occurred in the Midwest, with more than 676,000 jobs lost en masse."

OTHER KINDS OF LAYOFFS

Sometimes, layoffs are a necessary corollary to seasonal or intermittent employment common in some industries, for example in construction, where building activity typically slows or stops in the winter months and resumes in spring. Industries that manufacture goods sold for winter use often have high levels of production (including lots of overtime) in the summer. The inverse of that takes place when spring and summer goods are made in winter. Industries highly linked with the tourist season typically have layoffs. People employed in these types of activities adapt to the layoffs by having alternative forms of employment in the "off-season." As seen in 2008, layoffs also take place in times of economic downturn because overall demand declines. Producers will cut back from three shifts to two or one or release some employees even when only operating one shift. Economy-driven layoffs are not always permanent, and workers may be "called back" when things pick up again.

The laid-off worker has no guarantee of being called back to work; similarly, the employer may not be able to hire back labor if contracts do not renew or the business does not pick up. It was a telling sign of the times that the Department of Labor (DOL) began collecting data on layoffs in April 1995 for the first time and has since published such data monthly. For example, in January 2010, the monthly report from the DOL states, "Employers took 1,761 mass layoff actions involving 182,261 workers." Even more revealing is the fact that the DOL later added categories such as layoffs due to "overseas relocation" and "import competition" the latter category indicating jobs lost because work in-house has been replaced by imports.

Downsizing typically has multiple causes of which one may well be increased productivity. According to the DOL, productivity in manufacturing (output per hour) increased on average 2.7 percent *a year* from 2000 to 2009 and 3.2 percent a year in business as a whole. If demand for goods and services is steady, this means that each year fewer workers are needed to supply the economy. The second factor behind downsizing is declining revenue due either to a poor economy and a drop in consumer activity, or increased foreign competition. Finally, if labor is available at lower costs overseas and the work can be transferred, business will relocate jobs to reduce costs.

SMALL BUSINESS IS NOT EXEMPT

Small business is also subject to seasonal patterns and therefore lays off employees as needed, calling them back at a later time. More painfully, however, the small business must also respond to economic and market pressures and therefore must occasionally reduce its employment because the revenues are just not there. Every owner, therefore, should have plans and policies for reducing employment permanently. Such managerial techniques involve: 1) conformity with law; 2) appropriate communications; and 3) employee assistance, sometimes called "outplacement" in human resources jargon.

In common parlance the first issue is based on fairness, but fairness is enforced by employment and civil rights statues. When downsizing the workforce, the owner must base his or her actions on the requirements of the business and make every effort to avoid even the suggestion of bias against protected minorities: women, the disabled, racial minorities, workers over the age of forty, and veterans. In many cases, job terminations will be based on functions that can no longer be supported; if these have to be reduced rather than eliminated, a neutral criterion such as job tenure may be used, with the most junior employees terminated first. Such a rule would also apply if an across-the-board reduction, based on a percentage of all employees, is adopted. The rules being applied should be made public so that their fairness is visible to all involved, whether they stay or leave.

Communications are important both to maintain the morale of employees retained and to hold the goodwill of those discharged. They may be back again. The practice of announcing a downsizing late on Friday or the day before Christmas reflects adversely on the owner's courage and tact, of course. Employees may have to leave, but they appreciate a clear statement of the reason why

they are being terminated and like to have as much notice as possible.

Some owners feel that they may lose the effective labor of those laid off by announcing early; but in almost all such situations, employees have long anticipated problems; therefore early notice may actually improve productivity during this period by removing uncertainty. If the selection rules are obviously fair and impartial, all employees will react favorably toward the company. This will be doubly true if the announcement includes information about help the employer intends to provide to those leaving. Announcing layoffs in a casual environment where an open forum is invited will allow employees to ask any questions they may have, thus clearing up any major misunderstandings and helping clarify that what is happening must happen, not that it is happening because the owner is greedy or discriminatory.

Providing outplacement help involves extra work on the owner's part but invariably has a favorable effect. Such help may involve getting assistance from one or more employment agencies, providing information on how to file for unemployment benefits, counseling by the owner or a third party, helping to prepare good resumes, providing leads and contacts, and preparing letters of recommendation.

Many owners, quite naturally, feel that the need to downsize is a sign of personal failure and this despite a good track record of long and successful employment of lots of people. Experience, however, teaches that business does have its downs as well as ups and also teaches that the owner will benefit from minimizing his or her own frustrations. A good way to do that is trying to help those affected.

ALTERNATIVES TO DOWNSIZING

A few companies have had, and continue to have, "no-layoff" policies or, more realistically, a "no-layoff" philosophy. Julia King, writing in *Computerworld*, described two such companies, Lincoln Electric and FedEx. "The employment practices go by different names," King wrote, "but the spirit and business strategies behind them are the same. By shunning downsizing as a matter of corporate values, both companies are looking to create a fiercely loyal and productive workforce, which in turn generates high customer satisfaction ratings and bottom-line results. And so far, it's a strategy that seems to work well, in both good economic times and bad."

Elizabeth Smith Barnes, writing in *Workforce Management*, described the no-layoff policy of Hypertherm, Inc. Barnes provided a telling quote from the company's founder, Dick Couch, revealing the mind-set behind such policies. "I was at a conference on entrepreneurship at Dartmouth," Barnes quotes Couch as saying. "The guy next to me was a young, very bright venture capitalist who believed that the purpose of business is to maximize shareholder equity. I say that the purpose of business is to satisfy the customer and to focus on the development and well-being of your associates, from which good things will happen including the 'accidental' benefit to shareholders. It seems some corporate folks are never going to understand the value of no layoffs because their fundamental philosophy about what we're in business for is very different."

However, no-layoff policies are not realistic for many small businesses, and certainly not realistic at all for the marketplace in general and global companies. However, the practices of leaders suggest ways and means both of avoiding layoffs and dealing with cost problems creatively. Techniques mentioned include careful hiring, cross-training of employees so that many are able to shift from job to job, intense employee involvement in the business through suggesting programs and innovations, and, in the extreme case, pay reductions or reduced work hours so that all employees stay and share the hardship in common.

LEARNING CURVES

Learning curves graphically portray the costs and benefits of experience when performing routine or repetitive tasks. Also known as experience curves, cost curves, efficiency curves, and productivity curves, they illustrate how the cost per unit of output decreases over time as the result of accumulated workforce learning and experience. That is, as cumulative output increases, learning and experience cause the cost per unit to decrease. Experience and learning curves are used by businesses in production planning, cost forecasting, and setting delivery schedules, among other applications. The nature of how humans learn, how the economy works, how supply and demand can be forecast, and how businesses can excel or fail can often be understood using various learning and cost curves.

Learning curves are geometric curves that can be graphed on the basis of a formula. Typically, the X (horizontal) axis measures cumulative output, and the Y (vertical) axis measures the cost per unit. The curve starts with a high cost per unit at the beginning of output, decreases quickly at first, then levels out as cumulative output increases. The slope of the learning curve is an indication of the rate at which learning becomes transformed into cost savings.

LEARNING CURVE BASIC STANDARDS

An 80 percent learning curve is standard for many activities and is sometimes used as an average in cost forecasting and production planning. An 80 percent learning curve means that, for every doubling of output, the cost of new output is 80 percent of prior output. As output doubles from one unit to two units to four units, the learning curve descends quite sharply as costs decrease dramatically. As output increases, it takes longer to double previous output, and the learning curve flattens out. Thus, costs decrease at a slower pace when cumulative output is higher.

One can explain the shape of learning curves another way. When a new task or production operation begins, a person or system learns quickly, and the learning curve is steep. With each additional repetition, less learning occurs and the curve flattens out. At the beginning of production or learning, individuals or systems are said to be "high" on the learning curve. That means that costs per unit are high, and cumulative output is low. Individuals and systems "move down" the experience or learning curve by learning to complete repetitive tasks more efficiently, eliminating hesitation and mistakes, automating certain tasks, and making adjustments to procedures or systems.

Some theorists believe that learning curves are not actually curves, but more like jagged lines that follow a curving pattern. They assert that learning occurs in brief spurts of progress, followed by small fallbacks to previous levels, rather than in a smooth progressive curve. Such a model of learning, however, does not affect the usefulness of learning curves in business and production applications.

The phrase, of course, has spread from management science to business and other activities generally. In the broader frame "learning curve" has come to mean that every new activity requires the acquisition of knowledge and skill. It takes time (and therefore money) to master new jobs and new fields, but accumulated knowledge provides efficiency and leverage.

EXPERIENCE CURVES: WHAT MATTERS IN BUSINESS IS KNOW HOW

In today's global marketplace, nearly every industry will face changes in how business is done, how products are made, and how services are delivered. For these reasons, it is important that employees continue to learn more and more about their trade while they maintain their jobs. In general, a given tradesperson can improve his or her overall effectiveness and productivity within a small business. This will behoove both workers and the employer: higher productivity means more product in less time, and it also means that the workers, having educated themselves on the job, have made themselves more valuable to the overall operation.

LEARNING ORGANIZATIONS

The term learning organization refers to the orientation of organizational stakeholders towards the continuous pursuit of new knowledge and approaches for executing work processes both at the individual and collective level. The key objectives of learning organizations are closely related to those of research & development (R&D) activities in organizations.

Notably, though, the two concepts are diametrically different from each other in terms of adoption and application. Whereas R&D is a formal component of an organization's strategic planning, organizational learning has more to do with voluntary search for new approaches to work processes by organizational stakeholders either individually or collectively. Moreover, the orientation towards learning organizations occurs through gradual changes in organizational culture, while R&D can be adopted and applied in organizational operational structures at any point in time.

Indeed, the core activities of learning organizations are identifiable as the exploitation of new thinking patterns and a collective approach to the breaking of new grounds of knowledge. The modes of operations in learning organizations are subject to the influence of self-driven initiatives by individual employees and work groups. The concept of a learning organization is a key ingredient of operations for small business enterprises seeking to achieve competitive advantage. By and large, learning organizations must demonstrate commitment to:

- Well-defined and interactive communication processes
- High frequency of inquisitiveness among employees
- Guaranteed feedback communication channels
- Adequate support for individual and group efforts targeted towards the generation of new and emerging work approaches

The prevalence of interactive communication processes dismantles the difficulties associated with hierarchical flow of information through flexible peer-to-peer communication exchanges across hierarchical structures. Frequency of inquisitiveness among employees, on its part, breeds a culture of peer-to-peer consultations and an increased appetite for understanding interdisciplinary organizational functionalities.

Guaranteed feedback communication channels portend a motivational impact among employees as they gain confidence and self-efficacy while discharging individual and collective organizational responsibilities. Organizational support for individual and group-initiated knowledge initiatives encourages continuous exploration for alternative and enhanced approaches for improving overall operational and strategic performance in business organizations.

HISTORICAL PERSPECTIVE OF LEARNING ORGANIZATIONS

Learning organizations is a management conceptual framework that is closely identifiable with the work of Peter Senge (b. 1947). The concept emerged in the 1980s when it was used in reference to pragmatic organizational entities that pursued experimental approaches to business process in response to markets characterized by high levels of turbulence and competition.

Arguably, the proponents of the organizational learning concept had in mind the lengthy economic recession that hit the United States in the early 1980s, a period during which many business organizations experienced huge losses or closed down all together. To this end, business organizations kept on crafting appropriate strategic measures designed to guarantee their survival during periods of economic difficulties but also to optimize existing business opportunities.Senge played a pivotal role in reigniting incisive discussions on the subject of learning organizations through his 1990 book *The Fifth Discipline: The art and Practice of Learning Organizations.* In fact, Senge is credited with having catapulted organizational learning to prominence in both the corporate world and academic domains. Senge earned his graduate engineering degree and social systems modeling Ph.D. from Stanford University and Massachusetts Institute of Technology, respectively.

Senge devoted much of his study of organizational dynamism and adaptation strategies to operational challenges of varying natures imposed by an ever-changing business environment. He also founded the Society for Organizational Learning (SoL) in 1997, a not-for-profit

organization governed by members that went on to replace the Center for Organizational Learning previously run by the Massachusetts Institute of Technology. Senge's dalliance with the concept of learning organizations saw him earn distinguished accolades and recognitions in the United States and across the globe. In 1999, for example, the *Journal of Business Strategy* accorded him recognition as one of the twenty-four most influential business strategists of the twentieth century. His pragmatic ideas on organizational learning have continued to resonate in the corporate world as well as among small and medium-sized business enterprises through the twenty-first century.

CHARACTERISTICS OF LEARNING ORGANIZATIONS

Learning organizations are usually characterized by an expansion of people's capacity for creating the desired results in work processes and responsibilities. In his critical analysis of learning organizations, Senge modeled his arguments on five main pillars of reference: personal mastery, mental models, systems thinking, team learning, and shared vision. Whereas the first two characteristics are premised on transformation of employees or other key organizational stakeholders at individual levels, the last three characteristics are heavily reliant on group transformation dynamics in organizations.

Personal Mastery. The characteristic of personal mastery has at its core the ability to remain realistic while articulating future prospects at the individual level in an organizational set up. Individuals who are committed to self-mastery demonstrate open and honest receptiveness to prevailing realities and constantly seek clarification to their visions. Ultimately, self-mastery stands to reap greater benefits if individuals are:

- Exposed to continuous interactions with organizational leaders who have the potential to exert positive influence
- Allowed to share and express their experiences openly
- Subjected to frequent interactions at different levels of supervision
- Encouraged to follow up on feedback whenever seeking clarifications
- Inclined to achieve favorable balance between work responsibilities and personal life

The successful adoption of self-mastery as a component of learning organization processes potentially enhances the capacity of a business enterprise to harness sustained employee commitment to organizational operational and strategic objectives. Employees and other members of the organization gain the ability to confront any challenges that are related to their work performance and contribute suggestions for improving work processes.

Mental Models. Mental models refers to a transformational attribute that defines the capacity of an individual within an organization to draw realistic comparisons between perceptions and the vision that guides one's beliefs. In effect, an individual achieves coherence in understanding by pursuing a reconciled position between reality and perception. Mental models are largely influenced by logic and philosophical orientation at individual levels such that learning organizations stand to benefit from the development of potentially valuable habits and talents among employees. Progressive individuals in learning organizations facilitate the development of their mental models by:

1. creating learning schedules;
2. demonstrating openness in their self-reflections;
3. practicing persistence in seeking clarifications; and
4. continuously adapting to changes in organizational work processes.

The subjection of learning organizations to mental models potentially leads to diminished defensiveness and reflexive attitudes among employees when performing their routine duties. As such, the organization gets to breed functional behavioral patterns supported by the willingness and readiness of employees to confront difficult work situations.

Shared Vision. Shared vision is a characteristic of learning organizations that focuses on the creation of a common futuristic position among individuals work groups in an organization. Shared visions draw impetus from mutual understanding of both short-term and long-term objectives that have significant implications for the future survival of the organization. Group-initiated measures such as honesty, trustworthiness, spirit of cooperation, genuine participation of group members, disseminative communication attitudes, and interpersonal empathy are paramount ingredients of successful development of shared vision in the organizational culture. Indeed, shared vision enables work groups to adjust to organizational changes with the desired speed and convenience as members collectively contribute to the achievement of acceptable standards of compliance. Similarly, the alignment of the interests of each of the members of a group to the group's overall work and communication objectives eliminates conflicts and enhances interpersonal understanding.

Team Learning. The team learning characteristic of learning organizations bears some similarities with shared

vision in that it emphasizes the nurturing of genuine interactions and relationships among work groups in organizations. To this end, individuals are encouraged to withdraw any forms of reservations about each other so as to be able to initiate objective intragroup dialogue as opposed to passive discussions and negotiations. A learning organization seeking to initiate and continuously enhance its team learning characteristic should always prioritize the creation of effective feedback-oriented communication processes both upwards and downwards in its hierarchical structures.

Dialogue among members of a group should always be premised on building of consensus rather than mere rubber stamping of predetermined decisions. The activities of work groups should also be informed by creativity, imagination, and ingenuity among members. Careful consideration of the team learning attribute in a business organization ignites a collective sense of awareness for a work group, promotes indiscriminative learning and free exchange of ideas across the entire hierarchy of an organization, and stimulates objective cohesion.

Systems Thinking. Systems thinking is a group transformation characteristic that defines the contextual approach to thinking with due reference to the consequential impact of actions to all parts and components of a system. By and large, systems thinking encourages dynamism in building interrelationships in organizational processes. The aspects of organizational knowledge and communication gain increased significance as different work groups pursue integrative approaches to work. The end result of successful inception of systems thinking in organizational processes is the achievement of continuity in learning processes and revolutionized approaches to change.

SETTING THE FOUNDATION FOR A LEARNING ORGANIZATION

Learning organizations exhibit particular types of organizational change processes and especially knowledge acquisition processes. Indeed, a learning organization dismantles any traces of authoritarian hierarchical structures by encouraging active rather than passive contribution of employees in decision-making processes in the organization. The organization can develop and maintain the desired standards of knowledge and skills among employees at the individual level and for the entire organization as well.

Ultimately, the provision of development opportunities for employees in an organization is an inducement strategy that motivates employees and also ignites devotion in their contributions to organizational work processes. Bard Kuvaas and Anders Dysvik further emphasized that it is particularly important for an organization to demonstrate that the work contributions of employees are always valuable and appreciated. Such gestures empower employees and enable them to draw positive perceptions between the value of their individual and group efforts on the one hand and their individual well-being on the other. Employee development further creates interests for knowledge advancement through pursuit of educational and training programs.

APPROACHES TOWARDS BECOMING A LEARNING ORGANIZATION

The transformation of organizational cultural orientation into that of a learning organization is not a preserve of large corporate entities only but is also of significance to small business enterprises. The concept of learning organizations is a source of competitive advantage for organizations seeking to utilize the continuous pursuit of knowledge as a strategy for keeping pace with changes imposed by globalization and technological advancements. However, the transformation of an organizational entity into a learning organization cannot be achieved over a short spell of time. The process requires long-term commitment and gradual adoption of relevant strategies targeted towards changing the organizational culture.

The aspect of developing learning within the cultural context of the organization has been emphasized by Moya Mason in an article titled "What Is a Learning Organization?" Evidently, gradual acculturation of learning into the structures of an organization provides the basis for creating a continuous and sustainable learning culture capable of outliving different generations of employees.

The Toyota Motor Vehicle Corporation is one example of an organization where continuous learning is synonymous with organizational culture. The company incorporated team work and continuous employee training within its core production systems with a view to empower employees through multitask responsibilities. To this end, work teams are accorded numerous minor responsibilities such as repair of equipment in exercises that also involve the participation of team leaders.

Peter Senge's works have always emphasized the need of organizations to be able to design leadership structures that are effective and whose composition are a reflection of the different people across all levels of functionalities in the organizations. There must also be adequate recognition of the fact that the members of an organization are capable of seeking solutions to problems facing the organization by pursuing knowledge through continuous learning. The stated measures should then be coupled with the creation of a culture of trust, open approach to issues, and honesty so as to be able to empower employees through allocation of decision-making responsibilities.

However, the gradual change in organizational culture can only be successful if the organization endeavors to shift the mindset of employees from a self-centered perspective to a collective perspective of themselves in the organization. In an article titled "Make Learning Matter: Become a Learning Organization," Susan Heathfield proposed three approaches towards becoming a learning organization, namely:

1. beginning with the leadership role;
2. creating a company-specific learning organization setup;
3. debriefing of each and every project and initiative.

Leading by Example. The aspect of beginning with the leadership role has a lot to do with the commitment of leaders to learning from the perspective of role models. Leaders of the organization bear the responsibility of crafting an appropriate vision that defines the reasons for the existence of an organization and subsequently communicates the same vision to the rest of the organization. More importantly, communication of the significance of continuous learning and improvement of work processes should remain paramount among the strategies adopted by organizational leaders. However, the leadership of an organization should always endeavor to consider alternative views about a vision from the rest of the organization's employees through consensus building. The approach of constant consultations with employees provides managers with the much-needed facilitation for acting as agents of change and models of continuous learning processes.

Kaizen is one good example of a continuous learning strategy that is practiced by managers in learning organizations in the implementation of continuous improvement objectives. *Kaizen* is a simple model for effecting change in organizations through the convergence of small improvement efforts contributed by all employees. Indeed, *kaizen* is premised on the implementation of continuous efforts designed to enhance the overall performance of an organization. The involvement of each and every member of an organization in the continuous improvement processes is what informs the core objectives of *kaizen*. Normally, organizations apply *kaizen* through a two-pronged approach consisting of maintenance and improvement.

The maintenance aspect involves emphasis on the full implementation of the prevailing standards of operations, management, and technology. As Vadim Kotelnikov observed in his article "Kaizen: The Japanese Strategy of Continuous Improvement," the maintenance attribute is observed by establishing appropriate policies and standard operating procedures (SOPs) followed by the emphasis on the mastery of the SOPs by all organizational members. Improvement, on the other hand, entails continuous reviews of the prevailing organizational processes with the objective of establishing enhanced operational, managerial, and technological standards. Kotelnikov pointed out the example of suggestion systems where two-way communication is integrated in organizational work processes to enable employees to interact freely with managers and amongst themselves.

Creation of Own Learning Organization. The creation of a company-specific learning organization is an approach that seeks to bring on board the contribution of every member of an organization in the transformation processes geared towards becoming a learning organization. According to Heathfield, creation of an own learning organization can be achieved through simple actions such as reading together and attending training programs. The collective pursuit of self-enhancement activities within different groups in an organization enhances cohesion and interpersonal communication among members of the group. The strategy is particularly applicable in the development of leadership programs at different levels of organizational hierarchies. For example, departmental heads in an organization can form an effective reading group through which they can share insights into different ways they can enhance their leadership styles. Similarly, a head of a particular department can form a reading group for the purpose of discussing different chapters of a book that are relevant to the work and responsibilities of members of the department.

Canon, for example, developed a working system where workshop supervisors were required to take a 30-minute break once a day solely to meditate on ways of introducing improvements in the work setup. As such, the workshop supervisors utilized the brief breaks to think through the work process with the objective of coming up with appropriate suggestions for improving work processes in their designated workplace. Canon even went a notch higher by incorporating a continuous program for optimizing employee performance at the workplace called the Five S's (*Seiri*, *Seiton*, *Seiso*, *Seiketsu*, and *Shitsuke*). These are Japanese expressions that mean sort, set in order, shine, standardize, and sustain, respectively, and they serve as the guiding framework through which employees continuously improve their job performance.

Training programs and professional conferences are also appropriate sources of skills and knowledge for pursuing new ways of doing things and ultimately improving work performance. An organization can also enhance learning processes among its leaders through the provision of alternative learning materials such as electronic notebooks, information databases, or Web sites. Generally, leading by example is designed to achieve the overriding objective of encouraging learning through the empowerment of employees.

Debriefing of Organizational Projects and Initiatives. The significance of continuous learning in organizations is clear because experience has shown that workplace improvement programs have a direct bearing upon the performance standards of an organization. Debriefing of organizational initiatives and projects provides leaders and team members of an organization with the opportunity to assess the factors that lead to the success or failure of its strategic programs like new product development or introduction of information systems.

The debriefing process enables the organizational leaders to set benchmarks to improve on successful projects or, in case of a failed project, design measures to avoid failure in future. For example, management styles in Japan not only provide employees with opportunity to raise different forms of suggestions but also encourage them to do so frequently. Organizational managers then proceed to incorporate some of the employee suggestions in the overall operational objectives and strategies of the organization. Employees are also accorded due recognition for their contribution towards improvement of work processes.

By heralding employee contributions towards the smooth running of an organization's short-term and long-term affairs, the organization's leadership gets to build positive perceptions among its employees. In a study titled "Front Line Managers as Agents in the HRM Performance Casual Chain: Theory, Analysis and Evidence," John Purcell and Susan Hutchison observed that the perception of employees of the behavioral aspects of an organization's leadership directly related to their work performance and commitment to organizational objectives. The assumption is particularly true with regard to organizations that rely on line managers in the execution of significant human resource management responsibilities. Realistically, line managers portend influential impact on the outcome of employee work initiatives relative to their perception of the organization in its entirety.

The key areas of employee perception include the effectiveness of supervisory support and the level of commitments to employee development investments. This directly impacts employee commitment and the quality of their work. The debriefing process should not be treated as a chance for blaming others for the failure of a project or bestowing too much praise on an individual for the success of a project. Rather, the process should be treated as an avenue for pursuing greater knowledge and understanding about the key factors that contributed to the success or failure of a project.

LEASING PROPERTY

A lease is a contract between an owner and a user of property. In business lease agreements, the owner (lessor) receives financial compensation and in exchange, the tenant (lessee) is given the right to operate his or her

business on the property. There are many different types of property lease arrangements and many different considerations that business owners should weigh before entering into such a contract. Leasing is very popular with small-business owners: such arrangements allow new or financially strapped businesses to divert their capital to other business needs. Indeed, many small businesses operate in leased facilities for their entire existence. Leasing property, of course, may itself be a small-business activity.

Web sites are increasingly easy to create and maintain, and many small businesses start first with a virtual, Web-based business before growing to a bricks-and-mortar site. "E-tailors" are a new breed of retailers who sell exclusively online and do not operate a traditional storefront. Ebay.-com has been the platform for the launch of many small businesses that sell niche products. Other online auction or marketplace sites, such as etsy.com for handmade items, provide a low-overhead way for a business to start selling to customers. Small business owners may run the shipping logistics out of their home, or lease a space that does not need to be prime, high-rent real estate for shopping.

In addition to the use of Web-based retail, there are many kinds of property to lease, including mall kiosks and food carts. Many urban centers have seen an explosion of food carts. Portland, Oregon, had 461 mobile food carts registered in 2009, representing a 25 percent increase from 2008, according to a January 2010 article by *Oregon Business.* Vendors specialize in a variety of food, from frog legs to Thai to tacos. Food carts can be financed like an automobile or purchased used.

Business owners should be aware that lease costs are more expensive in high-traffic or highly visible areas. Lease terms are largely negotiable and can even be renegotiated after the lease is signed under certain circumstances. Declining property values and occupancy rates can create an upside for business owners looking to sign a new lease or renegotiate lease terms. Before signing the lease, business owners should inquire about leasing incentives, such as a free period of rent, free improvements to the property, or paid moving expenses. A business owner already leasing during a recession can try to renegotiate a lease if the landlord would prefer lowering rent to lessee going out of business and no longer paying rent.

TYPES OF PROPERTY LEASES

There are several different types of property leases, including full-service lease, gross lease, net lease, and percentage lease.

Full-Service Lease. This type of lease is used primarily in multitenant office buildings. In essence, lessees who agree to such arrangements pay a single lump sum for a wide range of supplementary services in addition to the lease payment. Under the terms of full-service leases, the landlord is responsible for providing a number of different services for his or her tenants, including security, maintenance, janitorial, and various utilities (water, electricity, air conditioning, heat).

Gross Lease. Under the terms of a gross lease contract, the lessee pays the lessor a gross amount for rent (as well as sales tax when applicable). Property costs such as property taxes, insurance, and maintenance are the landlord's responsibility; the tenant is responsible for utilities. Sometimes the lease contract will include provisions that require the tenant to cover property costs that go over a certain specified level.

Variations of this basic lease arrangement include the flat lease and the step lease. The flat lease is the most basic type of agreement and generally the most popular with small businesses. It calls for the lessee to pay a flat set price for a specific period of time. The step lease, on the other hand, calls for a gradual escalation of the base rent payment over time in recognition of the likely rise in owner expenses in such areas as taxes, insurance premiums, and maintenance. A related lease contract, usually known as the cost-of-living lease, includes rent increases based on general inflation figures rather than increases in specific expenses.

Net Lease. The net lease is the most ubiquitous of the various lease contract types. Under the terms of a net lease, the tenant pays the landlord a base rent plus an additional sum that covers the tenant's share of property taxes. When taxes increase, it is the tenant's responsibility to cover those costs. The obligations of each tenant are figured by determining what percentage of the total facility is occupied by each tenant; thus a tenant occupying 20 percent of the facility pays 20 percent of the increase.

Variations of the basic net lease include the "double-net" and "triple-net" lease. Under a double-net lease, the tenant is responsible for picking up added insurance premiums as well as tax increases; under triple-net leases, tenants are responsible for covering insurance premiums, tax increases, *and* costs associated with maintenance and repair of the building, the parking lot, and other areas used by the lessee. The triple-net lease is popular with landlords for obvious reasons; small-business owners should note that such arrangements sometimes make landlords less attentive to upkeep in these areas than they might be if they had to foot the bill themselves.

Percentage Lease. This arrangement calls for tenants to pay a base rent and sometimes also a percentage of the lessee's gross revenue. This percentage, which can run as high as 10-12 percent in some contracts, is paid on an annual, semiannual, or quarterly basis (some malls and

shopping centers, however, call for even more frequent payments). This arrangement is a favorite of lessors with property in coveted retail areas. Tenants are less favorably inclined, but the laws of supply and demand often make it possible for owners of desirable property to insist on it. Small-business owners should fully understand what the contract defines as "gross revenue." "Be specific in how you define gross sales," wrote Fred Steingold in *Legal Guide for Starting & Running a Small Business*. "Depending on your type of business, certain items should be deducted from gross sales before the percentage rent is determined. Here are some possibilities:

- returned merchandise
- charges you make for delivery and installation
- sales from vending machines
- refundable deposits
- catalog or mail-order sales
- sales tax

In short, make sure your lease excludes all items that overstate your sales from the location you're renting."

ADVANTAGES AND DISADVANTAGES OF LEASING

The Small Business Administration (SBA) counsels small business owners to consider a variety of factors when weighing whether to lease or buy property. These considerations include:

- Operating requirements if the business's operating requirements are expected to change significantly over the next several years, leasing would probably be preferable, since it allows businesses to move more easily.
- Capital supply and capital needs. Leasing frees up a greater percentage of a small business's capital for other operating needs (advertising, production, equipment, payroll, etc.). If the business does not have a lot of extra cash on hand (and few small businesses do), then leasing may be the more sensible choice. This is probably the biggest reason why small companies lease.
- Financing and payment flexibility. It is generally easier to secure financing to lease rather than purchase a property. In addition, leases can be spread out over longer periods than loans and can be structured to compensate for cash flow variations (the latter can be an important factor for seasonal businesses).
- Resale value. Is the value of the property likely to increase? If so, how much? Many small-business owners choose to purchase rather than lease even if they have to accrue significant debt if they decide that the asset is a worthwhile long-term investment.
- Equipment. Many lease agreements include stipulations that provide lessees with increased flexibility in terms of upgrading and maintaining equipment.
- Taxes. Property owners enjoy tax benefits such as depreciation and investment tax credits that are not open to tenants.

OTHER LEASE TERMS

In addition, there are other elements of a lease agreement that can weigh heavily on a contract's overall acceptability. Details of lease contracts can vary enormously. "In theory," noted Steingold, "all terms of a lease are negotiable. Just how far you can negotiate, however, depends on economic conditions. If desirable properties are close to full occupancy in your city, landlords may not be willing to negotiate with you over price or other major lease terms. On the other hand, in many parts of the country where commercial space has been over-built, landlords are eager to bargain with small businesses to fill empty units."

Leasehold Improvements. Leases typically cover any remodeling that needs to be done to the property and specify who will pay for it. Most such work falls under the category of "leasehold improvements": carpeting, insulation, plumbing and electrical wiring, lighting, windows, ceiling tiles, sprinkler and security systems, and heating and air conditioning systems. The lease should specify each improvement and when it will be made ideally before move-in. A landlord will be more willing to make such improvements if the lease duration is long, the space taken is substantial, and the improvements are general in nature. However, as Steingold noted, "if you [the small business owner] have specialized needs for example, you're running a photo lab or a dance studio and your darkroom or hardwood floor would be of limited value to most future tenants, don't expect the landlord to willingly pick up the costs of the improvements. The landlord may even want to charge you something to cover the cost of remodeling the space after you leave." Some leases provide tenants with the option of making improvements themselves provided that they adhere to certain guidelines and restrictions.

Length of Lease. Negotiations between tenants and landlords often snag on the question of lease length unless the small-business owner has a clear picture of the future. Lessors normally want long leases, while some lessees prefer short leases with rights of renewal. Generally, small-business owners try to secure leases with mid-range lengths. Leases of less than a year can leave them more vulnerable than they would like, but multiyear terms can

be dangerous as well, especially if the business is new and unproven. A common compromise is to include an "option clause" in the contract so that the lessee can stay if he or she wishes at the conclusion of the original lease period.

Exclusivity. Many small-business owners quite reasonably insist that any lease agreement they sign contain what is commonly known as an "exclusivity clause." This clause provides the tenant with an exclusive right to sell his or her product or service on the property, obliging the lessor to prevent such sales by other tenants.

Insurance. Landlords often ask lessees to secure insurance in the event that: 1) the tenant damages the leased property; or 2) customers or others suffer injuries on the premises. Such clauses may be absent if the space rented is strictly for office use. When insurance is required by the tenant, the landlord frequently sets the amount.

Use of Premises. Shopping center/strip mall landlords typically include language in the lease contract providing specific details on approved uses of the premises that are being rented. Such stipulations often serve to protect the businesses of other tenants. For example, the owner of a cafe in a strip mall may be quite unhappy if his neighbor, who formerly ran a quiet sports memorabilia shop, decides to change gears and launch a tattoo parlor.

In addition, lease contracts provide stipulations and regulations on many other issues of interest to both lessors and lessees. These include:

- Signage (regulates the size, style, and brightness of tenant advertising signs)
- Compliance with various zoning laws, permits, and restrictions on use of space
- Compliance with other local, state, and federal laws
- Subletting or assigning the lease
- Definition of the space being leased
- Security deposit
- Landlord's right to enter leased space
- Relocation (wherein the landlord relocates a tenant to another space because of remodeling or expansion by a neighboring tenant)
- Default provisions
- Hours of operation
- Incidents of damage or destruction from natural causes
- Repairs
- Indemnification provisions
- Abandonment (by the tenant, through outright abandonment, diminished hours of operation, etc.)
- Condemnation (cases where all or part of the property is taken by city, county, state, or federal government for other use, such as road, right-of-way, or utility easement)
- Bailout clauses (in the event of catastrophic developments tornadoes, riots, wars, floods, droughts, etc.)
- Cotenancy clauses (allows the business owner to break the lease if an anchor store closes or moves)
- Recapture clauses (also known as a cancellation clause, this allows landlords to evict tenants for breach of contract if the tenant is unable to meet minimum rent requirements)

CHOOSING BETWEEN EXISTING AND PLANNED BUILDINGS

Most start-up businesses move into already existing facilities. Many small-business owners with the means to do so choose new facilities for the features or the prestige and take out leases while the facility is still in its planning stages. The savvy small-business owner will consider the potential benefits and drawbacks of both choices before deciding. "Leasing in an existing building provides the Lessee ... with more [knowledge about the place] at the time new space is occupied than any other facility option," wrote Wadman Daly in *Relocating Your Workplace*. "More so than in any other circumstances, the [lessee] is in a position to closely inspect both the facility and the terms of proposed leases in a number of competing locations. However, the nature of the lease in an existing building signifies minimum tenant control over the potential variables in either lease or facility. Rental rates, maintenance and escalation costs, utilities and building features are fixed or relatively non-negotiable. Landlords may vary in their abatements and finish-to-suit clauses, however their basic price structure, like that of the building and mechanical systems, remains unchanged. Of course, there are no investor implications with this option."

However, Daly cautions that leasing in a planned building contains its own mix of attractive features and uncertainties: "Building features [in a planned building] will be new, up-to-date and, to a certain minimal extent, capable of adjustment to tenant need. If your lease is important enough to the developer, you may receive some attention when it comes to special requests for identification, parking, security, a prime location in the building, etc." Nonetheless, small-business owners should be cautious when approaching such leases, for both the final appearance and utility of the building as well as its

costs remain unseen and untested when the building is in its planning stages. "Proposed rental rates must be examined in the light of comparable projects with similar advantages," Daly wrote. "Descriptions of less obvious features like parking, air handling systems, security, maintenance, etc., should be clear and complete. The track record of the developer making the offer should be inspected carefully. Is there a history of quality construction at the rental rate asked, or one of build for quick resale? Is there a reputation for good maintenance or benign neglect? Regardless [of] the size of the lease or the duration of the proposed tenancy, these and related questions should be probed."

LEGAL SERVICES

Legal services are an important consideration for any business owner, but especially for small-business owners, who often face a number of legal hurdles. Protecting the owner's personal assets from lawsuits against the business, ensuring protection for the business against lawsuits charging discrimination, wrongful termination, and sexual harassment, and handling employee contracts, copyright claims, and incorporation are just a few of the legal issues that commonly face small-business owners.

The high costs of retaining a lawyer often make it seem as if competent legal services are out of reach of most small-business owners. In addition, experts emphasize the dangers of entering into legal agreements without first obtaining advice from a qualified attorney. There are reasonably priced methods of obtaining such services, like prepaid plans and legal software. But in many cases this attempt to cut corners can turn small problems into big ones for small-business owners.

"Perhaps your tax structure is not to your best advantage, or you are not adequately protected from liability," Charles Poling noted in the *New Mexico Business Journal.* "If you're in a regulated business, you might run afoul of the law simply because you haven't gotten educated by your lawyer. Failing to consult with a securities or financial lawyer when you're raising capital can cause serious problems."

The type of legal services a small business should obtain varies with the size and age of the business. Common legal needs are:

- Setting the legal structure of the business, also known as business entity formation
- Filing and protecting intellectual property, trademarks, and copyright
- Contracts with suppliers, distributors, employees, etc.
- Breach of warranty: when a customer claims that product or service is not as advertised
- Workers" compensation: employee injury at the workplace
- Wrongful termination or discrimination

"A general business lawyer can help you as day-to-day questions come up, reviewing contracts and tax questions. But for more complicated matters,you might need a specialist.... Just starting up? Find someone who specializes in forming corporations or partnerships. Going public? Find a securities lawyer. Other specialties include environmental law, banking, patenting, copyrighting, medicine, nonprofit corporations, employment law, and so on," Poling wrote.

According to Michael Barrier in *Success*, the best way to find a good attorney is by getting referrals from people you trust, especially those with similar legal needs. Before signing a retainer, small-business owners should inquire about the attorney's experience, charges, and potential conflicts of interest. It may also be helpful to check your company' insurance policy, because certain litigation expenses may be covered.

PREPAID LEGAL SERVICES

Perhaps the most cost-effective way for small-business owners to obtain legal advice is through a prepaid legal services plan. These plans provide companies with affordable access to legal advice and attorney's services for one low, monthly fee. According to the American Prepaid Legal Institute, an affiliate of the American Bar Association, roughly 120 million Americans are enrolled in prepaid legal services.

The services are often included in union contracts or offered as an employee benefit.

ADVANTAGES OF PREPAID SERVICES

The primary advantage associated with prepaid legal services is savings. For example, a typical prepaid plan might charge $85 to $125 per hour for attorney's fees, plus the monthly premium, which can range up to $100 per month. Without the plan, the attorney's fees often begin at around $200 per hour with a retainer fee of several thousand dollars often demanded up front.

Quality service is another promise of most prepaid plans. For example, one plan requires its attorneys to have a minimum of 15 years of service, experience in business law, a favorable rating from Martindale-Hubbell (the rating service of the American Bar Association), and a clean record that shows no indication of ethical or malpractice claims against the attorney. Of course, these services vary in quality, just as attorneys vary in quality. Small-business owners should do their research before signing up with a service. There are new ones joining the industry each year.

Another benefit of prepaid plans is their size. By pooling hundreds of small businesses, the prepaid plan instantly becomes one of the largest clients of the law firm handling the account. This is a huge benefit for small-business owners. One owner on his or her own will be a very small part of any law firm's business. As part of the prepaid plan, however, the small business becomes one part of a very important client that the law firm wants to keep happy to ensure continued business.

Prepaid plans also make it easier for small businesses to practice preventive law instead of reacting to crises. Without the plan, a business owner is more likely to take his or her chances in any given situation and hope that no legal problems arise, rather than pay for expensive legal advice. The plan, however, makes advice readily available and encourages owners to make use of it so that small problems do not become big problems.

LEGAL SOFTWARE AND ONLINE ADVICE

Small-business owners can also gain expertise and reduce risks and costs by utilizing one of the online legal listings or software packages that are designed for small businesses.

Legal directory Web site avvo.com provides a forum for attorneys to post profiles and contribute to free legal guides. Clients can also review their attorneys on the site. A number of other Web sites provide directories of attorneys, sources for legal research, samples of various types of forms and documents, and free legal advice. For example, the American Bar Association site provides the addresses of state and local bar associations and lawyer referral services at http://www.abanet.org/legalservices/lris/directory/.

According to Carol Ebbinghouse in *Searcher*, small-business owners should approach online legal services with caution. Obtaining legal advice online makes it difficult to establish a recognized attorney-client relationship, which may leave a small business without the protection of confidentiality and with no recourse in cases of malpractice or conflict of interest. Another potential pitfall is that online attorneys may not be licensed in the business owner's state. They may even be law students or otherwise lack the necessary experience or qualifications to provide good advice. For those who do use online legal services, Ebbinghouse recommends making sure the site is in compliance with Internet privacy and security protocols, reviewing all disclaimers and conditions, and double-checking the advice received.

LETTER OF INTENT

A letter of intent (LOI) is a document in which one or more parties signify an intention to do or to refrain from doing one or several things. The LOI is often used to: 1)clarify key

points of a complex transaction; 2)officially show that two parties are in negotiations; and 3)provide safeguards if a deal or partnership turns sour. LOIs are commonly seen in commercial real estate transactions, mergers, joint ventures, the purchase of assets or shares, or in complex negotiations.

Letters of intent are controversial under law, being viewed ambiguously as both binding and not binding. In *Corbin on Contracts*, the late Arthur Corbin commented on a letter of intent in the following terms: "a letter of intent is not a useless document, but it is not, in principle, a contract except perhaps a contract to continue bargaining in good faith."

The chief utility of letters of intent appears to be: 1) to obtain a preliminary agreement on a matter before full details are worked out; 2) to establish confidentiality of elements being negotiated; and 3) to agree on how negotiations shall proceed. The general outlines of the deal may be included in the form of intentions, but not as binding until a final contract is negotiated. Thus LOIs have psychological value in somewhat committing both parties *early*; in other words, an agreement has been reached in principle. If made public, a letter of intent also serves as a signal to other interested or potential competing or hostile parties that the "deal is made." Signers of LOIs, however, continue occasionally to back out of deals, which leads to litigation. Courts are then required to settle which parts of LOIs are and are not binding.

CHARACTERIZATIONS

The best types of LOIs, as described by Robert McLean for the *Charlotte Business Journal*, are those that specify what terms are binding and nonbinding. "When drafting an LOI, the parties should state which sections are binding. They should agree that no future conduct, including negotiations, will create an obligation unless a final written agreement is reached."

Gregory Gosfield, writing for the American Bar Association's *Business Law Today*, suggests that LOIs can be put into four groups arranged from least to most binding. The first type openly disclaims any contractual force to the letter, but as Gosfield points out, the letter will have "contractual effect as to the disclaimer." He places letters that deal only with rules for negotiation into the second group and views this type as the best use of LOIs. The third involves letters of intent that clearly spell out elements of the agreement in such a manner "as to permit a competent drafter to complete final documentation without a tremendous amount of additional negotiation." Letters of this type will specify a condition, left to the future, which will make the agreement legal; for example, approval by a board of directors or signature by a specified officer. The last and fourth type of LOI Gosfield labels "letters of intent that have failed." In fact they *are* contracts. Gosfield suggests that "To reduce the risk of litigation, the single most important provision of the letter of intent is to disclaim contractual effect as to all but specifically preserved terms, a key one being the disclaimer itself."

Vasilios Kalogredis, writing for *Physician's News Digest*, provides categories typically listed as binding. He includes: 1) confidentiality agreements relating to mutual information sharing; 2) nondisclosure of information to third parties; 3) "no-shop" clauses under which, for instance, a seller is prohibited from dealing with others during the negotiation; 4) setting of break-up fees in advance should the deal collapse; 5) termination dates and conditions to limit the negotiations; and 6) allocation of expenses to each party. Kalogredis suggests that nonbinding aspects would deal with terms of the transaction itself. Finally, he indicates that closing conditions are often included in LOIs. These would include financing contingencies such as loan approvals and third-party approvals if needed.

PROS AND CONS

In complex negotiations such as, for instance, the purchase or sale of a business, multiple contracts between buyers and sellers usually take place, many things are discussed, and many things are said. The process may also take substantial amounts of time. Oral transactions of this type are subject to misinterpretation later, and oral agreements also have contractual force. In such situations a letter of intent written at the proper time before final closing and drafting of actual language can fix the main issues under discussion in written form and also clearly lay down rules which may be hampering negotiations, such as confidentiality of information. One may also have tactical advantages in having an LOI, especially in cases where multiple buyers are competing for one property. Writing the LOI serves to focus issues and to identify neglected matters. The LOI may also assure an insecure seller that the buyer is serious and vice versa. LOIs also sometimes produce momentum and clarity and hence speed up a process that both wish to conclude. Finally, a well-written LOI is of substantial help to those charged with drafting the final contract.

On the negative side, LOIs take time to prepare and may turn into final negotiations which are supposed to *follow* the LOI. This can happen because parties may feel that even nonbinding terms will become nonnegotiable later, so why not negotiate them now? Thus time delays may be introduced. An LOI opens up channels of information for at least one of the parties, which may harm the other party if the deal ultimately fails. Writes McLean: "It can burden a transaction with too many conflicts too early, damaging momentum. If terms are set before one side fully understands the transaction or performs its diligence, the LOI can weaken that party's bargaining position."

Letters of intent, by nature ambiguous, may become public (at least internally) and produce expectations or anxieties on the parts of employees, vendors, and customers. Kalogredis in addition points to "no-shop" clauses which may prevent a seller from discussing alternative deals, thus losing time, if in final negotiations an impasse arises.

LEVERAGED BUYOUTS

A leveraged buyout (LBO) is the acquisition of a company in which the buyer puts up only a small amount of money and borrows the rest. The buyer's own equity thus "leverages" a lot more money from others. The buyer can achieve this desirable result because the targeted acquisition is profitable and throws off ample cash used to repay the debt. Such transactions are also known as "bootstraps" or HLTs (highly leveraged transactions). The LBO is a type of private equity investment.

Since they first appeared in the 1960s and took hold in the 1970s, LBOs have had mixed reviews from business people and other observers. Some see them as tools to streamline corporate structures, to rationalize meaninglessly diversified companies, and to reward neglected stockholders. Others see the LBO as a destructive force destroying economic and social values, the activity motivated by greed-driven predation.

TYPES OF LBOS

LBOs are typically used for three purposes, each in the category of corporate acquisitions generally. These are: 1) taking a public company private; 2) financing spin-offs; and 3) carrying out private property transfers frequently related to ownership changes in small business.

Public to Private The first situation arises when an investor (or investment group) buys all of the outstanding stock of a publicly traded company and thus turns the company into a privately held enterprise ("taking private" in reverse of "going public"). These deals may be friendly or hostile, the two terms related to management's point of view. Friendly cases typically involve the management buying the company for itself with plans to operate it thereafter as a privately held entity. Hostile cases involve an investor or investor group intent on buying, reorganizing, and then reselling the company again to realize a high return. The sale of the company may be to another company or may be to the public in a stock offering. In the last case the situation actually amounts to a transaction more aptly labeled *public-to-private-to-public.* There are other variants in the disposition or in the payback of a third-party investor, although they tend to be rare, such as very high dividend payments and recapitalization by other groups.

The twenty-first century saw a marked increase in LBOs due to looser lending standards and the passing of the Sarbanes-Oxley Act of 2002 (SOX). SOX was enacted in response to the corporate and accounting scandals of Enron, Tyco International, WorldCom, and others. The act increased the compliance costs (financial reporting and the audits of those reports) required of publicly traded companies and prompted some public companies to use an LBO to go private.

Spin-Offs. Public or private companies often wish to sell off elements of their business to get cash. In some cases the seller may itself have been bought in an LBO and is spinning off assets to pay the investors back. In such situations the spun-off element's management may itself be the buyer or may be passive in the transaction. An LBO is used to purchase the subsidiary or division in question. The fundamental financial logic of such deals, however, remains the same.

Private Deals. The last situation concerns cases where a privately held operation is bought by an investor group. Such cases often arise when a small-business owner, having reached retirement age, wishes to divest him- or herself of the company and either cannot find a corporate buyer or does not wish to sell to a company. The buying group itself may be the company's employees or individuals associated in some way with the owner. These people organize an LBO because they only have limited equity.

FINANCING AND PAYBACK

Good candidates for an LBO include companies with low debt levels; stable cash flow; hard assets, such as property, plant, equipment, inventory, and receivables, that can used to secure the debt; the opportunity for new management to improve company performance; and a market perception that the company is undervalued.

The target of an LBO must, almost by definition, be profitable, growing, and produce a suitably large cash flow. In acquisitions jargon this is often abbreviated as EBITDA, meaning earnings before interest, taxes, depreciation, and amortization the component elements of cash flow as ordinarily defined. Why cash flow? Because repayment of the large, leveraged debt is *from* future cash flows of the company.

Other assets, of course, are also taken into consideration. If cash flow cannot keep pace with repayment, it is desirable that the company has saleable components (e.g., potential spin-offs) or liquid assets. Third party investors cannot be persuaded to put up cash unless the numbers look good, the elements of the company seem easily saleable, the company has lots of cash on its books, or all of the above are present.

The leveraged portion of the LBO is typically 50 85 percent, but may be as high as 95 percent of the deal in periods of LBO frenzy. The rest is in the form of equity. Multiple "layers" of financing are involved: senior debt, senior subordinated debt, subordinated debt, mezzanine debt, bridge financing, and finally the purchaser's own equity. The instruments described here are listed in increasing order of risk. In the case of a default, those holding senior debt will be paid first, owners of equity last (if at all). These security relationships are contractually built into the instruments themselves. Mezzanine financing is a hybrid between straight equity and debt, structured so that "mezzanine" holders are just barely paid something in an extreme case where equity holders lose everything. Bridge loans are short-term loans intended to be repaid either from the acquired company's cash holdings or from rapid disposition of company assets. Debt, of course, may be in the form of high-yield and therefore high-risk "junk" bonds.

LBO risks are high because payback depends entirely on the company's future performance. If the economy falters or some event halts the purchased company in its tracks (a major lawsuit, the loss of a major account) or if the high repayments actually hamper the company by starving it of capital, investors may see their money turn into thin air. Healthy, growing, cash-rich companies purchased by an LBO therefore may lose their flexibility by losing their cash and simultaneously acquiring a huge load of debt: small shocks in the past become large shocks in the present. For these reasons investors expect returns above 20 percent per annum.

FOR AND AGAINST

Philosophical views of business go far in explaining positive and negative views of LBOs as well and LBOs particularly (among merger and acquisition methods) because users of LBOs are predominantly interested in *changing* companies in order to extract benefits in the process. Those who see corporations predominantly in capitalist terms favor a business model in which stockholder equity is always maximized regardless of any other consideration. Those who view corporations as economic and social institutions with a wide array of other interests also involved stakeholders including employees, distributors, customers, and vendors view this method of acquisition, especially if used in hostile takeovers aimed at dismembering the corporation, slashing its employment, and taking it public again, as disruptive and predatory.

In more mechanical terminology, proponents of such acquisitions claim multiple benefits. One of these is a more optimal debt-to-capital ratio. High debt and low capital mean lower taxes: interest costs are deductible. Reduced ability to invest in capital good increases the company's efficiency by reducing overcapacity. Companies using their profits for growth rather than dividends shortchange the stockholder. Highly diversified companies in many unrelated businesses have much higher overheads, which are unnecessary if badly fitting parts are spun off. These motives translate into leaner and more profitable ventures producing higher return on investment, all of which favors ownership interests. Opponents, on the contrary, favor control and predictability through diversification, market share gains, flexibility in production and in ability to respond, all of which favors management, employees, and other stakeholders. Ultimately both sides have legitimate points to make, and the controversy, therefore, is likely to continue.

LBO TRENDS

In general, LBOs are highly dependent on the availability of investment funds. When money is tight and less risky ventures pay high returns, LBOs diminish and the degree of leverage used declines. Buyers have to put up more of their own equity. When the economy is flush with cash, the number of deals and their magnitude increase, purchase prices balloon, and investors also begin "reaching down" to purchase smaller companies. In addition, leveraged deals depend on healthy companies with high and predictable future cash flows,without which investors are difficult to attract to a deal. Hostile LBOs also require publicly traded companies so that the buyer can reach stockholders and persuade them to give the buyer control.

The first LBOs were made in the 1960s; their use took hold in the 1970s and began to boom in the 1980s. In the first half of the 1980s LBOs were very successful,

leading to a boom mentality in the second half of the decade with extraordinarily high rates of leverage. This led to many bankruptcies and failures in the early 1990s. A legislative reaction at the state level (states control incorporation and rules related to them) went through several cycles. States tightened rules against hostile takeovers; the Supreme Court curbed such activities in a 1982 judgment; states then revised their rules to get around the high court's ruling, and these workarounds were later approved in another Supreme Court case in the late 1980s. The upshot was to make hostile takeover more difficult, requiring buyers to acquire a higher percentage of stock in order to take control.

From the recession of the early 1990s emerged more formalized private equity firms, which then drove massive dot-com LBO deals in the later part of the 1990s. After the collapse of the dot-com bubble from 1999 to 2000, low interest rates and the real estate bubble fueled new record LBO deals during the period from 2004 to 2007. The real estate downturn and the recession of 2008 and 2009 dampened enthusiasm in LBOs, but private equity is set to remain a strong asset class, with billions of dollars from investors already committed to private equity firms.

LIABILITIES

A liability is a debt assumed by a business entity as a result of its borrowing activities or other financial obligations (such as funding pension plans for its employees). Liabilities are paid off under either short-term or long-term arrangements. The amount of time allotted to pay off the liability is typically determined by the size of the debt; large amounts of money usually are borrowed under long-term plans.

Payment of a liability generally involves payment of the total sum of the amount borrowed. In addition, the business entity that provides the money to the borrowing institution typically charges interest, figured as a percentage of the amount that has been lent.

A company's liabilities are critical factors in understanding its financial status. The company's liability status also enters into every transaction related to obtaining loans or leases on equipment.

TYPES OF LIABILITIES

Current liabilities are short-term financial obligations paid off within 1 year or one current operating cycle, whichever is longer. (A normal operating cycle, while it varies from industry to industry, is the time from a company's initial investment in inventory or services to the time of collection of cash from sales of that inventory, of products created from that inventory, or of completed services.) Typical current liabilities include such accrued expenses as wages, taxes, and interest payments not yet paid; accounts payable; short-term notes; cash dividends; and revenues collected in advance of actual delivery of goods or services.

Economists, creditors, investors, and other members of the financial community all regard a business entity's current liabilities as an important indicator of its overall financial health. One indicator associated with liabilities often studied is working capital. The term refers to the dollar difference between a business's total current liabilities and its total current assets. If a business has a working capital deficit, turning to a line of credit is a common solution. A business can improve its liquidity and working capital situation by managing its inventory, accounts receivable and payable, and cash.

Another barometer is the current ratio. Creditors and others compute the current ratio by dividing total current assets by total current liabilities, which provides the company's ratio of assets to liabilities. For example, a company with $1.5 million in current assets and $500,000 in current liabilities would have a three-to-one ratio of assets to liabilities.

LONG TERM LIABILITIES

Liabilities not paid off within a year (or within a business's operating cycle) are known as long-term or noncurrent liabilities. These often involve large sums of money necessary to undertake opening of a business, major expansion of a business, replace assets, or make a purchase of significant assets. Long-term debt is secured by: 1)the new asset purchased; 2)an unencumbered physical asset that has no outstanding liens or debt; or 3)a personal guarantee from the business owners. Such debt typically requires a longer period of time to pay off. Examples of long-term liabilities include notes, mortgages, lease obligations, deferred income taxes payable, and pensions and other post-retirement benefits.

When debt classified as long-term is paid off within the next year, the amount of that paid-off liability should be reported by the company as a current liability in order to reflect the expected drain on current assets. An exception to this rule comes into effect if a company decides to pay off the liability through the transfer of noncurrent assets that have been previously accumulated for that very purpose.

Contingent Liabilities. A third kind of liability accrued by companies is known as a contingent liability. The term refers to instances in which a company reports that there is a possible liability for an event, transaction, or incident that has already taken place; the company, however, does not yet know whether a financial drain on its resources will result. It also is often uncertain of the size of the financial obligation or the exact time that the obligation might have to be paid.

Warranties are a common contingent liability and companies must estimate the liability based on the percentage of warranties likely to be redeemed. Contingent liabilities often come into play when a lawsuit or other legal measure has been taken against a company. An as yet unresolved lawsuit concerning a business's products or service, for example, would qualify as a contingent liability. Environmental cleanup and protection responsibility sometimes falls under this classification as well if the monetary impact of new regulations or penalties on a company is uncertain.

Companies are legally bound to report contingent liabilities. These are typically recorded in notes attached to a company's financial statement rather than as an actual part of the financial statement. If a loss due to a contingent liability is seen as probable, however, it must be included as part of the company's financial statement.

LICENSING

A license is simply the right to do or to use something. The word, from Latin, means "permission," thus implying that a license is given by a party who controls something to another. Licenses divide into three basic forms: 1) the right or permission to carry out an activity otherwise regulated or prohibited by government; 2) the right to use a name, image, or representation (including a brand) in packaging, promotion, signage, marketing, and similar contexts; and 3) the right to use and apply proprietary know-how, whether patented or not, for any legal purpose, including its integral embodiment in products. Licensing activity comes in two forms: licensors*give* licenses *to* others; licensees *receive* licenses *from* others.

The word itself, licensing, does not cover all forms and instances of the underlying relationship. For example, users of other people's patents are typically "licensed" to do so, but users of other people's copyrights are said to have "permission" to do so. In municipal government, many activities require "permits." These are functionally identical to licenses in that the permit holder must qualify in some way and is subject to rules.

Fred Steingold, in his 2008 book, *Legal Guide For Starting & Running a Small Business* notes that licenses serve different functions. First, they help licensors (often governments) raise money from businesses. Second, licenses maintain public health safety and basic industry regulations or standards. Increasingly, Steingold argues, licensing is also used to preserve aesthetics. For example, building codes may be created to prevent certain large or ungainly structures from being built.

GOVERNMENT LICENSING

The most common form of licensing is the governmental kind. After all, most adults are licensed drivers. State government, in addition, licenses many skilled and professional occupations, including those that form the core of many small business activities. Small business, therefore,

is most likely to be touched by this form of licensing. Municipal government issues all kinds of permits, equivalent to licenses. In Miami-Dade County, Florida, for instance, the county requires that all businesses have "occupational" licenses in the sense of occupying a store.

A surprisingly large number of occupations are subject to license. In the state of Rhode Island, for example (picked at random), the state licenses 150 occupations as of 2010, according to the Rhode Island Department of Labor and Training. These occupations include architects and attorneys; barbers, beekeepers, and boxers; chiropractors; dieticians, dentists, and anyone associated with dog racing; electricians as well as professional engineers; funeral directors and buyers of fur at wholesale; hairdressers, cosmetologists, estheticians, and manicurists; investment advisers; occupations associated with the sport Jai Alai; lottery agents and livestock dealers; massage therapists; every kind of professional-level nurse and midwife; occupational therapists and opticians; plumbers and physicians; real estate brokers; speech-language pathologists and many school-related occupations; travel agents and tattoo artists; veterinarians; wildlife rehabilitators; and even professional wrestlers.

The rationale behind licensing of occupations is varied and based on the enforcement of health, safety, commercial, and other laws. One rationale behind Rhode Island's licensing of beekeepers, for instance, is to control importation of bee hives from another state, on which a fee is levied. In 2006, the last year for which information is available, the state issued eighty-seven such licenses, managed by its Division of Agriculture and Resource Marketing. Licensing of professional boxers is evidently part of enforcing health rules by the state's Division of Racing and Athletics. Requirements for boxing licenses are minimal, but do require boxers to be checked for physical condition before each match. Boxers are also required to take a drug test either after or before a match. In 2008 the state issued sixty-four such licenses. In some cases, licenses are required to maintain a good ethical standard in the industry. For example, lottery agents in Rhode Island must fulfill certain accountancy educational requirements before being licensed by the Board of Accountancy.

In professional categories, educational requirements must be met, and these requirements often are quite complex, especially for health-care-related fields. A nurse-midwife in Rhode Island, for example, must have completed "an approved educational program in midwifery that is accredited by the American College of Nurse-Midwives." To qualify for licensing, nurse-midwives must have finished 60 semester hours specifically related to family or marital therapy, 1 year of an internship, and 12 hours of supervised practice during their education. They must also "be of good moral character" and must have passed a Professional Exam Service (PES) exam. In addition, nurse-midwives must have a minimum of 100 hours of case work, 2,000 hours of contact with clients, and at least 2 years of relevant work experience.The licensing is handled by Rhode Island's Office of Health Professions Regulation, part of its Department of Health. In 2008 seventy-one licenses were issued.

IMAGE LICENSING

Marketing of goods and services relies, in the first place, on capturing a potential customer's attention and then holding it by inducing a favorable reaction. Famous icons be they celebrities, cartoon figures like Mickey Mouse, or widely recognized symbols like the letters NFL, GM, IBM, or the five interlocking rings of the Olympics have a function in attracting attention and in passing on the values that they represent to objects or messages to which they are attached. Icons are created in commerce by arduous performance and promotion, in which case they are brand identities; they are also "borrowed" or "recruited" by associating famous names with products. For purposes of brevity, all of these recognizable symbols may be summed up as "images." Images are licensed for the purpose of helping people market goods.

Underlying such licensing is law which protects brands, logos, and other trademarked symbols from use by others; individuals also have the right to permit or to restrict their names from commercial exploitation by others. Thus, for instance, a newspaper may use the name Schwarzenegger in a headline but cannot label its paper as "The paper Schwarzenegger reads each day" without the California governor's express permission. Should such permission be forthcoming, the paper would be *licensed* to use the name.

According to the International Licensing Industry Merchandisers' Association (LIMA), retail sales of licensed items and products in Canada and the United States in 2007 was $107.8 billion. But even if all these sales had taken place in the United States, they would have represented a mere fraction of total retail sales. According to the U.S. Census Bureau, total retail sales in the United States for 2007 were $4,064.9 billion, and therefore licensed items would only account for about 2.6 percent of the total sales. These numbers indicate that image licensing affects a tiny proportion of sales at retail and therefore represents only a sometimes-used marketing tactic.

LIMA identifies several types of image licensing, including "Character and Entertainment Licensing," "Corporate Trademark and Brand Licensing," "Fashion Licensing," "Sports Licensing," and "Art Licensing." According to LIMA, character and entertainment licensing involves licensing the images or likeness of characters from television, movies, or books, or licensing other entertainment properties. For example, using a Disney cartoon character in an ad would involve character and entertainment

licensing, but so would using the picture of the home of a popular Disney character. This is the most popular form of image licensing and in 2007 it generated $2,710 million in sales revenues.

While character and entertainment licensing may be the most popular, other forms of image licensing are also growing in popularity. Corporate trademark and brand licensing, for example, involves the use of company brands, logos, and other trademarked items. This is the second most profitable form of image licensing, generating $1,060 million in sales revenues in 2007, according to LIMA. Fashion licensing involves the use of fashion names and brands. Often, this form of licensing gives a brand owner or designer the ability to branch into different areas. For example, a fashion designer may use this type of license to launch a home accessories division. Sports licensing allows sports leagues (professional, amateur, and collegiate) to operate licensing businesses and sell licensed products or licensing rights in order to generate revenue. In 2007 this type of licensing generated $815 in sales revenue. Art licensing allows artists and businesses to license designs and art images which are used to adorn a wide range of consumer goods.

KNOW HOW OR TECHNOLOGY LICENSING

Many inventors and technology companies use patented methods and closely held practices as the basis of licensing activity. Under a know-how or technology license, the licensee is enabled to deploy a design or use a patented process in his or her own manufacturing activities. The practice is as old as patent law and is present in all of the modern arts of production. Wherever the focus of invention is most intense, there new technologies spring up and are spread by licensing. In the twenty-first century these techniques have mushroomed in electronics, pharmaceuticals, genetic manipulation, alternative energy, and exotic materials technologies, while, at the same time, continuing in traditional fields like mechanics and chemical and petrochemical processing.

LICENSING IN, LICENSING OUT

Using software purchased from others or operating a proprietary process under a license is to be "licensing *in*." But the small business may also have an opportunity to "license *out*" if it has made a useful invention which may be of interest to others. In most cases the activity of licensing others is a new business in its own right, with unique activities and problems, of which the first may be patenting the invention itself to secure all rights to the new art. The activity is relatively easy if the company experiences positive demand for its invention and buyers are calling or visiting. When not, help from an experienced patent attorney may be the best first step in examining the feasibility of turning invention into profit.

LICENSING AGREEMENTS

A licensing agreement is a legal contract between two parties, known as the licensor and the licensee. In a typical licensing agreement, the licensor grants the licensee the right to produce and sell goods, apply a brand name or trademark, or use patented technology owned by the

licensor. In exchange, the licensee usually submits to a series of conditions regarding the use of the licensor's property and agrees to make payments known as royalties.

Licensing agreements cover a wide range of well-known situations. For example, a retailer might reach agreement with a professional sports team to develop, produce, and sell merchandise bearing the sports team's logo. Or a small manufacturer might license a proprietary production technology from a larger firm to gain a competitive edge rather than expending the time and money trying to develop its own technology. Or a greeting card company might reach agreement with a movie distributor to produce a line of greeting cards bearing the image of a popular animated character.

In cases where several patent holders have patents for similar or interlinked technologies, licensing agreements are also needed or sometimes even pushed forward by legal action. For example, if patent holder A has the patent for a specific printer technology but needs the technology of patent holder B to create printers using that technology, the patent holders will usually create a licensing agreement in order to allow patent holder A the right to create printers. In some cases, when patent disputes arise, patent holders go to court to compel someone to sign a licensing agreement. The infringer is usually advised to sign an agreement rather than face legal costs and legal problems.

ELEMENTS OF A TYPICAL LICENSING AGREEMENT

Because of the legal ground they must cover, some licensing agreements are fairly lengthy and complex documents. But most such agreements cover the same basic points. These include the scope of the agreement, including exclusivity or territorial restrictions; financial aspects including required advances, royalty rates, and how royalties are calculated; guarantees of minimum sales; time schedules involving "to market" dates, length of contract, and renewal options; the lessor's rights of monitoring and quality control, including procedures to be followed, minimum inventories required to be maintained, and returns and allowances.

One of the most important elements of a licensing agreement covers the financial arrangement. Payments from the licensee to the licensor usually take the form of guaranteed minimum payments and royalties on sales. Royalties typically range from 6 to 10 percent, depending on the specific property involved and the licensee's level of experience and sophistication. Not all licensors require guarantees, although some experts recommend that licensors get as much compensation up front as possible. In some cases, licensors use guarantees as the basis for renewing a licensing agreement. If the licensee meets the minimum sales figures, the contract is renewed; otherwise, the licensor has the option of discontinuing the relationship.

Another important element of a licensing agreement establishes the time frame of the deal. Many licensors insist upon a strict market release date for products licensed to outside manufacturers. After all, it is not in the licensor's best interest to grant a license to a company that never markets the product. The licensing agreement will also include provisions about the length of the contract, renewal options, and termination conditions.

Most licensing agreements also address the issue of quality. For example, the licensor may insert conditions in the contract requiring the licensee to provide prototypes of the product, mockups of the packaging, and even occasional samples throughout the term of the contract. Of course, the best form of quality control is usually achieved before the fact by carefully checking the reputation of the licensee. Another common quality-related provision in licensing agreements involves the method for disposal of unsold merchandise. If items remaining in inventory are sold as cheap knockoffs, it can hurt the reputation of the licensor in the marketplace.

Another common element of licensing agreements covers which party maintains control of copyrights, patents, or trademarks. Many contracts also include a provision about territorial rights, or who manages distribution in various parts of the country or the world. In addition to the various clauses inserted into agreements to protect the licensor, some licensees may add their own requirements. They may insist on a guarantee that the licensor owns the rights to the property, for example, or they may insert a clause prohibiting the licensor from competing directly with the licensed property in certain markets.

It is important for businesses to keep in mind that when entering into licensing agreements with overseas entities, laws regarding licensing agreements vary widely by country. For example, concerns were raised in 2009 that China's legislation permits compulsory licensing. These enforced licensing agreements, according to some experts, effectively allow legislators to grant intellectual property rights to third parties at will. Other countries may also be signatories of the Trade-Related Aspects of IPR (TRIPS) Agreement, which allows for enforced licensing. As more companies work with business partners overseas, these licensing concerns become larger problems for some companies.

Small businesses often overlook the possibilities available with licensing agreements. Some small businesses assume that they do not have the money to enter into such agreements with larger companies. Many small businesses also do not take care carefully to protect the intellectual property rights inherent with any ideas or inventions

created for the company. Christopher Golis, Patrick Mooney, and Tom Richardson, in their 2009 book, *Enterprise and Venture Capital: A Business Builder's and Investor's Handbook*, suggest that businesses sign contracts with all employees, contract workers, and consultants, ensuring that any ideas or inventions created for the company stay within the company as company property. This can help prevent expensive licensing agreement battles down the road.

LIFE INSURANCE

In general, life insurance is a type of coverage that pays benefits upon a person's death or disability. In exchange for relatively small premiums paid in the present, the policy holder receives the assurance that a larger amount of money will be available in the future to help his or her beneficiaries pay debts and funeral expenses. Some forms of life insurance can also be used as a tax-deferred investment to provide funds during a person's lifetime for retirement or everyday living expenses. According to the 2009 *Life Insurers Fact Book, published by the American Council of Life Insurers, about 22 percent of families lack any life insurance at all. There are some signs that Americans are becoming more serious about life insurance, however. According to the Life Insurers Fact Book,* in 2008 Americans purchased about $3 trillion worth of life insurance coverage.

A small business might provide life insurance to its workers as a tax-deductible employee benefit like health insurance and retirement programs in order to compete with larger companies in attracting and retaining qualified employees. In addition, there are a number of specialized life insurance plans that allow small-business owners to reduce the impact of estate taxes on their heirs and protect their businesses against the loss of a key employee, partner, or stockholder. Group life insurance is generally inexpensive and is often packaged with health insurance for a small additional fee. Companies that provide life insurance for their employees can deduct the cost of the policies for tax purposes, except when the company itself is named as the beneficiary.

Life insurance is important for individuals as well, particularly those who, like many entrepreneurs, are not covered by a company's group plan. Experts recommend that every adult purchase a minimum amount of life insurance, at least enough to cover their debts and burial expenses so that these costs do not fall upon their family members. The insurance industry uses a standard of five times annual income in estimating how much coverage an individual should purchase. The individual can also use a "backwards" calculation to establish what survivors would need to cope: current debt, 2 years of income to give the spouse time to find work, college funds for children, balance on the house, and estimated funeral expenses. For entrepreneurs, especially those owning a family business or closely held firm, it may also be beneficial to consider the amount of money needed to keep the business running until it can be sold or restructured.

In many cases, small businesses are required to have life insurance before a bank will offer the business a loan. Anyone developing a small business, therefore, may want to invest in life insurance before trying to raise funds. Most lenders will want to see some evidence of insurance, as reassurance that debts will be paid even if a business owner dies with some debts unpaid. Without life insurance, of course, a small-business owner's family may become financially responsible for debts incurred during the entrepreneur's lifetime. In his 2008 book, *The Small Business Bible: Everything You Need to Know to Succeed in Your Small Business,* Steven D. Strauss notes that most entrepreneurs develop businesses in order to offer better financial stability for their heirs and families. Strauss notes that without life insurance, this stability is far too contingent upon the entrepreneur's continued health and life.

The cost of life insurance policies depends upon the type of policy, the age and gender of the applicant, and the presence or absence of dangerous lifestyle habits. Insurance company actuaries use these statistics to determine an individual's mortality rate, or estimated number of years that person can be expected to live. Policies for

women usually cost less than those for men, because women tend to live longer on average. This means that the insurance company will receive premiums and earn interest on them longer before it has to make a payment. Experts recommend that companies or individuals seeking life insurance coverage choose an insurance agent with a rating of A or better, and compare the costs of various options before settling on a policy.

Many small businesses and individuals avoid paying life insurance due to the cost of premiums. However, Fred Steingold, in his 2009 book, *Legal Forms for Starting & Running a Small Business* notes that life insurance is in fact far more affordable than saving for an emergency or borrowing money after an emergency. A business or individual has to invest far less in a life insurance policy than they would have to invest in savings to get the same amount of benefits. After a death, borrowing the amount of money needed for funeral expenses and other costs is often very difficult. Therefore, life insurance often makes the most financial sense, even for those with a healthy amount of assets.

TYPES OF LIFE INSURANCE POLICIES

The different types of life insurance policies are term insurance, whole life insurance, universal life insurance, and current assumption life insurance. There are also various riders and options.

Term Insurance. Term life insurance is the simplest and least expensive type, as it pays benefits only upon the policy holder's death. With annual renewable term insurance, the policy holder pays a low premium at first, which increases annually as he or she gets older. With level term insurance, the premium amount is set for a certain number of years, then increases at the end of each time period. Experts recommend that people who select term insurance make sure that their policies are convertible, so they can switch to a cash-value plan later if needed. They also should purchase a guaranteed renewable policy, so that their coverage cannot be terminated if they have health problems. Term insurance typically works best for younger people with children and limited funds who are not covered through an employer. This type of policy enables such a person's heirs to cover mortgage and college costs, estate taxes, and funeral expenses upon his or her death.

Whole Life Insurance. With whole life insurance, the policy holder pays a level premium on an annual basis. The policy usually covers until the end of the person's life age 90 or 100. In most cases, the policy holder is overcharged for the premium, and the extra amount goes into an interest-bearing dividend account known as a cash value account. The individual can use the money in this account to pay future premiums, or can withdraw it or borrow against it to cover living expenses. With a variable whole life policy, the individual controls the investments made with his or her cash value account. Selecting certain types of investments, such as mutual funds, may allow the policy holder to increase the balance in the account significantly. Regardless of the performance of the investments, however, the amount of the insurance benefit can never drop below its original value. When choosing a whole life policy, it is important to analyze the fund's past performance and inquire about commissions and hidden costs. Although whole life insurance can provide added security upon retirement, it should not be considered a replacement for retirement savings. Ordinary investment approaches are meant to provide for the future, life insurance, above all else, is meant to handle the contingency of death.

Strauss likens a term life insurance policy to renting a home and a whole life insurance policy to owning a home. That is, in the whole life insurance policy, the policy holder builds equity in the insurance policy by paying premiums. Term policy does not build equity but incurs fewer costs for the policy holder. Strauss recommends term life insurance for most people, noting the substantial savings. He recommends investing the difference in assets or one's business.

Universal Life Insurance. Universal life insurance was introduced in the 1980s as a higher-interest alternative to whole life insurance. Universal life premiums are based not only on the cost of the insurance but also on the interest rate offered on investments. Still, they are usually less expensive than whole life policies. Universal life policies provide individuals with a wider array of investment choices and higher projected interest rates. They are essentially similar to a term policy with a fixed rate of interest guaranteed for a year at a time.

Current Assumption Life Insurance. Current assumption life insurance features a fixed annual premium for the duration of the plan. This type of policy pays a set interest rate on premiums received, less the actual cost of the insurance. They can be useful as a tax-deferred investment vehicle, since they usually pay 2 to 4 percent more than banks. Policy holders may elect to overpay their premiums early in the plan period to accumulate cash value. They can withdraw or borrow from the funds later for any purpose, including retirement income, or can use the cash value to pay the premiums for the remainder of the plan period.

Riders and Options. Most types of life insurance policies give individuals the opportunity to add optional coverage, or riders. One popular option is accelerated benefits

(also called living benefits), which pays up to 25 percent of the policy value to the holder prior to his or her death if he or she is struck by a serious illness. Another option, known as a waiver of premium, allows an individual to continue coverage without paying premiums if he or she becomes disabled. Many policies also provide an accidental death and dismemberment option, which pays twice the amount of the policy if the insured dies or loses the use of limbs as a result of an accident.

KEY PERSON PROTECTION

Small businesses tend to depend on a few key people, some of whom are likely to be owners or partners, to keep operations running smoothly. Even though it is unpleasant to think about the possibility of a key employee becoming disabled or dying, it is important to prepare so that the business may survive and the tax implications may be minimized. In the case of a partnership, the business is formally dissolved when one partner dies. In the case of a corporation, the death of a major stockholder can throw the business into disarray. In the absence of a specific agreement, the person's estate or heirs may choose to vote the shares or sell them. This uncertainty could undermine the company's management, impair its credit, cause the flight of customers, and damage employee morale.

Life insurance can help small businesses protect themselves against the loss of a key person by providing a source of income to keep business running in his or her absence. Partnership insurance basically involves each partner acting as beneficiary of a life insurance policy taken on the other partner. In this way, the surviving partner is protected against a financial loss when the business ends. Similarly, corporate plans can ensure the continuity of the business under the same management, and possibly fund a repurchase of stock, if a major stockholder dies. Although life insurance is not tax deductible when the business is named as beneficiary, the business may deduct premium costs if a partner or owner is the beneficiary.

LIMITED LIABILITY COMPANY

The Limited Liability Company (LLC), a hybrid of the partnership and the corporation, has become a popular legal alternative for business owners. Now available in almost all states, the LLC combines the benefits of limited liability and pass-through taxation, much like an S corporation. However, the LLC's legal structure is much looser, allowing many companies that find S corporation status too restrictive to take advantage of its benefits. Small-business owners are taking advantage of the LLC because it is easier to set up and maintain than a corporation.

The LLC is a fairly new option in the United States; it first became available in Wyoming in 1977, but most other states did not follow suit until the 1990s. Each state has its own statutes concerning LLCs, and keeping up with the laws that govern LLCs can be a tricky business. When considering the LLC option, consulting knowledgeable and up-to-date legal and tax advisors is a must.

ADVANTAGES OF FORMING AN LLC

Some of the benefits of this form of business entity are described below.

Limited Liability. Like corporations, LLCs provide their members (owners) with protection from personal responsibility for the company's debt. Members are only liable to the extent of their investments in the company. If a customer slips and is injured on company property, a lawsuit may still bankrupt the business, but it cannot touch the personal assets of the LLC's members. This limited liability, then, is a great advantage over partnerships. In general partnerships, all members are liable for the company's debts, and in a limited partnership, at least one member must still be liable.

Avoiding Double Taxation. Like S corporations, LLCs enjoy exemption from the double taxation required of C corporations. In other words, the LLC's profits pass through

to the company's members who report their share of the profits on personal federal tax returns. The company itself does not pay a federal tax before the money is distributed to the members, as in the case of C corporations. But state and local taxes may still be levied against the LLC.

Flexibility of Income Distribution. According to some observers, one of the biggest benefits that small businesses enjoy when choosing LLC status is that allocation of profits and losses for tax purposes is easier under this form. Whereas the amount of profits the S corporation's shareholders report on their federal tax returns must be proportional to their share of stock, an LLC's members can determine amongst themselves how to divide their income as long as they follow the rules of the Internal Revenue Service (IRS) on partnership income distribution.

Simplicity. Another great advantage of LLCs over corporations is the ease of setting up and running them. Whereas incorporation can be an involved and costly process, all that is required to start an LLC is the filing of an Articles of Organization and the drafting of an Operating Agreement defining the company's policies and procedures (a filing fee, however, will still be required of LLCs). And whereas a corporation requires a board of directors, officers, and regular shareholders' and directors' meetings, an LLC is not required to observe such formalities in its operation. An LLC can be run from day to day essentially as if it were a partnership.

No Ownership Restrictions. The biggest drawback of forming an S corporation is the restrictions on the type and number of shareholders the corporation may have, but this is avoided by forming an LLC. The members of an LLC may be foreign nationals or other companies, both of which are prohibited from owning stock in an S corporation. In addition, there is no limit on the number of members an LLC may have, as there is with an S corporation.

Member Involvement in the Company. One problem with limited partnerships is that those partners who wish to protect themselves with limited liability (which may be all but one of the members) are prohibited from direct involvement in running the company. These partners may have only a financial investment in the firm. All members of an LLC may be directly involved in the company's management without jeopardizing their limited liability.

Attractive to Foreign Investors Because LLCs have been in existence in Europe and Latin America for over a century, investors from those parts of the world are particularly knowledgeable about this business form. According to *The Essential Limited Liability Handbook*, "LLCs often prove to be the most familiar and least imposing business structure for foreign entrepreneurs who wish to enter the American market."

Attractive to Potential Customers and Clients. According to Shira Levine's 2010 article, "What You Should Know Before You LLC," customers and clients may regard an LLC more highly than a small business. Levine argues that the addition of LLC to a company name can give a company more prestige and can make a business seem more established.

DRAWBACKS OF FORMING AN LLC

Not everything about LLCs is desirable, however. Ther are potential problems to consider as well.

No Perpetual Existence. Most states require that an LLC's Operating Agreement set a limit to the company's existence (usually 30 years). In the absence of a clause in the Operating Agreement providing for the continuance of the LLC in the event of the death or withdrawal of a member, the LLC will cease to exist when such events occur. The transfer of ownership is also more restricted for an LLC (like a partnership) than for a corporation.

Exclusions. A few types of entities cannot be organized as LLCs. These include banks, insurance companies, and nonprofit organizations. The situation may change in the future.

Very Limited Benefits for Businesses With No Employees. Some self-employed persons and very small businesses consider forming LLCs, especially since several states have allowed one-person businesses to file for LLC status in the twenty-first century. However, according to Levine, most businesses with no employees cannot benefit from LLC status. If a business only contains one person, that individual's personal assets would not be protected by an LLC. Most one-person businesses only seek LLC status to appear larger, but in fact these very small businesses do not get the full benefits of LLC status.

CREATING AN LLC

It is important that the organizer of a prospective LLC follow the "enabling statutes" or formation laws of the state in which the company will be formed in order to be designated as an LLC. Without this designation, the company will lack the protection of limited liability and will be treated as a general partnership. Therefore, the first step in creating an LLC is to find out the specific enabling statutes of any state.

The organizer does not have to be one of the company's members. The organizer's function is to file the articles of organization, a task which can be accomplished by a lawyer,

a hired agent from a service company specializing in such business, or a manager of the prospective company.

Naming an LLC. Before forming an LLC, the company name must be reserved with the secretary of state or its equivalent. Most states require that the words "Limited Liability Company" or the abbreviation "LLC" be included in the name of the company. In some states, "Limited Company" or "LC" is the preferred designation. In all states, however, the name of the LLC must not resemble the name of any other corporation, LLC, partnership, or sole proprietorship that is registered with the state.

The Articles of Organization. This form, called the articles of organization or certificate of formation, must be obtained from the secretary of state's office or its equivalent, filled out by the organizer, and filed with the same office. A filing fee, which varies from state to state, will also be charged. This simple document requires, at minimum, the company name and address, a description of the business to be conducted, the name and address of the registered agent (the contact to whom notices of lawsuit or other official matters can be served), the names of the company's members and managers (usually the members themselves), and the dissolution date. Other information may be required, depending on which state the articles of organization are filed in. It is important that the articles describe the business in a way that will allow the IRS to designate the company a partnership for tax purposes, and not a corporation. In order for the IRS to do so, the articles must show that the company possesses no more than two of the following four characteristics (which describe a corporation):

- Perpetual existence
- Centralized management
- Free transferability of ownership interest
- Limited liability

One of the easiest ways to show that the LLC is not a corporation is to limit its existence. In fact, most states require that a dissolution date be determined in the articles of organization. On this date the LLC's assets will be liquidated and its business will cease (occurrences such as the mutual written agreement of the members or the death or retirement of a member may also terminate the LLC's existence before the dissolution date). If no date is specified, a default period of usually 30 years will be enacted. However, the members may decide to continue the LLC's existence at a later date.

Fees. Filing fees vary from state to state, from $50 to $500. In addition, some states require the LLC to publish an announcement of its creation to the public in a generally circulated newspaper. This latter requirement can be very expensive, ranging from $500 to $2,000.

According to Levine, it is important to file and pay filing fees in the state where the LLC will be conducting its business. Even if filing fees are less expensive in a nearby state, filing in the state where the LLC resides means less hassle and is almost always cheaper in the long run. Also, entities filing for LLC status outside their home state will need to file annual reports in more than one state and may need to pay additional franchise taxes.

The Operating Agreement. At the first meeting of the members, called the organizational meeting, an operating agreement should be drafted. Although each state has laws governing how LLC's should be operated, the members should create their own operating agreement to document that all members agree on how the company should be run. It should be carefully constructed with an eye to preventing future disagreements and deadlocks. Most basically, the agreement should address the division of profits, members' voting rights, and company management. A good operating agreement will address the following issues:

- Who the members are and how they will be elected in the future.
- Grounds on which members may be terminated, and procedures to execute such terminations.
- Stipulations regarding allocation of business shares after the death of a member.
- If a member becomes disabled, how will the company provide for him or her: with disability insurance or out of its own funds?
- How managers will be selected and what their duties, salaries, and grounds for dismissal will be.
- How major decisions will be made. Which decisions will require unanimous approval of the members and which a simple majority vote? Which decisions can be delegated to the manager in charge of daily affairs?
- How often meetings will be held and how much notice members must receive.
- Who will keep records and how they will be kept.
- How members will invest in the LLC: will only cash contributions be allowed, or can members contribute services as well? If so, which services will be accepted and how will they be valued?
- How profits and losses will be allocated to members.
- How compensation (salary) for actively participating members will be determined.

- How new capital should be acquired should the company need it.
- What procedures must be followed to transfer interests in the company.
- What banking procedures should be followed.
- Penalties, if any, if members or managers fail to act in accordance with the operating agreement.

Fred Steingold, in his 2008 book, *Legal Guide For Starting & Running a Small Business*, suggests that businesses can either draft their own operating agreement or hire an attorney to create such an agreement. However, Steingold strongly recommends that businesses who draft their own agreements have a qualified attorney look at the document before it is signed. An attorney can help note and correct any internal inconsistencies, technical errors, and other problems which can result in hassles and disputes down the road.

Not all states require an operating agreement, but in those states (such as Oregon) where such an agreement is not required, any LLC without such an agreement has its member rights controlled by default via state statutes. For this reason, it is advisable that all LLCs draft an operating agreement in a timely fashion and strive to make the agreement as comprehensive as possible. An agreement can help an LLC establish a better structure than state statutes offer. For example, under 2009 Oregon laws, all members of an LLC managed by members have equal management votes and one vote can determine majority. If an LLC was established by members who contributed different amounts of money for start-up, this arrangement may not be satisfactory. An operating agreement can create a system agreeable to everyone.

LIQUIDATION AND LIQUIDATION VALUES

Liquidation means turning fixed assets into liquid assets, namely into cash. Thus an owner selling his or her business for cash as a going concern is technically liquidating it. However, in usual parlance the term is applied only to a situation where a business is closed and all of its assets are sold. This may happen voluntarily or involuntarily; the owner may simply decide to stop doing business, put a "Closed" sign on the shop or a message to that effect on his or her Web site, and proceed to sell everything. Alternatively the business is forced into liquidation to pay off a foreclosed loan or, alternatively, assets are insufficient to cover debt, and Chapter 7 bankruptcy liquidation is necessary.

It is a truism of business that a going concern is always worth more than its parts. This is a good rule unless the business is actually losing money and cannot be turned around. There is no particular magic involved in this valuation. The assets of a running business include its clients and their purchases. Machinery, equipment, shelving, and communications systems arranged complexly for a purpose are more valuable as a group than taken individually. The assets of a business may fetch as little as 20 cents on the dollar, possibly even less, all depending on the nature of the business and its inventory. A jewelry shop, the assets of which are mostly unsold diamonds and gold, will do much better than a machine shop with most tools 30 years old or older.

A liquidation tends to be a painful time in business life. Many liquidations follow months, occasionally years of anxiety and agony as a business gradually fails, and liquidation is *still* painful. It is, furthermore, as painful for a manager liquidating a subsidiary or a division for a large company as for an owner liquidating his or her business. While it is happening, those involved do not appreciate that they will gain valuable experience from the process as people no less than as business persons. To liquidate a business effectively is itself a business skill; it can be done well or poorly.

THE LIQUIDATION PROCESS

Good timing and sober judgment are important aspects of "success" in times of failure. The earlier the owner realizes that liquidation cannot be avoided, the more resources will be present to liquidate with least pain. Human nature and reason tend to conflict in such situations, as owners hang on for dear life in the face of clearest evidence and lottery-like odds. Almost always the tantalizing possibility of being saved is out there in the form of a big bid, a potential buyer, or some hoped-for event. Setting clear, hard deadlines and proceeding in a businesslike manner toward a closing is the best policy. A business liquidating voluntarily and in an orderly fashion will almost always discover that its creditors, customers, and vendors will be cooperative. The sense of control will remain. If in the midst of such a process the miraculous turnaround event actually takes place, reversing course will also be easier.

Preparations. Once a decision to liquidate has been reached, the business needs to be closed, employees discharged, and company assets secured and inventoried. In larger operations, the owner will require help in managing the liquidation. Therefore selecting one or more trusted employees to participate in the process is essential before layoffs are announced and implemented as rapidly as possible. Effective actions in good time are important. Business closures sometimes produce unusual behavior in employees; they may feel cheated; the atmosphere of a free-for-all sometimes develops and caution is indicated to avoid wholesale theft and sabotage. Arrangements must be made to have locks changed and valuable goods safely stored. This is sometimes difficult to do and requires early arrangements. Vendors and customers must be notified after the layoffs are accomplished. This, too, will require early planning. Finally, the owner should take his or her own inventory before third parties become involved.

Participants. People entering the twilight zone of liquidation will discover it is populated by an entire industry little suspected to exist. There are professional appraisal firms whose routine business it is to value business assets. They appraise all manner of inventories and equipment daily and have an enormous depth of expertise. Owners facing such an appraisal, however, must brace themselves because prices named may seem extraordinarily low. Alongside appraisers are liquidators specializing in selling inventory and equipment; a variety of selling techniques are used, including auctions. Unusual venues may be common. For example, all the inventory may be moved to an empty warehouse and laid out for a sale that might extend over several days. Many liquidators have added Internet outlets to their marketing and therefore a photographer may be taking digital shots of selected items as part of inventory.

Owners usually can and sometimes do set aside equipment to be held indefinitely or for sale by themselves. By the nature of their contacts, owners may have ideal clients for certain kinds of equipment. The owner can then assign the remainder to a specialist who will sell everything else and dispose as waste or scrap what cannot be moved.

VOLUNTARY AND INVOLUNTARY LIQUIDATIONS

In a bankruptcy liquidation under Chapter 7 of the bankruptcy law, a court-appointed trustee will oversee the process and make crucial decisions. However distressed the owner might be and the distress will be much greater if liquidation is forced by a foreclosure he or she should refrain from letting things "get ugly." Such liquidations are termed "hostile." The owner then resists liquidation by neglecting orderly preparations, refusing to cooperate, delaying or denying necessary papers, and engaging in various kinds of disruption. Such situations can lead to further legal action and ultimately to much higher costs.

Voluntary liquidations take two forms. The best of these takes place when the owner decides to go out of business while still solvent and able, after liquidation, to pay off all outstanding debt. The second form involves an agreement with one or more creditors to liquidate but without a formal process. This is sometimes called an informal or out-of-court liquidation.In the latter case, which tends to be rather rare, the owner will work in close cooperation with one or more agents of creditors, all parties endeavoring to get the highest possible yield for all assets.

According to a 2008 article by Deborah Thorne, creditors sometimes become anxious when a business seeks voluntary liquidation, especially out-of-court liquidation. Some creditors in fact push for involuntary liquidation in order to protect their interests if they see that a company is in trouble. According to Thorne and other experts, the key to successful voluntary out-of-court liquidation procedures is open communication and the sharing of detailed information. Creditors are more likely to be comfortable if they receive assurances as well as details about a company's holdings, while companies will be more comfortable if they see that creditors will not push for involuntary liquidation.

According to Ralph Warner and Beth Laurence's 2009 book, *Save Your Small Business: 10 Crucial Strategies to Survive Hard Times or Close Down and Move On*, voluntary liquidation in which an agreement is reached between creditors and business owners is often the most advantageous for all involved. The owners will generally receive a higher price on their assets and remain in

control of the process. They will also not have to pay the legal fees required in a liquidation via bankruptcy. As a result, creditors can expect to have a larger amount of their debt repaid. Creditors also do not have to worry that a court will forgive some of a business's debt. The creditors and business can decide together what an agreeable repayment sum is.

ALTERNATIVES TO LIQUIDATION

If an owner feels that he or she must stop operating the business, one alternative to liquidation is to sell the business. This will be possible only if the decision is reached early enough, before the business actually fails. Sales may have been slipping, profits may have disappeared, but if there is still "life" in the business, it may well be possible to sell it and at a price higher than liquidation will guarantee. Many options are available. For a failing business the route most likely to be successful will involve letting the new owner pay off the acquisition price over time, with the current owner continuing to share the risk with the new owner up to a point.

According to Thorne, businesses in trouble also have the option of filing Chapter 11 bankruptcy before selling, which offers some protection from creditors. This allows companies to continue to exist at a minimal functional level. Once a buyer is located, the buyer can purchase the business clear of claims and liens. This is important, as this makes the business more attractive to buyers. The current owners can then use the money from the sale to pay creditors.

If a company notices that sales are doing poorly early enough in the process (before going out of business becomes an absolute necessity), it is sometimes possible to save the business through extensive restructuring. Restructuring for a small business may involve changing the location of a business, changing the inventory or employee structure, as well as other fundamental changes. It can also involve changing the repayment terms on any existing business loans. In general, restructuring is easier if a business has not lost too much money and still retains a number of assets.

For a larger business or corporation, restructuring may be court-ordered or out-of-court. It usually involves changing a board of directors, management, and day-to-day operations.When successful, restructuring can help a business become more efficient and more profitable, therefore helping the company survive.

LOAN PROPOSALS

Small businesses can obtain modest lines of credit by applying for credit cards, most of which will issue on the basis of a mere credit check by the issuing agency. Significant loans for the purchase of real estate, equipment, raw materials, or purchased components, as well as serious lines of credit, will require documentation of a correspondingly serious nature. Getting large loans is functionally identical to getting start-up financing in that the same kind of preparation, planning, care, and documents are necessary. A loan proposal will minimally consist of the proposal itself, a business plan, and financial data. All other things equal, comprehensive presentations fare better than brief and minimal packages.

A focused and professional approach is stressed by experts as a crucial element in getting funded. Kenneth DeWitt, for example, writing in *Commercial Carrier Journal.* cited the New Hampshire Commercial Financial Group (NHGC) as follows: "The vast majority of all business-financing proposals are eventually turned down. Key reasons for decline include (1) inadequate cash flow, collateral or security, and (2) proposing financing that is not compatible with a reasonable assessment of risk. But another reason is a submission that is either unprofessional or insufficient." DeWitt added that most business owners start with two strikes against them. "They are unaware of and unprepared for the standards they will be expected to meet in order to obtain financing."

Barbara Killmeyer, in her 2010 book, *It's Nobody's Business But Yours: A Comprehensive Guide for the Woman Who Wants to Turn Her Business Idea into a Reality,* suggests that even small businesses with a good relationship with a lender can benefit from a formally written loan proposal. According to Killmeyer, a well-written proposal helps to show the lender that a person is a good risk. Small businesses, in particular, according to Killmeyer, tend to be seen as a higher risk by lenders, and a formal loan proposal can

be helpful in showing lenders that a business is serious about its financial responsibilities.

PREPARATIONS AND RECONNAISSANCE

Most lenders give more attention to loan proposals prepared specifically for them and therefore tend to give lower rank to "one size fits all" submissions obviously aimed at multiple lending agencies. But in order to personalize a loan proposal, the business owner must get to know the lender and internalize the lender's needs and preferences. It is, of course, best to select a bank in the first place with a view of using it later as a lender. In that process the owner begins his or her own "look at the landscape" before a loan is ever discussed. Later, as the need for a loan makes itself felt, financial advisors to small business, such as the Small Business Administration, recommend preliminary discussion to get an understanding of the lender's criteria, qualification rules, the kinds of proposals the lender expects to receive, and the process of review to follow. As a minimum the owner ought to know smallest and largest amounts available, kinds of collateral expected, types of loans offered (line of credit? real estate only? lease financing?). Some banks have policy-based restrictions which may involve geography or type of business. If the lender is a poor match, the owner is well-advised to go elsewhere and possibly open a second account at (or move the account to) a bank which looks most promising. Lenders tend to favor their own customers.

It is generally desirable to have preliminary contact with the lending officer before a proposal is actually submitted. In smaller banks and when substantial loans are involved, this person may well be the bank's president. The business owner researching the loan application process and potential lender can indicate the size and nature of the loan in broad outline and thus see if a proposal is likely to be welcomed. Many banks handle unusually large numbers of transactions, the evaluation of which is automated by using so-called loan origination software (LOS). In attempting to talk to people, the owner can determine in advance the amount and kind of attention the loan proposal is likely to receive and either adapt to the procedures or go elsewhere.

ELEMENTS OF THE PROPOSAL

The loan proposal may be broken into four elements: 1) the loan itself; 2) description of the business subdivided into several categories; 3) financial data; and 4) references. The proposal may also have appendices, if appropriate, such as photographs, testimonials, and possibly even samples. In addition, the owner will typically write a concise cover letter which briefly highlights the proposal. It is well to keep the objective in mind: the loan proposal is a document intended to communicate facts and projections, the latter documented as well as possible, and to persuade the lender of the merits of a case. Everything helpful to achieve this objective should be present.

Loan Description. The first part of the loan proposal should describe the loan: why it is sought; the benefits anticipated; how much is being borrowed; anticipated repayment schedule; how repayment will be accomplished and from what sources of money; and the collateral being offered to secure the loan. Many banks require that this portion of the loan proposal be put on forms that they provide. If the forms are unsuitable for communicating some piece of vital information, additional sheets may be added to amplify the presentation.

Business Description. This part of the proposal should include information on the company's history and projected future path; its management, including resumes of key individuals; and an assessment of the business's market, including its general features and trends, competitors of the business, and key vendors and customers. If the company is relatively new, this information is sometimes supplied in the form of a business plan typically an updated version of the plan used to obtain initial financing. If the company has been in operation for some time and it prepares an annual plan, that plan itself may be usable or adaptable for this purpose.

In her 2010 book, *It's Nobody's Business But Yours: A Comprehensive Guide for the Woman Who Wants to Turn Her Business Idea into a Reality*, Barbara Killmeyer suggests that businesses provide at least the rudimentary facts about a business. This includes the business name, address, and the details of each principal member of the business, including each individual's name and social security number. Killmeyer suggests that this information can even be provided at the start of the loan proposal.

Killmeyer also suggests that the business description include details such as number of employees, assets held, industry details, age of the business, and other details. This information can help lenders determine the size and scope of a company and therefore the company's ability to repay a loan. Further, Killmeyer advocates describing the legal structure of the business as well as details about each principal member of the company. These details about each principal member can read like a short résumé: education, skills, experience, and accomplishments. This amount of detail lets lenders see the resources a business has for meeting its loan obligations.

Financial Documents. The business should submit at least 3 years' of financials balance sheets and income statements. These should be year-end data for the past

and the last month of data for the current year. Federal income tax returns for the same period should be included. Projections of operations should be made out for 1 year at least by month. A separate cash flow projection should accompany this part of the proposal. This is vital because ability to repay the loan is based on net cash flow. If finances are audited, the audit report will be included, of course. In some situations, it will be also necessary for the owner to submit personal financial statements as well. Details on important liabilities should be provided up front, such as other loans, lines of credit, and leases; the providing agency's or agencies' names, terms, and maturities.

References. Included in this section will be contacts with knowledge of the business, including its outside accountant, if any, a payroll service, the law firm, occasionally major suppliers able to comment on the company's bill-payment performance, and clients who can testify about future intentions to buy from the company.

REVIEW AND SUBMISSION

The business owner should anticipate presenting and defending the loan proposal to the lender. The best preparation for this will be careful review of the proposal, looking at it as if from the lender's perspective. Thinking through the questions that are likely to be asked and preparing thorough answers to those questions in advance is also very helpful.

In her 2009 book, *Business Loans from Family and Friends: How to Ask, Make It Legal and Make It Work*, Asheesh Advani recommends using various forms of fund-raising and turning to formal bank loans last. This way, owners can explain in their loan proposal the various ways they have raised funds already and how much money remains. This can help the lender see that the company is serious about raising the cash it needs. It also shows the lender that others were willing to risk their money on the business, suggesting that the business is a good risk.

Successful businesspeople come in every conceivable variety, from detail-oriented number crunchers to charismatic, high-flying salesmen who do not necessarily have a head for numbers. The lender, of course, will be oriented toward numbers and facts, will want to talk about them, and will expect the owner to interact effectively on the details. For most owners this is not a problem, although a little homework will help. Those unskilled at this sort of thing, who rely on a financial officer to herd the numbers, is well advised to take that officer with them to the presentation.

In the real world all aspects of the loan process are vital the initial reconnaissance and lender qualification; the proposal itself, not only in its comprehensiveness but also in the rationality of its internal strategy; and finally the presentation to the lender. However, even when all these aspects are handled effectively, the loan may still be turned down. If so, the final step, careful follow-up to discover the reasons for the rejection, will get the owner ready for the next attempt.

LOANS

Businesses are financed either by equity or debt, usually by both. Equity, of course, is the capital paid into the business by its owner and other investors who buy shares. This money can be recovered only by selling the shares or by selling the company, and investors are at risk for the total of their investment. Debt is based on contractual arrangements under which both repayment of the principal and payment of interest are specified, although certain forms of debt bear no interest: an example is trade credit under which a buyer may have up to 90 days to satisfy a bill. All forms of credit, in effect, represent loans from one party to another. Thus leasing of rental space or of equipment may be viewed as loans of real estate or of equipment, with rents and lease payments representing interest.

All such transactions are recorded on a company's books as liabilities. A company's debt-equity ratio (liabilities divided by equity) represents the degree to which it is said to be "leveraged." The ratio is one of the measures lenders use to make judgments on whether to lend or not or, alternatively, on how much to lend. The old-fashioned,

traditional view is that debt should be avoided; progressive thought holds that a good balance between debt and equity gives a company optimum flexibility for growth; speculative views favor maximum leverage in order to achieve the highest possible return for stockholders.

The balance of loans and equity may depend on the size of a business. Larger companies often have larger amounts of income generated and may have an easier time securing funding than smaller businesses. Barbara Killmeyer, in her 2010 book, *It's Nobody's Business But Yours: A Comprehensive Guide for the Woman Who Wants to Turn Her Business Idea into a Reality* suggests that most lenders want to see a small business financed no more than 25 percent to 50 percent by loans. To apply for a business loan, Killmeyer suggests, small businesses should ensure that they are supplying at least half of the total funds necessary through other means (such as personal savings).

CHARACTERISTICS OF LOAN TRANSACTIONS

Lending and borrowing transactions are characterized by time factors, costs, and risk considerations; all three are closely related.

Time Factors. Term loans, also known as installment debt, are classified by the length of time for which money is lent. Loans come in short-, intermediate-, and long-term forms. Revolving credit and perpetual debt, however, have no fixed retirement dates. Revolving credit, better known as a "line of credit," provides a sum of money which the borrower draws down and then pays back, borrowing again when funds are needed again. Interest is paid only when funds are being used. Brokerage houses that extend margin credit for customers on certain securities work the same way. Business credit cards are also a popular form of revolving credit for business expenses. The holder of a perpetual loan, usually issued through a registered offering, only pays interest on the money and decides in his or her own time when to retire the principal.

Repayment Schedules match the type of loan obtained and also affect the costs of the borrowing. Payment terms available either call for combined payments of principal and interest at regular intervals or require interest payments only with the principal repaid as a single sum at the end of the contract. In the first case, interest is charged only on the remaining balance of principal so that the interest portion declines over time. Under some types of leases, the lessor gradually acquires the real estate or the equipment being leased. In these cases the lease payment remains the same but the lessor's costs decline because he or she is able to claim a portion of the property as depreciation against taxes.

Cost. The cost of a loan is the interest charged. Interest may be fixed for the term of the loan or may be variable. If the rates are variable, they may be adjusted daily, annually, or at intervals of years (3, 5, and 10). Such rates (called floating rates) are tied to some index such as the prime federal lending rate. As a general rule, interest costs are based on the current cost of money and the relative risk of the loan, so that collateralized debt costs less than unsecured debt. As their name implies, fixed interest rate loans have the same interest rate during the entire term of the loan.

Security. Assets pledged as security against the loss of the loan are known as collateral. Credit backed by collateral is secured. In many cases, the asset purchased by the loan often serves as the only collateral, but in other cases the borrower puts other assets, including cash, aside as collateral. Real estate or land collateralize mortgages. Equity in real estate can also be used to secure business loans. Unsecured debt relies on the earning power of the borrower. Since secured loans are safer for the lender, they typically have lower interest rates. However, if a business defaults on a secured loan, the asset used as security may be seized or repossessed by the lender.

Third parties can also provide security for loans. In his 2008 book, *The Small Business Bible: Everything You Need to Know to Succeed in Your Small Business*, Steven D. Strauss notes that the Small Business Administration (SBA) is a great resource for businesses seeking a loan. The SBA guarantees loans for businesses, thereby reducing the risk lenders need to take when offering funding for small businesses. Looking for lenders offering SBA-guaranteed loans is often a good idea, especially for small businesses, as SBA-guaranteed loans tend to have favorable interest rates and less stringent qualification standards than unsecured loans.

Lender. The type of lender granting a loan to a business may impact the loan type, interest charged, and the terms of the loan. For example, many small businesses seek off-the-books loans from friends and family. These informal loans often feature very generous terms and low interest rates. Since they are not usually listed on a company's credit report, they also do not affect a business's ability to secure other types of funding.

Credit. A company's credit history is usually carefully considered by a lender. The lender will examine the types of loans a business has had and the repayment history of those loans. If a company has gone into bankruptcy in the past or has struggled financially, the lender may offer the business a bad credit loan only, if indeed he or she offers any loan at all. By the same token, newer small businesses often have a hard time securing loans because they do not have an established credit history. That is, the businesses are too new to have borrowed and repaid

money on time, making them ineligible for prime rate loans. In some cases, lack of a credit history makes the businesses ineligible for traditional bank loans.

COMMON TYPES OF LOANS

Consumers and small businesses obtain loans with varying maturities in order to fund purchases of real estate, transportation and production equipment, inventory, raw materials, parts, and other needs. The source of such funding may be friends and relatives, banks, credit unions, finance companies, insurance companies, leasing companies, and trade credit. State and federal governments sponsor a number of loan programs to support small businesses.

Short-Term Loans. A special commitment loan is a single-purpose loan with a maturity of less than 1 year. Its purpose is to cover cash shortages resulting from a one-time increase in current assets, such as a special inventory purchase, an unexpected increase in accounts payable, or a need for interim financing. Trade credit is also a kind of short-term loan extended to the business by a vendor who allows the purchaser up to 3 months to settle a bill. In the past it was common practice for vendors to discount trade bills by 1 or 2 percentage points as an incentive for quick payment.

The SBA offers a 7(m) Microloan program which offers short-term loans of up to $35, 000 for equipment, supply, or inventory purchases. These loans can also be used for working capital but may not be used to buy real estate. These SBA microloans are only available through approved nonprofit groups.

A seasonal line of credit of less than 1 year may be used to finance inventory purchases or production. The successful sale of inventory repays the line of credit. A permanent working capital loan provides a business with financing from 1 to 5 years during times when cash flow from earnings does not coincide with the timing or volume of expenditures. Such loans are common in seasonal businesses where, for instance, goods are manufactured in summer for winter sale or vice versa. In all such cases, creditors expect future earnings to be sufficient to retire the loan.

Like lines of credit, credit cards are a popular way for businesses to get funds. Strauss notes that up to half of all businesses use credit cards to borrow for start up costs and other business costs. However, as Strauss notes, many business failures are also attributed to credit card debt, since this type of debt is expensive and difficult to repay. Strauss and others recommend seeing credit cards as a last resort.

Intermediate-Term Loans. Term loans finance the purchase of furniture, fixtures, vehicles, and plant and office equipment. Maturity generally runs more than 1 year but less than 5. Consumer loans for autos, boats, and home repairs and remodeling are analogous intermediate loans.

Long-Term Loans. Mortgage loans are used to purchase real estate and are secured by the asset itself. Mortgages generally run between 10 and 40 years. A bond is a contract held in trust with the obligation of repayment. An indenture is a legal document specifying the terms of a bond issue, including the principal, maturity date, interest rates, any qualifications and duties of the trustees, and the rights and obligations of the issuers and holders. Corporations and government entities issue bonds in a form attractive to both public and private investors. A debenture bond is unsecured, while a mortgage bond holds specific property in lien. A bond may contain safety measures to provide for repayment.

The SBA offers a 504 Certified Development Company Loan program. This program offers fixed-term, long-term loans for company modernization, expansion, and for purchases of equipment and other needs. Even more popular than the 504 Certified Development Company Loan program is the SBA 7(a) Loan Guaranty. This very flexible loan program offers funding to companies for start-up, real estate, working capital, and most other business expenses. Strauss notes that this loan program is one of the SBA's best-known loan offerings. Terms for 7(a) loans range from 10 to 25 years.

MIXED MOTIVES

In virtually all lending/borrowing situations the motives of the parties involved are in some conflict, at least on the margins. The business borrower's primary motive is to obtain the necessary financing to run the business at the least possible cost. His or her ideal source of funding is paid-in capital, but such equity is put at risk, and the owner feels this risk particularly if it is his or her own money. At the same time, if the money comes from investors, they will own shares of the company, and the more owned by outsiders the less control the owner has. Even the most persuasive owner, able to get equity funding from others easily, will be constrained at some point lest he or she lose control of the business. In this balancing act debt becomes an attractive alternative source of money. The owner's motive will be to get as much unsecured financing of this type as necessary at the lowest possible rates of interest and to obtain secured loans only if there is no other way. The owner will try to avoid debt because servicing it costs money and it has to happen from cash flow. The less debt the business has to carry, the more rapidly his or her own equity will grow.

Independent investors in the business (if any) have yet another set of motives: they want to pay as little as possible for each share and see the value of that share grow. Investors like to "leverage" their investment by seeing it matched by borrowing. Since the borrowed money is used on their behalf, the more borrowing they can leverage the better.

But here, too, constraints set in. Under current law the creditors of a business are first in line when the business fails. If the company is highly leveraged, investors are likely to lose their entire investment. Thus leverage is good but it must be kept in line.

The lender, finally, is moved by a desire to earn money by lending it safely. Sources of large amounts of cash (banks, credit unions, insurance companies) are typically restrained by law and prudence from speculative investment of the money they hold in trust for others. They are conservative by their very structure and aim at predictable earnings by the safest possible means. Lenders ideally want secured loans at high interest rates, the latter kept low by competitive forces. They prefer to lend to the financially strongest possible borrowers; if competitive pressures force them to lend to weaker customers, they hedge the risks by charging more. From the lender's point of view, a financially strong borrower is one who has invested much and therefore has a great stake in the business's success; the business will also have a long, successful, and steady history of operations, and will offer ample collateral.

A small start-up with a brief history of mild success is thus in a relatively weak bargaining position and must make a very strong case before a favorable action by a potential lender is assured.

QUALIFYING FOR A LOAN

Aside from a successful track record, the three main factors that will help the small business qualify for a loan are good cash flow, a favorable debt-equity ratio, and carefully prepared documentation.

Net Cash Flow to Debt. The lender first looks at a loan-applicant's cash flow because it is the source of loan repayment. Cash flow is often different from the profitability or assets of a business because sales booked appear on the books immediately but may show up as cash only later (when payment is received) and purchases made are immediately shown as costs but may only require cash later (when payments are actually made). The lender will initially calculate the amount of cash available to service the current portions of any new debt. If this amount is minimally 1.25 times the debt service required, the business is at least in the ballpark to receive a loan. A company with a net cash flow of $5,000 a month and a future debt with a $1,750 monthly payment, has a ratio of cash to debt of 2.86 plenty, in other words. To be sure, the lender will look for a *history* of such cash flows: a 2-month history will not be enough. The higher this ratio and the longer the history, the more inclined the lender will be to lend. If the cash flow is lower, the battle is almost certainly lost for the time being.

Debt-Equity Ratio. This ratio is calculated by taking a company's liabilities and dividing them by the company's equity. A ratio of 1 means that for every dollar in equity the company has $1 of debt. A company with no debt at all will have a debt-equity ratio of 0. In capital-intensive industries the ratio will be significantly higher; in others much lower. In 2009 Microsoft's ratio was 0.14; Honda had a 1.02 ratio in the same period; General Electric's ratio was 4.35.

The ratio will tell the lender the commitment investors have made in the company, and the higher this commitment is in relation to borrowing, the more confidence the lender will have in being repaid.

Documentation. In addition to favorable financial ratios, the lender will be looking at the company's performance over time. The borrower should anticipate providing the lender a loan proposal justifying the loan. Parts of that proposal will be a business plan, financial statements, and details on other debts and liabilities. Sometimes unfavorable ratios can be overcome by a consistent history of profitable performance and high growth and even innovative plans with high potential for success will carry weight. But the wise business owner will not bet on that.

The New Automation. In the modern lending environment, computers and the Internet have amplified (and sometimes even usurped) the role of lending officers at financial institutions. One such development is loan origination software (LOS) offered by a number of companies over the Internet to banks, credit unions, and other financing agencies. These packages automate judgment on loan applications by calculating ratios, using averages for industrial categories, weighting experience factors, and even obtaining credit ratings automatically. These packages "score" loan applications and thus give loan officers confirmation for their own judgment or give them pause. In 2009 LOS software was also providing real-time updates of regulatory changes as well as automation of the entire loan process.

Downsizing in the banking sector, as reported by Mike Byfield in *Alberta Report* has caused an increase in caseloads and thus reliance on such services and software. Conditions continuously change and cycle, to be sure, but the well-prepared business owner with good justification can still prevail and get his or her loan. That, of course, is just the beginning of getting on with the program.

LOCAL AREA NETWORKS (LANS)

In the modern office, most workers are equipped with a personal computer. The computer may be free-standing (very much the exception these days) or it may be connected to a network, minimally to the Internet. In many small operations, like a doctor's office, a single computer, linked to the Internet, may be used. In most typical office situations, however, the computers of the organization are interconnected to each other as well by way of a local area network (LAN), typically by means of a single dedicated computer known as the "server," short for "file server." The linkage may be by wire or by a special radio frequency. The server used may also provide each "node" in the network with Internet service; and interoffice communications between computers are by e-mail. As the name suggests, such networks are *local* and shielded from external influences except as these are mediated by the network server, which is itself protected by "firewalls" from unauthorized interference. Communications between LANs may be over proprietary communications lines (wired, wireless, or a combination) or may use the Internet.

One of the benefits of a LAN is that it may be installed simply and incrementally, upgraded or expanded with little difficulty, and moved or rearranged with little disruption. LANs are also useful because they can transmit data quickly.

LANs allow workers or even families to share resources. For example, many offices have multiple computers but a limited number of printers or copy machines. LANs allow users of multiple machines to send their print jobs to printers, copiers, or fax machines. This helps create additional space, since the machines do not have to be in the same room. It also saves money, as the printers or other shared resources do not have to be purchased individually for every computer user. In their 2009 book, *Contemporary Business 2009 Update*, Louis E. Boone and David L. Kurtz note that LANs are also useful for connecting businesses where company employees work in different offices or buildings. A LAN allows company employees to share information, Internet connections, and documents quite easily, allowing for group work or teamwork even where employees work separately.

Indeed, connectivity seems to be an increasing concern for businesses. In February 2010 *InformationWeek* conducted a survey of 585 businesses. All 585 businesses identified real-time communication applications (such as high-definition video, good quality videoconferencing, and other applications) as a main use and a main concern where business LANs were concerned. Many businesses responding to the survey were especially interested in high-definition videoconferencing for both internal business communication and wide communications with clients, customers, and other businesses.

As William Stallings reports in his 2008 book, *Business Data Communications*, wired LAN technology is increasingly being replaced by wireless technology, since wireless LANs provide mobility and allow for LANs in places that are difficult to wire. Of course, wireless LANs can support a range of nontraditional business environments, including telecommuting.

PHYSICAL COMPONENTS OF LANS

The physical properties of a LAN include network access units (or interfaces) that connect the personal computer to the network. These units are actually interface cards installed on computer motherboards. Their job is to provide a connection, monitor availability of access to the LAN, set or buffer the data transmission speed, ensure against transmission errors and collisions, and assemble data from the LAN into usable form for the computer.

Network cards may communicate with the network either by wire or by radio signal. By 2010 many LANs were wireless, no doubt to take advantage of wireless laptops, printers, and other technology. Wireless communication is between radio devices which are themselves cards or specialized modems. Advantages are avoidance of wiring costs and hassle; disadvantages are distance limitations and

interference. Unless a wireless system is properly configured to use signal encryption, the problem of the ''evil twin'' appears a phrase used to label a device that appears to participate in communications because it inadvertently interferes with a poorly configured network. A number of companies have emerged to help companies with this common problem by offering wireless site surveys. This service allows companies to hire IT professionals, who arrive at the place of business and determine the optimal placement of wireless devices and routers for maximum efficiency of signals. A wireless site survey can also help businesses establish a wireless LAN or can help pinpoint possible problems which may interfere with wireless signals and thus disrupt the LAN.

WIRED LAN TOPOLOGIES

LANs are designed in several different physical arrangements of node computers, known as topologies. These patterns can range from straight lines to a ring. Each terminal on the LAN contends with other terminals for access to the system. When it has secured access, it broadcasts its message to all the terminals at once. The message is picked up by the terminal for which it is intended, or multiples of these. The branching tree topology is an extension of the bus, providing a link between two or more buses.

A third topology, the star network, also works like a bus in terms of contention and broadcast. But in the star, stations are connected to a single, central node (individual computer) that administers access. Several of these nodes may be connected to one another. For example, a bus serving six stations may be connected to another bus serving ten stations and a third bus connecting twelve stations.

The ring topology connects each station to its own node, and these nodes are connected in a circular fashion. Node 1 is connected to node 2, which is connected to node 3, and so on, and the final node is connected back to node 1. Messages sent over the LAN are regenerated by each node, but retained only by the addressees. Eventually, the message circulates back to the sending node, which removes it from the stream.

THE FILE SERVER

The administrative software of the LAN resides either in a dedicated file server; in a smaller, less busy LAN; or in a personal computer that acts as a file server. In addition to performing as a kind of traffic controller, the file server holds files for shared use in its hard drives, administers applications such as the operating system, and allocates functions.

When a single computer is used as both a workstation and a file server, response times may lag because its processors are forced to perform several duties at once. This system will store certain files on different computers on the LAN. As a result, if one machine is down, the entire system may be crippled. If the system were to crash due to undercapacity, some data may be lost or corrupted.

The addition of a dedicated file server may be costly, but it provides several advantages over a distributed system. In addition to ensuring access even when some machines are down, its only duties are to hold files and provide access. Dedicated servers can also be protected more diligently against attacks and security concerns than workstations acting as servers.

OTHER LAN EQUIPMENT

LANs are generally limited in size because of the physical properties of the network, including distance, impedance, and load. Some equipment, such as repeaters, can extend the range of a LAN. Repeaters have no processing ability, but simply regenerate signals that are weakened by impedance. Other types of LAN equipment with processing ability include gateways, which enable LANs operating dissimilar protocols to pass information by translating it into a simpler code, such as ASCII. A bridge works like a gateway, but instead of using an intermediate code, it translates one protocol directly into another. A router performs essentially the same function as a bridge, except that it administers communications over alternate paths. Gateways, bridges, and routers can act as repeaters, boosting signals over greater distances. They also enable separate LANs located in different buildings to communicate with each other.

The connection of two or more LANs over any distance is referred to as a wide area network (WAN). WANs require the use of special software programs in the operating system to enable dial-up connections that may be performed by telephone lines or radio waves. In some cases, separate LANs located in different cities and even separate countries may be linked over the public network.

Boone and Kurtz note that most businesses already use WANs in the form of long-distance telephone services. Telephone companies provide these WAN services. WANs are designed to provide not only links between different LANs but are also designed to help link computers across larger geographic areas than LANs are designed to do. Therefore, if a business has multiple locations, a business owner may decide to establish LANs in each business location and use a WAN to link all the businesses together.

LAN DIFFICULTIES

LANs are susceptible to many kinds of transmission errors. Electromagnetic interference from motors, power lines, and sources of static, as well as shorts from corrosion, can corrupt data. Software bugs and hardware failures can also introduce errors, as can irregularities in wiring and connections. LANs generally compensate for these errors by

working off an uninterruptable power source, such as batteries, and using backup software to recall most recent activity and hold unsaved material. Some systems may be designed for redundancy, such as keeping two file servers and alternate wiring to route around failures.

Increasing LAN reliance has also created additional problems for companies. As LANs get larger, the energy they use increases. Larger servers mean that companies must find larger spaces for their servers as well as a means of cooling larger dedicated servers. Many companies have built such intricate LANs that they must use datacenters (dedicated rooms containing servers and other computing equipment). These computer areas need to be cooled, controlled, and kept free of moisture. In the 2010s many companies have outsourced their server needs by storing data and applications on remote servers which do not take up such an immense amount of room.

Security problems can also be an issue with LANs. They can be difficult to manage and access because the data they use is often distributed between many different networked sources. In addition, many times these data are stored on several different workstations and servers. Most companies have specific LAN administrators who deal with these issues and are responsible for the use of LAN software. They also work to back up files and recover lost files.

Many applications, including network management software and applications, have been developed to help companies manage their computer networks. These applications tell business owners when employees access certain network applications, when servers may overheat, and other vital information.

According to a 2010 article in *InformationWeek*, LANs are increasingly being used for content sharing. For example, many businesses want to use their LANs and computers for whiteboarding, or applications which allow many employees to work on the same project using the same template but on different computers. High-definition teleconferencing and video streaming also tends to place a high burden on LANs. Many companies are now using cost-effective video surveillance systems (which use the LAN) as a security system. Always evolving applications mean that companies must spend money to update their LANs.

PURCHASING A LAN

When considering if a LAN is suitable for a business, several things must be considered. The costs involved and the administrative support needed often far exceed reasonable predictions. A complete accounting of potential costs should include such factors as purchase price of equipment, spare parts, taxes, installation costs, labor and building modifications, and permits. Operating costs include forecasted public network traffic, diagnostics, and routine maintenance. In addition, the buyer should seek a schedule of potential costs associated with upgrades and expansion and engineering studies.

The vendor should agree to a contract expressly detailing the degree of support that will be provided in installing and tuning up the system. In addition, the vendor should provide a maintenance contract that binds the company to make immediate, free repairs when performance of the system exceeds prescribed standards. All of these factors should be addressed in the buyer's request for proposal that is distributed to potential vendors.

LANs can also be purchased for home use. Initially, these kits were expensive and slow and transmitted data via the phone lines in the home. New products have emerged that are faster, more affordable and use wireless technology to allow multiple computers to share printers and perform other LAN functions. This technology allows phone lines, cable connections, and LANs to be used simultaneously and is perfect for a small-business owner who works out of his or her home.

LOSS LEADER PRICING

Loss leader pricing, sometimes also called leader pricing, is an aggressive pricing strategy in which a store sells selected goods at cost or even below cost in order to attract customers who will, according to the loss leader philosophy, make

up for the losses on highlighted products with additional purchases of profitable goods. Grocery stores often make use of loss leader pricing in their weekly ads, for example. In general, loss leader pricing is best on products and services that customers are familiar with, as this allows customers to readily spot a good bargain and therefore be tempted to come into the store. Loss leader pricing is employed by retail businesses; a somewhat similar strategy sometimes employed by manufacturers is known as penetration pricing. According to Steve Monas and Richard Hooker in their 2008 book *Shoestring Venture: The Startup Bible*, a related concept is captive product pricing. In this type of marketing strategy, companies charge below cost on one item but then charge extra on a necessary accessory to that item. For example, printers are often sold for $40 or less, but cartridges for those printers cost almost as much as the printer itself. While the printer company may lose money on the printer (a one-time purchase) it will earn money again and again on the profit-rich cartridges.

Loss leader pricing is, in essence, a bid to lure customer traffic away from the businesses of retail competitors. Retail stores employing this pricing strategy know that they will not make a profit on those goods that are earmarked as loss leaders. But such businesses reason that the use of such pricing mechanisms can sometimes attract large numbers of consumers who would otherwise make their purchases elsewhere. In the world of e-commerce, loss leader strategies are intended to draw consumer traffic to an online retailer's Web site. The technique is also used for product introduction, which might include several free copies of a magazine to induce purchase of a subscription, low rates for cable services, and other "introductory" pricing which, if not always priced at a loss, function in the same way.

Loss leader pricing has been practiced with considerable success, especially by large national discount retailers, but the strategy is not without its critics. In his 2009 book, *Know This: Marketing Basics*, Paul Christ notes that businesses interested in loss leader pricing should consider their state laws. Several states have passed legislation under the Unfair Sales Act. In some states, this legislation makes it illegal to sell specific products, such as tobacco or gasoline, at or below cost. In other states, the laws are more comprehensive and are designed to stop large chain stores from selling items at below cost in a manner that might inhibit small business growth. In 2008 Oklahoma had some of the toughest Unfair Sales Act legislation in the United States, requiring product pricing on most items to be 6 percent or more above cost. Similar trends have emerged in Europe, with a ban on loss lead pricing in Irish groceries being a case in point. Lawsuits alleging that some loss leader pricing strategies amount to illegal business practices have also increased, although plaintiffs have not always been victorious. Opponents of such pricing practices argue that the strategy is basically predatory in nature, designed ultimately to force competitors out of business. Some products in particular tend to stir controversy when companies use loss leader pricing. In 2008, for example, Wal-Mart was accused of loss leader pricing after is began offering heavy discounts on its pharmacy items.

Defenders of the practice contend that loss leader pricing is simply one of many measures that retail establishments take to increase in-store traffic and, ultimately, their financial well-being. They note that U.S. antitrust and trade regulation statutes are designed to protect competition, not individual competitors, and that legitimate marketplace competition inevitably results in economic winners and losers. The furor over the practice is not expected to subside anytime soon, however, because many small businesses, with strong support in many state legislatures, have been economically damaged over the past several years by larger competitors willing to take losses or razor-thin profit margins on some products in order to expand their customer bases.

Business experts note that suppliers sometimes object to loss leader pricing as well, despite the greater volume of sales that the practice often spurs within a given store. These increases may be offset by drops in sales at other stores where the brand is still priced high. Such developments can strain relations between supplier and customer, and in worst case scenarios, bring pressure on the supplier to lower its price for the goods in question. The practice is most debated among retailers. Some see loss leader pricing potentially inducing downward spirals of pricing which hurt everyone except the chuckling consumer carrying ten cans of peanut butter or instant coffee out to the car at 7:05 in the morning, 5 minutes after the store's opening.

Indeed, in recent years, retail industries have acknowledged a side effect of loss leader pricing. It's known as "cherry picking." This is a practice wherein customers move from store to store, making purchases only on those products that are priced near or below acquisition cost. Such purchasing patterns effectively foil the strategy underlying loss leader pricing.

LOW-PROFIT LIMITED LIABILITY COMPANY (L3C)

A low profit limited liability company (L3C) is an organizational entity driven by both charitable and profit-making interests. An L3C combines the characteristics of philanthropic organizations and for-profit entities in the pursuit of social benefits through profitable business activities. The L3C concept provides charity foundations with the opportunity to leverage their capital base through partnerships and joint venture initiatives with private investors. As such, L3C is a form of social entrepreneurship that is closely related to a limited liability company (LLC), the main difference being the nature of profit motivation. Moreover, whereas LLCs primarily operate with the objectives of maximizing profits, L3Cs primarily seek to improve the social welfare of communities from an entrepreneurial perspective. Profit generation largely remains a secondary objective among L3Cs. Similarly, L3Cs are different from charity organizations because they are not tax exempt and freely distribute after-tax profits to the owners of the business entity.

ADVANTAGES OF L3C

LC3s are associated with numerous advantages which encourage increased social investment activities in not-for-profit organizations and socially sensitive investors. Some of these advantages include:

- L3Cs serve as viable alternatives for private foundations in the quest for satisfying the minimum requirements for annual contributions.
- L3Cs enable private foundations to create sustainable sources of funds through minimal income generation from fund investments, marking a pragmatic shift from direct grants which portend no income at all.
- L3Cs may access loans attracting capital from foundations seeking to invest in socially conscious ventures.

PROGRAM RELATED INVESTMENT

Qualification as a program-related investment (PRI) is what makes L3Cs unique and viable entities for pursuing sustainable, socially beneficial ventures in the philanthropic sector. PRI is basically an investment that is designed with the primary objective of pursuing social benefits aimed at furthering the underlying mission of a foundation, with income generation or property appreciation forming no part of the foundation's core objectives.

PRI plays a very important role in the taxation of L3C organizations. In the United States, tax-exempt foundations are legally required by law to distribute minimum amounts annually in their charitable missions. Minimum distributions are usually tagged at 5 percent of a foundation's net asset valuations in addition to a foundation's direct expenditures on tax-exempt activities. As such, PRI can be among the distributions which qualify as minimum amounts. However, since the ascertainment procedures for PRI investments are costly and time consuming, private organizations have developed tendencies to avoid creating PRIs and instead seek to meet the requirements for minimum distributions through grant making to operating foundations that are private and public charity organizations. It is at this point that L3Cs come in handy as viable alternatives for private foundations seeking to ascertain PRI qualifications of investments they are legally designed to meet the requirements for PRI investments for purposes of tax-exempt accomplishments. (More information about PRIs can be accessed from www.primakers.net.)

L3C AND TAX IMPLICATIONS

Although the pursuit of social benefits remains the primary objectives for L3Cs, these entities are not exempt from income taxation by the federal government. Therefore, taxes are deducted from the gross income before the apportionment of any profits to members of the organization. Furthermore, the Internal Revenue Service (IRS) does not necessarily recognize L3C investments under PRI programs. In fact, in an article titled *Low Profit Limited Liability Companies A New Approach to Achieve Social Progress*, Steve A. Ruskin and B. Seth Bryant acknowledge that the IRS is yet to rule on ancillary tax provisions, with particular regards to income generated by private foundations through L3Cs. The lack of clear guidelines has given rise to persistent doubts as to whether income earned by private foundations through L3Cs should be subjected to tax provisions of Section 511 of the Internal Revenue Code, as is usually the case with the tax imposed on income that is generated from unrelated trade or business.

L3C LEGISLATIONS

L3Cs have undergone transformation over time to become effective channels for engineering social change, a development that has prompted the adoption of

relevant federal and state regulatory frameworks to govern the formation and operation of L3C enterprises. In the United States, for example, several states require L3C entities to satisfy the following benchmarked conditions before being granted legal recognition:

- The intent to fulfill charity or education programs should be the primary inspiration for the formation of the entity.
- Significant pursuit of charity or education programs by the entity with reference to provisions in Section 170 of the U.S. Internal Revenue Code.
- Income generation or property appreciation should not be ranked as the primary motivation for the entity.

SIGNIFICANCE OF L3C PROGRAMS

L3Cs have tremendous potential for generating adequate resources for furthering charity and education programs because they bring private and social investors on board to support community-based, state-based, and national social venture initiatives, such as construction and support of schools, affordable housing programs, or provision of low-interest loans through microfinance institutions. Given that the objectives of L3Cs are closely related to those of social entrepreneurship, they have expanded the opportunities for implementation of social ventures through not-for-profit and for-profit joint initiatives. L3Cs are gaining wide acceptance as an excellent choice for social venture initiatives. L3Cs are therefore the appropriate platform for visionary entrepreneurs to engage in socially beneficial programs such as social corporate responsibilities but at reduced costs and operational convenience. Participation in community social development programs can transform the image of business entrepreneurship from that of a profit maximization channel to a societal development agent.

M

MAILING LISTS

Advertising is all about reaching the right people with the right message, and direct mail is one of the advertising media used to deliver that message. Direct mail is thought to be a powerful tool precisely because it can be directed at preselected audiences, including subgroups of those proven to respond to direct mail. This targeting of the message is accomplished by creating and using mailing lists for many different profiles of potential buyers. A business can gradually build up its own mailing list by directly soliciting the addresses of its customers in its outlets and by using print advertising. Alternatively it can rent mailing lists from compilers. It may even choose to sell its own list to others.

Based on data published by the U.S. Census Bureau, in 2007 revenues for advertising were $79.033 billion and revenues for direct mail were $12,255 billion, about 15.5 percent of the total advertising revenue total.

In addition to direct mail, advertisers and companies have the option of electronic solicitation over the Internet. This mode of contact, by the nature of its very low costs and ease of distribution, rapidly aroused spirited consumer opposition and came to be regulated under the CAN-SPAM Act of 2003. Electronic mail solicitation is often significantly different from direct mail in content. Advertisers have the option of using sound, audio, and video in e-mail or in linking Web sites to attract customers, for example.

MAILING LISTS IN CONTEXT

Mailing lists are compiled using various categories likely to appeal to a prospective mailing list buyer and thus represent virtually a catalog of any and all kinds of interests and profiles. Important classes are lists based on: 1) income and demographics; 2) political, religious, and charitable characteristics based on donations and memberships in organizations; 3) occupations and professional society memberships; 4) avocational and other interests as drawn from subscription lists to magazines; 5) past purchases of classes of products; 6) public lists available to list builders from government and regulatory agencies; 7) stockholders in companies; and 8) geographical lists compiled from telephone directories. The great variety of lists available for purchase ensures that most businesses looking for potential clients will be able to get a suitable list, whether their criteria are general ("the super rich") or very specific ("kayakers in Colorado").

Once companies have a mailing list, they generally use the mailing list to mail one of three items: a package, a self-mailer, or a catalogue. The catalogue, of course, is a booklet or book containing the company's products and details on how to order. The self-mailer is anything that is not enclosed in an envelope. It can include a coupon, a flyer, a brochure, or similar material. A package is what people associate with direct mail. It looks like a letter and contains a letter, advertising materials, a response postcard or self-addressed stamped envelope, and other materials to convince the reader to "order now."

Mailing lists are costly to assemble and to maintain. People are constantly in motion both physically and in other ways (they get divorced, go bankrupt, pick up other hobbies, etc.). Even if they remain on a list, they may no longer *belong* on a list. As a consequence of this dynamism, mailing lists are never completely up to date and tend to vary in quality based on the effort expended on purging and requalifying lists by the vendor; list vendors

rarely expend the same intense efforts on *all* their lists. The upshot of this is that the list buyer will always also buy some "waste." He or she may be able to recover the cost of these names from the vendor but not the money spent on mailing to useless addresses.

Although people speak of "buying" mailing lists and selling these to list vendors *does* take place routinely the typical user of a mailing list actually *rents* the list for a one-time use. List vendors include addresses in every list intended to monitor what their customers send out. If a business rents a lists for a single mailing and then uses the list several times instead of only once, the vendor will know about this and send a new bill for second and subsequent uses with proof in hand that the list has been reused. However, if someone from a list responds to a marketer and becomes a customer, that customer's contact information then belongs to the company, and the business can send that new customer further marketing materials without paying the list vendor.

Response rates to mailings tend to be very low. The best rates are achieved by the very costly mass mailings of sweepstakes marketeers ("You May Have Already Won!" "Winner Notification Certificate Inside!"), which occasionally achieve return rates above 10 percent. Many direct mail users routinely get returns of less than 1 percent and only a portion of these translate into sales. Due to the costs of mailing lists and the low response rate, many marketers and businesses test lists before buying or continuing with a specific list. Testing a list means sending mailings to a selection of the list and waiting for a response, then analyzing and tabulating the responses. Multiple lists can be tested by using coding on each mailing. List testing is a complex process and is generally best left in the hands of experienced list brokers or direct mail advertising firms.

TYPES OF LISTS

Mailing lists are classified by the method of compilation. *Response lists* consist of names and addresses of individuals who have responded to an offer of some kind (by mail, telephone, billing inserts, etc.). The addresses provided may be that of a business or a home. Because these people are known responders, their names are generally priced higher than those in lists compiled by other means. But individuals on response lists may have responded to solicitation other than direct mail (e.g., a phone call) and may not even open their "junk mail." Thus it is important for the small-business owner to know what percentage of a list was direct-mail compiled.

The business owner's most valuable response list is always the "house list" of current and past customers. According to Susan K. Jones's 2008 book, *Business-to-Business Internet Marketing*, house mailing lists can be a company's most effective list, provided that the list is carefully compiled and maintained. Jones explains that the secret to success with such a house list is to compile a range of data carefully. She suggests segmenting the list according to current customers (or past customers) and potential customers. She further suggests segregating the list of current or past customers by amount of products purchased, frequency of purchase, and by most recent purchase. She recommends rating potential customers by how likely they seem to buy. This allows businesses to focus on those targets who are either frequent customers, large order customers, or most likely to become customers.

Compiled lists contain names and addresses of individuals gleaned from the White Pages and Yellow Pages, often enhanced with information gathered from public records (e.g., auto registrations, birth announcements, business start-ups). A very popular method of list compilation is through magazine subscriptions, since lists of readers provide an excellent means of targeting individuals in specific industries (e.g., *Institutional Investor*) or within distinct areas of interest (e.g., *Field and Stream*). Lists may also be compiled based on zip code when the small-business owner seeks to reach consumers in a particular geographic area or income level. The average income of a zip code area is determinable from the decennial population census and thus can be used to classify such lists fairly precisely by level of wealth. Credit card lists are also an effective means of list compilation.

Membership lists come from all manner of associations and organizations with permanent members. Selling such lists is a source of income for the associations and groups involved. To be sure, this category itself is a compilation, but with the special character that members of such groups are self-selecting and have specific profiles and associated income and interest patterns.

Opt-in lists are lists to which members actually subscribe. Often, by entering a contest or signing up for a free gift, entrants or customers agree to be placed on a mailing list with the written understanding that the customer can "unsubscribe at any time." This type of list is especially popular online, where e-mail marketers often promise all sorts of free items, including audio or e-book downloads, in order to build an e-mail marketing list.

LIST SELLERS AND SERVICERS

Direct mail is populated by a large number of list sellers. The base of the pyramid is represented by *list owners* who may be businesses with customer lists, banks with credit card customers, publishers of periodicals with subscription lists anyone, in fact, with a list of names he or she is entitled to rent or sell to others. *List compilers* rent or purchase such lists for retail to final users and frequently combine and create their own composite lists. Compilers,

being specialists in the management of lists, typically employ staffs for the purpose of qualifying, analyzing, purging, and otherwise engineering mailing lists. They are in the business of renting lists directly to end users and supplying list brokers. The *list broker* is a marketing expert specializing in direct mail; his or her job is to know what lists are available and which can be deployed for the purposes of a client. Brokers work with list owners or compilers and are paid a commission for list rentals (around 20 percent of the transaction). They typically represent the final user and are thus technically "buyers." The industry also has a specialized seller, known as the *list manager*. Managers represent owners and promote lists to ultimate users, compilers, and brokers.

Service bureaus have emerged in this industry. They specialize in the physical management of lists on behalf of owners and compilers. These operations are computationally advanced businesses which perform data mining, enhancement, and the more routine maintenance steps of merging and purging huge lists, eliminating duplicates, and "normalizing" variant forms of the same names and addresses.

Letter shops service the ultimate list user by minimally performing mailing operations. Many also offer data processing services to ensure that the addresses used conform to U.S. Postal Service regulations and that the sorting is done to achieve lowest possible postage costs.

E-Mailings and Spam. With the dramatic rise in Internet communications, e-mail rapidly came to be used for commercial solicitation. Here the mailing list transforms into a list of e-mail addresses which Web sites can capture from visitors mechanically and build into databases with a little programming effort. The volume of this new kind of mail grew so rapidly that it acquired the derogatory label of "spam." It was used and abused by organizations sending out millions of unsolicited e-mail messages selling anything from drugs to insurance to pornography. Companies became very enthusiastic about e-mailings because they were so inexpensive when compared with direct mail. Also, e-mail solicitation could easily reach tens of thousands of customers with just one click, theoretically increasing the chances of a positive response. E-mail solicitation continues but has been curbed somewhat by Internet gateway providers that filter it out.

E-mail solicitation has also come under government regulation,in the form of legislation titled Controlling the Assault of Non-Solicited Pornography and Marketing Act which just happens to abbreviate to the CAN-SPAM Act of 2003 (Public Law 108-197). The law took effect in 2004. It requires that senders of unsolicited commercial e-mail label their messages, but Congress did not require a standard labeling language. Such messages must carry instructions on how to opt-out of receiving such mail; the sender must also provide its actual physical address. Misleading headers and titles are prohibited. Congress authorized the Federal Trade Commission (FTC) to establish a "do-not-mail" registry but did not *require* the FTC do so. CAN-SPAM also has preemptive features: it prohibits states from outlawing commercial e-mail or to require their own labeling.

Despite laws regarding e-mail solicitation, however, there are signs that the problem of unsolicited e-mails is getting worse. Companies now use bots, which automatically e-mail solicitations to a growing number of e-mail users. Some companies are complying with basic laws, such as the law requiring clear opt-out options, but are making it harder for customers to leave e-mail lists. For example, a 2010 study found that the number of online e-mail advertisements requiring three or more clicks to unsubscribe is 39 percent. In 2008 the number of advertisers that required that many clicks was only 7 percent. The same study found that 30 percent of marketers continue to send at least one additional e-mail solicitation after a customer opts out of a list. In 2008 the number of marketers using that aggressive practice was 26 percent.

Another recent problem has been related to mailing lists targeting text phones. The Federal Communications Commission rates unsolicited text marketing under the same category as unsolicited cell phone calls. Text solicitations are also regulated by the CAN-SPAM Act, which prohibits unsolicited text messages from advertisers. Cell phone carriers have been attempting to filter unwanted texts, but many cell phone users continue to use up their texts on unwanted e-mail as marketers get more clever at eluding filters.

MAIL-ORDER BUSINESS

A mail-order business is one that receives and fulfills orders for merchandise through the mail. The terms "mail-order," "direct mail," and "direct marketing" are sometimes used interchangeably; in fact the mail-order category is a subset of the two other categories, which include any and all kinds of solicitation by mail, be it of sales or contributions to causes. Mail-order businesses thrived before the rise of the World Wide Web. Most mail-order companies were able to make the switch to online retailing while occasionally retaining a paper catalog. There is a growing section of retailers who promote and sell their products online and then mail the product to the customer. Essentially, such "dot-coms" or "e-tailors," as they are commonly called, are mail-order companies without the traditional printed paper trappings.

The rise of fast Internet connections and online shopping led to the rapid decline of printed catalogs at the end of the 1990s and the beginning of the twenty-first century. Many consumers prefer the speed and ease of online shopping. Price increases for shipping also adversely affected the industry. Mulitchannel Merchant reported in 2009 on the impact of even incremental postage rate increases on the profit and viability of mailing catalogs. "For many retailers, the price of printing and shipping catalogs began to outweigh the sales received as consumers turned their attention to the Web. The USPS in 2008 lost 9 billion pieces of volume. Catalog-dominated service categories were down nearly 25% for the year ended Sept. 30, 2008."

Data from the U.S. Census Bureau for 2008 showed an industry with sales of $2.27 billion that year. Sales in electronic shopping and mail-order houses have risen annually since 1998: with a year-on-year increase of 9 percent in 2007 and 2 percent in 2008. In the fourth quarter of 2009, e-commerce represented 3.8 percent of all retail, up from 3.4 percent in the same quarter of 2008.

While mail-order catalogs still exist, consumers concerned about the environmental impact of printing and mailing catalogs have begun "opting out" from receiving catalogs. There are even websites, such as www.catalogchoice.org, that facilitate catalog opt-outs and encourage e-mail solicitations instead.

Prior to the introduction to the official North American Industrial Classification System (NAICS), the Census Bureau classified mail-order as "Catalog and Mail-Order Houses" with the Standard Industrial Classification (SIC) code of 5961. As a sign of the times, beginning in 1997 the bureau began using NAICS code 454110 and calling these businesses "Electronic Shopping and Mail-Order Houses." Since that time, both in governmental classification as well as in common reference, "catalog sales" are treated as a single category regardless of what form the catalog takes.

PERENNIAL MOTIVE: CONVENIENCE

Mail-order businesses date back to pre-Revolutionary War days when gardeners and farmers ordered seeds through catalogs. Early catalog sales of general merchandise drew their support from a predominantly rural population for which shopping usually meant a day-long absence from the farm; but the retail stores the isolated farmers visited in nearby towns usually stocked only necessities/commodities with but a rare item of luxury now and then. In the nineteenth century catalog sales filled a vacuum, the catalogs always at hand, Montgomery Ward being the early dominant merchant, soon yielding market share to Sears Roebuck and Company. Until the late twentieth century and the rise of the Internet, catalogs were always on paper but transformed themselves by using color photography. Both the solicitation and the ordering were at first by mail but, as telephone service became universal, telephone ordering from a printed catalog became an alternative. Since the 1990s, catalogs have appeared on the Web. The same catalog may be accessible both in printed and in online formats. In the twenty-first century, mail-order has been largely replaced by the ease and convenience of the Internet. Retailers can provide more interactive information about a productmdash;including multiple views and customer reviewsmdash;no longer constrained by space and cost for printing and shipping.

The driving force behind "distance sales," as this field is sometimes characterized, has always been convenience. In rural times isolation made the catalog handy; in modern times very busy lifestyles (not least high and increasing female workforce participation), have motivated shoppers. Online and catalog shopping have always shown peaks in busy holiday seasons. At the beginning of

the twenty-first century, online shopping at work even spawned the term "Cyber Monday." This was a play on one of the busiest shopping days of the year, the day after Thanksgiving, otherwise known as Black Friday. Employees used broadband connections at work the Monday after the Thanksgiving break. However, this day is no longer among the busiest for online retail now that broadband is widespread and employees have been reprimanded for their at-work shopping habits.

A VARIETY OF CATALOGS

Catalogs come in three major categories: business-to-business, consumer catalogs, and catalog showrooms. Business-to-business catalogs provide merchandise to be used in the course of business, including everything from office supplies to computers. In industrial settings, business-to-business catalogs are used to sell everything from heavy machinery to hand tools. Business-to-business catalogs are mailed to individuals at their place of business, with most purchases being made on behalf of the business.

Consumer catalogs are mailed to consumers at home and come in a variety of forms: independent catalog houses sell only from a catalog; retailers use catalogs to generate store traffic, to sell goods directly, and catalogs intended to do both. Manufacturers' catalogs feature only products by a single producer. Catalogs distributed by museums or in the context of a major exhibition are a variant. Some catalogs are used by credit card companies to stimulate credit purchasing.

MANAGEMENT INFORMATION SYSTEMS (MIS)

A management information system (MIS) is the integration of computer systems with management objectives. The MIS is a computer database that gathers, analyzes, and produces reports on timely information to key decision makers in a company. MIS is used to sort through large, unwieldy amounts of data to mine and disseminate crucial information faster and more accurately than could be done by employees. The MIS is programmed to monitor and report on those metrics that reflect the health of the company. MIS is commonly used to produce financial statements, performance reports, hypothetical "what if" scenarios for changes in strategy, and data processing.

The main purpose of the MIS is to give managers feedback about their own performance; top management can monitor the company as a whole. Information displayed by the MIS typically shows "actual" data in comparison to "planned" results and results from a year before; thus it measures progress against goals. The MIS receives data from company units and functions. Some of the data are collected automatically from computer-linked check-out counters; others are keyed in at periodic intervals. Routine reports are preprogrammed and run at intervals or on demand while others are obtained using built-in query languages. Many sophisticated systems also monitor and display the performance of the company's stock.

In the twenty-first century, MIS are still doing their jobs, but their function is now one among many others that feed information to people in business to help them manage. Systems are available for computer-assisted design and manufacturing (CAD-CAM); computers supervise industrial processes in many industries; and systems manage and transfer money worldwide and communicate worldwide. Virtually all major administrative functions are supported by automated systems. MIS has thus become mostly a subset of "information technology," the category often used to designate any and all software-hardware-communications structures that today work like a virtual nervous system of society at all levels.

MIS AND SMALL BUSINESS

If MIS is defined as a computer-based coherent arrangement of information aiding the management function, a small business running even a single computer appropriately equipped and connected is operating a management information system. A medical practice with a single doctor running software for billing customers, scheduling appointments, connected by the Internet to a network of insurance companies, cross-linked to accounting software capable of cutting checks, is de facto an MIS. In the same vein a small manufacturer's representative organization with three principals on the road and an administrative manager at the home office has an MIS system. That system can link to the inventory systems, handle accounting, and serve as the base of communications with each representative, who carries a laptop or smartphone.

But while virtually every company now uses computers, not all have integrated all disparate systems. To take this step, however, has become much easier, provided that good reasons are present for doing so. The motivation for organizing information better usually comes from disorder. Motivation may arise also from hearing about others who are exploiting some resource, like a customer list. Targeted implementation of MIS usually results in cost savings by increasing efficiency and identifying where problems lie.

There are sometimes also reasons for *not* automating things too much: implementing technology for its own sake rather than for a specific business purpose. In addition, a business can grind to a dead halt because "the network is down."

The MIS solution can be as simple as a Software as a Service (SaaS) system that is managed over the Internet. For example, with a customer mailing list, there are many e-mail newsletter programs that track customer response rates. The small-business owner should keep in mind the time needed to input data or otherwise keep the MIS relevant and useful.

MIS solutions can be focused on a single business function, such as accounting or inventory tracking, or a range of software packages for various problems that are gradually linked into one system with the help of a value-added reseller (VAR) or a systems integrator. This solution is probably best for the small business with fewer than fifty employees. Larger companies may in addition also want to explore options to install enterprise resource planning (ERP) systems that integrate manufacturing, purchasing, inventory management, and financial data into a single system with or without Web capabilities. Before implementing an integrated MIS or ERP system, the small-business owner should be aware of the level of support needed to maintain the system's functions. This could range from hiring a full-time MIS manager to an ongoing IT consultant relationship.

MANAGEMENT BY OBJECTIVES

Management by objectives is a collaborative process of setting goals; it is a technique applied primarily to personnel management. In essence it requires deliberate goal formulation for periods of time (like the next calendar or business year); goals are recorded and then monitored. The management guru Peter Drucker (1909 2005) first taught and then described the technique in a 1954 book (*The Practice of Management*). In Drucker's formulation the technique was called "management by objectives and self-control," and Drucker saw it as one of the forms of "managing managers." It became popular in the 1960s, by then abbreviated as MBO. It experienced both an upward and downward drift: it came to be applied not only to the organization as a whole but also to employees below the managerial level, so that in many corporations many employees labored, and still labor, at least once yearly, in formulating objectives. MBO was and remains an activity practiced predominantly in large corporations, although it spread in the 1970s and 1980s to mid-sized organizations, commercial and other. In the twenty-first century it became viewed in many circles as a somewhat dated technique not well adapted to the rapid changes and uncertainties of a dynamic Information Age. However, MBO continues to have committed and enthusiastic supporters. "Alcoa, Tenneco, Black & Decker, General Foods, and Du Pont, for example, have used versions of MBO with widespread success," wrote Ricky Griffin and Gregory Moorhead in *Organizational Behavior:*

Managing People and Organizations. The authors attribute the technique's long-standing popularity to its many strengths, including the potential to motivate employees by implementing goal setting throughout the organization; clarifying the basis for rewards; and encouraging communication.

In the early 2010s, management trends stressed strategic planning and integration of a company-wide strategy with mentoring and empowering employees. MBO is less emphasized; instead, as organizational structures flatten, companies look to MBO as one of many tools used to maintain a competitive advantage.

MBO BASICS

Planning is the central concept supporting MBO in the sense that individuals and organizations do better by formulating goals than just by working or living alone and merely responding to crises and events. If an organization has clear objectives, and managers and employees have set themselves objectives which support and harmonize with the company goals, a coordination and orchestration of conscious motives will be driving the corporate activity. Thus management by objectives moves corporate planning downward so that it becomes translated into personal goals. But MBO was always articulated as a collective and supervised activity rather than as a personal discipline precisely so that objectives could be coordinated. Goal setting is an annual exercise. The employee is asked to set five to ten personal goals; ideally these should be measurable in some way. Goals are discussed with the supervisor one level up. If the objectives are too vague or too easy, the employee must try again. Goals are next fixed in writing. Finally, periodic reviews of accomplishments against goals are carried out, the manager evaluating the employee. Reward systems are built around achieving the objectives.

MBO came of age in a time of change and ferment in U.S. management history, with corporations then responding to the dramatic rise of Japanese industry and Japan's commercial invasion most visibly of the automobile market. In this environment Japanese techniques were admired and imitated in MBA programs in business schools. "Quality circles" sprang up and corporations were adopting numerical quality control a Japanese technique the Japanese had learned from American statistician and business consultant W. Edwards Deming (1900 1993), and then perfected. Along with these methods came the promotion of other innovations all based on the conviction that loyalty could be trained and commitment induced: catchphrases like the "learning organization," "total quality control," "team management," "matrix management," "reengineering," and "empowerment" arose in this environment with battalions of consultants and gurus in business to teach the way.

Pros and Cons. The fundamental concept underlying management by objectives is based on wisdom: "If you don't know where you're going, you're certainly not going to get there." In any kind of complex activity, be it a wedding or a new product introduction, planning is good. Highly motivated individuals have conscious goals, pursue them with concentration, and do not rest until their aims are met. Effective individuals have to-do lists on slips of paper, on personal digital assistants (PDAs), or in their head. In a sense MBO is simply the extension of the to-do list to a longer period with a few additional refinements: goals should be precise and measurable in some way. Discovering a measure in itself leads to closer attention to the goal. If the goal is broad and vague ("greater customer satisfaction") looking for a measurement might refine it ("reduce product returns by 80 percent"); the goal will then more correctly focus attention on a company's quality problems or poor packaging. Focused, goal-driven activity produces all sorts of benefits, not least more effective use of resources, saved time, and also higher morale. Conversely, companies and individuals that simply "go with the flow" may find themselves "swept away." One might say that effective managers and employees practice MBO knowingly or not.

MBO assumes that if employees are actively involved in setting goals and how to achieve those goals, they are more likely to perform better and accomplish those goals. Employees should feel more ownership of their goals and responsibilities when they are actively involved with shaping those goals. When MBO works well, it should increase employee empowerment, and facilitate communication between management and employees.

The negative aspects of MBO have been due primarily to the more or less thoughtless, mechanical, and wholesale application of the technique. MBO was and still is typically introduced as an exercise from the top and then administered by the numbers. Frequently employees with relatively narrow and straightforward job descriptions (not just managers) are required to scratch their heads and come up with a precisely fixed number of goals. If the technique does not fit job descriptions well if the only reasonable goals employees can come up with are restatements of tasks they ought to do in any case the exercise becomes a ritual. People instinctively know when a technique is *pro forma*. For this reason, in many organizations the exercises resulted in detailed objectives recorded on paper and filed away to be routinely forgotten. Experience has shown that MBO works reasonably well where management leads and actively promotes goal achievement. But in such situations it is difficult to know

whether it was the MBO program or *leadership* that actually achieved the results.

Rodney Brim, CEO of Performance Solutions Technology, LLC, and a critic of MBO, identified four reasons for the weakness of the MBO technique. He believed that the method went into decline in the market turndown of the early 1990s when "downsizing," "right sizing," and other coping mechanisms captured management attention. "With the upturn of the market and the start of the Internet gold rush," Brim wrote, "management by objectives slipped further into the past. The term 'management' itself seemed to lose a sense of compelling interest. Riches were made based upon technology, upon acquisitions, upon something new, upon association with the WEB, not (for heaven's sake) management of work effectiveness." Brim's tally of weaknesses included the following points:

1. Emphasis on goal setting rather than on working a plan.
2. Underestimation of environmental factors, including resources available or absent and the crucial role of management participation (already referred to above).
3. Inadequate attention to unforeseeable contingencies and shocks which sometimes make objectives irrelevant.
4. A neglect of human nature.

Concerning the last point, Brim wrote: "People, the world over, set goals every year but don't follow them through to completion. One can surmise that this is the standard goal follow through behavior." Brim points out that business is well aware of this tendency, one reason why "work-out clubs ... predictably sell more memberships at the first of the year than they plan on supporting through the year. The problematic assumption is that if you manage by goals and objectives, direct reports and team members will organize their work around what you are managing by, e.g. those same goals and objectives."

MBO AND SMALL BUSINESS

The small-business owner who has a vague feeling that his or her business may be adrift might wish to look into management by objectives as a method for developing a strategy and reviving focus. "Strategy creates purpose, instills the sense of need, provides direction and focus, and clearly helps you know what's important," wrote Larry Mandelberg for the *Sacramento Business Journal.* Business owners will probably benefit from reading one or two books on the subject, including Drucker's work, available in paperback, and then trying the method on themselves.

MBO was originally conceptualized as a management tool for managers, and the managers were presumed to be inherently motivated. MBO works well when its principles are *internalized.* It tends to fail when it is imposed. Its great benefits lie in the planning that it requires. In the case of the small business, corporate plans and the owner's personal plans often coincide, thus giving MBO ideal scope. The requirement of formulating *measurable* objectives is a good discipline. If the MBO works well for the owner, the owner's own enthusiasm may act infectiously on other managers in the business.

MANAGING ORGANIZATIONAL CHANGE

Organizational change occurs when a company makes a transition from its current state to some desired future state. Managing organizational change is the process of planning and implementing change in organizations in such a way as to minimize employee resistance and cost to the organization while simultaneously maximizing the effectiveness of the change effort.

Today's business environment requires companies to undergo changes almost constantly if they are to remain competitive. Companies of all sizes and business models can face the need to change. The impetus for change may result from a positive event (a surge in growth and hiring) or a negative event (an economic downturn). Factors such as globalization of markets and rapidly evolving technology force businesses to respond in order to survive. Such changes may be relatively minor,as in the case of installing a new software program, or quite major, such as refocusing an overall marketing strategy, fighting off a hostile takeover, or transforming a company in the face of persistent foreign competition.

Organizational change initiatives often arise out of problems faced by a company. In some cases, however, companies change under the impetus of enlightened leaders

who first recognize and then exploit new potentials dormant in the organization or its circumstances. Some observers, more soberly, label this a "performance gap" which able management is inspired to close.

However, organizational change is also resisted and can readily fail. "Many organizations fail when they try to adopt new strategies, institute new processes or technologies, merge or acquire, or any number of other changes," reported Kate Nelson for the *Business Courier of Cincinnati*. "They don't necessarily fail outright, but the benefits they expect never appear or are far less than expected. In fact, about 70 percent of all projects that require people to change fail to meet their objectives." The failure may be due to the manner in which change has been visualized, announced, and implemented or because internal resistance to it builds. Employees, in other words, sabotage those changes they view as antithetical to their own interests.

AREAS OF ORGANIZATIONAL CHANGE

Students of organizational change identify areas of changein order to analyze them. Daniel Wischnevsky and Fariborz Daman, for example, writing in *Journal of Managerial Issues*, single out strategy, structure, and organizational power. Others add technology or the corporate population ("people"). All of these areas, of course, are related; companies often must institute changes in all areas when they attempt to make changes in one. The first area, strategic change, can take place on a large scale for example, when a company shifts its resources to enter a new line of business or on a small scale, when a company makes productivity improvements in order to reduce costs. There are three basic stages for a company making a strategic change: 1) realizing that the current strategy is no longer suitable for the company's situation; 2) establishing a vision for the company's future direction; and 3) implementing the change and setting up new systems to support it.

Technological changes are often introduced as components of larger strategic changes, although they sometimes take place on their own. An important aspect of changing technology is determining who in the organization will be threatened by the change. To be successful, a technology change must be incorporated into the company's overall systems, and a management structure must be created to support it. Structural changes can also occur due to strategic changes, as in the case where a company decides to acquire another business and must integrate it, as well as due to operational changes or changes in managerial style. For example, a company that wished to implement more participative decision making might need to change its hierarchical structure.

People changes can become necessary due to other changes, or sometimes companies simply seek to change workers' attitudes and behaviors in order to increase their effectiveness or to stimulate individual or team creativeness. Almost always, people changes are the most difficult and important part of the overall change process. The science of organization development was created to deal with changing people on the job through techniques such as education and training, team building, and career planning.

RESISTANCE TO CHANGE

A manager trying to implement a change, no matter how small, should expect to encounter some resistance from within the organization. Resistance to change is normal; people cling to habits and to the *status quo*. To be sure, managerial actions can minimize or arouse resistance. People must be motivated to shake off old habits. This must take place in stages rather than abruptly so that "managed change" takes on the character of "natural change." In addition to normal inertia, organization change introduces anxieties about the future. If the future after the change comes to be perceived positively, resistance will be less.

Education and communication are therefore key ingredients in minimizing negative reactions. Employees can be informed about both the nature of the change and the logic behind it before it takes place through reports, memos, group presentations, or individual discussions. Another important component of overcoming resistance is inviting employee participation and involvement in both the design and implementation phases of the change effort. Organized forms of facilitation and support can be deployed. Managers can ensure that employees will have the resources to bring the change about; managers can make themselves available to provide explanations and to minimize stress arising in many scores of situations.

Some companies manage to overcome resistance to change through negotiation and rewards. They offer employees concrete incentives to ensure their cooperation. Other companies resort to manipulation, or using subtle tactics such as giving a resistance leader a prominent position in the change effort. A final option is coercion, which involves punishing people who resist or using force to ensure their cooperation. Although this method can be useful when speed is of the essence, it can have lingering negative effects on the company. Of course, no method is appropriate to every situation, and a number of different methods may be combined as needed.

TECHNIQUES FOR MANAGING CHANGE EFFECTIVELY

Managing change effectively requires moving the organization from its current state to a future desired state at minimal cost to the organization. Key steps in that process are:

1. Understanding the current state of the organization. This involves identifying problems the company faces, assigning a level of importance to each one, and assessing the kinds of changes needed to solve the problems. Executive management should ask themselves why change is necessary and what is at stake if the organization does not change.
2. Competently envisioning and laying out the desired future state of the organization. This involves picturing the ideal situation for the company after the change is implemented, conveying this vision clearly to everyone involved in the change effort, and designing a means of transition to the new state. Company leaders should then be visible participants in the change process. An important part of the transition should be maintaining some sort of stability; some things, such as the company's overall mission or key personnel, should remain constant in the midst of turmoil to help reduce people's anxiety.
3. Engaging employee and stakeholder participation in shaping the change. While resistance to change is ingrained in human nature, people are more likely to support what they help create. "Successful changes are ones that include people in designing either the outcome or the path to the outcome. Successful change happens when the implementers go out and seek feedback proactively to build commitment to the change," wrote Nelson.
4. Communication with employees. The company's leaders should try to generate enthusiasm for the change by sharing their goals and vision and acting as role models. It is important for employees to hear why the company needs to make the change and what is at stake if that does not happen. Successful change galvanizes employees around a cause. "People need to understand why this change is important and how the company, customers and they themselves will benefit," noted Nelson. "Effective communication requires repetition, consistency and transparency. Appealing to both the head and the heart helps, too. A need that can be felt emotionally rather than just understood logically is more apt to spur action."
5. Implementing the change in an orderly manner. This involves managing the transition effectively. It might be helpful to draw up a plan, allocate resources, and appoint a key person to take charge of the change process. In some cases, it may be useful to try for small victories first in order to pave the way for later successes.

Change is natural, of course. Proactive management of change to optimize future adaptability is invariably a more creative way of dealing with the dynamisms of industrial transformation than letting them happen willy-nilly. That process will succeed better with the help of the company's human resources than without.

MANUFACTURERS' AGENTS

Manufacturers' agents or representatives are independent contractors who work on commission to sell products for more than one manufacturer. They are not under the immediate supervision of the manufacturers typically called principals that they sell for, so their relationship generally falls into client-customer patterns.

Manufacturers' agent firms range from businesses operated by a sole entrepreneur to considerably more extensive organizations armed with numerous salespeople covering specific territories. These firms are found in every state selling every conceivable product line, including goods produced in the automotive, plastics, electronics, food and beverage processing, apparel, lumber and wood, paper, chemical, and metals industries. Virtually any product that is made and sold can be handled by a manufacturers' agent.

Manufacturers' agents generally represent several different companies that offer compatible, but not competing, products to the same industry. This approach reduces the cost of sales by spreading the agent's costs over the different products that he or she represents. Consequently, manufacturers' agents view themselves as a cost-effective alternative to full-time salaried sales forces, an evaluation shared by thousands of small and medium-sized manufacturers in the United States. Indeed, manufacturers' agents are particularly popular among companies that do not have the financial resources to launch their own sales team. In addition, since manufacturers' agents are generally paid by commission, the small manufacturer incurs no cost until a sale is made.

SMALL BUSINESSES AND MANUFACTURERS' AGENTS

In addition to the above-mentioned financial benefits that manufacturers' agents offer to small-business owners, they also provide relocating or start-up firms with immediate frontline information on marketplace trends and demographics. By contracting with a manufacturers' agent, a company gains instant access to industry expertise or knowledge of a particular country or region. However, the small-business owner should also consider if the manufacturers' agent can be supplemented or replaced by Internet sales.

"The manufacturers' rep is an independent businessperson whose survival depends on performance, since classical representatives (reps) work on commission and cover all selling expenses, regardless of the outcome of their calls. Rep advocates contend that only superior salespeople can make a living under these conditions, implying the average rep is highly competent," wrote Erin Anderson in the study "The Salesperson as Outside Agent or Employee: A Transaction Cost Analysis."

There are other distinct advantages as well. For manufacturers with a narrow product line, agencies offer one of the best ways to access the market. Because they normally sell compatible products to a single market, the manufacturers' agent firms are usually well connected with the manufacturers' principal market targets. This offers manufacturers immediate entry to markets that may be hard to reach with a direct sales force. In addition, rep firms can provide new businesses with ideas about where to advertise, comment on what the competition is doing, and give estimates of a given territory's potential.

Disadvantages. Consultants and business owners note, however, that while using manufacturers' agents may make a lot of sense to the small company that needs to allocate its financial resources carefully and learn about the marketplace quickly, there are drawbacks associated with the practice as well. Lack of control over the agent is easily the most frequently mentioned complaint that business owners cite when discussing rep firms. Since the manufacturers' agent is not an employee of the company, the company's ownership cannot dictate how he or she goes about business. Certainly, the small-business owner can negotiate for certain things in his or her business dealings with the agent, just as any client can do with any vendor. But the agent has far greater freedom to operate as he or she feels fit than do salespeople who are actual employees of the company.

Some critics also claim that since manufacturers' agents conduct business on behalf of more than one manufacturer, they are not always able to devote the necessary time to one single product line. The study by Anderson mentioned above reported that a company is more likely to have an in-house direct sales force for complex, hard-to-learn product lines that require significant nonselling services like paperwork or attending tradeshows. Some agents also may be reluctant or unable to provide service beyond the point of sale. Fundamental elements of customer service, such as start-up assistance and follow-up service, often must be supplied by the manufacturer even if the goods were sold through a manufacturers' agent.

Another concern frequently raised about manufacturers' agents is that they add to the cost of sales by acting as another layer in the distribution process. Because reps are rewarded on sales-based commissions, they are more inclined to work with products that have a short-term payoff; they may not be motivated to incur the expenses involved for products that require a long sales cycle. However, the sales function must be carried out, and costs incurred in engaging a rep will show up as in-house costs if that alternative is avoided. Rep firms in effect represent an instance of outsourcing of the sales function.

SELECTING AN AGENT

Manufacturers have many factors to consider when going through the process of selecting a manufacturers' representative. Small-business owners should look for someone who shows an ability and a willingness to become knowledgeable about their products and applications, as well as someone who will respond quickly to calls and present the product in terms of how it will meet customer needs. A good agent will also represent the various product lines he or she markets in a just fashion, giving each line the attention it deserves, regardless of how much income it accounts for. (This latter concern is especially acute for small and start-up businesses.)

The best rule of thumb for manufacturers is to be patient and do plenty of preliminary research. After all, the choice is going to be the primary link between the company and its target audience. A poor selection can

ruin a company; conversely, a good choice can help launch a new manufacturer to long-term financial stability. Given the stakes involved in this choice, the Manufacturers' Agents National Association (MANA) suggests that business owners consider doing the following when weighing their choices.

- Create a profile of the ideal agency. Make the profile clear, but also be flexible and realistic. Perfect agencies are nonexistent, but there are many that will do a good job if given the opportunity.
- Create a profile of the manufacturing firm. Manufacturers are encouraged to compile a profile of their target customers, a rundown of the business's needs, and a summary of the governing philosophy of the business. Many agencies can be selective in terms of who they will add to their client list, so it makes sense to inform them about the business and its goals and prospects. The profile should be honest and touch on growth plans, real advantages of the products it manufactures, and previous history.
- Secure referrals from other agencies. Manufacturers' representatives are a close-knit fraternity in the United States, and many can provide the names of several agencies that would be a good fit for the line.
- Get referrals from other manufacturers. Companies in the same area that sell similar but noncompetitive products can be a good source of information in locating potential representatives. Some may even recommend their own agencies, although others may be reluctant to have their agents take on additional product lines and responsibilities.
- Be patient. While manufacturers do not have the luxury of waiting forever when filling rep openings, doing preliminary research usually is a good idea. Many manufacturers who have been burned in this regard later admit that they did not devote sufficient time to exploring their options and learning about the agent they did select. It is better to take the needed time to select the right prospect than to rush into a bad situation and have to rectify it later.
- Be flexible in setting up territories. Agents must have exclusive rights within a territory, but rather than assign arbitrary territories based on geography, it is often preferable to select the agents that best fit the company line and let their coverage determine the territories.

Finding the right agent to represent a business is not unlike hiring a trusted employee. A good match, not least good chemistry and shared values, is essential because the rep is an independent agent and the inherent distance created by that relationship can introduce problems unless both sides feel that they are part of one team. To be sure, nothing succeeds like success, so a good product line will move if in the right hands, and the rep will sell it enthusiastically if it fits his or her usual clientele.

DEALING WITH AGENTS

Manufacturers must remember that their rep firms are independent sales agencies that are not employees of any of its principals, but business partners with each of them. As such, the manufacturers cannot have the same type of direct control as they do over their own personnel. From a legal standpoint, it is important to remember that the manufacturers pay nothing to a rep until a sale is made. They also pay no withholding taxes or Social Security. Using manufacturers' agents also means that some of the manufacturer's bookkeeping needs will be taken care of by nonemployees. This is an important distinction for the Internal Revenue Service, which frowns mightily upon arrangements in which companies disguise employees under the veil of independent agencies or contractors. When judging this, the IRS typically uses as one of its tests the amount of direct control exercised over sales reps. If regular reports are demanded of independent agents, the IRS can declare the rep an employee and require the various withholding taxes that apply.

Communication remains an integral part of the relationship between agents and their clients. Both parties need to keep the other appraised about their operations. Agents should let their principals know what they are doing for them in the field, regardless of the level of sales at that particular moment, while agents need updated information on matters such as product specifications and pricing. Ultimately, both parties simply need to recognize that a cohesive working relationship is in their shared best interests. In their dealings with representatives, manufacturers expect the following qualities: loyalty; knowledge of the territory and industry; knowledge of product lines after a reasonable amount of exposure; quick response to suggestions; regular follow-up; and a fair share of the agent's time. Agents, meanwhile, have every right to expect a fair contract that recognizes performance and rewards success and longevity; access to customer service, training, and technical backup; a quality product; timely delivery; and a true commitment to build business in their territory.

MARKET QUESTIONNAIRES

Market questionnaires are a form of quantitative, primary market research that can provide small business owners with specific information about their customers' needs. Whether conducted over the telephone, through the mail, over the Internet, or in person, market questionnaires are designed to survey a sample group of respondents whose opinions reflect those of the business's target customers.

Like other forms of market research, questionnaires are designed to connect marketers to consumers through information gathering and evaluation. Market research is commonly used to identify marketing problems and opportunities, as well as to develop and evaluate the effectiveness of marketing strategies. Small-business owners, because of their usually limited financial resources, have a particular need for adequate, accurate, and current information to aid them in making decisions. Market research can help entrepreneurs evaluate the feasibility of a start-up venture before investing a great deal of time and capital, for example, as well as assist them in effectively marketing their goods and services.

Questionnaire design requires a great deal of thought and skill, and mistakes are easy. Jodie Monger, writing for *Call Center,* pointed out a number of common errors which she labels, not quite tongue-in-cheek, as "survey malpractice." Her list includes, among other issues, measuring too many things or not measuring enough; using an unreliable scale in which words like "excellent" and "fair" are used but not defined; "measuring the wrong thing or the right things wrong"; relying on people's memories after these have degraded; and poorly qualifying the people answering the questionnaire.

In general, a good market questionnaire will consist of a screening or qualifying question, an introduction, demographic questions, closed-ended questions, and open-ended questions. Each of these elements serves a particular purpose. The screening question, which should usually be posed first, makes sure that the respondent is a member of the target group and thus is qualified to participate in the survey. For example, a home remodeling and repair company might ask whether the person has had any work done in the previous 6 months. The introduction then informs qualified respondents what company is conducting the survey and why, and explains the benefits answering might have on their future business relationship with that company. Demographic questions, which cover such basic information as age, gender, marital status, education level, and income level, allow the business to categorize responses. Since some respondents may be hesitant to answer such personal questions, demographics should usually be addressed near the end of the questionnaire.

Closed-ended questions ask respondents to select from a limited set of answers. This enables businesses to collate responses and analyze results more easily. Closed-ended questions may require a "yes" or "no," or "true" or "false" answer. They may also be set up as a multiple-choice question, so that respondents choose one possible answer from a list. Finally, closed-ended questions may involve a scaled response, such as rating a product or service on a scale of one to ten or on the basis of categories such as "strongly like," "like," "neither like nor dislike." In contrast, open-ended questions enable respondents to provide a more lengthy response in their own words. Although open-ended questions can provide valuable information, the results can also be difficult for companies to analyze and categorize.

Good rules to follow at least until experience has been gained may be summed up under five points: 1) the survey should be as short as possible and collect only necessary information; 2) questions should be clearly worded and concise, without excessive technical jargon; 3) questions should be framed so that they do not imply a correct answer; 4) questions should be limited so that they only seek one piece of information, and answers fall into distinct categories; and 5) questionnaires should be arranged so that they begin with easier questions and progress into more difficult ones after a measure of trust has been achieved. It may be helpful to test a market questionnaire on a small group and then make any necessary refinements before using it in a large-scale market research effort.

INTERNET QUESTIONNAIRES

The rise of Internet survey companies has made it easier than ever to collect responses to questionnaires, but special care must be taken with Internet surveys. First, industries issuing online surveys must remember that not every individual has access to the Internet. A part of the target market thus might be missed if online questionnaires become the sole or primary form of research. Second,

although an Internet survey can gather responses from a wider audience, those who take surveys on the Internet may be a self-selecting group who do not have the same vested interest in the survey or product as those who stop to complete surveys in person or as part of a focus group. Since the time cost to the consumer is lower when filling out a survey online, participants may not be as serious about the process.

Additional problems may arise when monetary or other incentives are offered to complete online surveys. Participants may click through the survey without accurately considering their answers or even reading the questions in an effort to get to the end and collect their reward. The danger of this can be minimized by putting safeguards into place, such as capture questions that test whether an individual is reading the survey or just clicking. Requesting short answers instead of using a multiple choice format can also minimize the risk of collecting improper data, but more resources are then required to review the answers.

Although online surveys can have some drawbacks, there are also many benefits associated with such surveys. In addition to being lower cost, online surveys can reach a wider audience. There may be less of a tendency for individuals to skew their responses toward what they believe surveyors want to hear since there is no personal relationship between the conductors of the survey and the participants. It is also possible to have a greater degree of control over the order in which respondents complete questions in Internet surveys.

Companies can design and host their own online surveys or use a service to conduct the survey for them. Services are relatively inexpensive and can either host the survey and simply report results as presented or can be more involved, assisting businesses in interpreting feedback and providing full service marketing insights.

MARKET RESEARCH

If the "market" is viewed as the totality of all environmental factors that bear down on a business, market research may be defined as a disciplined investigation aimed at discovering what is going on and, most importantly, what is *changing* in the environment. The object is to discover opportunities and threats. and to assess how some intended action might play itself out. The research may be designed broadly or narrowly, but even limited studies must have sufficient scope to give the investigation context.

GENERAL ASPECTS

Market research answers questions along the following lines: How big is the market and how does it divide into product lines or services or geographically? Who are the buyers and why do they buy? Who is the competition and what methods are they using? What is on the horizon that will change this market? How will a certain company benefit or suffer if these changes take place?

Managements undertake such research for some motive; thus market research always has a context. The context may be negative (declining profitability or sales) or positive (new technology, rapid growth); it may be brought about by forces outside the company's control such as legislative events, the economy as a whole, or a new entrant to the market. Most start-ups that need front-end funding begin their ventures by doing a comprehensive market study in order to put the results into a business plan.

Company size is itself a context, and while, in general, business is business at any scale, problems and opportunities manifest differently. Managements in large organizations, for example, are inevitably at a much greater distance from the actual interface where customers and products meet where the action is. Small-business owners are closer to the market but rarely have vast resources at their command. Distance from the market and the extent of it that must be surveyed influence the techniques deployed. Market research may take the simple form of driving around and talking to a lot of people, or just parking someplace and counting the number of cement trucks a competitor sends out. At the other extreme, it may cost hundreds of thousands of dollars and may even involve undertaking test marketing in several cities.

Useful market research has a time element. It will present a history of developments and include a projection of future events. A manager wants to make decisions about what to do next and therefore needs a look at the future. Projecting data forward requires special but somewhat opposing skills: statistical expertise on the one hand and an inspired, open, and yet sober gaze. Market research that merely confirms management's prejudices, hopes, or fears is worth little but the findings, of course, may do just that. Managements often *do* see the future accurately.

MAJOR COMPONENTS

Not surprisingly, most small businesses develop a sense of their market in the course of day-to-day operations, rather than by spending thousands of dollars on studies. They talk with vendors, customers, and competitors. They listen to the gossip and translate bits and pieces of information into rough numbers. This process is rarely but *can* be formalized. Small-business owners and their key managers can sit down with notepads and work out the market size and structure. Sometimes this is useful for planning or for justifying loan applications. At the local level, disciplined recording and analysis of such information yields results comparable to very expensive studies at the larger scale and looking at CBP data can produce rough confirmation.

Market Share and Competition. An important aspect of every market is its concentration, measured by creating a list of participants, sorting them by sales, and then adding up the market shares of the top layer the top five, the top three. If the top three have most of the market, the industry is highly concentrated; if the top five have around 15 to 20 percent, concentration is low. Most market share listings have an "All Other" category. Small businesses are invariably hidden in that line. The sales volumes of small operations are rarely available publicly, but work-arounds are available to infer their size. Important measures are employment and square footage. A "typical" small business can calculate its own sales per square foot in retail, for instance or its sales per employee and can then proceed to develop approximate company size estimates for its competitors by applying the same unit measures to them after counting their people and eyeballing their floor space. There are all kinds of other "proxy" measures available. A ready-mix concrete supplier knows his or her revenues per truck, and can count competitors' trucks. Economic forces tend always to produce the same averages across an industry.

Competitive strategies are also accessible to the small business. The method of detecting such strategies will depend, of course, on the relative visibility of the competitor. Retail stores advertise; the frequency of their sales and the items they use as loss leaders indicate strategy. They can be visited. Vendors are a useful source of information on less visible competitors' strategies, as are observations of such companies at trade shows. The alert small-business owner will constantly watch his or her competitors and note when they enlarge their leases, build or pave their parking lots, or when their inventories overflow *to* the parking lots. Problems that they encounter also leave telltale signs. When such observation becomes routine, and when the owner collects ads, news stories, and records observation in notes, doing a market share and competitive analysis for a plan will be relatively easy.

Products Research and Consumer Surveys. A small business intending to test products before launching them to the market will expose them to employees, friends, customers, relatives, vendors, suppliers anyone at all with a likely opinion and will thus gradually discover what seems to be the best design, positioning, packaging, name, and even marketing slogan. The more systematic this type of exposure is, and the more effectively informants' opinions are recorded and analyzed, the more it will resemble the practices of large organizations, which deploy sophisticated methodologies like focus groups and consumer surveys. Focus groups, however, can be costly, with the average cost in 2010 of around $6,000.

In general, "sophistication" translates into disciplined planning of tests and the application of specialized expertise in that planning. Focus groups and customer surveys frequently employ psychologists before a trial (preparing settings, choosing respondents, framing questionnaires, etc.), during a trial (observing reactions), and after the trial (analyzing results). But in effect, a high level of sophistication is simply an attempt to formalize and then to apply mechanically what is nothing other than good entrepreneurial "feel" and "instinct." Many a very successful product was launched because the entrepreneur simply *liked* it and so did the people around him or her.

Small businesses generally lack the resources for massive, costly trials and surveys and, instead, rely on innovative ways to obtain consumer feedback. A store, for instance, may mount two very different product displays and then instruct the clerks to note which one the customers spend more time examining. Surveys can be conducted at very modest costs by simply asking every customer a question at checkout time, and then recording the answer. Such approaches may lack the "scientific" halo of big studies but will produce actionable and reliable results if properly done.

Market research surveys have also become more popular and less expensive with the rise of the Internet. According to a 2009 report by the Census Bureau, Internet use has tripled since 1997, and 62 percent of households now have access to the Internet. Internet surveys can be more cost effective than traditional research and can appeal to a wider market, especially through offering monetary or other incentives for taking part in them. As Sonya Turner, a senior qualitative analyst at Immoderate Research reported, "The ubiquity of Web 2.0 tools has created consumers who are eager to make their opinions, passions and values heard and marketers need to listen."

Users can visit the surveys on their own schedule and can return to them as many times as desired. The order of questions can also be controlled, as the Internet allows a company to prohibit skipping questions. The downside to Internet surveys, however, is that not all individuals

have access to the Internet. Further, offering an incentive without sufficient measures in place to ensure that users actually answer the survey questions instead of simply clicking to get the incentive can result in skewed data.

Other Market Influences. An important component of all market research is identification and assessment of forces external to the market itself but likely to influence it. A classical example of government action for a small business might be the routing of a freeway; it could isolate the business from major parts of its clientele or massively increase its traffic. External influences include government, as already mentioned, which can by its enactments increase pay (the minimum wage) or returns (accelerate depreciation), impose costs by regulation, modify interest rates, stimulate or inhibit exports, and do hundreds of other things. Changes in demographic patterns were underway in the twenty-first century as the baby boom generation marched toward retirement, eroding some markets and swelling others. The aging of the baby boomers may be especially significant, according to a *Business Week* article, because marketers typically pay less attention to the fifty-plus market, which will become the largest segment of the population as baby boomers age. Furthermore, *Business Week* stated, "The massive postwar boomer generation that drove every significant cultural and marketing trend for 50 years from Howdy Doody to the Beatles and the Ford Explorer is defying marketers' expectations about how it wants to live and shop. As boomers head into their 60s starting next year, this generation, which grew up with the mass market and witnessed the rise of network TV and then the Internet, is once again forcing marketers back to the drawing board, this time to rethink the rules for reaching graying customers."

In most industries, insiders watch certain indicators vital to the industry: interest rates in residential construction are an example; housing starts, in turn, send signals to a large number of suppliers, such as producers of appliances. Hotels and resorts watch gas prices and air travel costs, and so on. The small business doing market research may find it more difficult to find precise indicators that serve as signal for its operations. One way to identify them is to spend some time with trade publications which like to track and publicize changes in relevant second- and third-order influences on the market.

RESEARCH TOOLS AND TECHNIQUES

Most formalized market research techniques are used by large corporations to "see" a market difficult to track by its very diversity and size. Major categories are: 1) audience research; 2) product research; 3) brand analysis; 4) psychological profiling; 5) scanner research; 6) database research, also called database "mining"; and 7) post-sale or consumer satisfaction research. When these techniques involve people, researchers use questionnaires administered in written form or person-to-person, either by personal or telephone interview; questionnaires may be closed-end or open-ended; the first type provides users choices to a question ("excellent," "good," "fair") whereas open-ended surveys solicit spontaneous reactions and capture these as given. Focus groups solicit opinions but without a questionnaire; people interact with products, messages, or images and discuss them. Observers evaluate what they hear.

Some major techniques are intimately linked with targeting marketing efforts or designing messages. Audience research is aimed at discovering who is listening, watching, or reading radio, TV, and print media, respectively. Such studies in part profile the audience and in part determine the popularity of the medium or portions of it. These studies have become more complicated with the rise in popularity of the DVR, or Digital Video Recorder. Since more individuals are recording and watching television shows later instead of watching them live, questions have arisen as to whether networks should also be paid for time-shifted viewing and as to whether DVR-watching should count in a television show's ratings.

Scanner research uses checkout counter scans of transactions to develop patterns for all manner of end uses, including stocking, of course. From a marketing point of view, scans can also help users track the success of coupons and to establish linkages between products. Database mining attempts to exploit all kinds of data on hand on customers which frequently have other revealing aspects. Purchase records, for example, can reveal the buying habits of different income groups, the income classification of accounts taking place by census tract matching. Data on average income by census tract can be obtained from the Census Bureau.

Product tests, of course, directly relate to use of the product. Good examples are tasting tests, used to pick the most popular flavors, and consumer tests of vehicle or device prototypes to uncover problematical features or designs.

Post-consumer surveys are familiar to many consumers from telephone calls that follow having a car serviced or calling help-lines for computer- or Internet-related problems. In part such surveys are intended to determine if the customer was satisfied. In part this additional attention is intended also to build goodwill and word-of-mouth advertising for the service provider.

MARKET SEGMENTATION

Market segmentation is the science of dividing an overall market into customer subsets or segments that sharing similar characteristics and needs. Segmentation typically involves significant market research and can thus be costly. It is practiced especially in major companies with highly differentiated product lines or that serve large markets. The small business tends to discover the segment it serves best by the trial and error process of dealing with customers, which leads to it ultimately stocking products more suitable to its particular clientele.

Segmentation lies somewhere near the middle of a continuum of marketing strategies that range from mass marketing, in which a single product is offered to all customers in a market, to one-to-one marketing, in which a different product is specifically designed for each individual customer (e.g., plastic surgery). Most businesses realize that since no two people are exactly alike, it is unlikely that they will be able to please all customers in a market with a single product. They also realize that it is rarely feasible to create a distinct product for every customer. Instead, most businesses attempt to improve their odds of attracting a significant base of customers by dividing the overall market into segments, then trying to match their product and marketing mix more closely to the needs of one or more segments. A number of customer characteristics, known as segmentation bases, can be used to define market segments. Some commonly used bases include age, gender, income, geographical area, and buying behavior.

MARKETING STRATEGIES

Although mass marketing (also known as market aggregation or undifferentiated marketing) cannot fully satisfy every customer in a market, many companies still employ this strategy. It is commonly used in the marketing of standardized goods and services, including sugar, gasoline, rubber bands, or dry cleaning services, when large numbers of people have similar needs and they perceive the product or service as largely the same regardless of the provider. Mass marketing offers some advantages to businesses, such as reduced production and marketing costs. Due to the efficiency of large production runs and a single marketing program, businesses that mass market their goods or services may be able to provide consumers with more value for their money.

Some producers of mass market goods employ a marketing strategy known as product differentiation to make their offering seem distinct from that of competitors, even though the products are largely the same. For example, a producer of bath towels might embroider its brand name on its towels and sell them only through upscale department stores as a form of product differentiation. Consumers might tend to perceive these towels as somehow better than other brands, and thus worthy of a premium price. But changing consumer perceptions in this way can be very expensive in terms of promotion and packaging. A product differentiation strategy is most likely to be effective when consumers care about the product and there are identifiable differences between brands.

Despite the cost advantages mass marketing offers to businesses, this strategy has drawbacks. A single product offering cannot fully satisfy the diverse needs of all consumers in a market. Consumers with unsatisfied needs expose businesses to challenges by competitors who are able to identify and fulfill consumer needs more precisely. In fact, markets for new products typically begin with one competitor offering a single product, then gradually splinter into segments as competitors enter the market with products and marketing messages targeted at groups of consumers the original producer may have missed. These new competitors are able to enter a market ostensibly controlled by an established competitor because

they can identify and meet the needs of unsatisfied customer segments. In recent times, the proliferation of computerized customer databases has worked to drive marketing toward ever-more-narrowly focused market segments.

Applying a market segmentation strategy is most effective when an overall market consists of many smaller segments whose members have certain characteristics or needs in common. Through segmentation, businesses can divide such a market into several homogeneous groups and develop a separate product and marketing program to fit more exactly the needs of one or more segments. Although this approach can provide significant benefits to consumers and a profitable sales volume (rather than a maximum sales volume) to businesses, it can be costly to implement. For example, identifying homogeneous market segments requires significant amounts of market research, which can be expensive. Also, businesses may experience a rise in production costs as they forfeit the efficiency of mass production in favor of smaller production runs that meet the needs of a subset of the market. Finally, a company may find that sales of a product developed for one segment encroach upon the sales of another product intended for another segment. Nonetheless, market segmentation is vital to success in many industries where consumers have diverse and specific needs, such as homebuilding, furniture upholstery, and tailoring.

SEGMENTATION BASES

In order successfully to implement a market segmentation strategy, a business must employ market research techniques to find patterns of similarity among customer preferences in a market. Ideally, customer preferences will fall into distinct clusters based upon identifiable population characteristics. This means that if customer requirements were plotted on a graph using certain characteristics, or segmentation bases, along the axes, the points would tend to form clusters.

In general, defining customers often involves two separate facets: who the customers are and what the customers believe. Who they are relates to base demographic information such as age, gender, income, and geographic location. What they believe involves understanding how they think, how they make buying decisions, and what motivates them as consumers and as individuals.

In marketing jargon, customer segments must be measurable by clear characteristics; they must be large enough to constitute a market; reaching them should be predictably easy (they all watch *American Idol*, for example, or subscribe to one of four magazines); they must be predictably responsive to marketing; the segment must be stable over time and not a one-time aggregation.

Determining how to segment a market is one of the most important questions a marketer must face. Creative and effective market segmentation can lead to the development of popular new products; unsuccessful segmentation can consume a lot of dollars and yield nothing. There are three main types of segmentation bases for businesses to consider: descriptive, behavioral, and benefit bases. Each breaks down into numerous potential customer traits.

Descriptive bases for market segmentation include a variety of factors that describe the demographic and geographic situations of the customers in a market. They are the most commonly used segmentation bases because they are easy to measure, and because they often serve as strong indicators of consumer needs and preferences. Some of the demographic variables that are used as descriptive bases in market segmentation might include age, gender, religion, income, and family size, while some of the geographic variables might include region of the country, climate, and population of the surrounding area.

Behavioral bases for market segmentation are generally more difficult to measure than descriptive bases, but they are often considered to be more powerful determinants of consumer purchases. They include those underlying factors that help motivate consumers to make certain buying decisions, such as personality, lifestyle, and social class. Behavioral bases also include factors that are directly related to consumer purchases of certain goods, such as their degree of brand loyalty, the rate at which they use the product and need to replace it, and their readiness to buy at a particular time.

Businesses that segment a market based on benefits hope to identify the primary benefit that consumers seek in buying a certain product, then supply a product that provides that benefit. This segmentation approach is based upon the idea that market segments exist primarily because consumers seek different benefits from products, rather than because of various other differences between consumers. One potential pitfall to this approach is that consumers do not always know or cannot always identify a single benefit that influences them to make a purchase decision. Many marketers use a combination of bases that seem most appropriate when segmenting a market. Using a single variable is undoubtedly easier, but it often turns out to be less precise.

THE SEGMENTATION PROCESS

The process itself begins with narrowing the universe to be studied into a specific market now served by the company and obtaining basic information on competing products or services now on offer. Once this step has been completed, variables to be used are identified, reviewed, and tested. At the most basic level such variables, for example, might involve income and demographic characteristics of the consumers.

With these preparations completed, actual market research is organized to collect and to analyze data on the selected broad body of consumers. Analysis of the data will begin to cluster the consumers into distinct groupings based on the variables. Additional analysis, possibly involving more research, will next be conducted to develop detailed profiles of each segment already identified. This is often referred to as customer relations management or CRM.

The Internet has given rise to new opportunities for market segmentation that are both easier and more cost effective. Consumers are essentially using social media outlets to create their own market segments in a process referred to as "self-segmentation." Making use of the data provided by customers as they self-segment may prove more reliable than traditional methods of developing a market segment for customers. According to Nick Wreden in his article, "The Promise of 'Self-Segmentation'," "This opens the door to fostering brand ambassadors, enabling customer collaboration, and facilitating word-of-mouth cross-fertilization."

Whether CRM or self-segmentation is used, if the right variables are chosen at the outset and the market research is competently done, the resulting groupings will have characteristics distinct enough, and documented well enough, to permit the company to select one or more segments which will be easiest or more profitable to serve. The company's own strategy will play a role. Its aim, for example, may be to use its capacity more fully, and the company will therefore select a segment which will purchase the largest volume; alternatively, the company's aim may be low production levels with high profits, leading to a focus on another segment.

The last stage of the segmentation process will be the development of product and marketing plans based on the segment(s) most closely matching the company's "ideal" situation.

In general, customers are willing to pay a premium for a product that meets their needs more specifically than does a competing product. Thus marketers who successfully segment the overall market and adapt their products to the needs of one or more smaller segments stand to gain in terms of increased profit margins and reduced competitive pressures. Small businesses in particular may find market segmentation to be a key in enabling them to compete with larger firms. Many management consulting firms offer assistance with market segmentation to small businesses. But the potential gains offered by market segmentation must be measured against the costs. In addition to the market research required to segment a market, these costs may include increased production and marketing expenses.

MARKET SHARE

A company's market share is the percentage of all products in a category that that company sells. Thus market share is calculated by dividing a company's sales by the total sales in a category. If the company sells all the product in a market, it will have a 100 percent share and be a monopoly. Market share is typically measured at fixed intervals, such as once a quarter or once a year.

CALCULATING MARKET SHARE

All companies with reasonable record-keeping practices know what their own sales in a particular product or services category are during any selected period of time. The difficulty arises in knowing what *total sales* are. Unless data on total sales are collected by the government in its economic census activities every 4 years (years ending in 2 and 7) and by sampling surveys in the years in between or unless sales data are cumulated by an industry association or by regulatory agencies (e.g., electrical power generation) total sales may be impossible to determine, and so will a company's market share.

However, online resources may be available to assist in determining market share statistics. Resources can be found, occasionally for free and often for sale, from the *Market Share Reporter*, *Advertising Age* data center,

the *World Market Share Reporter*, Stat-USA, *Mintel Market Reports*, and Price's List of Lists (see www.specialissues.com). Each of these Web reference sources offers various data a small business can use to do a market share analysis. For example, the *Advertising Age* data center offers some market share data for free to consumers in various categories. The Web site primarily focuses on market leaders within major industries, for example, providing data on the stocks for the top fifty marketing companies or the top ten soft drink companies. While the availability of market share data on the Internet may be limited to certain industries or top brands unless someone is willing to pay hefty fees, Internet resources can be a good starting point for market share research.

The granularity of data on product sales tends to be rather coarse, meaning that data on canned vegetables may be available but data on canned artichoke hearts will be very difficult to get. If a product moves in different size categories, detail on packaging size categories is rarely available. For this reason major durable goods categories like autos or aircraft are easier to track than custom jewelry or specific clothing items. Services are even more difficult to measure. It is possible to get a count of open-heart surgeries, but data on home-care delivery will forever be rather approximate.

Indirect measures are often employed to get at total sales. Examples of this are tracking "installed capacity" in such industries as cement, paper, oil refining, and power generation. Data on capacity must, of course, be refined by gathering information on capacity utilization. If utilization is running at 40 percent, total capacity must be discounted. Hotels have a determinable number of rooms, but occupancy is what counts.

These measurement problems serve as a general indicator concerning the nature of the "market share" measure. It is almost always a very rough measure, and in most categories the underlying factual basis is equal parts data and guesswork.

HOW MARKET SHARES ARE USED

Companies attempt to calculate their own shares of the market in attempts at self-evaluation. They also try to obtain share information on their competitors. Market share, of course, is a measure of relative strength, and because it changes over time, it is an indicator of progress or regress. Companies "gaining share" are reassured, unless competitors are gaining shares faster; a company that is "losing share" is getting a strong hint that something is amiss. In most large corporations where formal annual planning is practiced, managers routinely assemble market share data on their competitors and calculate their own as part of planning. A long and persistent loss of market share has been the sad accompaniment of the decline of domestic auto makers.

Market share being a measure of strength, such data are used in economic analysis to evaluate industries as a whole. One such measure is concentration. Industry concentration is calculated by ranking all major competitors on the basis of market share. The shares of the top companies are summed. These may be the top three, five, or more companies. If the total share of the leaders is high, the industry is said to be concentrated. Where concentration is very high, in cases where the top three have 60 percent or more of the market, entry to the industry is difficult, competition is low, and pricing will be high. If the top ten companies have less than 10 percent share in the aggregate, entry will be easy. Concentration is, of course, also an indicator of capital intensity or monopoly over some production art available through control of patents. Market share measurements are thus used in government evaluation of mergers and acquisitions in order to determine whether antitrust laws would be violated by proposed combinations.

SHARE AND SMALL BUSINESS

Market share is rarely used as a measure in small business for the simple reason that the data necessary to obtain reasonably precise share data on competitors are rarely available. Small businesses tend to use other and more indirect ways of tracking how they are doing. They watch the competition and collect data from vendors and customers.

MARKETING

Marketing is a term used to describe the various activities involved in transferring goods and services from producers to consumers. In addition to the functions commonly associated with it, such as advertising and sales promotion, marketing also encompasses product development, packaging, distribution channels, pricing, and many other

functions. Modern marketing is often presented as an effort to discover and satisfy customer *needs*. It is often also a method of inventing products and services and *creating a demand* for them by artful persuasion.

In most large organizations the selling function is divided into distinct marketing and sales functions. In organizations where symbolic product presentation is all-important and buying decisions tend to be emotional, marketing is given much higher rank and emphasis. Such is the case typically with mature products that have over time achieved a commodity status and therefore persuasion to buy *this brand* is the central focus. In organizations where the product performance as such remains the chief selling feature, sales activity is dominant. Business-to-business distribution tends to have this character, with the selling burden carried by experts (e.g., in finance), sales engineers, and skilled, product-savvy sales people. In some industries, such as pharmaceuticals, emphasis is evenly divided, with the public bombarded by marketing messages ("Ask your doctor...") while "detail men" (and women) are doing technical selling at the doctor's office.

MACROMARKETING AND MICROMARKETING

Macromarketing refers to the overall economic/communications process that directs the flow of goods and services from producer to consumer. It includes: 1) the buyer's behavior in seeking and judging goods and services; 2) the seller's efforts to draw and to persuade customers to buy; 3) the physical distribution of goods, including warehousing and storage at intermediate stages; 3) product-related activities like standardization, grading, and sorting; 4) the financing of distribution at all stages, not least consumer credit; and 5) the communications processes supporting all of these activities.

Micromarketing refers to the activities of the individual providers operating within this system. Organizations or businesses use various marketing techniques to accomplish objectives related to profits, market share, cash flow, and other economic factors that can enhance their well-being and position in the marketplace. The micromarketing function within an entity is commonly referred to as marketing management. Marketing managers strive to match products to customers; in this process they are equally interested in getting products customers will want to buy and influencing consumers to buy the products the company wishes to sell.

THE TARGET MARKETING CONCEPT

Micromarketing encompasses a number of related activities and responsibilities. Marketing managers must carefully design their marketing plans to ensure that they complement related production, distribution, and financial constraints. They must also allow for constant adaptation to changing markets and economic conditions. Perhaps the core function of a marketing manager, however, is to identify a specific market, or group of consumers, and then deliver products and promotions that ultimately maximize the profit potential of that targeted market. This is particularly important for small businesses, which more than likely lack the resources to target large aggregate markets. Often, it is only by carefully selecting and wooing a specific group that a small firm can attain profit margins sufficient to allow it to continue to compete in the marketplace.

For instance, a manufacturer of fishing equipment would not randomly market its product to the entire U.S. population. Instead, it would likely conduct market research, using such tools as demographic reports, market surveys, or focus groups, to determine which customers would be most likely to purchase its offerings. It could then more efficiently spend its limited resources in an effort to persuade members of its target group(s) to buy its products. Perhaps it would target males in the Midwest between the ages of eighteen and thirty-five. The company may even strive to further maximize the profitability of its target market through market segmentation, whereby the group is further broken down by age, income, zip code, or other factors indicative of buying patterns. Advertisements and promotions could then be tailored for each segment of the target market.

There are many ways to address the wants and needs of a target market. For example, product packaging can be designed in different sizes and colors, or the product itself can be altered to appeal to different personality types or age groups. Producers can also change the warranty or durability of the good or provide different levels of follow-up service. Other influences, such as distribution and sales methods, licensing strategies, and advertising media also play an important role. It is the responsibility of the marketing manager to take all of these factors into account and to devise a cohesive marketing program that will appeal to the target customer.

THE FOUR PS

The different elements of a company's marketing mix can be divided into four basic decision areas, known as the "four Ps": product, place, promotion, and price. Marketing managers can use these four areas to devise an overall marketing strategy for a product or group of goods. These four decision groups represent all of the variables that a company can control. But those decisions must be made within the context of outside variables that are not entirely under the control of the company, such as competition, economic and technological changes, the political and legal environment, and cultural and social factors. For

example, pharmaceutical marketers must comply with tighter regulations passed in many states, such as the California Marketing Compliance Law (CMCL), which created restrictions on direct marketing to physicians, among other limitations.

Marketing decisions related to the product (or service) involve creating the right product for the selected target group. This typically encompasses research and data analysis, as well as the use of tools such as focus groups, to determine how well the product meets the wants and needs of the target group. Numerous determinants factor into the final choice of a product and its presentation. A completely new product, for example, will entail much higher promotional costs to raise consumer awareness, whereas a product that is simply an improved version of an existing item likely will make use of its predecessor's image. A pivotal consideration in product planning and development is branding, whereby the good or service is positioned in the market according to its brand name. Other important elements of the complex product planning and management process may include selection of features, warranty, related product lines, and post-sale service levels.

Considerations about place, the second major decision group, relate to actually getting the good or service to the target market at the right time and in the proper quantity. Strategies related to place may utilize middlemen and facilitators with expertise in joining buyers and sellers, and they may also encompass various distribution channels, including retail, wholesale, catalog, and others. Marketing managers must also devise a means of transporting the goods to the selected sales channels, and they may need to maintain an inventory of items to meet demand. Decisions related to place typically play an important role in determining the degree of vertical integration in a company, or how many activities in the distribution chain are owned and operated by the manufacturer. For example, some larger companies elect to own their trucks, the stores in which their goods are sold, and perhaps even the raw resources used to manufacture their goods.

Decisions about promotion, the third marketing mix decision area, relate to sales, advertising, public relations, and other activities that communicate information intended to influence consumer behavior. Often promotions are also necessary to influence the behavior of retailers and others who resell or distribute the product. Three major types of promotion typically integrated into a market strategy are personal selling, mass selling, and sales promotions. Personal selling, which refers to face-to-face or telephone sales, usually provides immediate feedback for the company about the product and instills greater confidence in customers. Mass selling encompasses advertising on mass media, such as television, radio, direct mail, and newspapers, and is beneficial because of its broad scope.

In addition to these established venues, the Internet has also become a hugely profitable forum for marketing, providing unique opportunity for interactive communication with customers. Online social media sites such as Twitter, Facebook, and MySpace permit direct interaction between marketers and consumers, allowing marketers to stay in almost constant contact with interested customers to keep them abreast of new products and services.

A relatively new method of publishing includes mobile marketing, which involves targeting market efforts and dollars to reach consumers on SmartPhones that permit access to the Internet. Companies can offer popular applications for such phones, called apps, which allow customers to compare prices while shopping or find the nearest store location to them at any given moment using GPS services on smart cell phones.

Determination of price, the fourth major activity related to target marketing, entails the use of discounts and long-term pricing goals, as well as the consideration of demographic and geographic influences. The price of a product or service generally must at least meet some minimum level that will cover a company's cost of producing and delivering its offering. Also, a firm would logically price a product at the level that would maximize profits. The price that a company selects for its products, however, will vary according to its long-term marketing strategy. For example, a company may underprice its product in the hopes of increasing market share and ensuring its competitive presence, or simply to generate a desired level of cash flow. Another producer may price a good extremely high in the hopes of eventually conveying to the consumer that it is a premium product. Another reason a firm might offer a product at a very high price is to discount the good slowly in an effort to maximize the dollars available from consumers willing to pay different prices for the good. In any case, price is used as a tool to achieve comprehensive marketing goals.

COMPETITIVE STRATEGIES

Decisions about product, place, promotion, and price will often be dictated by the competitive stance that a firm assumes in its target market. Common strategies are to be the low-cost supplier, to be highly differentiated, or to satisfy a niche market.

Companies that adopt a low-cost supplier strategy are usually characterized by a vigorous pursuit of efficiency and cost controls. A company that manufactures a low-tech or commodity product, such as wood paneling, would likely adopt this approach. Such firms compete by offering a better value than their competitors, accumulating market share, and focusing on high-volume and fast inventory turnover.

Companies that adhere to a differentiation strategy achieve market success by offering a unique product or service. They often rely on brand loyalty, specialized distribution channels or service offerings, or patent protection to insulate them from competitors. Because of their uniqueness, they are able to achieve higher than average profit margins, making them less reliant on high sales volume and extreme efficiency. For example, a company that markets proprietary medical devices would likely assume a differentiation strategy.

Firms that pursue a niche market strategy succeed by focusing all of their efforts on a very narrow segment of an overall target market. They strive to prosper by dominating their selected niche. Such companies are able to overcome competition by aggressively protecting market share and by orienting every action and decision toward the service of its select group. The Internet has made niche marketing a more profitable and possible business, as it is easier than ever before for marketers to find access to niche customers using search engine optimization tactics and targeted marketing to a wide Internet audience.

INTERNET MARKETING

In the twenty-first century, most small businesses have sought to take advantage of the global reach of the World Wide Web and the huge number of potential customers available online. While some think it novel, Internet marketing is actually not so different from long-established procedures. As Maria Duggan and John Deveney wrote in *Communication World*, "Internet marketing employs the same methods and theory as traditional public relations and integrated marketing   the basic tools for any campaign."

Duggan and Deveney outline five steps for marketing managers to follow in putting together an Internet marketing campaign. Whether the campaign is intended to increase awareness of an existing brand, draw visitors to a Web site, or promote a new product offering, the first step involves identifying the target market. As is the case with any other type of marketing campaign, the small business must conduct market research in order to define the target audience for the campaign, and then use the information gathered to determine how best to reach them.

The next step is to develop a strategy for the campaign. This involves setting concrete and measurable goals and tying the campaign into the organization's traditional marketing efforts. The third step is to present the strategy to key decision makers in the small business. It is important at this stage to develop a timeline and budget, and also to be prepared to encounter resistance among colleagues not familiar with cyberspace. The fourth step is to implement the Internet marketing campaign. The final step, evaluation, should be conducted throughout the process. Online surveys of customers are one source of potential feedback.

Self-segmentation that exists on the Internet through online social networking groups can also be a boon to marketers. A company can easily find self-selected groups of individuals online to market their products to. Companies can do this directly by approaching owners of Web sites that address their products, or can target groups on social media Web sites. Marketing tools such as Google Adwords streamline this process and make it easy for marketers and businesses to reach target markets. Through the use of Google Adwords and related services offered by Chikita, for example, a company can identify target keywords related to its products or services. AdWords then places the ads on Web sites that are relevant to those keywords, resulting in widespread distribution of marketing material on blogs or other sites that accept advertising.

MARKETING FOR SMALL BUSINESSES

In the early stages of forming a small business, a business plan is a vital tool to help an entrepreneur chart the future direction of the enterprise. A good plan will have a marketing component and demonstrate the owner's understanding of how to advertise and promote his or her product or service line. The more the business is narrowly focused on selling, the more important this element will be. Some businesses, of course, will be engaged in activities barely touched by marketing in the modern sense   but will always have a sales component.

As a small business grows, it may be helpful to create a separate marketing plan. While similar in format to the general business plan, a marketing plan will focus on expanding a certain product line or service rather than on the overall business. Such plans will be especially valuable in obtaining financing for ventures relying upon persuading buyers to try novel products not already on the market.

A number of resources are available to assist small businesses in marketing their products and services. It may be prudent to seek legal advice before implementing a marketing plan, for example. A firm with experience in consumer law could review the small business's product, packaging, labeling, advertising, sales agreements, and price policies to be sure that they meet all relevant regulations to prevent problems from arising later. In addition, many advertising agencies and market research firms offer a variety of means of testing the individual elements of marketing programs. Although such testing can be expensive, it can significantly increase the effectiveness of a company's marketing efforts.

MARKUP

Markup is the amount that a seller of goods or services charges over and above the total cost of delivering its product or service in order to make a desired profit. For example, if the total cost of a manufacturer's product is $20, but its selling price is $29, then the extra $9 is understood to be the "markup." Markup is utilized by wholesalers, retailers, and manufacturers alike.

For entrepreneurs in the process of starting a business, establishing markup is one of the most important parts of pricing strategy. Markups must be sizable enough to cover all anticipated business expenses and reductions (markdowns, stock shortages, employee and customer discounts) and still provide the business with a good profit. The informed small-business owner, then, is far more likely to arrive at a good markup price than the business owner who has a flawed understanding of the company's likely sales, its total operating expenses including material, labor, and overhead costs and its place in larger economic trends.

Entrepreneurs should also recognize that a flat markup percentage should not be blindly stamped on all of the company's products or services regardless of the frequency with which customers purchase those goods or services. As the Small Business Administration noted in its brochure *Pricing Your Products*, small-business owners "should seriously consider different markup figures when some lines have very different characteristics. For instance, a clothing retailer might logically have different initial markup figures for suits, shirts, pants, and accessories. [The small-business owner] may want those items with the highest turnover rates to carry the lowest initial markup."

Indeed, a small business may be able to realize a hefty profit even when it attaches a considerably smaller markup to one line of products, provided that the sales volume for that product line is high. For example, if company A and company B are selling the same $5 product, but company A insists on attaching a $4 markup on the product while company B limits itself to a $2 markup, the disparity in retail price may allow company B to register sales three or four times greater than the sales posted by company A. Company B thus realizes greater profits from the product than company A, even though the latter business had a higher markup.

Some businesses that resell products may be limited in their ability to mark up a product by the retailer who sold it to them. In *State Oil Co. v. Kahn*, the U.S. Supreme Court ruled that it was not unconstitutional for a company or manufacturer to set a maximum price ceiling for products distributed through a network of resellers. Such limitations, if present, will be found in agreements with suppliers, so small businesses should scan contracts for any such limitations before purchasing wholesale products.

Markups in Specific Industries. Markups vary enormously from industry to industry. In some industries, the markup is only a small percentage of the total cost of the product or service. Companies in other industries, however, are able to attach a far higher markup. Small appliance manufacturers can sometimes assign markups of 30 percent or more, while clothing is often marked up by as much as 100 percent.

MATERIAL REQUIREMENTS PLANNING (MRP)

Material requirements planning (MRP) is a computer-based inventory management system designed to assist production managers in scheduling and placing orders for items of dependent demand. Dependent demand items are components of finished goods, such as raw materials, component parts, and subassemblies, for which the amount of inventory needed depends on the level of production of the final product. For example, in a plant that manufactured bicycles, dependent demand inventory items might include aluminum, tires, seats, and bike chains.

The first MRP systems of inventory management evolved in the 1940s and 1950s. They used mainframe computers to explode information from a bill of materials for a certain finished product into a production and purchasing plan for components. Before long, MRP was expanded to include information feedback loops so that production personnel could change and update the inputs into the system as needed. The next generation of MRP, known as manufacturing resources planning or MRP II, also incorporated marketing, finance, accounting, engineering, and human resources aspects into the planning process. A related concept that expands on MRP is enterprise resources planning (ERP), which uses computer technology to link the various functional areas across an entire business enterprise.

MRP works backward from a production plan for finished goods to develop requirements for components and raw materials. MRP begins with a schedule for finished goods that is converted into a schedule of requirements for the subassemblies, the component parts, and the raw materials needed to produce the final product within the established schedule. MRP is designed to answer three questions: *What* is needed? *How much* is needed? *When* is it needed?

MRP breaks down inventory requirements into planning periods so that production can be completed in a timely manner while inventory levels and related carrying costs are kept to a minimum. Implemented and used properly, it can help production managers plan for capacity needs and allocate production time. But MRP systems can be time consuming and costly to implement, which may put them out of range for some small businesses. In addition, the information that comes out of an MRP system is only as good as the information that goes into it. Companies must maintain current and accurate bills of materials, part numbers, and inventory records if they are to realize the potential benefits of MRP.

MRP INPUTS

The information input into MRP systems comes from three main sources: a bill of materials, a master schedule, and an inventory records file. The bill of materials is a listing of all the raw materials, component parts, subassemblies, and assemblies required to produce one unit of a specific finished product. Each different product made by a given manufacturer will have its own separate bill of materials. The bill of materials is arranged in a hierarchy, so that managers can see what materials are needed to complete each level of production. MRP uses the bill of materials to determine the quantity of each component that is needed to produce a certain number of finished products. From this quantity, the system subtracts the quantity of that item already in inventory to determine order requirements.

The master schedule outlines the anticipated production activities of the plant. Developed using both internal forecasts and external orders, it states the quantity of each product that will be manufactured and the time frame in which they will be needed. The master schedule separates the planning horizon into time "buckets," which are usually calendar weeks. The schedule must cover a time frame long enough to produce the final product. This total production time is equal to the sum of the lead times of all the related fabrication and assembly operations. It is important to note that master schedules are often generated according to demand and without regard to capacity. An MRP system cannot tell in advance if a schedule is not feasible, so managers may have to run several possibilities through the system before they find one that works.

The inventory records file provides an accounting of how much inventory is already on hand or on order, and thus should be subtracted from the material requirements. The inventory records file is used to track information on the status of each item by time period. This includes gross requirements, scheduled receipts, and the expected amount on hand. It includes other details for each item as well, such as the supplier, the lead time, and the lot size.

MRP PROCESSING

Using information culled from the bill of materials, master schedule, and inventory records file, an MRP system determines the net requirements for raw materials, component parts, and subassemblies for each period on the planning horizon. MRP processing first determines gross material requirements, then subtracts out the inventory on hand and adds back in the safety stock in order to compute the net requirements.

The main outputs from MRP include three primary reports and three secondary reports. The primary reports consist of: planned order schedules, which outline the quantity and timing of future material orders; order releases, which authorize orders to be made; and changes to planned orders, which might include cancellations or revisions of the quantity or time frame. The secondary reports generated by MRP include: performance control reports, which are used to track problems like missed delivery dates and stock outs in order to evaluate system performance; planning reports, which can be used in forecasting future inventory requirements; and exception reports, which call managers' attention to major problems such as late orders or excessive scrap rates.

Although working backward from the production plan for a finished product to determine the requirements for components may seem like a simple process, it can actually be extremely complicated, especially when some raw materials or parts are used in a number of different products. Frequent changes in product design, order quantities, or production schedule also complicate matters. The importance of computer power is evident when one considers the number of materials schedules that must be tracked.

BENEFITS AND DRAWBACKS OF MRP

MRP systems offer a number of potential benefits to manufacturing firms. Some of the main benefits include helping production managers to minimize inventory levels and the associated carrying costs, track material requirements, determine the most economical lot sizes for orders, compute quantities needed as safety stock, allocate production time among various products, and plan for future capacity needs. The information generated by MRP systems is useful in other areas as well. There is a large range of people in a manufacturing company who may find the use of information provided by an MRP system very helpful. Production planners are obvious users of MRP, as are production managers, who must balance workloads across departments and make decisions about scheduling work. Plant foremen, responsible for issuing work orders and maintaining production schedules, also rely heavily on MRP output. Other users include customer service representatives, who need to be able to provide projected delivery dates, purchasing managers, and inventory managers.

MRP systems also have several potential drawbacks. First, MRP relies upon accurate input information. If a small business has not maintained good inventory records or has not updated its bills of materials with all relevant changes, it may encounter serious problems with the outputs of its MRP system. The problems could range from missing parts and excessive order quantities to schedule delays and missed delivery dates. At a minimum, an MRP system must have an accurate master production schedule, good lead time estimates, and current inventory records in order to function effectively and produce useful information.

Another potential drawback associated with MRP is that the systems can be difficult, time consuming, and costly to implement. Many businesses encounter resistance from employees when they try to implement MRP. For example, employees who once got by with sloppy record keeping may resent the discipline MRP requires. Or departments that became accustomed to hoarding parts in case of inventory shortages might find it difficult to trust the system and let go of that habit.

The key to making MRP implementation work is to provide training and education for all affected employees. It is important early on to identify the key personnel whose power base will be affected by a new MRP system. These people must be among the first to be convinced of the merits of the new system so that they may buy into the plan. Key personnel must be convinced that they personally will be better served by the new system than by any alternate system. One way to improve employee acceptance of MRP systems is to adjust reward systems to reflect production and inventory management goals.

MRP II

In the 1980s, MRP technology was expanded to create a new approach called manufacturing resources planning, or MRP II. "The techniques developed in MRP to provide valid production schedules proved so successful that organizations became aware that with valid schedules other resources could be better planned and controlled," Gordon Minty noted in his book *Production Planning and Controlling*, "The areas of marketing, finance, and personnel were affected by the improvement in customer delivery commitments, cash flow projections, and personnel management projections."

Minty went on to explain that MRP II "has not replaced MRP, nor is it an improved version of it. Rather, it represents an effort to expand the scope of production resource planning and to involve other functional areas of the firm in the planning process," such as marketing, finance, engineering, purchasing, and human resources. MRP II differs from MRP in that all of these functional areas have input into the master production schedule. From that point, MRP is used to generate material requirements and help production managers plan capacity. MRP II systems often include simulation capabilities so managers can evaluate various options.

While MRP continues to remain popular, many companies are now adopting Enterprise Resource Planning (ERP). ERP is a more comprehensive computer-based system that assists businesses in monitoring and managing both internal and external resources. While MRP tends to focus more on tangible goods, ERP manages all aspects of a business, including human resources and financial information. ERP generally has a centralized database that provides access to authorized users systemwide.

While a switch to new ERP systems may be beneficial to some companies, experts warn that there can be pitfalls in the transition. An *Information Week* article reported that "If your data migration is not done well, and you try to go live, you will have major problems." Problems are exacerbated by a switch from multiple systems, such as payroll processing and MRP products, into one cohesive ERP system, resulting in data that has different parameters and formats merging in one program.

Special offerings by companies that host ERP management systems online may help customers avoid these pitfalls by providing IT support. Companies such as Ramco offer an online ERP system for a monthly fee, handling the data conversion and all IT problems that arise. Consumers can buy various features on the hosted ERP system, making use of all or a limited range of enterprise management tools available.

MEDICARE AND MEDICAID

Medicare and Medicaid are health insurance programs sponsored by the federal government that cover medical expenses for elderly, disabled, and low-income Americans. Both programs took effect in 1965 and are administered by the Health Care Finance Administration (HCFA) which is part of the Department of Health and Human Services. The U.S. government provides health care coverage to a variety of groups, including federal employees, military personnel, veterans, and Native Americans. Until 2010, the Medicare and Medicaid programs accounted for the largest proportion of the federal government's health care expenditures. With the passage of major health care legislation (the Patient Protection and Affordable Care Act) in 2010, expansions of government-funded health care costs are expected to total between $894 billion and $1.3 trillion dollars through the 2010s. Part of these added costs will go towards expanding Medicaid, but the largest government expenditures will go towards subsidized health insurance premiums for lower-income families.

The cost of administering the programs has increased dramatically over the years with the rapid escalation in health care costs. In fact, the portion of overall federal government spending that was spent to support Medicare and Medicaid increased from 5 percent in 1970 to 20 percent, or $599 billion, in 2008. Advocates of the Patient Protection and Affordable Care Act believe that it will cut federal spending on health care and cut the deficit by imposing taxes on various insurance plans and increasing taxes on the wealthiest Americans (those who make over $200,000 per year). However, whether this is accurate will be determined at some point in the 2010s.

MEDICARE

Medicare is the nation's largest health insurance program, providing coverage in 2006 for 43 million Americans, 36 million of whom were at least sixty-five years of age. Medicare will not be expanding under the 2010 health care reform legislation, but Medicaid will, and a greater portion of the costs of Medicare will be shifted to taxpayers. Medicare coverage consists of four parts, labeled Parts A D.

Part A of Medicare is financed largely through Social Security taxes. It provides for the following services:

- Inpatient hospital services up to 90 days per "spell of illness"
- Skilled nursing facility services for up to 100 days per "spell of illness" following a hospital stay of 3 or more days
- Home health care up to 100 visits per "spell of illness" following a hospital stay of 3 or more days
- Hospice care
- Inpatient psychiatric care, for up to 190 days during a beneficiary's lifetime
- Blood (after the beneficiary pays for the first 3 pints per year)

Part B is financed through premiums paid by those who choose to enroll in the program and pay an extra fee for its services, and provides:

- Physicians' services, including office visits and a one-time physical examination for new beneficiaries
- Durable medical equipment (e.g., wheelchairs, oxygen) and supplies
- Outpatient hospital services
- Outpatient mental health services
- Clinical laboratory (e.g., blood tests, some screening tests) and diagnostic tests
- Outpatient occupational, physical, and speech therapy
- Home health care not preceded by a hospital stay and visits over the 100-day Part A limit
- Some preventive services (e.g., mammograms, diabetes screening)
- Blood (after the beneficiary pays for the first 3 pints per year)

Part C refers to the Medicare Advantage program (formerly known as Medicare+Choice), under which private plans provide Medicare benefits to enrollees.

Part D is a prescription drug program available as of January 2006 to everyone eligible for Medicare regardless of income and resources, health status, or current prescription drug expenses. There are two ways to get Medicare prescription drug coverage. One is to join a Medicare prescription drug plan, also called a PDP, and the other is to join a Medicare Advantage Plan or other Medicare Health Plans that offer drug coverage. Whichever is chosen, the plan is designed to help participants cover the cost of both brand-name and generic drugs.

Participants in the program are required to pay a monthly premium, an annual deductible, and a percentage of the cost of the drugs they acquire (a copayment). The program does offer some assistance for participants who can prove that they have limited incomes. The program is a complicated patchwork of private and competing insurance company policies, each with a list of covered medications and each with a different premium structure. In 2009, 3 years after the plan was implemented, the *American Journal of Managed Care* published a study accessing the effectiveness of the Medicare plan. According to the study, by 2008, nearly 90 percent of senior citizens had some type of prescription drug coverage that was at least as good as that offered under Part D. The study also demonstrated that the program offered coverage comparable to other health plans and that overall, the program was successful in providing affordable drug coverage to senior citizens. However, the study cautioned that concerns about the high cost of prescription drug coverage had not been resolved by Medicare Part D and that such concerns should be monitored closely.

Qualified people can enroll in the Medicare program by completing an application at their local Social Security Administration office. It is important to note that, once an employee becomes eligible for Medicare, a small-business owner is no longer required to offer him or her health insurance continuation coverage under the provisions of the Consolidated Omnibus Budget Reconciliation Act (COBRA). Since Medicare does not cover all of an elderly or disabled person's health care costs, many insurance companies offer Medicare Supplemental Insurance (also known as Medigap coverage) to fill in the gaps. Medigap policies commonly take care of copayments and over-limit expenses, for example, in exchange for a small premium. Due to past problems with disreputable Medigap providers, experts recommend that individuals shop carefully for this type of coverage.

MEDICAID

As the nation's second-largest health insurance program, Medicaid provided medical assistance to 53 million low-income Americans in 2006; under the 2010 health care reform legislation, an estimated additional 16 million people will be added to the ranks of those covered by Medicaid by 2014. Medicaid was established through Title XIX of the Social Security Act of 1965 to pay the health care costs for members of society who otherwise could not afford treatment. The program is jointly funded by the federal government and the state governments, but is administered separately by each state within broad federal guidelines. Medicaid recipients include adults, children, and families, as well as elderly, blind, and disabled persons, who have low or no income and receive other forms of public assistance. Medicaid also

covers the "medically needy," or those whose incomes are significantly reduced by large medical expenses.

Medicaid covers the full cost of a wide range of medical services, including inpatient and outpatient hospital care, doctor visits, lab tests, X-rays, nursing home and home health care, family planning services, and preventative medicine. A large proportion of the Medicaid population is elderly or disabled, and thus also qualifies for Medicare. In these cases, Medicaid usually pays for Medicare premiums, deductibles, and copayments, in addition to some noncovered services.

THE FUTURE

Although many Americans plan to rely on Medicare to meet their health insurance needs later in life, the program as it stood in 2000 actually covered only half of an average elderly person's medical costs, according to the American Association of Retired Persons (AARP). Medicare does not provide funds for dental, vision, or hearing care, for example, and 97 percent of the time it does not cover nursing home care. While President Barack Obama promised no cuts to Medicare benefits as part of the health care reform legislation passed in 2010, benefits such as subsidies for Medicare Advantage plans are expected to be reduced or eliminated in order to reduce total overall government spending on Medicare. The legislation is also unclear on whether Medicare benefits will cover nursing home care or other types of care not currently provided through Medicare plans. However, the act does clearly close the "doughnut hole" in prescription drug plans, a term used to describe the gap in coverage that forced citizens to pay out-of-pocket costs for medication until a certain amount of coverage was reached and coverage began again.

In 2008 Medicare's annual costs accounted for 3.2 percent of the gross domestic product. A report by the Social Security Association in 2009 suggested that the program was financially unsustainable as it was functioning and that Congressional action was necessary to protect it. The full effect of the 2010 health care reform legislation on Medicare will not be known for some years.

MEETINGS

Meetings, while disliked by many, are an essential part of many business operations. They are often the best venue in which communications can take place, for issues to be discussed, for priorities to be set, and for decisions to be made in various realms of business management. Because it is more common these days for responsibility

to be spread out across an organization, and because cross-functional efforts are common at almost every business, meetings are the best method for achieving organizational participation.

Meetings can be either effective or ineffective. According to a 2009 study in Hong Kong conducted by Robert Half Legal, workers believed that 32.6 percent of meetings they attend are a waste of time. The primary reasons for a meeting being unproductive is the lack of a meeting agenda (33 percent of all ineffective meetings were determined to result from this cause). Other potential reasons for a meeting to be considered ineffective included irrelevant people requested to attend, an inability to remain focused on the topic, unclear motivation for the meeting, and the absence of important individuals.

PLANNING A SUCCESSFUL BUSINESS MEETING

In order to avoid having an ineffective meaning, planning is the most important step. This includes determining who should attend, who will run the meeting, and what will be discussed. Before the meeting, a list of attendees should be finalized. This is especially important for meetings where a quorum is needed to conduct official business. Without a quorum, it is usually best to simply postpone the meeting until more group members can attend.

When determining who should be included in a meeting, there are several criteria to be weighed. Charlie Hawkins pointed out in *Public Relations Quarterly* that the most important personnel to invite are those people who can best achieve the objective of the meeting. This can be people who are affected by a problem, those who will be most affected by the outcome of the meeting, experts on the subject at hand, or people who are known to be good problem solvers or idea generators. Inviting people solely for political reasons should be avoided, although experts recognize that this may not always be possible. Disruptive people should not be invited unless they absolutely have to be there. Finally, some meeting topics may benefit from the inclusion of an informed outsider who has no stake in the issue; sometimes a fresh, objective perspective can be most beneficial.

Once the meeting's moderator has determined who needs to be in attendance, he or she should develop an agenda and circulate it in advance of the meeting. There are two schools of thought on how to order the agenda. One school recommends starting the agenda with less important items that can be handled quickly and easily. The theory is that this helps to build a positive atmosphere and makes it easier to move on to tougher issues later in the meeting. The other school of thought, however, feels that this is a waste of time and that the agenda should be prioritized, with the most important items coming first. This means jumping right into the most significant issue. Regularly scheduled meetings, such as staff meetings, lend themselves to the "most important first" style.

Many consultants, managers, and business owners contend that the traditional agenda model of "old minutes/old business/new business/adjournment" does not really work anymore. Agendas need to be more fluid and dynamic, yet still need to be structured and effective. Adhering to the following tips can help ensure that the meeting agenda can be addressed effectively:

- State the purpose of the meeting and write it clearly at the top of the agenda. If no clear goal or topic comes to mind, then perhaps the meeting is not even necessary. Consider using a memo, e-mail, conference call, or series of one-to-one meetings to canvas participants about meeting topics prior to creating the agenda.
- Set priorities. Reading the minutes from a past meeting is a colossal waste of time. It is acceptable to hand out the minutes from the previous meeting, but reading them is just not needed.
- Less is more. One of the fundamental meeting mistakes is tackling too many issues. Keep the agenda focused on a few key items.

If other group members are to play a role at the meeting, they should be called or visited once the agenda is established so that they clearly understand their role. It is best to assign a time limit to each of the agenda items. Having time limits helps keep a meeting on track and prevents rambling discussions. The agenda item "any other business" should never be included. It encourages time-wasting at the end of the meeting and also serves as a method for a savvy (or sneaky) meeting participant to exploit the meeting by bringing up an item that is of importance to him or her alone.

Once an agenda has been established, many consultants recommend the appointment of a meeting facilitator in advance of the meeting itself. It is the facilitator's job to keep the meeting focused and on schedule. He or she must remain "issue neutral" and encourage the free exchange of ideas without taking sides. The best facilitators are good listeners and communicators who successfully blend assertiveness with tact and discipline with humor, set a cooperative tone, and are achievement-oriented. The facilitator should remain focused and not allow side issues to distract from the agenda. Appointing a separate timekeeper who alerts the facilitator when agreed-upon time limits are approaching is recommended. Some professional meeting planners recommend using cofacilitators, which keeps one facilitator from falling in love with his or her own ideas. For small companies, this idea may not be feasible. However, if the company does hold a lot of meetings, perhaps several company members can be sent for formal

training in meeting facilitation. This would make it easier to appoint cofacilitators.

For small companies, perhaps facilitators are not needed at every meeting. Indeed, small-business owners often serve as facilitator, key information source, and chief strategist all in one. But some small businesses have successfully instituted systems in which meeting planning and leadership responsibilities are rotated among staff members.

PITFALLS OF MEETINGS

Despite the best efforts and the strongest facilitator, meetings can quickly spin out of control. Following are some common pitfalls that beset meetings, launching them into downward spirals of inaction or flawed decision making:

- The facilitator puts aside the meeting agenda for his or her own personal agenda
- The facilitator allows interruptions such as telephone calls.
- Loud group members are allowed to dominate the meeting
- Decisions are made based on generalizations, exaggeration, guesswork, and assumptions
- Discussions consistently wander off the topic
- Key members of the group are not present
- Overly ambitious agendas
- Meetings that exceed previously agreed-upon time limits
- Minutes that are inaccurate or biased
- Too many participants
- Waiting for latecomers to arrive
- An unclear, or inappropriate, decision-making process. For example, taking a vote when leadership and unilateral action by a company's CEO is clearly needed.

MEETINGS IN A FAMILY OWNED BUSINESS

Many small businesses are family-owned. While it might seem that a family-operated business might not need to worry about holding successful meetings, that is not true. Family meetings can be an important means of keeping the business fresh, generating new ideas, and keeping grievances to a minimum.

Family meetings, when run properly, can help ensure business success and its continued survival into the next generation. The meetings do not need to be formal, but they should be structured and should be held on a regular basis. Because a family business affects all family members, not just those who are an active part of the business, some analysts contend that everyone in the family should be invited to the meetings. If everyone takes the meeting seriously and is willing to participate, the meeting can lead to greater cohesion, communication, and long-range planning.

Business experts say that the agenda for such a meeting can combine business and pleasure. Serious topics typically need to be addressed during these meetings. These might include creating a mission statement, strategy planning, setting a clear path of succession, professional growth and development, market analysis, and estate planning. However, the agenda should also reflect a recognition of the family environment in which it is taking place. Meetings that include a meal (dinner, picnic, etc.) as a centerpiece are among the most popular options.

As with any other meeting, the family meeting should have a facilitator. An outside facilitator can be brought in if family members are concerned that objectivity might otherwise be hard to achieve, although hiring a facilitator can be expensive. It is possible to use a family member as a facilitator as long as that person is able to remain unbiased in the face of emotional discussions. Steering clear of longtime family conflicts is also a must if the facilitator is to succeed at his or her job, although admittedly this can sometimes be difficult. ''Facilitating one's own family meeting can seem daunting because of the potential emotional intensity of family discussions,'' wrote John Ward and Sharon Krone in *Nation's Business.* ''To be effective, a family member acting as a facilitator must overcome emotional barriers, dispel longtime family stereotypes, and curtail long-standing conflicts among family members. All are tough to do.''

Ward and Krone provided several other tips for holding successful family meetings, including the following:

- Consider using cofacilitators as a safeguard to prevent one family member from wielding undue influence over the meeting's direction and tone.
- The facilitator must keep others involved. Assign jobs keeping notes, creating charts or overheads, keying and distributing minutes, or chairing committees and avoid the impression that one person is dominating the meeting.
- Provide formal training for the facilitator. While the person selected may have strong interpersonal and leadership skills, formal training in communications, conflict resolution, active listening, decision making, and group management can prove invaluable.
- Each person attending the meeting should reflect on his or her own strengths and weaknesses and personality style.
- Recognize when professional help *is* needed. Intense conflicts and domination by one person or a small

group of people are examples of when it might be time to bring in a professional facilitator.

- Avoid surprises. Distribute agendas and notes in advance if possible.
- Set ground rules for the meeting.
- Have fun. Even if the business at hand is very serious, set aside some time for relaxation or fun.
- Use a well-lit meeting room with comfortable furniture. Make sure refreshments are provided and provide ample breaks.
- Do not rush things, and do not overload the agenda with too many heavy topics if at all possible.

Studies also suggest that an off-site meeting or gathering can be especially beneficial for family-owned firms. This can provide better opportunities for open communication away from the business environment and can allow individual members of the family to have their voices heard on business matters in a low-key, low-pressure setting. Organized activities at a retreat can also build unity, helping family members learn to work together more effectively in pursuit of common goals.

VIRTUAL MEETINGS

Virtual or online meetings have become increasingly popular in recent years. Virtual meetings allow geographically diverse employees to meet without traveling to a common location. This can save in travel time and expense for a company, minimizing the loss of production time required when individuals from different locations and divisions need to work together. In addition, it can permit more frequent communication between employees working in different locations, allowing for more unity in company policy and projects.

The principles behind virtual meetings are similar to those of standard meetings. The meeting should be clearly focused and have a definitive agenda. Only those individuals who have a vested involvement in the meeting subject should be invited to attend. Visual aids and other presentation tools can also be used using virtual technology, allowing parties to share charts and grafts. Virtual desktop software can even allow users to contribute to the same document or work from the same computer during a virtual meeting.

Conducting virtual meetings can be a great money-saving tool, and small businesses especially may benefit. Companies would be wise to consider this emerging technology as an addition to their meeting agendas.

MENTORING

Mentoring denotes a relationship between a more experienced person the mentor and a less experienced person the protégé. The mentor's role is to guide, instruct, encourage, and correct the protégé. The protégé should be willing to listen to instruction and constructive criticism, and should also feel as though the mentor is concerned with his or her welfare. Mentor/protégé relationships are less structured and more personal than traditional teacher/student situations.

In many large corporations, formal systems of mentoring have been established in recent years. They are designed to quickly involve new employees in the work at hand, and to strengthen the work force in much the same way that other teambuilding strategies are designed to do. These systems pair experienced workers exhibiting strong leadership skills with new employees not yet acquainted with the nuances of the corporation, the work at hand, or their potential within the framework of the company.

Intel, for example, instituted a new Mentoring Movement in 2002, using technology to match new and old employees. The Intel system asked mentors to enter their areas of expertise, while those seeking guidance could select the things they most wanted to learn. This process streamlined the assignment of mentors, and employees

reported increased productivity and learning. One employee commented "It felt like the burden was taken off of me."

HOW MENTORING WORKS IN SMALL BUSINESSES

But while mentoring is perhaps most closely associated with large corporate settings, the practice can be effectively utilized by small businesses as well. In fact, in many small businesses, an informal mentor/protégé relationship develops naturally as managers and business owners work closely with a small staff.

Small-business owners themselves can become involved in mentoring relationships, on either the mentor or the protégé side. Entrepreneurs may seek out business owners or executives with more experience in certain areas and approach them about establishing a mentoring relationship. Because this kind of approach acknowledges success, experience, and market savvy, a potential mentor will likely be flattered and appreciate the drive and initiative of the potential protégé. In other instances, more experienced small-business owners may wish to initiate mentor/protégé relationships from the mentor angle, spurred by generous instincts as well as a wish to strengthen the skills and knowledge of other people within their organization. These mentoring systems can be loosely or formally structured, either determined by the owner or simply encouraged by the owner and initiated by employees. A mentoring program may even prove to be a useful part of a succession plan.

Protégés and mentors should feel relatively comfortable with each other, as the relationship ideally is one of trust and mutual growth. Mentors should not be expected to become drill sergeants. The mentor relationship is not intended to be one of management exerting its will over young or inexperienced employees. Rather, the relationship should reduce anxiety by clearly defining goals and boundaries, and should increase productivity as a result.

Small-business owners seeking mentors have several structured alternatives to choose from. For example, the Small Business Administration can put potential protégés into contact with some groups. In addition, the Service Corps of Retired Executives (SCORE) includes mentoring among its various offerings.

BENEFITS OF MENTORING

Mentoring relationships can be beneficial to all parties. Any mentoring situation requires an investment of time, experience, and trust. But these investments will be rewarded in a strong tie between colleagues and the deepened experience of not just the protégé, but also the mentor.

Benefits for the Mentor. Mentors may receive great satisfaction from their experience with protégés. They feel respected and appreciated for their knowledge and skill. And mentors can become more invested in their work as a result: they have personal relationships to foster in the business setting, and they feel that the owner trusts and respects their judgment and talents. In their position as role models, mentors may even more closely evaluate their own performances and become more productive in their own business dealings and duties. A 2006 study reported that individuals who served as mentors to others experienced a higher salary, a higher rate of promotions, and more general career success compared to those individuals who did not provide mentoring services.

Benefits for the Protégé. The protégé, whether a new employee of a business or a new entrepreneur, will benefit from the transfer of knowledge and know-how that can be passed on by a mentor of greater experience. Perhaps the greatest benefit is being able to learn from other people's mistakes. A mentor can warn of pitfalls as yet unforeseen by the protégé, saving the time and the pain involved in making those mistakes.

An employee who is a protégé also benefits by having a mentor trained in the management of a business, who can pass along the true meanings behind policy decisions and the unwritten rules of the workplace. The mentoring relationship can make the transition into productive, comfortable employee a much smoother one. Protégés will quickly learn what is expected of them, their place within the framework of the business, and the responsibilities of other departments and personnel within the workplace. Career opportunities and areas of improvement can both be sensitively illustrated by a mentor, and transitions within the company and changes of business practice can be made less stressful with suitable guidance.

Benefits for the Business Owner. The business owner benefits from the mentor/protégé relationship within his or her business in several ways. New employees can be thoroughly trained in technical aspects of the work by a mentor, resulting in employees who move quickly through the learning curve and into productive work. Mentoring relationships have also been shown to promote employee satisfaction, leading to decreased turnover in the workforce and higher production rates.

MERCHANDISE DISPLAYS

Merchandise displays are special presentations of a store's products used to attract the buying public. The nature of these displays may vary somewhat from industry to industry, but all use basic principles designed to increase product purchases. Merchandise displays are an integral element of the overall merchandising concept, which seeks to promote product sales by coordinating marketing, advertising, and sales strategies.

Merchandise displays generally take one of several basic forms:

- Storefront Window Displays. These typically open onto a street or shopping mall walk or courtyard and are intended to attract passersby who might not otherwise enter the store.
- Showcase Displays. These typically feature items that: 1) are deemed to be too valuable for display in storefront setups; or 2) are niche items of high interest to the business's primary clientele. These display centers are usually located in high-traffic areas and typically feature multiple tiers for product display. If the display area is part of a counter area then it will often open up on the proprietor's side for easier product management, as seen in most small bakeries.
- "Found-Space" Displays. This term refers to product presentations that utilize small but usable areas of the store, such as the tops of product carousels or available wall space.
- Point of Sale. Displays at the point of sale are those located near the cash register, on or near the counter or hanging on nearby walls. These are designed to attract the attention of customers who are waiting to pay for goods or are making their transaction.

The type of merchandise a small business is selling will typically dictate what type of display structures are used. CDs are often placed in racks that are hung on walls or arranged on tables, while books are placed on shelves or displayed in special stands. Decorative tables or risers can be used to display sculptures, vases, or similar objects. A small business has more leeway to be creative and can often incorporate unusual items such as barrels or local artwork.

BALANCE AND EMPHASIS

Balance and emphasis are two vital parts of any display structure. There are two general types of balance: formal and informal. Formal balance is highly symmetrical, so that two sides of the display mirror each other, and is often used to show traditional and simple items. Informal balance is characterized by a variety in shapes and color that subtly points to a single spot, and is used to introduce newer ideas or fashions.

Emphasis is where the focus of the display is kept. This is usually in the upper left corner, or in the optical center of the display, halfway between both sides and slightly above the vertical center. Contrast is used to create this emphasis, whether with color, shape, or texture.

DISPLAY LINES AND PROPORTION

Display lines are the rows of merchandise and how they draw the eye along from one part of the display to another. The lines can move in any direction and can follow nearly any path, but even at the most complicated they usually only have simple curves. Displays may use multiple lines, but one line will be dominant, and this line defines the character of the display. Vertical lines are considered forceful, dignified, and precise, while some regard horizontal lines as more peaceful and calm. Diagonal lines can give either a feeling of order or a feeling of instability, depending on which way they move.

The size relationship of all items in the display is governed by proportion. None of the objects used should feel out of proportion compared to the other objects. Instead, they should work together. The four most common ways to divide a display are a pyramid, a step, a zigzag, and a repetition. The pyramid is a classic triangular-faced shape with a center peak and a wider base that can be used with many different types of products. A step is less formal than a pyramid and can viewed from multiple angles. The zigzag is typically used to display different types of color or cloth. Repetition simply repeats a pattern or particular image and is useful for showing brands or collectibles.

KEYS TO SUCCESSFUL MERCHANDISE DISPLAY

Trudy Ralston and Eric Foster, authors of *How to Display It: A Practical Guide to Professional Merchandise Display*, cited several key components of successful merchandise display that are particularly relevant for small-business owners. First, displays should be economical, utilizing only space, materials, and products that are already available. Second, portable displays should be versatile, able to fit in a variety of locations and display many different kinds of merchandise depending on the scenario. Finally, displays have to be effective. They should be easily seen and convey an immediate message with an actual example of the produce for added effect.

Other general merchandising practices will also improve the effect of displays. Guidelines to follow include:

- Allocate merchandise display space and expenditures appropriately in recognition of customer demographics. If the bulk of a business's customers are males between the ages of twenty and forty, the bulk of the displays should probably be shaped to catch their interest.
- Be careful of pursuing merchandise display designs that sacrifice effectiveness for the sake of originality.
- Make certain that the cleanliness and neatness of the display is maintained.
- Do not overcrowd a display. Customers tend to pass over messy, busy-looking displays. Merchandisers should instead focus on one item or point of interest, and all products should complement one another.
- Small items should be displayed so that customers can get a good look at them without having to solicit the help of a member of the staff.
- Pay attention to details when constructing and arranging display backgrounds. For example, Foster and Ralston counsel business owners to "avoid dark backgrounds when customers will be looking through a window, since this makes the glass behave as a giant mirror."

MERGERS AND ACQUISITIONS

Mergers and acquisitions (M&As) is a phrase used to describe financial activities in which companies are bought and sold. In an *acquisition* one party buys another by acquiring all of its assets. The acquired entity ceases to exist as a corporate body, but the buyer sometimes retains the name of the acquired company. In a *merger* a new entity is created from the assets of two companies; new stock is issued. Mergers are more common when the parties have similar size and power. Mergers tend to have a more positive connotation than acquisitions, so at times the two are purposely confused. An acquisition, however, can be either friendly or hostile, depending on circumstances.

WHY M&A?

M&A activity focuses on increasing stockholder value. Stockholder interests are central, because these transactions must have the approval of a majority of stockholders, and stockholders are unlikely to vote their shares in favor of a sale, purchase, or merger unless they believe that they will benefit. Other financial and personal motives also influence the process, to a lesser extent. Companies may combine or acquire to facilitate growth, gain more resources, access new technology, or simply diversify.

When an acquisition is hostile, resistance is common among managers who fear losing control or being forced to adopt new methods. These managers may have some degree of influence over stockholders and can sometimes reveal facts about the takeover the stockholders may otherwise not have known. However, stockholders tend to be attracted to the increase in their stock value above

most other factors, which is how many acquiring companies gain the necessary votes.

Motivations for selling a company are complex. Retiring founders of small businesses sell companies to realize the business's cash value after a lifetime of work. Companies projecting failure sell before the failure is actually knocking on the door. Companies reach the limit of their resources, financial or technical, and see benefit in joining a larger company able to fund growth.

TYPES OF ACQUISITIONS

Acquisitions are classified by their structural effects, the attitudes of the parties, and by the mechanisms of the transaction. The classifications are not mutually exclusive.

Acquisitions can be horizontal, vertical, or conglomerative. Horizontal acquisition occurs when a company expands by purchasing another company in its own field. The second type, vertical, involves a company buying another business along its supply chain, such as a supplier or distributor with which it formerly worked. This allows the company to take advantage of the economies that come with being in charge of multiple stages of production. In a conglomerative acquisition the buyer's business has nothing to do with the business of the purchased company. A business may be trying to diversify or enter a new field more suited to it.

Classification by mechanism defines how the buyer pays for the seller. Payment may take the form of cash, stock, or a combination of the two. Cash-for-stock is the simplest method but more costly for the stockholder: the transaction is taxable, the stockholder having to pay capital gains taxes. The stock-for-stock method is the most popular because it is tax free; the seller's stockholders receive stock in the buyer's company; if the action is a merger, stock in the new entity is issued in payment instead. If the deal is a combination, the cash portion of the deal is taxable.

VALUING THE CANDIDATE

Many different techniques are used to value a company prior to a merger or acquisition. While the net worth (assets minus liabilities) can be a helpful indicator, a number of more complex formulas are also used to gauge the worth of a business.

The most common method of valuation used in M&A is discounted cash flow (DCF) analysis. It involves projecting the financial performance of the company over some period, typically 10 years, and then calculating net cash flow for every year. The analyst then discounts (reduces) future earnings using the purchaser's actual rate of return on capital. The goal is to see how much the buyer can expect to make in profit in the future, and use that as a measurement of present value.

Another common measure used for valuation is the price-earnings ratio (P/E Ratio) in which the price of a share of stock is divided by the company's after-tax earning per share. A $100 share earning $10 per share a year, is said to have a 10:1 ratio. The market, in other words, is willing to pay $10 for every $1 of earnings. A company with an annual after-tax earnings of $500,000 and a P/E Ratio of 7 would thus be valued at $3.5 million.

The enterprise value to sales ratio (EV/Sales Ratio) is also used. Enterprise value is calculated by taking the company's outstanding stock, adding its debt, and deducting its cash or cash-equivalent assets. This value is then divided by the company's sales (not earnings) to arrive at an EV/Sales Ratio. This is done to treat both stock and debt as liabilities for the acquiring company.

Synergies are also factored in company valuation. Synergy refers to all the benefits the buyer will gain through the acquisition process itself. For instance, the acquisition should at least temporarily raise the stock value, or it may take pressure off a particular supply chain.

SUCCESS AND FAILURE

Are mergers and acquisitions a success or a failure? Many smaller companies are successfully sold to larger operation where they continue to operate and grow. Larger deals tend to be less successful in the long term, since the economies of scale and diversification benefits are less certain than the more tangible consquences. Sometimes it takes too much work and time to join two similar companies.

Results for stockholders depend on which side of the deal they are on. Stockholders in businesses that are acquired typically gain 20 percent stock value in mergers. Most small company owners realize substantial gains when selling successful, privately held corporations to a public buyer. The gains of stockholders of acquiring firms are difficult to measure, but the best evidence suggests that shareholders in bidding firms gain little.

Small businesses can improve their chance of a successful merger or acquisition by focusing on the emotional side of the change. If employees are given support and shown clearly what their new goals and expectations are, the chances of a successful transaction will quickly rise. Many acquisitions fail because employees are uncertain of their future and unaware of their new mission and company values. This uncertainty and lack of knowledge trickle down to the customer as bad service and worsen the collective company image. The new school of thought in mergers and acquisitions holds that if social transitions are planned for and executed with as much finesse as the monetary side of the transaction, the change will be smoother and more profitable.

METROPOLITAN STATISTICAL AREA (MSA OR METRO)

A Metropolitan Statistical Area (also known as an MSA or metro) is a designation the U.S. government uses to refer to a region that consists of a city and its suburbs, plus any surrounding communities that are closely linked to the city because of social and economical factors. A reference in a report to "the Detroit MSA" refers to a geographical area of which the official City of Detroit is just a part. No one is actually administratively responsible for the metro itself.

Defining urban areas has typically been the responsibility of the Office of Management and Budget (OMB), an element of the White House. Definitions were begun in 1949 by OMB's predecessor, the Bureau of the Budget, and continued in in 1958, 1971, 1975, 1980, 1990, and 2000. The purpose of these definitions has been to give a uniform basis for identifying urbanization in the context of the population census. The designations are widely used in government and industrial reference.

TERMINOLOGY

The categories used before the 2000 redefinition were, in hierarchical order, free-standing MSAs, PMSAs (primary) which were parts of a larger aggregate, and CMSAs (consolidated metropolitan statistical areas) which held multiple PMSAs.

The new definitions, still in hierarchical order by size, are Micropolitan Statistical Areas (micros), Metropolitan Statistical Areas (metros), and Combined Statistical Areas (CSAs holding two or more micros or metros). Further complicating matters, micros and metros are collectively referred to as Core-Based Statistical Areas or CBSAs. New England areas may also use NECTAs or New England City and Town Areas, which are focused more on towns and cities than on county areas.

DEFINITIONS

Unit definitions are based on population, and population is measured by county (except in New England).

Core-Based Statistical Area. A CBSA is one or more counties with an urbanized cluster of at least 10,000 people. The area as a whole is defined by the interaction between the core and the outlying areas. This interaction, measured by commuting, means that at least 25 percent of people in outlying areas are working in the core. The CBSA is a generic definition of micros and metros, the difference being core population size.

Micropolitan Statistical Areas. A micro is simply a small CBSA, a county or counties with an urbanized core of 10,000 but fewer than 50,000 in population. Outlying areas included are, again, defined by commuting patterns. As of November 2008, according to the Census Bureau, there were 574 micros in the United States and five in Puerto Rico.

Metropolitan Statistical Areas. A metro has an urbanized core of minimally 50,000 population and includes outlying areas determined by commuting measures. In 2008 the United States had 366 metros and Puerto Rico eight.

Combined Statistical Areas. CSAs are two or more adjacent CBSAs in which there is at least a 15 employment interchange (measured by commuting) between cores. If this exchange is 25 percent or higher between a pair of CBSAs, they are combined into a CSA automatically; if the measure is at least 15 percent but below 25 percent, local opinion in both areas is used to decide on combination. The United States had 127 CSAs in 2008.

Metropolitan Divisions. Metropolitan divisions are used to further subdivide major metropolitan areas into divisions with minimally 2.5 million core populations. Thus, for instance, the Boston area is subdivided into four, the Chicago Area into three, Detroit into two, the

New York area into four such divisions. All told there were twenty-nine divisions in the ten largest metro areas: Boston, Chicago, Dallas, Los Angeles, Miami, New York, Philadelphia, San Francisco, Seattle, and Washington, D.C.

NAMING CONVENTIONS

Statistical areas are named after the city the OMB defines as the "principal city," namely the administrative entity which forms the largest urban core. "Atlantic City, N.J. MSA" is a typical MSA name. The area includes a single county, Atlantic County, N.J. Under OMB rules, however, additional cities may also qualify for the "principle" designation based on population and employment size measures.

SMALL BUSINESSES AND METROS

Small businesses are directly affected by metros in several ways. One of the most important is the research done by the Small Business Administration and other organizations which dictates how much grant and loan money is available in any particular area. The SBA uses metros and micros as a reference for its loan activity (known as small-business lending markets) and often assigns certain funds to particular areas based on their census information. A small business can have a better or worse chance of receiving SBA loans and others like them by choosing a particular metro as a base of operations.

Analysts who study national cash flows and patterns of growth use metros when making economic forecasts. For small businesses already established, this information can provide important clues on emerging markets and areas where they may be able to sell their products more successfully. Certain organizations, such as *CNN Money*, also use these economic forecasts to pinpoint the best metros to start a small business, based on loan availability, presence of talent, and growth potential. According to this source, for 2009 the best place to launch was the metro centered around Hattiesburg, Mississippi.

MEZZANINE FINANCING

Mezzanine financing, named for its terraced formation, is a loan with terms that subordinate the loan to other types of debt already in existence. The mezzanine lender typically has a warrant (meaning a legal right fixed in writing) enabling him or her to convert the money he or she is owed into equity in the borrower's business at a predetermined price per share if the loan is not paid on time or in full. This ensures that the lender will receive at least some payment, and it encourages lenders who have an interest in a specific business or believe that a business will flourish in the near future. Major sources of mezzanine financing include private investors, insurance companies, mutual funds, pension funds, and banks.

MEZZANINE MECHANICS

Mezzanine lenders can receive equity immediately, a sale of equity as part of the loan, or equity as a default payment if the borrower is not able to pay off the loan completely in the required time. Lenders are often concerned about security and usually require a higher interest rate than current market rates in addition to other forms of financial protection.

In the ideal case, the mezzanine lender anticipates earning a high interest on the loan and rapid appreciation of the equity he or she may acquire. Some mezzanine loans are made during acquisitions, when interested lenders assume they will be able to sell their equity at a profit after the shares of the acquired business are transferred and made public again. At other times, borrowers seek out mezzanine loans because they are having difficulty acquiring loans from more traditional sources such as banks or the government.

THE PROS AND CONS

Mezzanine financing has certain potential advantages, such as:

1. The owner rarely loses outright control of the company or its direction. Provided the company continues to grow and prosper, its owners are unlikely to encounter any interference from the mezzanine lender.

2. The method offers a lot of flexibility in shaping amortization schedules and the rules of the borrowing itself, not least specifying special conditions for repayment.
3. Lenders willing to enter into the world of mezzanine financing tend to be long-term investors who are acquainted with business cycles and can offer both patience and strategic assistance.
4. Mezzanine financing can increase the value of stock held by existing shareholders as long as the borrower is not forced to sell equity to the lender.

While those are the benefits of mezzanine financing, some potential pitfalls are:

1. Mezzanine financing may involve loss of control over the business, particularly if the equity portion of the borrowing is high enough to give the mezzanine lender undue influence.
2. Subordinated debt agreements may include restrictive covenants. Mezzanine lenders may insist on requirements that the borrower is not to borrow more money, refinance senior debt from traditional loans, or create additional security interests in the company's assets. Covenants may also force the borrower to meet certain financial ratios cash flow to equity, for example.
3. Similarly, business owners who agree to mezzanine financing may be forced to accept restrictions in how they spend their money in certain areas, such as compensation of employees or other shareholders.
4. Mezzanine financing is more expensive than traditional or senior debt arrangements.
5. Most mezzanine deals take at least 3 months to arrange, and many take twice that long to complete.

SMALL BUSINESSES AND MEZZANINE LOANS

The appeal of mezzanine loans waxes and wanes with market conditions. If a small business plans its growth at the right time, a mezzanine loan can be very attractive. These loans can often bridge the gap between start-up equity and traditional bank loans that small businesses can struggle to qualify for. In order to appeal to mezzanine lenders, a small business must have excellent financial records that show promise for good returns. This also appeals to mezzanine lenders because smaller businesses do not typically require as heavy an investment as do larger companies.

However, mezzanine financing depends largely on the current attitudes of mezzanine lenders. In 2008 mezzanine lending was very popular and many lenders were offering tiered loans at manageable rates (around 15 to 18 percent with 12 to 14 percent required yields). In 2009, however, mezzanine lending fell off sharply and most lenders left the market. This raised costs to around 35 percent, an amount unmanageable for small businesses.

Because mezzanine loan conditions fluctuate from year to year, a small business encountering unfavorable conditions for such a loan should search for sources of equity and investors who may be interested in becoming equity partners. Returns on equity are likely to be the same as unfavorable mezzanine requirements but with the absence of debt.

MINIMUM WAGE

The Fair Labor Standards Act of 1938 (FLSA) is the basic law controlling employment and compensation issues in the United States. FLSA mandates that a minimum wage be paid, but the act classifies employees into two broad classes: those who are covered by the law because they are paid by the hour and those who are exempted because they are paid a salary. All matters pertaining to the minimum wage are applicable only to "nonexempt" employees. In addition to the federal minimum wage, state minimum wage rates are also in place.

RATES AND COVERAGE

The longest period during which the federal minimum wage level remained unchanged occurred between 1996 and 2007, during which the rate stayed at $5.15 per hour. During 2007 rate increases began, until on July 24, 2009, the federal minimum wage was raised to $7.25.

States have followed suit with updates to their own laws. In 2010 there were only five states with no minimum wage law of their own: Louisiana, Mississippi, Alabama, Tennessee, and South Carolina. However, there were also five states which had minimum wage rates lower than the 2010 federal rate: Wyoming, Colorado, Minnesota, Arkansas, and Georgia. Other states have either the same rate as the federal level or higher rates. In 2010 the highest rate was Washington's, which was $8.55 an hour.

Exemptions. Estimates of the number of people earning the minimum wage are difficult to establish in part because exemptions to the law exist for certain classes of worker. For example, family members of the employer may be paid less than the minimum wage. Also exempt are employers of the disabled, if the disability affects the person's ability to work. Full-time students are not covered; students and apprentices, part of whose work is learning a skill, need not be paid the minimum wage. Finally employees earning tips are exempted under the presumption that tips will make up the difference.

Statistics. In 2009 72.6 million people in the United States over the age of sixteen were paid with hourly wages. This group represented 58.3 percent of the total number of wage and salary workers in the country. Only 980,000 made exactly the federal minimum wage, while 2.6 million made wages below the minimum.

Overall, the minimum wage workers were young, with most under twenty-five and the majority teenagers. Part-time workers were more likely than full-time workers to be paid minimum wage, and those in service occupations such as food preparation were the mostly likely to earn the minimum amount.

MINORITY BUSINESS DEVELOPMENT AGENCY

Established in 1969 by executive order, the Minority Business Development Agency (MBDA) works to foster the creation, growth, and expansion of minority-owned businesses in the United States as a part of the Department of Commerce. The agency was originally called the Office of Minority Business Enterprise, but its name was changed in 1979.

The MBDA describes its mission as a series of responsibilities including: 1) coordination of federal government plans, programs, and operations that affect minority business enterprises; 2) promotion and coordination of activities of government and private organizations that help minority businesses grow; 3) collection and dissemination of information that will help those interested in establishing or expanding a successful minority-owned firm; and 4) funding organizations to provide management and technical assistance to minority entrepreneurs. A wide range of individuals are eligible for MBDA assistance, including Hispanic Americans, Asian and Pacific Island Americans, Alaska Natives and Native Americans, African Americans, and Hasidic Jews.

The Minority Business Development Agency's headquarters are located in Washington, D.C., but it also maintains five regional offices (in Atlanta, Chicago, Dallas, New York, and San Francisco) and four district offices (in Miami, Boston, Philadelphia, and Los Angeles), as well as a group of local community-based outreach centers across the country. These facilities include Minority Business Development Centers (MBDC), Native American Business Development Centers (NABDC), Business Resource Centers (BRC), and Minority Business Opportunity Committees (MBOC). These centers offer a variety of programs to assist local minority entrepreneurs, including providing one-on-one assistance in writing business plans, marketing, management, technical systems, financial planning, and securing financing for business ventures. While these centers provide minority entrepreneurs with help in locating sources of financing and preparing loan proposals, they do not have any authority to make grants, loans, or loan

guarantees. These centers are operated by private firms, government agencies (both state and local), educational institutions, and Native American tribes.

GOALS, AIMS, AND BUDGET

When it comes to the growth of minority-owned businesses in the United States, the MBDA seeks to gain economic parity with the total U.S. population. This means that, given their different sizes, there will be an equal percentage of successful businesses for both minorities and the total population. In the early 2010s, minorities tended to own fewer businesses than the U.S. population as a whole. The MBDA projects that if the percentage of businesses among minorities were to rise to meet industry averages, 16 million jobs would be created, and $2.5 trillion in revenue would be generated every year.

While the MBDA helps many different kinds of minority small-business owners, administrator David Hinson has voiced his intention to concentrate more on growing companies that have a chance to make annual profits of $100 million or more. Hinson was quoted in an article by Sheena Harrison, published by *CNNMoney.com*, as stating, "We will focus less on organic growth at the start-up level and more on companies that want to grow through mergers and acquisitions, resulting in significant revenue growth and job creation."

MBDA's budget for 2009 was $29 million, but it typically helps raise far more money in contracts and financing for minority-owned businesses, reaching $2 billion in 2008.

FOREIGN TRANSACTIONS

The MBDA has also shown an increased emphasis on making certain that minority entrepreneurs are able to compete in the international marketplace. In 1992 it entered into an agreement with the International Trade Administration (ITA) to assist U.S. minority entrepreneurs in their efforts to export successfully and compete in foreign markets. Shortly afterward, the MBDA launched its International Trade Initiative, which provides information to minority firms concerning export laws, marketing plans, potential foreign markets, and trade guidelines. The MBDA also helps connect willing foreign market businesses with specific minority business owners interested in extending their customer base, handling the costs of communication to benefit both parties.

For more information on MBDA programs, minority entrepreneurs can contact the agency at its headquarters at 64 New York Avenue, NE, Washington, DC 20230; 202-671-1552 or via the Internet at the MBDA Web site, www.mbda.gov.

MINORITY-OWNED BUSINESSES

Minority-owned businesses are on the rise. Over the past 20 years the African American, Hispanic, Asian, and Native American communities all saw significant surges in small business start-ups and growth. This success has been attributed both to generally positive economic trends and to advances in education and access to capital. Even with this success, minority entrepreneurs can still face challenges in the modern world of business, and may be hindered by racism, cultural differences, or the isolation that can plague some minority communities.

COUNTING MINORITY OWNED BUSINESSES

According to the U.S. Census Bureau, 51 percent or more of the stock or equity of the business must be owned by a person or persons of the minority group being measured in order to qualify as a minority-owned business. The following figures on minority-owned businesses in the United States, as of 2002, are from Census Bureau data and reports.

African-American-Owned Businesses. In 2002 there were 1.2 million firms owned by African Americans in the United States, employing more than 756,000 people. The 1.2 million black-owned firms generated nearly $89

billion in revenues and accounted for 5.2 percent of all U.S. nonfarm businesses.

The data suggests that many African American business owners created sole proprietorship businesses without the need or means to hire employees, since firm growth has risen while firms with paid employees have remained relatively unchanged. The areas in which African American business ownership is highest are in the retail trades and in health care and social assistance. Of the revenue generated by black-owned retail businesses, 54 percent was from businesses in the industry classified as ''motor vehicle and parts dealers.''

Hispanic-Owned Businesses. As of 2002, Hispanics owned 1.6 million nonfarm businesses in the United States, which employed about 1.5 million people and created $222.0 billion in business revenues. These Hispanic-owned firms accounted for 6.8 percent of all businesses in 2002. Of all Hispanic-owned businesses, 12.7 had paid employees.

In a similar pattern to African American business growth, Hispanic businesses grew more quickly from 1997 to 2002 than the business average, but most of these appeared to be sole proprietorships without paid employees. The number of Hispanic businesses with paid employees actually fell in the years between 1997 and 2002.

Hispanic-owned businesses are diversified but many, 29 percent, operated in construction and other services, such as personal services, and repair and maintenance. Retail and wholesale trade accounted for 35.9 percent of Hispanic-owned business revenue. Again, as with the African American-owned businesses, a large part of the retail trade revenue (80 %) was concentrated in the automobile industry, and motor vehicle and parts dealers.

Asian-Owned Businesses. The 2002 business ownership data show that there were 1.1 million Asian-owned businesses in the United States, with over 2.2 million workers employed. These businesses generated more than $326 billion in business revenues. Asian-owned firms accounted for 4.8 percent of all U.S. nonfarm businesses. Asian businesses grew by 23.6 percent between 1997 and 2002, with paid employee businesses growing faster than the national average at about 11 percent.

The single industrial area in which the greatest number of Asian-owned businesses operate is wholesale trade. Retail trade and the services also rank high in terms of areas of concentration for Asian-owned firms.

Women-Owned Businesses. In 2002 there were 6.5 million businesses owned by women in the United States, employing 7.1 million people and generating $940.8 billion in business revenues. These women-owned firms accounted for nearly one-third of all businesses.

When the data on women-owned businesses for 2002 are compared with the data from 1997, increases are seen across all categories. The number of women-owned firms grew by 19.8 percent over the period, nearly twice the national average (10.3%), and the firms with paid employees experienced a similar growth average (8% to the national 4%).

Thirty-two percent of women-owned firms operated in health care and social assistance, and other services (such as personal services, and repair and maintenance), where they owned 43.7 percent of all such businesses in the United States. Wholesale and retail trade accounted for 38.3 percent of women-owned business revenue.

FACTORS IN MINORITY BUSINESS GROWTH

Analysts cite several reasons for the explosive growth in minority-owned businesses in the United States over the past two decades. A shifting population demographic has been a major contributor to this shift in business ownership dynamics, and government initiatives have also played a part. Once the growth began it gathered momentum, aided by the following factors:

- Community Support. Many entrepreneurial ethnic minorities benefit from reciprocity from the communities they offer services and products to. The community's autonomy is improved, and people use their financial gains to reinvest in the business.
- Increased Networking. As the number of minority entrepreneurs has grown, so too has the number of organizations, associations, and other groups that have formed to provide assistance and information to minority-owned businesses. The growing number of minority entrepreneurs also allowed for the growth of partnerships and collaboration.
- Programs. In addition to federal set-aside programs, a variety of local, state, and federal agencies have extended help to minority businesses. Most aid takes the form of grants, loans, or legal resources. The Small Business Administration also increased its aid to minorites.
- Corporate Acceptance. Many minority businesses have been encouraged by improved relations with the wider corporate world. Partnerships and transactions all along the supply chain are now common.
- Urban Revitalization. Many minority entrepreneurs have established themselves as business owners in urban areas at a time when several large cities have experienced heartening signs of rebirth. Many started

with government grants for improving impoverished urban areas.

- Higher Levels of Education and Business Experience. Modern-day minority-owned businesses are significantly more experienced in financing, marketing, and accounting than their counterparts were in previous years.
- Alternate Financing. While government funding has played its part in encouraging minority-owned businesses, many business owners have also benefited from private lenders willing to invest in minority entrepreneurs. Part of this trend is due to an overall acceptance of small businesses, but part is also due to increased respect for minority markets.
- Expansion Into Emerging Industries. Traditionally, minority business owners have been primarily involved in small-scale retailing and service industries. But increasing numbers of minority entrepreneurs have successfully ventured into other realms, including manufacturing and high-technology industries.

AFFIRMATIVE ACTION AND "SET ASIDE" PROGRAMS

Set-asides were first created in 1953, when the U.S. government passed a law that set aside 5 percent of all procurement contracts for small businesses owned by socially and economically disadvantaged people. The SBA eventually redefined the terms, but they originally included Black Americans, Hispanic Americans, Native Americans, Asian Pacific Americans, and other minorities.

By the early 1970s, similar regulations were passed to ensure private contractors also set aside a percentage of their work for subcontracts with individuals from disadvantaged backgrounds. Some laws specifically mentioned minorites or women in an effort to equalize funding.

During the 1980s and 1990s, critics of affirmative action and set-aside policies argued that minority-owned businesses were coming of age and could compete in the mainstream economy. In fact, they claimed that "set-asides" impeded minority-owned businesses' chances of success, because companies came to depend on them to the detriment of seeking contracts through competition. Finally, some critics contended that such policies discriminated against white business owners.

Other researchers and minority entrepreneurs rejected these arguments, pointing out that revenues of minority-owned businesses still fell short of those found in comparable white-owned firms. Supporters of affirmative action programs contended that "public policy drives private behavior," and that any government decision to tear down programs designed to help minority-owned businesses would serve as tacit approval for discriminatory behaviors.

ONGOING FUNDING ISSUES

Other debates have arisen regarding government funds, small businesses, and minority ownership. For instance, the American Recovery and Reinvestment Act of 2009 gave $787 billion to the SBA to start the America's Recovery Capital (ARC) program, which gave lenders 100 percent guarantees for the loans they made to struggling small businesses. New American Media researched the loan distribution and found that out of the 4,497 loans given out, only 9 percent went to minority businesses (3 percent to Hispanics, 3 percent to Asian-based businesses, and 1.5 percent to African American-owned firms.) This low percentage suggests that the problem of minority underrepresentation in small business continues.

MISSION STATEMENT

Mission statements are documents intended to serve as a summary of a business's goals and values. They are used both to enhance performance and serve as communication to the general public about the business's purpose.

As companies grow, the mission statement also provides focus for the different branches and executives

creating company policy. Entrepreneurs can often keep starting businesses on track without an explicit mission statement, but the need for a core purpose increases with the size of the organization.

When produced in a thoughtful manner, mission statements can be useful vehicles for communicating the importance of an organization's activities and the reasons why employees should value their work there. Mission statements that are too complex or use strict formulas can be difficult for employees to relate to. Too often, businesses attach far greater weight to the mission statement's public relations function than to its value as a potential touchstone that can help the business maintain a steady course.

Characteristics of Effective Mission Statements. Small-business owners, consultants, and researchers all agree that effective mission statements often feature the following characteristics:

1. Simple, declarative statements. Mission statements that are cluttered with trendy buzz words and jargon rather than basic declarations tend to fall flat. A mission that can be easily articulated is more likely to be remembered and to have resonance.
2. Honest and realistic words. A business should not create a mission statement at odds with its actual business practices. Mission statements should not be used to refute allegations against the company or defend any particular position. This type of statement often invites even more criticism.
3. Well-communicated expectations and ethics. As Sharon Nelton noted in *Nation's Business*, a thoughtfully rendered mission statement can define not only what a company's business goals are but also how it reaches those goals. A good mission statement often includes general principles to which a business's workers are expected to adhere, and declarations of the business's obligations to its employees, its customers, and the community in which it operates.
4. Periodic updates. Just like other business documents, mission statements can lose their vitality and relevance over time if they are not reexamined on a regular basis. Mission statements should undergo continual review and refinement to ensure that they remain useful.

Specific Types of Mission Statements. Mission statements are not always applicable to an entire business. Many companies, especially larger corporations, create separate mission statements for particular divisions or activities. These separate mission statements still serve as points of clarification, but only apply to specific areas. They are often written when a company enters a new field or market, or adopts a new governing philosophy.

Environmental mission statements, for instance, are popular among corporations and usually exist independently from traditional mission statements. An environmental statement outlines the company's view toward ecological matters and often has some form of environmental commitment.

Some companies, such as Coca-Cola, write separate mission statements for employees and customers. An employee mission statement has values related to service and attitudes important to the company, often set in a rule-like format. A mission statement intended for customers is made more available and details how the company approaches its products, services, and commitments.

Writing a Mission Statement. While there may be no best way to write a mission statement for every business, business owners should take certain factors into account when creating their own statements for the first time. A good mission statement should reflect the values of the business they are written for, not those of other companies. Other mission statements can provide inspiration, but the content of the statement being written should be original, stemming directly from the specific qualities of the small business.

Short mission statements tend to have more value than long ones. A good mission statement may be only a few lines, or just one sentence long, if it effectively captures the spirit of the business. A short paragraph at the most is enough to state company aims in a mission statement format. If it is any longer, the statement will lose focus and be more difficult to remember and act upon as the business grows.

MONEY MARKET INSTRUMENTS

The money market is a financial arena where short-term securities are sold by financial institutions to investors. This type of network exists both in the United States and abroad.

The short-term debts and securities sold on the money markets, which are known as money market instruments, have maturities ranging from 1 day to 1 year and are extremely liquid. Treasury bills, federal agency notes, certificates of deposit (CDs), eurodollar deposits, commercial paper, bankers' acceptances, and repurchase agreements are examples of instruments. The suppliers of funds for money market instruments are institutions and individuals with a preference for the highest liquidity and the lowest risk.

The money market is important for businesses because it allows companies with a temporary cash surplus to invest in short-term securities. Conversely, companies with a temporary cash shortfall can sell securities or borrow funds on a short-term basis. While large corporations tend to invest in particular money market sectors using their own dealers, small businesses are often relegated to investment in a variety of money market securities.

Money markets are used for many purposes. The U.S. government uses its own actions in the money market to influence economic conditions. Large corporations and banks use very short-term securities as a method of storing their cash, so that it can earn interest for a day or two instead of sitting unused. Investors of all kinds put funds in money markets for their low-risk returns, but money markets are not entirely guaranteed. While organizations borrowing in money markets tend to be of highest repute (such as the government itself) prevailing economic conditions can still have their effect. In the latter part of 2008, even the largest funds sank from ¢100 on the dollar to ¢97 due to doubt in the market. The liquidity of money market funds is also uncertain, and organizations cannot always deliver money according to contract.

TYPES OF MONEY MARKET INSTRUMENTS

There are a variety of different instruments, including treasury bills, federal agency notes, short-term tax exempts, certificates of deposit, commercial paper, bankers' acceptances, and repurchase agreements.

Treasury Bills. Treasury bills (T-bills) are short-term notes issued by the U.S. government. They come in three different lengths to maturity: 90, 180, and 360 days. The two shorter types are auctioned on a weekly basis, while the annual types are auctioned monthly. T-bills can be purchased directly through the auctions or indirectly through the secondary market. Auctions may be either competitive or noncompetitive. In the latter case, bid prices are decided based on averages of successful bids.

Federal Agency Notes. Some agencies of the federal government, including the loan agencies Fannie Mae and Sallie Mae, issue both short-term and long-term obligations. These obligations are not generally backed by the government, so they offer a slightly higher yield than T-bills, but the risk of default is still very small. Agency securities are actively traded but are not quite as marketable as T-bills. Corporations are major purchasers of this type of money market instrument.

Short-Term Tax Exempts. These instruments are short-term notes issued by state and municipal governments. Although they carry more risk than T-bills and tend to be less negotiable, their interest is not subject to federal income tax laws. For this reason, corporations find that the lower yield is worthwhile on this type of short-term investment.

Certificates of Deposit. Certificates of deposit (CDs) are one of several types of interest-bearing "time deposits" offered by banks. An individual or company lends the bank a certain amount of money for a fixed period of time, and in exchange the bank agrees to repay the money with specified interest at the end of the time period. The certificate constitutes the bank's agreement to repay the loan. The maturity rates on CDs range from 30 days to 6 months or longer, and the face value can vary greatly as well. There is usually a penalty for early withdrawal of funds, but some types of CDs can be sold to another investor if the original purchaser needs access to the money before the maturity date.

Large denomination (jumbo) CDs of $100,000 or more are generally negotiable and pay higher interest rates than smaller denominations. The Federal Deposit Insurance Corporation (FDIC) will only insure up to $100,000, so these CDs have higher risk. Eurodollar CDs are also available, issued against U.S. dollar obligations in a foreign branch of a domestic bank.

Commercial Paper. Commercial paper refers to unsecured short-term promissory notes issued by financial and non-financial corporations. Commercial paper has maturities of up to 270 days (the maximum allowed without SEC registration requirement). Dollar volume for commercial paper exceeds the amount of any money market instrument other than T-bills. It is typically issued by large, creditworthy corporations with unused lines of bank credit and therefore carries low default risk.

Standard and Poor's and Moody's provide ratings of commercial paper. The highest ratings are A1 and P1, respectively. A2 and P2 paper is considered high quality but usually indicates that the issuing corporation is smaller or more debt burdened than A1 and P1 companies.

Unlike other types of money-market instruments, in which banks act as intermediaries between buyers and sellers, commercial paper is issued directly by well-established companies, as well as by financial institutions. Banks may act as agents in the transaction, but they assume no principal position.

Bankers' Acceptances. These are instruments issued by corporations in the name of a bank that guarantees the acceptance to the lender. This shows the lender that the bank believes the borrower to be capable of repaying according to their terms. This is common among companies that need to finance activities on credit or for those dealing in doubtful foreign trading. The maturity of acceptances ranges from 1 to 6 months.

Repurchase Agreements. Repurchase agreements, also known as repos or buybacks, are Treasury securities that are purchased from a dealer with the agreement that they will be sold back at a future date for a higher price. These agreements are the most liquid of all money market investments, ranging from 24 hours to several months. They are very similar to bank deposit accounts, and many corporations arrange for their banks to transfer excess cash to such funds automatically.

BUSINESS MONEY MARKET ACCOUNTS

Business money market accounts are accounts offered by banks for small businesses to put extra funds in. These accounts are then invested in short-term securities by the bank itself, which in turn offers a higher rate of interest to the business with the same type of liquidity seen in checking accounts. Many banks even issue debit cards for money market accounts to allow for easier withdrawal. The banks usually require a minimum balance, such as $5,000, to keep the account open.

It can be advantageous for small businesses to invest at least some of their extra cash into money market funds, if not a money market account. The securities tend to earn more interest than other options, and the high liquidity of the money market allows small businesses to have easy access to funds in case of unforeseen expenses.

MULTICULTURAL WORK FORCE

A multicultural work force is made up of men and women from a variety of different cultural and racial backgrounds. The labor force of any country is a reflection of the population, despite distortions that may be caused by discrimination or cultural bias. In the United States, the population has continued to grow more racially and ethnically diverse in the last decades, and this diversity is now reflected in the workplace. Businesses should strive to manage diversity for the benefit of both company and community.

GROWTH IN DIVERSITY

According to U.S Census data from 2004, about 80 percent of the U.S. population registered as belonging to a single or mixed white heritage. Black or African American registration accounted for about 13 percent of the population, while those of Hispanic origin counted for 14 percent. (Totals are greater than 100 because some registered as having heritage in more than one ethnic group.) Although Asians accounted for only 4.8 percent of the population, they were one of the fastest-growing ethnic groups in the United States between 2000 and 2004, growing by over 16 percent. This growth was only exceeded by those of Hispanic origin, whose population grew by 17 percent in the intervening years.

A great deal of diversity within the racial and ethnic divisions measured by the Census Bureau also exists. Italian Americans, for example, are likely to have very different cultural habits than immigrants from Russia or any of the countries in the Middle East. Hispanics from Argentina are also likely to differ quite a lot in cultural habits from Hispanics whose origin is Puerto Rico. But these additional levels of diversity only add complexity to the picture. The overall trend is clearly towards greater racial, ethnic, religious, and cultural diversity in both the general population and the workforce.

CHANGING THE WORKPLACE

Increased diversity at home and increased global collaboration require businesses to manage diversity. This includes communicating effectively to employees of different cultures and backgrounds, marketing to a wider variety of cultures, and partnering with suppliers or distributors who speak different languages or live in different countries.

Managing diversity is a comprehensive process for developing an environment that is comfortable for all employees. Businesses that view diversity with a positive attitude will be able to reap the benefits of multicultural talents and viewpoints. As in international trade, cultural norms shift relative to language, technological expectations, social organization, face-saving, authority conception, nonverbal behavior and the perception of time.

EFFECTIVE MANAGEMENT OF A MULTICULTURAL WORK FORCE

If a business is struggling with a multicultural work force, a new strategy should be implemented, beginning with restating common company goals that everyone shares. Management should make it clear that diverse viewpoints are encouraged in pursuit of these goals. This general strategy can also include more specific techniques, including:

- Communicate in writing. Company policies that explicitly forbid prejudice and discriminatory behavior should be included in employee manuals, mission statements, and other written communications.
- Offer training programs. Businesses use two types of training programs to encourage multicultural appreciation in the work force: awareness classes and skill-building classes. Awareness programs are designed to make employees aware of the diversity present in their business and how multicultural elements in the work force should be embraced. Skill-building sessions are designed to teach information about specific cultural issues and how they can be dealt with in a respectful way.
- Recognize individual differences. Business owners should not make the mistake of assuming that differences are always "cultural." Differences in a multicultural work force can stem from individual behavior, personality, or competence, as well as cultural issues. A business's multicultural health should be judged by specific events, not assumptions.
- Actively seek input from minority groups. Soliciting the opinions and involvement of minority groups is beneficial not only because of the contributions that they can make, but because these actions confirm that they are valued by the company.
- Revamp reward systems. An organization's performance appraisal and reward systems should reinforce the importance of effective diversity management. This includes assuring that minorities are provided with adequate opportunities for career development based on performance and initiative.
- Make room for social events. Company-sponsored social events, such as picnics, softball games, volleyball leagues, bowling leagues, Christmas parties, and so on, can be tremendously useful in getting members of different ethnic and cultural backgrounds together and providing them with opportunities to learn about one another.
- Create a flexible work environment. Flexible work environments may have particularly beneficial results with people from nontraditional cultural backgrounds. Flexibility regarding time and communication is also often necessary when dealing with international businesses.
- Do not assume similar values and opinions. In the absence of reliable information people tend to assume others share their viewpoints. In multicultural work environments there should be an understanding that peers may not have a common perspective.
- Continually monitor policies. Experts recommend that business owners and managers establish and maintain systems that can continually monitor the organization's policies and practices to ensure that the workplace continues to be a good environment for all employees. Businesses should be flexible and apply their basic lessons to new situations as they arise.

Increased diversity may present a challenge to business leaders who must work to maximize the opportunities that diversity provides while minimizing its costs. The organization that achieves this objective will create an environment in which all employees are able to contribute to their fullest potential.

SMALL BUSINESSES WITH A MULTICULTURAL WORK FORCE

Small businesses interested in developing a multicultural work force should begin participating in local organizations that support minorities and ethnic groups, where contacts can be developed. In addition to multicultural networking, small businesses should also strive to appeal to a variety of ethnicities in their marketing and staffing efforts. If only one ethnic group is targeted in these advertising projects, it will be difficult to attract employees from other ethnic backgrounds. Other businesses may be able to develop internship programs with schools located in nearby diverse areas to bring in employees from other cultures.

If a language barrier develops at work, then instruction and reciprocation can solve many problems. Small businesses should offer English instruction (many local colleges have programs they offer to business owners on-site) or some other type of study program to acquaint employees with customs or vocabulary they may not be familiar with. A translator can also be used in some circumstances, but the business should promote the translator from within rather than spending money on bringing in someone from the outside who does not understand the business as well.

MULTILEVEL MARKETING

In his book, *According to Kotler*, Paul Kotler defines multilevel marketing (MLM) as follows: "[S]ystems in which companies contract with individuals to sell a set of products door to door or office to office. It is called multilevel because a contractor can also invite others to work and [can] earn money on their performance." The sales representative thus has an incentive to enlarge the sales force and earn added commissions on the sales of his or her recruits.

HOW MULTILEVEL MARKETING WORKS

Multilevel marketing is, strictly speaking, not marketing at all but a form of direct sales with special features, among which recruiting is fundamental. A person recruited by the company to sell a product earns commissions. If that person recruits others, this second layer is called the person's "downline." The person earns a cut, called an "override," on the sales made by people in the downline. Individuals in the second level may *also* recruit others and create their *own* downlines. The original person in the chain gets an override from every level, regardless of how many levels there may be. The amount of the originator's share, however, diminishes the farther removed he or she is from the source of the sale. Often recruits are required to purchase an initial "starting inventory" of the product. In many cases the MLM company will not repurchase this inventory or will do so at a very reduced price if the recruit decides to leave the operation. These characteristics have caused MLM to be associated with pyramid schemes, and some technically *are* such schemes. Not surprisingly, reputable direct marketing companies and the associations to

which they belong are continuously engaged in policing the field and in advocating legislation aimed at setting clear rules. The term "network marketing" is in part used because multilevel marketing has at best an ambiguous reputation.

In his book *Franchising & Licensing* Andrew Sherman reports that six states explicitly regulate MLM: Georgia, Maryland, New York, New Mexico, Wyoming, and Louisiana, and Puerto Rico does as well. Laws regulating MLM typically: 1) require MLM companies to explicitly permit their agents to cancel their agreements and to agree to repurchase inventories at not less than 90 percent of the original transfer price; 2) prohibit inducements under which the agent is told that he or she will earn a specific amount of money; 3) prohibit the purchase of a minimum inventory; and 4) prohibit operations under which agents are only paid for recruiting others. Many states without MLM regulation nevertheless have laws prohibiting pyramid schemes under which they attempt to police MLM companies that overstep the line.

In a strictly functional sense, MLM is a way to exploit natural networks of acquaintances. The participants (predominantly women) first sell to and recruit others in their circle; the latter, in turn, do the same, and so on (in the hopes of the MLM company) *ad infinitum.* Many individuals participating in these networks do so part-time. In due time they will have sold to all of their friends, and success will begin to fade. For this reason MLM companies are frequently tempted to make all sales final in the early stages so that inventories do not come trickling back.

In the hands of effective sales companies with appropriately chosen products, MLM has produced some very successful organizations. Among them are Amway, Mary Kay Cosmetics, Pampered Chef, and Longaberger Baskets, to name only a few.

MLM businesses appeal to people who want to work part-time and need a flexible schedule, such as students and mothers of young children. The Direct Selling Association has concluded from its studies that 90 percent of MLM sales representatives work fewer than 30 hours per week, and 50 percent work fewer than 10 hours per week. In addition, MLM businesses usually do not require a long-term commitment from their sales representatives.

An agent can enter an MLM business on very little capital (around $100), and yet will feel as if in business for himself or herself. Jeffrey Gitomer, writing in the *Business Journal*, noted that many people value the opportunity to be their own boss and control their own destiny. "The secret to successful network marketing is you the messenger and your willingness to dedicate and focus on preparation," Gitomer wrote. "Your willingness to become a salesperson who believes in your own ability to succeed. Everyone wants success, but very few are willing to do what it takes to be successful."

Of course, like any other entrepreneurial venture, achieving significant success requires much more than a bit of selling here, a bit there. Only a tiny proportion of people entering this form of direct sales stay in it and make a good living. They do so because they work the job like any other successful sales agent operating between a customer and a producer.

MLM PROS AND CONS

When done correctly, MLM can be very profitable and rewarding. So what does a reputable multilevel marketing company look like? It will have a product or service that has a ready and fast market into which new offerings bearing similar qualities can be easily added. It will utilize a streamlined recruitment process, as opposed to a traditional pyramid approach, and provide all required training and support materials to facilitate sales, administration, and downline recruitment. Other important features of a reputable MLM enterprise include low start-up costs, dynamic leadership, a solid marketing plan, a strong support system, and an established incentive program.

The downside of MLM involves potentially substantial time and financial obligations tied to the sales and recruitment processes, declining morale due to frequent rejection up to 80 percent of contacts may result in rejection and risks associated with unwitting involvement in a dishonest multilevel marketing scheme.

As with any business opportunity, it is essential to investigate before investing time and money in a multilevel marketing program. There is a wealth of information available online about MLM, most of it from people who have had a bad distributor experience. However, a little Internet sleuthing can help sort the good from the bad. The Federal Trade Commission contributes to a nonprofit Web site (www.pyramidschemealert.org) that highlights the latest disreputable schemes.

MULTIPLE EMPLOYER TRUST

A Multiple Employer Trust (MET) is a group of ten or more employers that form a trust in order to minimize the tax implications of providing certain types of benefits for their employees, particularly life insurance. The U.S. Congress authorized the formation of METs in 1984 under Section 419(A) of the Internal Revenue Code. The rules set forth for METs are stringent and require that no single employer contribute more than 10 percent of total funding for the benefit plan purchased by the MET. In addition, the MET must be an indivisible entity, with all participating employers sharing equally in the benefits contributed by other members of the group. The employees of each participating employer are viewed as if they worked for a single company and are subject to the same eligibility and participation requirements.

A similar arrangement to a MET is a Multiple Employer Welfare Arrangement (MEWA). MEWAs include plans established by two or more employers to provide welfare benefits to their employees, including health care and pensions. The main difference between a MET and a MEWA is that a MEWA is generally subject to the requirements of the Employee Retirement Income Security Act of 1974 (ERISA), which regulates pension plans of businesses with more than twenty-five employees and imposes penalties on employers for breaches of fiduciary duty.

The main purpose of a MET is to give entrepreneurs and small-business owners a tax-friendly way to provide life insurance benefits for themselves and their key employees. Essentially, an MET provides the business owner with an income-tax deduction without a corresponding income-tax liability. Under ordinary circumstances, life insurance is tax deductible for the employer in the current year, but any amounts that could be considered "bonus" life insurance must be reported as taxable income by the employee. Larger businesses are often able to get around this problem by funding life insurance benefits as part of a qualified retirement or profit-sharing plan. Although the benefits provided through such plans are usually tax free, there are a number of restrictions and complicated paperwork requirements associated with them that reduce the attractiveness of life insurance for smaller businesses. For example, the government requires companies that set up qualified plans to establish eligibility and vesting rules and then offer the benefits to all employees who meet them. "All employer contributions to a MET are deductible by the employer as ordinary and necessary business expenses under IRC Section 162. And, plan contributions are generally not taxed to participating employees," according to *National Underwriter Life & Health.* METs are typically designed to enable business owners to use pretax business funds to meet the life insurance liquidity needs of their estates. At the same time, the business owner may be able to reduce the company's accumulated earnings tax penalty (a flat 38.6 percent excise tax) by applying excess earnings to the MET fund.

THE IMPORTANCE OF LIFE INSURANCE

It may seem odd for small businesses to go to the trouble of forming a MET just for the sake of providing life insurance for employees. But life insurance has a variety of uses that make it a very attractive benefit, particularly for key employees. A small business might need to provide life insurance to its workers in order to compete with larger companies in attracting and retaining qualified employees. For example, in addition to providing benefits upon the death or disability of the insured, some forms of life insurance can be used as a tax-deferred investment to provide funds during a person's lifetime for retirement or everyday living expenses. There are also a number of specialized life insurance plans that allow small-business owners to reduce the impact of estate taxes on their heirs and protect their businesses against the loss of a key employee, partner, or stockholder.

Small businesses tend to depend on a few key people, some of whom are likely to be owners or partners, to keep operations running smoothly. Even though it is unpleasant to think about the possibility of a key employee becoming disabled or dying, it is important to prepare so that the business may survive and the tax implications may be minimized. In the case of a partnership, the business is formally dissolved when one partner dies. In the case of a corporation, the death of a major stockholder can throw the business into disarray. In the absence of a specific agreement, the person's estate or heirs may choose to vote the shares or sell them. This uncertainty could undermine the company's management, impair its credit, cause the flight of customers, and damage employee morale.

Life insurance can help small businesses protect themselves against the loss of a key person by providing a source of income to keep business running in the individual's absence. Partnership insurance basically involves each partner acting as beneficiary of a life insurance policy taken on the other partner. In this way, the

surviving partner is protected against a financial loss when the business ends. Similarly, corporate plans can ensure the continuity of the business under the same management and possibly fund a repurchase of stock if a major stockholder dies. Although life insurance is not tax deductible when the business is named as beneficiary, the business may deduct premium costs if a partner or owner is the beneficiary.

In addition to tax breaks, recruitment benefits, and business protection, participation in a MET also provides member companies with important economies of scale, collective bargaining leverage, and added strength against market volatility. In addition, a MET tends to involve low investment expense; cost-effective administrative support and reporting for plan participants, and some degree of fiduciary and regulatory oversight.

MET REQUIREMENTS

Participating in a MET enables a small business to provide life insurance to its key employees without subjecting them to negative tax implications. It does this by allowing tax-deductible contributions to a life insurance plan, made by the employer on behalf of employees, to be used for severance benefits. Basically, the cash value of the life insurance is available for severance benefits, while the mortality portion of the life insurance is payable to the beneficiary named by insured. In a MET, each employer's contribution to the plan must be available to pay benefits for all participants, regardless of their individual employer. This requirement may make anything other than a pure death benefit payout unappealing to small businesses. Whether a severance component is included or not, a MET must be structured properly in order to comply with the tax laws these rules are significantly less extensive than those pertaining to qualified pension and profit-sharing plans.

The rules that a MET must follow in order to gain tax benefits are laid out in IRS Notice 95-34. This notice states that severance benefits can only be paid when the termination of employment is beyond an employee's control. Otherwise, if the severance arrangements appear to be providing deferred compensation benefits to an employee, the employer's tax deduction will be denied. The notice also states that the deduction will not be allowed for "nondeductible prepaid expenses," which may include contributions to the plan that are made as lump sums or using accelerated funding techniques.

MULTITASKING

Multitasking refers to the ability of an individual or machine to perform more than one task at the same time. In the field of human resources, multitasking is a popular term that is often used to describe how busy managers or business practitioners are able to accomplish ever more in the same amount of time. The term was popularized in the late 1990s with the increasing move to a 24-hours-per-day, seven-days-per-week work and service culture. As globalization has continued to expand the number of time zones in which a business may operate, the need to be available around the clock has also expanded. Many use the term "24/7" as shorthand for a growing reality among many businesses that feel they must be accessible at all times. To keep up, people often feel that they must multitask. In fact, the term multitasking is now used regularly to describe what individuals do not only while at work but also in their roles as parents, friends, family members, and any number of other roles performed as part of the balancing act between professional and personal life.

MULTITASKING IN THE WORKPLACE

The multitasking abilities of both individuals and teams are important as companies strive to stay connected with customers, suppliers, and partners, and as new products and services are continually developed and introduced. Multitasking is becoming the norm as the amount of

information a manager or professional feels he or she must process increases at a staggering rate.

According to a 2009 survey conducted by online payroll provider SurePayroll, business owners have embraced multitasking as a way to help keep customers happy and keep their businesses running smoothly in a difficult economy. The survey found that 88 percent of small-business owners consider multitasking to be a key component in running a successful enterprise. Among respondents, 56 percent said they often handle three or more tasks simultaneously as they struggle to produce the same output levels with fewer resources.

Technological developments are facilitating the trend toward multitasking. They make it possible, for example, to receive and reply to e-mail messages while attending an awards banquet or student concert. Technological demands are also growing as a part of this trend. For example, computers can now commonly perform or execute several programs at the same time, which is a form of multitasking or multiprocessing. In the computer arena, multiprocessing sometimes implies that more than one central processing unit (CPU) is involved. When only one CPU is involved, the computer may switch from one program to another quickly enough to give the appearance of simultaneous execution.

THE DOWNSIDE OF MULTITASKING

Multitasking enables individuals to participate in many different types of activities on a daily basis. This diversity can lead to a feeling of increased excitement and richer experiences, which in turn helps fend off boredom and fosters inspiration and creativity. However, these benefits are accompanied by equally important drawbacks.

Many adept multitaskers have experienced an unexpected consequence when their ability to multitask was hampered, such as when their e-mail service was disabled for a period of time. They discovered that they were actually **more** productive during that period. What causes this increased productivity? in his book *The New Brain: How the Modern Age Is Rewiring Your Mind*, neurologist Richard Restak explains that the human brain works most efficiently "on a single task and for sustained rather than intermittent or alternating periods of time.... This doesn't mean that we can't perform a certain amount of multitasking but we do so at a decreased efficiency and accuracy." Very similar results have been found in other well-publicized studies from the University of Michigan and from Carnegie Mellon, which found that as the number of tasks undertaken simultaneously increases, the efficiency and accuracy with which each is done declines. Employee and customer relationships can also suffer from a heavy focus on multitasking. Building strong, lasting bonds requires a great deal of attention, time, and effort, all of which are divided and diminished during multitasking.

EFFICIENT MULTITASKING

Business owners can help reduce the negative impact of multitasking and optimize results by getting organized. They should start by creating a prioritized list of projects and their associated daily tasks. The list can then be used to allocate dedicated work time for each task and manage overall work flow. Burnout is common among overworked individuals, so it is important that any daily activity plan includes a few short breaks each day. It may also be worth considering the use of outsourcing options for certain aspects of the business, such as payroll or marketing. Taking a few time-consuming tasks off the owner's plate can alleviate some pressure and allow the organization to focus on other responsibilities of operating the business and maintaining success.

MYERS-BRIGGS TYPE INDICATOR (MBTI)

The Myers-Briggs Type Indicator (MBTI) is an instrument designed to evaluate people and provide descriptive profiles of their personality types. Based on the theories

of psychologist Carl Jung (1875 1961), it is widely used in the fields of business, education, and psychology.

MBTI was developed by Isabel Briggs Myers (1897 1980) and her mother, Katharine Cook Briggs (1875 1968), during World War II. The two women were acquainted with Jung's theories and sought to apply them to help civilians choose wartime jobs well-suited to their personality preferences. Myers and Briggs felt that this would make people happier and more productive in their work. Consulting Psychologists, Inc., bought the rights to MBTI in 1975. The company estimates that it administers MBTI testing to two million people per year worldwide. In addition to the test vehicle itself, the organization offers businesses some thirty-five MBTI-support products, including reports, guides, training programs, and facilitation tools.

MBTI BASICS

The MBTI system begins with a test in which participants respond to questions that provide clues about their basic outlook or personal preferences. These responses are scored to see where participants' preferences lie within four sets of attributes: extroversion/introversion; sensing/intuiting; thinking/feeling; and judging/perceiving.

The attributes extroversion (E) and introversion (I) are designed to indicate whether a participant derives his or her mental energy primarily from other people or from within. Similarly, the attributes sensing (S) and intuiting (N) explain whether a participant absorbs information best through data and details or through general patterns. The attributes thinking (T) and feeling (F) show whether a participant tends to make decisions based on logic and objective criteria or based on emotional intelligence. Finally, the attributes judging (J) and perceiving (P) indicate whether a participant makes decisions quickly or prefers to take a more casual approach and leave his or her options open.

The MBTI system organizes the four sets of attributes into a matrix of sixteen different personality types. Each type is indicated by a four-letter code. For example, ESTJ would designate a person whose primary attributes were extroversion, sensing, thinking, and judging. For each personality type, the MBTI system includes a profile which describes the characteristics common to people who fit into that category. For example, an article in the *Harvard Business Review* noted that people who fit into the category ISTP (introverted-sensing-thinking-perceiving) tend to be "cool onlookers quiet, reserved, and analytical; usually interested in impersonal principles, how and why mechanical things work; flashes of original humor," while people of type ENFJ (extroverted-intuiting-feeling-judging) are "sociable, popular; sensitive to praise and criticism; responsive and responsible; generally feel real concern for what others think or want."

MBTI APPLICATIONS

MBTI is a popular evaluative tool. Many colleges and universities use it in career counseling to help guide students into appropriate fields for their personality types. In the business world, companies use it to make hiring decisions, identify leadership potential among employees, design training for specific employee needs, facilitate team building, and help resolve conflicts between employees. By giving people an increased understanding of their behavior and preferences, MBTI is said to help them increase their productivity, build relationships, and make life choices.

Companies seeking to translate MBTI findings into business advantage should act quickly. It is important for businesses to apply the results as part of specific action plans designed to leverage individual employee strengths. The plans should be flexible and encouraging, and they must be implemented as soon as possible after the MBTI results are publicized to participants. Waiting too long may cause employees to question the organization's motivation, perceive the exercise as a waste of time, and lose interest in using the results to facilitate improvements.

In addition to swift action, the small-business owner can help optimize understanding and application of MBTI results by encouraging frank but positive discussion among employees about the personality differences that were identified from the Myers-Briggs testing; embracing a variety of perspectives is important to business success. Employees should also be allowed to celebrate their talents as revealed through the MBTI results. Scores may reinforce or illuminate qualities or abilities that, when recognized, can boost morale, guide career development, and increase productivity.

Proponents of MBTI see the testing system as a valuable aid to personal development and growth. However, critics of MBTI argue that its personality profiles are so broad and ambiguous that they can be interpreted to fit almost anyone. Some also worry that, once a university career counselor or employer knows a person's "type," that person might tend to be pigeonholed or pushed in a certain direction regardless of his or her desires. Criticism based on "confirmation bias," namely that people tend to behave in ways that are predicted for them, has been offered but runs counter to experience. This critique asserts that a person who learns that he or she is "outgoing," according to MBTI, will be more likely to behave that way. Temperaments, however, are not that easily influenced by hearsay; shy people labeled outgoing will not suddenly become the life of the party any more than boisterous individuals will clam up just because a label has been placed on them. The real danger of personality stereotyping is that employees

may feel confined by a designation and limit their pursuit of growth and achievement in other areas.

The Myers-Briggs assessment is not a cure-all for company hurdles or employee relations, but it can be a valuable tool to help improve communication, teambuilding, and effectiveness throughout the organization.

MYSTERY SHOPPING

Mystery shopping is a term that describes a field-based research technique of using independent auditors posing as customers to gather information about product quality and service delivery by a retail firm. The "mystery shopper" poses as a customer in order to gather information objectively on the business being studied. Getting a customer's view of one's business is a widely recognized tool in both the marketing and customer service arenas. When mystery shoppers are dispatched to visit a business, they use criteria developed by the client to evaluate the business. The focus is primarily on service delivery and the sales skills of employees. Their reports, usually written, are forwarded to the client and can be used in a number of ways. Mystery shoppers can also objectively evaluate competitors and their service delivery and product mix for comparison and benchmarking purposes.

The use of mystery shoppers is one way for a business to create a competitive edge. It may also serve retailers in developing and evaluating strategies to retain current customers. The first step in mystery shopping is to identify the firm's important customer service characteristics and objectives, which often flow from the organization's strategy and overall goals and objectives. Next a firm uses these variables to develop a mystery shopping questionnaire, either alone or with the help or a consultant or mystery shopping firm. The survey can include a mix of narrative and check-off questions. Typical areas of assessment are customer service, suggestive selling and up-selling techniques, teamwork, employee and management activities, headcount, store appearance and organization, merchandise displays and stock, cleanliness of the location, signage and advertising compliance, time in line and time elapsed for service, product quality, order accuracy, customer preferences, cash handling, and return policies. After pretesting the questionnaire, a sample size as well as a period of time for the mystery shopping program is determined. Then mystery shoppers are hired to do an assessment, which can be on-site or via the telephone or even the Internet, and results are used for feedback.

USE OF MYSTERY SHOPPING RESULTS

Many restaurants, banks, supermarkets, and clothing retailers have used the technique, along with hotels, furniture stores, grocery stores, gas stations, movie theaters, automotive repair shops, bars, athletic clubs, bowling alleys, and almost any business where customer service is important. As the service sector of the economy increases, so does the demand for mystery shoppers.

Some retailers are large enough to have their own in-house program in place. Smaller companies that do not have the resources to develop a quality mystery shopping program in-house use mystery shopping contractors. These contractors directly hire and train the mystery shoppers. The association representing such contractors, the Mystery Shopping Providers Association (MSPA), operates in North and South America, Europe, and Asia/Pacific and has a membership of more than 150 companies. Finding a contractor should therefore be relatively easy.

Managers can use the reports from mystery shoppers to evaluate their locations. The reports can measure training and levels of customer service pre- and posttraining. Mystery shopping allows managers to determine if the services employees are providing are appropriate. Shopping reports can assess promotional campaigns and even verify employees' honesty in handling cash and charges.

The use of mystery shopping is just one part of a company-wide program to develop and augment employee performance. The idea is to learn from a consumer's point of view which areas of service and product quality are most important and which areas need improvement. In many cases, this allows a company to address problem areas more quickly than they might have otherwise. Most professionals in the field advise that the results should be used for employee development and reward purposes and not for punishment. For example, employee recognition and incentive programs help promote desirable behaviors while reinforcing loyalty and morale.

CREATING A PLAN

Before initiating a mystery shopping investigation, small businesses should consider taking the following steps:

- Determine what insight is sought. Is the information aimed at improving customer service, verifying employee honesty, identifying competitor advantages, or something else?
- Recruit a reputable mystery shopping provider that can help determine how many shoppers are needed, the number of shopping visits required, the length of each visit, and the frequency of repeat visits. A reputable firm will provide savvy mystery shoppers who are adept at observing and communicating results. A firm should also be aware of the many mystery shopping scams. The MSPA can facilitate finding reputable providers.
- Develop an assessment program to determine how the shopping experience will be recorded (e.g., survey, summary, checklist).
- Determine which personnel will have access to the mystery shopping results. Appropriate data analysis is key.
- Create an action plan to address the results. Information without application is useless. Outline how the findings will be used to make improvements.

ONLINE MYSTERY SHOPPING

A growing trend in the mystery shopping field is the use of online mystery shopping. This approach is typically used to evaluate the products, services, and Web sites of companies engaging in e-commerce as a primary or significant part of their business. The key difference here is that the evaluation is conducted exclusively online. Mystery shoppers in the online arena are often used to assess the site's ease of use, marketing effectiveness, and customer service response.

Mystery shopping is a valuable tool for businesses and is especially helpful for small, start-up businesses that need accurate and fast information to assess their employees and compare their products and services to the competition.

N

NATIONAL ASSOCIATION FOR THE SELF-EMPLOYED (NASE)

The National Association for the Self-Employed (NASE) is a nonprofit, nonpartisan organization that provides resources, benefits, and support for persons who are self-employed or own small independent businesses.

According to its Web site, NASE aims to bring "a broad range of benefits to help entrepreneurs succeed and to drive the continued growth of this vital segment of the American economy." The group also says it "provides big-businesses advantages to hundreds of thousands of micro-businesses across the United States." NASE defines a "micro-business" as one with ten or fewer employees.

Founded in 1981, NASE is a 501(c) (6) nonprofit organization with approximately 250,000 members across the United States. Applicants can choose a basic membership or a premium level that provides access to all the group's products and services. In recent years, the NASE membership has followed national demographic trends by skewing towards more service- and information-oriented businesses and to younger workers.

The four major areas in which NASE serves its members are:

- Value-added products and services, such as access to health insurance benefits for the self-employed
- Knowledge resources, a set of educational benefits, and tools and access to advisors to help small-business owners run their enterprises more effectively
- Legislative advocacy at the federal and state levels
- Business development grants
- College scholarships for families of members

The organization is based in Dallas, Texas, and has staff in Washington, D.C. It is governed by a board of directors that consists of small-business owners from a cross-section of microbusinesses. The board sets strategic direction as well as overseeing and managing the various NASE activities.

PRODUCTS AND SERVICES

When NASE was formed in 1981, its initial mission was "to bring collective buying power and clout to [the] smallest businesses," according to its Web site. The group now provides a wide range of other choices to its members, including access to insurance, legal advice, and credit cards at discounted rates. "Through the organization's consolidated buying power, NASE members receive significant savings on many products and services," the group stated.

A primary reason many companies and entrepreneurs join NASE is for access to health insurance at discounted prices. While the impact of the U.S. health care reform that became law in 2010 continues to unfold, NASE has partnered for many years with a variety of insurance companies to provide access to such health care coverage as major medical, prescription drugs, dental, and vision plans.

"In most states, the NASE-contracted insurance companies offer traditional medical policies," Skip McGrath wrote in *Titanium EBay*. "However, some states have passed laws that guarantee coverage to every individual regardless of his current medical condition or history. In

these states, NASE only offers scheduled plans which have very strict limits on how much they will pay for hospital stays, surgeries, and other services."

Linda Rolie, in *Getting Back to Work*, suggested self-employed persons should "explore the affordable health insurance offered by the National Association for the Self-Employed. Because of their very large membership base, they are able to negotiate very reasonable rates on health insurance and other forms of support."

NASE emphasizes health insurance because new companies see providing health coverage as a key advantage in recruiting employees. "Providing health benefits for employees is a substantial challenge for startup companies," Eric Koester wrote in *What Every Engineer Should Know About Starting a High-Tech Venture*. Koester continued, "According to a survey by the National Association for the Self-Employed, nearly all respondents agreed it was important or even necessary to offer a health insurance benefit to find and hire qualified people. However, the options available for smaller-sized companies to provide such a benefit are extremely limited."

Support for businesses seeking advice and information on accounting and taxes is also a key area of concern for NASE. The organization provides a variety of information at its Web site and access to tax professionals who are available to answer members' questions. The group also releases periodic press releases about trends, concerns, and changes regarding federal taxes, IRS audits, and similar topics.

Other products and services available to members at free or discounted prices include:

- Home and automobile insurance
- Office supplies
- Legal services
- Shipping services
- Travel, hotel, and car rental discounts (for both professional and personal trips)
- Payroll and payment processing
- Business consultants
- Web site building and hosting
- Communications and marketing
- Computer software
- Grocery and shopping coupons

KNOWLEDGE RESOURCES

NASE "has a great online database that can help with advice on tax deductions, affordable health insurance, methods of screening and hiring new employees, and the latest business trends," Desiree Smith-Daughety wrote in *Using Other People's Money to Get Rich*. The NASE is also frequently recommended as a resource in other books and articles about starting a small business.

The "Knowledge Center" section of the NASE Web site includes educational tools such as how-to articles, health insurance and tax resources, and access to NASE publications such as *Self Employed* magazine. The "My Consultants" section of the center also provides access to advisors on taxes, estate planning, and finance, as well as other experts who specialize in small businesses.

LEGISLATIVE ADVOCACY

Since the early 1980s, the NASE has had "a strong track record advocating for its members on Capitol Hill," the organization stated on its Web site. The group actively solicits input from its members on issues of concern to the small-business community. "The NASE provides an easy and timely way for micro-business owners to get involved and express their opinions to elected officials," the organization stated.

For example, NASE was heavily involved in lobbying over the 2010 U.S. health care reform legislation. Kristie Arslan, NASE executive director, told the *Washington Business Journal* that the self-employed will see no benefits from those changes until certain provisions become effective in 2014. Although "the self-employed are excluded" from such provisions as the Small Business Health Care Tax Credit, Arslan said she was "thrilled" with the progress that was made in that legislation.

According to the *National Journal*, the NASE is one of the key advocacy groups identified by congressional aides as the most significant organizations that carry the message of small businesses to Capitol Hill. Other groups identified in the article, "A Chorus of Voices Speak for Small Business," include the National Federation of Independent Business, the National Small Business Association, the Small Business Council of America, and the U.S. Chamber of Commerce Small Business Council. NASE "represents 250,000 of the tiniest small businesses those with less than 10 employees," Bara Vaida wrote. "The group has four registered lobbyists in Washington and spent $690,000 on lobbying in the first nine months of 2009."

Key areas for the NASE's lobbying efforts include:

- Access to affordable health coverage
- Fairness in tax compliance
- Self-employment taxes
- Home office deductions
- Tax cuts for small businesses
- Retirement security

- Federal programs supporting small businesses
- Keeping the Internet tax-free
- Similar issues related to the economy and microbusinesses

BUSINESS DEVELOPMENT GRANTS

The NASE's Business Development Program provides individual grants for up to $5,000 to help members expand and grow their businesses. Members apply for the grants through an online application process. Grant proceeds are used to address specific business needs such as computer and industrial equipment, marketing materials, hiring part-time staff, and other expenses. The organization awarded $95,243 in grants to twenty members during 2009, almost $10,000 more than it provided during 2008. The program began in 2006 and had awarded more than $400,000 in grants by 2010.

COLLEGE SCHOLARSHIPS

Since 1989 NASE has awarded more than $1.8 million in merit-based scholarships to the dependents of NASE members. In 2009 NASE awarded eighteen students scholarships of $4,000 each. Another student received a $12,000 scholarship and is eligible to receive another $12,000 over the following 3 years by meeting high academic standards.

NASE has two types of scholarships. The $4,000 scholarships are based on such qualifications as leadership skills, teacher recommendations, and prior academic performance. The NASE Future Entrepreneur Scholarship can be worth up to $24,000. On its Web site, NASE stated this award is "the largest scholarship of its kind in the U.S. and the only program that promotes the entrepreneurial philosophy. This unique opportunity is awarded each spring to one ambitious individual who demonstrates the characteristics of a future micro-business owner."

The 2009 entrepreneur scholarship award went to Joe Pielago, a student at the University of San Francisco, according to an article in *Walletpop*. Nicole Charky wrote that Pielago launched his own company that provides streetwear clothing drawn from the Southern California culture. His company, VOILA, was incorporated in 2007 and has four employees. The firm provides T-shirts, hats, tank tops and other goods.

In recent years, the NASE has continued to expand its programs, benefits and advocacy activities on behalf of microbusinesses and entrepreneurs. Current information about the NASE, including benefits and membership rates, are available at its Web site, www.nase.org.

NATIONAL ASSOCIATION OF SMALL BUSINESS INVESTMENT COMPANIES (NASBIC)

Small Business Investment Companies (SBICs) are privately organized and managed venture capital firms licensed by the U.S. Small Business Administration (SBA) to make equity capital or long-term loans available to small companies. The Small Business Investment Act of 1958 provided the legal basis upon which this program has been developed and outlines the licensing procedures used by the SBA to register SBICs. The National Association of Small Business Investment Companies (NASBIC) is the association that unites these independent SBICs. The primary concern

of NASBIC is providing representation before government on behalf of the SBIC industry. The association is located at 1100 H St., NW, Suite 610, Washington, DC 20005; 202-628-5055. The association's Web site is www.nasbic.org.

According to NASBIC, the several thousand SBICs operating in the United States and Puerto Rico are privately organized and managed financial institutions that invest capital in small independent businesses. They differ from venture capital firms in that they are licensed by the SBA. In exchange for investing only in small businesses, the SBA helps SBICs qualify for government-insured long-term loans. SBICs have complete control over their own lending policies and investment choices and are not bound by government regulation to make capital available to any particular type of business or business owner. Among the companies that began with funding from an SBIC are Apple Computer, Federal Express (now FedEx), Outback Steakhouse, America Online, and Intel. According to NASBIC, since its inception in 1958 the SBIC program has provided $57 billion in long-term debt and equity growth capital to more than 100,000 small U.S. companies.

SSBICs, or Special Small Business Investment Companies, are identical to SBICs except that they tend to concentrate their lending in the area of socially and economically disadvantaged entrepreneurs. However, all SBICs may consider applicants from all backgrounds.

SBICs and SSBICs, like most venture capital firms, depend on the health of the economy to offer new capital to small businesses. The venture capital sector was especially hard hit by the recession of 2008 and 2009. In 2009 venture capital firms committed $15.2 billion, less than half the amount committed in 2008 and one-seventh the funds committed in 2000, according to the National Venture Capital Association (NVCA). To counter the downturn, venture capital investors began capping investment size and targeting new investment areas that offered ripe opportunities. The federal government also stepped in: the administration of President Barack Obama set aside some $2 billion of the 2009 American Recovery and Reinvestment Act (ARRA) specifically for U.S. small businesses. Among its many rule changes designed to loosen small business capital, ARRA added money to SBICs investing in a single fund (from $137 million to $150 million) and enabled SBICs to invest more of an SBA-backed fund in a single company (up to 30 percent compared to 20 percent previously). Leveraged SBICs quickly pounced on the newly available SBA money.

The NVCA further lobbied Congress to allow venture capital companies to compete for money normally reserved for small businesses through the Small Business Innovation Research program (SBIR). Small-business owners that depended on SBA-backed loans argued against the prospect of competing with venture capital firms for government programs, however. The owner of Invocon, a Texas-based manufacturer of high-tech electronics with 25 employees, told the *Wall Street Journal* that opening up SBIR contracts to venture firms would hurt companies like his own. Invocon had won $9 million in federal assistance since 1991.

FACTORS IN APPROACHING AN SBIC

Small-business owners contemplating a pitch to a SBIC should be mindful of the following considerations, according to NASBIC:

1. Loan size. Consider the amount of capital the business will need when choosing a particular SBIC as their policies differ and many have a defined range within which they are willing to lend.
2. Loan type. Deciding in advance whether the business will be better served by a straight loan, an equity investment, or another kind of financing is useful. Different SBICs offer different options.
3. Industry. Some SBICs choose to lend only to businesses in a particular industrial sector, due to the expertise of the SBIC's officers or directors.
4. Geography. Although SBICs may operate regionally or even nationally, it is wise to look into the closest suitable SBIC, because they tend to lend to businesses in their general locale.

Seekers of financing should also note that SBICs may consider working in conjunction with one another to provide pooled capital if a special case merits a departure from standard policy, so no one company should be immediately ruled out.

Requirements. A business qualifies as a "small business" according to NASBIC parameters if it has a net worth under $18 million and average after-tax earnings of less than $6 million for the past 2 years. If a business fails these tests, it may still qualify under employment or annual sales parameters.

When presenting a business to a SBIC for consideration, business owners must provide a business plan that includes information on every aspect of the operation, including detailed descriptions of the product or service and the facilities; an explanation of the customer base and distribution system; a description of the business's competition; an account of all key personnel and their qualifications; and financial statements, such as balance sheets and revenue projections. The ultimate acceptance or denial

process will take a few weeks, although an indication will be made immediately of general interest or lack thereof.

When considering all sources of funding, a small-business owner should weigh the appropriateness of each source with his or her needs. The wide variety of funding options provides many choices, with only a small number, perhaps, that will be suitable. SBICs provide a unique offering in that they have the security of the government behind them, but with the flexibility of a private firm as well.

NATIONAL ASSOCIATION OF WOMEN BUSINESS OWNERS

As of 2008 there were 10.1 million women-owned businesses (75 percent ownership or more) in the United States, employing 13 million people, according to the Center for Women's Business Research. Roughly 40 percent of all privately held firms are comprised of women-owned companies. As the number of women-owned businesses grows, representation and support for female entrepreneurs and business owners becomes more and more visible. The National Association of Women Business Owners (NAWBO), based in Washington D.C., provides women-owned businesses with a resource for such support and representation. Covering the many-faceted interests of women entrepreneurs in all areas of business, NAWBO has chapters all across the United States and maintains affiliate chapters around the world. Membership is available through annual dues paid to both the national organization and to a local chapter.

NAWBO began as a small group of Washington, D.C., businesswomen who started meeting in 1975 as a networking group, discussing mutual experiences, exchanging information, and helping to develop business skills for group members. The group incorporated as NAWBO that same year. The first members in the newly formed organization were recruited in 1976, and in 1978 the first national chapters were formed. Today, its headquarters are located at 601 Pennsylvania Ave. NW, South Building, Suite 900, Washington, DC 20004; 800-556-2926. It also maintains an informative Web site at www.nawbo.org.

NAWBO's vision and mission statement encompasses propelling women entrepreneurs into "economic, social and political spheres of power worldwide." Principle aims of the organization, as articulated in its mission statement, include:

1. Strengthening the wealth-creating capacity of members and promoting economic development
2. Creating innovative and effective changes in the business culture
3. Building strategic alliances, coalitions, and affiliations
4. Transforming public policy and influencing opinion makers

In addition, NAWBO provides women entrepreneurs with assistance in gaining access to financial opportunities. For instance, the organization offers special loans, discount prices on certain equipment and services, and other opportunities which may translate into substantial savings on the start-up costs of business. NAWBO also provides educational experiences and leadership training, and sponsors a wide range of special conferences, workshops, seminars, and counseling services. Finally, the organization's local, regional, national and international contacts provide networking opportunities that may be otherwise unavailable to small, women-owned businesses.

Like most small businesses, women-owned enterprises were especially pummeled by the economic recession of 2008 and 2009. A $787 billion federal bailout package aimed to revitalize small businesses, including those owned by women. However, only 34 percent of $39 billion in direct federal contracts were awarded to small businesses (7.6 percent of which were owned by women), according

to the Kirwan Institute. Since more than three-quarters of stimulus funds flowed through state and city governments, measuring the exact impact of direct federal spending on women-owned businesses proved difficult at best. Additionally, lending to women entrepreneurs became especially constricted between 2008 and 2009. In 2009, for instance, in New Jersey, women-owned businesses accounted for only 23 percent of loans backed by the Small Business Administration, a decrease from the previous 2 years, according to *NJBIZ*.

In addition to its position as "helping hand," NAWBO has established a strong political presence, emerging as a strong voice of advocacy for small, women-owned businesses. For example, the group was instrumental in supporting and helping to pass the 1988 Women's Business Ownership Act, which expanded women entrepreneurs' access to credit markets; instituted a 3-year, $10 million training and technical support initiative for women business owners; and created a National Women's Business Council. The organization also founded the Center for Women's Business Research to provide data to counter negative perceptions of women-owned businesses. A regular presence at the White House and on Capitol Hill, NAWBO members work to make sure that the needs of women-owned businesses are represented: the organization spoke to the Obama administration in 2010 regarding expanding federal contracting opportunities for women-owned small businesses.

Affiliations. NAWBO is the U.S. representative in Les Femmes Chefs d'Entreprises Mondiales (FCEM, or The World Association of Women Entrepreneurs) with chapters in more than sixty countries, representing thousands of businesses. This affiliation allows NAWBO members access to international business ideas and trends and provides networking opportunities throughout the world.

The National Foundation for Women Business Owners (NFWBO) is a nonprofit research and leadership development foundation established by NAWBO. This offshoot of NAWBO gathers information about women-owned businesses and makes that information available to organizations around the globe.

NAWBO is also affiliated with the Small Business Technology Coalition (SBTC) and with the Women Business Owners Corporation (WBOC), which helps small women-owned businesses compete for government contracts. This organization helps women entrepreneurs and business owners to meet professional certification and training needs.

In 2003 NAWBO formed the NAWBO Institute for Entrepreneurial Development (IED). This 501(c)3 organization seeks to expand the educational opportunities for emerging and established women entrepreneurs. NAWBO IED initiatives have included the sponsorship of educational programming at NAWBO's annual Women's Business Conferences. The program also supports the issuance of conference scholarships for emerging women entrepreneurs.

NATIONAL BUSINESS INCUBATION ASSOCIATION (NBIA)

The National Business Incubation Association (NBIA), founded in 1985, is a nonprofit organization comprised of business incubator developers and managers, corporate joint venture partners, venture capital investors, and economic development professionals. The association seeks to promote the growth of new business and educate the business and investor community about the benefits of incubators. NBIA offers information and training on how to form and manage incubators; conducts statistical

research; provides a referral service; and publishes a newsletter, membership directory, various reports and monographs, and a state of the industry analysis. NBIA also hosts an annual convention where it bestows a number of industry awards.

Business incubators are facilities that provide shared resources for young businesses, such as office space, consultants, and personnel. They may also provide access to financing and technical support. For new businesses, these services provide a more protected environment in which to grow before they become self-sustaining. The ultimate goal of any business incubator is to produce viable businesses, called "graduates" of the incubator. In 2010 there were an estimated 1,900 NBIA-affiliated business incubators in operation across the United States as well as affiliates in more than sixty countries.

A business qualifying for incubator assistance must meet certain criteria, in much the same way it would for a venture capital firm. Some incubators have diversified interests, accepting different types of start-ups into the fold, whereas others concentrate in one particular area or industry. For instance, some special interest incubators exclusively support women and minority-owned businesses, and others choose to focus on innovative software or medical applications.

A variety of sponsors support incubators. Some incubators are supported by government and nonprofit bodies. These incubators' main goals are job creation, tax base expansion, and economic diversification. Other incubators are affiliated with universities and provide faculty, alumni, and related groups with research and business opportunities. In addition, a number of incubators are hybrids combining resources from both government and the private sector.

For-profit incubators surged in popularity during the 1990s. This growth was fed in general by the decade's explosive economic expansion, and specifically by the advent of e-commerce. However, NBIA estimates that the majority of for-profit incubators fail within 2 years of opening. For this reason, the NBIA encourages entrepreneurs to research incubators carefully before committing to membership.

Small businesses that join incubators typically pay rent and take advantage of space and shared services that might otherwise be too costly for a start-up. Photocopier, printers, and fax machines might seem trivial, but they are three fewer expenses a new business has to worry about when joining an incubator program. Often a small business will have to expand while still in an incubator program incubators usually rewrite a lease to enable their businesses to grow while still utilizing their services.

Some incubators are more selective than others in accepting new businesses into their programs. The Lennox Tech Enterprise Center, an incubator based outside of Rochester, New York, turns away businesses when owners show no interest in getting coached or trained. Mentoring is an important component to many incubator programs and one that entrepreneurs should be willing to accept as part of their growth prospects.

Business incubators can be an important source of capital and space for new businesses in tough economic times. As a result of the recession of 2008 and 2009, venture capital funding dropped 47 percent in 2009 compared to a year earlier, the slowest fund-raising year since 1993, according to Thomson Reuters. Venture capital performance, which is the measure of a venture capitalist's return on his or her investment, similarly suffered as funded businesses struggled under a worsening economy.

While the recession shuttered many small businesses, some incubator- start-ups showed remarkable resiliency. DocuTap, a healthcare software service provider based in Sioux Falls, South Dakota, started as a one-man business in 2000 and grew into a national business with twenty-seven employees. The company graduated from the South Dakota Technology Business Center incubator program in 2007 and in 2009 was named a finalist for Outstanding Incubator Graduate award by NBIA. DocuTap was able to weather the economic downturn by focusing on a burgeoning sector of the health care industry: urgent-care facilities. DocuTap's software products include Web check-in, patient registration, document management, and integrated fax services. One of the first tenants of the technology center, the company moved out of the incubator program in 2007 and has since thrived by focusing on a core industry segment and specializing its products and marketing around that segment.

Membership. Membership in the NBIA conveys a variety of benefits. They include a subscription to the *NBIA Review*, the association's newsletter; access to a members-only listserv; research, documentation, and dissemination services; support from NBIA staff for information and referrals; legislative and government program updates; and discounts on publications, educational materials, software products, and insurance products from Aon Affinity Insurance Services, among other services. Annual membership dues range from $525 to $1,500 depending on the type of membership. The organization offers three main membership plans to incubator programs: Silver (three people receive full membership benefits plus one discount coupon for books, Webinars, conference registration, etc.); Gold (six people receive full membership benefits plus two discount coupons); and Platinum (twelve people receive full membership benefits plus three discount coupons). Organizations not actively involved in developing or operating an incubator may also become NBIA members as a consultant/vendor/service provider (five or fewer

employees) or corporate member (more than five employees). Businesses may contact the organization by mail or phone for information on how to apply for membership. The National Business Incubator Association's headquarters are at 20 East Circle Drive, Suite 37198, Athens, OH 45701; 740-593-4331. It also maintains a Web site at www.nbia.org.

NATIONAL FEDERATION OF INDEPENDENT BUSINESS (NFIB)

The National Federation of Independent Business (NFIB) is a nonprofit, nonpartisan organization that provides resources, benefits, and support services for small businesses across the United States.

NFIB describes itself as the "leading small business association representing small and independent businesses." The NFIB Web site states that the group's mission is "to promote and protect the right of our members to own, operate and grow their businesses. NFIB also gives its members a power in the marketplace. By pooling the purchasing power of its members, the National Federation of Independent Business gives members access to many business products and services at discounted costs. NFIB also provides timely information designed to help small businesses success."

Founded in 1943, NFIB had grown to approximately 600,000 members at its height in the late 1990s. By around 2009, membership had fallen to about 350,000 but it still ranked as the largest such group in the country. A key feature of NFIB is the frequent surveys of members, which form the basis of its political lobbying efforts at the state and national levels.

The major areas in which NASE serves its members are:

- Access to price savings on a wide range of business products and services, including health and worker's compensation insurance
- Access to expert advice on taxes, law, and other areas of expertise
- Knowledge resources such as books, online articles, and posters that provide guidance in such areas as law, taxes, accounting, and human resources
- Legislative advocacy at the federal and state levels through its lobbying activities, as well as contributions to candidates through its political action committee (PAC)
- College scholarships and mentoring programs through its Young Entrepreneur Foundation

The NFIB is based in Nashville, Tennessee, with its federal government lobbying operations in Washington, D.C. NFIB also has offices and active staff in all fifty state capitals.

PRODUCTS AND SERVICES

The NFIB provides its members access to many business products and services at discounted costs. NFIB pools the purchasing power of its members to obtain discounts similar to those of large corporations.

Products and services available to members at discounted prices include:

- Health care and workers' compensation insurance in certain states
- Computers and information technology
- Office supplies
- Shipping and freight services
- Banking
- Payroll and credit card processing
- Business consultants

- Web site building and hosting
- Sales leads
- Commercial credit reports
- Online training programs
- Workplace safety software programs, safety training videos, and similar materials on risk management practices

Members can also receive workplace safety and training information, free federal government workplace posters, online discussion forums, and access to the bimonthly *MyBusiness* magazine. A toll-free employment law hotline provides answers to questions about workplace issues.

In addition to nationwide benefits, the NFIB also provides additional products and services that are specific to the state where a member's business is located. These can include merchant card rates, office supplies, computer monitors, and health insurance on a state-by-state basis.

SURVEYS AND KNOWLEDGE RESOURCES

The NFIB gathers data from and shares information with its members in two ways: first, the extensive surveys it conducts regularly to gauge member sentiment on political issues and the current state of the economy; second, the resources on running a business that it distributes to its membership.

One of the earliest hallmarks of the NFIB was its many surveys to gauge member sentiment about problems, priorities, and opinions on various issues facing small businesses. In some cases, these surveys drive the organization's legislative initiatives at both the federal and state levels. The results of those surveys and other studies done by the NFIB Research Foundation are also a useful tool for making small-business owners' concerns known to the general public.

The NFIB's monthly survey of small business optimism is also widely cited by newspapers, magazines, and businesses to represent the views of noncorporate business owners on current trends. The surveys also look at small-businesses owners' positions and concerns about the economy and related subjects. For example, the *Washington Post* reported that in 2010, while federal officials were working to make more loans available to help jump-start the stalled economy, an NFIB survey found 51 percent of NFIB members were concerned about slow sales, while only 8 percent were worried about difficulties obtaining credit. The same survey also showed one-third of those business owners had taken out loans against their personal homes to obtain funds to continue running their companies. The results led NFIB leaders to advocate other approaches to helping small businesses get back on their feet instead of increased loan availability. The survey was also cited in such publications as *Northwestern Financial Review*, *US Banker*, *Investment Advisor*, and *CFO Magazine*.

Similarly, other articles in the *Washington Post* and *U.S. News and World Report* cited an NFIB survey indicating Congressional proposals for tax incentives and other measures were unlikely to stimulate or impact small business hiring and capital spending. That survey indicated small businesses would continue to be cautious until the general economy improved and customers resumed prerecession spending habits. An article in *Fleet Owner* noted that Ford Motor Company cited the NFIB's "optimism index" as an early indicator of economic recovery.

While knowledge about its members' concerns is one key to achieving the NFIB's goals, providing knowledge that helps those members grow and succeed in their businesses is also an important component of the organization's offerings. NFIB offers Webinars, books, articles, and access to expert advice on a variety of topics. The general categories of member-oriented research include starting and selling a business; finance and accounting; sales and marketing; staffing; technical and office support; safety; training; and management and leadership. Many of these resources are available free of charge or at significant discounts to active members.

NFIB also provides a number of legal resources through its Small Business Legal Center foundation. The center has a free employment law hotline, a toll-free number that members can call to obtain advice on legal issues in the workplace. The NFIB Web site also contains articles on compliance issues in such areas as workers' compensation, labor, immigration, wages, and general human resources topics.

POLITICAL LOBBYING

Since its founding in the 1940s, the NFIB has had a long tradition of advocating for its members on Capitol Hill and in state capitols across the country. Through its extensive surveys and offices in all fifty states, the group actively solicits input from its members on issues of concern to the small-business community. That local input drives the legislative advocacy agenda at both levels of government.

An article in the *Idaho Business Review* quoted Suzanne Budget, the NFIB's Idaho state director, as saying the organization typically requires 60 percent of its members to support a given issue before it takes a stand. She noted the NFIB's strength comes not from advocating issues supported by a small group of members in a certain trade, for example, but by tackling issues with a broad range of interest throughout its ranks.

The *National Journal* reported that the NFIB "is the most established small business trade group in D.C., with a foothold in almost every congressional district." The

report stated that NFIB had $92 million in revenues in 2008, and that it spent $2.3 million on lobbying activities during the first nine months of 2009.

In addition to federal issues, the NFIB's state offices are also active at the local level. Various media reports show the NFIB calling for budget cuts to reduce spending in New York and Colorado; opposing a Virginia measure to require insurance coverage for autistic children; resisting Idaho plans for sales tax increases and cell phone bans for drivers; and urging the governor of Georgia to sign a bill providing tax credits for job creation.

Key areas for the NFIB lobbying efforts include:

- Health care issues at the state and federal levels
- Competition
- Job creation, particularly incentives and business-friendly policies that encourage smaller companies to hire more employees
- Regulatory reform
- Immigration
- Labor issues and practices
- Social Security
- Tax policies, including payroll tax holidays for both employers and employees, reducing the personal income tax rate, and clarifying IRS rules for worker classification
- Technological innovations
- Other issues related to the economy and the interests of small businesses

COLLEGE SCHOLARSHIPS AND HIGH SCHOOL PROGRAMS

The NFIB's Young Entrepreneurs Foundation provides scholarships and other programs to promote "the importance of small business and free enterprise to the nation's youth,"; according to its Web site. The foundation's mission statement says it is "committed to educating young people about the critical role of small business and the American free enterprise system."

One of the most visible activities is the foundation's Young Entrepreneurs Awards, a scholarship program "designed to reward and encourage entrepreneurial talents among high school students."; The awards range from $1,000 to $10,000 each, which students can apply towards tuition at the university, college or vocational/technical school of their choice. The scholarships began in 2003. By its eighth year in 2010, the NFIB Young Entrepreneurs Foundation had awarded 2,095 scholarships to graduating high school seniors totaling almost $2.4 million.

According to a report in the *Idaho Business Review* on that state's winners, students are nominated by NFIB members. Candidates submit essays outlining the entrepreneurial activities they have engaged in and what their goals are for the future. The selection process also considers grade and standardized test scores, the report noted. In 2009 6,000 applications were received and 168 scholarships totaling more than $600,000 were awarded, according to the report.

The foundation's other activities are under the umbrella of an "entrepreneur in the classroom" program. This group of programs includes a free curriculum and resources for high school students, a "Johnny Money" online teaching game, and the "Take Time to Teach (T3)" mentoring program. The T3 program shows young people how to start and run their own businesses. The foundation also recognizes teachers and other mentors who work with students learning about small business.

In recent years, the NFIB has continued to expand its activities on behalf of small and independent businesses by moving more of its resources online. Current information about the NFIB, including benefits, products, services and membership rates, are available at its Web site, www.nfib.com.

NATIONAL LABOR RELATIONS BOARD (NLRB)

The National Labor Relations Board (NLRB) is a federal organization that oversees the establishment and conduct of union organizations as well as the conduct of businesses involved with unions. Its national headquarters are located at 1099 14th St. NW, Washington, DC 20570. The organization’s phone number is 866-667-6572, and its Web site is located at www.nlrb.gov.

History and Purpose of the NLRB. The NLRB was created in 1935 by Congress to administer the National Labor Relations Act (NLRA). The NLRA governs relations between labor unions and employers whose operations involve interstate commerce. Though there are other federal and state laws which also protect the rights of employees, such as the Fair Labor Standards Act (FLSA), the NLRA is the act specifically tied to the NLRB and to union organization.

The act itself gives employees the right to organize and bargain collectively with their employers, as well as the right not to organize. In short, employees may join a union or not, as they so choose. The law covers only employees working for employers involved in interstate commerce with a few exceptions (airlines, railroads, agriculture, and government). The act ensures that employees can choose their own representatives for the purpose of collective bargaining, establishes procedures for secret-ballot elections, and defines unfair labor practices, to which both employers and unions are subject.

The NLRB conducts elections and prevents and remedies unfair labor practices. It is made up of two different branches. The board is a group of five persons based in Washington, D.C., who act in a judicial capacity, though they are not judges. This group decides whether improper labor practices have actually occurred, either during an election campaign or during management-union bargaining sessions. The General Counsel is the prosecutorial side of the board. It has offices throughout the country and is charged with the investigation and prosecution of those who engage in unfair labor practices. The NLRB is designed to be completely equitable, taking sides for neither management nor union, acting as a sort of “referee” in what is usually an emotionally charged action between employees and employers.

The debate over labor law grew rancorous in 2008 and 2009 as an economic recession forced million of Americans out of work. Many organizations called on Congress to institute new reforms that would solidify existing laws, improve work environments, protect workers’ organizing rights, and create better job security. One such proposal, the Employee Free Choice Act, would enable workers to request union representation if a majority of them sign a card in favor of that decision.

Meanwhile, union membership saw significant shifts in the first decade of the twenty-first century. Private sector union membership dropped to 7.2 percent in 2009, down from 7.6 percent a year earlier. However, 37.4 percent of public employees were represented by unions. While union-dominated manufacturing industries shrank, unions continued to make inroads in other sectors such as retail and health care.

Impact on Business. The employees of any business may seek representation by filing a petition with the NLRB requesting an election. The NLRA requires that representation must be by a “labor organization,” as defined by the NLRA. The definition of a labor organization is fairly liberal, and entrepreneurs should always be familiar with both large and smaller unions that might seek to organize a business’ employees. The larger ones, such as the AFL-CIO or the United Auto Workers (UAW), are well known, but there are many smaller organizations as well.

Once an election has been held and employees have determined that they want representation by a union for the purposes of collective bargaining, the employer is required by law to bargain with no other organization for

the workers in that business. All workers are covered by the decision, whether they become members of the union or not. Generally, employment concerns such as wages, hours, and working conditions are included in the collective bargaining agreement, which is set up during meetings between the employer and the union representatives.

UNFAIR LABOR PRACTICES.

The judicial arm of the NLRB becomes involved when there is a dispute about the conduct of the employer or the union during a union election campaign or during bargaining. The General Counsel investigates the charge to determine if it is valid and should be pursued. The charge can become a local-level complaint at this stage, or can be dismissed. The great majority of charges filed with the NLRB are settled or withdrawn at the stage when investigation has been completed, before a complaint has been issued.

If a complaint is filed, the case is heard before an administrative law judge, part of the judicial branch of the NLRB. The administrative law judge's decision on the case is then adopted by the board. If exceptions are made, the transcript, briefs, and other documentation of the case are all sent to the board in Washington for a decision. The NLRB rarely hears oral arguments; it usually makes decisions based on the documentation from the administrative law judge.

As an example of an NLRB action, in 2010 the NLRB sought a federal court order to force a Buffalo egg processor to rehire seven union supporters who were allegedly threatened and fired before a union vote. Most of the workers at Deb-El Food Products signed cards in 2009 seeking a union election. Company associates allegedly discouraged union support, threatened workers with dismissal, and asked workers to sign an anti-union petition in the weeks leading up to the election date, according to the NLRB. Eighteen workers cast ballots for the union while twenty-one voted against. The NLRB subsequently found that the alleged preelection misconduct made a legitimate vote impossible and asked for an injunction from the U.S. District Court.

NLRB decisions do not have the impact of law because the NLRB is an administrative agency. Its decisions do, however, carry a great deal of weight in a court of law. If either the union or employer is unwilling to follow the guidelines set down in the decision, the NLRB files a petition in the Court of Appeals, the level directly below the Supreme Court, for the district where the case arose. If this decision is contested, the board will request that the United States Supreme Court hear the case.

NATIONAL VENTURE CAPITAL ASSOCIATION (NVCA)

The National Venture Capital Association (NVCA), founded in 1973, is an organization of venture capital firms, corporate backers, and individuals dedicated to professionally investing private capital in new companies. In its own words, it exists to " foster greater understanding of the importance of venture capital to the U.S. economy, and support entrepreneurial activity and innovation" by, among other things, promoting the public policy interests of the venture capital and entrepreneurial communities.

The NVCA seeks to foster greater understanding of the necessity of investing in young companies and their role in the overall health of the U.S. economy. To that end, it works to stimulate the flow of risk equity capital to emerging and developing companies. It also aims to promote communication between venturing bodies throughout the United States and strives to improve the level of knowledge of the venturing process in government, universities, and the general business community. In support of these activities, the NVCA conducts research, hosts educational and networking programs, and serves as an information clearinghouse for its members. It makes available the results of its research in various publications, such as its *Annual Economic Impact of Venture Capital Study, Job*

Creation Survey, Expert Analysis of Legislative and Regulatory Issues, and other scholarly works. Specific information available through the NVCA includes industry statistics, venture capital news, and listings of venture capital firms. NVCA headquarters are located at 1655 North Fort Myer Drive, Suite 850, Arlington, VA 22209; 703-524-2549. The association also maintains a Web site at www.nvca.org.

Venture capital fundraising is vulnerable to economic conditions, and the recession of 2008 and 2009 had a significant impact. In 2009 794 venture capital firms were active in the United States, down from a high of 1,023 firms in 2005. Venture capital funds totaled $15.2 billion for the year, down 47 percent from 2008, marking the slowest fund-raising year since 1993, according to NVCA. Venture capital performance, which is the level of return on a venture capitalist's investment, similarly suffered. The 10-year return fell by nearly 80 percent in the third quarter of 2009 compared to the same period a year earlier, according to the Cambridge Associates U.S. Venture Capital Index. Likewise, the 5-year return dropped 54 percent over the same period. Some firms discontinue raising new funds during an economic downturn, opting instead to support existing investments. Others lower their fund fees or simply raise smaller funds. For instance, venture capital firm Highland Capital closed a $400 million fund in 2009, half the size of its previous fund raised in 2006.

VENTURE CAPITAL

New business owners who lack the collateral and experience to garner traditional bank financing often must seek funds elsewhere. Many entrepreneurs seek "venture capital" informally, obtaining seed money from friends and family or wealthy individuals willing to risk an investment. Others, of course, seek funding by professional firms. In these cases, the new firm assesses any number of business plans to determine which holds the greatest potential for success and presents this plan to prospective venture capital firms. The venture capital firm which finances a new venture will have an ongoing relationship with the start-up, providing coaching, training, management expertise, and other services, and often holding a seat on the young company's board of directors. Businesses that are accepted for funding by a venture capital firm should expect the organization to take an active part in shaping the business.

According to the NVCA, funds used by venture capital firms come from a variety of sources, including institutional investors such as pension funds, foundations and endowments, insurance companies, wealthy individuals, professional money managers, foreign investors, and the venture capitalists themselves.

NVCA MEMBERSHIP

The NVCA actively advocates public policies that are beneficial to the entrepreneurial and venture communities. The association also provides educational programs accessible throughout the United States to its membership. Programs are conducted in person and via Webcast by industry scholars, practitioners, and analysts. In addition, the NVCA offers a director and officer insurance program intended for both members and their portfolio companies that provides risk management and loss control protection.

Beyond its regular programming, the NVCA operates a slate of special interest groups designed to assist venture investors in particular industries. These include:

1. Medical Industry Group Addresses the needs of life science venture investors
2. Corporate Venture Group Provides information, education, and networking services to corporate venture investors to accelerate growth and innovation
3. CFO Taskforce A task force comprised of venture firm CFOs to provide guidance and technical expertise on various venture industry issues
4. Strategic Communications Group Assists in venture capital industry communications and helps members maximize returns on brand development and investor relations
5. Legal Roundtable Provides best practices and discussion over legal challenges facing the industry to general counsels and other legal personnel
6. Human Capital Forum Offers compensation trends, best practices, technology solutions, and search firm services to HR personnel
7. Cleantech Advisory Council Assists the NVCA in identifying regulatory and legislative issues important to the development of Cleantech technologies.

NVCA has several requirements of potential members. Those seeking membership (by invitation) must be capital organizations, investment advisors, corporate investors, or buyout funds. Members need not be full-time venture capitalists, but they must have as their primary business the deployment of venture capital. They also must represent capital funds and utilize a professional approach before and after they make an investment, including the maintenance of a continuing interest in companies they sponsor. The managers of the business must be American citizens or resident aliens and operate from an office located in the United States. In addition, members must invest from a dedicated U.S.-based venture capital pool of funds of at least $5 million. Finally, the members' business must be subject to U.S. taxation and

laws. Dues range from $1,000 to $35,000 and depend on the amount of capital under management.

NEGOTIATION

Negotiation describes any communication process between individuals that is intended to reach a compromise or agreement to the satisfaction of both parties. Negotiation involves examining the facts of a situation, exposing both the common and opposing interests of the parties involved, and bargaining to resolve as many issues as possible. Negotiation takes place every day in nearly every facet of life, from national governments negotiating border disputes, to companies negotiating work agreements with labor unions, to real estate agents negotiating the sale of property, to former spouses negotiating the terms of a divorce. Small-business owners are likely to face negotiations on a daily basis when dealing with customers, suppliers, employees, investors, creditors, government agencies, and even family members.

Many companies train members of their sales forces in negotiation techniques, and many others hire professional negotiators to represent them in business dealings. Some organizations employ a process known as "behavior analysis" when training people to become negotiators. For instance, sales training firm Huthwaite uses behavior analysis when conducting negotiation training exercises to measure a person's negotiation skills against those of a seasoned negotiator. This kind of constructive feedback can help an employee understand how well he or she negotiates, as well as what areas of the negotiation process could be improved. Good negotiation requires advance preparation, a knowledge of negotiating techniques, and practice. Meeting those criteria could make a difference in a small business' bottom line: companies with no negotiation process suffer an average revenue decline of 63 percent, compared to a 43 percent revenue increase for companies that embrace the negotiation process, according to a 2009 report by the International Association for Contract and Commercial Management.

Regardless of the type of negotiation, experts recommend entering into it with a cooperative rather than a competitive attitude. They stress that the point of negotiating is to reach agreement rather than to achieve victory. "Any method of negotiation may be fairly judged by three criteria," Roger Fisher and William Ury write in their book *Getting to Yes: Negotiating Agreement without Giving In.* "It should produce a wise agreement if agreement is possible. It should be efficient. And it should improve or at least not damage the relationship between the parties." When one of the parties uses "hard" negotiating techniques, or bullies and intimidates the other side in order to obtain a more favorable arrangement, it only creates resentment and poisons future negotiations. Instead, the idea should be to find a win/win solution that satisfies the needs and interests of both parties.

PREPARING FOR A NEGOTIATION

Four basic things are recommended for any party about to engage in discussions to arrive at a negotiated agreement: 1) advance preparation; 2) an understanding of the underlying assumptions and needs to be satisfied on both sides; 3) a basic knowledge of human behavior; and 4) mastery of a range of negotiating techniques, strategies, and tactics. In his classic book on the subject, *Fundamentals of Negotiating.* Gerard I. Nierenberg outlines a number of steps toward adequately preparing for a negotiation. The first step is to "do your homework" about the other side. In nearly every negotiation, this will entail research to uncover their underlying motivations. In negotiating a business property lease, for example, it may be useful to find out the cost to the landlord of keeping the building vacant. The next step is to assess your own side's needs and establish objectives for the negotiation. It is important that the objectives remain relatively fluid, however, so as not to hinder progress with discussions and maintain maximum flexibility.

Another element of preparing for a negotiation involves deciding whether to use an individual or a team as a representative. This decision needs to be considered separately for every negotiation and will always depend to some extent on what the other side is doing. A negotiating

team offers a number of potential advantages. For example, it enables a small business to involve people with different areas of expertise in order to avoid misstatements of fact. Teams can also play into negotiating strategies and help gain concessions through consultation among team members. However, it is important to note that bringing extra people can be harmful to a negotiation when they do not have a distinct function. Using a single negotiator also offers some advantages. It prevents the weakening of positions that often occurs through differences of opinion within a team, and it also may help gain concessions through the negotiator's ability to make on-the-spot decisions.

The next step in preparing for a negotiation involves choosing a chief negotiator. Ideally, this person should have experience and training in negotiations, as well as a strong background in the area of the problem about which discussions are being held. Another important element of negotiation is selecting the meeting site. For a small business, holding the meeting on its own premises may provide a psychological advantage and will also save on travel time and expense. It may also be helpful in enabling the negotiators to obtain approval from managers or use their own facilities to check facts and find additional information as needed. Holding a negotiation at the other side's offices, however, may help the negotiators to devote their full attention to the task at hand without distractions. It may also play into negotiating strategy by enabling the negotiators to withhold information temporarily by claiming a need to speak to higher-level people or gather more information. A third alternative for a meeting site is a neutral location. Whatever site is chosen, it should be large enough to accommodate all parties and feature a telephone, comfortable chairs, visual aids, and available refreshments.

THE NEGOTIATION PROCESS

Fisher and Ury recommend conducting negotiations according to the process of "principled negotiation." Their method has four main tenets:

1. Separate the people from the problem. The idea should be for both sides to work together to attack a problem, rather than attacking each other. To achieve this goal, it is necessary to overcome emotional responses and set aside egos.
2. Focus on interests rather than positions. The natural tendency in many negotiations for example, dickering over the price to be paid for an antique is for both sides to state a position and then move toward middle ground. Fisher and Ury warn against confusing people's stated positions with their underlying interests and claim that positions often tend to obscure what people truly hope to gain through negotiation.
3. Generate a variety of options before deciding what to do. The pressure involved in any type of negotiation tends to narrow people's vision and inhibit their creativity, making it difficult to find optimal solutions to problems. Instead, Fisher and Ury suggest developing a wide range of possible solutions as part of the negotiating process. These possible solutions should attempt to advance shared interests and reconcile differences. For example, a small-business owner negotiates with an employee about leaving work early during the week to pick up a child from school. The business owner may suggest the employee makes up the extra time during evenings or the weekend. If the employee finds this a congenial arrangement, both parties win.
4. Base the result on objective criteria. No one will be happy with the result of a negotiation if they feel that they have been taken advantage of. The solution is to find and apply some fair standard to the problem in order to guarantee a mutually beneficial result.

The National Federation of Independent Business outlines seven basic steps of the negotiation process as it most likely relates to the small business:

1. Clarify interests. Ask about the other party's priorities and determine both sides' desires. Nierenberg suggests that it may be helpful to ask questions in order to form a better understanding of the needs and interests of the other side. The questions must be phrased diplomatically and timed correctly in order to avoid an antagonistic response. The idea is to gain information and uncover basic assumptions without immediately taking positions. Nierenberg stresses the importance of listening carefully to the other side's responses, as well as studying their facial expressions and body language, in order to gain quality information.
2. Focus on points of agreement. Start with areas over which both parties agree, while saving points of contention for later in the negotiation process.
3. Formulate multiple options. A company's proposed solution may not necessarily be the best one. Outline the possible benefits of a variety of options to the other side. A possible strategy is reversal, which involves taking a position that seems opposed to the original one. Similarly, feinting involves apparently moving in one direction in order to divert attention from the true goal. For example, a negotiator may give in on a point that is not very important in order to make the real objective more attainable. Another strategy involves setting limits on the negotiation, whether with regards to time, the people involved, or other factors.

4. Agree on a best option. Be willing to compromise, but only after exploring all possible options. One common strategy is to present a *fait accompli*, coming to a final offer and leaving it up to the other side to decide whether to accept it. In a simple example, a small-business owner may scratch out one provision in a contract that he or she finds unacceptable, then sign it and send it back. The other party to the contract then must decide whether to accept the revised agreement. Nierenberg warns that this strategy can be risky, however, and encourages those who employ it to appraise the consequences carefully first.
5. Be ready for an impasse. Keep the negotiation going as long as possible, as the other party may be willing to give in to your demands after a while. For a negotiation that stalls, however, calling a break or postponing the negotiation to gather more information may be helpful. One common strategy is forbearance, or "patience pays," which covers any sort of wait or delay in negotiations, as when one side wishes to confer in private, or adjourn briefly. It is also possible to change the participants in the negotiation if it seems to be at an impasse. For example, a neutral third party may be enlisted to help, or one or two people from each side may be sent off to continue the negotiation separately. It may also be helpful to break down the problem into small pieces and tackle them one by one. Another strategy might be to trade sides for a short time and try to view the situation from each other's perspective. All of these techniques may be applied either to gain advantage or to push forward a negotiation that has apparently reached an impasse.
6. Refine a deal. Fine-tune an agreement to ensure both parties are happy with it.
7. Wrap it up. Review the agreement and document the decision.

Nierenberg notes that good negotiators tend to employ a variety of means to accomplish their objectives. Small-business owners should be aware of some of the more common strategies and techniques that they may see others apply or may wish to apply themselves.

NEPOTISM

In the business world, nepotism is the practice of showing favoritism toward one's family members or friends in economic or employment terms. For example, granting favors or jobs to friends and relatives, without regard to merit, is a form of nepotism. These practices can have damaging effects on businesses, such as eroding the support of nonfavored employees or reducing the quality and creativity of management. In response, some larger companies have instituted "antinepotism" policies, which prevent relatives (by blood or marriage) from working in the same department or firm. However, for small family-owned businesses, which account for 60 percent of GDP, according to the Family Business Institute, nepotism is often viewed in more positive terms. Family members are trained in various aspects of management to ensure the continuity of the company when members of the earlier generation retire or die. In fact, in many small businesses nepotism is considered a synonym for "succession."

One of the most common arguments against nepotism is that the emotional ties between people who are related may negatively affect their decision-making abilities and professional growth. In the past, many businesses sought to avoid even the appearance of nepotism by forbidding relatives from working closely together. This began to change as women entered the work force in ever greater numbers and began to rise to positions of prominence. Often, both the man and the woman in a married couple were too valuable for a company to lose. Therefore, instead of instituting strict antinepotism rules, many businesses decided that family members could be accommodated within a merit system, especially if there was no

direct supervisory link between the positions of related employees.

Nepotism policies in regard to small businesses vary from state to state and should be considered when it becomes an issue. For instance, in California an outright prohibition on hiring spouses might run afoul of that state's Fair Employment and Housing Act. However, the same statute includes provisions that limit spouses from working in the same department, division, or facility in order to retain morale. If two spouses' work creates a conflict of interest, the small business in California can prohibit spouses from engaging in a manager-employee relationship that would create consternation among fellow employees. Businesses are further expected to make similar and reasonable accommodations for current employees who marry.

At the federal level, nepotism is often cited in cases of job discrimination. For instance, a 2007 survey by the Merit Systems Protection Board (MSPB) found that 31 percent of federal workers cited nepotism as a driver behind the promotions process. That figure was high, according to the MSPB, considering relatively few federal workers are related to other government employees.

Meanwhile, nepotism's impact even its perceived impact can have a potentially devastating effect on small businesses. When a streetside hot dog vendor was denied a permit by the city of Springfield, Massachusetts in 2009, he claimed the move was prompted by nepotism after the mayor's cousin opened a restaurant nearby. The vendor, John Verducci, had been operating his small business for 15 years when Pasquale Izzo, the cousin of Mayor Domenic Sarno, opened his new restaurant next to Verducci's hot dog stand. At the alleged behest of Izzo, the city rescinded a policy to allow street vendors to rent "meter bags" to mark their territory for $10 per night. Sarno insisted the action came after complaints by police and downtown business owners who pay thousands of dollars in municipal taxes and fees costs that were not borne by streetside vendors. As a result of the change in policy, dozens of vendors were not allowed to carry on their businesses, garnering the attention of city and state elected officials and eventually prompting the city council to reexamine its policy.

NEPOTISM IN SMALL BUSINESSES

Even within small businesses where family members often work together, concerns about how these nepotistic relationships may be viewed by others must be considered. Business owners have often feared that nonfamily employees would resent or even treat unkindly family members brought into the business. Newly hired family members may even be seen by some nonfamily employees as roadblocks to advancement in a company. An *Inc.*, poll revealed the extent to which this attitude prevails. In fact, nearly half of those polled (48 %) believed that being the boss' son is the secret to getting ahead, while only a quarter agreed that success comes from doing good work.

This attitude suggests that family-owned businesses need to make serious efforts to establish an environment in which it is clear that employees will be rewarded based on merit. This does not necessarily mean that hiring a relative is a bad idea. What is necessary, however, are policies and actions that show clearly that all employees are rewarded fairly and equally for company success. The emotional bonds between family members can actually have a positive effect on individual performance and company results. In addition, hiring family members can fill staffing requirements with dedicated employees. And it should not be forgotten that preparing a family member to carry on a business is a perfectly legitimate enterprise for the owner of a family business.

However, in order to avoid potential pitfalls and ensure that relatives work together effectively, the company should establish formal guidelines regarding hiring, responsibilities, reporting structure, training, and succession. These guidelines will differ according to the business's size, culture, history, and line of business, in addition to other factors. "How strict or liberal the rules… are is less important than clear communication of the rules before they are needed and fair application of the rules when timely," Craig E. Aronoff and John L. Ward write in *Nation's Business.*. After all, most nonfamily employees recognize the legitimacy of preparing younger family members to assume the company's reins down the road. But experts agree that a widespread workforce perception that family members are not being held responsible for their performance can develop into a major morale problem.

Regarding hiring, Aronoff and Ward recommend in *Family Business Succession* that family members meet three qualifications before they are allowed to join the family business on a permanent basis: an appropriate educational background; 3 to 5 years' outside work experience; and an open, existing position in the firm that matches their background. Of these qualifications, Aronoff and Ward stress that outside work experience is the most important for both the business and the individual. They claim that it gives future managers a wider experience base that makes them better equipped to deal with challenges, lets them learn and make mistakes before coming under the watchful eye of the family, makes them realize what other options exist and thus appreciate the family firm, and provides them with an idea of their market value.

Aronoff and Ward also suggest that family members begin their association with the business by working part-time during their school years or participating in internships. In addition, they stress that companies that hire

family members should make it clear to the individuals that they will be fired for illegal or unethical behavior, regardless of their family ties. Finally, they recommend that family businesses encourage their employees to maintain outside associations in order to avoid problems associated with a lack of creativity or accountability in management. For example, future managers could participate in industry or civic groups, enroll in night school classes or attend seminars, take responsibility for a division or profit center, and have their job performance reviewed by outside consultants or directors. Such steps can improve the employee's self-confidence and preparation for an eventual leadership role in the business.

NET INCOME

The net income of a company is its profit. The terminology is influenced by its source, which is the company's income statement. This statement shows income at the top, namely the company's sales (also called revenues and, in British usage, turnover). All sorts of items are then deducted from this income, including costs for raw materials, wages, supplies, purchased services, rents, lease payments, executive salaries, marketing expenses, management overhead, and depreciation. At each point the subtotals are less and less. At the very end, taxes are deducted. The last line of the income statement finally shows what is left over: net income. This, of course, is the company's profit, also called after-tax income. Wall Street calls this number "earnings after tax" or "earnings" for short. The designation is deceptive because most people think of earnings as their pay and costs come after that. In corporate finance, however, earnings are "the bottom line."

Net income is typically tallied once a month for tracking purposes. In publicly traded companies it is published quarterly and annually. It can be negative, indicating that costs have exceeded revenues. It can also be zero. In that case income and costs were exactly the same and the company has simply broken even.

While net income is the most important indicator of a company's profitability, it should not be confused with cash profit, unless the company accounts on a cash basis. Most companies use the accrual method of accounting. Under that system, income is "booked," that is, recorded, at the time when a sale is made, not when payment is received. Similarly, costs are recorded when purchases are made, not when payments are sent out. Under certain circumstances, a company may show high profits and yet have no cash on hand. The timing differences between bookings and cash receipts may also work the other way: a company may have ample cash and be experiencing losses on the books. This difference between profitability and cash flow is important because in many situations such as borrowing, getting a lease, or trying to sell a company the lender, lessor, or buyer will be interested in cash flow above all.

Subcategories. Most income statements will show four different income figures. The first is "operating income," common in companies that manufacture products. Operating income is what is left over from sales after production expenses have been subtracted but before overhead expenses have been applied. Next is "pretax income," the amount the company has left over after paying overhead but before deducting taxes. Reporting of this figure is optional under the accounting rules. The third figure is "income before extraordinary items," which is equal to ordinary revenues less ordinary expenses. Extraordinary items include any nonoperating gains or losses that are unusual in nature and infrequent in occurrence. They are separated from ordinary income in order to avoid confusing the readers of income statements. Reporting of this figure is mandatory whenever there are extraordinary items to be included. The fourth and final income figure shown

on an income statement is net income. It is the difference between total revenues and total expenses for the period, including taxes and extraordinary items. Net income always appears as the last figure in the body of the income statement. Its reporting is mandatory. Corporations (but not sole proprietorships or partnerships) are also required to divide the net income figure by the number of shares of stock outstanding in order to report the earnings per share (EPS) for the period.

Ratios. Net income is used in the calculation of various ratios that act as shorthand for evaluating a company's performance. One of the most popular, return on sales, is calculated by dividing income (before interest and tax) by sales. This ratio helps business owners determine how much profit is made per dollar of sales. Return on equity similarly measures profit that is produced with shareholder equity. It is calculated by dividing net income by shareholders' equity. Also used is the price-earnings (P/E) ratio, calculated by dividing share price by earnings-per-share. This produces a "multiple." If the shares are selling for $40 and earnings-per-share are $2.50, the P/E ratio is 16, suggesting that investors are willing to pay $16 for a dollar of earnings. A high P/E ratio may suggest that investors expect higher earnings in the future. However, investors also find the ratio helpful in comparing two companies operating in the same industry.

NET WORTH

The "net worth" of a business is what remains when total liabilities are deducted from total assets. For the small-business owner, it is basically what a person owns subtracted by what that person owes. Net worth illustrates how a company's wealth and debts are distributed. Banks examine a small business's net worth when determining whether to grant a loan. Certain Small Business Administration (SBA) loans are available for companies that boast a certain net worth. For instance, the SBA's 504 loan program targets businesses with net worth up to $8.5 million for use in land, building purchases, remodeling, and equipment. Similarly, potential buyers depend on the figure to ascertain a business's current condition as well as whether it will continue to be profitable.

Economic conditions can have a direct impact on a small business's net worth. The recession of 2008 and 2009 brought many companies' net worth down and rendered many more insolvent (negative net worth). However, even businesses deemed to have insufficient net worth were able to qualify for special financing in certain cases, thanks to federal stimulus moneys and state and local lending efforts. For instance, in 2010 the St. Louis County Economic Council (Missouri) introduced a small-business loan program known as "Boost," which funneled county funds and a $5 million line of credit to small-business owners whose net worth made them unable to qualify for conventional loans. Businesses that are able to tap into such financing are often able to ride out economic downturns and see their net worth become positive again.

Calculating net worth is moderately easy. If a company's total assets are $1 million and total liabilities $800,000, net worth will be $200,000. On a balance sheet, Assets are typically shown in the left column, Liabilities in the right column. Beneath total liabilities in the right column will be listed the Net Worth. Thus liabilities ($800,000) plus net worth ($200,000), will equal assets ($1 million). Both columns will have $1 million on the last line, "Total Assets" on the left and "Liabilities and Net Worth" on the right. Assume that the situation is reversed: the company has $800,000 in assets and $1 million in liabilities. In that case, net worth will be -$200,000, so that this negative number, when added to liabilities, also produces $800,000. However, with a negative net worth, the company is now insolvent. The company will fail if that condition is not turned around.

Typically, net worth is made up of two figures. One is labeled "capital," "owner's equity," "partner's equity," or "shareholder equity." This line depicts the money initially received for shares sold in the company to all investors (or paid in by partners); in a privately held company it includes the owner's initial capital contributions along with other investors' contributions. The second line is labeled "retained earnings." This represents profits (net income after tax)

retained by the company for future investment or debt retirement after deducting dividends paid out (if any). Capital and retained earnings together are net worth.

A simple balance sheet can help the small-business owner calculate his or her net worth. Such a worksheet might contain a variety of items under the Assets column, such as cash, real estate/property, and investments. Under the Liabilities column, there may be such items as current debts, mortgages, and loans. Filling out a balance sheet on a regular basis financial experts typically suggest annually can provide a progress timeline for a business and determine how close (or far) that business is to reaching its goals.

A company has three different values, of which its net worth is one. Every company has a "liquidation value," the money that its owners are likely to realize if the business stopped operating, all of its liabilities were satisfied, and all of its assets were sold off. The liquidation value will largely depend on the nature of the company's assets and what they will fetch when sold separately. Cash is worth exactly what it is, and the higher the cash, the higher the liquidation value. Land and buildings will normally sell above or at acquisition costs. Equipment, however, is rarely worth as much in separate pieces as it is when integrated into an up-and-running system of production. If the equipment is highly modified for a special purpose it will fetch least. Major machine tools transferable to another operation will fetch most. Owners are likely to realize only pennies on the dollar for furniture, fixtures, and excess inventories.

The business also has a "market value." This is the amount of money a knowledgeable buyer is likely to pay for it. Market value is based on a company's projected future earnings as an ongoing business. A profitable company with low debt, a well-established history of steady earnings, and good cash flow will fetch the highest price. Other factors play a role, including its technological know-how, market share, and the presence or absence of competing buyers. In the case of a service business where the most important asset is represented by individuals with special skills and knowledge, the willingness of such people to continue on with the business will play a major role.

A company's liquidation value is almost always the lowest, its market value the highest, and its net worth the value between these two polarities. Net worth serves as an ongoing measurement of the company's health, analogous to a blood-pressure measurement of a individual. Management and investors watch this figure closely. It is also of great interest to potential lenders to the company (along with other measures). Companies with high net worth relative to sales and good cash flow histories have the most success in attracting lenders.

NETWORKING

Network-savvy people tend to have a wide circle of friends; they enjoy social contact, like to be with people, and have a knack for connecting with others and then staying in touch. When they need something they have a circle of contacts to draw on for help or information. If they hear about an opportunity that may help something else, they pass it along in kind. The result is a highly successful business arrangement based on natural relationships.

The term "networking" first appeared in the late 1970s and early 1980s. It referred to gregarious behavior with the goal of gaining benefits in business. Networking has always had an ambiguous character. When it is practiced openly, and the networker's desire to make useful business contacts is up front and visible, it is a kind of salesmanship. When the contact-work is disguised as seeking social links or friendship, networking can take a more exploitative turn and may incorporate negative aspects.

Business networking, certainly in its earlier stages of development, was viewed by many as a valuable new discovery, a kind of leverage with small inputs that have large consequences. But networking is equivalent to marketing a corporate identity. Nothing specific is being sold except the networker's existence and this to one person at a time. Good corporate networking requires concentrated attention, record keeping, and the cultivation of the network hence it costs time and money. If the networker, realizing the high costs, narrows the field of contacts to individuals deemed more likely to be helpful in the future, networking loses one of its benefits, namely the discovery of unexpectedly helpful contacts.

Networking has three basic components: 1) making contacts deliberately; 2) recording contacts made; and 3) cultivating the network. *Making contacts* requires a willingness to engage people and other organizations in conversations, including all kinds of personal and digital interaction on behalf of the business. Showing interest

in others, paying attention to them, and engaging in give-and-take are often vital components of the process. Business conferences and expositions are a good venue for meeting potentially helpful people in a business context; the active networker will "work the booths" and get to know lots of people.

Keeping records is central because relatively brief contacts will fade from the mind, but notes in a database will bring back the memories. In physical meetings this requires creating an entry for contacts, but in electronic networking there are often easier methods of tracking helpful contacts.

Cultivating contacts refers to the process of keeping in touch from a business standpoint. Reminders and congratulations on behalf of the business can help networkers to reestablish connections and keep updated on any new opportunities. Here the give-and-take process is very important: contacts will have lasting potential if the networker offers help as well as seeks help from contacts. The proper courtesies are always important.

NETWORKING ONLINE

In the business-oriented corners of the Internet, networking clubs have been developed to help businesses develop interconnections and useful contacts. Among them are ItsNotWhatYouKnow (INWYK) and LinkedIn. According to Catherine Seda, writing in *Enterpreneur*, "It's simple to join, and most clubs are free or have a free level of access. Complete the registration form, invite your colleagues to join, and get on each other's 'connections' lists. The bigger your network, the greater your referral opportunities are, because members click on your contacts to see who you know."

Many small businesses prefer to stick with social networking, which comes in many different varieties but generally provides an inexpensive and effective way to meet new clients and establish relations with other businesses. Social network marketing campaigns are easy to run, cost effective to manage, and when consistently updated they give the business a series of valuable connections to its community.

Social networking includes blogs, microblogs, multimedia sites, and public networks. A small business interested in developing social network contacts might create a blog with weekly updates by the owner, or seek to write regular articles for another popular blog concerning its industry. Microblogs like Twitter can be used to effectively spread marketing messages or contact other people within the same social network, and there are free programs available for managing Twitter accounts and syncing them with popular public network sites like Facebook, which allows small businesses to create fan pages and profiles that can be used as a constant conversation with community and clients. Multimedia sites such as YouTube are directed more toward information and marketing purposes but can be used to direct people to more socially oriented sites.

SOCIAL CAPITAL CONCEPTS

Social capital refers to the benefits gained from managing relationships with community, clients, and other businesses successfully. It includes a number of networking practices and even personal habits, but the end result is a gain based on how much the business gives back to its contacts. Building social capital involves a wider number of variables than traditional networking, including grooming, casual conversation, topics of interest, and community involvement.

In this way, social capital can develop new potential for business in two ways, one scattered and one direct. The scattered method refers to a business's involvement in the entire community, from softball games to public dinners and charity projects. This subtle form of marketing benefits both the community the business operates in (returning as an investment in the form of more and better customers) and the social network the business is developing, as it becomes associated with positive change and quality work. An endorsement of community involvement to a potential client can be the same as an endorsement of a product or service.

Direct social capital refers to the relationships that a business depends on to run successfully. This includes investing time in suppliers, distributors, and customers, not just in the business sense but also in other facets of life. The relationship that develops between the business and its clients not only strengthens necessary contacts but also improves word of mouth marketing and acclamation among other potential customers in the market. This allows companies to increase their client base and spot new markets as they begin to emerge.

INTERNAL NETWORKING

Internal networking is the application of networking principles within the company, among employees. Small businesses may have very healthy internal networking in the beginning, as owners hire and work with people they know well enough to trust with components of the business. As the company grows, the owner will need to begin practicing internal networking to increase productivity and develop relationships with employees new to the business.

In the office, this often occurs as enterprise collaboration, when the owner devises new goals and campaigns based on discussion and input from employees. Project collaboration is more common in larger companies, where a network structure is mandated along project lines

that require input from multiple people in different departments. Employees practice internal networking of their own by being aware of the responsibilities and lives of their peers, offering community and input when appropriate.

Online, internal networking can be managed by the business in the form of Facebook groups for employees only, or similar sites where employees have a common network or blog page they can update for events or interesting news. For business purposes, a business-oriented wiki (a collaborative Web site that can be directly edited by all users) can accomplish similar goals.

NON-COMPETITION AGREEMENTS

Non-competition agreements are restrictive contracts between employers and employees that: 1) prohibit workers from revealing proprietary information about the company to competitors or other outsiders; or 2) forbid workers from competing with their ex-employer for a certain period of time after leaving the company. Non-competition agreements often appear as clauses within a larger employment agreement. Such agreements are a tool that small-business owners may use to try and ensure that key personnel do not walk off with company secrets or clients in order to start their own competing business or join an existing competitor in the area. Non-competition agreements have significant deterrent value in many situations, but they may also alienate some potential employees. It is important that their application within a firm is seen to be fair and equitable. Most firms that employ non-competition agreements do so to safeguard sensitive proprietary company information. Sensitive proprietary company information may cover any aspect of a business's operation, including production formulas, processes, and methods; business and marketing plans; pricing strategies; salary structure; customer lists; contracts; intellectual property; and computer systems.

These agreements are also called confidentiality or nondisclosure agreements or, simply, non-compete agreements, and they typically define confidential information, identify ownership rights, and detail employee obligations to ensure that confidentiality is maintained. But there are definite limits on the scope and duration of such covenants. Employers generally cannot use non-compete agreements to keep employees from practicing their trade or profession indefinitely. This is particularly true if the former employees were experienced in the specified occupation before they were hired. But while employees generally have every right to make use of skills and experiences gained in one company when they set off on the next stage of their lives, it is illegal for them to make off with trade secrets of their former place of employment.

Nonetheless, business owners do not always win court cases against ex-employees who pilfer in this area. In some cases, they lose for the simple reason that the business owner never identified the company's confidential or trade secret information. An ex-employee does not have the right to steal company confidential information or trade secrets that are identified as such. However, the ownership of information developed through company procedures must clearly differentiate between what belongs to the employee and what belongs to the company.

More often, however, courts throw out non-competition agreements out of concerns that such clauses constitute restraints of trade or that they force prospective

employees to choose between signing or continuing their job search elsewhere. In deciding whether to enforce a non-compete agreement, courts generally focus on two things. First, whether the covenant is ancillary to a valid employment contract. Second, whether the agreement imposes reasonable restrictions in terms of time and geography.

Enforcing Non-Ccompetition Agreements. Non-competition covenants are usually enforced by the courts if they are reasonable with respect to time and place and do not unreasonably restrict the former employee's right to employment. Of course, different parties have different conceptions of what constitutes a "reasonable" restriction. Legal experts contend that the courts are far more likely to side with the business owner if he or she does not go overboard on imposing restrictions in the following areas:

- Nature of prohibition. Restrictive covenants often are shaped with an eye toward the type of position that was held by the employee. Companies are more likely to target high-level managers or executives for stringent non-compete measures than programmers, writers, architects, or other staffers with specialized skills who have less overall knowledge of the company.
- Duration of agreement. Non-competition agreements are less likely to be enforced if they go beyond 1 year or so. In addition, according to Susan Gaylord Willis in an aricle in *HRMagazine*, businesses should consider establishing relatively short timeframes if the agreement stipulates a wide geographical scope "because the courts are unlikely to sustain a provision that leaves former employees with no way to earn a living in the field in which they are most experienced."
- Geographic area. It is generally recognized that small-business owners have a right to request competition protection from ex-employees in the immediate area in which they operate. Agreements, however, that attempt to forbid ex-workers from setting up a similar business in some distant geographic area or region are likely to be overturned unless the company conducts business in a multistate area or nationally.
- Restrictions on solicitation. Who is the employee prohibited from soliciting? Is it customers whom the employee personally acquired or any of the company's customers? The narrower the restriction, the more likely a court will enforce it.
- Restrictions on contacting other employees. The courts generally consider it unfair competition for one company to induce employees of another company who have acquired unique technical skills and secret knowledge during their employment to terminate their employment and use their skills and knowledge for the benefit of the competing firm. In such a case the plaintiff company could seek an injunction to prevent its former employees and the competing company from using the proprietary information.

Business owners should keep in mind, however, that attitudes toward non-competition agreements vary considerably from jurisdiction to jurisdiction. No federal statutes exist to regulate these types of agreements with former employees, unless the restrictions violate existing antidiscrimination laws. Instead, each state has its own unique contract laws. Some courts adhere to a "blue pencil" rule, meaning that they have the authority to edit unduly restrictive agreements so that the scope and duration of the agreement is lessened without throwing out the entire contract. Jurisdictions without such options in place, however, typically uphold the agreement in its entirety or strike it down entirely, leaving the employee free to pursue any course he or she wants. Consequently, it is important, when drawing up non-compete agreements, to investigate the related laws prevalent in the state (or states) in which the company conducts its business. For instance, in 2009 the California Supreme Court invalidated employee non-compete agreements except in cases involving the sale of a business. In *Edwards v. Arthur Andersen, L.L.P.*, an accountant had signed a non-compete agreement with an employee who, upon exiting the business, was then asked to sign a termination of that agreement with other release provisions. The employee refused and subsequently went to work for another business. The court sided with the former employee.

Other states are more willing to defend non-compete agreements, however. When Mark Papermaster, a twenty-six-year veteran of IBM, left that company in 2008 for a position at rival Apple, a U.S. district court in New York ordered him to stop work immediately out of fears he would share IBM trade secrets with his new employer. Papermaster had most recently served as IBM's vice president of blade development and had signed a non-compete agreement with the company in 2006. The agreement stipulated he not work for a competitor for at least 1 year after leaving IBM. IBM's complaint, quoted in *PC Mag.-com*, alleged that Papermaster was "in possession of significant and highly confidential IBM trade secrets and know-how, as well as highly sensitive information regarding business strategy and long-term opportunities."

One way in which the business owner can minimize the danger of having a non-compete agreement overturned in court is to create unique non-competition agreements for each employee affected. A company that

performs services locally, such as a diaper service or a carpet cleaning company, may need protection against pirating of customers in its area of operation. In that case, the company would want a covenant that would be of long duration, maybe 2 years, but limited geographically to the city, county, or metropolitan area. On the other hand, a company in a fast-moving field that sells nationally or internationally, such as a software publisher, may prefer a worldwide non-compete of shorter duration. With fast-moving businesses, the chances are any proprietary information gleaned from the employer would be public knowledge or obsolete within 6 months, and its disclosure after that would no longer pose a threat.

How a new employer handles the hiring process can also have an impact on the enforcement of a non-compete agreement. In an article published in *Mass High Tech*, Russell Beck explains that the language of an agreement is not the only component considered by courts; the nature of new employment is just as critical. Beck illustrates this point through the story of a successful salesperson who leaves her company for a direct competitor. In one version, the salesperson becomes the new company's director of marketing. In another version, she is hired as director of sales. As a director of marketing, the former salesperson is less likely to share proprietary information with the new employer, according to Beck. However, as director of sales, her position would more closely mirror the position she held at her former employer and would likely be more difficult to justify in a court. Beck concludes that the employee and new employer would be well-served to "take active steps to disclose (i.e., do not mislead or even be coy with the former employer about the new job), describe (i.e., the employee and the new employer should be clear about what the new role is and how it protects the former employer's legitimate business interests), and document their relationship before the employment begins."

POTENTIAL NEGATIVES

Although a useful tool in securing trade secrets, the non-compete agreement or clause may also complicate the development of loyalty with key employees. When asked to sign such an agreement many will feel like the less affluent partner in a couple planning to marry when the richer partner brings up the subject of a prenuptial agreement. Very small businesses have few employees and it is important that each one feel that he or she is a part of the whole, and that the loyalty that they offer is reciprocated.

As Jeffrey Gitomer explains rather colorfully in an article he wrote for *Long Island Business News*, "This single clause alienates and threatens every single salesperson in a manner that they begin their term of employment with a negative feeling toward the employer. 'This guy doesn't trust me and I haven't even stepped foot inside his building.' This feeling of animosity deepens when some form of employment termination occurs. Other lawyers begin huddling as to the enforceability of the non-compete clause and business once again reduces itself to the low-life challenge, 'My lawyer can beat up your lawyer.'"

Small-business owners must judge for themselves, and on a case-by-case basis, the value that having non-compete agreements has for their operations.

NONPROFIT ORGANIZATIONS

Nonprofit organizations are institutions that conduct their affairs for the purpose of assisting other individuals, groups, or causes rather than garnering profits for themselves. Nonprofit groups have no shareholders; do not distribute profits in a way that benefits members, directors, or other individuals in their private capacity; and (often) receive exemption from various taxes in recognition of their contributions to bettering the general social fabric of the community.

Nonprofit organizations are far more important to the overall U.S. economy than is generally recognized. There are indications that the sum total of nonprofit groups comprise a third sector of the American economy, along with the private (business) and public (government) sectors. As of 2009, there were over 1.5 million registered nonprofit organizations in the United States, with almost two-thirds of them registered as public charities and only around 8 percent as private organizations.

TYPES OF NONPROFIT ORGANIZATIONS

A wide range of charitable and other institutions are classified as nonprofit organizations under the Internal Revenue Code. Many of these qualify under the definition provided in Section 501(c)3 of the Code, which stipulates that all of the following qualify for tax-exempt status: "Corporations, and any community chest, fund or foundation, organized and operated exclusively for religious, charitable, scientific, testing for public safety, literary or educational purposes, to foster certain national or international amateur sports competition, or for the prevention of cruelty to children or animals," provided that the institutions adhere to basic standards of behavior and requirements of net earnings allocation. Section 501(c)3 makes provision for five different types of charity organizations, based on their funding and focus.

Publicly Supported Charity. These are organizations that depend largely on public donation to fund their activities and are the most well known by the public. Governed by 509(a)1, they include schools, hospitals, and churches.

Exempt Purpose Activity-supported Charities. These organizations are covered by 509(a)2 and are very similar to publicly supported charities, consisting of similar, well-known organizations. These nonprofits offer services which are exempt from taxation, but may also depend on fees they charge for these services in addition to grants and public funding.

Supporting Organizations for Charities. Supporting organizations are not directly supported through public funds, but have close ties to the nonprofits of 509(a)1 and 509(a)2 and channel the funds through to certain activities. These include foundations established by universities and hospitals for specific purposes. Foundations to support public institutions such as libraries and fire departments also fall in this category.

Public Safety Charities. These are a very select number of nonprofit organizations that file based on their role in testing for public safety. These roles include testing a wide number of products and services to ensure public health and safety is being promoted, apart from any associated business or industry.

Private Foundation. There are many different private foundations, but they function primarily as organizations that do not fit in the other categories. They tend to be privately funded but generate ongoing revenue through donations and investment holdings. Many focus on making private grants to other types of nonprofit organizations.

Within these types of organizations are another subset of nonprofits, defined by what purposes the organizations have. Charitable nonprofits, for instance, are the most numerous and deal primarily with poverty assistance, religious properties and outreaches, and general welfare. Advocacy nonprofits work to influence legislation and political processes. Social nonprofits are focused on members and include clubs, fraternities, and tournament organizations. Other nonprofits may be subsidiaries of other businesses or organizations.

ADVANTAGES AND DISADVANTAGES OF INCORPORATING

All nonprofit organizations are faced with the decision of whether or not to incorporate. As Ted Nicholas noted in *The Complete Guide to Nonprofit Corporations*, there are many benefits associated with incorporating: "Some are the same as those commonly enjoyed by *for-profit* business corporations. Others are unique to the nonprofit corporation. Perhaps the greatest advantages of all granted exclusively to organizations with bona fide nonprofit status is exemption from taxes at federal, state, and local levels." In addition to tax exemption, Nicholas cited the following as principal advantages of forming a nonprofit corporation:

- Permission to solicit funds. Many nonprofit organizations depend on their ability to solicit funds (in the form of gifts, donations, bequests, etc.) for their very existence.
- Low postage rates. Many nonprofit corporations are able to use the U.S. mail system at considerably lower rates than private individuals or for-profit businesses. To secure these lower rates, nonprofits must apply to the Postal Service for a permit, but this is generally not a major hurdle, provided that the nonprofit group has its affairs in order.
- Exemption from labor rules. Nonprofit organizations enjoy exemption from the various rules and guidelines of union collective bargaining, even if their work force is represented by a union.
- Immunity from tort liability. This advantage is not available in all states, but Nicholas observed that

some states still provide nonprofit charitable organizations with immunity to tort liability.

In addition, nonprofit corporations enjoy certain advantages that are also bestowed on for-profit corporations. These include legal life (nonprofit corporations are guaranteed the same rights and powers of individuals), limited personal liability, continued existence beyond the involvement of original founders, increased public recognition, readily available information on operations, ability to establish employee benefits programs, and flexibility in financial record keeping.

However, nonprofits also suffer the common disadvantages of incorporation. They must pay the fees associated with incorporation and institute reliable record-keeping systems to keep track of the organization's finances. This often means relinquishing personal control and appointing a board of directors. These requirements may not always agree with the original goals and purposes of the organization.

ORGANIZING A NONPROFIT ORGANIZATION

Those who wish to start a nonprofit organization should begin by considering their main purpose and the functions they will use to carry this purpose out. This will often place the nonprofit into a certain tax category which can be used to register the organization with state and federal governments. Those who are unsure of where to begin should consider enlisting the services of an attorney or accountant for the more complex proceedings.

Nonprofit entrepreneurs will also need to decide on organization focal points and a core of programs that will be used to achieve organizational goals. A leadership structure, including directors, officers, staff and administrative positions, will need to be decided on, along with any compensation for the positions. A physical location for the organization, or least a center of operations, should also be chosen. If the organization decides to begin as a corporation, the proper paperwork will need to be filled out and filed.

There are also less tangible steps that will need to be taken, including the formation of a strategic plan for achieving organizational goals and a business blueprint of the overall structure of the organization. Once methods of funding have been established, leaders will need to decide what avenues of communication should be used for raising awareness and increasing publicity.

FUNDRAISING

Nonprofit institutions can turn to several different methodologies to raise funds designed to support their mission. This is especially true for nonprofits that have tax-exempt status, which permits donors to deduct their gifts from their own personal income tax liability. Major avenues of fund-raising used by nonprofit organizations include fund-raising events (dinners, dances, charity auctions, etc.); direct mail solicitation; foundation grant solicitation; in-person solicitation; telemarketing; and planned giving.

In order to prosper, nonprofit institutions not only need to know where the sources of funding are, they also need to know how to solicit those funds and how to manage that revenue effectively when it comes into their possession. Fund-raising begins by determining exactly what financial and human resources are needed to accomplish the organization's mission. In the short run, fund-raising may be successful based on the organization's vision and the promises it makes to help its clients and community. In the longer run, contributors will want to see results. Performance is what counts, and poorly run nonprofits will find that their revenue streams will dry up quickly if they do not leverage their funds wisely.

For a small nonprofit organization, low-cost marketing and publicity planning is very important, and many small nonprofits are attracted to social networking sites online to spread their messages. Twitter, for instance, is a very popular application for nonprofit organizations to try to spread the word about their mission. The short status updates of Twitter allow the organization to make frequent, important updates, remind followers of upcoming events, and quickly raise awareness. More in-depth social networking sites such as Facebook allow nonprofit organizations to create group pages, customize their own tabs for easy linking and donations, and even hold nonprofit-oriented contests such as Nonprofit Page of the Month.

If a small nonprofit organization expects to grow quickly, it may want to devote time to creating a personal Web site that interested donators and volunteers can easily access for more information. Nonprofit Web sites should distinctly provide three important pieces of information: 1) the physical location of the organization so that volunteers can easily find it; 2) the hours of operation for the business and activities so that people know when to stop by; and 3) contact information such as phone numbers and e-mail for questions.

Other important Web site sections for nonprofits include newsrooms and blogs for updates on local news, and a mission statement or history section that explains what the nonprofit has done and what its primary aims are. A calendar section detailing upcoming events can also be very helpful, depending on the organization.

TRENDS IN THE NONPROFIT WORLD

Observers have pointed to several trends in the nonprofit community that are expected to continue or develop in the next few years. These range from changes in fund-raising

targets to expanded competition between nonprofit organizations to regulatory developments:

1. Increased emphasis on retaining donors. The renewal of steady donors is becoming a surer source of funding that acquiring new donors.
2. Corporate giving. Corporate giving to philanthropic causes has emerged as a major marketing tool for corporations in recent years, and this source of funds is expected to assume even greater importance as federal and state governments pare back their spending on various social programs.
3. Increased reliance on volunteerism. Reduced government expenditures on social programs is also expected to spur increased demand for volunteers who can meet the expected growth in organization activity. This need will be especially acute for nonprofit organizations primarily involved in charitable activities.
4. Competition with for-profit enterprises. Spurred by representatives of the for-profit small business community, regulatory agencies have undertaken more extensive reviews of ways in which some activities of tax-exempt groups allegedly damage the fortunes of for-profit businesses (which, of course, are subject to local, state, and federal taxes).
5. Increase in government regulation among nonprofits. Government oversight of fundraising activities may continue to increase at both the state and federal levels, at least in part because of the solicitation practices of fringe groups with suspect fund-raising tactics such as aggressive telemarketing.
6. Major donors will maximize benefits from contributions. Donors who can receive tax deductions, good publicity, or useful networking are being increasingly drawn to nonprofit organizations.

SUBSIDIARIES AND HYBRIDS

Not all businesses are clearly defined as for-profit or nonprofit. Some blur the line by combining different aspects of both kinds of business. One of the most common combinations is the for-profit subsidiary run by a nonprofit organization. This allows the nonprofit organization to maintain a smaller business that can bring in a source of revenue while also qualifying the parent company for the tax deductions and grants of a nonprofit organization.

Many nonprofits choose to create such a subsidiary so that it can perform profit-related activities that mesh with their business model but still keep their nonprofit status. For-profit subsidiaries can also bring in more professional employees by offering a greater chance at increased revenue and better benefits. A nonprofit hospital might create a for-profit pharmacy, a charity organization might begin a publishing company, and a public welfare business might become involved in the real estate market.

There are also other types of organizations that have both for-profit and nonprofit characteristics, hybrids that do not qualify for nonprofit status but use elements from each business model. One of the most popular is the growing sector of for-benefit businesses, companies that are strictly designed to generate revenue, but work in nonprofit circles or represent community or social interests. This is also referred to as social business or social enterprise.

NONPROFIT ORGANIZATIONS, AND HUMAN RESOURCES MANAGEMENT

Staffing decisions are among the most important decisions that nonprofit organizations make. Just as businesses and organizations of all sizes and areas of operation rely on their personnel to execute their strategies and advance their goals, so too do nonprofit groups. It follows, then, that nonprofit organizations need to attend to the same tasks as profit-seeking companies do when they turn to the challenges of establishing and maintaining a solid workforce.

When the overall economy is suffering, nonprofit groups will also be affected, because those who loyally tithe to favorite charities may suspend such activity due to a layoff or bankruptcy. In a 2010 article for the *New York Times*, Stephanie Strom reported, "A new survey of nonprofit groups suggests that this year will be as challenging for them as 2009, when many organizations suffered from declines in giving, delays in government payments and increased demand for their services," Lower income from donations results in fewer new hires, making it difficult to maintain the pace of the work that needs to be done. It may also mean paycuts and losses in volunteers who need to spend more time at their paying jobs to keep up with mortgages and other bills.

"An effective non-profit manager *must* try to get more out of the people he or she has," wrote Peter F. Drucker in *Managing the Non-Profit Organization.* "The yield from the human resource really determines the organization's performance. And that's decided by the basic people decisions: whom we hire and whom we fire; where we place people, and whom we promote. The quality of these human decisions largely determines whether the organization is being run seriously, whether its mission, its values, and its objectives are real and meaningful to people rather than just public relations and rhetoric."

Human resources managers know that people who are drawn to nonprofit work are similar to employees with for-profit companies in some essential ways. For example, a person is generally more effective when he or she is happy with work and feels fulfilled and appreciated. Managers can play a key role in this respect. In their 2010 book, *Coaching Skills for Nonprofit Managers and Leaders*, Judith Wilson and Michelle Gislason suggest allowing workers to evaluate the performance of the nonprofit manager. Some of the questions on an employee survey might include, "Am I empathetic?" and "Am I patient? Do I allow space for a thoughtful response?" Wilson and Gislason also note that these are great questions for managers of nonprofit organizations to ask themselves from time to time. Honest and open answers to these questions will allow a manager to stay in touch with employees, and in most instances, this will make them more productive and happy.

ASSESSING ORGANIZATION NEEDS

A key component of any endeavor to build a quality core of personnel is an honest assessment of current and future internal needs and external influences. Leaders and managers of nonprofit organizations should study workload history, trends in the larger philanthropic community, pertinent changes in the environment in which they operate (layoffs, plant closings, introduction of a new organization with a similar mission, legislative developments, etc.), personnel demands associated with current and planned initiatives, operating budget and costs, and the quality and quantity of the area worker pool, both for volunteer and staff positions. Moreover, all of these factors need to be studied within the framework of the organization's overarching mission statement. As many nonprofit leaders have noted, adherence to other general business principles (sound fiscal management, retention of good employees through good compensation packages, etc.) is of little solace if the organization loses sight of its mission it's reason for being in the process.

Writing in *Human Resources Management*, Gary Roberts, Carlotta Roberts, and Gary Seldon noted that "The process of selecting a competent person for each position is best accomplished through a systematic definition of the requirements for each job, including the skills, knowledge and other qualifications that employees must possess to perform each task." The authors identified several fundamental business principles concerning assessment of personnel needs that apply to nonprofits as well. These principles include:

- Filling positions with people who are willing and able to take on the job.
- Providing accurate and realistic job and skill specifications for each position. This helps ensure that positions will be filled by people capable of handling the necessary responsibilities.

- Writing job descriptions. These are essential to communicating job expectations.
- Choosing the best available candidates. Employees who are chosen on this principle are far more likely to have a positive impact than those who are chosen on the basis of friendship or expediency.
- Making performance appraisals. When coupled with specific job expectations, performance appraisals help boost performance.

RECRUITING AN ORGANIZATION WORKFORCE

For many nonprofit organizations, publicizing its very existence is the most important step that it can take in its efforts to recruit staff and volunteers alike. This is especially true if the nonprofit organization wishes to encourage volunteers to become involved. Volunteers are the lifeblood of countless nonprofit organizations, for they attend to the basic tasks that need performing, from paperwork to transportation of goods and services, to maintenance. Writing in *Quality Management in the Nonprofit World* Larry W. Kennedy noted that volunteers " supply valuable human resources which, when properly engaged, can be worth tens of thousands of dollars in conserved personnel costs to even the smallest organizations."

Nonprofit groups rely on three basic avenues to publicize their work and their staffing needs. The first is the Internet. This might include Twitter, Facebook groups, optimized Web sites, blogging, and input from friends and family who support the charity via e-mail, mass texts, or "status updates" on social networks. Next is the use of local media, including newspapers, newsletters, radio advertising, billboards, and so on. Last, other community organizations, including municipal governments, churches, civic groups, other nonprofit organizations, and others will effectively spread the word for a charitable organization. Many nonprofit groups have found that contact with some community organizations, particularly churches and civic groups, can be particularly rewarding since these organizations already have members that may be predisposed toward lending a hand.

Linking up with nonprofits that have similar missions but use different means is also very powerful. For example, the Red Cross, Unicef, Oxfam, Yele, and others banded together for the relief effort in Haiti after the 2010 earthquake that devastated the country. By offering a variety of charitable items, including medical care, clean water, food, clothing, and even doctors and surgeons, nonprofit organizations were able to make a tremendous difference for the people of Haiti. Almost all the people who went to Haiti associated with a nonprofit organization were volunteers.

Screening and Selection The interviewing process is another essential component of successful staffing for nonprofit groups. This holds true for volunteers as well as for officers, directors, and paid staff. Indeed, Kennedy remarked that "volunteers should be recruited and interviewed systematically the same way you would recruit paid staff. An orderly and professional approach to volunteer management will pay off handsomely for your organization. What you do in the recruitment phase of your work will set the standard for volunteer performance. If you are disciplined and well organized, you will often attract more qualified volunteers."

Managers of nonprofit organizations should make sure that they do the following when engaged in the process of staffing, screening and selection:

- Recognize that *all* personnel, whether they are heading up an organization's annual fund-raising drive or lending a hand for a few hours every other Saturday, have an impact on the group's performance. Certainly, some positions are more important than others but countless nonprofit managers can attest to the fact that an underperforming, unethical, or unpleasant individual can have an enormously negative impact on organization morale and organization reputation in the community. This can be true of the occasional volunteer as well as the full-time staff member.
- Use an application form that covers all pertinent areas of the applicant's background.
- Ensure that the screening process provides information about an individual's skills, attitudes, and knowledge. A simple online application form is a good place to begin the screening process but is not sufficient by itself. Second and perhaps even third interviews are advisable.
- Try to determine if the applicant or would-be volunteer is interested in the organization for legitimate reasons (professional development or advancement, genuine interest in the group's mission) or primarily for reasons that may not advance the organization's cause (loneliness, corporate burnout, etc.).
- Objectively evaluate prospective employees and volunteers based on criteria established in the organization's job specifications.
- Be realistic in putting together the volunteer work force. "Managers cause most of the problems with volunteers by making unreasonable assumptions about their intentions and capabilities," wrote Kennedy. An organization that sets the bar too high in its expectations of volunteers (in terms of services

provided, hours volunteered, etc.) may find itself with a severe shortage of this potentially valuable resource.

- Recognizing that would-be volunteers and employees bring both assets and negative attributes to the organization, nonprofit groups should be flexible in accommodating those strengths and weaknesses. "If you want people to perform in an organization, you have to use their strengths not emphasize their weaknesses," wrote Drucker.

Organizations that pay attention to these guidelines will be far more likely to enjoy positive and lasting relationships with their volunteers and staff than those who fill their human resource needs in haphazard fashion. As Kennedy wrote, "the time to begin evaluating the probable reliability of human resources is prior to their insertion into your internal structure."

ORIENTING STAFF AND VOLUNTEERS TO THE ORGANIZATION

Training is a vital component of successful nonprofit organization management. But many nonprofit managers fail to recognize that training initiatives should be built for all members of the organization, not just those who are salaried employees. "Specialized training should be designed for every person in the organization, including board members and volunteers," contended Kennedy. "The principles of quality management should be reinforced in each phase of training, with generous opportunities given to the trainees to talk about their questions and concerns .... If we select and train people with well-established and consistently implemented guidelines, we greatly increase the potential for team building. Beyond that, a common objective, a commitment to quality, a sincere concern for the team members, and a dedicated leader can cause wonderful things to happen."

Poor Performers. Many nonprofit organizations find that at one point or another, they must address poor performance by a member of the organization. When that person is a paid member of the staff, dealing with the issue is in many respects no different than it would be in the for-profit world. Organizations of all types have a right to assume certain standards of performance from paid employees, and if that standard is not met, they should by all means take the steps necessary to ensure that they receive the necessary level of performance from that position, even if that means firing a poor worker.

The situation becomes more complex when the person is a volunteer, however. The volunteer worker is an essential element of many nonprofit organizations, and the primary characteristics of volunteerism selfless service make it difficult to remove poor performers. In addition, insensitive handling of one volunteer can have a negative impact on other volunteers upon which an organization relies. Nonetheless, Kennedy stated that "volunteers should be held accountable just as though they were being paid top dollar to work. This does not mean that you can be careless about people's feelings. Even for-profit managers have learned that managing and supervising requires certain social graces and sensitivity to every individual. However, the reluctance of nonprofit managers to hold volunteers accountable to reasonable levels of performance or to terminate bad volunteer relationships can be their downfall."

Drucker noted that most nonprofits will, sooner or later, have to deal with people "who volunteer because they are profoundly lonely. When it works, these volunteers can do a great deal for the organization and the organization, by giving them a community, gives even more back to them. But sometimes these people for psychological or emotional reasons simply cannot work with other people; they are noisy, intrusive, abrasive, rude. Non-profit executives have to face up to that reality." If all else fails, such disruptive volunteers should be asked to leave. Otherwise, other members of the organization, including the executive, will find that their capacity to contribute is diminished.

Drucker agreed that dismissing an underperforming or otherwise undesirable volunteer can be a difficult task. "The non-profit executive is always inclined to be reluctant to let a non-producer go. You feel he or she is a comrade-in-arms and make all kinds of excuses," he granted. He contended that nonprofit managers should adhere to a basic guideline in such instances: "If they try, they deserve another chance. If they don't try, make *sure* they leave.... An effective non-profit executive owes it to the organization to have a competent staff wherever performance is needed. To allow non-performers to stay on means letting down both the organization and the cause."

NONPROFIT ORGANIZATIONS, AND TAXES

In recognition of the "public good"-oriented goals and objectives of nonprofit organizations, U.S. law grants these groups a number of special privileges. Of these, perhaps none is more valuable than the bestowal of tax-exempt status. Such status basically means that the organization's income and assets are not subject to federal taxes, and federal exemptions often (though not always) pave the way for state and local tax exemptions as well. For-profit enterprises, on the other hand, are subject to local, state, and federal taxation. In his 2010 book *The Law of Tax-Exempt Organizations*, Bruce R. Hopkins wrote, "While adopting a particular practice is not a requirement for tax exemption, the agency believes that an organization that adopts some or all of these practices is more likely to be successful in pursuing its exempt purposes and earning public support." The agency Hopkins mentions is the Internal Revenue Service (IRS), and a nonprofit organization will do well to stay on the good side of the agency in any effort to mainstain its tax-exempt status.

One of the main objectives of private enterprise is the pursuit of profit for the owners of the enterprise. Profits gained through private enterprise are taxable. Activities undertaken by tax-exempt organizations, however, have as their objective obtaining profits for use in the continued provision of services for the public good. Profits earned by organizations as a result of their tax-exempt missions are therefore not taxable. Nonprofit organizations can engage in virtually any business enterprise in the fulfillment of their mission objectives without jeopardizing their tax-exempt status. When these organizations undertake activities that are *unrelated* to their stated missions, the profits generated from those activities are taxable. It should be noted, however, that complete exemption from federal taxation does not *automatically* mean that the organization avoids other kinds of taxation, such as state and local income taxes, sales taxes, and property taxes.

Hopkins noted that not all nonprofit organizations qualify as tax-exempt organizations: "Nearly every tax-exempt organization is a nonprofit organization, but not all nonprofit organizations are eligible to be tax-exempt," he said. "The concept of a nonprofit organization is broader than that of a tax-exempt organization. Some types of nonprofit organizations (such as mutual, self-help type entities) do not, as a matter of federal law, qualify for tax-exempt status." While the majority of nonprofit organizations are presumed to be tax-exempt in nature, there are exceptions to that premise. The terms *nonprofit* and *charitable* are not interchangeable. A nonprofit organization is not necessarily charitably motivated while an organization that is truly charitable in nature may well be a profit-making enterprise. Both types of organizations may be entitled to tax-exempt status from the IRS. For example, a religious and apostolic association, even if it is organized for profit, and a teachers' retirement fund association, which is operated to produce profits for its beneficiaries, are both eligible for tax exemptions.

DEVELOPMENT OF NONPROFIT TAX EXEMPT STATUS

Until the end of the nineteenth century, all U.S. entities, whether they were private individuals or businesses, were exempt from taxation unless they were subject to a particular tax levy. The Tariff Act of 1894, however, changed that situation irrevocably. That legislation imposed a flat 2 percent tax rate on all U.S. corporations, but in recognition of the fundamentally different goals and objectives of for-profit businesses and charitable and educational groups, the bill exempted the latter organizations from the tax. The important aspect of this legislation was that

organizations involved in activities and those whose profits would be used for altruistic purposes were specifically excluded from the requirement to share the profits of their work through taxation. The initial emphasis of tax exemption was to protect those organizations involved in charitable activities from taxation, and it has remained as the central function of tax-exempt law to this day.

In recent years, the United States has seen a dramatic increase in the number of tax-exempt organizations operating around the country. Indeed, the rise in the number of churches, nursing homes, hospitals, chambers of commerce, charitable organizations, and social service agencies in many communities has led some observers to voice concern about the tax-base stability of some areas. Some cities and towns find that a substantial portion of their entire lot of privately held real estate is owned by tax-exempt organizations. In such areas there may not be any revenue flowing into local tax coffers from a taxable base. This state of affairs has led some corporate and individual taxpayers to register complaints about the "free ride" that some exempt organizations enjoy. Even the tax-exempt status of churches, protected from the very beginning of the tax code, has been questioned in recent years.

NONPROFITS AND PROFITABILITY

Many people operate under a fundamental misconception about nonprofit organizations and revenue. The word 'nonprofit' may carry with it an inference about profit that causes some people to think profitability by a nonprofit organization is illegal. This is not at all the case. Nonprofit, tax-exempt organizations are free to do anything a for-profit company might do in pursuit of their goals, *including making profits*. The law is designed to provide all the benefits of a free-market system plus the special favor of tax incentives for individuals and corporations who want to contribute financially to the nonprofit organization. Not only may nonprofit organizations operate enterprises profitably as tax-exempt organizations, they may also prosper through the patronage of others.

However, there are significant stipulations in place concerning the *distribution* of those profits that must be met for an organization to claim tax-exempt status. The stipulations that govern distribution of profits are delineated in Section 501 of the Internal Revenue Code:

1. The organization must be organized and operated exclusively for one or more of the following purposes: for religious, educational, charitable, scientific, or literary purposes; to test for public safety; to encourage amateur sports competition (either national or international); to prevent cruelty to children or animals; to lessen the burdens of government (through creation and maintenance of public buildings, monuments, parks, natural attractions, etc.); and to maintain public confidence in the legal system. Naturally, the organization may be involved in more than one of the above areas.
2. Net earnings garnered by the organization may not, under any circumstances, be distributed for the private benefit of individuals.
3. The organization may not participate in any way in any political campaigns, directly or indirectly, although it can use a political action committee or PAC to engage in political activities that are not political campaign activities.
4. The organization may not spend "excessive" time or energy on efforts to influence legislation. It is a common misconception that nonprofits may not engage in legislative activities, but as Hopkins stated, "a charity is permitted to engage in far more lobbying efforts than most people realize. Indeed, under some circumstances, a charitable organization can spend more than one-fifth of its funds for legislative ends."

FILING FOR TAX EXEMPT STATUS

A wide variety of organizations are eligible for tax-exempt status because of their goals and activities. These include the following:

- Corporations organized under an Act of Congress (includes federal credit unions)
- Title-holding corporations for exempt organizations
- Religious organizations
- Educational organizations
- Charitable organizations
- Scientific organizations
- Literary organizations
- Public safety organizations
- Organizations devoted to national or international amateur sports competitions
- Organizations devoted to preventing cruelty to children
- Organizations devoted to preventing cruelty to animals
- Civic leagues
- Social welfare organizations
- Local associations
- Labor organizations
- Agricultural and horticultural organizations
- Business leagues, chambers of commerce, and real estate boards

- Social and recreational clubs
- Fraternal beneficiary societies and associations
- Voluntary employees' beneficiary associations
- Domestic fraternal societies and associations
- Teachers' retirement fund associations
- Benevolent life insurance associations
- Mutual irrigation or ditch companies
- Mutual or cooperative telephone companies
- Cemetery companies
- State-chartered credit unions and mutual reserve funds
- Mutual insurance companies or associations
- Cooperative agricultural organizations
- Supplemental unemployment benefit trusts
- Employee-funded pension trusts (provided they were created prior to June 25, 1959)
- Organizations of past or present Armed Forces members
- Group legal services organizations
- Black lung benefit trusts
- Withdrawal liability payment funds
- Veterans' organizations (provided they were created prior to 1880)
- Religious and apostolic associations
- Cooperative hospital service organizations
- Cooperating service groups of operating educational organizations
- Farmers' cooperatives
- Political organizations (parties, committees, etc.)
- Homeowners' associations

Some organizations, such as churches, associations of churches, and auxiliary agencies of churches like mission societies and youth groups are generally considered automatically tax-exempt. They are not required to request this status from the government taxing agencies. Virtually all other kinds of organizations that fit legal definitions of eligibility for tax-exempt status because of their special benevolent purposes and goals cannot make the same assumption. They must ask the Internal Revenue Service to officially recognize their tax-exempt status.

To do so, organizations have to file an application for tax exemption with the IRS. (Nonprofit organizations may also have to make separate applications to state and local tax agencies if they wish to secure exemptions from taxes imposed by those jurisdictions.) In most instances, this filing step is a mere formality; approval of tax exemption is almost always based on the IRS's ruling on the organization's exemption application. The primary legal basis for all tax exemptions is Section 501 of the Internal Revenue Code of 1954. Organizations that have their exemption application approved, then, will often find that they are free from tax obligations at the local and state levels as well.

Experts note that while some nonprofit organizations are exempted from paying certain taxes, that does not mean that they have no filing obligations. "Despite the favoritism the law frequently bestows on nonprofit organizations, the reporting requirements are not one of them, particularly when the organization is tax-exempt," wrote Hopkins. "The annual information return that most tax-exempt organizations have to file with the IRS is far more extensive than the tax returns most commercial businesses must file. Then, there may be several state annual reports (if the organization is doing business in more than one state) and the state annual charitable solicitation act reports (perhaps over 40 of them)." Given this reality, most nonprofit organizations choose to use the services of professional attorneys and accountants in compiling and delivering these reports.

What To Know About Tax-Exempt Entities. According to a March 25, 2010, IRS news release, there are six facts about organizations that are tax-exempt that business owners, consumers, volunteers, and those who donate should be aware of. These facts are:

- In almost every instance, organizations that are tax-exempt have annual reports that are available to the public. In addition to the annual report, the application for tax exemption for a given entity is also available to the public. Anyone has the right to view these documents and when the request for the documents is made, the tax exempt entity is required to provide the documents within 30 days.
- The list of people or public institutions who made donations to a given tax-exempt entity is not information that the public is privy to. Therefore, those who donate to a given nonprofit organization may maintain their anonymity should they choose to. The exception to this rule is political organizations and private foundations.
- There are easy ways to find out whether or not an organization is tax-exempt. Those who make or are considering making donations can find out by simply calling the entity's main office or headquarters. If this proves to be too time consuming it is possible to obtain the information

from the IRS, which drafts a list of all the tax-exempt organizations in a document called *Publication 78*.

- Just because an entity is tax-exempt does not necessarily make it a nonprofit organization. A charitable entity that can receive deductable donations generally includes volunteer fire departments, organizations that aid veterans of the armed services, some fraternal institutions, and a number of other charity types listed in the IRS tax code 501(c).
- When an organization is tax-exempt but is not legally allowed to receive donations or other contributions that are tax-deductible, a representative of the organization or a publication must make this clear to the public and those who may wish to make donations.

UNRELATED BUSINESS INCOME

U.S. law has long differentiated between the activities of tax-exempt organizations that are related to the performance of tax-exempt functions and those that are not. Income garnered from these latter activities is subject to taxation. For incorporated organizations, net revenue from unrelated activities is subject to federal corporate income tax law, while for organizations that are not incorporated, this revenue commonly referred to as "unrelated business income" is subject to the canon of federal tax law on individuals. "The objective of the unrelated business income tax is to prevent unfair competition between tax-exempt organizations and for-profit, commercial enterprises," explained Hopkins. "The rules are intended to place the unrelated business activities of an exempt organization on the same tax basis as those of a nonexempt business with which it competes.… An organization's tax exemption will be denied or revoked if an inappropriate portion of its activities is not promoting one or more of its exempt purposes." Not only will this have a negative impact financially, but it can have long-term ramifications for the nonprofit's reputation. Take for example the French Hospital Medical Center of San Luis Obispo, California, which reportedly funneled monies into a housing loan to Alan Iftiniuk, the nonprofit hospital's CEO. This was after paying him a salary of $971,902. In addition, it was reported that French Hospital was netting more than $6 million per year. Following this disclosure, officers of the nonprofit medical facility announced that they would be expanding the hospital. As Karen Velie pointed out in an article for *Cal Coastal News* in March 2010, "Because of their tax-free charity status, not-for-profit hospitals such as French cannot funnel monies earned to owners or shareholders. Profits by federal law must be put back into the organization." When news like this leaks out, the organization becomes less attractive to would-be volunteers. Those who would have made charitable donations are also impacted, since donors are generally not in favor of their donations going toward a cushy salary or housing perks for a company officer.

The area of tax law covering unrelated business income, noted Hopkins, has been one marked by upheaval and change in recent years. "As tax-exempt organizations struggle to generate additional income in these days of declining governmental support, proposed adverse tax reform, more sophisticated management, and greater pressure for more services [tax-exempt organizations] are increasingly drawn to service-provider activities, some of which may be unrelated to their exempt purposes."

One emerging issue involves use of the Internet by nonprofit organizations. Some experts have expressed concern that linking to non-exempt sites, soliciting contributions online, or disseminating protected information could put an entity's exempt status at risk. In the case of the 2010 Haiti earthquake, many who made charitable donations via text or Internet were concerned that their money was not used entirely toward the relief effort. Some reports made reference to the fact that Visa, MasterCard, and other credit card companies were still taking their normal 2 to 3 percent cut on charges. The public was outraged at the notion of these companies profiting from the tragedy. Soon after this news went public, the credit card companies, which included American Express and Discover, announced that they would waive the 2 to 3 percent service charge. (In good news for Americans who donated to the Haiti effort, the IRS made an allowance for 2009 tax returns even though the donations to Haiti had been given in 2010, people filing their 2009 tax returns were able to claim the donations for the previous year.)

NONQUALIFIED DEFERRED COMPENSATION PLANS

Nonqualified deferred compensation plans are used by businesses to supplement existing qualified plans and provide an extra benefit to key personnel and highly compensated employees (HCEs). In small businesses, this usually includes the owner and founder, but an HCE is defined by the Internal Revenue Service (IRS) as someone who owns 5 percent or more of the business, or who was compensated $105,000 in 2008, $110,000 or more in 2009 or 2010. Broadly defined, a nonqualified deferred compensation plan (NDCP) is a contractual agreement in which a participant agrees to be paid in a future year for services rendered this year. Deferred compensation payments generally commence upon termination of employment (e.g., retirement) or preretirement death or disability. Nonqualified deferred compensation plans are often geared toward anticipated retirement in order to provide cash payments to the retiree and to defer taxation to a year when the recipient is in a lower tax bracket.

There are two broad categories of nonqualified deferred compensation plans: elective and nonelective. In an elective NDCP an employee chooses to receive less current salary and bonus compensation than he or she would otherwise receive, postponing the receipt of that compensation until a future tax year. In nonelective NDCPs the employer funds the benefit and does not reduce current compensation in order to fund future payments. Such plans are, in essence, post-termination salary continuation plans. The argument behind such nonelective plans, funded by employers, is the retention of key employees.

One feature of NDCPs that has made them very popular with large corporations and some small businesses is the fact that they are not limited by the same nondiscrimination rules imposed on qualified plans. NDCPs may be offered to a select group of employees only, unlike qualified plans to which all employees are eligible by definition. Consequently, the cost of this benefit is lower since it accrues to fewer people. Companies have recognized other advantages associated with nonqualified deferred compensation plans as well. Administrative costs, for example, are lower with a nonqualified plan than for similar qualified plans. Until December 31, 2004, companies were not required to report NDCPs to the IRS. They were only required to send a one-time letter to the U.S. Department of Labor stating that the plan was in place and reporting the number of participants it covered. With the passage of the American Jobs Creation Act of 2004, however, an additional reporting requirement was added. Companies with NDCPs now must also report to the IRS (on Form W-2 or 1099) amounts deferred and earned under the plan, even if these amounts are not included as taxable income.

There are two main types of nonqualified deferred compensation plans from which small business owners may choose: supplemental executive retirement plans (SERPs) and deferred savings plans. These two options share several common characteristics, but there are also important differences between the two. For example, eligibility for both plans may be based on the executive's salary, position, or both. But whereas deferred savings plans require employees to contribute their own earnings, executives that are placed in SERPs receive their compensation from their employers.

SUPPLEMENTAL EXECUTIVE RETIREMENT PLANS (SERPS)

SERPs generally are structured to mirror defined-benefit pension plans. They promise a stated benefit from the employer at retirement. SERP benefits, which can be allocated in conjunction with other benefit plans like qualified-plan savings and Social Security benefits, may be calculated in any number of ways. Employers may choose to pay their executives a flat dollar amount for an agreed-upon number of years; a percentage of their salary at retirement multiplied by their years with the company; or a fixed percentage of their salary at retirement for a given number of years. Companies also have the option of funding SERPs either through general assets (at the time of the employee's retirement) or via sinking funds or corporate-owned life insurance (COLI).

Sinking Funds. Businesses that utilize the sinking fund method allocate money on an annual basis to a fund that

will cover benefit payments as they come due. This money can be invested by the company as it sees fit, but it is nonetheless earmarked for retirement payments.

Corporate-Owned Life Insurance (COLI). Under the COLI funding method, businesses buy life insurance plans on those directors and executives that they wish to compensate. Each company pays the premiums on the purchased policies, and as each executive retires, the firm pays out his or her benefits from operating assets for a previously established period of time. The key benefit for the small-business owner under the COLI arrangement is that his or her business is designated the sole beneficiary of the tax-free proceeds from the insurance policy. Upon the death of an executive for whom such a policy has been acquired, the company is reimbursed for some or all of the costs of the insurance plan the actual benefits paid, the insurance premiums. According to a March 2010 *PRNewswire* press release, a survey released by Clark Consulting notes, "Corporate-owned or trust-owned life insurance (COLI/TOLI) is the most commonly used informal funding vehicle for both types of plans. 56% of respondents informally funding their NQDC [NDCP]plans and 100% of those informally funding their SERPs use COLI/TOLI." Entrepreneurs should note, however, that their firm will not receive a tax deduction for its contributions to a SERP until the director or executive actually receives the benefit payments. Businesses using qualified compensation plans, on the other hand, receive deductions in the current year.

DEFERRED SAVINGS PLANS

Deferred savings plans are similar to 401(k) plans in that affected employees are allowed to set aside a portion of their salary and a portion of bonuses into the plan. This money is directly deducted from employee paychecks, and taxes are not levied on the money until the employee receives it.

According to the 2010 *Employee Benefits Guide* by Barry Kozak, deferred compensation plans can be set up in a manner that allows the employee to decide at a point before services are rendered when, and in some cases how much, his or her currently taxable income will be paid at a later date. These kinds of deferred compensation options are usually thought of as a form of retirement pay. For this reason, NDCPs are often part of a structured retirement plan, and may often work symbiotically with a 401(k) retirement fund. This is an intelligent way for an employee to get the most out of both plans. As of 2010, a 401(k) will only allow an employee to defer $15,000 per year of his or her income. By pairing the 401(k) with the NDCP, the employee can defer and save as much as he or she desires.

Plans are set up to cover obligations in one of two ways: 1) the company simply guarantees a fixed rate of return on the deferred contributions, which come from its general operating assets at the time of payout; 2) the company ties each executive's savings to the performance of a particular mutual fund which the executive selects from among several offered by the plan. Companies that set up a fixed rate of return on the deferrals may invest the monies in question however they wish, provided they ultimately meet their payout obligations. In addition, consultants note that some small businesses (and large ones as well) have established a policy wherein they will offer matching funds on employee deferrals or add profit-sharing or incentive-based contributions.

Executives with deferred savings plans have a variety of payout options to choose from, although the number of options was reduced with the passage of the American Jobs Creation Act of 2004. Distribution of plan funds is allowed in the following ways under the American Jobs Creation Act: separation of service; disability; a specific time under the plan that is defined in the plan documentation; a change in company ownership or control of the corporation; an unforeseen emergency (as defined in the statute); or death. If an executive enrolled in this type of plan dies or is fired from the company prior to retirement, he or she (or their family) receives a lump-sum payout of their benefits. It should be noted, however, that nonqualified deferred compensation plans will not be protected from creditors if the company that created them files for bankruptcy.

PLANS FOR TAX EXEMPT ORGANIZATIONS

Nonqualified deferred compensation plans may also be utilized by tax-exempt organizations, but managers of these entities should be aware that for tax-exempt organizations, such plans are subject to considerably more stringent IRS regulations. Nonetheless, by subjecting employer-paid, tax-deferred compensation to risk of forfeiture or by paying the required taxes for these plans, tax-exempt organizations are able to develop workable alternatives for funding nonqualified deferred compensation plans.

Funding Options. Tax-exempt organizations seeking to fund employer-paid deferred compensation plans can choose from a number of options:

1. Unfunded benefits that vest at retirement. Under this strategy, employers provide supplemental retirement benefit plans with assets that are not dedicated to funding the plan. If the employer runs into financial trouble before the employee or employees covered under the plan retire, it can use those assets to pay off its creditors.

2. Unfunded benefits that vest during employment. Vesting occurs according to plan objectives as defined by the employer. As vesting occurs, the employer provides a cash distribution to cover taxes. The ultimate benefit at retirement is reduced to reflect the annual distribution of a portion of the benefit to pay taxes.
3. Benefits funded with deferred annuities. Under this arrangement, the small-business owner would acquire deferred annuities in the name of participating employees. The employer that takes this track usually provides cash distributions to cover the tax on both the contribution and the cash distribution, since contributions to the annuity are regarded by the IRS as taxable income.

Similarly, organizations looking to fund voluntary nonqualified deferred compensation plans may pursue the following funding alternatives:

1. Traditional deferred compensation plans with non-compete clauses. These do not pay out money until the end of a specified period of time. If an employee who is part of the plan leaves the company to join a competing business before that specified period of time elapses, the employee forfeits the contributions. Analysts note, however, that this choice is often not a palatable one for employers, since employees will likely resent efforts to impose such restrictions.
2. Deferred annuities. Under this alternative, employees purchase deferred annuities with after-tax income, and they do not owe taxes on annuity earnings until payout.
3. Deferral using after-tax dollars. Under this plan, employees are immediately vested and taxed on the deferred compensation. After-tax compensation is subsequently placed in a mutual fund by the employer, but it is maintained for the benefit of the employee.

NONTRADITIONAL FINANCING SOURCES

Entrepreneurs can turn to a variety of sources to finance the establishment or expansion of their businesses. Common sources of business capital include personal savings, and loans from various sources, including friends and relatives, financial institutions such as banks or credit unions, commercial finance companies, and the Small Business Administration and other government agencies. Other sources might include venture capital firms, investment clubs, and personal or corporate credit cards. But for some businesspeople, these sources of financing are either unavailable, or available with restrictions or provisions that are either impossible for the company to meet or deemed excessive by the business owner. In such instances, the capital-hungry entrepreneur has the option of pursuing a number of nontraditional financing sources to secure the money that his or her company needs. Some of the more common nontraditional financing sources include selling

assets, borrowing against the cash value of a life insurance policy, and taking out a second mortgage on a home or other property.

Selling Assets. Some entrepreneurs choose to sell some of their personal or business assets in order to finance the opening or continued existence of their enterprises. Generally, business owners who have already established the viability of their firms and are looking to expand their operations do not have to take this sometimes drastic course of action, since their records will often allow them to secure capital from other sources, either private or public. Whether selling personal or business assets, the small-business owner should take a rational approach. Some entrepreneurs, desperate to secure money, end up selling business assets that are important to basic business operations. In such instances, the entrepreneur may end up accelerating rather than halting the demise of his or her business. Only nonessential equipment and inventory should be sold. Similarly, care should be taken in the selling of personal assets. Items such as boats and antiques can fetch a decent price. But before embarking on this course of action, the entrepreneur should objectively study whether the resulting income will be sufficient, or whether the enterprise's financial straits are an indication of fundamental flaws.

Borrowing Against the Cash Value of a Life Insurance Policy. Entrepreneurs who have a whole life policy have the option of borrowing against the policy. (This is not an option for holders of term insurance.) This can be an effective means of securing capital provided that the owner has held the policy for several years, thus giving it some cash value. Insurers may let policyholders borrow as much as 90 percent of the value of the policy. As long as the policyholder continues to meet his or her premium payment obligations, the policy will remain intact. Interest rates on such loans are generally not outrageous, but if the policyholder dies during the period in which he or she has a loan on the policy, benefits are usually dramatically reduced.

Second Mortgage. Some entrepreneurs secure financing by taking out a second mortgage on their home. This risky alternative does provide the homeowner with a couple of advantages: interest on the mortgage is tax deductible and is usually lower than what he or she would pay with a credit card or an unsecured loan. But if the business ultimately fails, this method of financing could result in the loss of the home. Using a second mortgage as a vehicle for financing a company is very risky and is the best option only for people who want to borrow all the money they need at one time and secure fixed, equal payments.

Nonprofit Groups and the Government as Potential Lenders. The 2009 American Recovery and Reinvestment Act made it possible for many small-business owners to keep their doors open, but for many others the stimulus was not itself sufficient. To meet the needs of small businesses and to keep them from shutting down, some nonprofit groups and government programs stepped up to offer finances for struggling small enterprises. "These lenders ... working in tandem, offer small loans to businesses turned down by recession-bitten banks," wrote Dee DePass in the *Minneapolis Star Tribune*. DePass added, "These nonprofits and state entities ... match each others' loans, guarantee loans and get capital and jobs flowing for small companies."

Other Possible Sources of Financing. Some entrepreneurs obtain financing for growth and expansion through franchising or licensing. Basically, they get money by selling the rights to a unique business or product to other companies. Other small-business owners are able to form alliances or partnerships with firms that have a vested interest in their success, such as customers, suppliers, or distributors. These business owners may obtain funds from their partners through cooperative work agreements, barter arrangements, or trade credit. For those seeking loans from nontraditional sources, the Internet provides a potential source of leads. For example, America's Business Funding Directory, at www.businessfinance.com, includes a searchable database of nontraditional funding sources.

Experts recommend using nontraditional financing to start a business or provide funds during periods of rapid growth, but emphasize that small-business owners should consider it a temporary arrangement. The use of nontraditional financing is a last resort, and a business owner should make every effort possible to limit the time frame during which such financing is used.

Unorthodox and Modern Methods for Getting Financial Help. In a February 2010 article in *Business Week*, Steve Nielsen discussed two of the best ways to obtain working capital in a distressed economy. First, the entrepreneur should consider suppliers. Nielsen wrote, "Relationships that small business owners have with their suppliers can be a great resource for financing." Nielsen recommends treating a loan given by a supplier as seriously as any other loan from a venture capitalist or banking institution. This means that documents should be drawn up, credit reports run, and contractual agreements signed so that everyone understands all of the terms of the loan.

Nielsen also noted that networking at events such as seminars, conventions, workshops, and other gatherings can help the small-business owner come in contact with potential venture capitalists or joint venturers that make it possible financially to get off the ground, or to breathe

new life into an existing small business. Nielson wrote, "small business owners can continue to build these relationships online through niche Web sites with forums to engage in discussions, ask questions, and seek advice. More and more small business owners and entrepreneurs are turning to these sites and finding the resources they need for financing."

NONVERBAL COMMUNICATION

Nonverbal communication, such as facial expressions, gestures, posture, and tone of voice, is an important component of most human communications, including, of course, business communications. Most people use nonverbal signals when communicating. Understanding nonverbal communication techniques can help a small-business owner get a message across or accurately interpret a message received from another person. On the other hand, nonverbal communication can also send signals that interfere with the effective presentation or reception of messages. "Sometimes nonverbal messages contradict the verbal; often they express true feelings more accurately than the spoken or written language," Herta A. Murphy and Herbert W. Hildebrandt noted in their book *Effective Business Communications.* In fact, studies have shown that between 60 and 90 percent of a message's effect may come from nonverbal cues. Therefore, it is important for small-business owners and managers to be aware of the nonverbal messages they send and to develop the skill of reading the nonverbal messages contained in the behavior of others. There are three main elements of nonverbal communication: appearance, body language, and sounds.

Appearance. In oral forms of communication, the appearance of both the speaker and the surroundings are vital to the successful conveyance of a message. In the 2010 edition of their book, *Nonverbal Communication in Human Interaction,* Mark L. Knapp and Judith A. Hall discussed physical appearance. They wrote that co-workers and managers take notice of a number of appearance-based variables. People in an office settings take notice of whether someone smiles or frowns a great deal and whether he or she has poor hygiene. They will also take notice of things like wardrobe is it too formal or informal? Does he or she wear the same outfit nearly every day? The messages sent may or may not convey the truth about an employee, but employees are well advised to be aware of what kinds of messages they are sending.

Similarly, such details of the surroundings as room size, furnishings, decorations, lighting, and windows can affect a listener's attitudes toward the speaker and the message being presented. The importance of nonverbal cues in surroundings can be seen in the desire of business managers to have a corner office with a view rather than a cubicle in a crowded work area.

Body Language. Body language, and particularly facial expressions, can provide important information that may not be contained in the verbal portion of the communication. Facial expressions are especially helpful as they may show hidden emotions that contradict verbal statements. For example, an employee may deny having knowledge of a problem, but also have a fearful expression and glance around guiltily. Other forms of body language that may provide communication cues include physical contact between the speaker and the listener (a handshake, for example), posture, and gestures. For example, a manager who puts his feet up on the desk may convey an impression of status and confidence, while an employee who leans forward to listen may convey interest. Gestures can add emphasis and improve understanding when used

sparingly, but the continual use of gestures can distract listeners and convey nervousness..

Sounds. The tone, rate, and volume of a speaker's voice can convey different meanings, as can sounds like laughing, throat clearing, or humming. Silence, or the lack of sound, is a form of nonverbal communication as well. Silence can communicate a lack of understanding or even hard feelings in a face-to-face discussion.

HOW TO INTERPRET NONVERBAL COMUNICATION

In her 2008 book, *The Nonverbal Advantage: Secrets and Science of Body Language at Work* Carol Kinsley Goman discussed what she calls the Five C's. These are "context, clusters, congruence, consistency, and culture." Goman wrote, "Although first impressions may not always be accurate, you can improve your ability to read someone's body language by filtering your impressions through the five C's."

Context. When observing body language, it is important to place it in context. Goman uses the example of a person out in the cold, hunched and shivering, which in that context signifies nothing other than the fact that the person is cold. But at an office desk, this same hunched body language suggests many things lack of confidence, unsureness, distress, fear, and perhaps a weak ability to interact or communicate.

Clusters. Clusters of gestures, that is, more than one nonverbal cue at a time, can more accurately illustrate where someone's mind is or how he or she is feeling. Goman uses the example of a person in a conversation who crosses his or her arms while also wearing an unpleasant facial expression, shakes his or her head, and perhaps sits in a manner that turns a part of the body away from the other person. This combination shows that he or she is rejecting ideas that are being presented and is resistant to the subject matter. Goman notes that clusters of gestures are much more powerful indicators than single gestures.

Congruence. Congruence between what people are actually saying (orally) and the signals they are sending physically is a sign of confidence and truthfulness. It suggests that they will do as they say and may also give a clear indication of what they expect of others. Conversely, those who show verbal communication that is incongruent with their nonverbal communication may not be telling the truth, may not even believe what they are saying themselves, or may not be confident in what they are proposing.

Consistency. By understanding how a person typically reacts to normal office situations, the business owner or manager can gauge how this person is feeling or what he or she is thinking (to some degree) by paying attention to nonverbal cues that are not consistent with "baseline" nonverbal cues. Goman uses the example of a person being interrogated by the police. The interrogator may begin with some inconsequential, day-to-day questions. When he or she asks the more difficult questions, it will be easy to see what makes the interrogated party uncomfortable or nervous, and this can even indicate whether he or she is lying or telling the truth.

Culture. People from different backgrounds, countries, regions of the world, religions, and other cultural variations will react differently and show how they feel or what they are thinking in different ways. Goman notes that culturally variant gestures often become more prevalent during more stressful situations.

NONVERBAL COMMUNICATION IN INTERVIEWS

The interview might be one of the most important places in business where observation of body language and other nonverbal communication occurs. If nonverbal cues are perceived accurately by the interviewer, he or she may be able to determine whether the interviewee is a suitable candidate. According to a 2010 article by Dhawal Kumar, "10 Body Language Tips That Will Make Your Personal Interview Round Smoother," there are several things that an interviewee can do to improve the impression that he or she makes. While the article was written to give potential employees pointers, managers and business owners who interview can use these nonverbal cues to determine everything from confidence to lying (or telling the truth), levels of aggression or submissiveness, and overall attitude. Kumar gives the following advice to interviewees about body language.

- Sit up straight to convey a sense of confidence.
- Lean in ever so slightly toward the interviewer to convey a sense of taking an interest in what he or she has to say. This also shows a sense of mutual involvement.
- Maintain eye contact with the person conducting the interview so that a sense of interest is visible. By the same token, overly dramatic or intense eye contact can be a sign of dominance, and the interviewer may take this as a sign of aggression.
- Voice inflection, volume, and tone can all be indicators of personlity type. Too loud or too soft can be emblematic of agressiveness or low self-esteem, respectively. In addition, how an

interviewee chooses his or her words is important. An apologetic, defensive, or overconfident way of speaking should be avoided.

- If the interviewee's hands are on his or her knees, this is a sign that he or she attentive and ready to answer the interviewer's questions. Other hand placements can be indicators of confidence. Hands that are placed in the lap or on armrests of a chair show a relaxed demeanor while fidgety hands and busy legs are both signs of nervousness and anxiety.
- Blurting out commentary that is not germane to the conversation at hand is a sign of nervousness and can also be a sign of someone who does not consider his or her words carefully.
- Interruption of the interviewer is a poor strategy. It shows that the interviewee is over-eager. Jumpiness of this nature can be a sign that if hired, the interviewee may make snap decisions on important projects.
- If there is not a desk between the interviewer and interviewee, the interviewee will want to create some personal space. It is a fine line too close can make the interviewer uncomfortable or be a sign of alarming exuberance while too far away may indicate an aloof personality that may not work well on a team.
- An air of enthusiam (or lack thereof) will be conveyed by an interviewee's face. Nodding to agree is a good sign, but too much nodding (even a state of constant nodding in some cases) can be a sign that really, not much active listening is going on. Kumar strongly advises to use any kind of expression or gesture in moderation.

Navigating Employee Body Language. For the small-business owner or manager, it is important not only to be able to read nonverbal cues accurately, but also to be able to navigate them. In his March 2010 article, "Get the Message from Nonverbal Cues," Mark Schnurman writes, "Once you properly read a person's message, you must react accordingly. When you receive a negative message it is crucial to adjust your behavior. For example, if you ask someone a question and their behavior becomes negative (looking away and crossing their arms) you must recognize you failed to present a strong enough call to action. So try to understand their resistance, back track and build a stronger case."

For the managing business owner, knowing how to navigate through the messages that an employee, vendor, contractor, or supplier is sending with his or her nonverbal cues is as important as knowing how to balance the books or schedule shifts appropriately. When presented with cues that are not favorable, the business owner must illustrate a strong leadership role. He or she can do this by asking questions, maintaining his or her ground, keeping confrontation from occurring with firm and direct management, and by practicing body language that is consistent with the message he or she is sending verbally.

NORTH AMERICAN FREE TRADE AGREEMENT (NAFTA)

The North American Free Trade Agreement (NAFTA) is a treaty entered into by the United States, Canada, and Mexico; it went into effect on January 1, 1994. (Free trade had existed between the United States and Canada since 1989; NAFTA broadened that arrangement.) On that day, the three countries became the largest free market in the world the combined economies of the three nations at that time measured $6 trillion and directly affected more than 365 million people. NAFTA was created to eliminate tariff barriers to agricultural, manufacturing, and services; to remove investment restrictions; and to protect intellectual property rights. This was to be done while also addressing environmental and labor concerns (although many observers charge that the three governments have been lax in ensuring environmental and labor safeguards

since the agreement went into effect). Small businesses were among those that were expected to benefit the most from the lowering of trade barriers since it would make doing business in Mexico and Canada less expensive and would reduce the red tape needed to import or export goods.

Highlights of NAFTA included:

- Tariff elimination for qualifying products. Before NAFTA, tariffs of 30 percent or higher on export goods to Mexico were common, as were long delays caused by paperwork. Additionally, Mexican tariffs on U.S.-made products were, on average, 250 percent higher than U.S. duties on Mexican products. NAFTA addressed this imbalance by phasing out tariffs over 15 years. Approximately 50 percent of the tariffs were abolished immediately when the agreement took effect, and the remaining tariffs were targeted for gradual elimination. Among the areas specifically covered by NAFTA are construction, engineering, accounting, advertising, consulting/management, architecture, health care management, commercial education, and tourism.
- Elimination of nontariff barriers by 2008. This included opening the border and interior of Mexico to U.S. truckers and streamlining border processing and licensing requirements. Nontariff barriers were the biggest obstacle to conducting business in Mexico that small exporters faced.
- Establishment of standards. The three NAFTA countries agreed to toughen health, safety, and industrial standards to the highest existing standards among the three countries (which were always U.S. or Canadian). Also, national standards could no longer be used as a barrier to free trade. The speed of export-product inspections and certifications was also improved.
- Supplemental agreements. To ease concerns that Mexico's low wage scale would cause U.S. companies to shift production to that country, and to ensure that Mexico's increasing industrialization would not lead to rampant pollution, special side agreements were included in NAFTA. Under those agreements, the three countries agreed to establish commissions to handle labor and environmental issues. The commissions have the power to impose steep fines against any of the three governments that failed to impose its laws consistently. Environmental and labor groups from both the United States and Canada, however, have repeatedly charged that the regulations and guidelines detailed in these supplemental agreements have not been enforced.
- Tariff reduction for motor vehicles and auto parts and automobile rules of origin.
- Expanded telecommunications trade.
- Reduced textile and apparel barriers.
- More free trade in agriculture. Mexican import licenses were immediately abolished, with most additional tariffs phased out over a 10-year period.
- Expanded trade in financial services.
- Opening of insurance markets.
- Increased investment opportunities.
- Liberalized regulation of land transportation.
- Increased protection of intellectual property rights. NAFTA stipulated that, for the first time, Mexico had to provide a very high level of protection for intellectual property rights.
- Expanded the rights of American firms to make bids on Mexican and Canadian government procurement contracts.

One of the key provisions of NAFTA provided "national goods" status to products imported from other NAFTA countries. No state, provincial, or local governments could impose taxes or tariffs on those goods. In addition, customs duties were either eliminated at the time of the agreement or scheduled to be phased out in five or ten equal stages. A 2009 *Foreign Agricultural Service* policy notice reported that not only were nontariff barriers removed between the United States and Mexico, but other tarriffs were also removed in immediate conjunction while others would be phased out over the 5 to 15-year period from 2008 forward. The notification added, "This allowed for an orderly adjustment to free trade with Mexico, with full implementation beginning January 1, 2008." Specified sensitive items would be phased out over the longest 15-year period.

Supporters championed NAFTA because it opened up Mexican markets to U.S. companies like never before. Supporters, though, had a difficult time convincing the American public that NAFTA would do more good than harm. Their main effort centered on convincing people that all consumers benefit from the widest possible choice of products at the lowest possible price which means that consumers would be the biggest beneficiaries of lowered trade barriers. The U.S. Chamber of Commerce, which represents the interests of small businesses, was one of the most active supporters of NAFTA, organizing the owners and employees of small and mid-size businesses to support the agreement. This support was key in countering the efforts of organized labor to stop the agreement.

NAFTA AND SMALL BUSINESS

Analysts agree that NAFTA has opened up new opportunities for small and mid-size businesses. Mexican consumers spend more each year on U.S. products than their counterparts in Japan and Europe, so the stakes for business owners are high. (Most of the studies of NAFTA concentrate on the effects of U.S. business with Mexico. Trade with Canada has also been enhanced, but the passage of the trade agreement did not have as great an impact on the already liberal trade practices that the United States and its northern neighbor abided by.)

Some small businesses were affected directly by NAFTA. In the past, larger firms always had an advantage over small ones because the large companies could afford to build and maintain offices and manufacturing plants in Mexico, thereby avoiding many of the old trade restrictions on exports. In addition, pre-NAFTA laws stipulated that U.S. service providers that wanted to do business in Mexico had to establish a physical presence there, which was simply too expensive for small firms to do. Small firms were stuck they could not afford to build, nor could they afford the export tariffs. NAFTA leveled the playing field by letting small firms export to Mexico at the same cost as the large firms and by eliminating the requirement that a business establish a physical presence in Mexico in order to do business there. The lifting of these restrictions meant that vast new markets were suddenly open to small businesses that had previously done business only in the United States. This was regarded as especially important for small businesses that produced goods or services that had matured in U.S. markets.

However, small firms interested in conducting business in Mexico have to recognize that Mexican business regulations, hiring practices, employee benefit requirements, taxation schedules, and accounting principles all include features that are unique to that country. Small businesses, then, should familiarize themselves with Mexico's foundation of business rules and traditions not to mention the demographics culture of the marketplace before committing resources to this region.

OPPOSITION TO NAFTA

Much organized opposition to NAFTA centered on the fear that the abolishment of trade barriers would spur U.S. firms to pack up and move to Mexico to take advantage of cheap labor. This concern grew during the early years of the twenty-first century as the economy went through a recession and the recovery that followed turned out to be what some analysts called a "jobless recovery." By 2010 opposition to NAFTA was more the rule than the exception. Democratic congressman Gene Taylor (D-Miss.) introduced a bill for consideration in March 2010 that would repeal NAFTA. According to Taylor, there has been a 29 percent decline of available jobs in the United States since 1993. The hardest hit since the implementation of NAFTA have been manufacturing jobs, which have been shipped to Mexico or other countries where cheaper labor lowers a company's cost to produce goods.

A 2010 *Fox News* article notes that while NAFTA was put in place to "promote free trade," the result has been devastating job loss. Taylor is quoted as saying "The trade deficit with Mexico and Canada has quadrupled since NAFTA went into effect." Those who opposed Taylor did not take his proposed legislation lightly, providing concrete evidence that NAFTA had so far had positive impacts on economies of all three countries.

Opposition to NAFTA was also strong among environmental groups, who contended that the treaty's antipollution elements were woefully inadequate. This criticism has not abated since NAFTA's implementation. Indeed, both Mexico and Canada have been repeatedly cited for environmental malfeasance.

EFFECTS OF NAFTA DISPUTED

Since NAFTA's passage, American business interests have often expressed great satisfaction with the agreement. Trade has grown sharply between the three nations who are parties to NAFTA. However, that increase of trade activity has resulted in rising trade deficits for the United States with both Canada and Mexico the U.S. imports more from Mexico and Canada than it exports to these trading partners. Critics of the agreement argue that NAFTA has been at least partially responsible for these trade deficits as well as the striking loss of manufacturing jobs experienced in the U.S. over the last decade. However, supporters of NAFTA point out that manufacturing jobs began to decline before the NAFTA agreement. The debate about NAFTA continues.

Some analysts argue that isolating the effects of NAFTA within the larger economy is impossible. It is difficult, for example, to say with certainty what percentage of the current U.S. trade deficit is directly attributable to NAFTA. It is also difficult to say what percentage of the 3.3 million manufacturing jobs lost in the United States between 1998 and 2004 are the result of NAFTA and how many job losses would have occurred without this trade agreement. The same is true for 2008 and 2009, as the mass layoffs during this period could hardly be separated from those caused by implications of NAFTA. In January 2009 alone, there were 163,662 lost jobs. It is not even possible to say with certainty that the increased trade activity among the NAFTA nations is entirely the result of the trade agreement. Those who favor the agreement usually claim credit for NAFTA for the increased trade activity and reject the idea that the agreement resulted in job losses or the rising trade deficit with Canada and

Mexico. Those who are critical of the agreement usually link it to these deficits and to job losses as well.

What is clear is that NAFTA remains a lightning rod for political opinions about globalization and free trade generally. Opposition to NAFTA has grown and has made it far more difficult, politically, to pass other similar free trade agreements.

Yet the argument for NAFTA is hardly dead. A 2010 global trade article reported that " steel exports increased by 2.4 percent in January 2010 compared to December 2009 and by 39.7 percent compared to January 2009." David Phelps, the president of the American Institute for International Steel added that the cause of the increase was a higher demand for steel. "The improvement in exports in January in comparison with both December and January 2009 stems primarily from improved demand and market conditions in Canada and Mexico," Phelps stated.

LOOKING BEYOND NAFTA

Some analysts believe that although NAFTA may have had adverse consequences, there is little point in trying to repeal it. A 2010 article in the *Fayetteville Observer*, for example, contended that arguing the case against NAFTA was passé and that congresspersons opposing the trade agreement were "either posturing for constituents or deluded." The argument is that a global economy has changed the economic face of the entire world, and that repealing NAFTA is futile. According to this argument, NAFTA's provisions are obsolete and have no bearing on current affairs of trade. The 2010 *Fayetteville Observer* article commented, "NAFTA helped kill countless textile plants and other industries in this region, but the 21st century global economy won't be turned around by an American return to protectionism. Steep tariffs would backfire, triggering higher prices and consumer uproar."

NORTH AMERICAN INDUSTRY CLASSIFICATION SYSTEM (NAICS)

The North American Industry Classification System (NAICS) is an industry coding system designed to facilitate the collection, analysis, and presentation of economic data in the United States, Canada, and Mexico, all member nations of the North American Free Trade Agreement (NAFTA). First implemented in 1997, the NAICS is the successor to the Standard Industrial Classification (SIC) system, which had been used by U.S. agencies to compile and track national business data, and economic activity data generally, for more than six decades. Following NAFTA, which went into effect in 1994, a more comprehensive industry coding system was necessary. According to the U.S. Census Bureau Web site page for NAICS, the classification system was to be constituted of elements developed by the U.S. Economic Classification Policy Committee, the Instituto Nacional de Estadística, Geografía e Informática (INEGI) of Mexico, and Statistics Canada.

The U.S. Census Bureau describes the NAICS in the following way:

> [A] unique, all new system for classifying business establishments. It is the first economic classifica tion system to be constructed based on a single economic concept. Economic units that use like processes to produce goods or services are grouped together. This 'production oriented' sys tem means that statistical agencies in the United States will produce data that can be used for measuring productivity, unit labor costs, and the capital intensity of production; constructing input output relationships; and estimating employment output relationships and other such statistics that require that inputs and outputs be used together.... NAICS is forward looking and flexible, anticipating increasing globalization and providing enhanced industry comparability among the NAFTA trading partners while recog nizing important national industries and provid ing for periodic updates through three country review [the United States, Canada, and Mexico]. NAICS recognizes the structural and technolog ical changes occurring in the economies of the three North American countries and provides the means to measure these changes well into the next millennium.

THE SIC SYSTEM

The predecessor to the NAICS the Standard Industrial Classification system was the first comprehensive classification system used by American government agencies to organize economic statistics. Many people are under the misconception that NAICS was simply a replacement for SIC. In fact, NAICS was introduced while SIC was still in use. According to the January 2009 U.S. Census publication, *2007 North American Industry Classification System (NAICS) Updates for 2012*, "The implementation of the first vintage of NAICS NAICS 1997 affected almost half of the industries that were available for use under the 1987 Standard Industrial Classification (SIC). Subsequent NAICS revisions in 2002 and 2007 were more modest."

The SIC system was an establishment-based industry classification system that classified each establishment (defined as a single physical location at which economic activity occurs) according to its primary activity. For each of these recognized industries, the government kept detailed statistics in such areas as employment, payroll, receipts, profits, and capital investment.

After its unveiling in 1937, the SIC system's universe of economic data became a heavily utilized tool for conducting business research and tracking economic trends. Government agencies, nongovernmental organizations, and private businesses alike made extensive use of the data. But despite periodic updates and revisions to the SIC classification system, its inadequacies became more glaring with the passage of time.

The fundamental problem was that the SIC system was based on concepts developed in an era of American history the 1930s and 1940s when manufacturing was the dominant economic engine. Many service activities were not separately identified, and as service-oriented businesses became more important, SIC revisions did not keep pace. The economic statistics contained in the SIC system thus became progressively more incomplete as new technologies and areas of endeavor were not covered. This under representation of important economic sectors was further exacerbated by the SIC's framework, which gathered unrelated industries together into similar categories.

Despite its imperfections, however, the Standard Industrial Classification system continued to be widely used by business marketers through the 1990s. The SIC data did provide them with a method for classifying organizational customers and gauging industry trends (especially in manufacturing sectors), and it remained the only source of these important economic statistics. In addition, the 1987 revision added approximately twenty new service industries and tweaked several manufacturing industry classifications to reflect changing technological realities. Ultimately, however, the SIC system remained an outmoded one. "The SIC did a superb job of describing and detailing the structure of the footwear industry in the United States, but failed to recognize and account for the information age in which we live and work," summarized Carole Ambler in *Business America*. "The SIC scattered the production of high-tech products such as computers, semiconductors, and communications equipment in groupings of industrial machinery and electrical equipment, and included the reproduction of shrink-wrapped software in the same industry with software publishing."

The various inadequacies of the SIC system finally prompted public and private sectors in the United States to unite and call for a new industry classification system that would be based on the reality of a service-based, Internet-driven, technology-powered global economy. The ultimate shape and character of this new system was dramatically influenced by the implementation of NAFTA between the United States, Canada, and Mexico in 1994. This major trade treaty highlighted the need to develop a new industry classification system that would take into consideration the increased flow of goods, services, and capital between the three North American nations. Moreover, it emphasized the need for a system that could provide users with country-to-country comparability of statistical information.

CREATION OF THE NAICS

The North American Industrial Classification System was a cooperative effort that required the active involvement of U.S., Canadian, and Mexican government agencies. The primary U.S. body involved in NAICS creation and implementation was the Economic Classification Policy Committee (ECPC) of the Office of Management and Budget, but the Bureau of Economic Analysis, the Bureau of Labor Statistics, and the Census Bureau all contributed to the initiative. Statistics Canada and Mexico's INEGI, meanwhile, worked with the ECPC to ensure that the new system would be able to provide comparable statistics for industries in place in all three countries, while simultaneously providing flexibility so that each country could accommodate industries unique to its own economy.

In 1997 the Office of Management and Budget (OMB) announced its decision to adopt the new NAICS as the industry classification system used by statistical agencies of the United States. During this same period, the nuts and bolts of the NAICS were unveiled to largely positive reviews. "NAICS recognizes new, emerging, and advanced technology industries; NAICS acknowledges the information age in which Americans live and work; NAICS considers over 150 new service industries; NAICS provides for comparability of data with other NAFTA trading partners; and NAICS is based on a production-oriented conceptual framework," observed *Energy Conservation News*. Marketing professionals were particularly pleased with the new proposed system. "NAICS is based on an entirely different concept than SIC," stated Suzanne Sabrosk in *Searcher*. "Its goals were not only to identify new industries but to acknowledge a more consistent economic principle namely types of production activities performed, rather than the mix of production and market-based categories in the SIC. This process orientation, as opposed to an approach stressing supply and demand, accounts for the presentation of more detail in the service sector. NAICS classifies industries based on what the industries do, rather than whom the industries serve. For example, NAICS classifies bakeries that bake and sell on the premises under manufacturing, instead of as retailers, because of the way in which the bakeries produce their baked goods."

FRAMEWORK OF THE NAICS

The North American Industry Classification System defines over 1,000 industries in the United States. The industries are grouped in industrial sectors that are progressively subdivided into three-digit subsectors, four-digit industry groups, and five-digit industries. The definition of most five-digit industries is the same in all three countries (the United States, Mexico, and Canada) so that they can produce comparable data, but some U.S. industries feature a sixth digit. The old SIC system was based on a four-digit code that did not have any linkages between the NAFTA-member economies. "NAICS allows each country to recognize activities that are important in the respective countries, but may not be large enough or important enough to recognize in all three countries. The sixth digit is reserved for this purpose," explained the Census Bureau.

The base two-digit NAICS Industry Sectors are as follows:

11	Agriculture, Forestry, Fishing and Hunting
21	Mining
22	Utilities
23	Construction
31-33	Manufacturing
42	Wholesale Trade
44-45	Retail Trade
48-49	Transportation and Warehousing
51	Information
52	Finance and Insurance
53	Real Estate and Rental and Leasing
54	Professional, Scientific, and Technical Services
55	Management of Companies and Enterprises
56	Administrative and Support and Waste Management and Remediation Services
61	Education Services
62	Health Care and Social Assistance
71	Arts, Entertainment, and Recreation
72	Accommodation and Food Services
81	Other Services (Except Publish Administration
92	Public Administration

Of these base sectors, five are primarily goods-producing (manufacturing) in nature, while the remaining fifteen are services-oriented. This is a dramatic departure from the manufacturing-oriented perspective of the old Standard Industrial Classification system. Complete NAICS listings are available on the Census Bureau Web site at www.census.gov/naics.

Many of the NAICS sectors feature combinations of old SIC divisions, while others are long-neglected economic sectors. For instance, the NAICS has an information sector that includes all establishments that create, disseminate, or provide the means to distribute information. "So everything from data-processing services to motion pictures, broadcasting, and sound recording industries ended up here, as did newspaper, book, and periodical publishers, previously classified as manufacturing, and software publishers, previously included in SIC services," explained Sabrosk.

DIFFERENCES BETWEEN NAICS AND SIC SYSTEMS

Analysts have pointed out a number of significant differences between the new NAICS system and the Standard Industrial Classification arrangement that it replaces. Key areas in which the two systems differ include:

Focus The NAICS focused on services industries and new industries driven by advanced technology, whereas the SIC system was heavily weighted toward manufacturing. In addition, the NAICS benefits from a unified, production-oriented conceptual framework. "Businesses that use similar production processes to produce a good or service are grouped together," explained Ambler. "This single conceptual framework ensures that the classification system will produce data for improved analysis of input/output patterns, productivity, unit labor costs, and industrial performance. There was no consistent conceptual framework for the SIC." However, analysts note that the differing definitions that exist between the NAICS and the SIC will make historical trend analysis a difficult undertaking in many instances. "Comparative statistics and bridge tables may help at the 2-digit SIC and 3-digit NAICS level of activity," noted Robert Haas and Thomas Wotruba in *Agency Sales Magazine.* "[But] more detailed comparisons and links with past data may require what the Census Bureau calls 'synthetic estimates.' These involve applying proportions or trends from details making up one data set to the totals in a related data set or category."

Nomenclature Groupings within NAICS are known by different names than those in the SIC system. For example, the SIC called the highest level of aggregation in its system a "division," whereas the NAICS calls it a "sector." The SIC's next highest level of aggregation, meanwhile, was designated "major group," but in the NAICS it is known as a "subsector."

Update-friendly NAICS codes will be reviewed and updated on a regular 5-year cycle by NAFTA member countries to make the system as useful and relevant as possible. The old SIC system, on the other hand, was only revised every 10 or 15 years.

Comparability The Four-digit SIC system was not linked to the economic data tracking systems of Canada or Mexico in any way. The NAICS system, on the other hand, enables analysts directly to compare industrial production statistics collected and published by all three NAFTA members. In addition, NAICS provides for increased compatibility with the International Standard Industrial Classification System, developed and maintained by the United Nations and widely used in Europe.

The ECPC published a revision to the original NAICS structure in 2007 as part of a planned 5-year update cycle. The next update is scheduled for release in 2012.

In his 2009 book, *The Young Investor: The North American Guide to Investing Online*, Dan Fournier discusses other organizations that also offer codification of industries and businesses. Fournier notes that the Global Industry Classification Standard (GICS) is the system used in the financial world. GICS was developed by Standard & Poor's and Morgan Stanley Capital International. Another classification system, the Industry Classification Benchmark (ICB), is used to maintain and understand data presented by the Dow Jones. These systems are different because they were developed and continue to be revised by members of private industry and banking institutions while systems such as NAICS and SIC are developed by government agencies.

DIFFICULTIES ASSOCIATED WITH USING NAICS

Not every business especially small businesses will fit neatly into a category coded by the NAICS. Sometimes the issue is that a business may fit into more than one code, and other times the issue is that a business does not fit into any code category outlined by the NAICS. As Carolyn Shapiro noted in her March 2010 article, "2009 Retail: Tighter Belts, Fewer Sales in Hampton Roads," the challenges produced by coding difficulties can affect how accurate the outcoming data is. Shapiro writes, "Let's say a college runs its own coffee shop and reports those sales under Educational Services. Then, the college outsources the coffee shop to Starbucks as an independent operator, which would probably classify its sales under the Food Services and Drinking Places category. The coffee shop's sales would shift from one category to another causing sales to rise under Food Services and fall under Educational Services but the reason wouldn't show up in the data." Unfortunately, this is not a rare occurrence, and therefore the accuracy of some NAICS statistics may be questionable, especially where Web-based and small businesses are concerned.

NAICS EVOLVES TO INCLUDE INTERNET BUSINESS AND ONLINE ECONOMIES

The NAICS has evolved to compile data about businesses that have online storefronts rather than a brick and mortar store. It has also had to codify these businesses accordingly. In their 2008 book *The Internet and American Business*, William Aspray and Paul E. Ceruzzi discuss some of this coding and the overall effect that Internet business will have on the U.S. and global economies. Aspray and Ceruzzi discuss statistics regarding the Internet economy, including "computer hardware, computer software, and communications hardware and instruments." Unlike other industries, e-commerce does not have its own NAICS code this is because the industries, products, and services offered online span hundreds if not thousands of categories.

O

OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA)

The Occupational Safety and Health Administration (OSHA) was established by the Williams-Steiger Occupational Safety and Health Act (OSH Act) of 1970, which took effect in 1971. OSHA's mission is to ensure that every working man and woman in the nation is employed under safe and healthful working conditions. Nearly every employee in the United States comes under OSHA's jurisdiction. The only exceptions are people who are self-employed, workers in mining and transportation industries (who are covered by other agencies), and most public employees. Thus, nearly every private employer in the United States needs to be cognizant of OSHA rules and regulations. OSHA is an administrative agency within the United States Department of Labor and is therefore administered by an assistant secretary of labor.

OSHA OBJECTIVES AND STANDARDS

OSHA seeks to make workplaces safer and healthier by making and enforcing regulations called standards in the OSH Act. The act itself establishes only one workplace standard, which is called the "general duty standard." The general duty standard states: "Each employer shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees." In the OSH Act, Congress delegated authority to OSHA to make rules further implementing the general duty standard.

Standards made by OSHA are published in the *Code of Federal Regulations* (*CFR*). The three types of regulations are called interim, temporary emergency, and permanent. Interim standards were applicable for 2 years after OSH Act was passed. For this purpose, OSHA was authorized to use the standards of any nationally recognized "standards setting" organization such as those of professional engineering groups. Such privately developed standards are called "national consensus standards." Temporary emergency standards last only 6 months and are designed to protect workers while OSHA goes through the processes required by law to develop a permanent standard. Permanent standards are made through the same processes as the regulations made by other federal administrative agencies.

As OSHA drafts a proposal for a permanent standard, it consults with representatives of industry and labor and collects whatever scientific, medical, and engineering data is necessary to ensure that the standard adequately reflects workplace realities. Proposed standards are published in the *Federal Register*. A comment period is then held, during which input is received from interested parties including, but not limited to, representatives of industry and labor. At the close of the comment period, the proposal may be withdrawn and set aside, withdrawn and reproposed with modifications, or approved as a final standard that is legally enforceable. All standards that become legally binding are first published in the *Federal Register* and then compiled and published in the *Code of Federal Regulations.* Many of OSHA's permanent standards originated as national consensus standards developed

by private professional organizations such as the National Fire Protection Association and the American National Standards Institute. Examples of permanent OSHA standards include limits for exposure of employees to hazardous substances such as asbestos, benzene, vinyl chloride, and cotton dust. The OSHA Web site at www.osha.gov provides more information.

National Institute of Occupational Safety and Health. The OSH Act of 1970 also established a research institute called the National Institute of Occupational Safety and Health (NIOSH). Since 1973 NIOSH has been a division of the U.S. government's Centers for Disease Control (CDC). The purpose of NIOSH is to gather data documenting incidences of occupational exposure, injury, illness, and death in the United States. This information, which is highly valued by OSHA, is gathered from a wide variety of sources, ranging from industry groups to labor unions, as well as independent organizations.

OSHA RECORD KEEPING REQUIREMENTS

OSHA requires all companies subject to its workplace standards to abide by a variety of occupational regulations. One of OSHA's major requirements is that companies keep records on facets of their operations relevant to employee health and safety. All employers covered by the OSH Act are required to keep four kinds of records:

- Records regarding enforcement of OSHA standards
- Research records
- Job-related injury, illness, and death records
- Job hazard records

OSHA ENFORCEMENT OF STANDARDS

OSHA inspectors conduct planned or surprise inspections of work sites covered by the OSH Act to verify compliance with the OSH Act and standards promulgated by OSHA. The OSH Act allows the employer *and* an employee representative to accompany OSHA's representative during the inspection. In 1978, in *Marshall v. Barlow*, the United States Supreme Court declared that in most industries, employers have a right to bar an OSHA inspector from their premises if the inspector has not first obtained a search warrant.

If violations are found during an inspection, an OSHA citation may be issued in which alleged violations are listed, notices of penalties for each violation are given, and an abatement period is established. The abatement period is the amount of time the employer has to correct any violation(s). Penalties for a violation can be civil or criminal and vary depending on the nature of the violation (minor or serious, willful or nonwillful, first offense of repeat offense). Penalties are naturally more severe for serious, repeated, willful violations, and OSHA may refer such cases to the United States Justice Department for criminal enforcement. OSHA has not made extensive use of criminal prosecution as an enforcement mechanism, however, preferring instead to rely on the deterrent effect of civil penalties. In his 2008 book, *Corporate Safety Compliance: OSHA, Ethics, and the Law*, Thomas D. Schneid wrote, "A willful violation is the employer's purposeful and negligent failure to correct a known deficiency. This type of violation, in addition to carrying a large monetary fine, exposes the employer to a charge of egregious violation and the potential for criminal sanctions under the OSH Act or state criminal statutes if an employee is injured or killed as a direct result of the willful violation." Schneid goes on to discuss how repeat violations on the part of an employer can be cause for OSHA to probe quite deeply, especially if past known violations are particularly grave.

An employer has 15 days to contest an OSHA citation, and any challenge is heard by an Administrative Law Judge (ALJ) within OSHA. The ALJ receives oral and written evidence, decides issues of fact and law, and enters an order. If the employer is dissatisfied with that order, it can be appealed to the Occupational Safety and Health Review Commission, which will, in turn, enter an order. Finally, within 30 days of the issuance of that order, the employer or the secretary of labor can take the case to the U.S. federal court system by filing an appeal with a U.S. court of appeals.

OSHA AND ITS STATE COUNTERPARTS

Pursuant to the OSH Act, an individual state can pass its own worker health and safety laws and standards. Indeed, the 1970 legislation encouraged individual states to develop and operate their own job safety and health programs. If the state can show that its job safety and health standards are "at least as effective as" comparable federal standards, the state can be certified to assume OSH Act administration and enforcement in that state. OSHA approves and monitors state plans, and provides up to 50 percent of operating costs for approved plans.

To gain OSHA approval for a "developmental plan," the first step in the process of instituting a state plan for job safety and health, the applying state must first assure OSHA that it will, within 3 years, have in place all the structural elements necessary for an effective occupational safety and health program. These elements include: 1) appropriate legislation; 2) regulations and procedures for standards setting, enforcement, appeal of citations, and

penalties; and 3) adequate resources (both in number and qualifications of inspectors and other personnel) for enforcement of standards.

Once a state has completed and documented all its developmental requirements, it is eligible for certification. Certification is basically an acknowledgment that the state has put together a complete plan. Once the state has reached a point where it is deemed capable of independently enforcing job safety and health standards, OSHA may enter into an 'operational status' agreement with the state. Once this occurs, OSHA in effect steps aside and allows the state to enforce its laws.

The ultimate accreditation of a state plan is known as "final approval." When OSHA grants final approval, it relinquishes its authority to cover occupational safety and health matters that are addressed by the state's rules and regulations. Final approval cannot be given until at least 1 year after certification, and it is predicated on OSHA's judgment that worker protection is at least as effective under the state's standards as it is under the federal program. The state must meet all required staffing levels and agree to participate in OSHA's computerized inspection data system before being allowed to operate without OSHA supervision.

Some state safety agencies have been under fire by many who feel complaints are overlooked and workers' rights are being overlooked in many cases. In a 2010 *Wall Street Journal* article, Alexandra Berzon wrote that President Barack Obama was dissatisfied with the state of affairs with state agencies, and that OSHA should more closely monitor the state agencies with a more rigorous review process. "Workplace-safety advocates say that if successful, the administration's approach could correct what they say has been too-loose oversight of state agencies from the federal government in recent years, which they argue led to weaker enforcement of safety laws," wrote Berzon. The potential downside to a new tightening of state-run programs could include backlash from state agency heads and increased costs for state governments. Nonetheless, a way for better review of small and large businesses in states that have their own agencies will likely be on the minds of workers' rights advocates during the 2010s.

HISTORY OF THE RELATIONSHIP BETWEEN OSHA AND BUSINESS

OSHA has traditionally used "command and control" kinds of regulation to protect workers. "Command and control" regulations are those which set requirements for job safety (such as requirements for guard rails on stairs) or limits on exposure to a hazardous substance (such as a given number of fibers of asbestos per cubic milliliter of air breathed per hour). They are enforced through citations issued to violators.

In 1984 OSHA promulgated the Hazard Communication Standard (HCS), which was viewed as a new kind of regulation differing from "command and control." The HCS gives workers access to information about long-term health risks resulting from workplace exposure to toxic or hazardous substances, and requires manufacturers, importers, and distributors to provide employers with evaluations of all toxic or hazardous materials sold or distributed to those employers. This information is compiled in a form known as a Material Safety Data Sheet (MSDS). The MSDS describes the chemical's physical hazards such as ignitability and reactivity, gives associated health hazards, and states the exposure limits established by OSHA. In turn, the employer must make these documents available to employees and requires employers to establish hazard communication education programs. The employer must also label all containers with the identities of hazardous substances and appropriate warnings. Worker "right-to-know," as implemented on the federal level through the HCS, is designed to give workers access to information so that they can make informed decisions about their exposure to toxic chemicals.

OSHA has been criticized by businesses and industry groups throughout its history. In the 1970s, it was criticized for making job-safety regulations that businesses considered to be vague or unnecessarily costly. For example, a 1977 OSHA regulation contained detailed specifications regarding irregularities in western hemlock trees used to construct ladders. In the Appropriations Act of 1977, Congress directed OSHA to get rid of certain standards that it described as "trivial." As a result, in 1978 OSHA revoked 928 job-safety standards and increased its efforts to deal with health hazards.

On the other hand, OSHA has also been criticized by unions and other pro-worker groups throughout its history for doing too little to protect employees. Throughout its existence, OSHA has been criticized for issuing too few new standards, for failing to protect workers who report violations, for failing to adequately protect workers involved in the cleanup of toxic-waste sites, and for failing to enforce existing standards. The latter charge has been a particularly frustrating one for OSHA. Funding for enforcement has dwindled in recent years, and over the last few decades, both Congress and various presidential administrations have publicly supported efforts to keep OSHA and other agencies "off the backs" of business.

OSHA REFORMS

OSHA is criticized from both sides, for being too arbitrary with employers and for being too lax on employers. A 2000 survey of members of the National Association of Manufacturers cited OSHA as the nation's most intrusive federal agency (34 percent of responding manufacturers

cited OSHA, while 18 percent pointed to the Environmental Protection Agency, the second-highest vote-getter; another 11 percent said no federal agency significantly impeded their efficiency). The most frequent complaint leveled against OSHA is that U.S.workplace safety and health regulations are excessively burdensome on businesses of all shapes and sizes. Critics call for fundamental changes in OSHA's regulatory environment, insisting that changes should be made to encourage voluntary industry compliance on worker safety issues and reductions of penalties for nonserious violators of standards. In its *Handbook for Small Businesses*, OSHA itself has acknowledged that "in the public's view, OSHA has been driven too often by numbers and rules, not by smart enforcement and results. Business complains about overzealous enforcement and burdensome rules.... And too often, a "one-size-fits-all" regulatory approach has treated conscientious employers no differently from those who put workers needlessly at risk." Worker advocates and others, however, point out that OSHA standards have been an important factor in the dramatic decline of injury and illness rates in many industries over the past few decades, and they express concern that reforms could put workers in a variety of businesses at greater risk.

OSHA's reform initiatives have sought to address those issues raised by its critics while simultaneously ensuring that American workers receive adequate health and safety protection in the workplace. In 1995 OSHA announced a new emphasis on treating employers with aggressive health and safety programs differently from employers who lack such programs. "At its core," said OSHA, "this new approach seeks to encourage the development of worksite health and safety programs." The features that OSHA look for are:

- Management commitment
- Meaningful participation of employees
- A systematic effort to find safety and health hazards whether they are covered by existing standards or not
- Documentation that the identified hazards have been fixed
- Training for employees and supervisors
- A reduction in injuries and illnesses

Those firms equipped with good safety programs will receive special recognition that will include the lowest priority for enforcement inspections and the highest priority for assistance, appropriate regulatory relief, and major penalty reductions. Businesses that do not adequately provide for their workers' health and safety, however, will be subject to "strong and traditional OSHA enforcement procedures.... In short, for those who have a history of endangering their employees and are unwilling to change, OSHA will rigorously enforce the law without compromise to assure that there are serious consequences for serious violators."

OSHA also announced its plans to make more tightly focused inspections on companies that have effective safety and health programs. If a company with a strong record meets selected safety/health criteria, the OSHA inspector will conduct an abbreviated inspection. Conversely, in situations where a safety and health program is nonexistent or inadequate, a complete site inspection, including full citations, will be undertaken. Small businesses and other companies operating within industries that have poor safety records, such as refineries, construction, power plants, gas, electricity and other utilties, and factory farms are likeliest to be heavily scrutinized. Individual companies with a history of workplace violence, mistreatment of employees, including sexual harassment and unfair wages or unpaid wages will also be more closely monitored.

OSHA and business interests clashed repeatedly during the late 1990s over proposed new regulations designed to identify and address workplace injuries and illnesses traced to the issue of ergonomics. "OSHA would require companies to implement permanent engineering controls and employ interim personal protective equipment," noted *Purchasing*. "Examples of engineering controls involve changing, modifying, or redesigning the following: workstations, tools, facilities, equipment, materials, and processes.... Many businesses have already adopted ergonomic design tools and workstations that reduce strain where repetitive motions, sitting for long periods, or reaching are required. It's not clear yet what companies will be required to do in the way of changes in processes and materials used."

THE PROTECTING AMERICA'S WORKERS ACT OF 2009

Further reform to OSHA regulations were part of the proposed Protecting America's Workers Act of 2009. According to the Committee on Education and Labor of the United States, the act, also known as PAWA and HR 2067, would resolve a number of issues pertaining to workplace safety and the rights of employees. In 2009 Betsy Miller Kittredge wrote, "too many workers are still dying, getting injured or become ill by working in unsafe and unhealthy conditions. The Protecting America's Workers Act will provide additional tools to ensure that OSHA can fulfill its duty enforce safe and healthy workplaces for all American workers." Kittredge lists some of the benefits of PAWA:

- Expanding OSHA coverage to state, federal, and other public workers, and those employed by

airlines, the railroads, and contractors for the Department of Energy

- Increasing civil penalties and establishing mandatory minimum penalties for violations that result in fatality
- Giving workers the right to refuse to engage in certain work tasks if they feel it may harm them and protect them from discrimination if they do report an injury or an unsafe work environment
- Providing means for employees and their representatives to contest OSHA if it does not issue a citation to an employer or propose any penalties to an employer in violation of regulations
- Provisioning time that an employee spends reporting to or working with an OSHA investigator or representative as "time worked"
- Prohibiting OSHA from calling any citation an "unclassified citation," which allows an employer to avoid any consequences, even in connection with a willful violation

The Protecting America's Workers Act of 2009 includes other benefits for employees, but the main objectives are to improve working conditions and worker health while also providing better protection for whistle-blowers. As of early 2010, the bill had not been voted on.

OSHA AND SMALL BUSINESS

In recognition of the special challenges that often face small businesses, and the limited financial resources that they often have, OSHA administers a number of special programs specifically designed to help entrepreneurs and small-business owners provide a productive yet safe environment for their employees.

Among the special programs that OSHA has instituted for small businesses are the following:

- Penalty Reduction OSHA may grant reductions of 60 percent for employers with 25 employees or fewer; 40 percent if the employer has 26-100 employees; and 20 percent if the employer has 101-250 employees.
- Penalty Reductions for Good Faith OSHA has the option of granting a 25 percent penalty reduction if a small business has instituted an effective safety and health program for its employees.
- Flexible Requirements OSHA gives smaller firms greater flexibility in certain safety areas in recognition of their limited resources (i.e., lead in construction, emergency evacuation plans, process safety management).
- Reduced Paperwork Requirements OSHA has fewer record-keeping requirements for very small businesses. Employers with ten or fewer employees are exempt from most OSHA record-keeping requirements for recording and reporting occupational injuries and illnesses.
- Consultation Program While not limited to small businesses, OSHA's on-site consultation program has been particularly helpful to smaller companies (small firms accounted for about 40 percent of the program during the mid-1990s). This service, which is run by state agencies, provides businesses with the option of requesting a free on-site consultation with a state representative who helps them identify potential workplace hazards and improve or implement effective workplace safety and health programs.
- Training Grants OSHA awards grant money to nonprofit groups for the development of programs designed to help entrepreneurs and small-business owners establish safety and health guidelines for their companies.
- Mentoring OSHA and the Voluntary Protection Programs Participants Association (VPPA) operate a mentoring program to help small firms applying for entry into VPP refine their health and safety programs. The VPP is an OSHA program that is intended to recognize a firm's safety and health achievements. This mentoring program matches applicants with VPP members (often in the same or a related industry) who can help by sharing their experience with and knowledge about workplace safety and health programs.

OFFICE ROMANCE

Office romances romantic relationships between two people employed by the same employer are as common now as they have been throughout history. The long hours many people spend at work mean that for many, those with whom they work are not only colleagues but also their primary source of social contact. Therefore, romantic relationships are bound to develop. A 2009 survey reported in *Legal News* found that four out of every ten employees have had a romantic relationship with a co-worker or superior while numerous others report that they have been the co-worker or superior of someone in a workplace relationship. Further bolstering these numbers, a CareerBuilder survey cited in Peggy Klaus's 2008 book, *The Hard Truth About Soft Skills*, reported that 43 percent of people had experienced an office romance while 34 percent reported they had married a co-worker.

Many but not all office romances end happily. For businesses, workplace romances carry with them the potential to complicate the work environment and cause difficulties of various types lost productivity due to distraction; accusations of favoritism; jealousy among co-workers; the potential for an antagonistic mood should the relationship end poorly; and, in a worst-case scenario, allegations of sexual harassment in the event that one of the parties asserts that he or she was coerced. Because of these potential pitfalls, many firms have policies that were established to discourage or even prohibit such liaisons from forming. The question for the small-business owner or manager becomes: how best is one to manage such relationships so that they do not have a negative impact on the company without infringing unduly on the privacy of employees?

DEALING WITH OFFICE ROMANCES

Most experts suggest that a company establish some sort of policy addressing this issue so that it is not put in a difficult position when confronted with the first such romance. By planning ahead, incorporating guidelines on workplace romances into the employment policies, and publicizing these policies, a company can remove confusion and in most cases the concern about favoritism.

Small companies may be in a more difficult position than larger firms when it comes to managing workplace romances. In a large firm, an office romance may be more easily worked around, and those with a love interest may not even work in the same department, the same building, or even the same country. Arlene Vernon, a human resource consultant with HRX, explained it this way in an interview with journalist Janice Rhoshalle Littlejohn, in a *Pool & Spa News* article: "It becomes an issue for a smaller organization because everyone's watching and wondering if this one's going to last. It becomes this whole saga. You might as well turn it into a sitcom.... I think it is actually harder for the smaller organizations than the larger ones. It can be more invisible in the larger ones."

Knowing what to include in a workplace policy on dating or romantic relationships is not easy. Banning dating among employees may not be a reasonable solution, although exceptions can certainly be made in instances where one of the principals involved has a supervisory role over the other. One concern with a newly forming romance in the workplace is that it will be accompanied by inappropriate displays of affection in the office. This, in turn, can cause an uncomfortable environment for others and certainly presents a less than professional image. A company may address this concern by establishing an on-the-job code of conduct that specifically addresses a professional work environment and prohibits "public displays of affection."

SEXUAL HARASSMENT: THE POTENTIAL OUTCOME OF OFFICE ROMANCE

Many sexual harassment cases occur when one employee confronts and pursues another aggressively when the interest is not mutual. However, in some instances, sexual harassment can be a false charge against an employee or superior who was engaged in a mutually consensual relationship this is an unfortunate outcome that can damage a company reputation and cost people their jobs. Because of these dangers, measures should be put in

place, no matter how lenient or carefree a workplace may be. At a minimum, any policy designed to regulate dating or office romances should be designed to protect the company against sexual harassment liability and ensure a professional work environment. Actions to consider when preparing such a policy include:

1. State what is not acceptable Define in the policy exactly what types of relationships will and will not be tolerated. Most human resource professionals recommend establishing policies that prohibit supervisors from dating a direct report. Policies may also note that staff members are expected to behave professionally and that romantic trysts should be kept out of the work environment.
2. Make penalties clear Define what actions will be undertaken if the policies are violated transfer, demotion, termination.
3. Address sexual harassment head on State outright that any alleged sexual harassment will be handled in a legally proper manner. Managers must make employees aware that the company has a zero-tolerance policy on sexual harassment. Information should be provided about the consequences of such behavior. Companies may even require that their employees sign documentation indicating that they understand and will abide by the policy.
4. Reinforce policies on sexual harassment Provide training for all supervisors and managers about sexual harassment in all its forms. Educate them on the various signs that an office romance is having a negative impact on the company's efficiency (these signs can range from increased workplace friction to unprofessional displays of affection, anger, or other emotions).
5. Show respect for privacy Do not overstep boundaries of employee privacy. A company needs to make it abundantly clear that workplace performance is its primary concern.
6. Encourage open communications Consider requesting employees to disclose a relationship if it becomes romantic. This may be a difficult task for employees if the penalties for such a relationship are severe. If, on the other hand, the company is willing to work with the couple then it is more likely that they will communicate their involvement in an appropriate manner.

An owner should not flinch from intervening promptly in situations where a workplace relationship is having a detrimental effect on business productivity. In cases of sexual harassment claims, more often than not, court decisions on liability have little to do with whether a company had a dating policy in place and everything to do with how a company responded when a complaint was lodged. Prompt response to workplace issues that arise from an office romance gone sour can go far toward addressing the problem.

DISTINGUISHING BETWEEN FLIRTING AND SEXUAL HARASSMENT

In their 2010 book, *Managing Risk in Communication Encounters*, Vincent R. Waldron and Jeffrey W. Kassing define sexual harassment as "behavior that violates, derogates, demeans, or humiliates an individual based on sex or gender." Given the increase in sexual harassment lawsuits that have exposed an ongoing problem in many businesses, it is not surprising that small-business owners have expressed concern about the sometimes blurry boundaries between office flirtations which may lead to full-fledged office romances and ugly instances of sexual harassment. While businesses can take certain steps to define inappropriate office conduct, many of them quite effective, stopping sexual harassment is often a more complicated issue if the two people involved were formerly romantically involved. Indeed, some people resort to harassment in the wake of a breakup, while others have been known to level false harassment charges after being jilted. If an office relationship degenerates to such a point, it is important for the business owner to maintain an impartial stance and make sure that decisions are made on the basis of the evidence at hand.

In the end, regardless of the roots of sexual harassment, Kassing notes that overall, the effects can be quite paralyzing. Workers who have experienced sexual harassment in the office report lower desire to commit to the company agenda, lower productivity and performance, and lower satisfaction with their jobs than their counterparts who had not experienced sexual harassment.

VIRTUAL OFFICE ROMANCE

Just because the romantic relationship does not involve two people in the same workplace or in the same physical space a relationship that seeps into the hours of the work day can still occur. With the advent of texting, MMS messaging, instant messaging (such as AIM and Blackberry Messenger) and social networking, people in a relationship can chat, text, and respond to each other using a battery of social networks and other Internet and handheld applications. Some employers may not allow Internet access to employees for personal use, and others may allow social and personal use of the Web only during lunch breaks and other off time. Unfortunately, abuse of "romantic communication" is rampant across all kinds of businesses, and particularly common in the small business atmosphere

where employees are less likely to be policed by strict employee guidelines.

Some easily distracted employees may actually start and maintain a relationship on a social networking Web site; this is dangerous for many reasons, but for the small-business owner, it may mean that huge chunks of an employee's day are spent flirting and communicating with a person he or she may not even know. In her March 2010 article, "MySpace vs. REAL Space," Felice Roybal noted that dating via social networking has increased by 90 percent since 2005.

DISPARATE VIEWS OF OFFICE ROMANCE

Assessments of the dangers of office romance vary dramatically. Some observers view it as a wholly undesirable condition that should be avoided by business owners and managers if at all possible, while others view it as a potential positive development, provided that the relationship lies within certain parameters. But what happens when a philanderer dates and discards casually within a company, leaving angry, litigation-prone employees in his or her wake? Reasons for dating policies to address supervisors, subordinates, and clients, not to mention patients, suppliers, volunteers, and vendors, are understandable.

The risks that a deteriorating romance pose for a company that employs both parties are undeniable. Perhaps, however, the benefits of happily partnered employees is another possible outcome to an office romance. Famous cases abound: Microsoft's founder Bill Gates and opera impresario Luciano Pavarotti both married employees of their organizations. Obviously, businesses create dating policies to try and manage the negative aspects of office romances, and those that crash and burn. But, since perfectly happy relationships may result from office romances, policies that are clear and specific about exactly what they prohibit are best.

OFFICE SECURITY

Office security can be broken down into two main areas: 1) protecting an office and employees from vandalism, theft, and personal attacks; and 2) protecting an office from corporate sabotage, both from inside the company and out. The first area deals more with the actual office itself its layout, the use of security guards, alarm systems, and so on. The second area is primarily concerned with protecting a firm's intellectual property through the introduction and utilization of such measures as shredders; computer, Internet, and network security (firewalls, virus protection); and employee surveillance.

PHYSICAL SECURITY: PROTECTING THE OFFICE AND EMPLOYEES

Office security is an issue for every business, no matter the size. There are many steps that can be taken to improve security, many of which require relatively inexpensive outlays. To find out what is best for his or her company, a small-business owner should hire a security consultant to visit the business premises and conduct a

thorough security analysis. This review can identify weak spots and provide a clear plan for upgrading security.

The best place to start when examining office security is the physical layout of the office itself, or the layout of the larger building of which the office is a part. Office design should stress wide, open areas with clear sight lines. Hallways and offices should be open and have no nooks or crannies where an intruder could hide in the shadows. All areas should be well lit, especially after hours when employees might be working alone or in small groups. Mirrors in stairwells and inside and outside of elevators allow employees to see around corners or past obstructions.

Doors and windows are the most obvious access points to an office and should be secure. Ideally, entranceway doors, particularly those used for deliveries, should be steel, or steel-sheathed. This helps with security and also aids in fire prevention. Simply upgrading hinges and door locks is one of the cheapest and most effective security steps a business can take. Deadbolt locks are best, whether they are electronically controlled or manual in nature. All windows should use key locks, and windows near the ground level or fire escapes should have steel bars or lockable gates that meet local fire codes.

In their electronic handbook for tenants of their office buildings in Milwaukee, Siegel-Gallagher Property Management Company offers office safety suggestions. This comprehensive list of safety suggestions will serve any business owner well. The 2010 Siegel-Gallagher Management Handbook recommends the following office security measures:

- Restrict the deployment of office keys to only those who must have one.
- Keep important papers out of sight after hours, and in locked file cabinets when not being worked with.
- Keep a constantly updated and accurate list of persons who possess keys to the office, safes, file cabinets, petty cash, and so on.
- Always double and triple check that all doors and windows are locked upon leaving, and train the staff to do the same.
- Have the phone numbers for local police, fire department, building and office security companies, and alarm system company posted conspicuously anywhere there is an exit or a phone.
- Ask all repair and service persons for identification when they arrive to work on office equipment, the air conditioning, and so on.
- Ensure that all employees, managers, and partners are aware that they are not to leave their office keys unattended, even in a drawer, purse, or other inconspicuous location.
- Report suspicious-looking persons immediately to the security company or police.
- If the office is located in an office building and keys are lost to the suite or office space, report immediately to the property manager.
- If the business owner, managers, or employees find keys that do not belong to their office or company, report the missing keys to the security company and have them collected at once.

INCREASED USE OF ELECTRONICS

Improvements in electronics, computers, and other high-tech security features have given business owners new tools to fight crime in recent years. Perhaps the most common electronic tools are closed-circuit surveillance systems and access-control systems.

Closed-circuit surveillance systems use television cameras to monitor specific areas of a company's workspace and can be monitored remotely from the business owner's computer which he or she can view from anywhere in the world. Signals from the cameras are fed back to a central monitoring post, where a security guard or company employee watches for signs of abnormal activity. These systems are effective both during business hours and after hours. But while video technologies can be an effective deterrent and investigative tool, a closed-circuit system only works as well as the people monitoring it. The guard or employee must give the video monitors his or her complete attention.

Access-control systems start with establishing "point of control" access over an office. That means that all tenants and guests are routed through a control area before admittance is authorized. The control point can be as low-tech as a sign-in sheet or as high-tech as an elaborate system to scan the fingerprints or retinas of visitors. (Most security experts cite the former as an inadequate measure, in and of itself.) Most common is the use of access cards, or "swipe" cards. These cards are electronic "keys" the user passes a part of the card through an electronic reader stationed outside a door, and, if the person is authorized to enter, the door is unlocked. Newer versions of the swipe cards include video imaging. A central computer stores a photo of the employee and as much pertinent information as the company desires, including work hours, emergency contact numbers, license plate numbers and make of car, and other information. Electronic cards are preferable to metal keys because an electronic key can be deactivated at a moment's notice if an employee is fired or deemed a security risk.

Other electronic systems that are being used by security-conscious firms include tiny hidden cameras, panic buttons that summon security when pressed, and electronic door chimes that make it easy to tell when someone has entered a workspace. The tiny cameras are perhaps the most popular innovation. They are small enough to be hidden in a clock face or a heating vent, yet provide a powerful tool for monitoring employees in areas where employee theft is suspected. Use of the cameras only works if their existence is kept a secret from the employees that are under suspicion.

Finally, identification tag systems are an increasingly popular tool in many businesses. Laminated photo identification cards are inexpensive to produce and update, and they can instantly identify employees and the department in which they work. These photo ID cards can be particularly useful for larger, diversified enterprises in which employees may not know or interact with every other member of the workforce.

ALARM SYSTEMS

Alarm systems are another popular office security tool. There are two primary types of alarm systems: those that sound a loud siren or other noise when a break-in is detected, and those that send a silent alarm directly to a security company or to the police, who then respond to the alarm. The type of alarm chosen depends in large part on where the business is located, and depending on the industry the business is in, it may be a good idea to have both kinds of alarm systems in place. Loud alarms work well in small towns or in low-crime areas, but businesses located in urban or high-crime areas have found that nearby residents have often become so used to alarms going off that they ignore them. In that case, a silent system linked directly to the police may be preferable.

Systems can range in complexity and price. However, any alarm system must cover all the doors and windows into a business to be effective. Most common are motion sensors that detect movement where it is not supposed to be occurring, or window glass bugs that are activated when glass is broken. Examples of advanced systems include combined audio and video alert systems that are triggered by noise. When the sounds of a break-in are detected, the security company is alerted and can listen in to what is occurring at the site. The security company can then activate video monitors to see what is happening at the site, or the cameras can be set up to begin recording automatically when the first sound is detected. More advanced systems can also inform the business owner through his or her handheld device that there has been a security breach. The alarm itself can send a text or call, or a representative from the security company can call the business owner with the information. In this way, if it is a false alarm, the business owner does not have to go down to the office. Conversely, if it is urgent, the owner has the information about the breach and can head down to the office or police station.

As with the closed-circuit television systems, the key to a good alarm system is that it must be monitored at all times. If an alarm goes off and no one is there to notice, or if it is ignored, then office security has not been enhanced at all. In fact, the alarm may have provided a false sense of security that kept a company from pursuing other security measures.

SECURITY GUARDS

Using security guards is an increasingly popular form of office security. Guards can be used in two ways: to monitor the front desk of a company or building (the access control point), or to patrol the grounds of a larger company or office complex.

The old image of the security guard an elderly gentleman who slept as much as he monitored the grounds is a thing of the past. Today's guards, especially those who monitor building access, should have good communication skills and be able to handle many roles. Guards often act as concierges and goodwill ambassadors, greeting the public as they come into a company and answering questions and providing directions. Ideally, they should present a positive public image for the company or building that employs them. With this in mind, traditional uniforms have given way to a casual but professional wardrobe of blazers and trousers at many security firms. Guards are almost never armed the practice has come to be regarded as just too dangerous and they are primarily expected to do four things at all times: deter, detect, observe, and report. Today's guards can also be expected to help out by arranging for building maintenance or even assisting in life-threatening situations.

The other type of security guard the type that patrols the grounds of a larger company or an office park receive conflicting marks from security experts. Some feel that simply driving or walking by each part of an office complex every hour or half-hour does little to prevent crime because such measures still leave large windows of time for criminal activity to occur. Others argue the very presence of the guards is enough to deter all but the most professional or determined criminals. The question of whether to use such guards is one that each company will have to answer for itself.

Small-business owners should know that using security guards is not cheap. Round-the-clock coverage by a team of guards can cost upwards of $100,000 annually. Additionally, theft by the guards themselves has been a definite problem for some businesses. Many security firms

pay minimum wage, so turnover is high, and background checks are not always thorough. Business owners are advised to look for firms that perform thorough background checks, pay better than minimum wage, and have low turnover. Fellow members of the local business community can be a valuable resource in this regard.

THE SECURITY GUARD FOR THE NETWORK AND SERVER

It is equally if not more important to protect information, files, passwords, inventory lists, private employee and employer information, and other items held on the company server or network. Company information can be protected by hiring a different kind of security guard an IT professional. Someone with a firm grasp of IT who is a professional with experience can be hired contractually to equip company servers with firewalls, virus and spyware protection, and other applications that can control who can see what, and from where. A virtual network can be set up so that a business owner can see files on the server from anywhere in the world and even see when or if any files were modified. Certain employees can be granted more or less access depending on their need for it or how new they are to the firm. An IT professional can handle all of these requests, and while they are not cheap, generally the cost of losing information or having identities or trade secrets stolen is much more expensive.

THE ROLE OF EMPLOYEES

It is common knowledge that a security system is only as secure as its weakest link. In many cases, that weak link is the company's employees. Untrained in security measures and prone to the attitude that "it can't happen to me," many employees are their own worst enemies when it comes to security. When a company installs a new security system, it should take the time to bring in a security consultant to speak to employees about what they can do to increase their own safety and improve the company's security. In addition to the 2010 Siegel-Gallagher Management Handbook recommendations, other measures a consultant will advise are:

- Do not leave valuables unattended.
- Lock doors after hours.
- Do not go into poorly lighted areas after dark.
- Bolt down or secure equipment if possible.
- Engrave identification numbers on office equipment and keep a list of serial numbers to give to the police and insurance companies in case of theft.
- Provide each employee with a drawer that locks.
- Deposit checks and cash daily.
- Never leave visitors unsupervised.
- Try to leave with at least one other employee if working late.
- Do not advertise vacation plans.
- Make sure confidential files are secured when the office is closed.

CORPORATE SABOTAGE AND PROTECTING INTELLECTUAL PROPERTY

The biggest, most obvious and most overlooked way to protect data, intellectual property, and trade secrets is to keep them confidential. Many entrepreneurs get excited about a new idea and blow their own cover by sharing proprietary information with friends, lower-level co-workers, spouses, or workers in other divisions who should not be privy to the data. Of course, there are nondisclosure agreements and even noncompete agreements for nonemployees such as contractors. But these kinds of documents are proving to be less and less effective. The best ways to keep information and trade secrets safe is to excercise common sense: keep one person in charge of document and data safety, make confidentiality of information guidelines concise and clear to all employees, and regularly remind everyone of confidentiality requirements, and when possible or necessary, require the use of entry codes or badges where proprietary information is housed. Always make third parties sign confidentiality agreements but before anyone signs anything, make sure that the agreement is air tight. The only way to make these agreements bulletproof is to have them drafted to the letter of the law, and that means they must be written (or at the very least approved) by an attorney specializing in business law.

Unfortunately for most companies, the greatest risk of theft or sabotage (conventional or computer), often comes from the firm's employees and managers. In fact, many experts believe that a significant percentage of small-business failures are directly related to internal theft of money, property, information, and time. Few occurrences are as potentially destructive to a business as employee theft, embezzlement, or misappropriation of company funds.

Business security experts warn that employee theft can take many forms. Examples include:

- Forgery of company checks and use of company credit cards or accounts with vendors for personal gain.
- Using a "ghost payroll," which occurs when one or more employees create "phantom" employees, submit time cards for those employees, and then cash their paychecks themselves.

- Outright theft of inventory, equipment, or cash from a register, safe, or petty cash.
- Stealing ideas, information, or other proprietary data by hacking into the business owner or manager's e-mail or files on the network or company server.
- "Sweethearting," at the cash register, which can mean granting a friend or other person a discount at the register when they pay, undercharging them, or ringing up fewer items than the person has actually bought.
- Selling information to a competitor or other interested party.

Internal computer theft has become one of the most common forms of employee theft now that computers have become more common in nearly every industry sector. Indeed, employees often are more computer literate than their supervisors, which may strengthen the temptation to abscond with proprietary information or otherwise engage in illicit activities. Computer theft can take many forms, including false data entry, which is almost impossible to track; slicing off small amounts of data or money that add up over time; superzapping, which occurs when a computer network security bypass code falls into the wrong hands; and scanning, or using a high-speed computer to locate data that would be impossible to find by hand, then using that data for illegal purposes.

Sabotage, which can also cost millions, almost always involves disgruntled current or former employees and can take almost any form, from defacing company property to deleting or altering important company data. As mentioned above, using access-control cards for employees that can be easily deactivated makes it easier to keep ex-employees out of the workplace and track the activities of current employees.

Because employee theft is so prevalent and so costly to businesses, a business owner needs to take every precaution and use every means possible to stop it. Some of the steps that can be taken include:

- Making sure that security starts at the top. Executives must set a good and honest example. Establish a clear policy on theft and security and distribute it to all employees.
- Install a security program that meets the company's needs.
- Follow up on references provided by prospective new hires.
- Keep checkbooks locked up.
- Control cash flow and have good documentation on where money is spent.
- Do not leave bookkeeping to just one person without checks and balances.
- Audit internal financial documents frequently using independent auditors.
- Only allow a few people to have authority to sign checks.
- Check all invoices to make sure they match what was delivered.

OFFICE SUPPLIES

Office supplies encompass a wide range of materials that are used on a regular, daily basis by businesses of all sizes. The standard set of office supplies utilized by even the smallest company or home office includes pens, writing paper, notebooks, Post-It notes, scissors, erasers, staplers, CDs, binders, file folders, labels, tape, basic reference materials (dictionary, for example), envelopes, and toner cartridges, to mention only the most common. In addition, equipment that is used in most office environments,

such as printers, copy machines, and fax machines, is often included under this umbrella term.

Despite the growth of technologies that promised a future in which people would operate in ''paperless offices,'' most offices today are still filled with paper and with all the accessories needed to keep paper organized. In fact, a paper shredder is a common item in offices these days. Still, while offices are not entirely digital yet, there is a growing move to electronic office supplies. For example, it is now possible to send faxes entirely via the computer and Internet, without the need for a paper fax machine in the office. Steve Adams touted the benefits of Internet fax service in a 2008 article, citing such factors as greater mobility, since these faxes could be accessed from multiple locations; less paper; increased privacy; more office space; the availability of a toll-free fax number for the same cost; and the end to lost faxes.

Whether electronic options or standard supplies are used, there is still a cost for office supplies and services. Although the cost of office supplies is relatively small when items are purchased separately, in the aggregate this cost can amount to a substantial quantity. Consequently, small-business owners should make sure that they pay attention to office supply costs and keep all receipts of such purchases, since office supplies are a legitimate business deduction for tax purposes.

Entrepreneurs and business managers also need to take care to ensure that they get what they pay for. Most companies engaged in selling office supplies and equipment are scrupulous and reliable, but fraudulent suppliers do exist. For this reason, experts urge small businesses to proceed methodically, especially if dealing with a new supplier. ''Prevent supplier swindles by adopting a written purchasing policy, which includes a list of your approved vendors,'' stated Scott Clark in *Pugent Sound Business Journal.* ''A specific credit check procedure must be completed for a new vendor to be added to this list.'' Small-business owners should also insist on written confirmation of all supplier claims and demand an opportunity to review sample goods before placing an order.

Despite the continued need for office supplies, the market for such supplies is not inelastic. During the economic crisis in 2008, the Business and Institutional Furniture Manufacturers Association reported that shipments of office furniture fell 1 percent in September 2008, marking the lowest growth rate since 2004. Office Depot, which reported a quarterly loss in the second quarter of 2008, suggested that small-business owners and retail consumers spend less on office supplies during times of financial difficulty.

Procurement Options. In recent years, office superstores and online or catalog supply houses have emerged as the most efficient and inexpensive way to purchase various types of supplies. The average client of these superstores is the small to medium-sized business, as well as the home office market. The convenience of being able to find virtually any office supply at one location is one of the primary reasons for the popularity of the superstores. In addition to convenience, these stores offer merchandise that is very competitively priced since they are able to purchase their goods at bulk rates. Some of these savings are usually passed along to small business customers, especially if the stores are operating in a competitive environment.

Many small (and large) businesses are choosing suppliers who offer materials made from recycled materials. This trend towards ''green'' procurement can be seen in all types of paper products (computer paper, envelopes, tablets, file folders, etc.) as well as big-ticket items like office furniture. In the latter case, remanufactured, refurbished, or reused furniture has emerged as a particularly attractive option for cash-strapped start-ups and growing businesses because they are able to garner savings of 30-50 percent by pursuing used items. According to some experts, furniture recyclers now represent almost 10 percent of the $13.6 billion commercial furniture industry. The green movement has also led to other changes in office supplies. For example, in 2008, TheGreenOffice.-com was the first office supply retailer in the industry to refuse to sell office products made from polyvinyl chloride (PVC), such as vinyl binders, due to the potential environmental dangers of PVC substances.

ONLINE AUCTIONS

Online auctions are sales transactions that result from a competitive bidding process conducted over the Internet. Whether the sales take place between individuals, between consumers and merchants, or between businesses, online auctions experienced rapid growth with the spread of Internet access. The value of goods and services traded through online auctions is not tracked but is estimated to have grown rapidly in its early years, from under $10 billion in 2000 to well over three times that figure in 2005. According to an *Entrepreneur* magazine article about online auction marketplace leader eBay, sales through that company's online auction space alone accounted for more than $32 billion in 2004. However, a 2008 *Business Week* article reported that as the novelty and popularity of online auctions waned, more and more people rejected the format, favoring fixed price purchasing online instead. In fact, in 2007, nonauction, fixed-price sales on eBay represented 42 percent of total sales on the site, up from 38 percent 1 year earlier. Despite this slight drop, online auctions are still a prominent avenue for internet commerce.

The consumer online auction process has been described as similar to a garage sale, with commonly offered items including collectibles, antiques, toys, clothing, art, cars, tickets, electronics, and even real estate. Online auctions appeal to individuals who enjoy the competitive bidding process and like to feel as if they are getting a bargain. Most Web sites that host auctions allow buyers and sellers to negotiate payment methods and shipping details. Auction-related costs are usually limited to a small percentage of the final sales price.

Auctions have been a means of economic transaction for centuries. By moving onto the Internet, auctions have become accessible to a much larger number of participants, increasing the size of the marketplace dramatically. Although transactions between individuals are an important driver of the online auction market, the business-to-consumer and business-to-business portions of the market are growing rapidly. Online auctions offer potential benefits to all types of businesses. For example, since 2000 the firm SalvageSales has been helping insurance companies and their clients sell damaged shipments of commercial and industrial goods. In the past these salvage sale operations would have been handled locally, but the online auction option offered by SalvageSales has increased the size of the market that can be easily reached in salvage sales. The same increase in market size is being seen across the board for both used and new products. Another example of an online auction-based business is Cashco 1000, Inc., a business started by stay-at-home mother Angle Cash who wanted to try something she could manage from home while raising her children. In 2005, Cash found fame as an eBay success story when she reported expected income of $500,000 worth of home decorations on eBay in 2005. As of 2010, her store is still going strong and is celebrating its 10th anniversary.

"Many companies wonder when and why they should use online auctions as part of their business trading strategy," Lori Mitchell wrote in *InfoWorld*. "The short answer is, if you sell goods and services or if you purchase items to run your business, online auctions can work for you.... Companies of practically any size and within any industry can benefit from them."

Internet analysts note that online retailers who incorporate auctions into their sales activities tend to see a higher level of repeat visits, more frequent purchases, and increased promotional opportunities compared to other online retailers. Auctions also offer advantages for those businesses interested in selling to or buying from other businesses. Some businesses choose to host closed or private auctions for their existing business contacts. But online auction companies may be able to assist companies in enlarging the audience for auctions by analyzing the bidding patterns of previous auctions to identify potential new customers.

EBAY

By far the largest online auction host is eBay, a company founded in 1995 and through which an estimated 95 percent of all online auctions took place in 2005. Other online auctioneers include such companies as eBid, OZtion, Overstock, weBidz, CQout, uBid, ePier and ShopGoodwill to name just a few.

Small businesses may use eBay to boost sales in a number of ways. "Whether you're starting a brand-new business or just looking for ways to grow an existing operation, you can do it on eBay." This statement of introduction appears on an *Entrepreneur.com* Web site dedicated to providing guidance to those interested in setting up an eBay business. The site offers step-by-step guidelines for establishing an eBay account and creating a successful eBay vendor profile. The popularity and growth of eBay businesses can be seen clearly through the number of guides published for doing business on eBay, which include hundreds of print and eBooks, DVDs, and Web sites dedicated to the subject. Many

businesses have been formed and based exclusively on the sale of products through eBay auctions or direct eBay sales, and many others have taken existing retail businesses and expanded them by using eBay as a supplemental sales venue. In addition, businesses such as Auction Drop were created based on the business model of having other customers drop off items, which Auction Drop would then sell on eBay for a cut of the profits.

However, despite the popularity of eBay auctions at their advent and the continued use of the online marketplace as an auction site, eBay has been facing growth problems and user discontent toward the end of the first decade of the twenty-first century. In 2008, for example, eBay made changes to its fee structure in order to attract more buyers. The changes were prompted by the slow growth of the site; the number of active users rose only 4 percent in the first quarter of 2008.

In an effort to encourage more auction listings, which eBay believed would in turn prompt more buyer sign-ups, eBay slashed its listing fees but raised the commissions charged on completed auctions. EBay also announced a Diamond Power Seller Plan offering discounts for high-volume sellers and a change to their fixed-price fees, allowing sellers to pay 35 cents to list an unlimited number of identical items at a set price. This led to protest about the new fees and complaints that eBay was trying to shift form from its auction roots. Numerous users flooded eBay with complaints, prompting eBay to make some alterations to the new fee structure, but these alterations still did not satisfy many long-time eBay power sellers, some of whom protested by refusing to list items. Others reported to *USA Today* that they would be leaving the site.

Starting Out. Becoming familiar with the eBay way of doing business is an important first step in becoming involved in online auctions. Browsing the www.ebay.com site, watching auctions, taking the virtual tours offered on the site, are all ways to become familiar with the overall eBay experience. No registration is required to browse the site.

In order to buy on eBay, however, one must be registered. The key element in registering on eBay, for which there is no fee, is the selection of a User ID. Jim Griffith, author of *The Official eBay Bible*, advises new users to take care in selecting a User ID since it will be the official "handle" for all eBay transactions by that person or the organization he or she represents. It is crucial that a small company picks a User ID that is well suited to the company, conveys some meaning, and does not include the name eBay for reasons of trademark protection.

Selling on eBay requires a seller's account and a PayPal account. Setting up a seller's account is a simple process very similar to the registration process, and includes providing eBay with sufficient information to verify one's identity and preferred method of paying seller fees. The seller fees vary by category of item being sold. A PayPal account is necessary because it is the most popular online payment method used by eBay buyers. The PayPal system is owned by eBay, and there is no charge to open the account, although there is a charge to receive funds. The account is either used as a deposit account into which the account holder deposits and withdraws cash as necessary, or it is linked to a credit card that may be debited or credited as needed. The seller on eBay may choose to accept payments by any method he or she prefers, but PayPal is the most commonly used method on eBay and therefore the simplest account through which to manage eBay transactions.

Selling on eBay. Before attempting to sell on eBay it is recommended by most experienced eBay users that a person first try partaking in an auction or purchasing something offered on the site. There are many strategies used by buyers and sellers alike to try and get the best possible price. In summary, here are eleven areas that need attention when planning to sell through an eBay auction. This list provides a glimpse into the process.

- Fully use the "About Me" page. The "About Me" page is a free Web page offered to an eBay seller. This is a useful resource that any small business or individual seller should use and keep updated.
- Shop the competition. It is always a good idea to search for items already listed on eBay before preparing to list new items and set up auctions. A little competitive research will provide a new seller with important information about what category is most commonly used for an item, the price range for other similar objects, and the availability of supply of similar items currently listed.
- Choose a category. Items up for sale and auction on eBay are listed by category. Having one's items assigned to a category correctly is essential since customers looking for that perfect, customized swing set will never find it if it is erroneously listed as yard equipment.
- Write an informative and compelling description. Writing catchy and informative product descriptions is not a simple task. The auction title needs to catch a potential buyer's attention and compel him or her to click on the item. Because eBay's search engine uses the auction title to index items for sale, the title should be chosen wisely. It is better to refrain from using words like "wow" or "L@@K!" Include as many terms as possible for the item being sold, since people will refer to things in many ways pants, jeans, dress slacks, trousers, suit pants. Be as informative as possible in the description. For an

additional fee, there are other features that may be added to a listing. EBay offers several options for increasing visibility, like bold-face fonts and highlighting, but these come at a cost and their use should be weighed against the benefit added.

- Select a format. In addition to the classic auction format, there are other ways to sell on eBay. One can add a "Buy It Now" button to the auction, which permits a potential buyer to skip the auction process and purchase the item for the assigned price. Another option is to use a Dutch-style auction to sell multiple identical items in the same listing. This is popular among small businesses. However, formats that tend to work best for some products may not be the optimum formats for other products. For example, a 'Buy it Now" button may work best for lower-priced, impulse-buy items but may not help with higher priced or very unique items.
- Use photos to advantage. The use of photos in an auction is very important. Bidders do not have the opportunity to look at an item in person, so pictures factor heavily in their decisions about whether to bid, and if so, how much to bid.
- Set the price. Setting a price can become complicated, depending on the auction format chosen. One way that eBay makes it easy to list and sell is by allowing sellers to set a reserve price: a price below which the seller refuses to sell. Unless the bidding meets or exceeds the reserve, the item will not sell. Reserves make some buyers uncomfortable, however.
- Establish the auction length. Seven days is the default length, but there are reasons to select a different length. For example, many sellers want the bidding to conclude on a Sunday, a popular day for eBay bidding activity. Auctions may run for 1, 3, 5, 7, or 10 days.
- State payment methods acceptable. The seller decides what forms of payment will be acceptable. The more forms of payment accepted, the bigger the potential pool of bidders will be.
- Determine shipping costs and who will pay. Establishing from the outset who is responsible for shipping costs is the best policy. Most sellers require the buyer to pay for shipping costs, particularly as these are an unknown until the location of the buyer is revealed. Offering free shipping is, of course, one way to get a listing to stand out.
- Provide quality customer service. This may seem a self-evident recommendation, and, of course, it is sound advice for any business undertaking. When working with eBay, however, one's record of customer service and follow-through becomes a matter for public record. The eBay system has a built in mechanism for monitoring the actions of customers and sellers. It is called feedback and anyone active on eBay is encouraged to send feedback on the person or entity with whom he or she has had a transaction. These feedback comments and ratings are made a part of the recipient's eBay profile and are then used by future potential sellers and buyers in assessing the likely reliability of the trading partner. Poor feedback as a seller can also lead to disqualification of one's right to sell on eBay auctions.

ONLINE CLASSIFIED ADS

Online auctions have changed the world for retailers and entrepreneurs by giving them a national and international venue from which to sell. But shipping and transportation costs are not an insignificant barrier to the sale of many large items. A move back to geographically centered trading, to the local marketplace, is being accomplished online through the use of online classified ad sites. One such site that has shown strong growth is Craigslist.org. This city-centered online site is another venue through which small businesses may wish to sell products generally, post an ad for a particularly large item, post job openings, or use as a sales outlet for their overstock items.

OPERATIONS MANAGEMENT

Operations management is a multidisciplinary field that focuses on managing all aspects of an organization's operations. The typical company carries out various functions as a part of its operation. The dividing of a company's activities into functional categories occurs very early on, even in a company formed and operated by a single individual. Most companies make a product of some kind or produce a salable service. They must also carry out a sales and marketing function, an accounting function, and an administrative function to manage employees and the business as a whole. Operations managers focus on the function of providing the product or service. Their goal is to assure the production of a quality good or service. They apply ideas and technologies to increase productivity and reduce costs, improve flexibility to meet rapidly changing customer needs, assure a safe workplace for all employees, and when possible assist in assuring high-quality customer service.

For the most part, the title "operations manager" is used in companies that produce a tangible good manufacturers on the whole. In service-oriented businesses, the person responsible for the operations manager role is often called by another name, one that addresses the service being offered. Examples include project manager, consultant, lawyer, accountant, office manager, and datacenter manager.

While operations management is normally done in-house, some companies and small businesses opt to outsource operations management instead. This is common in situations where the key person involved in running the business is not a management specialist. For example, physicians may outsource the management of operations of their medical practices. When operations management is outsourced, it is often beneficial to purchase turnkey management services, which means all management is outsourced. This streamlines the process and creates greater overall efficiency efficiency.

KEY ISSUES IN OPERATIONS

As an organization develops plans and strategies to deal with the opportunities and challenges that arise in its particular operating environment, it should design a system that is capable of producing quality services and goods in the quantities demanded and in the time frames necessary to meet the businesses obligations.

Designing the System. Designing the system begins with product development. Product development involves determining the characteristics and features of the product or service to be sold. It should begin with an assessment of customer needs and eventually grow into a detailed product design. The facilities and equipment used in production, as well as the information systems needed to monitor and control performance, are all a part of this system design process. In fact, manufacturing process decisions are integral to the ultimate success or failure of the system. Of all the structural decisions that the operations manager makes, the one likely to have the greatest impact on the operation's success is choice of the process technology. This decision answers the basic question: How will the product be made?

Product design is a critical task because it helps to determine the characteristics and features of the product, as well as how the product functions. Product design determines a product's cost and quality, as well as its features and performance. These are important factors on which customers make purchasing decisions. In recent years, new design models such as Design for Manufacturing and Assembly (DFMA) have been implemented to improve product quality and lower costs. DFMA focuses on operating issues during product design. This can be critical even though design costs are a small part of the total cost of a product because procedures that waste raw materials or duplicate effort can have a substantial negative impact on a business's operating profitability. Another innovation similar to DFMA in its emphasis on design is Quality Functional Deployment (QFD). QFD is a set of planning and communication routines that are used to improve product design by focusing design efforts on customer needs.

Process design describes how the product will be made. The process design decision has two major components: a technical (or engineering) component and a scale economy (or business) component. The technical component includes selecting equipment and selecting a sequence for various phases of operational production.

The scale economy or business component involves applying the proper amount of mechanization (tools and equipment) to make the organization's workforce more productive. This includes determining: 1) if the demand for a product is large enough to justify mass production; 2) if there is sufficient variety in customer demand so that flexible production systems are required; and 3) if demand for a product is so small or seasonal that it cannot support a dedicated production facility.

Facility design involves determining the capacity, location, and layout for the production facility. Capacity is a measure of an company's ability to provide the demanded product in the quantity requested by the customer in a timely manner. Capacity planning involves estimating demand, determining the capacity of facilities, and deciding how to change the organization's capacity to respond to demand.

Facility location is the placement of a facility with respect to its customers and suppliers. Facility location is a strategic decision because it is a long-term commitment of resources that cannot easily or inexpensively be changed. When evaluating a location, management should consider customer convenience, initial investment necessary to secure land and facilities, government incentives, and operating transportation costs. In addition, qualitative factors such as quality of life for employees, transportation infrastructure, and labor environment should also be taken under consideration.

Facility layout is the arrangement of the workspace within a facility. It considers which departments or work areas should be adjacent to one another so that the flow of product, information, and people can move quickly and efficiently through the production system.

Implementation. Once a product is developed and the manufacturing system is designed, it must be implemented, a task often more easily discussed than carried out. If the system design function was done thoroughly, it will have rendered an implementation plan which will guide activities during implementation. Nonetheless, there will inevitably be changes needed. Decisions will have to be made throughout this implementation period about trade-offs. For example, the cost of the originally planned conveyor belt may have risen, which will make it necessary to consider changing the specified conveyor belt for another model. This, of course, will impact upon other systems linked to the conveyor belt, and the full implications of all these changes will have to be assessed and compared to the cost of the price increase on the original conveyor belt.

Planning and Forecasting. Running an efficient production system requires a great deal of planning. Long-range decisions could include the number of facilities required to meet customer needs or studying how technological change might affect the methods used to produce services and goods. The time horizon for long-term planning varies with the industry and is dependent on both complexity and size of proposed changes. Typically, however, long-term planning may involve determining workforce size, developing training programs, working with suppliers to improve product quality and improve delivery systems, and determining the amount of material to order on an aggregate basis. Short-term scheduling, on the other hand, is concerned with production planning for specific job orders: who will do the work, what equipment will be used, which materials will be consumed, when the work will begin and end, and what mode of transportation will be used to deliver the product when the order is completed.

Managing the System. Managing the system involves working with people to encourage participation and improve organizational performance. Participative management and teamwork are an essential part of successful operations, as are leadership, training, and culture. In addition, material management and quality are two key areas of concern.

Material management includes decisions regarding the procurement, control, handling, storage, and distribution of materials. Material management is becoming more important because, in many organizations, the costs of purchased materials comprise more than 50 percent of the total production cost. Questions regarding quantities and timing of material orders need to be addressed here as well when companies weigh the qualities of various suppliers.

BUILDING SUCCESS WITH OPERATIONS

To understand operations and how they contribute to the success of an organization, it is important to understand the strategic nature of operations, the value-added nature of operations, the impact technology can have on performance, and the globally competitive marketplace.

Efficient organization operations are a vital tool in achieving competitive advantage in the daily contest for customers or clients. What factors influence buying decisions for these entities? For most services and goods, price, quality, product performance and features, product variety, and availability of the product are critical. All these factors are substantially influenced by actions taken in operations. For example, when productivity increases, product costs decline and product price can be reduced. Similarly, as better production methods are developed, quality and variety may increase.

By linking operations and operating strategies with the overall strategy of the organization (including engineering, financial, marketing, and information system

strategy) synergy can result. Operations become a positive factor when facilities, equipment, and employee training are viewed as a means to achieve organizational objectives, rather than as narrowly focused departmental objectives. In recognition of this evolving viewpoint, the criteria for judging operations are changing from cost control (a narrowly defined operating objective) to global performance measurements in such areas as product performance and variety, product quality, delivery time, customer service, and operational flexibility.

In today's business environment, a key component of operational flexibility in many industries is technological knowledge. Advances in technology make it possible to build better products using fewer resources. As technology fundamentally changes a product, its performance and quality often increases dramatically, making it a more highly valued commodity in the marketplace. But the growth in high-tech business applications has created new competitors as well, making it important for businesses to try to register advantages in any and all areas of operations management.

TECHNOLOGY AND MANAGEMENT

Operations management in general has become more focused on technology. For example, software companies have produced integrated operations management software solutions for various industries. Manufacturing Operations Management (MOM) solutions software is one example of a software solution that helps manufacturing companies streamline their operations processes. CDC Factory, designed for the food and beverage industry, is another example of an operations management software solution. These solutions allow for virtual management of products, goods, human resources, and services, all in an integrated package.

Over time, operations management has grown in scope and increased in importance. In the twenty-first century, it has elements that are strategic, it relies on behavioral and engineering concepts, and it utilizes management science/operations research tools and techniques for systematic decision making and problem solving. As operations management continues to develop, it will increasingly interact with other functional areas within the organization to develop integrated answers to complex interdisciplinary problems. Indeed, such interaction is widely regarded as essential to long-term business success for small business establishments and multinational corporations alike.

OPPORTUNITY COST

Simply stated, an opportunity cost is the cost of a missed opportunity. It is the opposite of the benefit that would have been gained had an action not taken been taken the missed opportunity. This is a concept used in economics. Applied to a business decision, the opportunity cost might refer to the profit a company could have earned from its capital, equipment, and real estate if these assets had been used in a different way. The concept of opportunity cost may be applied to many different situations. It should be considered whenever circumstances are such that scarcity necessitates the election of one option over another. Opportunity cost is usually defined in terms of money, but it may also be considered in terms of time, person-hours, mechanical output, or any other finite resource.

Although opportunity costs are not generally considered by accountants financial statements only include explicit costs, or actual outlays they should be considered by managers. Most business owners do consider opportunity costs whenever they make a decision about which of two possible actions to take. Small businesses factor in opportunity costs when computing their operating expenses in order to provide a bid or estimate on the price of a job. For example, a landscaping firm may be bidding on two jobs, each of which will use half of its equipment during a particular period of time. As a result, they will forgo other job opportunities some of which may be large and potentially profitable. Opportunity costs increase the cost of doing business, and thus should be recovered whenever possible as a portion of the overhead expense charged to every job.

While opportunity costs must be factored in and considered when making business and investment decisions, any consideration of opportunity costs must be grounded in practicality. A 2009 *Forbes* article noted that sometimes attitudes towards opportunity cost can drive investors to do foolish things. For example, panicked investors can act in a manner that is contrary to their interests, removing money after incurring losses and missing out on stock market rallies, or investing in something after it has passed its peak in a futile effort to "chase yesterday's returns".

EXAMPLES OF OPPORTUNITY COSTS

One way to demonstrate the concept of opportunity costs is through an example of investment capital. A private investor purchases $10,000 in a certain security, such as shares in a corporation, and after one year the investment has appreciated in value to $10,500. The investor's return is 5 percent. The investor considers other ways the $10,000 could have been invested and discovers a bank certificate with an annual yield of 6 percent and a government bond that carries an annual yield of 7.5 percent. After a year, the bank certificate would have appreciated in value to $10,600, and the government bond would have appreciated to $10,750. The opportunity cost of purchasing shares is $100 relative to the bank certificate, and $250 relative to the government bond. The investor's decision to purchase shares with a 5 percent return comes at the cost of a lost opportunity to earn 6 or 7.5 percent.

Expressed in terms of time, consider a commuter who chooses to drive to work rather than using public transportation. Because of heavy traffic and a lack of parking, it takes the commuter 90 minutes to get to work. If the same commute on public transportation would have taken only 40 minutes, the opportunity cost of driving would be 50 minutes. The commuter might have chosen driving over public transportation because she had a use for the car after work or because she could not have anticipated traffic delays in driving. However, experience can create a basis for future decisions, and the commuter may be less inclined to drive next time, knowing the consequences of traffic congestion.

In another example, a small business owns the building in which it operates and thus pays no rent for office space. But this does not mean that the company's cost for office space is zero, even though an accountant might treat it that way. Instead, the small-business owner must consider the opportunity cost associated with reserving the building for its current use. Perhaps the building could have been rented out to another company, with the business itself relocated to a location with a higher level of customer traffic. The foregone money from these alternative uses of the property is an opportunity cost of using the office space and thus should be considered in calculations of the small business's expenses.

OPTIMAL FIRM SIZE

Optimal firm size refers to the speed and extent of growth that is ideal for a specific small business. Optimal firm size is dependent on a variety of internal and external factors. For some home-based businesses, the optimal size may be the two founding partners, a husband and wife, perhaps, if their primary operating goal is simply to bring in enough revenue for a comfortable standard of living while leaving large blocks of time for family or travel. This example aside, most companies are intent on expanding their operations. Growth of some kind, either in revenues, profits, number of employees, or size of facilities, is essential for almost every business. For many

companies competing in rapidly changing industries, expansion (of manufacturing capacity, geographic presence, market share, etc.) may be imperative for survival. But smart growth strategies can be elusive, as many entrepreneurs have learned to their chagrin. As James A. Schriner explained in *Industry Week*, "Growing a company is like blowing up a balloon. Your first few breaths, though difficult, produce immediate results. Subsequent breaths expand the balloon proportionally until it nears capacity. Stop too soon and the balloon never reaches its potential. Stop too late and it bursts."

Successful entrepreneurs and business experts agree that the key to finding the optimal firm size is to grow in a controlled way. In some cases, restraining growth is simply a matter of saying "no," or turning down new business. This is particularly true for service businesses that depend on the personal attention of the founder. When turning down business becomes necessary, the entrepreneur may wish to provide referrals in order to maintain good relations with potential customers. Another strategy in restraining growth involves hiring employees who like working in a small company atmosphere. These people tend to enjoy the diversity of challenges they encounter in a small business, and they often have a strong interest in the product and can provide their expertise to customers. It is important to note, however, that restraining growth does not mean refusing to change. Small businesses are not likely to remain in business long if they cannot be creative and adapt to changes in customer tastes and competitors' tactics.

Restraining uncontrolled growth may also be essential to maintaining good customer service and a healthy business model. A *Fast Company* article reported that many big companies are too focused inward, on benchmarks like gross sales, and as a result they are viewed as indifferent and distant by their customers. In relationship-based businesses, this distance can be detrimental to the optimum health of a company and can prevent it from recognizing the need to change and shift with the markets.

Schriner noted that one factor influencing the optimal size of a business is the availability of workers and other resources in the surrounding community. In fact, he suggested that it is possible for businesses to outgrow the communities in which they operate, particularly when they are located in a remote area. In this case, it may be difficult to attract talented workers from outside the immediate area, forcing the company to pay sharply higher wages to compete for labor. In addition, some communities cannot afford to provide services to growing companies (or provide top schools, parks, and other quality of life elements that attract high-quality employees necessary for successful business expansion). Finally, Schriner noted that being too integral a part of a community can make it difficult for a growing company to adapt to a changing business environment. Some factors that may indicate a company has outgrown its community include employing more than 10 percent of the local work force; growing at a faster rate than the community's labor force; providing more than one-third of the local government's funding through taxes; and being responsible for the death of the community if the company should shut down.

The increased importance of Internet businesses and available business technologies may also play a role in determining the optimal size for a business. Larry Downes, author of *Unleashing the Killer App: Digital Strategies for Market Dominance* reported that the lowered cost of transactions thanks to emerging technologies has reduced the optimal size of most businesses. Downes is quoted as saying "The focus of corporate strategy has been on maximizing physical assets. More trucks, more factories, more people. Now the focus of asset management and asset exploitation should be on data. . . . Organize your company, your strategy, and your execution around information." Downes believes that while having an economy of scale can create some advantages, a business can be more successful by acquiring more information and increasing its knowledge base rather than by simply growing in size.

ORAL COMMUNICATION

Oral communication describes any type of interaction that makes use of spoken words, and it is a vital, integral part of the business world, especially in an era dubbed the information age. "The ability to communicate effectively through speaking as well as in writing is highly valued, and demanded, in business," Herta A. Murphy, Herbert W. Hildebrandt, and Jane Thomas wrote in their book *Effective Business Communications.* "Knowing the content of the functional areas of business is important, but to give life to those ideas in meetings or in solo presentations demands an effective oral presentation." The types of oral communication commonly used within an organization include staff meetings, personal discussions, presentations, telephone discourse, and informal conversation. Oral communication with those outside of the organization might take the form of face-to-face meetings, telephone calls, speeches, teleconferences, or videoconferences.

According to the Seventh Annual Business School Study released by Harris Interactive and the *Wall Street Journal* in 2007, most recruiters list both communication and interpersonal skills at the top of their lists when it comes to hiring new candidates. Unfortunately, according to a *Bloomberg.com* article, most businesses and professionals fail to define what is meant by effective communication, and as such the exact meaning of the term has become unclear. This makes the requirement difficult to elucidate since there is no system for quantifying what constitutes "good" communications skills as opposed to "bad" ones.

Despite being hard to quantify, conversation management skills are essential not just for employees but also for small-business owners and managers who often shoulder much of the burden in such areas as client/customer presentations, employee interviews, and conducting meetings. For oral communication to be effective, it should be clear, relevant, tactful in phraseology and tone, concise, and informative. Presentations or conversations that bear these hallmarks can be an invaluable tool in ensuring business health and growth. Unclear, inaccurate, or inconsiderate business communication, on the other hand, can waste valuable time, alienate employees or customers, and destroy goodwill toward management or the overall business.

Richard Anderson, CEO of Delta Airlines, provided his five expectations for good communication in a *New York Times* interview. While each person's definition may vary, his five tips provide a good starting point for ensuring that one's point is clearly communicated and that one's conversation skills are effective. Anderson recommends that individuals study the fundamentals of the written word, practicing good grammar both on paper and when speaking orally. Anderson also suggests thinking clearly before speaking; preparing thoroughly for meetings; engaging in and encouraging open debate and discussion; and listening to others.

ORAL PRESENTATIONS

The public presentation is generally recognized as the most important of the various genres of oral business communication. As is true of all kinds of communication, the first step in preparing a public speech or public remarks is to determine the essential purpose or goal of the communication. As Murphy, Hildebrandt, and Thomas note, business presentations tend to have one of three general purposes: to persuade, to inform or instruct, or to entertain. Out of the purpose will come the main ideas to be included in the presentation. These ideas should be researched thoroughly and adapted to the needs of the audience.

The ideas should then be organized to include an introduction, a main body or text, and a summary or conclusion. Or, as the old adage about giving speeches goes, "Tell them what you're going to tell them, tell them, and tell them what you told them." The introduction should grab the listener's interest and establish the theme of the remainder of the presentation. The main body should concentrate on points of emphasis. The conclusion should restate the key points and summarize the overarching message that is being conveyed.

Visual aids can be a useful component of some presentations. Whether they are projected from a PC, displayed on chalkboards, dry-erase boards, or flip charts, visual aids should be meaningful, creative, and interesting in order to help the speaker get a message across. The key to successful use of visual aids is that they should support the theme of the presentation and aid in its transmittal. Sloppy, complicated, or even too entertaining visual aids should be avoided.

Once the presentation has been organized and the visual aids have been selected, the speaker should rehearse the presentation out loud and revise as needed to fit time constraints and to assure thorough coverage of the main points. It may help to practice in front of a mirror or in front of a friend in order to gain confidence. A good oral presentation will include transitional phrases to help listeners move through the material and will not be overly long or technical. It is also important for the speaker to anticipate questions the audience might have and either include that information in the presentation or be prepared to address them in a question-and-answer session at the end of the presentation. Professional and gracious presentation is another key to effective communication, whether the setting is a conference, a banquet, a holiday luncheon, or a management retreat. "Recognize that when you speak at a business event, you represent your company and your office in that company," stated Steve Kaye in *IIE Solutions.* "Use

the event as an opportunity to promote good will. Avoid complaints, criticism, or controversy. These will alienate the audience and destroy your credibility quickly. Instead, talk about what the audience wants to hear. Praise your host, honor the occasion, and compliment the attendees. Radiate success and optimism."

Oral presentations can be delivered extemporaneously (from an outline or notes); by reading from a manuscript; or from memory. The extemporaneous approach is often touted as a method that allows the speaker to make eye contact and develop a rapport with the audience while simultaneously conveying pertinent information. Reading from a manuscript is more often utilized for longer or detailed communications that cover a lot of ground. Memorization, meanwhile, is usually only used for short or informal discussions.

The delivery of effective oral presentations requires a speaker to consider his or her vocal pitch, rate, and volume. It is important to incorporate changes in vocal pitch to add emphasis and avoid monotony. It is also helpful to vary the rate of speaking and incorporate pauses to allow the listener to reflect upon specific elements of the overall message. Finding the appropriate volume is crucial to the success of a presentation as well. Finally, speakers should be careful not to add extraneous words or sounds, such as "um," "you know," or "okay," between words or sentences in a presentation.

Nonverbal elements such as posture, gestures, and facial expressions are also important factors in developing good oral communication skills. "Your outward appearance mirrors your inner mood," Hildebrandt, Murphy, and Thomas confirmed. "Thus good posture suggests poise and confidence; stand neither at rigid attention nor with sloppy casualness draped over the podium, but erect with your weight about equally distributed on each foot." Some movement may be helpful to hold listeners' attention or to increase emphasis, but constant shifting or pacing should be avoided. Likewise, hand and arm gestures can be used to point, describe, or emphasize, but they should be varied, carefully timed, and adapted to the audience. Finally, good speakers should make frequent eye contact with the audience, let their facial expression show their interest in the ideas they are presenting, and dress in a way that is appropriate for the occasion.

Small-business owners reflect the general population in that their enthusiasm for public speaking varies considerably from individual to individual. Some entrepreneurs enjoy the limelight and thrive in settings that call for public presentations (formal or informal). Others are less adept at public speaking and avoid being placed in such situations. But business consultants urge entrepreneurs to treat public presentations and oral communication skills as a potentially invaluable tool in business growth. "You may consider hiring a presentation coach or attending a workshop on business presentations," counseled Kaye. "These services can show you how to maximize your impact while speaking. In fact, learning such skills serves as a long-term investment in your future as an effective leader."

ORGANIZATION CHART

Organizational charts are detailed representations of organization structures and hierarchies. They are typically used to provide both employees and individuals outside the organization with a "snapshot" picture of its reporting relationships, divisions of work, and levels of management. Obviously, smaller firms, whether they consist of a single owner of a home-based business, a modest shop of a few employees, or a family-owned business with a few dozen workers, are less likely to need or to use organization charts. Small organizations can get along very well without them as long as everyone understands what he or she is to do and with whom to do it. But many consultants and small-business owners contend that an organization chart can be a useful tool for growing firms.

Business owners endeavoring to allocate responsibilities, activities, and management authority to various employees

also have to make certain that they coordinate the activities of those employees to avoid gaps and or redundancies in operations and management. "It is helpful to think of organizational design elements as building blocks that can be used to create a structure to fulfill a particular purpose," stated Allan R. Cohen in *The Portable MBA in Management.* "A structure is built by defining the requirements of each individual job and then grouping the individual jobs into units. These units are grouped into larger and larger units and coordinating (or integrating) mechanisms are established for these units. In this way, the structure has been built to support organizational goals and achieve the key factors for success." Ideally, a detailed organizational chart will provide the business owner or manager with an accurate overview of the relationships of these units/responsibilities to one another and a reliable indication as to whether the firm is positioned to meet the business's fundamental goals.

ADVANTAGES AND DISADVANTAGES ASSOCIATED WITH ORGANIZATION CHARTS

While organizational charts are commonly used by mid- and large-sized companies, as well as by significant numbers of smaller businesses with varied operations and a substantial workforce, their usefulness has been a subject of some debate.

Advantages. Supporters of organization charts claim that they are tools that can effectively delineate work responsibilities and reporting relationships. Managers of different organizational units may not fully understand how their work fits into the work of other units. An organization chart can provide this relationship guide and thus prevent the development of illogical and confusing relationships. In fact, the very process of charting the organization is a good test of the company's structure because any relationship that cannot be charted is likely to be confusing to those working in it.

Supporters also argue that "org charts" can be particularly useful as a navigational tool when small businesses expand their operations. Small firms that do rather well in the early stages of their development often begin to fail when the founders can no longer manage everything in their personal styles. The transition from small firm to successful large firm is impaired when employees are allowed to do jobs that fit their personality and unique skills rather than jobs necessary for organizational performance. The early adoption of an organization chart can help to identify the areas in which a small firm is lacking the supervisory role before this lack begins to have a more serious impact on the organization.

Organizational charts can be created on paper or by using special software. While special software may permit someone to structure a chart most easily, existing office software such as Microsoft PowerPoint can be used to create an organizational chart. The business Web site InformIT recommends using the SmartArt feature and tools in Microsoft PowerPoint to create an organizational chart. SmartArt allows a person to insert boxes and shapes and to create hierarchical categories, establishing the vertical and horizontal relationships between different individuals within a organization.

Disadvantages. The above perspective is not universally accepted by business consultants, researchers, executives, and managers, however. Detractors point out that formal organization charts do not recognize informal lines of communication and influence that are quite vital in many business settings. Organization charts are often seen as narrow and static in perspective. They may exclude important relationship and reporting factors like leader behavior, the impact of the environment, informal relations, and power distribution.

Critics of organization charts also sometimes charge that the diagrams may paint a misleading picture of the importance and influence of various people within an organization. Charts are, out of necessity, somewhat streamlined representations that only provide so much detail to a user. In some instances, for example, an organization chart may depict two employees as being equal in power and influence, when in reality, one of the individuals is rapidly ascending through the ranks and has the ear of the firm's principal decision makers, while the other may be regarded as steady but unremarkable (or even worse, an individual whose position has deteriorated from a higher level over the previous years). Daniel Sorid, writing in the *New York Times* in 2009, suggests that organizational charts are not sophisticated enough to recognize informal power structures that exist within a corporation, such as an executive assistant who limits or controls access to a key manager or president within the corporation. Thus, such charts provide an incomplete picture of the true sources of power and influence within a company.

Finally, observers suggest that organization charts may encourage individuals to take a very narrow view of their jobs and in this way the chart may discourage the development of leadership skills in some employees. In these situations, the result is an organization that is not responsive to change and lacks flexibility. The organization chart and all the supporting documentation become substitutes for action and creative responses.

USING ORGANIZATION CHARTS TO STUDY ORGANIZATION STRUCTURE

As alluded to earlier, the process of constructing an organization chart is sometimes cited as a valuable means by which a company can test its structural soundness. Proponents say that charts can be used to ensure that no one individual's productivity is constrained by the organizational structure.

Researchers, consultants, and executives note that this benefit can be even more pronounced in today's business world, which has seen dramatic changes in operating philosophies and management direction over the past few decades. Indeed, corporations are increasingly implementing innovative organizational redesigns in efforts to increase their productivity. The growth in cross-functional teams and the increasing frequency of reorganizations increase the usefulness of organizational charts for keeping track of operational relationships and lines of authority. It is important, then, for businesses that do rely on organizational charts to examine and update those diagrams continually to ensure that they reflect current business realities. In fact, the changes in organizational structures have spurred innovative changes in the format of many organizational charts. Whereas traditional models have been formatted along general "up-down" lines, newer models sometimes utilize flattened or "spoke" frameworks.

ORGANIZATION THEORY

An organization is an assembly of people working together to achieve common objectives through a division of labor. It provides a means of using individual strengths within a group to achieve more than can be accomplished by the aggregate efforts of group members working individually. Business organizations are formed to deliver goods or services to consumers a make a profit in return. Over the years, business analysts, economists, and academic researchers have pondered several theories that attempt to explain the dynamics of business organizations, including the ways in which they make decisions, distribute power and control, resolve conflict, and promote or resist organizational change.

As Jeffrey Pfeffer summarized in *New Directions for Organization Theory*, organizational theory studies provide "an interdisciplinary focus on a) the effect of social organizations on the behavior and attitudes of individuals within them, b) the effects of individual characteristics and action on organization,... c) the performance, success, and survival of organizations, d) the mutual effects of environments, including resource and task, political, and cultural environments on organizations and vice versa, and e) concerns with both the epistemology and methodology that undergird research on each of these topics."

BACKGROUND

Modern organization theory is rooted in concepts developed during the beginnings of the Industrial Revolution in the late nineteenth and early twentieth centuries. Of considerable import during that period was the research done by German sociologist Max Weber (1864-1920). Weber believed that bureaucracies, staffed by bureaucrats, represented the ideal organizational form. In Weber's idealized organizational structure, responsibilities for workers are clearly defined and behavior is tightly controlled by rules, policies, and procedures. Weber's work was complemented by Henri Fayol (1841 1925), who creating theories regarding strategic planning, staff recruitment, employee motivation, and guidance through polices and practices. These theories were later expanded to include training, wage incentives, employee selection, and established work standards.

Researchers began to adopt a less mechanical view of organizations and to pay more attention to human influences in the 1930s. Human behavior was given more credit for productivity than previous theories had suggested, and organizations became interested in ways to influence employees positively. The work of American psychologist Abraham Maslow (1908 1970), who developed the concept of a "hierarchy of human needs," was influential in this respect, as organizations focused on incorporating employee satisfaction into the organizational structure. By the 1950s, professor of management Douglas McGregor (1906 1964) had developed the influential X and Y theories. Theory X presumed that employees needed strict direction and preferred to avoid responsibility in favor of security, while Theory Y posited that employees learned to seek responsibility and could be trusted to create innovative solutions and improve

themselves given the correct opportunities. McGregor believed that theory Y was more conducive to productivity and more beneficial to organizations.

OPEN SYSTEMS THEORY

Traditional theories regarded organizations as closed systems that were autonomous and isolated from the outside world. In the 1960s, however, more holistic ideologies emerged. Recognizing that traditional theory had failed to take into account many environmental influences that impacted the efficiency of organizations, most theorists and researchers embraced an open-systems view of organizations.

The term "open systems" reflected the newfound belief that all organizations are unique and that they should be structured to accommodate unique problems and opportunities. For example, research during the 1960s indicated that traditional bureaucratic organizations generally failed to succeed in environments where technologies or markets were rapidly changing. Many businesses also failed to realize the importance of regional cultural influences in motivating workers.

Environmental influences that affect open systems can be described as either specific or general. The specific environment refers to the network of suppliers, distributors, government agencies, and competitors with which a business enterprise interacts. The general environment encompasses four influences that emanate from the geographic area in which the organization operates. These are:

- Cultural values, which shape views about ethics and determine the relative importance of various issues.
- Economic conditions, which include economic upswings, recessions, regional unemployment, and many other regional factors that affect a company's ability to grow and prosper.
- Legal/political environment, which effectively helps to allocate power within a society and to enforce laws. The legal and political systems in which an open system operates can play a key role in determining the long-term stability and security of the organization's future. This includes any regulations and taxes that legal bodies may impose on organizations.
- Quality of education, which is an important factor in high technology and other industries that require an educated work force. Businesses will be better able to fill such positions if they operate in geographic regions that feature a strong education system.

The open-systems theory also assumes that all large organizations are comprised of multiple subsystems, each of which receives inputs from other subsystems and turns them into outputs for use by other subsystems. The subsystems are not necessarily represented by departments in an organization, but might instead resemble patterns of activity. These subsystems are considered to have different levels of importance, and unlike traditional structure theories there is allowance for failure of individual subsystems without threatening the entire organization.

Modern organization theory also admits the existence of chaos principles at work in all organizational systems. There are always factors that cannot be controlled and variables that can create unexpected changes. Sometimes only small events can have ripple effects throughout an entire organization and produce results that are ultimately unpredictable. System success and failure may be aided by management decisions, but chaos theory also has a part to play. Therefore, organizations should not assume that they can control every aspect of business, or that they should even try.

BASIC ORGANIZATIONAL CHARACTERISTICS

Organizations differ greatly in size, function, and makeup. Nevertheless, the operations of nearly all organizations from the multinational corporation to a newly opened delicatessen are based on a division of labor, a decision-making structure, and rules and policies. The degree of formality with which these aspects of business are approached vary tremendously within the business world, but these characteristics are inherent in any business enterprise that utilizes the talents of more than one person.

Organizations practice division of labor both vertically and horizontally. Vertical division includes three basic levels: top, middle, and bottom. The chief function of top managers, or executives, is to plan long-term strategy and oversee middle managers. Middle managers generally guide the day-to-day activities of the organization and administer top-level strategy. Low-level managers and laborers put strategy into action and perform the specific tasks necessary to keep the organization operating.

Organizations also divide labor horizontally by defining task groups, or departments, and assigning workers with applicable skills to those groups. Line units perform the basic functions of the business, while staff units support line units with expertise and services. In general, line units focus on supply, production, and distribution, while staff units deal mostly with internal operations and controls or public relations efforts.

Decision-making structures, the second basic organizational characteristic, are used to organize authority. These structures vary from operation to operation in their degree of centralization and decentralization. Centralized decision structures are referred to as "tall"

organizations because important decisions usually emanate from a high level and are passed down through several channels until they reach the lower end of the hierarchy. Conversely, flat organizations, which have decentralized decision-making structures, employ only a few hierarchical levels. Such organizations are typically guided by a management philosophy that is favorably disposed toward some form of employee empowerment and individual autonomy.

A formalized system of rules and policies is the third standard organizational characteristic. Rules, policies, and procedures serve as templates of managerial guidance in all sectors of organizational production and behavior. They may document the most efficient means of accomplishing a task or provide standards for rewarding workers. Formalized rules provide managers with more time to spend on other problems and opportunities and help ensure that an organization's various subsystems are working in concert.

Thus, organizations can be categorized as informal or formal, depending on the degree of formalization of rules within their structures. In formal organizations, management has determined that a comparatively impersonal relationship between individuals and the company for which they work is viewed as the best environment for achieving organizational goals. Subordinates have less influence over the process in which they participate, with their duties more clearly defined.

In informal organizations individuals are more likely to adopt patterns of behavior that are influenced by a number of social and personal factors. Changes in the organization are less often the result of authoritative dictate and more often an outcome of collective agreement by members. Informal organizations tend to be more flexible and more reactive to outside influences. Critics contend that such arrangements may also diminish the ability of top managers to effect rapid change.

EFFECTIVENESS APPROACHES

A key component of organization theory is improvement. Executives and managers are interested in organizational theory primarily as a means to increase overall company effectiveness. To further this goal, theorists have devised different effectiveness approaches for testing and improving organizations.

Traditional effectiveness approaches include examinations of goals, system resources, and internal processes. Goal approaches deal primarily with output, and and deal with the operations of the organization. If output does not meet goals, then the organization needs to change either its operations or its goals in order to stabilize. System resource approaches focus on the beginning of the organization's process and study whether they are receiving resources like supplies or information in the most effective ways possible. This includes the ability to fill a need in the organization's market, to read market events correctly, to change based on market or industry data, and to maintain daily processes correctly.

Internal process approaches, the third type of traditional effectiveness approach, are the most popular in organization theory. These deal with work climate and corporate culture. Internal process approaches look for ways to improve team spirit, build confidence, and streamline the decision-making process so that decisions are made by those with immediate possession of the necessary facts and perspective. This includes most interactions among the different organization parts and what type of reward system the organization uses.

Contemporary effectiveness approaches tend to focus on specific goals for the organization. For instance, the stakeholder approach concentrates on delivering results and profit to company stakeholders. The satisfaction of the stakeholder is held as the most important goal, and activities throughout the organization are tailored to meet these stakeholder goals. Another popular contemporary approach is the competing values model, which looks at different organizational models (such as open system, rational goal, internal process, and others) and compares them to the specific organization to see what elements of each model can increase effectiveness.

TRENDS IN ORGANIZATIONAL THEORY

Current trends in business have been influenced by the continuing focus on Theory Y and open-system organization theory, including hybrid models such as theory Z, which incorporates detail-oriented management practices from Japan designed to increase efficiency and productivity. Organizational structures have become increasingly organic, with great emphasis on both self-sufficiency in employees and interconnectivity when it comes to community, industry, and business markets.

Today it is widely assumed that there is no best organizational structure. Theorists instead advise that a business choose its organization based on its own particular situation. A business should examine variables such as size, technology, and local environment before it assumes a particular organizational structure will work. Size will dictate whether a business should have a centralized concentration or power or decentralized, autonomous sections, along with frequency of delegation.

STAGES OF SMALL BUSINESS GROWTH

Small business can be divided into five different stages of growth, each of which is marked by key organizational changes that define a growing business. Rather than resist

these changes, a small business should be aware of how growth will affect structure and be prepared to incorporate these changes for maximum effectiveness.

Stage One: Existence. In this first stage, the small business is mostly concerned with basic activities. It is trying to gain enough customers to make a profit and increase its client base to form a reliable stream of revenue. The business is primarily concerned with making enough money to manage basic processes. The organizational system is very simple: the business owner knows the most about the business and gives direct orders to subordinates. There is very little formal planning and all important tasks are conducted by the owner.

Stage Two: Survival. In the survival stage, a business has created a customer base large enough to depend on for survival and the chief problem becomes revenue management. Does the business have enough revenue to cover its expenses? Does it need to increase sales in a particular area, or cut out expenses once thought necessary? Growth is considered, but keeping current systems running is typically more important. During this stage organization is still simple, but generally there are more layers of management, such as a sales manager or supervisor who gives instruction to employees. Decisions are still made primarily by the owner, but the owner is not as independent as in the existence stage. System development is concerned with cash forecasting, but there are not usually many complicated systems put into place at this stage.

Stage Three: Success. When a small business makes it to the success stage, it has enough profit to consider other activities. At this point, the small business undergoes an important choice. Either the owner disengages, and the business is run for stability and the generation of consistent revenue, or the business is consolidated and prepared for expansion. If the owner disengages, the organization will probably contain several functional managers overseeing specific areas of activity, but no more than one layer of management. There are also most likely professional staff with talents for accounting, production, marketing, or other areas for which the company needs competent specialists. Operational budgets are created by the owner and managers, and strategies center around maintaining current business conditions.

If the owner chooses to pursue growth, the organization will undergo key changes in preparation for expansion. Managers may still be in a single layer and functional in nature, but the owner will tend to make more careful decisions in the types of manager hired to ensure that they are talented and capable of managing larger processes and groups of employees. Operational planning is largely untouched, but strategic planning becomes vital and takes most of the owner's time.

Stage Four: Take-Off. In this stage, the small business is concerned with rapid growth and financing the changes that must take place during that growth. The owner typically learns to embrace delegation and may bring in additional managers and assistants to delegate to. (Success often depends on the attitude behind the delegation.) Cash flow becomes very important, and in order to increase efficiency the organization is typically broken up into separate divisions, decentralized into areas such as sales and production. These departments are headed by key managers who have an autonomy and responsibility unlike managers in previous stages of growth. Organizational planning becomes comprehensive, and input is spread out between the key managers and the owner. Both strategic and operational planning are vital, and new types of knowledge and training are introduced.

Stage Five: Resource Maturity. In this stage the small business enters a balancing act where the flexibility and spirit of the small organization are offset by the consolidation and control necessary to manage the business's new size and income. At this point, the owner has often sold the company or reliquished control to dependable managers, and is separate from the business. Management is expanded to increase efficiency in the face of larger divisions, and upper level managers work to produce budgets, strategic plans, standard cost systems, objective-oriented work processes, and marketing strategies. Management is thoroughly decentralized and depends heavily on experience and talent of individual managers to continue effectiveness.

ORGANIZATIONAL BEHAVIOR

The study of organizational behavior is an academic discipline concerned with describing, understanding, predicting, and controlling human behavior in an organizational environment. Organizational behavior has evolved from early classical management theories into a complex school of thought, and it continues to change in response to the dynamic environment and proliferating corporate cultures in which today's businesses operate. Crafting an organization that functions as efficiently as possible is a difficult task. Understanding the behavior of a single person is a challenge. Understanding the behavior of a group of people, each one with a complex relationship with the others in the group, is an even more difficult undertaking. It is, however a worthy undertaking because ultimately the work of an organization is done through the behavior-driven actions of people, individually or collectively, on their own or in collaboration with technology.

In fact, in 2007 researchers at the University of Washington suggested that one bad worker can create problems for a whole organization, inhibiting teamwork and overall employee morale in a way that even positive workers cannot overcome. Since negative behaviors tend to outweigh or overshadow positive ones, a worker who is emotionally unstable or does not do his or her fair share can create a catalyst that drags the whole team down. Employers must thus recognize and deal with the problem quickly in order to ensure the continued success and optimal performance of all employees, and ultimately of the company as a whole.

THE BEHAVIORAL SCIENCES

Organizational behavior scientists study four primary areas of behavioral science: individual behavior, group behavior, organizational structure, and organizational processes. They investigate many facets of these areas, such as personality and perception, attitudes and job satisfaction, group dynamics, politics and the role of leadership in the organization, job design, the impact of stress on work, decision-making processes, the communications chain, and company cultures and climates. They use a variety of techniques and approaches to evaluate each of these elements and its impact on individuals, groups, and organizational efficiency and effectiveness. The behavioral sciences have provided the basic framework and principles for the field of organizational behavior. Each behavioral science discipline provides a slightly different focus, analytical framework, and theme for helping managers answer questions about themselves, nonmanagers, and environmental forces.

In regard to individuals and groups, researchers try to determine why people behave the way they do. They have developed a variety of models designed to explain individuals' behavior. They investigate the factors that influence personality development, including genetic, situational, environmental, cultural, and social factors. Researchers also examine various personality types and their impact on business and other organizations. One of the primary tools utilized by organizational behavior researchers in these and other areas of study is the job satisfaction study. These tools are used not only to measure job satisfaction in such tangible areas as pay, benefits, promotional opportunities, and working conditions, but also to gauge how individual and group behavior patterns influence corporate culture, both positively and negatively.

Ray Williams of the *National Post* reported in 2010 that in recent years there has been a shift in the field of organizational behavior studies, with a newfound emphasis on looking for positive qualities and enhancing a positive work environment. This is an alternative to more traditional organizational structure studies and models, which tended to focus on identifying weaknesses or problems within the corporation. Williams cites several experts, all of whom suggest conducting behavioral research that emphasizes positive emotions, views employees as assets instead of costs, and broadens the horizon of behavioral studies from a focus on efficiency only.

ORGANIZATIONAL BEHAVIOR AND CORPORATE CULTURE

The terms "corporate culture" and "organizational behavior" are sometimes used interchangeably, but there are differences between the two. Corporate culture encompasses the shared values, attitudes, standards, and beliefs and other characteristics that define an organization's operating philosophy. Organizational behavior, meanwhile, can be understood in some ways as the academic *study* of corporate culture and its various elements, as well as other important components of behavior such as organization structure and organization processes. Organizational behavior is the field of study that draws on theory, methods, and principles from various disciplines to learn about *individual* perceptions, values, learning capacities, and actions while working in *groups* and within the total *organization.* This field of study also analyzes the external environment's effect on the organization and its human resources, missions, objectives, and strategies. Therefore, managers need to develop diagnostic skills and be trained to identify conditions symptomatic of a problem requiring further attention. The problems to watch for include declining profits, declining quantity or quality of work, increases in absenteeism or tardiness, and negative employee attitudes. Each of these problems is an issue of organizational behavior.

ORGANIZATIONAL DEVELOPMENT

Organizational development (OD) encompasses the actions involved with applying the study of behavioral science to organizational change. It covers a wide array of theories, processes, and activities, all of which are oriented toward the goal of improving individual organizations. Generally speaking, however, OD differs from traditional organizational change techniques in that it typically embraces a more holistic approach that is aimed at transforming thought and behavior throughout an enterprise. Definitions of OD abound, but they are all predicated on the notion of improving organizational performance through proactive techniques and activities. It is also worth noting that organizational development, though concerned with improving workforce performance, should not be mistaken for human resource development. "Organization development is the planned process of developing an organization to be more effective in accomplishing its desired goals," wrote Rima Shaffer in *Principles of Organization Development*. "It is distinguished from human resource development in that HRD focuses on the personal growth of individuals within organizations, while OD focuses on developing the structures, systems, and processes within the organization to improve organizational effectiveness."

ORGANIZATIONAL DEVELOPMENT BASICS

Although the field of OD is broad, it can be differentiated from other systems of organizational change by its emphasis on process rather than problems. Indeed, traditional group change systems have focused on identifying problems in an organization and then trying to alter the behavior that creates the problem. OD initiatives focus on identifying the behavioral interactions and patterns that cause and sustain problems. Then, rather than simply changing isolated behaviors, the OD process aims at creating a behaviorally healthy organization that will naturally anticipate and prevent problems.

Organizational development programs can be used to increase effectiveness and employee morale in a number of ways. For example, Professor Richard Lutz of Quinnipiac University suggests that organizational development may be an essential tool for helping employees fully to understand and embrace customer relations management (CRM). Lutz argues that customer relations management depends on full cooperation from all employees, since they often serve as the first line of contact with customers. He suggests that, through organizational development programs, employees and managers can be better educated on the importance of widespread acceptance of CRM and that team-building activities through OD can increase the exercise of positive customer relationships management efforts on a company-wide level.

OD programs usually share several basic characteristics. First, they are considered long-term efforts of at least 1 to 3 years in most cases. Second, OD stresses collaborative management, whereby managers and employees at different levels of the hierarchy cooperate to solve problems. Third, OD recognizes that every organization is unique and that the same solutions cannot simply be applied at any company. This assumption is reflected in an OD focus on research and feedback. Fourth, OD programs emphasize the value of teamwork and small groups. In fact, most OD systems use small teams, or even individuals,as a vehicle to implement broad organizational changes.

The catalyst, whether a group or individual, that facilitates the OD process is known as the "change agent." Change agents are often outside consultants with experience managing OD programs, although companies sometimes utilize inside managers. The advantage of bringing in outside OD consultants is that they can provide a different

perspective and have a less subjective view of the organization's problems and needs. The primary drawback associated with outside change agents is that they may lack an in-depth understanding of key issues particular to the company. In addition, outside change agents may have trouble securing the trust and cooperation of key players in the organization. For these reasons, some companies employ an external-internal team approach, which seeks to combine the advantages of internal and external change agents while minimizing the drawbacks associated with the two approaches.

MANAGING CHANGE THROUGH ORGANIZATIONAL DEVELOPMENT

Organizational development initiatives do not automatically succeed. The benefits of effective OD programs are myriad, as many executives, managers, and business owners will attest. However, as with any undertaking, an OD intervention that is pursued in a sloppy, half-hearted, or otherwise faulty manner is far less likely to bring about meaningful change than one that is carried out with the full support of the people involved. The following list presents conditions that should be present as a part of any OD intervention in order to maximize the likelihood of a successful outcome.

- All those involved in the process need to be genuinely and visibly committed to the effort.
- People involved in OD should be informed in advance of the nature of the intervention and the role they will be expected to play in the process.
- The OD effort has to be connected to other parts of the organization.
- The effort has to be directed by appropriate managers and guided by change agents (which, if used, must be competent).
- The intervention should be based on accurate diagnosis of organizational conditions.
- Owners and managers should show their commitment to OD at all stages of the effort, including the diagnosis, implementation, and evaluation.
- Evaluation is key to success and should consist of more than asking people how they felt about the effort.
- Owners and managers need to show employees how the OD effort relates to the organization's goals and overriding mission.

IMPLEMENTING OD PROGRAMS

OD efforts basically entail two groups of activities: "action research" and "interventions." Action research is a process of systematically collecting data on a specific organization, feeding them back for action planning, and evaluating results. Data gathering techniques include everything from surveys and questionnaires to interviews, collages, drawings, and tests. The data are often evaluated and interpreted using advanced statistical analysis techniques.

OD interventions are plans or programs made up of specific activities designed to effect change in some facet of an organization. According to Malika Amin of Alembic Limited, "OD interventions have become critical for an organisation. It enables the company to align employees' contribution towards the business objectives, and thereby, enhances overall efficiency through output." Numerous interventions have been developed over the years to address different problems or create various results. However, they all are geared toward the goal of improving the entire organization through change. In general, organizations that wish to achieve a high degree of organizational change will employ a full range of interventions, including those designed to transform individual and group behavior and attitudes. Entities attempting smaller changes will stop short of those goals, applying interventions targeted primarily at operating policies, management structures, worker skills, or personnel policies. Typically, organizational development programs will simultaneously integrate more than one of these interventions. A few of the more popular interventions are briefly described below.

Interpersonal Interventions. Interpersonal interventions in an OD program are designed to enhance individual skills, knowledge, and effectiveness. This type of program utilizes group dynamics by gathering individuals together in loosely structured meetings. Subject matter is determined by the group, within the context of basic goals stipulated by a facilitator. As group members try to exert structure on fellow members, group members gain a greater awareness of their own and other's feelings, motivations, and behaviors. Other types of interpersonal interventions include those designed to improve the performance review process, create better training programs, help workers identify their true wants and set complementary career goals, and resolve conflict.

Group Interventions. OD group interventions are designed to help teams and groups within organizations become more effective. Such interventions usually assume that the most effective groups communicate well, facilitate a healthy balance between both personal and group needs, and function by consensus as opposed to autocracy or majority rule.

Group diagnostic interventions are meetings wherein members of a team analyze their unit's performance, ask questions about what the team needs to do to improve, and discuss potential solutions to problems. The benefit of such interventions is that members often communicate problems of which their co-workers are unaware. Ideally,

such communication will spur problem solving and improved group dynamics.

Role analysis technique (RAT) is used to help employees get a better grasp on their role in an organization. In the first step of a RAT intervention, people define their perception of their role and contribution to the overall company effort in front of a group of co-workers. Group members then provide feedback to more clearly define the role. In the second phase, the individual and the group examine ways in which the employee relies on others in the company, and how they define his or her expectations. RAT interventions help people to reduce role confusion, which can result in either conflict or the perception that some people are not doing their job. A popular intervention similar to RAT is responsibility charting, which utilizes a matrix system to assign decision and task responsibilities.

Intergroup Interventions. Intergroup interventions are integrated into OD programs to facilitate cooperation and efficiency between different groups within an organization. For instance, departmental interaction often deteriorates in larger organizations as different units battle for limited resources or become detached from the needs of other units.

Conflict resolution meetings are one common intergroup intervention. First, different group leaders are brought together to secure their commitment to the intervention. Next, the teams meet separately to make a list of their feelings about the other group(s). Then the groups meet and share their lists. Finally, the teams meet to discuss the problems and to try to develop solutions that will help both parties. This type of intervention, say supporters, helps to gradually diffuse tension between groups that has arisen because of faulty communication.

OD joint activity interventions involve melding members of different groups to work together toward a common goal. Similarly, common enemy interventions achieve the same results by finding an adversary common to two or more groups and then getting members of the groups to work together to overcome the threat. Examples of common enemies targeted in such programs include competitors, government regulation, and economic conditions.

Comprehensive Interventions. OD comprehensive interventions are used to create change directly throughout an entire organization, rather than focusing on organizational change through subgroup interventions. One of the most popular comprehensive interventions is survey feedback. This technique basically entails surveying employee attitudes at all levels of the company and then disseminating a report that details those findings. The employees then use the data in feedback sessions to create solutions to perceived problems. A number of questionnaires have been developed specifically for such interventions.

Structural change interventions are used by OD change agents to implement organizational alterations related to departmentalization, management hierarchy, work policies, compensation and benefit incentives programs, and other cornerstones of the business. Often, the implemented changes emanate from feedback from other interventions. One benefit of change interventions is that companies can often realize an immediate and very significant impact in productivity and profitability (provided the changes are warranted and implemented appropriately).

Sociotechnical system design interventions are similar to structural change techniques, but they typically emphasize the reorganization of work teams. The basic goal is to create independent groups throughout the company that supervise themselves. This administration may include such aspects as monitoring quality or disciplining team members. The theoretic benefit of sociotechnical system design interventions is that worker and group productivity and quality is increased because workers have more control over (and subsequent satisfaction from) the process in which they participate.

A fourth OD intervention that became extremely popular during the 1980s and early 1990s is total quality management (TQM). TQM interventions utilize established quality techniques and programs that emphasize quality processes, rather than achieving quality by inspecting products and services after processes have been completed. W. Edwards Deming, an expert on TQM, noted that the process of using the practice to transform a company is typically long and can be difficult. Klaas D. Boer, a consultant based in the Netherlands, has a fourteen-step list for success for TQM. This list includes:

- Creating consistency of purpose
- Accepting responsibility
- Ending the emphasis on after-the-fact investigation
- Focusing on factors other than price but simultaneously improving production systems to cut costs
- Training individuals on the job
- Having clear leadership that does not use fear to motivate
- Breaking down barriers between departments
- Eliminating slogans and quotas and helping people to be proud of their work
- Instituting self-improvement programs and helping everyone in the company to work together

The important concept of continuous improvement embodied by TQM has carried over into other OD interventions.

ORGANIZATIONAL GROWTH

Growth is something for which most companies strive, regardless of their size. Small firms want to get big and big firms want to get bigger. Indeed, companies have to grow at least a bit every year in order to accommodate the increased expenses that develop over time. With the passage of time, salaries increase and the costs of employment benefits rise as well. Even if no other company expenses rise, these two cost areas almost always increase over time. It is not always possible to pass along these increased costs to customers and clients in the form of higher prices. Consequently, growth must occur if the business wishes to surivive in the long run.

Organizational growth has the potential to provide small businesses with a myriad of benefits, including things like greater efficiencies from economies of scale, increased power, a greater ability to withstand market fluctuations, an increased survival rate, greater profits, and increased prestige for organizational members. Many small firms desire growth because it is seen generally as a sign of success and progress. Organizational growth is, in fact, used as one indicator of effectiveness for small businesses and is a fundamental concern of many practicing managers.

Organizational growth, however, means different things to different organizations. There are many parameters a company may use to measure its growth. Since the ultimate goal of most companies is profitability, most companies will measure their growth in terms of net profit, revenue, and other financial data. Other business owners may use one of the following criteria for assessing their growth: sales, number of employees, physical expansion, success of a product line, or increased market share. Ultimately, success and growth will be gauged by how well a firm does relative to the goals it has set for itself.

WAYS IN WHICH ORGANIZATIONS ACHIEVE GROWTH

Many academic models have been created that depict possible growth stages or directions of a company. Six of the most commonly used methods for creating organizational growth within a small business are discussed below.

Joint Venture/Alliance. This strategy is particularly effective for smaller firms with limited resources, many of whom have been turning to joint ventures to expand in light of the tight credit market and global credit crunch in 2009. According to Bruce Walker, head of corporate finance for KPMG in Scotland, more than 1,759 joint venture deals were reported in 2007 worldwide, which was more than double the 2004 figure of 810 registered joint ventures. Such partnerships can help small business secure the resources they need to grapple with rapid changes in demand, supply, competition, and other factors. Forming joint ventures or alliances gives all companies involved the flexibility to move on to different projects upon completion of the first, or restructure agreements to continue working together. Subcontracting,

which allows firms to concentrate on those aspects of their business that they do best, is sometimes defined as a type of alliance arrangement (albeit one in which the parties involved generally wield differing levels of power). Joint ventures and other business alliances can inject partners with new ideas, access to new technologies, new approaches, and new markets, all of which can help the involved businesses to grow. Indeed, establishing joint ventures with overseas firms has been hailed as one of the most potentially rewarding ways for companies to expand their operations. Finally, some firms realize growth by acquiring other companies.

Licensing. A firm may wish to expand and grow by licensing its most advanced technology. This course of action is often recommended to firms with their own proprietary technologies because competitors will likely copy whatever a company develops at some point. Licensing is one method that can be used to maximize the benefit that a firm can gain from its technology. It is also a way to gain the resource to fund future research and development efforts.

Sell Off Old Winners. Some organizations engaged in a concerted effort to grow divest themselves of mature "cash cow" operations to focus on new and innovative lines of products or services. This option may sound contradictory, but analysts note that businesses can command top prices for such tried and true assets. An addendum to this line of thinking is the divestment of older technology or products. Emerging markets in Latin America and Eastern Europe, for instance, have been favorite places for companies to sell products or technology that no longer attract high levels of interest in the United States. These markets may not yet be able to afford large quantities of state-of-the-art goods, but they can still benefit from older models.

New Markets. Some businesses are able to secure significant organizational growth by tapping into new markets. Creating additional demand for a firm's product or service, especially in a market where competition has yet to fully develop, can spur phenomenal growth for a small company, although the competitive vacuum will generally close very quickly in these instances. In the last ten years, many small firms have turned to an online marketing presence as a tool for reaching beyond their traditional markets. For those who do not yet market and sell online, this is one area that may be explored. In addition, with an increasingly global economy, marketing to emerging countries can be essential to rapid expansion. This is true in the early 2010s, as markets in Asia (such as China) experience rapid growth in comparison to more mature markets in Europe and North America.

New Product Development. Creation of new products or services is a primary method by which companies grow. Indeed, new product development is the linchpin of most organizations' growth strategies.

Outside Financing. Many small companies turn to outside financing sources to fund their expansion. Smaller private firms search for capital from banks, private investors, government agencies, or venture capital firms.

PROBLEMS ENCOUNTERED WITH ORGANIZATIONAL GROWTH

Organizational growth has obvious upsides. It spurs job creation. It creates a stimulating and exciting environment within a firm. It creates opportunities for the business founder and others in the company to become wealthy. Organizational growth also has downsides. When growth is too rapid, chaos can prevail. In such a situation a company may see increased sales but a drop in profits. A business may outgrow the skills of its leader, its employees, and its advisers. All those involved are likely to become stressed trying to keep up with the demands of expansion.

Small-business owners seeking to guide their organizations through periods of growth, whether that growth is dramatic or incremental, must plan to deal with both the upsides and downsides of growth. When a firm is small in size, the entrepreneur who founded it and usually serves as its primary strategic and operational leaders can often easily direct and monitor the various aspects of daily business. In such an environment, the business owner and founder understands the personalities within the firm, the relationships that each has with others in the company, as well as with suppliers and customers. Organizational growth, however, brings with it an inevitable dilution of that hands-on capability, while the complexity of various organizational tasks simultaneously increases. As small organizations grow, so to do the complexities of managing the organization. There are ways of reducing the complexity by delegating responsibility and installing better date systems, but there is no way of avoiding it altogether.

Most entrepreneurs who are fortunate enough to experience growth soon discover that success as a business owner does not mean they have arrived and can now sleep at night. Expanding a company does not just mean grappling with the same problems on a larger scale. It means understanding, adjusting to, and managing a whole new set of challenges. It often means building and managing a very different sort of business. Organizational growth almost always produces a company that is much more complex one that needs a much more sophisticated management team and may well need a new infrastructure. Many companies have difficulties with this evolution, especially in the cases of rapid expansion. In a 2007 study conducted by Human Resource Planning Society (HRPS) in partnership with the Institute for Corporate Productivity (i4cp), two-thirds of human resources

professionals reported that human resources was not responding quickly enough to the strategic challenges that came with rapid growth in profits. In fact, the study suggested that unless the role of HR professionals expands to include a broader understanding of both customers and other departments within a growing company, HR professionals will continue to experience struggles with the increase in size and productivity of their organizations.

Organizational growth, then, may well require as much planning, effort, and work as did starting a company in the first place. Small-business owners face a dizzying array of organizational elements that have to be revised during a period of growth. Maintaining effective methods of communications with and between employees and departments, for example, become ever more important as the firm grows. Similarly, good human resource management practices, from hiring to training to empowerment, have to be implemented and maintained. Establishing and improving standard practices is often a key element of organizational growth as well. Indeed, a small business that undergoes a significant burst of growth will find its operations transformed in any number of ways. Often, it will be the owner's advance planning and management skills that will determine whether that growth is sustained, or whether internal constraints rein in that growth prematurely.

ORGANIZATIONAL LIFE CYCLE

Historians and academics have observed that organizations, like living organisms, have life cycles. They are born (established or formed), they grow and develop, they reach maturity, they begin to decline and age, and finally, in many cases, they die. Study of the organizational life cycle (OLC) has resulted in various predictive models. These models, which have been a subject of considerable academic discussion, are linked to the study of organizational growth and development. Organizations at any stage of the life cycle are impacted by external environmental circumstances as well as internal factors. Products too have life cycles, a fact that has been long recognized by marketing and sales experts. It seems reasonable to conclude that organizations also have life cycles.

Students of this subject agree for the most part that predictable patterns can be seen when viewing the life span of a business organization. These patterns can be characterized by stages, often referred to as development stages. These development stages tend to be sequential, occur as a hierarchical progression that is not easily reversed, and involve a broad range of organizational activities and structures. The number of life cycle stages identified by any particular researcher will differ from the finds of other researchers depending on the granularity of his or her study. Some analysts have delineated as many as ten different stages of an organizational life cycle, while others have flattened it down to as few as three stages. Most models, however, hold to a view that the organizational life cycle is comprised of four or five stages that can be summarized simply as start-up, growth, maturity, decline, and death (or revival).

THE OLC MODEL

Organizational life cycle is an important model because of its premise and its prescription. The model's premise is that requirements, opportunities, and threats both inside and outside the business firm will vary depending on the stage of development in which the firm finds itself. For example, threats in the start-up stage differ from those in the maturity stage. As the firm moves through the

developmental stages, changes in the nature and number of requirements, opportunities, and threats exert pressure for change on the business.

Organizations move from one stage to another because the fit between the organization and its environment is dynamic and ever-changing. The OLC model's prescription is that the firm's managers must change the goals, strategies, and strategy implementation devices to fit the new set of issues. Thus, different stages of the company's life cycle require alterations in the firm's objectives, strategies, managerial processes (planning, organizing, staffing, directing, controlling), technology, culture, and decision making.

Researchers traced changes in the organizational structure and managerial processes as the business proceeds through the growth stages. At birth, the firms exhibited a very simple organizational structure with authority centralized at the top of the hierarchy. As the firms grew, they adapted more sophisticated structures and decentralized authority to middle- and lower-level managers. At maturity, the firms demonstrated significantly more concern for internal efficiency and installed more control mechanisms and processes.

GROWTH PHASES

Many scholarly works focusing on organizational life cycles have been conceptual and hypothetical in content. One widely cited conceptual work was published in the *Harvard Business Review* in 1972 by L. Greiner. He used five growth phases: growth through creativity; growth through direction; growth through delegation; growth through coordination; and growth through collaboration. Each growth stage encompassed an evolutionary phase ("prolonged periods of growth where no major upheaval occurs in organization practices"), and a revolutionary phase ("periods of substantial turmoil in organization life"). The evolutionary phases were hypothesized to be about 4 to 8 years in length, while the revolutionary phases were characterized as the crisis phases. At the end of each one of the five growth stages listed above, Greiner hypothesized that an organizational crisis will occur, and that the business's ability to handle these crises will determine its future:

Phase 1 Growth through creativity eventually leads to a crisis of leadership. More sophisticated and more formalized management practices must be adopted. If the founders cannot or will not take on this responsibility, they must hire someone who can, and give this person significant authority.

Phase 2 Growth through direction eventually leads to a crisis of autonomy. Lower level managers must be given more authority if the organization is to continue to grow. The crisis involves top-level managers' reluctance to delegate authority.

Phase 3 Growth through delegation eventually leads to a crisis of control. This occurs when autonomous employees who prefer to operate without interference from the rest of the organization clash with business owners and managers who perceive that they are losing control of a diversified company.

Phase 4 Growth through coordination eventually leads to a crisis of red tape. Coordination techniques such as product groups, formal planning processes, and corporate staff become, over time, a bureaucratic system that causes delays in decision making and a reduction in innovation.

Phase 5 Growth through collaboration, is characterized by the use of teams, a reduction in corporate staff, matrix-type structures, the simplification of formal systems, an increase in conferences and educational programs, and more sophisticated information systems. While Greiner did not formally delineate a crisis for this phase, he guessed that it might revolve around "the psychological saturation of employees who grow emotionally and physically exhausted by the intensity of teamwork and the heavy pressure for innovative solutions."

TRENDS IN OLC STUDY

While a number of business and management theorists in the early to mid-1900s alluded to developmental stages, Mason Haire's 1959 work *Modern Organization Theory* is generally recognized as one of the first studies that used a biological model for organizational growth and argued that organizational growth and development followed a regular sequence. The study of organizational life cycles intensified, and by the 1970s and 1980s it was well established as a key component of studying overall organizational behavior.

In more recent decades, the study of the organizational life cycle has been taken up by management consultants who provide advice for executives and entrepreneurs who wish to navigate organizational change successfully. Management-advice books relying on various versions of the OLC model proliferated during the 1990s and early twenty-first century. Titles such as *Managing Corporate Lifecycles*, *Managing Change and Transition, The Change Cycle Handbook,* and *The Change Cycle: How People Can Survive and Thrive in Organizational Change,* offer advice for organizations from small businesses to large corporations. These books focus on meeting the challenges of transitions from one cycle to another by handling the organizational crises that drive the organizational life cycle.

ORGANIZATION LIFE CYCLE AND THE SMALL BUSINESS OWNER

Entrepreneurs who are involved in the early stages of business creation are unlikely to become preoccupied with life cycle issues of decline and dissolution. Indeed, their concerns are apt to be in such areas as securing financing, establishing relationships with vendors and clients, preparing

a physical location for business operations, and other aspects of business start-up that are integral to establishing and maintaining a viable firm. Basically, these firms are almost exclusively concerned with the very first stage of the organization life cycle. Small business enterprises that are well established, on the other hand, may find OLC studies more relevant. Indeed, many recent examinations of organization life cycles have analyzed ways in which businesses can prolong desired stages (growth, maturity) and forestall negative stages (decline, death).

Small-business owners and other organization leaders may explore a variety of options designed to influence the enterprise's life cycle, from new products to new markets to new management philosophies. After all, once a business begins to enter a decline phase, it is not inevitable that the company will continue to plummet into ultimate failure; many companies are able to reverse such slides (a development that is sometimes referred to as turning the OLC bell curve into an "S" curve). But entrepreneurs and managers should recognize that their business is always somewhere along the life cycle continuum, and that business success is often predicated on recognizing where the business is situated along that measuring stick and adopting strategies best suited to that position in the cycle.

ORGANIZATIONAL STRUCTURE

An organizational structure defines the scope of acceptable behavior within an organization, its lines of authority and accountability, and to some extent the organization's relationship with its external environment. More specifically, it shows the pattern or arrangement of jobs and groups of jobs within an organization, yet it is more than an organizational chart. The organizational structure pertains to both reporting and operational relationships, provided they have some degree of permanence. The individual elements of an organizational structure typically include a variety of components that one may usefully see as building blocks: 1) departments or divisions; 2) management hierarchy; 3) rules, procedures, and goals; and 4) more temporary building blocks such as task forces or committees.

Ideally, organizational structures should be shaped and implemented for the primary purpose of facilitating the achievement of organizational goals in an efficient manner. Indeed, having a suitable organizational structure in place one that recognizes and addresses the various human and business realities of the company in question is a prerequisite for long-term success. Nonetheless, all too often organizational structures do not contribute positively to a company's performance. This is usually because the structure was allowed to grow somewhat organically and was not redesigned, as the company grew, so as to ensure that individuals and groups would continue to be maximally productive, efficient, flexible, and motivated. Small-business owners seeking to establish a beneficial organizational structure need to recognize that the process may be complex since this task is often left until a start-up organization has already been established. By then, a de facto structure exists and changing it will need to be done carefully so as not to alienate or frustrate key players.

In a 2010 article for the *Wall Street Journal*, Deepak Patel, chief executive of Aditya Birla Minacs in India, discussed how globalization and outsourcing will continue to change how modern businesses are organized. He wrote, "While it's a big decision for any company to outsource its processes, outsourcing is now altering the entire organizational structure. The opportunity is immense." Patel predicted that businesses will continue to focus on what they do best and outsource the rest, which will necessitate changes to the organizational structure of these companies.

Even large corporations that attempt to restructure or reorganize and implement a new or changed organizational structure may discover that simply announcing a new structure does not immediately result in actual change. Hierarchy is an important element of any organizational structure. The more levels of management that are present in an organization, the more hierarchical it is.

During the late 1990s and the first decade of the twenty-first century it became fashionable to reduce the hierarchy in large corporations, and the trend was dubbed flattening the corporate structure. But, as Eileen Shapiro, a management consultant and author told Patrick J. Kiger in his article "Hidden Hierarchies," things are not always what they seem. "I've been inside a lot of companies that espouse flat organizational structures and self-management. But when you really start looking at how things actually work, you find that there is in fact a hierarchy one that is not explicit." Shapiro explains that most firms, regardless of style, do actually have a hierarchy, whether explicit or not, and that trying to reflect the true, functional hierarchy in the organizational structure will help prevent the hidden hierarchy phenomenon. It also prevents the misunderstandings that can arise when the explicit organizational structure does not match the actual, functional structure.

Cristóbal Conde, president and CEO of SunGard, discussed organizational structure in a 2010 interview in the *New York Times*. Conde asserted that the top-down management style emerged because "bosses either knew more or they had access to more information" than their employees. That is no longer the case. Information is now accessible to nearly everyone. Conde sees technologies such as e-mail and the Internet as tools that can be used to facilitate and enhance a flat organizational structure. Conde suggests that company leaders use these tools to promote collaboration and peer recognition, both of which are great motivators for employees.

KEYS TO ERECTING AN EFFECTIVE ORGANIZATIONAL STRUCTURE

All sorts of different organizational structures have been proven effective in contributing to business success. Some firms choose highly centralized, rigidly maintained structures, while others, perhaps even in the same industrial sector, develop decentralized, loose arrangements. Both of these organizational types can survive and even thrive. There is no one best way to design an organization or type of structure. Each depends upon the company involved, its needs and goals, and even the personalities of the individuals involved in the case of small businesses. The type of business in which an organization is involved is also a factor in designing an effective organizational structure. Organizations operate in different environments with different products, strategies, constraints, and opportunities, each of which may influence the design of an ideal organizational structure.

However, despite the wide variety of organizational structures that can be found in the business world, the successful ones tend to share certain characteristics. Indeed, business experts cite a number of characteristics that separate effective organizational structures from ineffective designs. Recognition of these factors is especially important for entrepreneurs and established small-business owners, since these individuals play such a pivotal role in determining the final layout of their enterprises.

As small-business owners weigh their various options in this realm, they should make sure that the following factors are taken into consideration:

- Relative strengths and weaknesses of various organizational forms.
- Legal advantages and disadvantages of organizational structure options.
- Advantages and drawbacks of departmentalization options.
- Likely growth patterns of the company.
- Reporting relationships that are currently in place.
- Reporting and authority relationships that owners hope will be implemented in the future.
- Optimum ratios of supervisors/managers to subordinates.
- Suitable level of autonomy/empowerment to be granted to employees at various levels of the organization (while still recognizing individual capacities for independent work).
- Structures that will produce greatest worker satisfaction.
- Structures that will produce optimum operational efficiency.

Once all these factors have been objectively examined and blended into an effective organizational structure, the small business owner will be in a position to pursue his or her business goals with a far greater likelihood of success.

ORIGINAL EQUIPMENT MANUFACTURER (OEM)

An original equipment manufacturer (OEM) makes equipment or components that are then marketed by its client, another manufacturer or a reseller, usually under that reseller's own name. An OEM may make complete devices or just certain components, either of which can then be configured by the reseller. An example of this relationship would be a large automobile manufacturer that uses an OEM's components in the production of the cars it makes and sells. Component parts, like a computer's processor, include items that go into the assembly of the final product. Other examples include CD-ROM drives included in personal computers, air bags in cars, and motors for appliances.

Originally OEM was an adjective only used to describe a company that produced items, usually hardware or component parts, to be marketed under another company's brand. Although this is still the norm, OEMs have begun in recent years to sell their products more widely and in some cases, directly to the public. Developments within the computer industry have played a role in this expansion. As people choose to upgrade their PCs with new parts, they often wish to do so by purchasing replacement parts that have been produced by the same manufacturer that made the originally installed item. The assumption in this case is that components and other processed items may work better or fit better if they come from the OEM. They are more likely to meet the original standards and product specifications established for the product. OEM parts can be contrasted to other replacement parts that may be referred to as "functionally equivalent" or "of like kind and quality."

OEM BRANDING

Today, many component parts and processed items have been the subject of branding efforts, and as such their names are often well known by consumers. In the past, these components were processed from raw materials and became part of a finished product without the consumer ever becoming aware of who made the component. In most cases, consumers did not care as long as the product worked as expected. But competition, largely within the computer hardware industry, has led to a change in this perception. Consumers who buy new computers or upgrade their existing systems may specify a new processor made by an OEM company that they respect or have experience with, such as Intel or AMD, and may request the processing power of the OEM's latest or most powerful release, such as Intel's Core i5 (released in 2010) or AMD's Athlon II series. Companies themselves may recommend specific OEMs for replacement parts. For example, General Motors recommends that consumers request Goodwrench parts when replacements are needed for a GM vehicle.

SETTING STANDARDS

Manufacturers must determine the quality and specify standards for components that go into their products. Some assembled products are not manufactured but put together from a variety of purchased component parts, like Dell computers. Some components may be custom made, requiring much teamwork between the engineering departments of both the buyer and the seller as well as management involvement in negotiating prices and other terms. In some industries, such as the automobile parts industry, there are associations of OEMs. These associations provide a forum for manufacturers to address standards and other issues of common concern.

Components are produced to accepted standards or specifications. Production personnel in the purchasing organization may specify quality. Because components become part of an organization's own product, quality is extremely important. The buyer's own name and entire marketing mix are at stake. Thus a buyer tries to buy from sources that help ensure a good product. In such a situation, a buyer may even find it attractive to develop a close partnership with a single supplier who is dedicated to the same objectives as the buyer and use this partner as a sole source supplier. As an example, Ford Motor Company forged a partnership with Firestone Tires. When the supplier's product was implicated in a series of accidents involving Ford sport utility vehicles, Ford took some responsibility for the problems and deaths that resulted.

If the co-branding and awareness of OEM manufacturers continues, more profitable replacement markets may develop for producers. Since component parts go into finished products, a replacement market often develops on its own. This after-market can be both large and very profitable. Car tires and batteries are two examples of components originally sold in the OEM market that become consumer products in the after-market. But because the target markets are different, different marketing

and overall strategies may be necessary for selling OEM parts directly to final consumers.

OUTSOURCING

Outsourcing is the movement of a function inside a company to an entity outside it. Before the word came into widespread use, people talked about "farming" or "contracting" things out. The corresponding opposite to outsourcing is to "bring it in-house." When something is brought in-house, the implication is that it will now be done properly; the implication of outsourcing something is that now it will be done cheaply. The outsourcing of functions has never been popular (to make an understatement) with employees affected by the action inside a corporation. But the activity only achieved a strongly negative flavor in general when the outsourcing became "offshoring," meaning the shipment of jobs overseas. Until then a job might be outsourced but remained part of the U.S. economy; in its offshored form it signaled trade deficits and lost jobs. The domestic form of outsourcing has always tended to benefit small business: small business was and is, more often than not, the recipient of the jobs farmed out by the large corporations. The outsourcing of a function, in fact, has been and continues to be an opportunity for a group of employees to set themselves up in business.

Outsourcing is also widely practiced by small business but usually for slightly different reasons. Small companies do not have the scale to support full-fledged accounting, payroll, and computer systems staffs of their own. If their managers try to do these jobs as well, they have to work too many hours. These functions, therefore, are farmed out. So are, frequently, large but intermittent jobs.

The driving force behind outsourcing, narrowly viewed, has always been and continues to be the desire to lower costs although it has additional benefits. In times of shrinking economic activity, it easier to buy less of something or to eliminate buying something altogether than it is to lay off employees and to close departments. It is easier to shop an activity around when higher quality or greater speed is the objective than to get an internal supplier to change its behavior. Any manager of a small division in a large corporation whose main supplier is another and larger division knows how unresponsive the internal vendor can be. The external supplier, which, presumably, also has other clients, can be the source of interesting innovation.

A growing trend in outsourcing is the use of professional employer organizations (PEOs). PEOs are companies that facilitate oursourcing by hiring their client's employees to provide contract work for their original employer. As of 2008, there were about 700 PEOs operating in the United States. PEOs covered between two and three million workers and accounted for $68 billion in revenues (up $5 billion from 2007). Although some companies use PEOs, they have been associated with fraud and evasion, particularly because of a process known as SUTA arbitrage, or SUTA dumping. SUTA dumping takes place when an employer who pays a high state unemployment tax (SUTA) uses a PEO to have employees work through companies with lower SUTA rates. Despite the 2004 SUTA Dumping Protection act, signed into law by President George W. Bush, which was designed to eliminate this practice, federal law does not prohibit companies from using a PEO in order to pay lower SUTA rates.

Outsourcing also has its disadvantages, many of which are easily overlooked in the hurry of achieving the cost savings that appear to be possible. When a company simply stops making some product and begins to buy it from the outside and, furthermore, the product is widely available outsourcing is generally fairly advantageous. But if the outsourced "object" is some kind of function normally handled in-house by a company, problems can arise. First, a portion of the function must be retained inside to act as an interface with the supplier, and because of language and other issues, this interface may start to grow rather large. Second, control is lost by distance and the presence of an institutional barrier. Solving problems can become more costly and take more time. If the function is unique, the buyer is exposed to risk due to potential vendor failure; the vendor may grow surprisingly independent, find other clients, raise prices, and erase the cost benefits. As Roger Parloff reports in *Fortune*, some contract producers overseas may establish a "third shift" to produce the buyer's own product, but relabeled and rebranded, for sale in competition but at a lower price. Close observers of the outsourcing phenomenon like to emphasize reality: outsourcing is just the old contracting, and when, in addition, an ocean or a linguistic and cultural barrier is interposed, the initial cost advantage may disappear. Not surprisingly, as *Business Week* reports, Western companies are beginning to buy up overseas

suppliers, thus "internalizing" again what they had "outsourced" before.

Outsourcing can also be defined as the transfer of specialized functions and the relocation of complete operations. When a business owner hires a payroll service to avoid spending weekends preparing payroll, he or she is transferring a specialized function, payroll. When a large corporation hires a company in India to provide over-the-phone tech support for computer and software installation, again a function has been transferred. But when a producer of bedsprings closes its U.S. factory and opens a factory in China, it has outsourced a complete operation.

Broad statistics are not available to measure which of these categories is more prevalent. What is clear is that computerization generally and the Internet specifically have produced a significant opportunity for the outsourcing of functions that require skills in symbol manipulation (thus engineering and technical functions) or linguistic skills that can be deployed by telephone. Data keying was an early activity outsourced, typically, to India, where knowledge of English is widespread. Engineering and technical support have gained share overseas; software engineering is growing, despite equally energetic growth in information technology (IT) employment in the United States; interpretation of medical and other lab results by distant experts is growing; and, most recently, legal research and brief preparation are gaining as an outsourced activity. Outsourcing, however, appears to be gaining ground across industries. As industry expert Mary Thomas noted, "Outsourcing statistics will tell you that the number of companies that are employing this strategy is increasing every year and the practice has now spread to industries that are not traditionally known to employ outsourcing."

BROAD FORCES AND TRENDS

At any point in time, outsourcing will tend to be defined by prevailing conditions in the structure of an industry, the national economy, and, currently, the global economy. Economies show a cyclic movement between centralization and decentralization driven by a mix of factors, including resources, technology, stage of development, confidence, and communications.

The cycle can be illustrated at the micro level by a process in which an enterprising contractor begins to build homes by working closely with small companies that specialize in concrete, carpentry, electrical work, plumbing, roofing, and so on. Gradually, to get ever better control, the contractor acquires little companies, hires his own craftsmen, and becomes a major building company that does its work exclusively with its own people. Many years later, during a prolonged recession in construction, the company may begin spinning off its functions until it retains only a managerial core which, as at the beginning, works with independents.

During a centralization phase an enterprise favors vertical integration; during decentralization, it favors specialization. In the twenty-first century, with outsourcing common, the economy appears to have a decentralizing tendency; this movement had already manifested itself in the last quarter of the twentieth century. Large corporations are specializing in finance and technology and shedding the labor-intensive execution functions. This is possible, first, because human and other resources are widely available and differentially priced across the globe. Labor costs are very high at the center of the developed world and relatively low in the growing economies. Second, communications and global financial systems have matured so that overall control is relatively easier. Third, until the sudden shadow of terrorism appeared, stability reigned across much of the globe.

Outsourcing as an attractive mechanism to achieve strategic aims will continue until wage rates equalize across the globe assuming nothing else changes first. However, trends in energy, increasing international instability, and consequently rising anxieties may cause it to diminish in the future as popular reaction causes political action. However, as Thomas wrote in 2009, "In recent years, outsourcing has gone from being a hot trend to a standard in business . . . Now, even entrepreneurs and small business entities are taking advantage of the many benefits that hiring offshore companies and individuals brings."

OVERHEAD EXPENSE

Costs in a business are traditionally divided into operating and administrative categories. Both are necessary for the company, but operating costs are closely tied to specific products and services whereas administrative costs are incurred on behalf of the enterprise as a whole. This latter expense is sometimes referred to as "overhead."

The distinctions are most clearly visible in manufacturing operations where, for instance, the "factory" has its own warehouses and yards while the "headquarters" is located elsewhere. All of the costs associated with production itself, including engineering, warehousing, energy, maintenance, labor, and raw materials, are accounted for as operating expenses. Ideally the accounting systems are sufficiently developed for these costs to be subdivided by major product lines. Suppose that the company makes golf carts, four-wheeled recreational vehicles, and boats. Factory costs associated with each should then be available and, indeed, assignable down to each unit produced.

At the headquarters of the company administrative expenses are incurred. These include executives and staff salaries and fringes. Accruing in addition will be the costs of the buildings' rents and maintenance, outside services, expenditures on advertising and sales promotion, personnel, health programs, executive travel costs, and so on. Assume that the company has engineers at the factory but also engages two engineers to conduct research. The research function will be part of the administrative expense. Depreciation on all of the company's assets, all taxes paid, and all insurance carried will be part of administration and be accounted for as overhead. The money spent on these items or activities support all three of the major product lines together, not separately.

Given this definition of overhead as costs incurred to make something else possible it is clear that different kinds of overhead will be incurred in a larger operation. The factory itself will have an overhead ("factory overhead"), namely the costs associated with factory management staffs and services. Sales office operations may have overhead costs associated with general supervision. The *general* overhead is that of the company's central management.

On a company's income statement, sales represent the incoming money and net profits after tax represent what is left over. Operating profit is an intermediate sum left over after production costs have been taken from sales. The difference between operating profit and net profit is another definition of overhead. It is the cost of "all else" after products are made and services have been delivered.

From this comes the concept of "overhead absorption," commonly used in service operations or in contracting. Where the chief cost of an operation is the salary of employees, companies often develop an "overhead rate" used as a multiplier of salaries. In bidding a job, managers first calculate costs based on the individuals who will do the work, the amount of time they will spend, travel expenses, and other necessary purchases. Then the managers apply an "overhead," usually by multiplying the initial estimate by some factor like 1.8. This means that every dollar of salaries paid to employees must absorb ¢80 of overhead. Overhead rates are typically developed once a year and used thereafter. The obvious implication of an "overhead rate" is that the operation must sell enough staff time to absorb all of the overhead; only after that does the operation make a profit.

A somewhat analogous concept arises in charitable operations that spend money on fundraising. Here, ideally, as little of each collected dollar is deducted for the fundraising itself as possible, and as much as possible handed over for the actual charitable operation itself.

In successful companies and in good times there is a tendency for overhead to increase because the money is there and additional services provide better information, less stress, and more amenities. When the economy slows or a company runs into difficulties, it will first reduce its overhead by shedding nice-to-have but not-absolutely-necessary services. The public is often amazed that a company can keep on operating after letting so many people go. The hidden part of this process is that the public is unaware just how much "weight" the company had put on before forced to go on a diet.

The financial crises that began in 2008 forced many businesses to reevaluate how they do business and, in many cases, make major changes to accommodate the changing financial times. For some small businesses, one way to reduce overhead is to go from being a brick-and-mortar business to an online business. The money saved by not having a storefront can be substantial, and as customers

become more and more at ease with making purchases online, it can be a very successful business model.

OVERTIME

Overtime is work done by hourly employees beyond the regular work hours per week. Any work over 40 hours per week for an hourly worker is considered overtime. Overtime and overtime compensation are provided for under the federal Fair Labor Standards Act of 1938 as amended. It is required under the FLSA that employers pay time-and-a-half to employees working more than 40 hours per week or 150 percent of the worker's salary for those hours exceeding the weekly average.

EXEMPT AND NONEXEMPT EMPLOYEES

U.S. labor law distinguishes between "exempt" and "nonexempt" employees regarding overtime. Exempt employees do not have to be paid overtime if they work more than 40 hours a week. Members of this class of employee include workers "employed in a bona fide executive, administrative, or professional capacity (including any employee employed in the capacity of academic administrative personnel or teacher in elementary or secondary schools) or in the capacity of outside [salesperson]." The Department of Labor (DOL) Web site contains a complete list and description of exempt categories (www.dol.gov/compliance/guide/minwage.htm). Any worker employed in an exempt category who meets DOL salary and duty tests is exempt from receiving overtime pay regardless of the number of hours he or she works.

In some businesses, employees attend to a wide variety of tasks that may include a blend of "exempt" and "nonexempt" duties. In these instances, their overtime status is dictated by their "primary duty" to their employer. Time spent on each task is an important but not decisive factor in determining exemption status. Instead, federal regulations dictate that the decisive factor is "the relative importance of the [exempt] duties as compared with other types of duties . . . and the relationship between [the employee's] salary and the wages paid other employees for the kind of nonexempt work performed." For instance, the Code of Federal Regulations notes that "in some departments, or subdivisions of an establishment, an employee has broad responsibilities similar to those of the owner or manager of the establishment, but generally spends more than 50 percent of his time in production or sales work. While engaged in such work he supervises other employees, directs the work of warehouse and deliverymen, approves advertising, orders merchandise, handles customer complaints, authorizes payment of bills, or performs other management duties as the day-to-day operations require. He will be considered to have management as his primary duty." The Code of Federal Regulations also includes tests that can be used to determine the primary duties of other white-collar workers, including executives, professionals, computer programmers, and administrative personnel.

The DOL's definition of exempt labor is continuously evolving and being updated. For example, in 2004, the DOL updated the regulations defining exemptions for white-collar executive, administrative, and professional employees. The DOL's discussion of "Who is Covered" was also updated in September 2009 and then again in March 2010, when the DOL changed its position (announced in 2006) on the exempt status of mortgage loan officers as administrative employees.

DECIDING TO USE OVERTIME

Businesses with seasonal peaks, with quotas and deadlines, or with the possibility of rush orders, will at some point probably not be able to meet staffing needs with the regular hours worked by employees. It is at these crisis points that overtime becomes an invaluable tool for the employer.

Most business experts, however, counsel owners and managers to use overtime sparingly if possible. The ideal use of overtime is when employees are willing to work longer hours for increased pay, and the employer needs qualified, trained individuals who will not need excessive supervision while tackling an increased workload. An employer should not, however, rely on employees working many more hours per week routinely to make up for work not accomplished during the regular work week. If overtime becomes essential to the performance of a business, even during regular operating scenarios, there may be other factors, such as poor compensation, morale, or inadequate staffing levels, to be considered.

One serious consideration often cited in the routine use of overtime is the effect it can have on employees' regular production. Increased work hours during one period may lead to increased absenteeism during others, due to family commitments that were put off during "crunch" periods or to illness exacerbated by stress. Family conflicts are also a common consequence and manifest themselves in higher levels of stress, alcohol and drug use, and absenteeism. In addition, employee productivity during regular business hours often undergoes a major downturn after periods of extensive overtime.

All overtime should be authorized by a manager or supervisor, preferably in writing. Consideration should be given to tracking the work accomplished during overtime hours; this ensures that employees are continuing to be productive at the increased pay rate, even with the stress of longer hours and increased sales or other pressures. Tracking what work is done on overtime will also aid the owner or manager of a business to plan for staffing needs in the future.

ALTERNATIVES TO OVERTIME PAY

Because overtime can become very expensive and can sometimes be draining for regular employees, some businesses have embraced alternate plans of human resource management.

Expanding workforce size. The first determination to be made is whether the amount of overtime used throughout the year is enough to justify the hiring of additional staff. This step should be very carefully considered, however, because while overtime is expensive, so are the costs (salary, payroll taxes, social security, benefits) associated with hiring additional employees.

Temps. Another alternative to overtime is to utilize temporary workers. This can be done independently by the owner or manager, or through a temporary employment agency. Depending on the task (and how much training and supervision is required), the temporary employee can save businesses significant overtime expenses. This alternative can be particularly attractive if increased staffing needs are seasonal and predictable, so that temporary employees can be hired in advance.

Stock options. Many employers have begun offering their workers stock options as compensation in lieu of actual overtime pay. In 1999 employer rights to offer stock options were codified into law with the passage and signing of the Worker Economic Opportunity Act. This act amends the Fair Labor Standards Act to exclude profits from stock options or purchase plans from the calculation of nonexempt employee's overtime if various requirements are met (such as full disclosure of terms and voluntary participation). Supporters of this law contend that it allows employers to offer stock options as incentives to hourly workers while safeguarding employees against businesses that might try to disseminate risky stock options in place of overtime pay.

EMPLOYEE REACTIONS TO OVERTIME

Many employees welcome the opportunity to augment their regular salaries with overtime pay. Some businesses can effectively use overtime as a kind of voluntary bonus: if the employees are willing to put in the added hours, they will be rewarded with increased pay. Because of the strong positive feelings many employees have about the opportunity to earn overtime pay, employers should carefully weigh the pros and cons of hiring temporary help; regular employees will recognize the loss of overtime, and morale may suffer, particularly if overtime has become an integral part of the business cycle.

However, the prevailing feeling among many business owners and executives is that employees are placing ever greater value on leisure and family time, and that they are willing to make some sacrifices in the realm of compensation in order to enjoy personal interests. In addition, analysts point out that families that have both parents in the workforce may not value overtime as much as employees of the past. Employers should remain sensitive to employees' needs and responsibilities outside of the workplace and should recognize that employees may not always be willing to volunteer for overtime.

Mandatory Overtime. In the medical field especially, affecting nurses particularly owing to shortages in this health care specialization, mandatory overtime is often imposed on employees. Hospitals like to staff 12-hour shifts with the consequence that work-day overtime (at minimum) becomes mandatory. This has led to stresses on the health care workforce as well as pushback by health care workers. As the American Nurses Association (ANA) points out, "Mandatory overtime is one of the many workplace issues that may be contributing to nurses leaving the workforce." The ANA includes mandatory overtime on its Nationwide State Legislative Agenda, and as of late 2009, fifteen states had restrictions on the use of mandatory overtime for nurses.

PACKAGING

Packaging is a vital industry for the paper, board, and plastic industries and is very important to the branding and advertising plans of all companies. As a process, packaging can either be incorporated into the production process or performed by a third party according to a company's specifications.

DEVELOPMENT

Packaging is nothing new and predates modern times, but the form it takes is a direct reflection of settlement patterns, the reach of the economy, food preservation technology, and the nature of the transportation system. Before the modern era took serious hold after World War I, only a few products were packaged. Canning dates back to the days of Napoleon, some of whose formations, marching into Russia in 1812, received canned goods in newly invented tin-lined metal cans. Other long-lasting products (often called long shelf-life products), like hard biscuits and cookies, were packaged; chocolates and candies came in fancy boxes as well. Perfumes were an early and highly visible packaged product. Paper packaging was used for perishable items, and wood pallet packaging for transportation is still used today.

During World War II, corrugated cardboard boxes began to take over bulk packaging. Milk moved from recyclable glass bottles to paper containers initially coated with wax and then, after the war, by hot melt plastics. Plastics saw an immense expansion in the 1950s and 1960s; polyethylene became a staple of flexible packaging, polyvinyl chloride (PVC) became a standard form of transparent packaging, and polyurethane foam plastics came to dominate a field that had once belong to pressed paper pulp. Composite materials (laminates) became possible as a consequence of the emergence of high-performance adhesives. Packaging grew stronger, lighter, and easier to process by machine. Aluminum entered the beverage market as aluminum cans and also as easy-open closures for steel cans.

As mass production developed in the underlying materials, and forming and packaging machinery became ever more affordable, many products not heretofore packaged were now "shrink-wrapped" onto sheets of cardboard, bagged, and boxed. Due to the advances of printer technology and packaging materials, packaging and marketing began to merge.

By the 1970s packaging had reached maturity and has since evolved less dramatically and visibly. However, the underlying materials sciences are still producing ever better and ever more specialized and differentiated packaging. Packaging processes that improve the shelf life of products and produce are consistently being developed, and new trends in biodegradable and recycled packaging are increasing in popularity. The continuing evolution of packaging *at a technical level* serves as an indicator that, despite much hype about the package as a promotional vehicle, the predominant function of packaging in the economy is product protection first, convenience next. The consumer also values objective information. Functionally, the hype comes last.

PACKAGING BASICS

Packaging divides into bulk, product, and portion packaging. Bulk packaging takes the form of cardboard boxes (much more rarely crates) and the pallets that carry these; it is intended to protect and is rarely ever used to advertise

(except the maker of the box itself). Product packaging typically has two roles: protection and communication. The communication may be promotional, a service to the user (menus, preparation instructions), or a labeling requirement. The chief purpose of portion packaging is to deliver convenience, although branding also plays a significant role. A good producer must balance various aspects of a packaging system, including product protection, costs, marketing exploitability, and ease of production.

From the consumer's point of view, the ideal package will be easy to store, to open, and to close. It should be safe and include any applicable warnings. If instructions can be placed on the packaging instead of in a separate manual, the instructions should be clear and easy to read. Consumers use brand identifications to choose products, but their strongest interest is in objective information, and most types of products are required to have ingredient and material information listed on their packaging.

PACKAGING AS A BUSINESS FUNCTION

Packaging often involves aggregation of multiple units into one package. The optimal package cost for the right aggregate has to be priced properly to achieve desired volume while fitting vendors' shelf space. Product aesthetics must accommodate legal labeling requirements. Different modes of packaging will deliver higher and lower out-of-pocket costs but may produce harder-to-predict sales volumes.

These problems tend to sort out reasonably well because a great variety of analogous cases exist in the market to suggest which general model to follow. Packaging is a large and sophisticated industry, and the small-business owner will be able to identify both package designers and suppliers of packaging equipment easily enough. Designers typically know the equipment available; conversely, packaging equipment suppliers can recommend designers they work with routinely.

If the cost of a third-party packager is too high, a small business can choose to print its own labels for applicable products. This is a popular option for many starting businesses that have products that do not need extensive packaging and can be easily identified by labels. If a small business wishes to use barcodes for inventory purposes, it will need to invest in a bar code printer, scanner, and rights to specific barcode series, especially if the business has plans to sell through distributors later on in the company's growth. If bar codes are not needed, then only label printing hardware is needed.

There are several label options available to small businesses for both ink and label material. Inkjet and laser printers are the most popular, since they are widely available and can be customized to a number of various sizes. Laser printers are faster but tend to be more expensive. Labeling materials range from simple coated paper to various plastic packaging options. Coated paper is cost effective but has low durability, while polypropylene plastic is much more resistant and can be printed with a variety of colors using high temperatures.

ECO FRIENDLY PACKING TRENDS

Eco-friendly packaging options, also known as sustainable packaging, has become increasingly popular as new techniques for recycling old packaging and making new types of biodegradable materials have improved. Small businesses can use these sustainable packaging techniques both to save money on more expensive forms of traditional packaging and improve their brand by incorporating environmentally friendly processes into their production system.

Sustainable packaging can be made either from recycled materials or paper products that break down easily without producing compounds that have been proven dangerous for the environment. Biodegradable packaging materials can be bought in bulk from "green" shipping and manufacturing companies. Plastic or Styrofoam packing materials can be replaced with cornstarch packing for shipping products. If the small business sells prepackaged food items, it may want to consider the growing trend of edible packaging, which are films designed to be eaten along with the food. Green packaged food is also often sold in biodegradable cartons made of sugarcane fiber or a similar plant-based material.

LABELING: UNITED STATES AND INTERNATIONAL

The Fair Packaging and Labeling Act of 1966 regulates packaging and labeling. The act requires that every product package specify on its "principal display label" that part of the label most likely to be seen by consumers the following information: 1) the product type; 2) the producer or processor's name and location; 3) the quantity (if applicable); and 4) the number and size of servings (if applicable). Furthermore, several restrictions apply to the way that the label is displayed. For example, mandatory copy required by the act must be in boldface type. Also, if the company is not listed in the telephone book, the manufacturer's or importer's street address must be displayed.

Foods, toys, drugs, cosmetics, furs, and textiles require special labeling. The label for edible products, for example, must provide sodium content if other nutritional information is also shown. Labels must also show ingredients, in descending order from the one of highest quantity to the one of least quantity. Certain food items, such as beef, may also be required to display qualitative "grade labels" or inspection labels. Likewise, "informative

labeling" may be required for products such as home appliances. Informative label requirements mandate information about use, care, performance capability, life expectancy, safety precautions, gas mileage, or other factors. Certain major home appliances must provide the estimated cost of running each make and model for 1 year at average utility rates.

Congress passed significant new labeling legislation, the Nutrition Labeling and Education Act of 1990, which was intended primarily to discourage misleading labeling related to health benefits of food items. Specifically, many package labels subjectively claimed that the contents were "low-fat," "high-fiber," or possessed some other health virtue when the facts indicated otherwise. Basically, the new laws require most food labels to specify values such as calorie and cholesterol content, fat and saturated fat percentages, and sodium levels.

There is also a family of third-party labels that businesses try to include in their packaging, logos and designs that show their products have a particular rating. One of the most popular is the Energy Star rating, which is granted to products in construction and technology that save more energy than the industry norm for that item. These labels often increase product value for a large percentage of consumers and can be worthwhile to pursue even for a small business, especially small construction companies who can recommend Energy Star-rated items such as windows.

International labels are also important for any small business that wants to sell products outside of the country. These labels vary from organization to organization, but generally they make it easier for products to be exported to specific countries. One of the more common examples is the CE certification given to products by the European Union, which allows them to be shipped and sold much more easily within the countries belonging to the union. International packaging standards are also being created to govern the recycling and biodegradability of package materials. If small businesses deal in importing, they may also be interested in the Fair Trade labels which show adherence to international fair trade standards and can be useful in appealing to socially concerned demographics.

PARTNERSHIP

MAJOR TYPES OF ORGANIZATIONS

Various forms of business organizations are differentiated by the tax and other liabilities borne by their investors. There are three major legal forms of business organization in the United States: partnerships, corporations, and limited liability companies (LLCs). Partnerships can be distinguished from corporations and LLCs in several important ways.

In a *partnership* each partner is an equal co-owner of the entity, pays an equal share of taxes due, and, in case of failure, equally shares in all of the liabilities of the partnership. Thus, in a partnership, liabilities are shared but not limited. The benefit of partnerships is that general partners are only taxed once. The partnership itself pays no taxes.

In a *corporation* an investor only risks the value of his or her investments in the company in the case of failure and only owes taxes on dividend income received. The corporation is legally a "person" and pays its own taxes. It is also at liberty to pay or not to pay dividends, although it is technically governed by the will of a majority of stockholders. The stockholder, in effect, is taxed twice: first on the net income of the corporation that he or she owns (in part) and then on the dividends. The investor, of course, never sees the first tax but gets less in dividends because it is paid by the company.

In an *LLC* the structures of a corporation and of a partnership are combined. Participants are "exposed" only to the extent of their investment because the LLC is treated as a corporation for purposes of liability. At the same time, the taxes owed by the LLC are paid by the participants in proportion to their share in the revenues. They are taxed once, not twice, as in corporations. LLCs have grown rapidly because of the advantages that they offer over both partnerships and corporations.

WHAT PARTNERSHIPS ARE

In the words of the Uniform Partnership Act, a partnership is "an association of two or more persons to carry on as co-owners of a business for profit." The essential characteristics of this business form, then, are the collaboration of two or more owners, the conduct of business for profit (a nonprofit cannot be designated as a partnership), and the sharing of profits, losses, and assets by the joint owners. A partnership is not a corporate or separate entity; rather it is viewed as an extension of its owners for legal and tax purposes, although a partnership may own property as a legal entity. While a partnership may be founded on a simple agreement, even a handshake between owners, a well-crafted and carefully worded partnership agreement is the best way to begin the business. In the absence of such an agreement, the Uniform Partnership Act, which is a set of laws pertaining to partnerships that has been adopted by most states, governs the business.

There are two main types of partnerships: general partnerships and limited partnerships.

General Partnerships. In this standard form of partnership, all of the partners are equally responsible for the business's debts and liabilities. In addition, all partners are allowed to be involved in the management of the company. In fact, in the absence of a statement to the contrary in the partnership agreement, each partner has equal rights to control and manage the business. Therefore, unanimous consent of the partners is required for all major actions undertaken. It is well to note, however, that any obligation made by one partner is legally binding on all partners, whether or not they have been informed.

Limited Partnerships. In a limited partnership, one or more partners are general partners, and one or more are limited partners. General partners are personally liable for the business's debts and judgments against the business; they can also be directly involved in the management. Limited partners are essentially investors (silent partners, so to speak) who do not participate in the company's management and who are also not liable beyond their investment in the business. State laws determine how involved limited partners can be in the day-to-day business of the firm without jeopardizing their limited liability. This business form is especially attractive to real estate investors, who benefit from the tax incentives available to limited partners, such as being able to write off depreciating values.

The family limited partnership (FLP) is a specific form of the limited partnership used by the owners of a family business who wish to pass on their company to their children while minimizing the federal tax burden that sometimes accompanies such a transfer. Generally established as part of the estate-planning process, the family limited partnership resembles other limited partnerships; however, FLPs are audited by the Internal Revenue Service (IRS) more frequently than other limited partnerships because the IRS views them as potential tax shelters and not always legitimate forms of partnership.

ADVANTAGES OF A PARTNERSHIP

Collaboration. As compared to a sole proprietorship, which is essentially the same business form but with only one owner, a partnership offers the advantage of allowing the owners to draw on the resources and expertise of the copartners. For one individual, running a business on his or her own, while simpler, can also be a constant struggle. But with partners to share the responsibilities and lighten the workload, members of a partnership often find that they have more time for the other activities in their lives.

Tax advantages. According to a 2008 IRS publication, "The rules governing the federal taxation of partners and partnerships are intended to permit taxpayers to conduct joint business and investment activities through a flexible economic arrangement without incurring an entity-level tax." That is to say, the profits of a partnership pass through to its owners, who report their share on their individual tax returns. Therefore, the profits are only taxed once (at the personal level of its owners) rather than twice, as is the case with corporations, which are taxed at the corporate level and then again at the personal level when dividends are distributed to the shareholders. Taxation rules for partnerships taxation are found primarily in Subchapter K of the Internal Revenue Code of 1986. The benefits of single taxation can also be secured by forming an S corporation (although some ownership restrictions apply) or by forming a limited liability company.

Simple operating structure.. A partnership, as opposed to a corporation, is fairly simple to establish and run. No forms need to be filed or formal agreements drafted (although it is advisable to write a partnership agreement in the event of future disagreements). The most that is ever required is perhaps filing a partnership certificate with a state office in order to register the business's name and securing a business license. As a result, the annual filing fees for corporations, which can sometimes be very expensive, are avoided when forming a partnership.

Flexibility. Because the owners of a partnership are usually its managers, especially in the case of a small business, the company is fairly easy to manage, and decisions can be made quickly without a lot of bureaucracy. This is not the case with corporations, which must have shareholders, directors, and officers, all of whom have some degree of responsibility for making major decisions.

Uniform laws. One of the drawbacks of owning a corporation or limited liability company is that the laws governing those business entities vary from state to state and are changing all the time. In contrast, the Uniform Partnership Act, originally adopted in 1914 and amended in 1994 and again in 1997, provides a consistent set of laws about forming and running partnerships that make it easy for small-business owners to know the laws that affect them. Because these laws have been adopted in all states but Louisiana, interstate business is much easier for partnerships than it is for other forms of businesses.

Acquisition of capital. Partnerships generally find it easier than corporations to acquire capital, because partners, who apply for loans as individuals, can usually get loans on better terms. This is because partners guarantee loans with their personal assets as well as those of the business. As a result, loans for a partnership are subject to state usury laws, which govern loans for individuals. Banks also perceive partners to be less of a risk than corporations, which are only required to pledge the business's assets. In addition, by forming a limited partnership, the business can attract investors (who will not be actively involved in its management and who will enjoy limited liability) without having to form a corporation and sell stock.

DRAWBACKS OF PARTNERSHIPS

Conflict with partners. While collaborating with partners can be a great advantage to a small-business owner, having actually to run a business from day to day with one or more partners can be a nightmare. First of all, a person has to give up absolute control of the business and learn to compromise. When big decisions have to be made, such as whether and how to expand the business, partners often disagree on the best course and are left with a potentially explosive situation. The best way to deal with such predicaments is to anticipate them by drawing up a partnership agreement that details how such disagreements will be dealt with.

Authority of partners. When one partner signs a contract, each of the other partners is legally bound to fulfill it. For example, if Anthony orders $10,000 of computer equipment, it is as if his partners, Susan and Jacob, had also placed the order. If their business cannot afford to pay the bill, the personal assets of Susan and Jacob are on the line as well as those of Anthony. This is true whether the other partners are aware of the contract or not. Even if a clause in the partnership agreement dictates that each partner must inform the other partners before any such deals are made, all of the partners are still responsible if the other party in the contract (the computer company) was not aware of such a stipulation in the partnership agreement. The only recourse the other partners have is to sue.

The Uniform Partnership Act does specify some instances in which full consent of all partners is required:

- Selling the business's goodwill
- Decisions that would compromise the business's ability to function normally
- Assigning partnership property in trust for a creditor or to someone in exchange for the payment of the partnership's debts
- Admission of liability in a lawsuit
- Submission of a partnership claim or liability to arbitration

Unlimited liability. As the previous example illustrated, the personal assets of the partnership's members are vulnerable because there is no separation between the owners and the business. The primary reason many businesses choose to incorporate or form limited liability companies is to protect the owners from the unlimited liability that is the main drawback of partnerships or sole proprietorships. If an employee or customer is injured and decides to sue, or if the business runs up excessive debts, the partners are personally responsible and in danger of losing all that they own.

Vulnerability to death or departure. Unlike corporations, which exist perpetually, regardless of ownership, general partnerships dissolve if one of the partners dies, retires, or withdraws. (In limited partnerships, the death or withdrawal of the limited partner does not affect the stability of the business.) Even though this is the law governing partnerships, the partnership agreement can contain provisions to continue the business. For example, a provision can be made allowing a buy-out of a partner's share if he or she wants to withdraw or if the partner dies.

Limitations on transfer of ownership. Unlike corporations, which exist independently of their owners, the existence of partnerships is dependent upon the owners. Therefore, the Uniform Partnership Act stipulates that ownership may not be transferred without the consent of all the

other partners. (Once again, a limited partner is an exception: his or her interest in the company may be sold at will.)

FORMING A PARTNERSHIP

There are two steps to take in forming a partnership: reserving a name and making a partnership agreement.

Reserving a Name. The first step in creating a partnership is reserving a name, which must be done with the secretary of state's office or its equivalent. Most states require that the words "Company" or "Associates" be included in the name to show that more than one partner is involved in the business. In all states, though, the name of the partnership must not resemble the name of any other corporation, limited liability company, partnership, or sole proprietorship that is registered with the state.

The Partnership Agreement. A partnership can be formed in essentially two ways: by verbal or written agreement. A partnership that is formed at will, or verbally, can also be dissolved at will. In the absence of a formal agreement, state laws (the Uniform Partnership Act, except in Louisiana) will govern the business. These laws specify that without an agreement, all partners share equally in the profits and losses of the partnership and that partners are not entitled to compensation for services.

RIGHTS AND RESPONSIBILITIES OF PARTNERS

The Uniform Partnership Act defines the basic rights and responsibilities of partners. Some of these can be changed by the partnership agreement, except, as a general rule, those laws that govern the partners' relationships with third parties. In the absence of a written agreement, then, the following rights and responsibilities apply:

Rights

- All partners have an equal share in the profits of the partnership and are equally responsible for its losses.
- Any partner who makes a payment for the partnership beyond its capital, or makes a loan to the partnership, is entitled to receive interest on that money.
- All partners have equal property rights for property held in the partnership's name. This means that the use of the property is equally available to all partners for the purpose of the partnership's business.
- All partners have an equal interest in the partnership, or share of its profits and assets.
- All partners have an equal right in the management and conduct of the business.
- All partners have a right to access the books and records of the partnership's accounts and activities at all times. (This does not apply to limited partners.)
- No partner may be added without the consent of all other partners.

Responsibilities

- Partners must report and turn over to the partnership any income they have derived from use of the partnership's property.
- Partners are not allowed to conduct business that competes with the partnership.
- Each partner is responsible for contributing his or her full time and energy to the success of the partnership.
- Any property that a partner acquires with the intention of it being the partnership's property must be turned over to the partnership.
- Any disputes shall be decided by a majority vote.

PARTNERSHIP AGREEMENT

Partnership agreements are written documents that explicitly detail the relationship between the business partners and their individual obligations and contributions to the partnership. Since partnership agreements should cover all possible business situations that could arise during the

partnership's life, the documents are often complex. Taking legal counsel in drafting and reviewing the finished contract is generally recommended. If a partnership does not have a partnership agreement in place when it dissolves, the guidelines of the Uniform Partnership Act and various state laws will determine how the assets and debts of the partnership are distributed.

Toddi Gutner noted in a 2010 article for *Entrepreneur* that even after a partnership agreement has been established and signed, it is essential for the partners periodically to review the parameters of the partnership and the partnership agreement itself. This will help to ensure that all the partners continue to be satisfied with the arrangement. This is a good way to maintain an open dialog and hopefully avoid future issues within the partnership.

RECOMMENDED ELEMENTS OF THE PARTNERSHIP AGREEMENT

1. Name and address of partnership.
2. Duration of partnership. Partners can point to a specific termination date or include a general clause explaining that the partnership will exist until all partners agree to dissolve it or a partner dies.
3. Business purpose. Some consultants recommend that partners keep this section somewhat vague in case opportunities for expansion arise, while others emphasize clear-cut and unambiguous entrepreneurial goals.
4. Bank account information. This section should note which bank accounts are to be used for partnership purposes, and which partners have check-signing privileges.
5. Partners' contributions. Valuation of all contributions, whether in cash, property or services.
6. Partners' compensation. It should be determined in detail how and when profits (and salaries, if applicable) will be distributed.
7. Management authority. What are the operational responsibilities of each partner? Will partners be able to make some decisions on their own? Which decisions will require the unanimous consent of all partners? What are the voting rights of each partner? How will tie votes be resolved?
8. Circumstances under which new partners might be admitted into the partnership.
9. Work hours and vacation.
10. Kinds of outside business activities that will be allowed for partners.
11. Disposition of partnership's name if a partner leaves.
12. Dispute resolution. It should be stipulated what kinds of mediation or arbitration will be utilized in the case of disputes that cannot be resolved amongst the partners. This is a way to avoid costly litigation.
13. Miscellaneous provisions. This portion of the agreement might delineate the circumstances under which the agreement could be amended, for example.
14. Buy-Sell Agreement.

The Buy-Sell Agreement. The buy-sell agreement is one of the most important elements of any partnership agreement. Lance Wallach summarized the problem in an article for *Accounting Today*. "Large problems can result from the death, incapacity, resignation, etc., of one of the owners," Wallach wrote. "How would the decedent's heirs liquidate the business interest to pay expenses and taxes? What would happen if an heir or an unknown outside buyer of the decedent's share decides to interfere with the business? Could the business or other owners afford to buy back the decedent's ownership interests?"

A buy-sell agreement is intended to forestall all such problems. In essence, it specifies the terms of a buyout in the event of death, divorce, disability, or retirement. The buy-sell agreement has become a "must" in many instances in which a partnership is seeking financing a loan or a lease. Lenders want to see the agreement and study its provisions.

The two primary structures for buy-sell agreements are cross-purchase agreements, in which the remaining partnership owners buy the departing partner's stock or partnership interest, and the stock-redemption agreement, in which the company buys the stock of the departing owner. Life insurance policies are the more typical technique employed to ensure that funds are available for cross-purchase transactions. With two partners in a business, the solution is very straightforward but requires more ingenuity to set up with multiple shareholders. With stock redemption agreements, on the other hand, the insurance would be written in favor of the company. One of the benefits of a buy-sell agreement is that, with the partners able to reach agreement, more innovative methods of solving the problem can be worked out and codified.

PART-TIME EMPLOYEES

Part-time employees typically work fewer hours in a day or during a work week than full-time employees; the latter are typically employed for 40 hours. Part-time workers may also be those who only work during certain parts of the year. Part-time work is treated for all practical purposes in the same way as full-time work under federal law. Specifically, the Fair Labor Standards Act (FLSA) applies to both types of workers in the same way. Under the Employee Retirement Income Security Act (ERISA), an employee who works 1,000 hours or more for a company during a calendar year is treated exactly in the same way as a full-time employee for purposes of qualifying for retirement coverage. The U.S. Department of Labor uses a definition of 34 or fewer hours a week as part-time work, but this definition is only used to gather statistical information.

MOTIVATIONS AND RATIONALES

Employers use part-time workers for many reasons, most of them voluntary. Work is seasonal in many industries or has sharp up-and-down fluctuations. The retail industry's busiest season is Christmas; the sector therefore staffs up heavily during the season to handle an increased volume; the Postal Service, similarly, has a large increase in volume and for the same reason. Businesses that cater to summer or winter vacation seasons (hotels, restaurants, entertainment providers, transportation firms) build staffs with part-time workers and then release them at the end of the season. Agriculture has a similar seasonality during the planting, growing, and harvesting seasons. Industries that support seasonal activities with products and equipment very often produce during the opposite season and shut down or cut back in the season itself; thus snowmobile producers build during the summer; boat producers build during the winter.

In many industries temporary surges in work produce the equivalent of "seasons" but are not tied to the calendar, such as massive data keying after survey mailings return, preparations for market launches, the processing of perishable goods, and so on.

Businesses hire part-time workers when work increases but not enough to justify a full-time hire or to establish a new department. They take advantage of the availability of skilled and familiar workers for catch-up work or to fill in for vacationing full-timers in the summer when students are on vacation. Part-time workers are sometimes highly skilled professionals who are hired during a certain phase of business, or may serve continuously but part time in order to fulfill a high function that does not require their continuous presence. Financial work, software development, sales consulting, and other specialties fall into this category. In times of labor shortage businesses must sometimes hire part-time people they would be glad to put on the full-time staff, but the individuals do not wish to work a full schedule because they are retired or wish to pursue other interests.

In the last decade of the twentieth and into the twenty-first century a new trend has become visible: employers who preferentially hire part-time labor in order to avoid paying benefits such as vacation pay, holidays, personal days, health care, and retirement benefits, all of which they offer to their full-time employees. Regarding compensation, FLSA's only mandate is that hourly labor be paid the minimum wage. Under other statutes, discrimination is prohibited. But FLSA rules require consistent treatment of all classes of employees. Full-time and part-time workers are distinct classes; sufficient differentiation exists to treat the two categories differently. From this arises the "work-without-benefits" aspect of part-time work. If ordinary benefits are costly, transitioning to this type of labor can save the business a lot of money. The move also has costs, of course, not least in public perception.

Employee Rationales. Employees take part-time work because they can find no other employment or for a variety of personal reasons. Many part-time workers are students; some work part time for family or personal reasons; some because they take care of children, have medical conditions, or wish to stay within certain income limits for tax reasons (e.g., Social Security recipients). The Bureau of Labor Statistics (BLS) tracks two separate categories of part-time workers: those who are part time for economic reasons and those who are part time for noneconomic reasons. The BLS states that economic reasons include "slack work or unfavorable business conditions, inability to find full-time work, or seasonal declines in demand," while noneconomic reasons are

"childcare problems, family or personal obligations, school or training, retirement or Social Security limits on earnings, and other reasons."

THE PREVALENCE OF PART TIME WORK

Based on data collected by the BLS in the Current Population Survey (CPS) released at the beginning of April 2010, out of a civilian workforce of 153.7 million people, 26 million (16.9 %) fell into the part-time category, that is, they worked fewer than 34 hours a week. The overall trend in part-time work has been relatively steady during the period between 1996, a year of very strong economic growth, and 2010, a year of slow recovery. Part-time workers in 1996 represented 17.3 percent of employment compared to the March 2010 figure of 16.9 percent. There has, however, been a shift in the reasons for working part time. Of all part-time workers counted in March 2010, 35.8 percent were working such hours for economic reasons (i.e., involuntarily because of slack work or business conditions or because they could only find part-time work). This figure represents a significant rise of involuntary part-time employment resulting from the recession of 2008 and 2009. In 2005 part-time employment because of economic reasons was only 13.5 percent.

Not surprisingly, median weekly earnings of part-time workers are substantially lower than those engaged in full-time work. In the final quarter of 2009, the median weekly earnings for part-time workers was $228, compared to $739 for full-time work. What is initially surprising is that women working part time earned slightly higher pay than men. In the final quarter of 2009, part-time women workers earned a median weekly income of $230 compared to $224 for men. In full-time work women trail men and have as far back as one wishes to look, and at all occupational levels. The explanation for the higher female pay in part-time work must have its roots in higher participation of functionally higher-ranking women in that work arrangement. Many more women, particularly higher-earning women, choose part-time work for noneconomic reasons such as childcare.

PATENT AND TRADEMARK OFFICE (PTO)

The Patent and Trademark Office (PTO) is responsible for administering all laws relating to trademarks and patents in the United States. It has thus been an important agency for several generations of entrepreneurs and small-business owners, as well as for larger corporations and universities. The PTO describes itself as follows: "Through the issuance of patents, we encourage technological advancement by providing incentives to invent, invest in, and disclose new technology worldwide. Through the registration of trademarks, we assist businesses in protecting their investments, promoting goods and services and safeguarding consumers against confusion and deception in the marketplace. By disseminating both patent and trademark information, we promote an understanding of intellectual property protection and facilitate the developments and sharing of new technologies worldwide."

In addition to handling the nation's patents and trademarks, the PTO also has a notable advisory function. It serves as both a developer of intellectual property policy and an advisor to the White House on patent, trademark, and copyright policies. In addition, the PTO provides information and guidance on intellectual property issues to international commerce offices such as the International Trade Commission and the Office of the U.S. Trade

Representative. In 1999 the PTO was established as an agency within the Department of Commerce.

By nearly all accounts, the PTO has historically done a laudable job of protecting the intellectual property rights of businesses and individuals while simultaneously encouraging the growth of business. "Since its inception, the patent system has encouraged the genius of millions of inventors," wrote Richard C. Levy in *Inventor's Desktop Companion*. "It has protected these creative individuals by allowing them an opportunity to profit from their labors, and has benefited society by systematically recording new inventions and releasing them to the public once the inventors' limited rights have expired.... Under the patent system, American industry has flourished. New products have been invented, new uses for old ones discovered, and employment given to millions."

LEGAL UNDERPINNINGS OF THE PTO

The fundamental principles of the modern U.S. patent system were first codified into law in 1790. Guided by Secretary of State Thomas Jefferson in its early years, the patent office grew quickly, and in 1849 the Department of the Interior was given responsibility for maintaining it. In 1870 the powers of the patent office were expanded dramatically; the commissioner of patents was given jurisdiction to register and regulate trademarks. The office thus came to be responsible for all U.S. trademarks, even though the word "trademark" would not appear in its name for another 105 years (the Patent Office became the Patent and Trademark Office on January 2, 1975). In 1926 responsibility for the Patent Office was handed over to the Department of Commerce, where it remains today.

The PTO currently touts the following laws as the primary statutory authorities guiding its programs:

- 15 U.S.C. 1051-1127 Contains provisions of the Trademark Act of 1946, a law that governs the office's trademark administration
- 15 U.S.C. 1511 Establishes the PTO as a subordinate agency of the Department of Commerce
- 35 U.S.C. Provides the PTO with its basic authority to administer patent laws
- 44 U.S.C. 1337-1338 Gives the PTO authority to print trademarks, patents, and other material relevant to the business of the office

In 1991 the PTO underwent a significant change in operation. The Omnibus Budget Reconciliation Act (OBRA) of 1990 included provisions to make the office a self-supporting government agency that would not receive federal funding. In order to provide the PTO with needed operating funds, Congress raised the PTO's patent application fees to cover operating costs and maintain services for inventors. The PTO has been funded solely by fees since 1993. In 1999 it was formally established as an agency within the Department of Commerce.

Due to the fact that the PTO is a self-supporting government agency, it suffered along with other U.S. businesses during the global recession that began in 2008. Any decline in the number of applications means a decline in revenue for the PTO. However, even with a reduction in applications, the PTO remains severely backlogged. The office had been recruiting and hiring new examiners in an effort to reduce the backlog of pending applications, though in 2009 the PTO was forced to cease hiring due to budget constraints. In a 2009 article, then acting director of the PTO John Doll said, "We've stopped hiring at this time. If we closed our doors today, it would take us almost two years to clear out our backlog."

As part of its efforts to process its patent applications in a timely manner, the Patent and Trademark Office established and opened an electronic patent application filing system open to all inventors in October 2000. The PTO's Web site (www.uspto.gov) now allows inventors to assemble all components of a patent application online, including calculating fees, validating content, and encrypting and transmitting the filing. At the same time, the PTO raised its patent fees to match current rates of inflation. This increase, the first since 1997, was needed to pay for the electronic system and other expenses associated with processing the huge volume of patent and trademark applications that pass through the PTO's doors every year. The office experienced an annual 10 percent growth in patent applications during the 1990s, and in calendar year 2008, the PTO issued nearly 91,850 to U.S. residents and more than 90,700 to residents of foreign countries; in fiscal year 2008, it registered more than 171,100 trademarks to U.S. residents and 38,800 to residents of foreign countries.

PAYROLL TAXES

Payroll taxes are all taxes that are collected, by federal, state, and local governments, based on salaries and wages paid to employees. These taxes must be withheld from wages by all businesses that have employees. Businesses are also required to make regularly scheduled reports to the Internal Revenue Service (IRS) and to state and local taxing agencies about the amount of taxes owed and paid. Businesses are not required to withhold payroll taxes on wages paid to independent contractors. Self-employed persons are responsible for paying their own payroll or income taxes directly to the appropriate taxing entity. It can be financially dangerous for small businesses to put off paying these taxes or filing the proper reports. The IRS can hold a business owner liable for the total amount of taxes owed regardless of the state of the business.

The basic types of payroll taxes are as follows:

1. FICA Taxes. FICA taxes are federal payroll taxes that cover two separate organizations: Social Security and Medicare. For both these taxes, a percentage is taken from the employee's wages, and that same percentage is also paid by the employer. For Social Security, the rate in 2010 was 6.2 percent, to which the employer had to pay a matching 6.2 percent (up to $97,500). The Medicare rate stood at 1.45 percent, with an equal matching amount required.
2. SUTA and FUTA Taxes. These are state and federal unemployment taxes. Like Social Security, the required FUTA rate was set at 6.2 percent for 2010, While tax rates state by state can vary, businesses are allowed to take a tax credit for up to 5.4 percent of paid SUTA taxes.
3. Additional Taxes. There are also local income tax rates which may need to be taken from payroll, but these, like SUTA, vary state by state, county by county, and even city by city.

PAYROLL TAX DEPOSITS

Businesses must make regular payroll tax deposits throughout the year, based on their tax status as employers. All employers file either a Form 941 or Form 940. Form 940 is the easiest form to use and is applicable to employees who have more than $500 and less than $2,500 every quarter in payroll taxes. If this is the case, the deposits can be made in the first month after the quarter ends. Form 941 governs amounts greater than $2,500 per quarter. In this case, the employer makes deposits either monthly or semiweekly. Monthly deposits are the standard for new employers.

There are two options for employers to pay these deposits. The first and suggested method is via the Electronic Federal Tax Payment System, or EFTPS. Many businesses are required to use the EFTPS, and its online simplicity can be of benefit to small businesses, although the second option is through Federal Tax Deposit coupons (Form 8109-B), a hardcopy method.

Business must also be prepared to send W-2 annual statements of all taxes withheld to their employees, with copies reserved for the Social Security Administration. A W-3 form, showing matching payments between the W-2 and the taxes deposited throughout the year, should also be included. States may have their own rules regarding income tax deposits, but these are likely to mirror federal versions, including the use of online filing.

EXCEPTIONS TO PAYROLL TAX RULES

There are certain situations in which small businesses can avoid owing payroll taxes. For example, special rules apply to sole proprietorships and husband-and-wife partnerships that pay their minor (under eighteen) children for work performed in the business. These small businesses receive an exemption from withholding FICA taxes from their children's paychecks, and are also not required to pay the employer portion of the FICA taxes until their children turn twenty-one. Parents must prove their children were reasonably compensated for hours worked.

If a small business uses independent contractors, there is no need to withhold payroll taxes, as long as the employees are legally classified under contractual tax laws. Their income is filed using Form 1099, as long as they were paid more than $600 over the course of a year. For amounts under $600, no form needs to be filed.

TRUST FUND RECOVERY PENALTY

The Trust Fund Recovery Penalty (TRFP) is a tax penalty for employers who do not make required payroll tax deposits. It is referred to as a trust fund tax because the money withheld from the employee's wages is assumed to be held in trust by the employee, who has a legal obligation to pass the tax along to the government. The TFRP

can be applied in addition to civil and criminal penalties, including the seizure of business assets and forced closure of the business. And since it is a penalty rather than a tax, the TFRP is not erased by bankruptcy.

In order to apply the TFRP to an individual, the IRS must prove the person's responsibility (that he or she had the power to make the decision about whether or not to pay) and willfulness (that he or she knowingly failed to act rather than made an honest mistake) for the business's failure to remit payroll taxes. In making its determination about who to hold responsible, the IRS looks at who made the financial decisions in the business, who signed the checks, and who had the duty of tax reporting. Under these rules, a small-business owner can be found personally liable even if a staff member or outside accountant was directly responsible for payroll tax compliance.

PENETRATION PRICING

Penetration pricing is an attention-grabbing technique for introducing new products or services to a market. In penetration pricing, the price is set low in order to acquire a following and market share. Once the product or service is established, price may move to a higher level. This is a short-term strategy used to advance market growth, and prices are rarely maintained at low levels indefinitely. Advantages to the process include:

- Speed. A business new to a market can use penetration pricing to enter it very quickly, developing a customer base before other businesses have a chance to respond.
- Attraction. Customers will be automatically drawn to lower prices. By the time prices are increased to market norms, customers will already have experience with the business and be more likely to shop there, although their interests may switch to other products or services.
- Performance standards. Businesses that use penetration pricing must develop a complete strategy to make up the costs for pricing so low, often too low to make a noticeable profit on the goods or services. This encourages a business to be very accurate in bookkeeping and keep excellent track of its advertising performance.
- Temporary market barrier. If an existing business uses a penetration pricing strategy to introduce a new product line or reinvent a service, then many new businesses, upon seeing the low prices, will take them for an industry norm and see it as a barrier to entry.
- Channel benefits. The technique can produce rapid turnover of stock, which can improve relations with suppliers and distributors in the short term.

Penetration pricing is used most often in elastic (varied price fluctuations) and less often inelastic (limited price fluctuations) goods and services. When used with elastic goods, there is a danger that customers will assume the low price is the market standard and leave when the price is raised again. Penetration pricing can be more popular in an elastic market with significant competition, where customers will be drawn to a product that stands out because of its low cost, even for a limited amount of time.

Even in inelastic markets, the low initial price may build price expectations, and it may be difficult, later, to raise prices without causing a market reaction. If the low price becomes part of the brand image, changing price will disturb that image in the consumer's mind. To counter this problem, penetration pricing is sometimes used in a disguised form. The pricing intended to be used later is applied to the product in outlets, but coupons are distributed for the penetration price, or a discount penetration price is advertised for only a short time frame.

A small business considering a penetration pricing strategy should examine its costs and production capabilities carefully. If costs can be lowered and production volume can be increased at the same time, then penetration

pricing may be an option for entering a market. If production volume cannot be increased, the small business will fail to meet the increased customer demand, and if costs cannot be lowered the lower profits cannot be covered. Penetration pricing should only be continued indefinitely if the small business can afford the strategy in the long term while still growing the business. In this case, penetration pricing may be used to lower production cost through economies of scale as market share increases. If a business can count on economies of experience, these too will lower costs with a larger production volume and help to make up the difference of penetration pricing.

While penetration pricing is used most commonly for more inexpensive or lower-end goods, it is matched by an opposite strategy used for high-end goods, known as skimming pricing. Skimming pricing artificially raises the price of a product to convince customers that it is an elite item worth the extra money. Demand goes down, but the product image is affected positively. Later on, the prices are lowered again to increase demand but keep the elite image of the product. Both pricing strategies require careful planning and balance by the businesses using them.

PENSION PLANS

The term "pension plan" is now used to describe a variety of retirement programs that companies establish as a benefit for their employees. These include 401(k) plans, profit-sharing plans, simplified employee pension (SEP) plans, and Keogh plans. Pension plans have progressed from rigidly defined benefits received upon retirement to these more flexible alternatives. Self-employed individuals and small-business owners may even choose to create their own personal pension plans when participating in a company-wide plan is not possible.

Small businesses typically create pension plans to increase the value of their employee benefits and draw more quality employees to the business. In most plans a certain percentage of an employee's wages are deducted for a retirement plan, and the employer matches this percentage up to a certain point. Small-business owners can deduct these employer-matching sums.

According to surveys conducted by the Small Business Administration, only about 53 percent of private sector workers had a pension plan or retirement benefits available to them at work. Sixteen percent of private sector workers had pension plan options but chose not to participate, while 37 percent did participate in a plan. In companies with fewer than 100 employees, 72 percent did not offer any type of retirement benefits.

PENSION PLAN OPTIONS FOR SMALL BUSINESSES

Small-business owners can set up a wide variety of pension plans by filling out the necessary forms at any financial institution (a bank, mutual fund, insurance company, brokerage firm, etc.). The fees vary depending on the plan's complexity and the number of participants. Some employer-sponsored plans are required to file Form 5500 annually to disclose plan activities to the Internal Revenue Service (IRS). The preparation and filing of this complicated document can increase the administrative costs associated with a plan, as the business owner may require help from a tax advisor or plan administration professional. In addition, all the information reported on Form 5500 is open to public inspection.

All business owners who want to create pension plans for themselves through their business must legally include employees who also meet participation requirements. The employer must then contribute to the pension plan in the same manner that employee funds are matched as they are withdrawn. Contributions by owners are limited based on the net earnings of the business, unlike employees, for whom gross figures are used for calculating contributions.

A number of different types of pension plans are available. Most are divided into defined contribution and defined benefit plans. Defined contribution plans are one of the most popular, and use allocation formulas that allow employees to set aside a percentage of their income to contribute to the retirement plan. The employer matches the amount up to a specific percentage, and the money invested grows. The defined benefit plan is a more traditional type of pension plan in which the employee accumulates a certain level of benefits which are paid out upon

retirement, decided by employee age, salary, years of service, and other conditions.

For small businesses, pension plans like SEP IRAs, Simple IRAs, Profit Sharing, and 401K plans are the most popular. SEP, or Simplified Employee Pension IRAs, are very common among small businesses, since there is no required plan document or annual IRS filing required. Employers must simply pay employee's matching amounts for whatever contributions they are making for themselves, although employees cannot make contributions for themselves. Contributions do not have to be made every year. Simple IRA plans are similar but are for companies with 100 employees or fewer, and employees can make contributions that must be matched by the employer up to 3 percent.

Profit-sharing plans give out shares of the profit as retirement plans. Like in SEP IRAs, whatever the employer contributes must also be given to participating employees, but amounts tend to vary from year to year with the success of the business. Although 401K plans can cost a couple thousand dollars a year, they are also another viable option for allowing employees to invest their earnings.

In nearly every type of qualified pension plan, withdrawals made before the age of 59 ½ are subject to an IRS penalty in addition to ordinary income tax. The plans differ in terms of administrative costs, eligibility requirements, employee participation, degree of discretion in making contributions, and amount of allowable contributions. Free information on qualified retirement plans is available through the Department of Labor at 800-998-7542, or on the Internet at www.dol.gov.

PERSONAL PENSION PLANS FOR INDIVIDUALS

For self-employed persons and small-business owners, the tax laws that limit the amount of annual contributions individuals can make to qualified retirement plans may make nonqualified plans more appealing. A nonqualified plan can be used to supplement retirement savings plans for business owners. Broadly defined, a nonqualified deferred compensation plan (NDCP) is a contractual agreement in which a participant agrees to be paid in a future year for services rendered this year. Deferred compensation payments generally commence upon termination of employment (e.g., retirement) or preretirement death or disability.

Although types of insurance policies, such as whole life or universal life, can also be used for retirement savings, variable life insurance tends to be the most popular. Variable life insurance providers allow individuals to select from a variety of investment options and transfer funds from one account to another without penalty. Many policies also allow individuals to vary the amount of their annual contribution or even skip making a contribution in years when cash is tight. Caveats are included in case of injury or early withdrawal. Retirement insurance plans are restricted by the IRS in ways similar to pension plans.

Upon reaching retirement age, an individual can begin to use the personal pension plan as a source of annual income. Withdrawals, which are not subject to income or Social Security taxes, first come from the premiums paid and earnings accumulated. After the total withdrawn equals the total contributed, however, the individual can continue to draw income in the form of a loan against the plan's cash value. This amount is repaid upon the individual's death out of the death benefit of the insurance.

PER DIEM ALLOWANCES

The term "per diem" means "daily." In a business setting, the term has come to mean the daily rates employees use for expenses incurred while traveling on business-related activities. These rates are likely to differ based on whether the employee travels in his or her home area, away from home, or internationally. The per diem allowance is the amount given to a traveler to cover expenses such as lodging, meals, and entertainment in connection with the performance of service duties for a company.

Typically the human resources department of an organization will establish per diem rates for reimbursement as well as policies for submitting travel expense forms and documenting expenses. Per diem amounts are normally set in advance. Employees may either claim actual expenses incurred or use established per diem rates, or a hybrid method. For example, the employee may claim a per diem amount for meals and claim actual costs for lodging, as long as lodging expenses do not exceed the per diem allowance for lodging.

SETTING PER DIEM RATES

Per diem rates are established for a number of areas, including domestic air travel; international air travel; lodging; rental cars, vans, and trucks; other transportation; meals and entertainment; telephone usage; miscellaneous reimbursable and nonreimbursable expenses; and travel insurance. Companies also may specify preferred travel agencies and programs and establish policies for payment of travel expenses and per diem rates.

Companies that do not set their own rates may use per diem amounts based on U.S. federal travel regulations. Internal Revenue Service (IRS) regulations and reporting requirements governing per diems vary. For employees, if the per diem requested exceeds the federal per diem rate for the given location and duration of the trip, the excess amount is considered reportable income and is added to the employee's W-2. For independent contractors, per diem payments made to such individuals are reportable income and are reported on Form 1099M.

Official per diem rates based on location are established by the IRS and take effect on October 1st of every year. The IRS typically specifies higher amounts for areas across the United States based on market conditions, and the General Services Administration sets an overall, lower federal amount. Any locations not specified by the IRS fall under the base federal amount. When a small business has employees who travel throughout the year, they have a choice. When the October 1st deadline comes, they can use either the rate of the current year, or the rate of the next year as specified. Whichever rate they choose to use as a per diem they must extend to all employees. When the new year officially starts, the business must switch to the new year per diem, or use the federal base level. This is known as the high-low method.

Rates typically increase to account for inflation and decrease in times of recession. The locations specified by the IRS in the United States may have special time frames unlike other areas. The highest eligibility rate in 2009 was $258 dollars per day, up $2 from 2008. The standard low rate set by the IRS for specific locations without exceptions was increased from $158 to $163, and the standard rate set by the federal government was $116, although amounts again differ based on location.

It is important for a company to establish clear per diem amounts and travel policies before employees are hired and begin to travel for the company. For example, a company must decide whether it will reimburse employees' personal phone calls as well as business calls while traveling. Fees for currency conversion, ground transportation, health clubs, laundry, postage, and any tolls or additional international fees must also be considered.

Some firms consider paying for extra services to reward, motivate, or retain employees in tight labor markets. These per diem items are typically local and based around extra activites such as club memberships, personal credit cards, salon fees, golfing fees, luggage, books, personal vehicle maintenance, saunas, and massages.

PER DIEM EXAMPLES

The Per Diem, Travel and Transportation Allowance Committee exists to ensure that uniform travel and transportation regulations are issued for members of the seven branches of the U.S. military (Army, Navy, Air Force, Marine Corps, Coast Guard, National Oceanic and Atmospheric Administration, and Public Health Service). The objective of these regulations is fair and equitable reimbursement of uniformed members and civilian personnel.

The U.S. government, through the Department of State, provides per diem allowance amounts for travel in foreign areas in lieu of reimbursement for actual subsistence expenses. The allowances are provided to employees and eligible dependents for daily expenses while on temporary travel status in the listed localities on official business away from an official post or assignment. The established rates are maximum amounts. Under travel regulations implemented by the General Services Administration and individual federal agencies, authorizing officials are required to reduce the maximum rates as needed to maintain a level of payment consistent with necessary travel expenses. Separate amounts are established for lodging and meals plus incidental travel expenses.

PERSONAL SELLING

Personal selling is the act of selling a product or service face-to-face, with a live facilitator, instead of through traditional or digital media. Growing business industries, the prevalence of product choices, and a distrust of aggressive selling policies have led to a prevalence of selling through promotion and advertising instead of one-on-one contact.

THE BUYING SELLING SITUATION

Consumers are interested in personal selling primarily during rare occurences when they need an additional source of information. This is why large purchases such as property, vehicles, and investments are often conducted with personal sellers such as realtors or investment advisors. In these situations, a seller who can provide information and advice is reassuring and often necessary. Smaller but exclusive items such as jewelry or dresses are also sold using personal selling. As a marketing tool, personal selling allows business to use the personality and knowledge of their sales teams to help convince consumers to purchase these high-end products at their stores.

CHARACTERISTICS OF SALESMANSHIP

In a hard sell, the job of the salesperson is to discover what the buyer wants, to present the goods that match the desire while dealing with objections, and to close the sale. The salesperson should have integrity and avoid selling something he or she knows to be defective or inferior. Small businesses should train their salespeople to have a thorough knowledge of the product and good communication skills, including the ability to see from the customer's point of view. Problems with products or contract contingencies should be discussed frankly, and any maintenance issues should be mentioned.

Personal selling processes are divided into steps, such as prospecting, preapproach, approach, and presentation. Prospecting and preapproach are two of the most important stages and require careful planning. A promising consumer must be identified, and the seller must become familiar with the prospect before approaching him or her. This requires empathy and study.

TYPES OF PERSONAL SELLING

Sales positions range from the sales clerk to the chief executive officer in public and in private enterprises. At the bottom of the sales pyramid the primary skills involve taking orders and helping customers find products. At the top, executive salespeople take complex and controversial topics and present them with clarity, persuading other firms and investors to take particular actions.

Sales positions are classified as "inside" and "outside." Inside sales above the clerk level involve telephone sales, mainstream retail sales in stores where product knowledge and presentation skills are required, and auto sales and similar equipment sales where customers visit the dealership. Inside sales may be combined with other functions such as scheduling and early information gathering for an outside agent.

Outside sales take place either at the prospective client's residence or place of business or in a third-party location, such as real estate sales. Outside sales may be combined with estimating tasks or product delivery. A special category is the sales engineer highly skilled in some aspect of industrial operations and thus able both to understand requirements and to provide technical support.

Beyond inside and outside, three types of personal selling are usually identified: order getting, order taking, and support personnel. Order-getting sellers are those who accomplish the traditional sales tasks, approach prospects, and convince them to place orders for products or use services. Order takers are those who perform the more basic jobs, such as completing the transaction. Sales clerks fall under this second heading. The third type, support personnel, do not only offer technical support but can also do missionary work in which products are promoted without being sold. This is common in the medical field where pharmacies send out advertisers to encourage doctors with free samples but do not ask them to buy any specific product.

Representatives. Sometimes personal selling is conducted by manufacturing represenatives. These individuals, who sometimes work in groups, are independent sellers who sell on behalf of a certain manufacture with various regions, working on commission. Hiring a rep firm allows a small business to avoid the cost of an in-house sales force. In addition, an established rep may provide the business

instant access to an established sales territory. Agents are particularly helpful for businesses with seasonal sales. The chief disadvantage of selling agents is that they usually work for several different firms and do not devote all of their time to one client.

TRENDS

Due to its expensive nature, personal selling and contact with live sales teams is diminishing and being outsourced to firms that specialize in the process. E-commerce has driven down the need for even basic personal selling for many industries. Some industries , however, are maintaining their sales teams. These teams are either necessary for industries like real estate and investment, or serve to increase business value when selling goods in up-scale retail markets.

Small businesses are often able to make more effective use of a salesforce than larger corporations. Since a small business can appeal to local markets through the use of customer service and knowledge concerning the area or consumer needs, they can increase the value of their products and services and the strength of their brand with a skilled sales team.

PHYSICAL DISTRIBUTION

Economists talk about the movement of goods in and out of business operations as "physical distribution." Physical distribution costs money. The cost of incoming transportation tends to be hidden in the price, but the business owner will feel the price directly if he or she has to ship product any distance or deliver it locally to the consumer. Jean-Paul Rodrique, Claude Comtois, and Brian Slack, in their book *The Geography of Transportation Systems*, estimated that logistics, or the arrangement and payment for product distribution, accounts for 10 to 15 percent of worldwide gross domestic product.

MODES AND NODES

Physical distribution is based on modes of transport such as ship, freight via railroad, freight via road, and air travel. Some physical products are also temporarily transported in pipes, such as oil, gas, and water. Distribution occurs in stages where the materials may be held for short periods of time at collecting points before being sent on to more specific destinations.

The development of the steam engine in the eighteenth century first influenced water transportation by providing an engine for ships and in the nineteenth century led to the almost explosive development of rail as a major mode of transportation. Rail captured the bulk of long-distance goods distribution, such as coal. Long-distance travel via road and air was developed with the combustion engine technology and flight of the twentieth century.

Due to its high cost, air distribution is typically used only with smaller physical materials in which speedy delivery is important, such as certain types of correspondence, medical supplies, and scientific samples. Long-distance land transportation today is dominated by trucking.

With the maturing of transport systems came combined modes generally referred to as "intermodal" transportation. Typical examples are "container ships" that carry boxes which can be placed directly on semitractor trailers and trucked to their final destinations. Within these boxes goods are packed on pallets ready for unloading by forklift trucks. These same containers can be transported by rail for long-distance hauls and then transferred to trucks for the final leg of the trip.

In terms of costs, the lowest cost is associated with water, then with rail, then with trucking, and finally with air transportation. The driving force is the production cost of the item moved, which is itself based on the producer's raw material, energy, and labor costs. If the product has a low production cost, it can "carry" a high transportation cost and still arrive at a lower cost than an item traveling a short distance but having a higher production cost.

SMALL BUSINESS PHYSICAL DISTRIBUTION LOGISTICS

Physical distribution is sometimes a problem for the small business if it is located in outlying areas poorly served by modes. Until the 1970s, transportation was regulated by the federal government, but deregulation began in 1977 with airlines and continued across the various methods used by all businesses.

Small businesses rarely have the resources to become experts in physical distribution and therefore converge on typical modes of distribution used in their industry by discovering how others do the job. Occasionally the small business is required to come up with something new and innovative as the consequence of an unusual contract, a new product launch, or the appearance of a new customer. An alternative to doing heavy homework is to make use of transport brokerage, freight forwarding, and transport service organizations that specialize in designing optimal methods of getting the goods where they belong.

A common problem for small businesses with inventory is a lack of storage space. Just-in-time inventories are not always possible, and the space to store a number of goods for distribution can be expensive. A small business operating in direct channels should invest in a private storage space of its own, or at least rent enough storage space to hold sufficient inventory to meet demand. A small business that is part of a larger distribution channel can often sell goods to a wholesaler, who will store the goods before selling them to other dealers further along the channel. This selling arrangement can provide a constant outlet for small business products and save on space. Contracts with other distributors should specify who pays for freight costs and who bears the risk of damage while the product is in transit.

In a physical distribution system, materials handling is also of great importance. Products, especially fragile products, should be packaged and treated with great care. A broken product will not only cost the small business money, it will significantly lower the reputation and value of the company in the eyes of the customer. Proper methods and equipment should be used by the small business, including packaging techniques that will ensure the safe arrival of the product when it passes into the hands of other distributors.

Modern technological developments have revolutionized some aspects of the physical distribution process. In certain cases, such as music distribution, physical methods are no longer necessary, and independent producers, studios, and labels can distribute digitally. Small businesses that work with products that can be easily sold over an online store can simplify their distribution methods by dealing with one order at time through their Web site interface, in which only a reliable package distributor is needed. Modern packaging and transportation methods also allow more options for a small business working on an order-by-order basis to market itself. If the small business wants to market its eco-friendly practices, it can advertise its use of recycled packaging. If it wants to note reduced carbon dioxide emissions that may also qualify it for tax benefits, the business can use hybrid vehicles for transportation or a distribution partner who uses similar methods.

POINT-OF-SALE SYSTEMS

Point-of-sale (POS) systems represent the computerization of the cash register and the linking of it to databases. POS systems give businesses the ability to retain and analyze a wide variety of inventory and transaction data on a continuous basis. In addition to helping small businesses with accounting, they can also be valuable tools for target marketing, supplier purchase tracking, and other types of sale analysis. Basic point-of-sale systems currently in use include stand-alone electronic cash registers, also known as ECRs, and their related network or controller systems.

Stand-alone ECRs. These electronic registers operate independently of one another and provide only basic information for transactions made on that particular register. These systems are often well-suited for small businesses because they are the least expensive of the POS options but provide many helpful features, including automatic sales and tax calculation abilities, programmable function keys, and scanning.

Network Systems. Network or ECR-based point-of-sale systems feature multiple terminals arranged into a primary/secondary configuration. One ECR in the store, equipped with extra memory capacity, serves as the primary

terminal and receives data from the secondary terminals. These systems give businesses the added capacity to manage storewide data and transmit data to mainframe or network servers.

Controller-Based POS Systems. The most complex POS systems are controller-based systems in which each terminal is connected to a computer that receives and stores all sales, merchandise, and credit data. The controller manages the system, checks for errors, and formats data for the main computer used by the business. It does its own sales analysis price information searches. Dual-control systems provide additional safety in case of failure. Most business scan to input information into these systems, which lowers the chance of error.

Point-of-sale systems, like many other computer-based innovations, continue to change and develop at a rapid pace. Small businesses should be able to find a variety of options at different prices and for different computer systems to fit their needs. Most POS systems are integrated with handheld scanners, customer promotions and discounts, credit card machines, scheduling, and invoices, all at relatively low cost.

POPULAR POS SYSTEMS FOR SMALL BUSINESSES

Some of more popular POS software options for small businesses include:

- Imonggo. Imonggo is a POS software download designed to be a free, minimalistic alternative to the other POS programs offered by companies such as Microsoft and QuickBooks. It allows for an unlimited number of users and allows business owners to collect and manage barcodes and images of products for easier inventory management.
- Microsoft Dynamics POS. Microsoft's POS system is designed to be role-based, allowing users to customize screens based on their jobs, such as cashier, sales representative, and retail store manager. The software includes options for status updates and touchscreen capabilities, which are showing increased popularity in POS systems.
- QuickBooks Point of Sale. The QuickBooks POS system integrates with other QuickBooks programs, which can be useful to small-business owners who have other QuickBooks software. The system allows users to print price tags and automatically generate purchase orders for a wide range of inventory management activities. Two versions are available, one oriented toward single-store businesses and the other toward businesses that have multiple store fronts.
- Lightspeed. Lightspeed is a POS program designed for use on Mac operating systems. It can be used for single or multiple stores, and includes several different management options that can be used to search and manage inventory, scan and complete transactions with customers, and sell online through a Web store system.

PORTABILITY OF BENEFITS

The portability of benefits is the idea that common job benefits, such as health insurance and pension plans, can be set up in such a way that they can travel with a worker who moves from one job to the next. These benefits are arranged and paid for by employers and give employees greater financial security.

Traditionally, employee benefit plans have been offered on a company-by-company basis, with each plan belonging to and administrated by the business itself. This system is still used in many government positions, but the private sector has branched out into other alternatives. It is common for employers to offer several pension or health plans to prospective employees, including portable options. Small businesses often find portable plans easier to manage,

and for some workers such as independent contractors, there may be few other options.

Portable health benefit plans can take three different forms. The first is a government-created market of various plans which small businesses can dip into as needed, choosing the plans that best fit their employees. This option is common in national health systems, and the United States appears to be moving in this direction as a result of health care reform legislation passed in 2010. The second option is a small version of government-sponsored health care in which businesses instead of governments gather together to create several health care options, or a single plan, for the entire industry or sector in which they work. This is most common in heavily unionized industries and does not tend to affect small businesses outside of these industries.

The third option is a privatization method in which employees are able to purchase benefit plans for themselves from a third party. These plans exist independently of businesses, but some businesses create benefit accounts which employees can use to fund their own plans, and the government may offer tax credit for employees who choose this option. One of the most popular options is the health savings account, where business owners can keep their funds in a single account and control deductibles and insurance company choices themselves. All three forms of portable benefits exist to a degree in the United States, though both government and privatized portability are gaining popularity.

Certain legislation has affected the portability of benefits in the United States, especially health benefits. The Health Insurance Portability and Accountability Act of 1996, known better as HIPAA, set the ground rules for the protection of electronic health information throughout U.S. industries and made it much easier for health plans to offer uniform coverage to employees at many different businesses. HIPAA legislation was updated in 2003, when the last security laws were added.

In addition to governmental control of portable benefits, most states, such as Michigan, provide portable benefit plans of their own that allow all state employees to invest in one out of a series of private pension plans using the state coverage program. The employee keeps the plan as long as they are working for the state. Many states offer a defined compensation plan in which they allow employees to move funds from the old plan to the state plan of their choice. In these cases, the states accept purchase of service credits, which let employees receive credit for retirement funds earned at a previous job that were not yet vested and that the employee would lose upon switching to a state position.

There are two types of pension plans: defined benefit and defined contribution. A small business that wants to create a portable pension plan to attract quality employees should use the more popular defined contribution plan, in which the employee pays a percentage of his or her wages into the plan and the employer matches it. Most individual retirement account (IRA) plans allow employees to rollover funds from one IRA to another when they switch jobs, or at least keep the old IRA until retirement.

Small businesses and businesses that are just beginning tend to benefit more from portable benefit options than large companies that already have benefit plans in place. The primary advantage to such plans is flexibility, which increases business value in the eyes of potential employees and allows the small-business owner to save money by choosing plans or accounts that leave room for tailored options and lower payments.

PREGNANCY IN THE WORKPLACE

Bureau of Labor Statistics figures indicate that 80 percent of all working women will become pregnant at some point in their working lives. Researchers have observed that attitudes toward pregnant employees tend to be predicated more on company culture than on the size of the firm. A small business headed by a driven entrepreneur who is determined to meet or exceed an ambitious agenda of growth may greet the news that his or her top salesperson is pregnant with far less equanimity than the leadership of a larger company that places greater weight on the long-term value of the salesperson.

Due to increased awareness of minority rights and legislation governing the treatment of women and pregnancy by businesses, companies are expected to have policies for managing pregnancy and protecting pregnant employees from harassment and biased actions. However, mistreatment still persists and in some cases has risen. In 2007 the number of complaints concerning pregnancy discrimination filed with the Equal Opportunity Employment Commission rose 65 percent, and in 2008 they rose by another 14 percent to 5,587.

PREGNANCY DISCRIMINATION AND FEDERAL LAW

The United States has passed two major federal laws that provide legal protections to pregnant employees as well as employees who might become pregnant. These are the Pregnancy Discrimination Act of 1978 and the Family and Medical Leave Act (FMLA) of 1993.

Pregnancy Discrimination Act of 1978. This legislation stipulated that all employers treat pregnant and nonpregnant employees in the same way, both in terms of benefits received and all other respects.

Family and Medical Leave Act of 1993. The FMLA stipulates that men and women may take as many as 12 weeks of unpaid leave annually for the birth or adoption of a child, care of a sick child, placement for foster care, or because of morning sickness or other illness (the illness does not have to be pregnancy-related). Employers and employees alike should note, however, that the FMLA does not impact businesses with fewer than fifty employees.

AVOIDING DISCRIMINATORY BEHAVIOR

Discriminatory behaviors still exist in the workforce, as demonstrated by practices such as ignoring pregnant applicants for a particular position or using job performance loopholes to fire pregnant women on other grounds. Small businesses should be aware of the regulations governing their behavior at both federal and state levels:

- Employers may not refuse to hire, refuse to promote, or fire a pregnant employee because of her pregnancy. Moreover, experts warn that the person's pregnancy cannot be *any* factor in the action taken.
- Employers have to provide the same benefits to all employees, whether or not they are pregnant, although they do not have to provide additional benefits to pregnant workers.
- Employers may not refuse to adjust workloads for a pregnant employee if they do so for a worker who is not pregnant but claims some other disability or mitigating circumstance.
- Employers may not discriminate against staff members who may be pregnant in the future or who announce intentions to get pregnant.
- Employers may not discriminate against employees who: 1) have had an abortion; or 2) are considering having an abortion.
- Employers are not allowed to reassign employees to lower-paying positions because of pregnancy. Similarly, employers may not change a worker's job description and then eliminate the new job via reorganization.
- Employers may not engage in discriminatory practices against men whose wives or partners become pregnant. It should be noted, however, that application of this law may vary from state to state, since states have different views of the rights of married and unmarried couples.
- Employers cannot demand medical notes from a pregnant woman's doctor concerning her work status if they do not require similar documentation from doctors of other employees who have short-term disabilities.

MANAGING THE LOSS OF EMPLOYEES DURING PREGNANCY AND MATERNITY LEAVE

Businesses, especially small businesses, must work to balance the needs of a pregnant employee with the operation of the business. Prior planning is an essential element of effectively managing the impact of pregnancies on business operations. Business owners and managers should study in advance how the pregnant person's responsibilities will be handled in her absence. Pregnant employees should be consulted concerning their responsibility and how their position can best be filled during their absence. Employees who cover the duties of the pregnant co-worker should be

compensated properly, and the business owner should be aware that a significant percentage of pregnant workers who take time to care for their newborns leave their current jobs. The business should create a plan for a replacement if the employee chooses not to return.

Most employees will continue working while pregnant and take parental leave instead of pregnancy leave to care for their newborn child. This leave can be taken at any time during the first year after the child is born. The business owner can allow the employee to take the time intermittently so that the employee can continue working part time, either with half days or a reduced number of days per week. The arrangement may vary, but the times must be agreed upon by employer and employee. A schedule should be created to plot out the leave which the employee will use. If a married couple is employed at a small business, the business owner may restrict their combined leave to a total of 12 weeks, but only if no health conditions relating to the pregnancy develop, since these would require extra time off unrelated to the pregnancy.

PRESENT VALUE

Present value (PV) is an accounting term meaning the value today of some amount of money expected to be available one or more years in the future. Since money in the future cannot be immediately invested today (and is subject to decreased values caused by inflation), it is not worth as much as a present value. One hundred dollars invested for a year at a 10 percent rate of return per annum will earn $10, hence will be worth $110 next year. This relationship can be reversed. If Man A can get 10 percent interest on his money, then $100 paid to him a year from now will only be worth $90.91 today. This is known as the time value of the money.

The formula for calculating present value for any given year in the future is the following:

$$PV = FV \times (1 + dr) \wedge \text{-n}.$$

In this formula, PV stands for present value, and Future Value (FV) is the cash projected for one of the years in the future, while dr is the discount rate. The caret symbol stands for exponentiation; n is the number of years; the negative n is the negative value of the year. Year 1 is −1, year 2 is −2 and so on.

When present value is calculated for multiple years of projected income, two numbers in the formula would change. FV might be different from year to year, and n would be different for each year. The sum of the PVs calculated would be the present value of the entire stream. Assume that there are three future earnings of $5,000, $5,500, and $8,750..These values total $19,250. Now assume a discount rate of 15 percent. Using an Excel spreadsheet, a person could calculate the PV as follows:.

Enter the three future year values in column A, row 1 and the values of future earnings, beginning with $5,000, in column B, row 1. Next, enter the following formula into column C, row 1:

```
=B1*(1+0.15)^(-(A1-2007))
```

This formula in column C would now produce the present value of the first year. Replicating this formula in rows 2 and 3 would produce all the new values: $4,348, $4,159, and $5,753. These sum to $14,260. The present value of $19,250, using the 15 percent discount rate, is $14,260.

The technique described can also be applied to quarterly or monthly income streams. In those cases the n term would be smaller increments, and the discount rate would be for the shorter period. A 15 percent interest rate for a quarterly calculation would be 3.75 percent and shown as 0.0375.

USES OF PV

The present value calculation can be used to determine the value of a property today expected to earn at least the projected stream of cash flows in the future, or the amounts that must be invested today in order to reap desired sums at future dates.

A common use of present value calculations is to determine the value of a business an investor is thinking of acquiring. The investor is likely to have a certain fairly predictable return on his or her investments based on past experience. That value is used as the discount rate. The future cash earnings of the acquisition target are projected year by year, usually for a 10-year period and using various conservative assumptions based on the target's own history. A residual value for the 11th year is calculated, typically assuming that the business will be sold for five or six times its earnings.

The resulting series of annual cash flows are then reduced to present value using the investor's own rate of return. The annual results are summed. If this value is greater than or equal to the asking price, the acquisition might be desirable. Many other factors may be added in more complex formulas to take into account the rate of inflation, the predicted success of the business, changing values of assets, and interest from other sources. Finding the present value is still an important piece to these calculations, but is only a part of the whole that investors will look at.

Other terms related to present value are used when valuing companies or investments in projects. Net present value, or NPV, is a term used specifically to describe present value when a future value is subjected to a discount rate and present costs are factored in. This shows how much net profit the investment will make in present-day amounts. The internal rate of return is also closely connected with present value, but shows an annual rate of return for a project, taking into account future costs.

PRESS KITS

A press kit is a tool used by small businesses to accompany an important public announcement at the company's headquarters, at a hotel, or at a conference, for instance to which members of the press have been invited or where they may likely appear. Trade press usually cover a trade conference, for instance. Such conferences often boast a press room where the company's announcement can be posted.

A press kit (or media kit), as the very phrase implies, goes beyond press releases. It is essentially a company's calling card. Its elements include narrative materials (the press release being one); ancillary documentary items (such as statistics, resumes, and handbooks); photographs, company logos, and other visual materials suitable for reproduction by a magazine or newspaper; and CDs or DVDs that contain audio or video biographies of the company's business. Occasionally, it may be possible to provide product samples or miniatures to draw the attention of reporters. The business that endeavors to make a public announcement is well-served by creating a press kit that effectively communicates the company's desired image.

Luring press interest in the information age presents a unique challenge to small businesses. *PR Week* reported, "Look on any reporter's desk (or the floor, shelves, and trash bins around it), and you'll likely find more than one press kit. These staples of the PR world have evolved from single-sheet releases placed neatly into folders to major UPS deliveries with gifts, samples, and swag dressed up in sometimes clever, more often corny, packages." Small businesses are as capable as major companies of fashioning a press kit that passes muster. Whether a company wants to go all out or keep things modest and dignified will depend as much on the event as on the temperament and style of the company's ownership.

A small business typically makes announcements in an industry context or in the local community, such as the unveiling of a new facility, operational unit, or acquisition. Local press normally covers the latter since the business is creating genuine local news. If the announcement is directed at the trade itself, favorable treatment by the trade press is also reasonably assured if the announcement is not "manufactured news" of little value. Writing in *Policy & Practice*, Francis Solomon advises, "Don't lie, don't hide. Creating news rarely works; the business, however, should not be shying from contact with the press, even though much experience indicates that they'll probably get something wrong. But to err is human. If the business is not particularly gifted with individuals familiar with media relations or hype, the best approach to making a press kit is to play it straight but light: a sense of humor helps. Thus the package should be attractive, may even feature something

novel and eye-catching, but its contents should be factual and designed to help the recipient write an accurate and complete story."

A press kit should be assembled with the reporter's perspective in mind. What would a reporter need to write a story about an event if he knew nothing about it and fell asleep during the press conference? Reporters always look for unusual facets to make an ordinary story interesting to their readers. Interesting background is always helpful. Some companies have fascinating start-up stories. The company's headquarters building may have historic importance not generally known. The product or service may have a colorful inventor. The product may have novel and unexpected uses. Reporters generally write quickly and prefer to avoid follow-up calls to get facts right. No knowledge on the media's part must be assumed. For instance, emphasizing names of people always spelled wrong is a reasonable item to highlight in a press kit. If a business owner is named Quiglly, a bold, all-caps reminder that "QUIGLLY is spelled with A DOUBLE LL" is not out of place. Technical subjects should be explained in layman's language and, ideally, accompanied by diagrams. Phrases like "torque-resistant topography" or "PostScript-generating package" may be common parlance inside the company, but is more likely Greek to a reporter. All else being equal, carefully prepared, complete, factual, and interesting content will always win out over a clever package that is puzzling especially some days after an event.

Rising postal and shipping rates coupled with an economic downturn in 2008 and 2009 made sending out press kits a more costly enterprise, especially for small businesses. Companies are often able to negotiate a set price with a shipping service if it expects to send a certain number of packages within a given amount of time. However, technology has greatly improved small businesses' shipping costs. Press kits can now be sent electronically by e-mail or via file transfer Web sites. One PR firm decreased its monthly postage bill to $200 from $3,000 by switching to e-mail, according to the *Houston Chronicle.* Some companies have even abandoned paper press kits in favor of flash drives that are much cheaper to mail.

Follow-up is crucially important when sending out a press kit. Sufficient time should be scheduled for a press kit to be mailed, received, and finally reviewed by a reporter before a company event or announcement is made. About a week after mailing, it is generally suitable to call a reporter or media representative to confirm the press kit was received. Calling during the morning or early evening hours is most effective, as these are typically down times for reporters.

Press kits carry potential benefits beyond garnering media interest. Many companies use press kits to send to prospective clients, vendors, and investors. While the recipient may be different, the intention is the same: to garner interest in a business.

PRESS RELEASES

Press releases also known as news releases are brief, printed statements that outline the major facts of a news story in journalistic style. As part of its overall public relations effort, a small business may need to prepare press releases in order to disseminate new information about its products, services, operations, or other activities. A steady flow of news helps to make a small business more visible to the public and creates favorable interest in its activities.

Not all companies need press coverage. A company that provides services to distant corporate clients, for example, will have little need for it. However, many company's will benefit from press coverage and can generate such publicity by noting newsworthy events and producing press releases to announce them. Examples are promotions, transfers, retirements, or hiring of personnel or the negotiation of a new labor contract. Building new facilities, planning a major expansion, installing new equipment, or offering a new product are other newsworthy events that might occur in a small business. In addition, human interest stories might arise from the unusual hobbies or avocations of employees, the success of company-sponsored sports teams or events, or the company's participation in charitable or community activities. If a small business received an award or a visit from a celebrity, these events might provide impetus for a news story as well. In general, a newsworthy story should be timely, of general or human interest, and somewhat unusual.

PREPARING A NEWS RELEASE

In order to attract the attention of the media to anything but a vitally important story, a small business will probably have to prepare and send out a news release. Ideally, the news release will generate enough interest that the media will choose to cover the story. A news release may also be useful as a handout to provide basic information to reporters who come to cover a story.

The release itself should obey standard journalistic practice, be free of jargon, and communicate in a straightforward manner. Include a bold and short headline to grab the reader's attention. Headlines are often set in a larger font than the rest of the press release, and are sometimes followed by a subheadline to add "punch" to the press release. If a headline is going to appear in a search engine, keep the character count under sixty to allow the entire headline to appear. A dateline starts the text of the press release to indicate when and where it originated. The first paragraph should signal the essence of the story: who, what, when, where, why, and how. The remainder of the news release should provide supporting information, such as facts and figures or quotes from people involved, in most-important to least-important order. Many press releases include a final paragraph that provides background information on the company. Overall, a news release should be crisp and concise, never exceeding two pages in length, and similar to a newspaper article in content and style. It is important that a small-business owner find someone to write the news release who has a good command of language, grammar, and punctuation.

News releases should be typed on company letterhead and include the name and address of the company; its trademark or logo; the name, telephone number, and e-mail address of a contact person (usually the small-business owner, even if the job of preparing the news release is delegated to another person); the date; and the words "News Release." The importance and scope of the story determines where it should be sent. In most cases, it would be appropriate to send it to the business editors of the local print media. Sometimes sending it to local radio and television contacts might be appropriate as well. A small business can create a mailing list of relevant addresses, which can be found in media and trade journals and some reference books, to simplify the process. Some publications have begun accepting press releases online.

PRESS RELEASES IN THE AGE OF ELECTRONIC INFORMATION

The common press release has undergone several significant changes in recent years as the Internet has revolutionized the way news is delivered. The wide availability of online information allows average investors to receive business news at the same time as analysts and news services. While some investors have been able to use this instantaneous information to their advantage, it has also opened the door to some dubious practices. For example, many companies have been victimized by fake press releases issued by disgruntled former employees, unscrupulous investors, or competitors. Such "news" is usually intended to cause harm to the targeted company by convincing investors to sell its stock.

On the other hand, some companies have taken advantage of the technology to issue press releases of debatable merit, apparently with the intention of increasing their stock prices. "Once a relatively mundane communications device, a press release now has the might to dramatically drive the price of a stock," according to *Business Week*. "As a result, more companies are designing press releases with that goal in mind. But it's not just edgy or pushing-the-truth headlines from lesser-known companies that are designed to spike share prices. Stock analysts say established companies are also playing fast and loose with press-release language, especially those involving earnings reports. They may exclude entire unprofitable subsidiaries, or leave out key information such as certain losses in order to appear rosy to investors."

Some companies release information prematurely. They might for example, announce a planned merger or joint venture before the deal is completed, whereas others bombard the information highway with daily press releases in an attempt to keep their stocks in the minds of analysts and investors. "Apparently, some high-tech companies use press releases not only to inform the trade press but also to impress Wall Street analysts and business reporters and through them to impress investors who have no other way to get news because they don't read the trade press," Mark Ferelli noted in *Computer Technology Review*. In any case, the Securities and Exchange Commission (SEC) has begun taking notice of business news releases on the Internet. Experts recommend that investors look beyond companies' paid public relations efforts and review their filings with the SEC before making investment decisions.

Rising postal and shipping rates have prompted small-business owners to take a hard look at their methods for sending press releases. Since practically all media workers have e-mail addresses, it is now easier than ever for a small business to deliver a press release to a reporter or editor via e-mail. And like e-mail, Web transfer sites enable businesses to disseminate press releases to the media quickly. In addition to saving on postage, printing and labor expenses are minimized.

Some online services enable small-business owners to distribute press releases without necessarily contacting a reporter. Free or low-cost services like www.pitchengine.com

and www.webwire.com distribute press releases online to search engines, where they remain for about a month. Many of these services distribute press releases directly into the e-mail inboxes of thousands of reporters and editors, depending on the industry. Higher-cost services like www.prnewswire.com enable more detailed results. A small business should have a monitoring system to measure how well a press release performs (i.e., how many news items it generates). That can help an owner decide whether to stick with an online distribution service.

PRICE/EARNINGS (P/E) RATIO

The price/earnings ratio (P/E ratio, or sometimes called the "absolute P/E") is one of a number of measures used to assess the value of a company. The "price" component of the ratio is the stock price of the company. The "earnings" portion is the net income (income after tax) reported by the company per share. These two numbers are divided to get a ratio. For example, if a company's stock sold for $24 per share and the company reported earnings per share of $1.50, the company's P/E ratio would be 16. This is also sometimes referred to as a "multiple," in the sense that the price is, in this case, 16 times earnings. The ratio also means that investors are willing to pay $24 for $1.50 in earnings. The higher the multiple the higher investor enthusiasm for the stock is, for whatever reason. A high price paid for low earnings is, obviously, a more risky investment, but the investor has faith in the company.

It is important to understand that earnings per share typically comes from the previous four quarters of a company's performance. However, earnings per share can sometimes stem from analyst estimates of the coming four quarters. This is also called "projected" or "forward" P/E. Some investors eschew current P/E ratios since they rely on past results and instead focus on forward P/E ratios. Another lesser used version is the "relative" P/E, which compares the current P/E to a benchmark or range of previous P/Es over a course of time, such as 10 years. Relative P/E illustrates what percentage the current P/E comprises of past P/Es: investors usually use this ratio to compare current P/E to the highest value among previous P/Es. A relative P/E lower than 100 percent indicates the current P/E is lower than its past value; one that is more than 100 percent indicates it has surpassed its previous value. For instance, if a company's P/Es have ranged from 15 to 40 over the past 10 years and its current P/E is 25, then the relative P/E would compare the current value to the highest value among the past multiples (25/40, or 62.5 percent of the decade high).

The P/E ratio is often taken as a "hard" measurement because the stock price is determined by open bidding in a free market by investors assumed to be well-informed and the earnings are taken from the company's own books as reported to the public under the requirements of the securities laws. In reality, however, the price component of the ratio only partially reflects the actual value of the company. A certain and unmeasurable portion of that price is set by investor opinion and is therefore influenced by subjective perceptions based on information, lack of it, reputation, rumor, speculation, and the like. "High-flying" stocks, for instance, may have an exaggeratedly high P/E whereas very solid stocks may be "undervalued" and thus have relatively low P/Es. During the dot-com boom, then chief of the Federal Reserve, Alan Greenspan, spoke of "irrational exuberance" in the market one source of investor motivation. Economic swings can have a significant impact on P/E ratios. The recession of 2008 and 2009 shifted the way many analysts and investors looked at P/E ratios. "In a recession, if you look at trailing P/Es, then you'll often find lower values than if you look at forward P/Es. That's because trailing earnings don't yet reflect the impact of the recession, and forward earnings will often fall," wrote Selena Maranjian in the *Motley Fool*. "When you study companies, give forward P/Es some

consideration (while acknowledging that there's much more to undervalued stocks than just P/Es)."

For these reasons it is better to view the P/E ratio as, at least in part, a thermometer of *investor* confidence and *not* as a thermometer measuring a company's health. At the same time, the P/E ratio can directly affect the company's well-being too. With a high P/E a company has easier access to capital. A low multiple can deprive a company of investor support indeed can expose it to hostile takeovers if its value is not fully reflected in stock value.

For instance, a diversified, large, profitable producer of industrial machinery, components, and supplies (lubricants or abrasives, for example) may be trading at low multiples of earnings because it is serving a wide range of industries in the "traditional" categories of manufacturing. None of its product lines are "sexy" but all are producing high margins. The complexity and diversity of the company makes it difficult for stock analysts to overview or to value, and for this reason it is ignored and rarely makes anybody's "buy" list. The company's management has accumulated a lot of cash and is attempting to spend it on new properties, in part to make the company more "exciting" and thus to lift its stock. Stockholders are restless despite high dividends because the stock is not increasing in value proportional to the company's stellar performance. The management is deeply troubled by the company's P/E of 8, sometimes dipping to 7, even 6. Then the inevitable happens: another company, quite able to see the real value of this one, mounts a hostile takeover. The stock is underpriced, the company has a lot of cash, and the stockholders are likely to side with the attacker.

Another company, with a similarly low P/E ratio, may be quite clearly visible to the investor community. Its low stock valuation, and consequently low multiple, may be due directly to its shrinking share of the market, outdated product, and several failed acquisitions. In this case the P/E accurately reflects value, in the other case not. What is true of low ratios can also be true of high ones: management may be manipulating the news in order to inflate stock value; it may be fraudulently overstating revenues or may simply dazzle stock analysts and investors based on perceived but unsubstantiated trends. Also, often, the reason for the high ratio is fully justified in fact the high multiple may not even accurately reflect the stock's upward potential.

Sometimes, the way a company accounts for revenue can have a direct impact on its P/E ratio. In 2010 Apple announced it would account for iPhone sales immediately rather than over the course of a 2-year subscription. That singular accounting change was, according to some analysts, expected to drive down the company's forward P/E ratio considerably, thereby making it a more affordable stock to potential investors. In this case, a low multiple might indicate poor business performance. However, Apple boasted $40 billion in cash, 3 billion downloaded apps (mobile applications), and an aggressive international iPhone expansion. The moral is: understanding how a company accounts for revenue can help clarify its forward P/E ratio as well as its current value.

Not surprisingly, the literature on this subject is filled with analysis on what P/E means and how it should be read. The careful investor and analyst will look deeply into a company's operation and not simply at the tea leaves left over at the bottom of the cup. P/E is an excellent starting point for analyzing a company, or an industry, by comparing the ratios of its major participants. For instance, it is not helpful to compare the P/E ratios of a technology company and a utility company. More needs to be known to discover a company's true value.

PRICING

The pricing of goods and services is almost always determined by demand, which creates the market or confirms an offering as legitimate. In free market economies prices also tend to be controlled by competition, and for most businesses the cost of production and distribution also play an important role.

Pricing methods have evolved but still represent a ritualized and very slow-motion auction. Prices will rise or drop depending on demand. Demand will rise and fall depending on supply. But while this happens instantly in live auctions, it takes place almost imperceptively in normal commerce.

PRICING A GOOD

The price of a good or a service is its total cost for the seller plus a profit margin over and above this cost. The profit margin will depend on the strength of the demand and the intensity of the competition. Feedback is an important part of the process: the seller will attempt to reduce the cost as much as possible while attempting to maintain quality high enough still to command consumer interest, and prices change based on sales.

A good seller will be able to manage location and inventory well enough to create a reliable profit margin for all products sold. Common mistakes in pricing arise from misunderstanding competition or failing properly to account for overhead costs and consumer preference. A standard markup percentage model may fail when met by more efficient methods of production, so effective pricing methods embrace market changes as well as increased revenue. An experienced business will keep track of:

- Detailed and up-to-date knowledge of costs beyond the cost of the actual item, i.e., overhead cost and how it is changing. Increases in rent, salaries, benefits, utilities, and services should be noted.
- Product knowledge, including any service costs or additional work involved in the transaction.
- Careful and detailed estimating of technical and services sales, sometimes including quick studies and tests or visits and close inspections in order to understand jobs fully.
- Current knowledge of competitor pricing.
- A deep understanding of the product mix sold with special attention to that mix of products which carries the business. Some products produce revenue, while others attract customers but produce low profits, and certain products may neither attract customers nor produce long-term revenue and should be discontinued.
- Close and detailed knowledge of vendors' offerings to identify unusual opportunities.

PRICING STRATEGIES

Pricing itself is a form of communication, and many different strategies exist. Major categories include the following.

Cost-Plus Pricing. This is the standard method of pricing everything initially, as described above. It combines all direct costs, apportions overhead to each product, and then adds the necessary profit margin, providing a base on which to offer discounts or price increases.

Manufacturer's Suggested Retail Price. Many small businesses prefer to price their goods in accordance with the manufacturer's suggested retail price. In some cases this is forced on the business because the price is prominently printed on the packaging. Going below it is possible, but going above it is almost impossible.

Price Bundling. This is the practice of giving the customers the option of buying several items or services for a single price. A furniture retailer might offer customers a sofa and love seat combination at a price somewhat lower than the two goods would cost if bought separately. Similarly, a landscaper might lure customers by offering 2 free months of lawn maintenance with any major landscaping job. Planning for bundled products should include expected changes in volume and inventory.

Multiple Pricing. Similar to price bundling, multiple pricing is the practice of selling multiples of a unit for a single price two for the price of one, ten for $15 and so on. This is most typically used for low-budget items.

Competitive Pricing. Some small-business owners choose to base their own prices on the prices of their principal competitors. Prices should be compared with businesses of similar size and distribution areas. This model can be difficult to follow in industries where market share and pricing strategies are highly valued.

Pricing Above Competition. Prices are typically set above industry standards among demographics that can either afford to pay higher premiums or have no other choice. Luxury items can be marked up to include additional service benefits, known as prestige pricing, while low-budget items can be priced higher than average in areas where consumers have little other choice due to transportation or availability.

Pricing Below Competition. Pricing below competition is a practice more commonly used by large corporations with tremendous amounts of purchasing power than small businesses. With high enough sales a large company can offset the lower profit margin with a larger volume of products sold. Small businesses tend only to use this model via competitive pricing.

Price Lining. Companies that engage in this practice hope to attract a specific segment of the community by

only carrying products within a specified price range. Here, again, very high-end retail (Cartier, Tiffany & Company) and very low-end (Dollar stores) ultimately use the same strategy. Advantages sometimes accrued through price lining practices include reduced inventory and storage costs, ease of merchandise selection, and enhanced status or large volume.

Odd Pricing. Odd pricing is used in nearly all segments of the business world. It is the practice of pricing goods and services at prices such as $9.95 rather than $10 or $79.99 rather than $80, because of the popular psychological tendency to consider the price significantly lower based on dollar amounts instead of cents. Alternatively, there may be some situations where pricing with zeros is more effective: people tend to associate flat prices such as $50 with quality.

Anchor Pricing. Anchor pricing is used by businesses establishing a new product line or giving prices to new customers. It refers to the practice of basing prices on the original or market price. If a small business is selling an independent good, then anchor pricing would dictate choosing the highest price of the more commercially available type of that good, and lowering that price by 15 percent. There are other strategies based on existing or first-named prices.

Multiple Payments. Multiple payment pricing breaks up larger prices for the customer, allowing them to pay in segments over time. This strategy serves two functions: it attracts new customers who are interested in only having to pay a quarter or less of the price to secure the good, and it reminds consumers of the deal they are getting with every subsequent payment.

Decoy Pricing. Decoy pricing is a common tactic used among businesses that offer estimates or services. A first price is listed for an inferior product or service, with the expectation that the consumer will refuse. A second price for a much better item is then used so that the consumer, impressed by the change in quality, will be more likely to buy the item at a higher price.

Penetration Pricing. Penetration pricing is typically only used by larger businesses that have the profits to be able to control their prices in the short term. A business lowers all prices for a product line substantially when it hits the market. (Other businesses, in the face of a strong competitor, may or may not follow suit.) The lowering of prices creates a large amount of sudden interest, and establishes the presence of the company in the market. Once a firm market share has been gained, the company raises the price again to a level where it can make a profit.

Skimming Pricing. Skimming pricing is the inverse practice of penetration pricing. A company drastically raises prices in order to convince consumers that their product is actually subject to prestige pricing and is worth extra money due to inferred value. The company then lowers the price again, and the consumers feel that they are getting a good deal on an item that should be worth more.

Value-Based Pricing. The concept of value-based pricing centers around exploring value from the eyes of the customer. This allows small businesses to adjust prices based not on costs but on the perceived value that their products and services have. Often, a small business will find that it can charge a higher price for its items than market conditions and competitor levels indicate. Many customers may prefer paying more for the convenience of local service. Small businesses can offer added features or flavor unique to the area that may hold more appeal to their consumer base.

REAL PRICE AND NOMINAL PRICE

For national accounting purposes, changes in prices for the same goods or services are calculated by using the Consumer Price Index (CPI), prepared and published at monthly intervals by the Bureau of Labor Statistics. CPI is calculated by systematically pricing goods and services in the dollars of the day, the actual dollars charged. This is then labeled the "nominal price." The current nominal price is compared with earlier recordings to calculate inflation and real prices of goods historically, with inflation mathematically removed from consideration.

RAISING PRICES

Small-business owners are often reluctant to raise prices once a good baseline price has been established. They worry that a price increase will alienate customers and drive them to the competition. However, owners who try to stall price increases lower the value of their products and gradually lose profit margin as overhead costs increase due to inflation and other market forces. Consumers tend to regard underpriced products with suspicion in a market that has moved beyond those price levels.

When price increases are implemented gradually and cautiously, small businesses should be able to maintain their customer base by focusing on quality, degree of service, and extra features. Effective small businesses will be able to explain the reasons for a price increase to customers and will be able to plan for a certain amount of discounts or allowances to keep large or loyal customers.

PRICE WARS

Price wars are common among small businesses where local competitors are present. One business lowers its prices, which starts a cascading effect where similar businesses

begin to lower their prices and become trapped in a reverse bidding war to try and appeal to consumers. A small-business owner should stay out of price wars whenever possible. Price wars can waste time with frequent new advertising and money due to lower profit margins and increased advertising costs.

A more effective strategy would be to focus on a quality that adds value to the products so that price levels can be maintained. A small-business owner may offer additional services, extra deals, or new features in order to justify keeping prices steady and avoiding the detrimental effects of a price war.

PRIVATE LABELING

Private labeling is a growing trend whereby manufacturers produce goods that carry the names or labels of the stores in which they are offered. Private-label products, also known as "store brands," were originally introduced as low-price alternatives to high-priced brands and are used to build loyalty to stores that have plenty of brand identity of their own (e.g., Kroger, CVS, Rite-Aid, and many others). Sometimes the manufacturer produces solely for the private-label market, distributing the same product with unique labels for different retailers; sometimes the manufacturer has a well-known brand of its own but sells a portion of its production under a private label. When a product is sold under an established brand *and* under one or more private labels, the only real difference between the two is that the branded product carries all the costs of brand promotion and the private-label product carries no such costs at all. The two products, of course, will have slightly different packaging for differentiation. Private-label products, for this reason, initially emerged as a way of exploiting a cost differential. They are typically sold at prices below that of their brand-bearing counterparts, with some variations. Thus the private-label product may be indistinguishable, somewhat inferior, or possibly even superior to a branded equivalent. Packaging in the past has ranged from deliberately unattractive to deliberately eye-catching, including imitations of the leading brand with which a product competes.

Private labeling emerged in the 1980s, ranging from versions carrying store labels to so-called generics, which came in bland, usually white packaging. The latter included canned goods bearing the product identification and labeling, but no brand whatever, on white wrappers. The recession of the late 1980s helped to establish this new category. It continued to thrive even as the economy rebounded in the 1990s, and it showed strong growth through the end of the twentieth century. During the recession of 2008 and 2009, private label products became even more important to cost-conscious consumers. Staples such as bread, meat, and cheese saw significant sales gains as private label products since buyers do not perceive much of a difference between them and higher-cost, branded products.

Businesses can use private labeling to their advantage during economic downturns. Retailers such as Kohl's, Tesco, and Zara actually added to their bottom lines during that particular recession by offering lower-priced private-label items. The world's five largest retailers reported increases in store brand sales in 2008. For Tesco, private labels accounted for half of sales and three-quarters of company profits. Likewise, nearly 80 percent of retailers reported boosting the percentage of private label goods on their shelves between 2006 and 2008. Store brand sales additionally counted for 30 percent of U.S. retail sales, and as much as 50 percent in the United Kingdom and other European countries.

As private labeling increasingly becomes the norm, a number of issues have crept to the fore. One is a lack of control over sourcing. While businesses once relied heavily on low-cost country sourcing, the recession of 2008 and 2009 forced many to reevaluate the sourcing policies and scrutinize overseas sources as well as domestic ones. Product recalls and contamination scares have also prompted

companies to be more diligent in considering consumer risk in the products the source for potential store-brand sale. Compliance has become a key attribute of many retailers' sourcing operations.

QUALITY AND PRICE

Quality is important, but, as Jill Rivkin points out in *Private Label Buyer*, price remains the most important factor. "When asked to rank the private label attributes of price, quality and package design in order of importance," Rivkin writes, "about 60 percent of primary grocery shoppers surveyed put quality in the top spot. But just moments later, when asked if they would purchase a private label item only if there is a significant price difference between it and the comparable national brand item, 64.7 percent agreed."

Although private labeling is widespread and can be found in most consumer categories (ranging from plastic sacks to lawnmowers), it tends to dominate the grocery and drugs and sundries categories. Major retailers exploit the possibilities of private labeling by fusing low-price store branding and store identity into a promotional approach that builds store loyalty. Thus in advertising and in issuing coupons, higher discounts are offered for store-branded items in order to attract and to keep customers.

Private Labeling and Small Business. Producing for the private label market has been a valued strategy by small businesses in the medium-size category, especially those with established recognized brands of their own in grocery categories (e.g., preserves, sauces, condiments, etc.). Plant expansions can be rationalized by adding a substantial private-label production run. A certain size is necessary because private-label distribution must satisfy a mass market. Distributing privately labeled products to many small stores, each requiring unique labeling, packaging, and low pricing, makes the approach less than cost-effective.

Some small businesses look for exclusive opportunities to satisfy a large private-label market by producing a regional supply of some product that meets all the specifications of the buying retailer. Whatever the strategy, small businesses can be just as effective at developing and monetizing private-label products by following a few key best practices:

1. Design/specification This early stage sees merchants collecting product data such as description, target price, and target margin. The product specification includes all requisite images, test criteria, and legal requirements necessary to sell the product. Establishing internal quality standards can make the overall sourcing process more effective and efficient, according to *CIO* magazine.
2. RFQ and quotation Businesses use product specifications to send out requests for proposal (RFQs) to potential manufacturers. Interested suppliers can accept, decline, or propose an altered version of a proposal. A business can then collect proposals to analyze the one that best meets its criteria.
3. Order visibility When a company signs a contract with a manufacturer, a series of key activities should ensue. Sampling, testing, production, and shipping each comes with its specific tasks and necessary approvals, according to *CIO*. Ensuring these processes are visible to both the retailer and the manufacturer gives all parties special insight into a project. New Web technologies are additionally enabling buyers and manufacturers to handle multiple processes at once.
4. Logistics visibility Once a product nears completions, a retailer should examine how it will be transported, handled for customs, and warehoused. Including supporting documents with each shipment will help avoid potential delays.

PRIVATE PLACEMENT OF SECURITIES

Private placement occurs when a company makes an offering of securities to an individual or a small group of investors. Since such an offering does not qualify as a public sale of securities, it does not need to be registered with the Securities and Exchange Commission (SEC) and is exempt from the usual reporting requirements. Private placements are generally considered a cost-effective way for small businesses to raise capital without "going public" through an initial public offering (IPO).

ADVANTAGES AND DISADVANTAGES

Private placements offer small businesses a number of advantages over IPOs. Since private placements do not require the assistance of brokers or underwriters, they are considerably less expensive and time-consuming. In addition, private placements may be the only source of capital available to risky ventures or start-up firms.

A private placement may also enable a small-business owner to handpick investors with compatible goals and interests. Since the investors are likely to be sophisticated business people, it may be possible for the company to structure more complex and confidential transactions. If the investors are themselves entrepreneurs, they may be able to offer valuable assistance to the company's management. Finally, unlike public stock offerings, private placements enable small businesses to maintain their private status.

There are also a few disadvantages associated with private placements of securities. Suitable investors may be difficult to locate, for example, and may have limited funds to invest. In addition, privately placed securities are often sold at a deep discount below their market value. Companies that undertake a private placement may also have to relinquish more equity, because investors want compensation for taking a greater risk and assuming an illiquid position. It can also be difficult to arrange private placement offerings in multiple states.

Despite the potential drawback, in the twenty-first century private placements have enjoyed explosive growth. This increase has consequently resulted in placing some risky securities in investors' hands. Likewise, private placements have come under increased federal scrutiny in recent years. The Financial Industry Regulatory Authority (FINRA) ramped up its investigation in response to a growing number of fraudulent private placements. In 2010 the authority exiled Provident Asset Management from the securities industry for selling fraudulent private placements worth $485 million through an affiliate in what was considered a Ponzi scheme. Another firm, Medical Capital Holdings, was charged with fraud by the SEC in the sale of $77 million in private placements. One Northern California investment advisor was arrested and charged the same year for bilking more than 2,000 investors out of at least $200 million in fraudulent private placements, according to *The Press Democrat*.

"There is nothing inherently wrong with private placements," wrote Jane Kim in the *Wall Street Journal*. "Many companies whose securities have lost value recently were simply victims of the recession." However, because of the scarce oversight paid to private placements, Kim noted that investors should use caution. Potential investors can call their state securities regulator to learn whether an issuer, brokerage, or individual seller of a security is licensed or has a history of infractions. FINRA's BrokerCheck service (www.finra.org/brokercheck) further lists the disciplinary records of FINRA-registered brokers. Congress has endeavored to require closer SEC review of private placement filings within a certain period of time before they are offered to investors. State regulators have also lobbied for more power in scrutinizing such filings.

RESTRICTIONS AFFECTING PRIVATE PLACEMENT

The SEC formerly placed many restrictions on private placement transactions. For example, such offerings could only be made to a limited number of investors, and the company was required to establish strict criteria for each investor to meet. Furthermore, the SEC required private placement of securities to be made only to "sophisticated" investors those capable of evaluating the merits and understanding the risks associated with the investment. Finally, stock sold through private offerings could not be advertised to the public and could only be resold under certain circumstances.

In 1992, however, the SEC eliminated many of these restrictions in order to make it easier for small companies to raise capital through private placements of securities. The rules now allow companies to promote their private placement offerings more broadly and to sell the stock to a greater number of buyers. It is also easier for investors to resell such securities. Although the SEC restrictions on private placements were relaxed, it is nonetheless important for small-business owners to understand the various federal and state laws affecting such transactions and to take the appropriate procedural steps. It may be helpful to assemble a team of qualified legal and accounting professionals before attempting to undertake a private placement.

Many of the rules affecting private placements are covered under Section 4(2) of the federal securities law. This section provides an exemption for companies wishing to sell up to $5 million in securities to a small number of accredited investors. Companies conducting an offering

under Section 4(2) cannot solicit investors publicly, and the majority of investors are expected to be either insiders (company management) or sophisticated outsiders with a preexisting relationship with the company (professionals, suppliers, customers, etc.). At a minimum, the companies are expected to provide potential investors with recent financial statements, a list of risk factors associated with the investment, and an invitation to inspect their facilities. In most respects, the preparation and disclosure requirements for offerings under Section 4(2) are similar to Regulation D filings.

Regulation D, which was adopted in 1982 and has been revised several times since, consists of a set of rules numbered 501 through 508. Rules 504, 505, and 506 describe three different types of exempt offerings and set forth guidelines covering the amount of stock that can be sold and the number and type of investors that are allowed under each one. Rule 504 covers the Small Corporate Offering Registration, or SCOR. SCOR gives an exemption to private companies that raise no more than $1 million in any 12-month period through the sale of stock. There are no restrictions on the number or types of investors, and the stock may be freely traded. The SCOR process is easy enough for a small-business owner to complete with the assistance of a knowledgeable accountant and attorney. It is available in all states except Alabama, Nebraska, and New York.

Rule 505 enables a small business to sell up to $5 million in stock during a 12-month period to an unlimited number of investors, provided that no more than thirty-five of them are nonaccredited. To be accredited, an investor must have sufficient assets or income to make such an investment. According to the SEC rules, individual investors must have either $1 million in assets (other than their home and car) or at least $200,000 in net annual personal income for each of the past 2 years (or joint income with a spouse of $300,000 or more), while institutions must hold $5 million in assets. Finally, Rule 506 allows a company to sell unlimited securities to an unlimited number of investors, provided that no more than thirty-five of them are nonaccredited. Under Rule 506, investors must be sophisticated. In both of these options, the securities cannot be freely traded.

DISCLOSURE

Although the 1992 SEC revisions eliminated the requirement for companies to prepare a Private Placement Memorandum for investors, experts suggest that it is still a good idea. The memorandum should describe the business, provide background information on management, discuss the terms of the offering (including the number of shares available, the price, and the intended use for the funds), outline the company's capital structure before and after the sale of securities, disclose the opportunities and risks involved in the investment, and provide copies of financial statements. Overall, the level of disclosure should be consistent with applicable state and federal securities laws, as well as with the sophistication of potential investors and the complexity of the terms of the offering.

A series of documents known as subscription materials should also be included with the information sent to potential investors in a private placement transaction. Subscription materials consist of two major documents that investors sign to indicate their desire to subscribe to purchase the securities offered. One of these documents is the offeree and purchaser questionnaire, which asks for background information about the investor to determine his or her level of sophistication. The second document is the subscription agreement, which is a contract showing that the investor has reviewed the offering information, is aware of the risks involved, and wants to invest.

PRIVATIZATION

Privatization is the transfer of some property or activity from public to private control. In the international context privatization typically refers to the denationalization of government-run industries. In the United States the term is used to denote activities of local government; the word, however, occasionally occurs in policy debates at the federal level as well. When a function has been performed or a service delivered by government employees and is then contracted out to the private sector, the result is partial privatization because government continues to control the activity. Most "privatized" municipal functions are, in fact, *performed* by private sector companies but *controlled* by the government. Environmental functions like garbage collection, sewage treatment, and drinking water provision are increasingly privatized in this sense. Outright transfer of ownership to the private sector has also taken place, usually in the context of toll roads.

Control is a fundamental aspect of ownership. Government control over activities and property tends to increase in troubled times and decrease in good times. During a war, government frequently takes over industries by regulatory control. After the September 11, 2001, terrorist attacks on the United States, government took over airport security, for instance, presently managed by the Transportation Security Administration. When private initiative does not spontaneously supply necessary functions, government will get involved and perform the function; later it may hand it over. Major sewer systems were built and operated by government; space exploration continues to be dominated by government enterprise although private sector ventures have appeared.

Privatization is thus one phase in a broader spectrum of control and its relaxation in response to external stimuli. Privatization is similar to deregulation, another instance of government relaxing its grip over functions. Government's exercise of control and its opposite are ultimately sanctioned by the public will brought to expression in politics. Government involvement must be paid for by taxes (or, in recent history, by borrowing). The public is more or less willing to let go of some functions or services. Attempts to privatize Social Security, for instance, by the institution of "private accounts" have failed; so have initiatives to privatize public education by the mechanism of "vouchers." In other areas privatization has gone forward side by side with deregulations more or less continuously since the end of World War II. When such efforts falter or fail, reregulation is immediately in the news. Direct government control is the extreme form of regulation.

Promoters of privatization (and of deregulation) base their position on the greater efficiency of free markets and competition. They hold up consumer choice as a high value. But current events and history show that the population, expressing itself by means of government, will exert its power when it does not like the outcome of free-market choices. Thus in the early twenty-first century, sharp hikes in gasoline prices immediately led to demands for government intervention to control prices at the pump. In 2009, the administration of President Barack Obama stepped in to prevent the "Big Three" automakers General Motors, Ford, and Chrysler from falling into insolvency. Poor management decisions coupled with the effects of the recession pushed the automakers to the brink of closure, prompting the federal government to provide billions of dollars to save them. (Ford turned down the bailout offer and later found its way to profitability.) By providing a bridge loan to GM and Chrysler, the federal government effectively became a majority owner of both companies, thereby stripping them of their private status until they could once again function independently.

The federal bailout of these and other financial institutions was hotly debated in and out of Congress. Many citizens groups argued against using taxpayers' dollars to save failing companies; some economists insisted the bailout was necessary to save the larger American economic system; and executives at firms receiving federal assistance complained of too much government meddling.

AREAS OF PRIVATIZATION

Narrowly viewed, privatization has had its greatest impact at the local level as municipal services performed by city or township employees have been converted into operating contracts handled by the private sector. This activity has created opportunities for small business for many decades, primarily in solid waste collection and disposal, street repair, in recreational facility management like landscaping and groundskeeping services. In the 1990s and first decade of the twenty-first century, the operation of water and sewer systems was also privatized. Some cities, like Chicago, are strong proponents of privatization. In 2010 Chicago mayor Richard M. Daley suggested privatizing portions of McCormick Place, a municipal convention center, after the facility lost several key conventions. The "Windy City" previously privatized Chicago Skyway (toll road) and parking meters, both efforts that reaped billions of dollars in upfront fees to the city. Larger businesses have, of course, participated in this activity. They have taken on the

operation of ports from port authorities, have purchased toll roads or taken on their management and maintenance, and taken over entire functions like the construction and operation of recreational centers and water systems.

As *Public Works* magazine has pointed out, privatization, reaching back decades, has not been without controversy. "Some cities proclaim major cost savings and efficiency improvements through private ownership and/or operation of [systems]," the magazine says. "Other agencies, citizen groups, and public employees are less convinced of the long-term benefits of turning over control of public services to private entities." Citing a survey of 125 municipal decision makers conducted for the Malcolm Pirnie organization, *Public Works* noted the following: "When asked about the challenges they face, 23 percent of drinking water utility participants said they needed to improve business practices to face the 'threat from the private sector.' As to the benefits of privatization, 28 percent mentioned increased efficiency and 23 percent cost savings. Disadvantages included loss of control (39 percent), private companies' profit motive (18 percent), and financial disadvantages (18 percent)."

Joshua Kurlantzick, writing for *Entrepreneur* (and highlighting opportunities for small business) provides reasons for privatization. "With state and local governments desperately short of revenue," he wrote, "the privatization of public services is likely to increase at a faster pace."

Areas of greatest opportunity for small business, Kurlantzick noted, are drinking-water and wastewater management. "Many cities' water and wastewater systems are in dire straits, with pipes dating back 100 years. . . . Privatization allows city governments to have a contractor do the upgrade and manage the systems, often for far less, since private firms are given incentive-laden contracts that push them to work more cheaply, says Clay Landry, a principal at WestWater Research LLC, a water economics research firm in Laramie, Wyoming.

Postal Service. The recession of 2008 and 2009 prompted the federal government to take a harder look at what agencies might be privatized to save money. The U.S. Postal Service (USPS) became a particular target of scrutiny, as the postmaster general, Congress, and even the president took sides on the issue. The USPS suffered a net loss of $3.9 billion in fiscal 2009 and was headed toward a $7 billion loss a year later. Faced with such looming losses, the postmaster general offered a number of short-term fixes: eliminating Saturday mail delivery and ending annual prepayments to postal workers' health benefits among them. When asked about the theoretical privatization of the service, President Obama responded by saying that privatization of public services was a "bad idea most of the time." However, other industry observers suggested the opposite.

"Given the state of technology, privatization is probably the only long-term solution for the USPS. But it is so saddled with legacy costs that no investor would touch it," read an editorial in the *Washington Post.* "If Congress gives management the tools it needs to meet the crisis, and if management uses them effectively two big ifs, we admit the Postal Service will have a chance to get its house in order and one day attract private capital, as European postal services have done."

Looming Ahead: Education. Education is the largest public employer in the United States and enjoys substantial public support. The public does not view education as a consumable commodity, and for this reason it has thus far resisted the pressure to privatize it, although some observers foresee the intrusions of the free market into this realm as well. Governmental responses have thus far occurred chiefly at the state level where education is controlled. They have further been characterized by pressures to reduce costs, shifting the tax burden from property to general taxes, and gradually pushing up tuition for higher education. The advocacy of voucher systems which would, in effect, commodify public education by making it more portable has thus far not won much support. The No Child Left Behind legislation at the federal level (signed into law in January 2002) represents a pressure for measuring performance, seen by some as a preliminary step towards commercialization. Whether or not this sector will also yield to market forces is as yet difficult to discern. Advocates of making schools compete for students anticipate both reductions in costs and increases in educational achievement. However, all currently available models open for comparison, including very-high-achieving foreign systems, are publicly staffed and administered.

Private Privatization. A curious aspect of the private-public debate is that a very large component of private industry, whether measured in dollars or employment, is called "public." These are, of course, the publicly traded corporations operating under the regulatory oversight of the Securities and Exchange Commission (SEC). When privately held corporations offer their stock for trade on open markets, they are "going public." When a group of investors buys up a sufficiently large portion of the publicly traded stock (the percentage varies based on state incorporation laws), they can "take the company private" as well a form of privatization of the private sector. This normally happens as a stage in merger and acquisition activity in order to bring a company under control, transform it in various ways for example, by spinning off elements of it, prior to taking it public again. But the process is also becoming popular as a way of shielding corporations from federal oversight by the SEC, thus

escaping many costly and administratively onerous reporting and accounting requirements. Among such requirements is the Sarbanes-Oxley Act of 2002, passed by Congress to curb excesses revealed in the bankruptcy of Enron Corporation.

PRO FORMA STATEMENTS

Pro forma, a Latin term meaning "as a matter of form," is applied to the process of presenting financial projections for a specific time period in a standardized format. Businesses use pro forma statements for decision making in planning and control, and for external reporting to owners, investors, and creditors. Pro forma statements can be used as the basis of comparison and analysis to provide management, investment analysts, and credit officers with a feel for the particular nature of a business' financial structure under various conditions. Both the American Institute of Certified Public Accountants (AICPA) and the Securities and Exchange Commission (SEC) require standard formats for businesses in constructing and presenting pro forma statements; SEC rules require that, to avoid misrepresentation, companies issuing pro forma statements must also show the most comparable statement on the company's finances, prepared using Generally Accepted Accounting Principles (GAAP), alongside the pro forma statement.

As a vital part of the planning process, pro forma statements can help minimize the risks associated with starting and running a new business. They can also help convince lenders and investors to provide financing for a start-up firm. But pro forma statements must be based upon objective and reliable information in order to create an accurate projection of a small business's profits and financial needs for its first year and beyond. After preparing initial pro forma statements and getting the business off the ground, the small-business owner should update the projections monthly and annually.

USES OF PRO FORMA STATEMENTS

Pro forma statements are used for various purposes, including business planning, financial modeling, assessing the impact of changes, and for external reports.

Business Planning. A company uses pro forma statements in the process of business planning and control. Because pro forma statements are presented in a standardized, columnar format, management employs them to compare and contrast alternative business plans. By arranging the data for the operating and financial statements side by side, management analyzes the projected results of competing plans in order to decide which best serves the interests of the business.

In constructing pro forma statements, a company recognizes the uniqueness and distinct financial characteristics of each proposed plan or project. Pro forma statements allow management to:

- Identify the assumptions about the financial and operating characteristics that generate the scenarios.
- Develop the various sales and budget (revenue and expense) projections.
- Assemble the results in profit and loss projections.
- Translate these data into cash-flow projections.
- Compare the resulting balance sheets.

- Perform ratio analysis to compare projections against each other and against those of similar companies.
- Review proposed decisions in marketing, production, research and development, and assess their impact on profitability and liquidity.

Simulating competing plans can be quite useful in evaluating the financial effects of the different alternatives under consideration. Based on different sets of assumptions, these plans propose various scenarios of sales, production costs, profitability, and viability. Pro forma statements for each plan provide important information about future expectations, including sales and earnings forecasts, cash flows, balance sheets, proposed capitalization, and income statements.

Management also uses this procedure in choosing among budget alternatives. Planners present sales revenues, production expenses, balance sheet and cash-flow statements for competing plans with the underlying assumptions explained. Based on an analysis of these figures, management selects an annual budget. After choosing a course of action, it is common for management to examine variations within the plan.

If management considers a flexible budget most appropriate for its company, it would establish a range of possible outcomes generally categorized as *normal* (expected results), *above normal* (best case), and *below normal* (worst case). Management examines contingency plans for the possible outcomes at input/output levels specified within the operating range. Since these three budgets are projections appearing in a standardized, columnar format and for a specified time period, they are pro forma.

During the course of the fiscal period, management evaluates its performance by comparing actual results to the expectations of the accepted plan using a similar pro forma format. Management's appraisal consists of testing and retesting the assumptions upon which management based its plans. In this way pro forma statements are indispensable to the control process.

Financial Modeling. Pro forma statements provide data for calculating financial ratios and for performing other mathematical calculations. Financial models built on pro forma projections contribute to the achievement of corporate goals if they: 1) test the goals of the plans; 2) furnish findings that are readily understandable; and 3) provide time, quality, and cost advantages over other methods.

Financial modeling tests the assumptions and relationships of proposed plans by studying the impact of variables in the prices of labor, materials, and overhead; cost of goods sold; cost of borrowing money; sales volume; and inventory valuation on the company in question. Computer-assisted modeling has made assumption testing more efficient. The use of powerful processors permits online, real-time decision making through immediate calculations of alternative cash-flow statements, balance sheets, and income statements.

Assessing the Impact of Changes. A company prepares pro forma financial statements when it expects to experience or has just experienced significant financial changes. The pro forma financial statements present the impact of these changes on the company's financial position as depicted in the income statement, balance sheet, and the cash-flow statement. For example, management might prepare pro forma statements to gauge the effects of a potential merger or joint venture. It also might prepare pro forma statements to evaluate the consequences of refinancing debt through issuance of preferred stock, common stock, or other debt.

External Reporting. Businesses also use pro forma statements in external reports prepared for owners (stockholders), creditors, and potential investors. For companies listed on the stock exchanges, the SEC requires pro forma statements with any filing, registration statements, or proxy statements. The SEC and organizations governing accounting practices require companies to prepare pro forma statements when essential changes in the character of a business' financial statements have occurred or will occur. Financial statements may change because of:

- Changes in accounting principles due to adoption of a generally accepted accounting principle different from one used previously for financial accounting.
- A change in accounting estimates dealing with the estimated economic life and net residual value of assets.
- A change in the business entity resulting from the acquisition or disposition of an asset or investment, or the pooling of interests of two or more existing businesses.
- A correction of an error made in a report or filing of a previous period.

Management's decision to change accounting principles may be based on the issuance of a new accounting principle by the Financial Accounting Standards Board (FASB); internal considerations taking advantage of revised valuations or tax codes; or the accounting needs of a new business combination. By changing its accounting practices, a business might significantly affect the presentation of its financial position and the results of its operations. The change also might distort the earnings trend reported in the income statements for earlier years. Some examples of changes in accounting principles might include valuation of inventory via a first-in, first-out

(FIFO) method or a last-in, first-out method (LIFO), or recording of depreciation via a straight-line method or an accelerated method.

When a company changes an accounting method, it uses pro forma financial statements to report the cumulative effect of the change for the period during which the change occurred. To enable comparison of the pro forma financial statements with previous financial statements, the company would present the financial statements for prior periods as originally reported, show the cumulative effect of the change on net income and retained earnings, and show net income on a pro forma basis as if the newly adopted accounting principle had been used in prior periods.

A change in accounting estimates may be required as new events occur and as better information becomes available about the probable outcome of future events. For example, an increase in the percentage used to estimate doubtful accounts, a major write-down of inventories, a change in the economic lives of plant assets, and a revision in the estimated liability for outstanding product warranties would require pro forma statements.

THE SEC FORMAT

The SEC prescribes the form and content of pro forma statements for companies subject to its jurisdiction in circumstances such as the above. Some of the form and content requirements are:

1. An introductory paragraph describing the proposed transaction, the entities involved, the periods covered by the pro forma information, and what the pro forma information shows.
2. A pro forma condensed balance sheet and a pro forma condensed income statement, in columnar form, showing the condensed historical amounts, the pro forma adjustments, and the pro forma amounts. Footnotes provide justification for the pro forma adjustments and explain other details pertinent to the changes.
3. The pro forma adjustments, directly attributable to the proposed change or transaction, which are expected to have a continuing impact on the financial statements. Explanatory notes provide the factual basis for adjustments.

With the passage of the Sarbanes-Oxley Act of 2002, modifying accounting and disclosure statements, the SEC has begun issuing new requirements related to pro forma statements. Most specifically, the SEC has found that pro forma statements, which are not required to follow GAAP, may give a false impression of the company's actual financial status. For this reason, the SEC requires that all pro forma statements be accompanied with forms that *do* conform to GAAP; the company is required to select those versions of formal statements most closely resembling the pro forma.

Pro Forma Statements for Changes in Entity and for Business Combinations. The FASB, the AICPA, and the SEC have provided significant directives to the form, content, and necessity of pro forma financial statements in situations where there has been a change in the form of a business entity. Such a change in form may occur due to changes in financial structure resulting from the disposition of a long-term liability or asset, or due to a combination of two or more businesses.

The purpose of pro forma financial statements is to facilitate comparisons of historic data and projections of future performance. In these circumstances users of financial statements need to evaluate a new or proposed business entity on a basis comparable to the predecessor business in order to understand the impact of the change on cash flow, income, and financial position. *Pro forma adjustments* to accounting principles and accounting estimates reformat the statements of the new entity and the acquired business to conform with those of the predecessor.

Occasionally, a partnership or sole proprietorship will sell all or part of the business interest. Sometimes it is necessary, especially if the business is "going public," to reorganize into a corporation. The financial statements of a corporation with a very short history are not helpful in a thoughtful analysis of future potential. Similarly, because of the differences in federal income tax liabilities, a restatement of the predecessor business in historical terms only confuses the picture. Since the financial statements of the predecessor business do not contain some of the expense items applicable to a corporation, the pro forma financial statements make adjustments to restate certain expenses on a corporate basis. In particular these would include:

- Stating the owners' salaries in terms of officers' salaries.
- Calculating the applicable federal taxes on the predecessor business as though it were a corporation.
- Including corporate state franchise taxes.
- Adding the balance of the partners' capital to contributed capital in the combined company rather than to retained earnings for partnerships acquired through the pooling of interests.

Subchapter S corporations exercise the tax option of the shareholders to individually assume the tax liability rather than have it assumed by the corporation as a whole. If the shareholders choose to go public or change their qualifications, the corporation loses the tax option. Therefore, in addition to the pro forma statement showing historical earnings, the new company will make pro

forma provision for the taxes that it would have paid had it been a regular corporation in the past. When acquisition of a Subchapter S corporation is accomplished through the pooling of interests, the pro forma financial statement may not include any of the retained earnings of the Subchapter S corporation in the pooled retained earnings.

When presenting the historical operations of a business previously operated as a partnership, the financial information is adjusted to bring the statement in line with the acquiring corporation. Historical data listed in these instances includes net sales; cost of sales; gross profit on sales; selling, general, and administrative expenses; other income; other deductions; and income before taxes on income. Pro forma adjustments would restate partnership operations on a corporate basis, including estimated partnership salaries as officers and estimated federal and state taxes on income, as well as pro forma net income and pro forma net income per share. Accountants make similar adjustments to pro forma statements for businesses previously operated as sole proprietorships and Subchapter S corporations.

Acquisition or Disposal of Part of a Business. For a company that decided to acquire part of a new business or dispose of part of its existing business, a meaningful pro forma statement should adjust the historical figures to demonstrate how the acquired part would have fared had it been a corporation. Pro forma statements should also set forth conventional financial statements of the acquiring company, and pro forma financial statements of the business to be acquired. Notes to the pro forma statements explain the adjustments reflected in the statements.

A pro forma income statement combines the historical income statement of the acquiring company and a pro forma income statement of the business to be acquired for the previous 5 years, if possible. Pro forma adjustments exclude overhead costs not applicable to the new business entity, such as division and head office expenses.

The purchase of a sole proprietorship, partnership, Subchapter S corporation, or business segment requires pro forma statements for a series of years in order to reflect adjustments for such items as owners' or partners' salaries and income taxes. In this way, each year reflects the results of operations of a business organization comparable with that of the acquiring corporation. However, the pro forma statements giving effect to the business combination should be limited to the current and immediately preceding periods.

SUMMARY

Pro forma statements are an integral part of business planning and control. Managers use them in the decision-making process when constructing an annual budget, developing long-range plans, and choosing among capital expenditures. Pro forma statements are also valuable in external reporting. Public accounting firms find pro forma statements indispensable in assisting users of financial statements in understanding the impact on the financial structure of a business due to changes in the business entity, or in accounting principles or accounting estimates.

Although pro forma statements have a wide variety of applications for ongoing, mature businesses, they are also important for small businesses and start-up firms, which often lack the track record required for preparing conventional financial statements. As a planning tool, pro forma statements help small-business owners minimize the risks associated with starting and running a new business. The data contained in pro forma statements can also help convince lenders and investors to provide financing for a start-up firm.

PROBATIONARY EMPLOYMENT PERIODS

When hiring new employees, many employers use probationary employment periods to ascertain whether the new workers will be able to handle the duties and challenges associated with their new job. Such periods are intended to provide employers time to evaluate employees before making the job permanent.

Many consultants to small-business owners believe that probationary employment periods also sometimes known as trial periods can be quite useful to both entrepreneurs hoping to get a start-up off the ground and

established small-business owners seeking to maintain or increase their current level of success. As countless small-business owners and researchers will attest, the quality of a small company's workforce can mean the difference between business success and failure. Indeed, personnel costs (wages, benefits, training, etc.) are among the most expensive elements of business operations; this cost becomes multiplied if the business is saddled with a poor worker. Probationary periods, which can range from 2 weeks to 90 days in length, are simply meant to give the small-business owner the best possible chance of securing and retaining quality employees and releasing substandard employees without legal penalty.

As part of any probationary period, an employee would not have immediate access to most benefits with the exception of health benefits. The Health Insurance Portability and Availability Act provides that businesses offer immediate access to health insurance to incoming employees, probationary or not, under many circumstances. Meanwhile, an employee would have to graduate the probationary period in order to qualify for additional benefits.

Analysts do note, however, that companies that terminate probationary employees do not enjoy total protection from lawsuits. These terminated employees do have fewer legal rights than established workers, but they are not without recourse in certain situations. For example, the employment "at-will" doctrine that characterizes probationary periods is not a valid legal defense for employers if it can be proven that the work arrangement suggested that termination would only be made for cause. Business owners should consult with an attorney to minimize their exposure in this regard. On the other hand, employees sometimes fall prey to the misunderstanding that even though they have made it through their probationary period, their jobs are "safe." Another common error is that once an employee has successfully completed a trial period, the at-will employment relationship becomes modified so that the employer cannot fire him or her at will. In fact, employee lawsuits that are brought against employers for being fired after probationary periods are most often difficult to argue in court and subsequently dismissed. Nonetheless, labor attorneys have recently suggested that companies eschew the label "probationary" because it is so often misunderstood by employees. Instead, they advise alternative terms such as trial, introductory, provisional, or initial period.

ELEMENTS OF AN EFFECTIVE PROBATIONARY PERIOD

Business experts advise that small-business owners should take the following steps when implementing a probationary period with a new hire:

- Make sure that the specifics of the probationary period (length of probation, for instance) are explicitly stated in company guidelines.
- Make certain that the new employee is aware that he or she will be "on probation" for the specified period.
- Monitor how well the new employee executes assigned tasks, using quantitative measurements whenever possible.
- Monitor the new employee's work habits; for example, a new worker who is consistently tardy in arriving at work or returning from lunch may well be a cause for concern.
- Monitor how well the new employee gets along with supervisors/managers.
- Monitor how well the new employee gets along with fellow staff.
- Determine whether the new hire is a "self-starter," or one who needs continued guidance.
- Provide the new hire with feedback that will help him or her shape performance to business expectations; this will not only improve the likelihood of securing a good worker, but also provide the employer with possible legal protection in the event of an unfair dismissal legal action (documentation indicating a pattern of poor performance carries significant legal weight).

Of course, not every employee will be a superior one, and shortcomings in one (or even more) of the above areas does not necessarily mean that the employee should be let go. Factors such as availability of other workers and performance in critical areas usually have to be considered, and few companies are fortunate enough to be staffed entirely by workers of superior skills, excellent work habits, and healthy ambition.

In addition to new hires, probationary periods can be instituted for existing employees who receive a promotion or transfer. Companies often offer such opportunities based on merit or an employee's ability to do the job. In some cases, however, a company will allow an employee to return to his or her previous position if at any time during the probationary period it is determined that the current work assignment will not pan out. In other cases, existing employees who perform poorly can also be put on probation. This can come as a result of poor quality of work or a decline in the employee's interactions with colleagues, attendance, and punctuality. In instances such as these, probationary periods are often recommended after a performance review. Since no laws regulate the probation of at-will employees, appealing probationary decisions remains at the company's discretion. An employer may have a process in place for appealing probationary decisions or may be flexible in interpreting its policies during a probationary period.

Analysts indicate that new employees who perform poorly during probationary periods are rarely able dramatically to improve their performance after the trial period has ended. After all, if the worker did a bad job during a probationary period, when all parties were aware that performance would be monitored, why should the small-business owner believe that the worker's performance would improve at the conclusion of that trial period, when pressure to "be on one's best behavior" would presumably be relieved somewhat? Ultimately, business owners must decide for themselves whether an employee's performance during the trial period warrants continued employment.

PRODUCT COSTING

Product costing is the process of studying all the expenses associated with the production of a good or service, from the purchase of raw materials to final shipment. Product costing evolved during the second half of the twentieth century as more managers focused on optimizing production. Determining corporate profitability is generally achieved by tracking raw materials, labor, tooling, and energy inputs and adding them into production costs. Product costing simply drills down to provide a more granular view of expenses accrued during product development.

Product costing a certain item depends on specific variables. For instance, product costing a new car might vary depending on the types of components used and how much labor is used in applying them to the final product. Some parts might require more or less strength and heavier forgings, thereby requiring more or less machining. Some components might be attached mechanically, while others are welded. Such operations are measured in time and dollars. Product costing analyzes the inputs, labor, and materials to arrive at a net product cost minus scrap (in the case of a car). It additionally measures such factors as packaging, warehousing, and delivery to the buyer.

Product costing is a routine part of most large manufacturing operations, though it can be just as helpful to the small-business owner. Data from product costing provides important feedback used to identify ideal work flow, improve tooling purchases, and, ultimately, price goods. The level of detail can vary and usually is determined by the company's size. Even small businesses employ product costing to discern the costs associated with important product development functions

Product costing has also given rise to activity-based costing (ABC). ABC is based on the notion that costs arise in various *activities.* Management consulting group John Starks Associates defines it as a paradigm "based on the principle that it is not the products that a company produces that generate costs, but rather the activities that are performed in planning, procuring and producing the products. It is the resources that are necessary to support the activities performed during the course of business that result in costs being incurred. Product costs should therefore be calculated by determining the extent to which each product makes use of the activities being performed. Products 'consume' activities and activities 'consume' costs." ABC may be viewed as a more refined method for precisely capturing inputs associated with overhead functions such as engineering and design.

Mike Stevens offers a snapshot of the ABC approach at *AllBusiness.com.* The process accounts for:

- Materials costs   materials, including acquisition and handling costs.
- Unit cost   an accurate measurement of "touch labor" and machine hours. Barcode systems can effectively capture this data; timing actual operations several times over is another way to get an accurate unit cost.
- Batch cost   if, for instance, setup costs $400 and a company makes 5,000 units, setup adds ¢8 per part. That could mean the difference between a profit and loss. Stevens suggests including engineering costs in this number as well.
- Product cost   development hours for a standard product.
- Global costs   conventional indirect costs like utilities, managers' salaries, etc.

"ABC is a controversial topic among accountants, and switching to ABC can be complex if you buy into every detail of the theory, start using the new terminology, and so on," warns Stevens. "At its core, the ABC approach to costing is nothing more than aligning your pricing process to reality."

PROBLEMS OF MEASUREMENT

Product costing emphasizes capturing all costs, including nebulous ones. This partly explains the growing popularity of ABC. In the production process, measurement is relatively easy, even if the process is complex. Purchasing raw materials, for instance, includes the costs of developing good supplier relations, which is difficult to measure and apply to individual products. Warranty service, typically handled long after a sale, often is not factored in product costing, though it should be in many cases.

Product costing's level of detail will be more apparent in the course of operations. Very detailed product costing has a cost of its own namely, how the data will be utilized.

PRODUCT COSTING IN SERVICE OPERATIONS

Product costing services rather than goods is a different experience. The "product" of a sales consultancy may be a printed report to a client accompanied by a Microsoft PowerPoint presentation. Here, the real cost of the product will have little relationship to the costs of the tangible "deliverables." The business is actually selling information and judgments acquired by interviews, focus groups, data searches, reading, analysis, discussions, and consultations, some of which may have required extensive travel. The expense of those activities are all factored into product costing for the company's service. Another company might evaluate sites for hazardous waste and deliver its findings in the form of a report. Product costing in this case would include the work required to accomplish groundwater sampling and extensive searches of old real estate transactions. Likewise, a carpet cleaning business might include equipment and labor applied to cleaning a home's carpets in its own product costing process.

In most situations, product costing occurs in advance of the work. Good estimating is the difference between turning a profit or booking a loss. The principles that apply in product costing a good or service are identical. In services and manufacturing, accurate costing depends on subdividing the work carefully into its many categories, measuring time, materials, and services. In manufacturing, faulty products are rejected. In service work, there is wasted time, false starts, and other similar factors. The chief difference is that service activities almost never repeat exactly. Nevertheless, costing a service, like a product, can lead to greater operational efficiencies.

PRODUCT COSTING TEMPLATES

A number of software programs are available to the small-business owner hoping to engage in product costing. Many firms sell costing templates using Microsoft Excel database programs. Templates include dozens of product ranges or services, unit cost forecasts, and variables that forecast best, median, and worst-case cost scenarios, all saved in one Excel worksheet. Costing templates enable business owners more accurately to allocate overheads for calculating real product and divisional costs, contributions to profits, and for estimating and pricing data. Owners can thereby identify unprofitable products and cut out unproductive resources.

PRODUCT DEVELOPMENT

Product development is everything that occurs from the initial conception or invention of a product to its market launch. In the small business environment, product development tends to be many things; the process is likely to be more creative, sometimes chaotic, and may be carried out by a single individual or a small team. Small businesses rarely have new product managers or departments, so product development is closer to invention than to engineering and more likely to be led by a charismatic figure. Thomas Edison and Gabrielle "Coco" Chanel are two such inventors who embraced the concept of product development.

CONTEXT AND HISTORY

Product development is closely tied to creativity, invention, and insight, and often follows the flash of an idea. For instance, a knife is the culmination of some prehistoric

human's insight that a flat stone with one sharp edge followed by ages of product development.

According to Michael McGrath in his book, *Next Generation Product Development*, conscious focus on the *development* process began late in the nineteenth century. "Generations" of product development emphasis soon followed. The first, ending in the 1950s, focused on commercialization of inventions; the second generation formalized product development as a process, lasting until the 1980s. In the third generation of product development, corporate management focused on getting product to market faster. In the twenty-first century, according to McGrath, emphasis has shifted to R&D-based development.

The most dramatic and revolutionary product introduction of the latter half of the twentieth century did not obey the rules. The personal computer was slapped together by an inspired technical man, Steve Wozniak, and sold by a visionary entrepreneur, Steve Jobs. The Apple computer resulted from a product development process that saw Wozniak and Jobs agonizing together in a garage. They didn't even intend to sell computers   just mother boards. They "evolved" the product by trial and error.

The many inventions that followed small computers illustrates the unruly nature of the creative process. It cannot be reduced to a recipe, algorithm, or bureaucratic procedure. Many product development approaches exist side by side. As in gambling, no "system" guarantees success. Similarly, economic factors can positively or adversely impact product development. Like many small businesses, Brooklyn Park, Minnesota-based Octane Fitness saw its gross revenue slip 15 percent in 2009 compared to a year earlier owing to recessionary pressures. However, the small business's keen product development sense helped it end the year with a compound annual growth rate of 41 percent since 2003. Octane Fitness started with one product   an elliptical cross-trainer. That one model registered about $4.4 million in sales in 2003; 6 years and eleven more products later, the company tallied nearly $34 million in sales. A small business that can weather adverse economic conditions with solid product development processes will earn industry respect and the attention of investors, as did Octane Fitness.

BASIC ELEMENTS

Product development fuses different disciplines to meet a specific goal. The disciplines include design, engineering, manufacturing, distribution, market positioning, marketing, and sales. A company developing a product must envision every stage of the process backward from the perspective of the ultimate buyer and from design forward. The process can readily repeat itself.

For example, initial estimates are made using prototypes; the prototypes are used to envision manufacturing processes and to establish a price range based on estimated production cost. But exposing prototypes to customers may elicit suggestions for improvement or criticism of certain features; sometimes suggestions come from dealers or retailers. Market research often unearths reactions to competing products   or even their unsuspected presence. After this early exposure, flaws must be removed, advantages exploited, and competitive challenges met. Redesign, reengineering, and new production estimates may be required. Iteration can also come later as problems are encountered. Some element of the product may be too costly to produce, and the problem can only be overcome by changing the product. If the change is substantial enough, talking to customers becomes necessary again.

How much iteration is sensible? The answer depends on the ultimate size of the market and the projected product life. Company resources are also an issue. Most small businesses can only afford limited market research. The natural substitute is to consult the intuitive reactions of family and friends   in effect, to use a much smaller sample than a global company would.

Product development is typically led by a product manager assisted by a small team representing basic specialties: engineering, manufacturing, marketing, and finance. It is the responsibility of the team to interact effectively with their counterparts in the company to obtain services, estimates, and feedback.

PLANNING VERSUS CREATIVITY

A seesaw movement between formality and process and openness and innovation tends to occur in product development. Edward K. Bower writes in his book, *Specification-Driven Product Development*, "Small companies typically conduct their development programs in an informal, hit-or-miss fashion, intuitively managing the process on a day-by-day basis. After agreement has been reached on the general nature of the desired new product, its design begins. The detailed features of the product evolve as side effects of implementation decisions. As market considerations are discovered, changes are made to the product's goals, leading to redesign. This unpredictable process leads to schedule and budget overruns, and produces products whose structure wasn't coherently planned, but evolved as requirements changed."

Likewise, David M. Anderson advises in his book, *Design for Manufacturability & Concurrent Engineering*, "For creative product development, start with a creative, open-minded, receptive team that is stimulated by the challenge. The team should be diverse in knowledge as well as cultural and thinking styles. The team should be fired up. … Creativity is enhanced when people *really want* to invent something. … Do *not* start creative product development discussing administrative issues. … This will

immediately stifle creativity and shift attention to meeting deadlines and budgets."

Bower and Anderson seemingly emphasize opposite tendencies yet accurately highlight important aspects of product development. It requires the right mix of disciplined implementation and adaptive openness. Existing systems must be used to create a new product. This must happen as rapidly and as inexpensively as possible. Concentrated attention to process and detail and openness to possibilities are necessary for success.

NEW PRODUCT DEVELOPMENT FOR SMALL COMPANIES

As business experts, analysts, executives, and entrepreneurs all know, there is no one way to organize a company for effective new product development. Nonetheless, analysts point to several universal factors in determining whether a business will enjoy measurable success in new product development efforts. These include comprehensive market and cost analysis, top management commitment, enthusiasm among workers, clear lines of authority, and past experience. Concentration, funding, and leadership are key legs that hold up the structure.

Concentration. First, a small business needs to focus on its goals. Limited time and resources mean that hard decisions must be made and a strategic plan needs to be developed. Companies should "do the right things right" by using the best information available to choose the right technologies and decide on what new products to invest in. Growing companies are easily tempted to do too many things at once and finish none. Companies needing diversification are tempted to repeat the customary and therefore never establish that "second front" they need. Concentration on the goal will help keep the focus clearly on a well-thought out plan.

Small-business development centers (SBDCs) are an important resource for small businesses and start-ups looking to boost their product development skills. Partly funded by the Small Business Administration, SBDCs provide counselors, trainers, and researchers who help small-business owners distill the essence of their product development goals, often at little to no cost.

Equally important to knowing product goals is knowing the market. Thoroughly understanding the market in which to introduce a new product to is a critical prerequisite to product development. For instance, the environmental revolution of the early twenty-first century created many new product development opportunities for small businesses. The federal government began awarding grants to businesses to help fund new technologies and services aimed at meeting specific environmental needs. Many new products have resulted from the environmental push, such as pesticide spray drift-reduction technologies, remote pollutant sensors, urban runoff systems, and animal feeding pollution prevention systems.

Funding. Another key to new product development for small businesses is to secure the resources and skills needed to create and market the new product. Small companies may lack the in-house resources needed to create a new product, making it seem out of reach, but analysts note that small-business owners have other avenues that they can often pursue. If the product idea is good enough, the company may decide to look outside its own walls for partnership and outsourcing opportunities. Sometimes "funding" takes the form of assigning a highly talented person who knows the company well to the "new venture," although that person will be sorely missed in his or her leadership position. Federal grants are also available for product development projects in certain cases. For instance, the National Institute of Dental and Craniofacial Research offers small business grants for the development of new technology to improve orofacial health.

Leadership. The third and final pillar for building new products is to find the leadership needed to bring a new product from the idea stage to completed product. This leader will often take the form of a "product champion" who can bring both expertise and enthusiasm to the project. In small business environments, this product champion will often be the entrepreneur/owner himself. A strong product champion will be able to balance all the issues associated with a product   economic factors, performance requirements, regulatory issues, management issues, and more   and create a winning new product.

The product champion has to guide the project through a predetermined series of viability tests   checkpoints in the development process at which a company evaluates a new product to determine if the product should proceed to the next development stage. If it is determined that the market has shifted, or technology has changed, or the project has become too expensive, then the product must be killed, no matter how much money has already been poured into it. This is where a strong product champion makes the difference   he or she has to have the honesty and authority to make the call to kill the product and convey the reasons for that decision to the product development team. If goals were clearly defined, resources properly allocated, and leadership was strong, then the decision to kill a project should not be a difficult one.

LAUNCHING A NEW PRODUCT

Once the product-line architecture has been established and a new product is being developed, it is time for a company to think about how to successfully launch the product in its target market. This is the stage where an advertising or public relations agency can come into play, especially for small businesses without the internal resources

to handle such a job themselves. When using an outside agency to launch a product, a company should:

- Have a well-defined product concept (which is where product-line architecture comes into play).
- Provide the agency with background information on its products and goals.
- Conduct necessary patent research, applying for new patents as needed.
- Have the manufacturing process in place and ready to go, either internally or via outsourcing.
- Have a formal business plan in place that defines funding of the project.
- Determine who will approve the marketing or advertising plan that the agency creates (the fewer people communicating with the agency, the better).
- Determine the proper timing for the launch.

SPEED TO MARKET AND PRODUCT DEVELOPMENT

In today's technology-fueled business environment, the always-important speed-to-market factor has become perhaps the most critical factor in new product development. Improved communication (especially the Internet), increased globalization, and rapid changes in technology have put tremendous pressure on companies to get their product to market first. To improve speed-to-market, a company should first make sure that it is making the best possible use of available technology. If it is, there are other steps that can be taken to speed product development through efficient, market-oriented product planning that takes the customer into account.

SERVICE COMPANIES AND NEW PRODUCTS

Service companies should take a disciplined, analytical approach to developing new services, relying on targeted customer input just as companies outside the service sector do. Companies in the service industry know that they are competing for customers based on perceived value as much as actual price. If customers feel they are getting better treatment, or more service options, or more "free" services as part of their purchase, they are more likely to remain a client of that company. If, however, a company stops innovating and adding new services to its core business, the service becomes a commodity and clients look at only one thing price when deciding on what company to choose.

Service companies should routinely ask themselves a series of questions:

- Could current services be presented in a different way?
- Could they be offered to new customer groups?
- Are there little things that can be tweaked to freshen or update a service?
- Could services be improved or changed?

Because by their very nature services are easy to copy (no materials or product knowledge is needed), service companies actually face more pressure to innovate and develop new products than manufacturers. By continually asking the above questions and by following the same models manufacturing companies follow when pursuing product development, service companies can stay ahead of their competitors and make their services clearly identifiable to consumers.

PITFALLS TO PRODUCT DEVELOPMENT

Finally, when embarking on the product development process, business owners should try to remember in advance what the obstacles to success are. These pitfalls are many and varied, and can include:

- Inadequate market analysis.
- Inadequate cost analysis.
- Strong competitor reaction.
- Undue infatuation with the company's own technology and expertise.
- Overreaching to make products beyond the company's financial and knowledge grasp.
- Technical staff too attached to a project and too proud to admit defeat, even when a project can not be justified according to preestablished criteria.
- Problems with patent, license, or copyright issues.
- No real criteria for deciding if a project is good or bad.
- Changes in strategy at the corporate level are not conveyed to the product development team.
- Low product awareness.
- Money and staff allocated to a project are hidden in the budget of another project.
- Company decision makers blinded by the charisma or charm of the person presenting the new product idea.
- Project accepted on the basis of who gets it first.

PRODUCT LIABILITY

Product liability comprises a number of laws and court rulings that apply to any business that makes or sells a product. Businesses that make or sell products are responsible for ensuring that those products are safe and do not pose a hazard to the public. Such businesses can be held liable for any damage or harm their products might cause.

According to Section 102(2) of the Uniform Product Liability Act, product liability includes "all claims or action brought for personal injury, death, or property damage caused by the manufacture, design, formula, preparation, assembly, installation, testing, warnings, instructions, marketing, packaging, or labeling of any product." Product liability issues have become increasingly important to manufacturers and marketing managers, due to the spread of the doctrine of strict liability and the adoption of new theories that permit recovery in so-called delayed manifestation cases.

Because of their limited resources, small businesses must be particularly aware of their responsibilities under product liability laws. In addition to making safe products, this responsibility extends to prominently displaying warnings of any potential hazards on products and packaging. Experts recommend that small-business owners consult with legal counsel experienced in the product liability field. An attorney can help the small-business owner sift through the numerous federal and state laws that apply to different types of products. Small businesses are also encouraged to purchase product liability insurance. Unfortunately, the increasing number of lawsuits and large damage awards in this area have made such insurance very expensive and reduced the amount of coverage available. In fact, the expense of insuring against product liability has prevented small manufacturers from competing in certain product areas.

DEVELOPMENT OF PRODUCT LIABILITY LAWS

Product liability began to have meaning in the mid-1800s, when the U.S. courts increasingly found that sellers of goods had a "duty" to use reasonable care in the production of those goods. Sellers were held liable to third parties for negligence in the manufacture or sale of goods "inherently dangerous" (the danger of injury arises from the product itself, rather than from a defect in the product) to human safety, ranging from food and beverages to drugs, firearms, and explosives. In the early 1960s, tort principles were first applied to product liability. During this time, the concept of "inherently dangerous" goods was still held to be significant, but there was a shift to negligence (tort) principles that held that producers of goods were required to apply "due care" in the marketing of goods to users.

Since that time, businesses have operated under an understanding that because they knowingly market products which affect the interests of consumers, they owe a legal duty of caution and prudence to consumers. Since manufacturers may foresee potentially harmful product effects, they are responsible for attempting to minimize harm. Establishing this legal duty between the manufacturer and the consumer made it possible for plaintiffs to argue the negligent breach of that duty. These principles are now accepted throughout the country and followed by all U.S. courts. Eventually, the concept of "inherently dangerous" products fell into disuse and the concept of negligence was expanded beyond production to include labeling, installation, inspection, and design.

From time to time Congress has attempted to pass legislation to protect small business from heavy exposure to product liability suits and to ease their costs in purchasing product liability insurance. Attempts in this direction include the Small Business Liability Reform Act of 2001, the Product Liability Fairness Act of 1991, and the Product Liability Reform Act of 1998. No changes, however, have

been enacted. Instead, the scope of product liability continues to increase.

MAKING MANUFACTURERS LIABLE FOR SUPPLIERS

Legislation that was passed in the twenty-first century increases the obligation of businesses to sell and produce safe products. The Consumer Product Safety Modernization Act of 2008 was passed amid concerns about products made in China, mostly toys, containing lead or other toxins. This law raises maximum civil penalties for consumer product safety violations and allows state attorneys general to take civil action if residents of their states have been affected by consumer product safety violations.

"The law puts strict safety requirements on manufacturers and retailers of all sorts of consumer products, increases the penalty to $100,000 per violation, up from $5,000, and makes officers and directors criminally responsible for some violations," wrote Bryant Ruiz Switzky, for the *Washington Business Journal*. "Everyone, down to the retailer, is liable for problems that could happen all the way down the supply chain," noted Chuck Samuels at Mintz, Levin, Cohn, Ferris, Glovsky and Popeo PC for Switzky's article. Samuels continued, "Companies are going to have to spend a lot more time knowing who is supplying their products."

The The Consumer Product Safety Modernization Act is seen by many as overly broad and burdensome, and the Consumer Product Safety Commission is looking at possible adjustments to the law to improve compliance. "Manufacturers complain the law's requirements to test and certify children's products for lead and phthalates and attach permanent tracking labels on them are unreasonable and too costly for many small businesses," wrote Kent Hoover for the *Houston Business Journal*. It is quite likely that the 2010s will see numerous modifications in order to make the law more palatable and less costly for businesses while still retaining its core purpose.

ELEMENTS OF PRODUCT LIABILITY

Four elements must be present for a product liability case to be considered under the negligent tort principles:

- The particular defendant owes a duty to the particular plaintiff to act as a reasonably prudent person under the same or similar circumstances.
- There is a breach of such a duty by the defendant that is, a failure to act reasonably.
- There is an injury, including personal injury or property damage.
- There is a causal link between defendant's breach of duty and injuries sustained by the plaintiff.

The concept of negligence is applicable to every activity preceding a product's availability in the market. This encompasses everything from product design, the inspection and testing of materials, and the manufacture and assembly of the product to the packaging, the accompanying instructions and warnings, and the inspection and testing of the final product. Negligence can result from omission as well as commission failure to discover a flaw is as negligent as creating one. Similarly, failing to provide adequate warnings about potential dangers in the use of a product is a breach of duty.

However, it is often difficult to prove negligence in product liability cases. Defendants must only meet the general standards of reasonable behavior as judged against the behavior of a reasonably careful competitor who demonstrates the standard skills and expertise of the industry. In reality, a manufacturer must only show that "ordinary care under the circumstances" was exercised to avoid liability for negligence. This is easy compared to the task of consumers showing evidence to the contrary.

Many products, even the most ordinary, pose some level of risk, and the law recognizes that it is often not possible to design a totally safe product. However, manufacturers are legally obligated to warn consumers about known dangers. Manufacturers may be found negligent if:

- They fail to warn users about recognized or foreseeable risk.
- The warning is too vague or not sufficiently detailed to be adequate.
- The warning is not brought to the user's attention.

There is no duty to warn against misuse that is so rare or unusual that it cannot be foreseen. The obligation to warn consumers of potential dangers poses a unique difficulty for manufacturers who must not only provide warnings but must communicate them such that a reasonable person will find and understand them. In some cases a warning buried in a product's instructions may be judged inadequate; in other situations, a warning sticker on the product itself may be considered sufficient.

STRICT PRODUCT LIABILITY

The most recent evolution in tort law, strict liability, has transformed the very nature of product liability because it eliminates the entire question of negligence. Strict liability only requires a plaintiff to demonstrate that a product caused an injury because it was defective; the reason for the defect is irrelevant. The product itself, not the defendant's use, is under investigation.

Under strict liability, the manufacturer is held liable for allowing a defective product to enter the marketplace. The issue is a matter of public policy, not the manufacturer's

unreasonable or negligent conduct. The introduction of a defective product into the marketplace brings each member of the product's distribution channel into liability for negligence. The theory of strict liability holds that manufacturers: have the greatest control over the quality of their products; can distribute their costs by raising prices; and have special responsibilities in their role as sellers.

The tort of negligence at least provided a standard by which to make a case for negligence, although it imposed the added evidentiary burden of proving that the defendant was in fact negligent. Although strict liability eases those burdens for the plaintiff and improves chances of recovery, it does not provide a universally accepted standard for measuring breach of duty. Instead, it relies on what has become known as the "consumer-expectation" test: one who sells any product in a defective condition unreasonably dangerous to the user is subject to liability for physical harm caused to the user if: 1) the seller is engaged in the business of selling such a product; and 2) the product is expected to and does reach the user without substantial change in the condition in which it is used. "Unreasonably dangerous" is defined as dangerous beyond the expectations of the ordinary consumer who purchases it. Despite its great influence, this definition has not been universally accepted.

Tort law does recognize that some products beneficial to society cannot be made entirely safe. Prescription drugs and vaccines are notorious examples. Such products are not considered defective simply because of their inevitable hazards; something else must be wrong with them as well. Therefore, drug companies are not held strictly liable for a properly manufactured product accompanied by appropriate directions and warnings.

Another potential defense is the "sophisticated user doctrine" adopted by thirty states as of 2009. This doctrine negates a manufacturer's duty to warn of potential dangers when the user should have had knowledge of the product's hazards. This includes trained professionals like electricians, beauticians, mechanics, and others dealing with machinery or chemicals as part of their profession. The defense can be extended to protect manufacturers from the duty to warn the end user of a product when the purchaser of the product is knowledgeable of potential hazards. For example, the manufacturer of ski boot bindings can reasonably expect that the retail ski shop will provide information about potential hazards to the purchaser. However, small-business owners should consult an attorney who specializes in product liability for the most current additions to the law.

PRODUCT LIFE CYCLE

The theory of a product life cycle was first introduced in the 1950s to explain the expected life cycle of a typical product from design to obsolescence, a period divided into the phases of product introduction, product growth, maturity, and decline. The goal of managing a product's life cycle is to maximize its value and profitability at each stage. Life cycle is primarily associated with marketing theory.

INTRODUCTION

This is the stage where a product is conceptualized and first brought to market. The goal of any new product introduction is to meet consumers' needs with a quality product at the lowest possible cost in order to return the highest level of profit. The introduction of a new product can be broken down into five distinct parts:

- Idea validation, which is when a company studies a market, looks for areas where needs are not being met by current products, and tries to think of new products that could meet that need. The company's marketing department is responsible for identifying market opportunities and defining who will buy the product, what the primary benefits of the product will be, and how the product will be used.
- Conceptual design occurs when an idea has been approved and begins to take shape. The company has studied available materials, technology, and manufacturing capability and determined that the new product can be created. Once that is done, more thorough specifications are developed, including price and style. Marketing is responsible for minimum and maximum sales estimates, competition review, and market share estimates.
- Specification and design is when the product is nearing release. Final design questions are answered and final product specs are determined so that a prototype can be created.

- Prototype and testing occur when the first version of a product is created and tested by engineers and by customers. A pilot production run might be made to ensure that engineering decisions made earlier in the process were correct, and to establish quality control. The marketing department is extremely important at this point. It is responsible for developing packaging for the product, conducting the consumer tests through focus groups and other feedback methods, and tracking customer responses to the product.
- Manufacturing ramp-up is the final stage of new product introduction. This is also known as commercialization. This is when the product goes into full production for release to the market. Final checks are made on product reliability and variability.

In the introduction phase, the company is learning about the market, building sales and distribution, receiving feedback from early customers, and even working out problems in the product itself. Sales may be slow as the company builds awareness of its product among potential customers. Advertising is crucial at this stage, so the marketing budget is often substantial. The type of advertising depends on the product. If the product is intended to reach a mass audience, then an advertising campaign built around one theme may be in order. If a product is specialized, or if a company's resources are limited, then smaller advertising campaigns can be used that target very specific audiences. As a product matures, the advertising budget associated with it will most likely shrink since audiences are already aware of the product.

Techniques used to exploit early stages make use of penetration pricing (low pricing for rapid establishment) as well as "skimming," which is pricing high initially and then lowering price after the "early acceptors" have been lured in. While the marketing effort is focused on increasing sales, the company must ensure that it can meet the demand its marketing aims to create by setting up distribution channels and identifying extra manufacturing capacity that can be quickly brought online.

GROWTH

The growth phase occurs when a product has survived its introduction and is beginning to be noticed in the marketplace. At this stage, a company can decide if it wants to go for increased market share or increased profitability. This is the boom time for any product. Production increases, leading to lower unit costs. Sales momentum builds as advertising campaigns target mass media audiences instead of specialized markets (if the product merits this). Competition grows as awareness of the product builds. Minor changes are made as more feedback is gathered or as new markets are targeted. The goal for any company is to stay in this phase as long as possible.

It is possible that the product will not succeed at this stage and move immediately past decline and straight to cancellation. That is a call the marketing staff has to make. It needs to evaluate just what costs the company can bear and what the product's chances for survival are. Tough choices need to be made because sticking with a losing product can be disastrous.

If the product is doing well and killing it is out of the question, then the marketing department has other responsibilities. Instead of just building awareness of the product, the goal is to build brand loyalty by adding first-time buyers and retaining repeat buyers. Sales, discounts, and advertising all play an important role in that process. The marketing department should gather as much information as possible about potential customers in order to understand what features or benefits they care about most. For products that are well-established and further along in the growth phase, marketing options include creating variations of the initial product that appeal to additional audiences.

MATURITY

At the maturity stage, sales growth has started to slow and is approaching the point where the inevitable decline will begin. Defending market share becomes the chief concern, as marketing staffs have to spend more and more on promotion to entice customers to buy the product. Additionally, more competitors have stepped forward to challenge the product at this stage, some of which may offer a higher-quality version of the product at a lower price. This can touch off price wars, and lower prices mean lower profits, which will cause some companies to drop out of the market for that product altogether. The maturity stage is usually the longest of the four life cycle stages, and it is not uncommon for a product to be in the mature stage for several decades.

The savvy company should focus on understanding its competitors what their next moves might be as well as why some customers prefer the competitors' products. At the same time, the company should listen to its customers and its competitors' customers to find ways to improve its own product. The smart company will also seek to lower unit costs as much as possible at the maturity stage so that profits can be maximized. The money earned from the mature products should then be used in research and development to come up with new product ideas to replace the maturing products. Operations should be streamlined, cost efficiencies sought, and hard decisions made.

From a marketing standpoint, experts argue that the right promotion can make more of an impact at this stage than at any other. One popular theory postulates that there are two primary marketing strategies to utilize at this stage offensive and defensive. Defensive strategies consist

of special sales, promotions, cosmetic product changes, and other means of shoring up market share. It can also mean quite literally defending the quality and integrity of the product versus the competition. Marketing offensively means looking beyond current markets and attempting to gain brand-new buyers. Relaunching the product is one option. Other offensive tactics include changing the price of a product (either higher or lower) to appeal to an entirely new audience or finding new applications for a product.

DECLINE

This occurs when the product peaks in the maturity stage and then begins a downward slide in sales. Eventually, revenues will drop to the point where it is no longer economically feasible to continue making the product. Investment is minimized. The product can simply be discontinued, or it can be sold to another company. A third option that combines those elements is also sometimes seen as viable, but comes to fruition only rarely. Under this scenario, the product is discontinued and stock is allowed to dwindle to zero, but the company sells the rights to supporting the product to another company, which then becomes responsible for servicing and maintaining the product.

PROBLEMS WITH THE PRODUCT LIFE CYCLE THEORY

While the product life cycle theory is widely accepted, it does have critics who say that the theory has so many exceptions and so few rules that it is meaningless. Among the holes in the theory that these critics highlight:

- There is no set amount of time that a product must stay in any stage; each product is different and moves through the stages at different times. Also, the four stages are not the same time period in length, which is often overlooked.
- There is no real proof that all products must die. Some products have been seen to go from maturity back to a period of rapid growth thanks to some improvement or redesign. Some argue that by saying in advance that a product must reach the end of life stage, it becomes a self-fulfilling prophecy that companies subscribe to. Critics say that some businesses interpret the first downturn in sales to mean that a product has reached decline and should be killed, thus terminating some still-viable products prematurely.
- The theory can lead to an overemphasis on new product releases at the expense of mature products, when in fact the greater profits could possibly be derived from the mature product if a little work was done on revamping the product.
- The theory emphasizes individual products instead of taking larger brands into account.
- The theory does not adequately account for product redesign or reinvention.

PRODUCT POSITIONING

"Product positioning" is a marketing technique intended to present products in the best possible light to different target audiences. The method is related to "market segmentation" in that an early step in major marketing campaigns is to discover the core market most likely to buy a product or the bulk of the product. Knowledge of competitors is also crucial, as product positioning often demonstrates why a product is better than the competition. Once segmentation has defined this group ("active seniors," "affluent professional working women," "teens," etc.) the positioning of the product consists of creating the message likely to reach this group. Positioning involves symbol and message manipulation, including displays and packaging.

Al Ries and Jack Trout, in their book *Positioning: The Battle for Your Mind*, introduce the subject by saying: "[P]ositioning is not what you do to a product. Positioning is what you do to the mind of the prospect. That is, you position the product in the mind of the prospect. So it's incorrect to call the concept 'product positioning.' As if you were doing something to the product itself. Not that positioning doesn't involve change. It does. But changes made in the name, the price and the package are really not changes in the product at all.... Positioning is also the first body of thought that comes to grips with the problems of getting heard in our overcommunicated society."

Louis E. Boone and David L. Kurtz, in their book *Contemporary Marketing*, put it this way: "Product positioning refers to consumers' perceptions of a product's attributes, uses, quality, and advantages and disadvantages

relative to competing brands. Marketers often conduct marketing research studies to analyze consumer preferences and to construct product position maps that plot their products' positions in relation to those of competitors' offerings.''

Whether a small business has a niche product or is aiming for large distribution, there should be a clear focus on who will buy the product and what their needs are. While conducting the product positioning process through questionnaires, interviews, focus groups, and market tests, the business should ask itself key strategic questions:

- Who is the customer?
- What customer need does the product solve?
- What factors influence the customer's decision to buy a similar product?
- Who are the competitors and what are their strengths and weaknesses?

A company that can answer such strategic questions can better target their product positioning.

IN MASS MARKET PRACTICE

Concepts like "segmentation" and "positioning" typically arise in the "large" rather than in the "small" business context. The underlying concepts apply to both, but access to the mass market requires substantially more preparation. These methods have thus developed of necessity and in order to save money. They do not represent some kind of "high sophistication" the small business has overlooked. Small-business owners practice segmentation and positioning as much as the giants and multinationals but the small-business owners think of these things differently and do not use the same phrases.

The preparation of major product introductions and related packaging design, promotional and advertising campaigns, and incentives for the supply channel can be very costly. Money can be wasted unless careful planning comes quite early. Market segmentation, an early step in the positioning of products, is intended both to limit the costs of sales and marketing and also to channel the money to the most cost-effective points in the communications network. Related market research, distinct from segmentation, is often used to set price points, identify competitive aspects of the product, and so on.

Some product lines, of course, have obvious and built-in segmentation: the marketing of baby foods will be directed at young mothers; lipsticks and cosmetics are rarely advertised on televised football games. Market segmentation is ultimately a highly developed extension of such quite commonsense linkages between social, demographic, income, and gender groups and the products these typically buy or shun. It might be argued that segmentation studies have gone too far, that the slicing and dicing of sub-sub-subgroups has reached rather silly extremes, but those who spend the money on highly elaborate market surveys and focus groups at least *believe* in the effectiveness of such techniques, which do have a certain scientific grounding.

Segmentation studies invariably attempt to capture *opinion* and then to extrapolate it using *statistical* methods. Groups are selected and interviewed based on preselected characteristics to determine their reactions to products, features, packaging concepts, price-points, appearance, symbols, and message contents. It is vital in these studies that the participants be "representative" of groups that can be measured objectively using census data; for example, urban working women between thirty and forty-five with children in the home. To the extent that participants in the study meet the criteria, it is then assumed that the opinions of a small sample will be the same as the opinions of the total population in that category. Segmentation, therefore, is one category of opinion polling as a whole. Its effectiveness depends on the design of the research and is measured by results later much as political polling is upheld or falsified by election results.

A rather vast body of knowledge, expertise, and interpretation has developed around this type of research in order properly to discern what consumers really mean, how their views and actions correspond, and so on. The amount of effort expended and professional skills deployed is directly related to the very large amounts of money expended on persuasion generally.

Product positioning is derived from segmentation and similar marketing studies. Research of this type will determine the different reactions of distinct and measurable groupings of consumers. Some will have a high level of enthusiasm, others will be indifferent. The largest grouping returning a favorable opinion is then selected as the target market; the marketing message is tailored to appeal most specifically to this group and will be shown most frequently in media this group routinely uses. Positioning, of course, may extend to several secondary groups as well, so that a product may be launched with somewhat different emphases and approaches in different media depending on who is watching, listening, or reading. Positioning becomes a very complex process in that attempts are made to coordinate all aspects of the symbology, to echo the very words people used in focus groups, and to select those images, packages, and lifestyle linkages identified earlier. Occasionally it happens, contrary to the opinion expressed by Ries and Trout, that the product itself may be significantly modified especially if most consumer groups polled found fault with some features.

IN SMALL BUSINESS PRACTICE

Probably the biggest difference between mass marketers and small businesses is that small operations *practice* product positioning but *without* the very costly machinery of

elaborate and formal segmentation, market research, and testing paid for by the big companies. To be sure, some small businesses (those of the larger kind and able to spend such dollars) do conduct studies quite similar to the majors. But in most small businesses the positioning of products is based on the opinions of the business owner, his or her family, and selected friends and customers; *they* are the "sample."To some extent small businesses also conduct what might be called "experiential" studies once products are launched. They observe who buys most of the product, receive feedback from the market, and then later, in response, modify the ways in which they advertise, where they advertise, how they label, how they display product in the store, and even how they package. If the product is initially at least moderately successful, this type adaptation based on experience is much more effective because it reflects consumer *behavior* rather than consumer *opinion.*

There are many low-cost methods a small-business owner can use to get feedback from the market. Online surveys can be sent to customers via e-mail or be embedded on the company Web site. Often, customers post reviews of products and companies on the Web. More informally, customers may post to their Twitter account information about a product or service. Both online reviews and tweets provide opportunities to learn directly from the customer their likes or dislikes about a product and perhaps even why they purchased it. Successful product positioning can be done at low cost when a small business monitors the Web for mention of their business, responds promptly to rectify a negative customer experience, improves their product, or targets promotions to potential customers and loyal shoppers.

PRODUCTIVITY

Productivity is a versatile measure used at the individual, company, and national levels to look at how much work gets done. On the individual level, people strive to be more productive in their jobs and their lives. Companies analyze costs or sales per employee and are often concerned with employee morale as a means of maintaining or increasing productivity. Economists use productivity as a measure of output, or the amount of work per hour, to gauge economic performance at the national level.

Statistics on productivity are collected routinely by the U.S. Bureau of Labor Statistics (BLS) and their publication every quarter usually brings coverage in the business press. BLS measures "labor productivity" based on dollar output per hour of labor; the agency also publishes a more complex measure known as "multifactor productivity" which takes other inputs into account. Productivity is also measured at the level of the enterprise in output of physical product by a worker. When the worker's pay is directly based on number of pieces produced, that type of work is known as "piecework": pay is tied to the item ("collars sewn," for instance, rather than time spent).

THEORETICAL ASPECTS

In economic theory (echoed in popular opinion), labor compensation is determined by productivity. In theory a person can only earn a fixed amount because his or her labor must be compensated by the sale of the product made, and all things being equal, competition will keep the prices competitive. This translates to an essentially stagnant economy unless, in some way, the cost of the production process can be lowered. One way to lower costs is to increase output while keeping the input the same. Thus if a worker can increase his or her production from eight items an hour to twelve items an hour while still being paid $9 an hour, the labor costs of the items will decrease from $1.125 an item to $0.75 an item. The converse of such an improvement in productivity is that the price of the item could be held steady and the laborer could be paid more. In this instance the worker's pay could be increased to $13.50 an hour ($1.125 × 12, not × 8). For this reason, it is a fundamental assumption of economics that wages in a genuinely free market can only increase if productivity increases.

Productivity can only increase if: 1) the worker's skills increase; 2) the worker's effort increases; 3) the quality of the material processed increases; 4) the worker's tooling is better; and 5) the work process itself is improved by better arrangements of workers, work flow, and so on. Increases in skill require time and experience, increased effort requires incentives, and the remaining factors are produced by improvements in technology.

Wages, of course, can also increase as a consequence of social force. Thus workers can unionize and impose their will. Higher costs are then imposed on the public. Similarly, government can enforce a wage level with similar consequence, the minimum wage being an example. These situations, of course, no longer represent a genuine "free market."

Throughout the period of modern industrial history, productivity has been rising steadily as a consequence of

all of the factors enumerated above, namely education in general and the invention and deployment of technology, which itself is based on knowledge and energy. Arguably modern civilization rests on the discovery of fossil fuels and their exploitation, which have enabled humanity to have leisure to learn and power to burn.

PRODUCTIVITY MEASURES

Government data on productivity are calculated by measuring or estimating the output of different sectors of the economy in dollars and the hours worked. The output divided by the hours produces the base of a productivity measure. But because the economy has its ups and downs as well as its seasonal swings, BLS does not publish the raw numbers but, instead, produces an index number. If a base year of an index is 1992, then the values measured in that year are taken as 100. Other years are expressed as deviations from 1992. In 2000, for instance, manufacturing output per hour was 138.3, meaning that it had improved 38.3 percent over 1992. Productivity data are adjusted to account for seasonality and inflation.

The two major categories used are Manufacturing and Business as a whole. The most precise are data for manufacturing because, in that sector, the U.S. Census Bureau collects hourly compensation data separately from other employment data. In both categories, productivity has risen substantially since 1992. Manufacturing productivity stood at 138.3 in 2000 and at 171.2 in 2005. In Business as a whole, the productivity index in 2000 was 120.3; it increased to 136.7 by 2005. Even in 2008, during a recession, productivity increased at an annual rate of 6.6 percent, which is the highest gain since the summer of 2003. However, the productivity figure does not tell the whole story. "Aggressive cost-cutting efforts helped boost the bottom line and kept companies operating, but labor costs declined at an alarming 5.9 percent. That's the largest drop since the second-quarter of 2000 and slightly more than the 5.8 percent decline a month ago," wrote the *Charlotte Business Journal* in September 2009. Essentially, the employees who kept their jobs during the recession had to take on additional work responsibilities for the same pay.

Multifactor Productivity (MP). Labor productivity, of course, is a very rough measure because it only incorporates sales or revenues on the one hand and hours worked on the other. It is thus used as a stand-in, a kind of abbreviation, for more complex and very difficult calculations that take other and often intangible factors into account. One attempt to do so is the effort to measure multifactor productivity.

The BLS, in its press release on this subject, provides the following comment: "Multifactor productivity is designed to measure the joint influences of economic growth on technological change, efficiency improvements, returns to scale, reallocation of resources, and other factors, allowing for the effects of capital and labor. Multifactor productivity, therefore, differs from labor productivity (output per hour worked) measures that are published quarterly by BLS since it includes information on capital services and other data that are not available on a quarterly basis."

The MP index separately measures labor and capital inputs and then combines them based on the relative importance of each in a given sector to create a "composite" input. It similarly measures outputs per hour and outputs per unit of capital employed. The index is then computed from the two composites.

The MP index began in 1987, has a base year of 2000 (index at 100), and is available to 2008, as of 2010. The index increased 7.7 percent between 2000 and 2004. In 2008 there was just a 1.1 percent year-on-year increase in the private, nonfarm sector. Multifactor productivity thus produces a more sobering picture of productivity by reflecting the role of capital which, indirectly, reflects the importance and costs of technology.

The data streams required to calculate MP are difficult to get and the index therefore difficult to replicate. Cause-and-effect relationships can only be inferred indirectly. For these reasons, MP is used primarily in academic analyses.

PRODUCTIVITY, COMPENSATION, AND GLOBALIZATION

Labor productivity and compensation grow in tandem but not in precise coordination. In times of economic slowdown, inventories tend to be high but fall over time and early layoffs take place. In times of upturn, employers are slow to hire new labor until growth is well established. The overall growth rate of compensation lags that of productivity, in part explained by the "multifactor" influence of technology which, ultimately, accounts for productivity.

PRODUCTIVITY AND THE SMALL BUSINESS

The small business lacks the scale often needed to justify the high levels of automation and lower labor costs of large-scale operations. However, a well-managed small business can encourage higher levels of employee productivity if the company can build and maintain employee morale. While the small businesses has limited resources, it is not constrained by bureaucratic big-company protocol and can be innovative in its human resource management. The methods are many soliciting employee feedback, encouraging a work-life balance, sponsoring a wellness program, even redesigning the office layout.

The small business can easily fall into higher labor costs from little automation and unavoidable overhead functions that have less production to absorb their costs.

The alert business owner, however, will use technology to lower these costs and increase productivity. HoHSmall business also has unique opportunities to achieve productivity through flexibility and creativity. It is very common in small businesses to have highly skilled and cross-trained employees who do "everything." Communications and decision making are easier and often swifter. Small businesses tend to be innovators, not least in the novel use or invention of technology. Many of these traits are indirectly captured in multifactor productivity statistics even though they escape the simple calculation of sales divided by hours worked.

PROFIT CENTER

A profit center is a business unit that generates revenue in excess of costs. Profit centers are expected to turn a profit by selling something. By contrast, a cost center in a company provides necessary services but has no revenues. It is expected to keep costs low while providing the assigned services within the budget. During the first decade of the twenty-first century, the definition of a profit center broadened to cover the creation of new value and profit from a business's unused or underutilized resources, such as warehouse space, database knowledge, or intellectual property.

Companies have attempted to convert service units into profit centers by two basic stratagems: charging for services rendered to internal customers (other departments) and selling a portion of cost-center outputs to outsiders in order to generate revenues. Thus "profit center" has taken on meaning as a search for higher profits by putting pressures on functions heretofore shielded from the "market."

All companies, of course, have both cost and profit centers even the one-person company. In this example, some things done by the entrepreneur are done to keep things going, while others are directly related to revenue generation. In most companies corporate functions such as human resources, information technology (IT), purchasing, maintenance, research, and other staff-functions distant from production are cost centers. These are service functions necessary to do other things directly related to the market. Production activities, including engineering, design, data processing tied to the factory, production itself and warehousing and testing associated with it can usually be tied to product and thus are parts of profit centers.

All companies have profit centers and cost centers, but not all companies organize their accounting practices around the "profit center concept." Where this concept has taken root, management makes attempts to view all operations under the rubric of profit and tries to convert functions so that they too have bottom lines.

TRANSFORMING COST INTO PROFIT CENTERS

A cost center may actually provide services that could generate a profit if they were offered on the open market. This theoretical possibility is at the root of profit center accounting. One implementation of the concept is to require departments using a service to pay for it. This, of course, is a meaningless change in bookkeeping (and an added administrative cost) unless the purchasing departments have alternatives to buying from within. Thus implementation typically permits departments to shop around and buy the service outside the company, too. The notion is that such competition will make the cost center behave more responsibly in order to "keep the business." Similarly, the newly converted cost center is also empowered to sell its services outside. In both cases, selling in or outside, the cost center could mark up its costs to get a real profit margin of its own.

All cost centers "do something" and therefore theoretically have something to sell, but the marketability of many centers is problematical or must be relaunched as new ventures. Thus a human resources department could theoretically turn itself into a recruiting company, but to do so effectively it would have to transform itself, develop its own marketing, and lose its character as an internal service provider concentrating on achieving corporate goals first of all. The "two masters" problem arises. The accounting department's payroll function could also, similarly, head out and do battle for market share with well-entrenched independent payroll services providers.

Certain functions, like information technology, appear more suited to this concept than others because except for the addition of a selling function little else (except perhaps expansion) would be required. Managing external databases is functionally the same as managing those in-house. Other technically based functions would have

similar advantages, including product design, modeling departments, and product testing.

PROS AND CONS

The perceived advantages of "conversion" arise chiefly from the assumption that costs of the function would decline over time and thus make the company more profitable overall. Under competitive pressure, the former cost center would become leaner, more responsive, and more efficient. If successful externally, it would increase total revenues.

The negatives arise from the fact that corporations are "organizations" and therefore both kinds of centers, cost as well as profit, are necessary "organs" of the entity with characteristics that have evolved to make them work ideally together. The conversion of cost centers into independent functions introduces competitive forces into the organization itself. The motivations of managers running such units change; they begin to be measured by a different yardstick. At a minimum if this policy is pursued very energetically it will create tensions and disorders.

Primarily for these reasons, managerial initiatives to implement a profit center culture tend to translate, in practice, into greater focus on the costs and benefits of service elements. This occasionally leads to the exploitation of new opportunities for outside sales but rarely results in creating a chaotic internal "auction" under which operational managers have to expend excessive time and effort to get a part or to hire a new employee.

PROFIT CENTERING VS. OUTSOURCING

The attempt to achieve higher returns from internal service functions is conceptually and motivationally similar to moves that result in shedding entire functions, which are replaced by buying their services from outside vendors. This approach is administratively easier and for that reason, perhaps, growing in extent. Transforming an internal department into a service-selling entity, required to find outside customers as well, thus becomes the first stage toward the discovery that the function might not be needed at all.

CREATING A NEW PROFIT CENTER

The small-business owner may view the transformation of business units from cost to profit centers as an management tool of large corporations. However, competitive companies of any size should look at where they might create profit centers from unused or underutilized resources. This requires a thorough look at the company's activities to identify new areas to create value. For example, a company can perform an audit of all its intellectual property (IP) to find IP that can find new life within the company, be licensed, or be sold to create a noncompeting product. Companies may also find the source for a new profit center in unused office or warehouse space, data collected from customers, or employee suggestions.

PROFIT IMPACT OF MARKET STRATEGIES (PIMS)

The Profit Impact of Market Strategies (PIMS) is a comprehensive, long-term study of the performance of strategic business units (SBUs) in 3,000 companies in all major industries. The PIMS project began at General Electric in the mid-1960s. It was conducted at Harvard University between 1972 and 1974. In 1975 PIMS was taken over by a Massachusetts-based nonprofit organization, formed for that purpose, called the Strategic Planning Institute (SPI). Since then, SPI researchers and consultants have continued working on the development and application of PIMS data. The PIMS database is available to individuals for a subscription price (in 2010) of $995 for 1 month's use and $2,500 for 3 months' use. Longer periods of subscription are available from SPI by special arrangement. The subscription includes access to: 1) Return on Investment Report; 2) Market Share Change Report; 3) Marketing Budget Report; and 4) Market Attractiveness/Competitive Strength Report.

According to the SPI Web site, the PIMS database is "a collection of statistically documented experiences drawn from thousands of businesses, designed to help understand what kinds of strategies (e.g., quality, pricing, vertical integration, innovation, advertising) work best in

what kinds of business environments. The data constitute a key resource for such critical management tasks as evaluating business performance, analyzing new business opportunities, evaluating and reality testing new strategies, and screening business portfolios."

The main function of PIMS is to highlight the relationship between a business's key strategic decisions and its results. Analyzed correctly, the data can help managers gain a better understanding of their business environment, identify critical factors in improving the position of their companies, and develop strategies that will enable them to create a sustainable advantage. PIMS principles are taught in business schools, and the data are widely used in academic research. As a result, PIMS has influenced business strategy in companies around the world.

THE PIMS DATABASE

The information comprising the PIMS database is drawn from member companies of SPI. These companies contribute profiles of their SBUs that include financial data as well as information on customers, markets, competitors, and operations. The SBUs in the database are separated into eight classifications: producers of consumer durables, consumer nondurables; capital goods; raw materials; components, or supplies; wholesale and retail distributors; and providers of services. Specific companies and industries are not identified. Each SBU profile includes financial data from the income statement and balance sheet, as well as information about quality, price, new products, market share, and competitive tactics.

The classifications are rather broad, at least from a small business perspective. The category of consumer durables, for instance, includes such diverse products as refrigerators, cell phones, air conditioners, computers, microwave ovens, lawnmowers, television sets, and much else. Thus data averaged from such a category have a rather rough granularity. The data are also drawn from large corporations and then averaged.

Judging by generic, pro forma sample tabulations available on SPI's Web site, the user comes to the database with his or her financial and other ratios as an input and can then derive comparative data from the broad categories listed above and held in the PIMS database. The outputs appear to be statistical and rely on the assumption that broad category averages can effectively guide strategy. PIMS data appear to be a good approach to benchmarking, provided that broad categories are sufficient for the PIMS data users. SPI also provides consulting services, based on PIMS, as PIMS Associates, Inc.

PIMS TODAY

Interest in PIMS as an analytical approach does not appear very high in the twenty-first century, if coverage of the subject in the technical and business press is any indication. This waning interest in PIMS may correspond to the rise of the view that business factors are complex, intertwined, and change rapidly. Robert Grant, in his 2010 book, *Contemporary Strategy Analysis*, only briefly mentions PIMS. "The PIMS analysis assumes that the various strategy and market structure variables have independent influences on profitability. The more complex are the interactions between different strategy and market variables, the less valid is the guidance based upon results of large database regression estimates."

A 2005 book on the subject by Paul W. Farris and Michael J. Moore is largely a look backward an attempt to assess the contribution PIMS has made to the field of management science. Looking forward, the authors analyze how the PIMS project might be structured if it were launched in the current era. Another broad study of contemporary marketing, written in 2009 by Louis E. Boone and David L. Kurtz, mentions a comprehensive use of PIMS by the Marketing Science Institute. The MSI study came to the not-so-startling conclusion that (in Boone's and Kurtz's words) "two of the most important factors influencing profitability were product quality and market share."

SMALL BUSINESS RELEVANCE

PIMS was from the outset and apparently continues as a "big company" methodology to measure broad strategies capable of being captured by statistical measures. The reliance of this method on concepts (and measurements) like market share performance and marketing expenditures seems to make its relevance to small business marginal at best. Small companies on average find it very difficult even to guess at their own market shares and only very rarely engage in the kinds of major marketing efforts associated with the GEs, IBMs, and Coca-Colas of the world.

PROFIT MARGIN

The profit margin is an accounting measure designed to gauge the financial health of a business or industry. In general, it is defined as the ratio of profits earned to total

sales receipts (or costs) over some defined period. The profit margin is a measure of the amount of profit accruing to a firm from the sale of a product or service. It also provides an indication of efficiency in that it captures the amount of surplus generated per unit of the product or service sold. In order to generate a sizeable profit margin, a company must operate efficiently enough to recover not only the costs of the product or service sold, operating expenses, and the costs of debt, but also to provide compensation for its owners in exchange for their acceptance of risk.

Profit margin is a measure of pricing power because it reflects the prices companies can charge above their costs to produce goods and services. A company can increase or maintain prices if demand is strong for its product. If demand weakens, the usual competitive response is a corresponding decrease in price. As an example of a profit margin calculation, suppose firm A made a profit of $10 on the sale of a $100 television set. Dividing the dollar amount of earnings by the product cost, that firm's profit margin would be .10 or 10 percent, meaning that each dollar of sales generated an average of ten cents of profit. Thus, the profit margin is very important as a measure of the competitive success of a business, because it captures the firm's unit costs.

A low-cost producer in an industry would generally have a higher profit margin. Since firms tend to sell the same product at roughly the same price (adjusted for quality differences), lower costs would be reflected in a higher profit margin. Lower cost firms also have a strategic advantage in a competitive price war: they have the ability to undercut their competitors by cutting prices in order to gain market share and potentially drive higher cost firms out of business.

Firms clearly exist to expand their profits. But while increasing the absolute amount of dollar profit is desirable, it has minimal significance unless it is related to its source. This is why firms use measures such as profit margin and profit rate. Profit margin measures the flow of profits over some period compared with the costs, or sales, incurred over the same period. Thus, one could compute the profit margin on costs (profits divided by costs) or the profit margin on sales (profit margin divided by sales).

Other specific profit margin measures often calculated by businesses include: 1) gross profit margin gross profit divided by net sales, where gross profit is the money left over from total revenue after subtracting cost of goods sold (raw materials, labor, creation of finished goods or services, etc.); and 2) net profit margin net profit divided by net sales, where net profit (or net income) is profit after deducting costs such as advertising, marketing, interest payments, rental payments, and taxes. Comparison of profit margin ratios between companies should be limited to competitors in the same industry with the same capital structure. Outside such confines, profit margins vary between industries due to area-specific competitive forces and the capital investment required of different industries.

RATE OF PROFIT

Profit margin is related to other measures such as the rate of profit (sometimes called the rate of return), which comprises various measures of the amount of profit earned relative to the total amount of capital invested (or the stock of capital) required to generate that profit. Thus, while the profit margin measures the amount of profit per unit of sales, the rate of profit on total assets indicates the efficiency of the total investment. Or, put another way, while the profit margin measures the amount of profit per unit of capital (labor, working capital, and depreciation of plant and equipment) consumed over a particular period, the profit rate measures the amount of profit per unit of capital advanced (the entire stock of capital required for the production of the good).

Using the previous example, if a $1,000 investment in plant and equipment were required to produce the $100 television set, then a profit margin of 10 percent would translate into a profit rate on total investment of only 1 percent. Thus, in this scenario, firm A's unit costs are low enough to generate a 10 percent profit margin on the capital consumed (assuming some market price) to produce the TV set; but in order to achieve that margin, a total capital expenditure of $1,000 must be made.

The difference between the profit margin measure and the profit rate concept then lies in the rate at which the capital stock depreciates, and the rate at which the production process repeats itself, or turnover time. In the first case, if the entire capital stock for a particular firm or industry is completely used up during one production cycle, then the profit margin would be exactly the same as the profit rate. In the case of turnover, if a firm succeeds in doubling the amount of times the production process repeats itself in the same period, then twice as much profit would be made on the same capital invested, even though the profit margin might not change. More formally, the rate of return = profit margin × sales / average assets, where average assets is the total capital stock divided by the number of times the production process turns over. Thus, the rate of return can be increased by increasing the profit margin or by shortening the production cycle. Of course, this will largely depend on the conditions of production in particular industries or firms.

If costs rise and sale prices do not rise to keep up, then the profit margin will fall. In times of business cycle upturns, prices tend to rise; in business cycle downturns, prices tend to fall. Of course, many factors, and not only costs, will affect the profit margin namely, industry-specific factors that relate to investment requirements,

pricing, type of market, and conditions of production (including production turnover time).

It is important for small-business owners to remember that generating a profit margin does not guarantee that their business is healthy, or that they will have money in the bank. Rather, a small business must have a positive cash flow in order to pay its bills and compensate its employees. To use a profit margin figure to determine whether a start-up firm is doing well, an entrepreneur might compare it to the return that would be available from a bank or another low-risk investment opportunity.

PROFIT SHARING

"Profit sharing" is a type of compensation paid to employees by companies. Payment of a profit-sharing bonus to non-management employees typically takes place at the discretion of the company and does not constitute an entitlement, although if it is paid routinely and year after year, employees may come to count on it as part of their compensation. Profit-sharing bonuses are treated as income for tax purposes upon receipt unless made to deferred compensation plans.

As part of its National Compensation Survey, the U.S. Bureau of Labor Statistics (BLS) collects data on cash profit-sharing bonus payments to employees. Data for 2009 indicated that 5 percent of all private-company workers had access to such bonuses. The BLS data may actually understate the prevalence of profit sharing because it also reports "end-of-year bonus" and "holiday bonus" categories. Many small businesses pay such bonuses at the end of the year and without labeling them as "profit sharing" but the bonuses are only paid in good years. This interpretation of the BLS data is borne out by the fact that bonuses labeled "profit sharing" were available to 4 percent of workers employed by small firms (under 100 employees) while 6 percent of workers in larger organizations had access to such bonuses. But 14 percent of workers in small establishments had access to end-of-year bonuses and 13 percent to holiday bonuses, whereas only 9 percent of workers in larger organizations had access to end-of-year bonuses and 7 percent to holiday bonuses. If all three categories are combined, it would appear that small businesses used this mechanism as a form of employee recognition more than large businesses.

BLS data also indicate that profit-sharing bonuses (excluding end-of year and holiday bonuses) were more likely available to blue collar workers (8% versus the average of 5%), full timers (6%), unionized workers (8%), and higher wage workers (in the highest 25th wage percentile, 10%) than other categories. Eleven percent of workers in goods producing and 4 percent of workers in services producing industries had access to such bonuses.

TYPES OF PROFIT SHARING PLANS

Companies use any number of different formulas to calculate the distribution of profits to their employees and have a variety of rules and regulations regarding eligibility. In general, however, two types of plans prevail. The first takes the form of cash bonuses under which employees receive a profit-sharing distribution at the end of the year. The main drawback to cash distribution plans is that this income is immediately subject to income tax. This also holds if the bonus is paid out in the form of company stock.

To avoid immediate taxation, companies are permitted by the Internal Revenue Service (IRS) to set up qualified deferred profit-sharing plans. Under a deferred plan, the second type of profit sharing, profit-sharing distributions are held in individual accounts for each employee. Employees are not allowed to withdraw from their profit-sharing accounts except under certain, well-defined conditions. As long as employees do not have easy access to the funds, money in the accounts is not taxed and may earn tax-deferred interest. BLS data for this form of profit sharing do not show the extent of corporate participation or the number of employees eligible overall.

Under qualified deferred profit-sharing plans, employees may be given a range of investment choices for their accounts, including stocks or mutual funds. Such choices are common when the accounts are managed by outside investment firms. It is becoming less common for companies to manage their own profit-sharing plans due to the fiduciary duties and liabilities associated with them. A 401(k) account is a common type of deferred profit-sharing plan, with several unique features. For example, employees are allowed voluntarily to contribute a portion of their salary, before taxes, to their 401(k) account. The company may decide to match a certain percentage of such contributions. In addition, many 401(k) accounts have provisions that enable employees to borrow money under certain

conditions. The BLS reported in 2009 that 67 percent of all private companies offered some type of retirement plan.

The latter half of the first decade of the twenty-first century saw an increase in companies using profit sharing to replace defined 401(k) matches in order to have more flexibility to respond to economic pressures. "During the depths of the downturn, 8 percent of plan sponsors eliminated or reduced 401(k) matching contributions. Now, as the economy picks up, two thirds of those expect to restore the matches in some form by April 2011, according to a survey of 200 large companies conducted last October by Watson Wyatt Worldwide," wrote Fran Hawthorne in March 2010 for *Institutional Investor*.

OTHER ISSUES CONCERNING PROFIT SHARING PLANS

Deferred profit-sharing plans are a type of defined contribution plan. Such employee benefit plans provide an individual account for each employee. Individual accounts grow as contributions are made to them. Funds in the accounts are invested and may earn interest or show capital appreciation. Depending on each employee's investment choices, their account balances may be subject to increases or decreases reflecting the current value of their investments.

The amount of future benefits that employees will receive from their profit-sharing accounts depends entirely on their account balance. The amount of their account balance will include the employer's contributions from profits, any interest earned, any capital gains or losses, and possibly forfeitures from other plan participants. Forfeitures result when employees leave the company before they are vested, and the funds in their accounts are distributed to the remaining plan participants.

Employees are said to be vested when they become eligible to receive the funds in their accounts. Immediate vesting means that they have the right to funds in their account as soon as their employer makes a profit-sharing distribution. Companies may establish different time requirements before employees become fully vested. Under some deferred profit-sharing plans employees may start out partially vested, perhaps being entitled to only 25 percent of their account, then gradually become fully vested over a period of years. A company's vesting policy is written into the plan document and is designed to motivate employees and reduce employee turnover.

In order for a deferred profit-sharing plan to gain qualified status from the IRS, it is important that funds in employee accounts not be readily accessible to employees. Establishing a vesting period is one way to limit access; employees have rights to the funds in their accounts only when they become partially or fully vested. Another way to limit access is to establish strict rules for making payments from employees accounts, such as upon retirement, death, permanent disability, or termination of employment. Less strict rules may allow for withdrawals under certain conditions, such as financial hardship or medical emergencies. Nevertheless, whatever rules a company may adopt for its profit-sharing plan, such rules are subject to IRS approval and must meet IRS guidelines. The IRS also limits the amount that employers may contribute to their profit-sharing plans.

Companies may determine the amount of their profit-sharing contributions in one of two ways. One is by a set formula that is written into the plan document. Such formulas are typically based on the company's pretax net profits, earnings growth, or some other measure of profitability. Companies then plug the appropriate numbers into the formula and arrive at the amount of their contribution to the profit-sharing pool. Rather than using a set formula, companies may decide to contribute a discretionary amount each year. That is, the company's owners or directors at their discretion decide what an appropriate amount would be.

Once the amount of the company's contribution has been determined, different plans provide for different ways of allocating the funds among the company's employees. The employer's contribution may be translated into a percentage of the company's total payroll, with each employee receiving the same percentage of his or her annual pay. Other companies may use a sliding scale based on length of service or other factors. Profit-sharing plans also spell out precisely which employees are eligible to receive profit-sharing distributions. Some plans may require employees to reach a certain age or length of employment, for example, or to work a certain minimum number of hours during the year.

Although profit sharing offers some attractive benefits to small-business owners, it also includes some potential pitfalls. It is important for small-business owners who wish to share their success with employees to set up a formal profit-sharing plan with the assistance of an accountant or financial advisor. Otherwise, both the employer and the employees may not receive the tax benefits they desire from the plan. Also, small-business owners should avoid making mentions of profit sharing or stock ownership to motivate employees during the heat of battle. Such mentions could be construed as promises and lead to lawsuits if the employees do not receive the benefits they feel they deserved.

PROGRAM EVALUATION AND REVIEW TECHNIQUE (PERT)

The Program Evaluation and Review Technique (PERT) is a widely used method for planning and coordinating large-scale projects. PERT analyzes the tasks necessary for completing a project and the time it takes to complete those tasks in order to estimate when the project will be completed.

As Harold Kerzner explained in his book *Project Management*, "PERT is basically a management planning and control tool. It can be considered as a road map for a particular program or project in which all of the major elements (events) have been completely identified, together with their corresponding interrelations. … PERT charts are often constructed from back to front because, for many projects, the end date is fixed and the contractor has front-end flexibility." A basic element of PERT-style planning is to identify critical activities on which others depend. The technique is often referred to as PERT/CPM, the CPM standing for "critical path method."

PERT was developed during the 1950s through the efforts of the U.S. Navy and some of its contractors working on the Polaris missile project. Concerned about the growing nuclear arsenal of the Soviet Union, the U.S. government wanted to complete the Polaris project as quickly as possible. The Navy used PERT to coordinate the efforts of some 3,000 contractors involved with the project. Experts credited PERT with shortening the project duration by 2 years. Since then, all government contractors have been required to use PERT or a similar project analysis technique for all major government contracts when the project completion date, rather than cost, is of primary importance.

NETWORK DIAGRAMS

The chief feature of PERT analysis is a network diagram that provides a visual depiction of the major project activities and the sequence in which they must be completed. Activities are defined as distinct steps toward completion of the project that consume either time or resources. The network diagram consists of arrows and nodes and can be organized using one of two different conventions. The arrows represent activities in the activity-on-arrow convention, while the nodes represent activities in the activity-on-node convention. For each activity, managers provide an estimate of the time required to complete it.

The sequence of activities leading from the starting point to the finishing point of the diagram is called a path. The amount of time required to complete the work involved in any path can be figured by adding up the estimated times of all activities along that path. The path with the longest total time is then called the "critical path," hence the term CPM. The critical path is the most important part of the diagram for managers: it determines the completion date of the project. Delays in completing activities along the critical path necessitate an extension of the final deadline for the project. If a manager hopes to shorten the time required to complete the project, he or she must focus on finding ways to reduce the time involved in activities along the critical path.

The time estimates managers provide for the various activities comprising a project involve different degrees of certainty. When time estimates can be made with a high degree of certainty, they are called deterministic estimates. When they are subject to variation, they are called probabilistic estimates. In using the probabilistic approach, managers provide three estimates for each activity: an optimistic or best case estimate; a pessimistic orz worst case estimate; and the most likely estimate. Statistical methods can be used to describe the extent of variability in these estimates, and thus the degree of uncertainty in the time provided for each activity. Computing the standard deviation of each path provides a probabilistic estimate of the time required to complete the overall project.

PERT ANALYSIS

Managers can obtain a great deal of information by analyzing network diagrams of projects. For example, network diagrams show the sequence of activities involved in a project. From this sequence, managers can determine which activities must take place before others can begin, and which can occur independently of one another. Managers can also gain valuable insight by examining paths other than the critical path. Since these paths require less time to complete, they can often accommodate slippage without affecting the project completion time. The difference between the length of a given path and the length of the critical path is known as slack. Knowing where slack is located helps managers to allocate scarce resources and direct their efforts to control activities.

For complex problems involving hundreds of activities, computers are used to create and analyze the project networks. The project information input into the computer includes the earliest start time for each activity,

earliest finish time for each activity, latest start time for each activity, and latest finish time for each activity without delaying the project completion. From these values, a computer algorithm can determine the expected project duration and the activities located on the critical path. Managers can use this information to determine where project time can be shortened by injecting additional resources, like workers or equipment. Needless to say, the solution of the algorithm is easy for the computer, but the resulting information will only be as good as the estimates originally made. Thus PERT depends on good estimates and sometimes inspired guesses.

PERT offers a number of advantages to managers. For example, it forces them to organize and quantify project information and provides them with a graphic display of the project. It also helps them to identify which activities are critical to the project completion time and should be watched closely, and which activities involve slack time and can be delayed without affecting the project completion time. The chief disadvantages of PERT lie in the nature of reality. Complex systems and plans, with many suppliers and channels of supply involved, sometimes make it difficult to predict precisely what will happen. The technique works best in well-understood engineering projects where sufficient experience exists to predict tasks accurately in advance.

PERT FOR THE SMALL BUSINESS

Companies with engineering, building, or other projects can use PERT to map out the flow of activities for an understanding of which activities need to be completed before another stage of the project can begin. While PERT is mostly used for complex, large-scale projects, the small-business owner can use similar logistical planning tools. There are many software programs on the market for project planning and the creation of Gantt charts (a bar chart that shows the project schedule). Managers can input data at each stage of the project, assign tasks to those responsible, and create alerts for supervisors if the project is not progressing according to schedule.

Regardless of the project complexity, the small-business owner should define the goals, objectives, and requirements of a project. Next, a statement of work should be outlined that breaks the project into tasks and allows the owner to determine the expertise, software, or hardware necessary for these tasks to be accomplished. A schedule can then be formed around these tasks. It is important to assign responsibility for each task to ensure that the project continues to move forward. Regardless of whether PERT, CPM, or another management technique is used to guide the project process, the small-business owner can use project planning to accomplish many business goals, from streamlining inventory to producing a big marketing campaign.

PROJECT MANAGEMENT

Project management involves the conception, planning, budgeting, execution, and completion of any endeavor outside the regular functions of a business or organization. Unlike day-to-day functions, a project has a specific time frame, with a beginning and an end, although it can last from minutes for the simplest project, such as painting a wall, to years or even decades for a complex one, like designing a new aircraft. "Any dream, opportunity or problem can become a project," Sid Kemp wrote in his 2006 book, *Project Management Made Easy.* Designing a new model of an automobile, building the prototype, constructing a car factory, and installing the assembly line are all examples of projects. Routine manufacturing of the cars themselves, which involves repetitive processes, is not a project, although modifications or repairs to any of those processes can be.

Managing a project often involves assembling a team for the duration of that project. These team members can come from within the company or organization, from outside, or from a combination of both. Project management typically also includes obtaining resources, such as material and equipment, specifically for the project. These resources can also be marshaled from within the business or organization or be obtained from outside.

A project manager differs from a functional manager in that the former has authority only over the designated project. A project manager and a functional manager within an organization, however, may use the same resources, including personnel and equipment. This creates a potential for conflict, which is why it is important for a project manager to gain the support for a project from functional managers who share those resources. Project managers "often work within every function in an organization, " James P. Lewis wrote in

the second edition of *Mastering Project Management*, published in 2009. He called project management "more of a *performing art* than a cognitive discipline."

While experts have varying theories and terminology concerning project management, they agree on basic principles. For example, in his 2006 book, *Successful Project Management*, Ken Lawson wrote that project management is distinguished by the following characteristics: it has particular goal and time boundaries; it acts as a tool for change; it involves specific resources; and it contains an element of risk. "Good project managers think like doctors," Kemp wrote. They diagnose a problem, fix it, check up later, and prescribe follow-up therapy. Kemp called this the PDCA method, which stands for plan, do, check, act. Project management principles can be applied to projects of all sizes. Kemp wrote that he spends half an hour to write a plan for a 2-hour project to avoid 4 hours of hassle.

"Even on the smallest project, the project manager would be foolish and irresponsible to spring into action as soon as the starting gun is fired," Mike Watson wrote in the second edition of *Managing Smaller Projects: A Practical Guide*. For smaller projects, though, he advised focusing on vital factors, such as project definition, risk assessment, and budget, while paying less or no attention to such areas as team building and conflict resolution.

HISTORY OF PROJECT MANAGEMENT

People have managed projects since ancient times. Examples of historic projects include the Great Pyramid of Giza, the Great Wall of China, and the Roman Coliseum. Creation of those projects had many of the hallmarks of modern project management in that they involved execution of a unique concept (a pharaoh's tomb, in the case of the Great Pyramid), detailed planning, the organizing of human and material resources, something resembling a budget, and a completion date. In more recent times, the building of the great cathedrals of Europe, the trans-continental railways, and the Manhattan Project (the World War II effort to develop the atomic bomb) also had the hallmarks of project management. Even the Great Escape from a German prisoner-of-war camp by Allied airmen during World War II could be described as project management, as author Mark Kozak-Holland did in his 2007 book, *Project Lessons from the Great Escape*. The Great Escape, though, lacked the written correspondence and records so crucial to modern project management.

"An early form of project management was used in antiquity to manage societal changes," David I. Cleland and Lewis R. Ireland wrote in the preface of the fifth edition of *Project Management: Strategic Design and Implementation*, published in 2007. "In recent years, there has been a growing interest in the use of projects as building blocks in the strategic management of the enterprise." No record of the plans for ancient projects exist. Cleland and Ireland noted that perhaps the earliest publication on project management was an essay by Daniel Defoe (1659 1731), best known as the author of the novel *Robinson Crusoe*. In the essay, Defoe referred to the building of Noah's Ark as "the first project I read of."

Inventor Thomas Edison (1847 1931) is often credited with developing many modern project management procedures and techniques in the late nineteenth century. "He summed up those techniques nicely when he said that all things come to those who hustle while they wait," Ron Black wrote in *The Complete Idiot's Guide to Project Management with Microsoft Project 2003*. At the beginning of the twentieth century, Henry Ford (1863 1947) revolutionized manufacturing with the introduction of the production line to mass-produce the Model T automobile. During the rapid industrialization of the World War I, engineers and scientists such as Frederick Winslow Taylor (1856 1916) and Elton Mayo (1880 1949) began studying productivity in factories, according to Dennis Lock in the ninth edition of *Project Management*, published in 2007. In 1917 mechanical engineer Henry Gantt (1861 1919), an employee of Taylor's, developed the Gantt chart, "a standard format for displaying project schedule information by listing project activities and their corresponding start and finish dates in a calendar format," as Kathy Schwalbe explained in the sixth edition of *Information Technology Project Management* in 2010.

Project management did not evolve into a distinct profession until the 1950s, with the advent of complex nuclear weapon systems and the invention of the Critical Path Method by the DuPont Corporation. In his 2010 book, *Project Management Best Practices: Achieving Global Excellence*, Harold Kerzner credited the cold war arms race with giving the U.S. Department of Defense the impetus to abandon "over-the-fence management" when pursing complex projects such as the Minuteman Intercontinental Ballistic Missile and the Polaris submarine. "The government wanted a single point of contact, namely, a project manager who has total accountability through all project phases," Kerzner wrote. The government also wanted such a manager to be a technical expert. The difficulty in estimating the duration of these projects led to development of the program evaluation and review technique, or PERT method. This is a statistical analysis of optimistic, pessimistic, and most likely estimates, as Michael W. Newell and Marina N. Grashina explained in 2004 in *The Project Management Question and Answer Book*.

"The Project Manager," a 1959 *Harvard Business Review* article by Paul Gaddis, "described the role of an individual in an advanced-technology industry who functioned as a focal point for the management of resources

being applied to manage ad hoc activities across organizational boundaries," Cleland and Ireland noted. They cited two other articles from the early 1960s as important contributors to project management theories: the 1961 essay, "Functional Teamwork" by Gerald Fish in the *Harvard Business Review*; and a 1964 article on "matrix organization" by John. F. Mee in *Business Horizons*. Cleland himself, who has been called "the father of project managment," was coauthor with William R. King *System Analysis and Project Management* (1968), an early scholarly work on the "systems approach" in project management.

"Project management has evolved from a set of processes that were once considered 'nice' to have to a structured methodology that is considered mandatory for the survival of the firm," Kernzer wrote. "Companies are now realizing that their entire business, including most of the routine activities, can be regarded as a series of projects."

PRINCIPLES OF PROJECT MANAGEMENT

Project management mainly involves commonsense thinking, Kemp pointed out. "Outside of NASA (the U.S. space agency, where a lot of project ideas were developed), project management isn't rocket science," Kemp wrote. He identified fourteen questions that should be asked before embarking on any project: Why? What? How? When? How much time? Cost? What makes it good? How to ensure it gets done? What could go wrong? Who will do what? How to keep in touch and on the same page? What is needed and how to get it? How to keep it all together? Whether to go ahead or cancel? "We should always keep in mind the possibility of cancellation," Kemp wrote. He advised first asking if a project will be good for business and if possible to assign a "hard-dollar value," such as the saving per widget of opening bidding to multiple vendors. If it is not possible to predict that, a business person might be able to describe a "soft-dollar value," he said.

According to Lawson, common originators of original ideas include customers, consultants (especially those hired to generate ideas), senior management (such as when acting on hunches), and project managers ("In this case, the onus to sell the project idea to others is on you."). Before embarking on a project, it is important to evaluate the support for it. That includes obtaining the opinion of management and clients. "If a client is pushing the project, check first with senior management to see if they are interested," Lawson wrote. "If they reject the idea outright, there is little point in hearing views from colleagues with less influence on a final decision." Lawson also recommended soliciting input from "devil's advocates" such as the "most negative people in the company."

It is also important to define the vision for the project, Lawson observed. That includes identifying key players, getting feedback from those players, spelling out a vision statement that avoids jargon, and meeting with the key players to vet that vision statement. "Only if most players are in agreement can you guarantee continued commitment to the project," Lawson wrote. In setting objectives, Lawson and others advise being specific. ("Increase sales" is too vague. It is better to state, "Gain X per cent in Y months.") Objectives should also be measurable (using indicators such as sales figures), aggressive but realistic, and time sensitive.

"In project management everything gets written down," Kemp wrote. "We need a written plan to bring things under control." Kemp cited television and movie production as good examples of project management: "One mistake ruins the shot and that costs a lot of money."

According to Kemp, stakeholders in a project include the sponsor (who provides the money), the executive manager (who runs the company undertaking the project), customers (who benefit from the project), project manager (who runs the project), project team (which does the work), vendors (who provide products and services to the team), peripheral stakeholders (who have occasional involvement), and other stakeholders (anyone else connected with the project). He also outlined the relationships the project manager has with the respective stakeholders. For example, the project manager provides the sponsor with regular status reports, reports on specific concerns, and asks for more money if needed.

An important stakeholder in any project is the project champion. This is a prominent member of the organization who advocates for the project, Stanley E. Portny noted in the 2007 edition of *Project Management For Dummies*. "Sometimes the best champion is one whose support you never have to use," Portny wrote. "Just knowing that this person supports your project helps other people appreciate its importance and encourages them to diligently ensure its success." The champion is not necessarily the project initiator, who is also important. "Project success requires that, at a minimum, you meet this person's needs and expectations, " Portny wrote.

Some important tools of the modern project manager are the statement of work (SOW) and the work breakdown structure (WBS). These are both best practices developed by government project managers, according to Kerzner. A statement of work is a "written confirmation" of what a project will produce and includes the purpose, objectives, constraints, and assumptions associated with the project, Portny explained. The work breakdown structure divides the project into "manageable chunks" that can be further subdivided. The lowest level is what Pornty calls a "work package."

BENEFITS OF PROJECT MANAGEMENT

Kemp identified three categories in which projects benefit a business (by increasing gross revenue, reducing costs, and reducing risks) and eight ways projects accomplish those benefits (bringing a new product or service to market, increasing production, increasing market share, reaching new markets or customers, marketing or delivering products in new ways, speeding up the cycle time, reducing or avoiding costs, and reducing risks and protecting assets).

"Internal projects "don't make money directly, but they change the way you work," Kemp wrote. In such cases, the customer is inside the company or organization. External projects are for customers outside the corporation. They make money "and delight the customer." They can also lead to repeat business and referrals.

There are two types of companies, Kemp noted. Each benefits from project management in different ways. Type 1 companies focus on external projects and do unique custom work for customers. These include law firms, caterers, Web design companies, architects, and television commercial production companies. Type 2 companies (including manufacturers, wholesalers, and retailers) make or sell products. These include beauty parlors, restaurants, retail stores, manufacturing companies, and building supply stores.

"When Type 1 companies do good work on projects, they deliver on time, within budget, and give the customers everything they wanted and more," Kemp wrote. Projects within Type 2 companies help "solve problems and work smarter." Examples include the launch of a new product, the opening of a new location, production of a catalog, or solving a problem like a broken assembly line. "Internal projects need to make sure that, when we've done installing the new technology, we're actually working in new ways, and that those new ways of working actually are more effective and more efficient," Kemp wrote.

A project manager should avoid jargon, but make objectives SMART (specific, measurable, aggressive, realistic, and time-sensitive), Kemp advised. "The more specific you are, the more likely other people will understand and meet those needs," Portny wrote.

PITFALLS OF PROJECT MANAGEMENT

The transitory nature of projects can create problems because of the additional assignments, new people on teams, and a lack of direct authority, Portny cautioned. "The project manager's own experience is often technical in nature, yet her success requires a keen ability to identify and resolve sensitive organizational and interpersonal issues," he added.

Obstacles to project planning, according to Lawson, include areas related to company culture. Examples are cost restraints, a fire-fighting mentality within the organization (the preoccupation with crises), and over-reliance on outside consultants. Individual reluctance can also create obstacles in the form of laziness, risk aversion, overconfidence, and poor experience. "Without a clear definition, a project is virtually doomed to failure from the start," Lawson wrote.

Kerzner cited a case where a company gave hefty raises to project managers as rewards for their work, which caused resentment among critical line managers. They threatened to quit if not put on the project-manager career track. "Executives were now faced with a headache of trying to repair the damage," Kerzner wrote.

Increasing customer demand for best practices and increased complexity of projects also pose challenges for project managers. "Spending too much time and money on customer satisfaction could lead to financial disaster on a given project," Kerzner warned. "Spending too much time on internal controls could lead to noncompetitiveness."

"When projects take longer than expected, they waste time and money," Kemp wrote. "Worse, nearly half of all projects fail altogether." A frequent mistake is to skip the planning and start phases if a project resembles a previous one, Portny wrote. The problem is "some elements are always different" such as staff or equipment.

Another common challenge is "scope creep," where incremental changes in a project's terms threaten its success by piling on new costs and causing delays. Kendrick called scope creep "the most damaging type of change risk, resulting in an average schedule slip of nearly nine weeks." Scope creep often arises from well-intentioned efforts to improve a project, especially a technical one. Ways that Portny recommended to deal with scope creep include always assessing the effects of any proposed changes, being honest about whether a change can even be implemented, and developing "mutually trusting relationships" with clients.

Adding more people to a project, to help out with the work, can increase the costs and cause delays. That is because of the extra communication needed to familiarize new team members with the project, Duncan Haughey wrote in "A Brief History of Project Management," a January 2010 essay posted on the Project Smart Web site. It is especially true of software project management, where the idea is known as "Brooks's law," named for Frederick P. Brooks, author of *The Mythical Man-Month: Essays on Software Engineering.*

TRENDS IN PROJECT MANAGEMENT

Project management theories and techniques are continually evolving. For example, the fourth edition of *A Guide to the Project Management Body of Knowledge*, published in

2009, eliminated any reference to the "Triple Constraint" or "Iron Triangle" of time, cost, and scope, which had been a key principle of project management. "Instead it discusses how project managers must balance the constraints of scope, quality, schedule, budget, resources and risk," noted Cyndi Snyder Stackpole in a January 2009 article on the Project Smart Web site. A similar trend in project management "is to pay more attention and recognize more of the factors outside the project and even outside the company that may influence project success," Newell and Grashina wrote in 2004.

"Project management is a dynamic process, and new ideas are continually entering into the methods of practice," Michael C. Thomsett wrote in his 2010 book *The Little Black Book of Project Management.* Among the trends he noted was the rising popularity of the Six Sigma approach to reducing defects in production. Developed in the 1980s by Mikel Harry, an engineer with Motorola, Six Sigma aims to reduce those defects to 3.4 for every million opportunities. Other quality management methodologies include Total Quality Management (TQM), and *kaizen*, from the Japanese for "improvement." Other trends Thomsett noted are the use of virtual project teams where team members are in multiple locations, increased use of outsourced vendors and suppliers, and an expanded focus on risk management to take into account terrorism, system hacking, identify theft, corporate espionage, and natural disasters.

PROJECT MANAGEMENT SOFTWARE

The use of computers has revolutionized project management. Software makes it easier and quicker to perform calculations and prepare charts that previously required tedious effort. For example, before the advent of computers, calculating the internal return on investment, a popular tool for evaluating the viability of a project, could only be determined by trial and error, Newell and Grashina wrote.

"Software tools for project management can make 'what-if' exploration of project options easier," Kendrick wrote in 2010. Among the most popular project management applications is Microsoft Project. Kendrick described this as a "midrange" tool adequate for modest projects lasting 6 months to a year. For more elaborate projects, he recommended a high-end tool, such as from Primavera. As Portny noted in 2007, more than fifty project management packages are on the market. Many other stand-alone software applications, such as Microsoft Word and Intuit QuickBooks, are also used in project management. Open-source project management applications include GanttProject, which creates Gantt charts and assigns human resources, among other tasks, according to its Web site.

"Remember the old adage: Garbage in, garbage out," Portny warned. "Even the most advanced software package can't help your project if people don't submit accurate and timely data."

PROJECT MANAGEMENT CERTIFICATION

Many universities offer programs in project management. Professional organizations also offer certification in the profession. A leading organization is the Project Management Institute. Founded in 1969 and based in Newtown Square, Pennsylvania, the PMI had 420,000 members as of 2010. The PMI offers five credentials. These range from Certified Associate in Project Management to Project Management Professional (PMP). The certified associate designation requires a high school diploma or equivalent and 1,500 hours of experience or 23 hours of project management education. The PMP designation requires 4,500 hours "leading and directing project tasks" with a bachelor's degree or equivalent, or 7,500 hours with a high school diploma or equivalent, according to the PMI website. The PMI also publishes *A Guide to the Project Management Body of Knowledge*, also known by its trademarked name *PMBOK Guide*. The fourth edition was published in 2009.

Other professional bodies include the International Project Management Association (IPMA), the American Society for the Advancement of Project Management (ASAPM), the American Academy of Project Management (AAPM), and the Association of Project Management (APM) based in the United Kingdom.

PROMISSORY NOTES

A promissory note is a promise to pay. It is a formal written commitment (also known as a loan agreement or contract) between two parties that is usually necessary when money is borrowed and lent between them. All business loans secured from a bank or other lending institution have some sort of promissory note, but they are also recommended for loans between two individuals (even if the loan is between family members or close friends) to avoid any misunderstandings or possible legal troubles. A promissory note differs from an IOU, which is an informal notice of debt and does not specify repayment terms.

A promissory note should have several essential elements, including the name of the borrower and lender, the amount of the loan, the date by which it is to be paid back, the interest rate, and a record of any collateral that is being used to secure the loan. Other interest-rate options, like discounting or compensating balance requirements, can also be included.

A compensating balance is usually required for large loans or lines of credit. It requires that the borrower maintain an account with a specified minimum level account balance at the lending institution (usually a bank). This account balance earns little or no interest and also raises the effective interest rate of the loan. Default terms (what happens if a payment is missed or the loan is not paid off by its due date) should also be spelled out in the promissory note. When the promissory note is discounted, the interest is taken off the principal amount at the beginning of the loan. The borrower pays back the entire amount, even though he only received the principal minus the interest. This practice is not very common because it is a higher effective rate of interest than the stated rate for the borrower.

When signing a promissory note, both the lender and the person receiving the loan should be fully aware of the note's language, including all legal terms, accounting principles, agreement terms in very small print, arbitration clauses, and other boilerplate language. One obvious way to do this is to read the promissory note carefully in its entirety before committing a signature to it. If there are any questions or confusion regarding the contents of the promissory note, a certified public accountant (CPA) or lawyer should be called on to make sure everything is understandable. When a casual promissory note is drawn up between two individuals, the Internal Revenue Service (IRS) has a required interest rate. A CPA can help determine if the interest rate stated in the promissory note is too low and if it will result in penalties or automatically be raised. If the loan is interest free, the IRS may consider it a gift and require that a gift tax be paid on it. Conversely, there are state laws governing maximum interest rates to prevent usury, or interest rates that make repayment excessively difficult for the borrower.

Another point that businesses may want to consider when drafting a promissory note is what to do in case the business does not succeed. If the business is a corporation or limited liability company, it should be determined if the corporate shareholders or limited liability members will personally guarantee the loan. If this is not the case, they have no personal legal obligation to repay the loan in a worst-case scenario.

PROPRIETARY INFORMATION

Proprietary information, also known as a trade secret, is information a company wishes to keep confidential. Proprietary information can include secret formulas, processes, and methods used in production. It can also include a company's business and marketing plans, salary structure, customer lists, contracts, and details of its computer systems. In some cases, the special knowledge and skills that an employee has learned on the job are considered to be a company's proprietary information.

LEGISLATION

Federal legislation came into effect in 1996 with the enactment of The Economic Espionage Act of 1996 (EEA). The EEA was in part modeled on The Uniform Trade Secrets Act (UTSA), a model law drafted by the National Conference of Commissioners on Uniform State Laws, but expands UTSA's definition. The EEA definition of trade secret follows from Section 1838, paragraph (3):

"[T]he term 'trade secret' means all forms and types of financial, business, scientific, technical, economic, or engineering information, including patterns, plans, compilations, program devices, formulas, designs, prototypes, methods, techniques, processes, procedures, programs, or codes, whether tangible or intangible, and whether or how stored, compiled, or memorialized physically, electronically, graphically, photographically, or in writing if

"(A) the owner therefore has taken reasonable measures to keep such information secret, and

"(B) the information derives independent economic value, actual or potential, from not being generally known to, and not being readily ascertainable through proper means by, the public[.]"

With the passage of EEA, trade secrets now enjoy protection under federal law as do inventions through patents, creative works through copyright, and unique names and symbols through trademark legislation. There are additional U.S. laws that define trade secrets in various ways and define the conditions under which theft has taken place. Based on such laws a significant body of case law covers proprietary information and trade secrets. This legal framework recognizes a company's right to have proprietary information and provides the company with remedies when its trade secrets have been misused or illegally appropriated.

PROTECTING TRADE SECRETS

In general, for information to be considered proprietary, companies must treat it as confidential. Courts will not treat information readily available in public sources as proprietary. In addition, proprietary information must give the firm some sort of competitive advantage and should generally be unknown outside of the firm. A company must be able to demonstrate that it has taken every reasonable step to keep the information private if it hopes to obtain court assistance in protecting its rights. "Courts require that trade secret holders take 'reasonable' steps to maintain the secrecy of their trade secrets," Randy Kay wrote in the *San Diego Business Journal*. "Courts do not require that companies take all measures conceivable to maintain the secrecy, nor do courts require absolute secrecy. Rather, the confidentiality measures must be 'reasonable under the circumstances.'"

A company has several options to keep its information proprietary. Key employees with access to such information may be required to sign restrictive covenants also called confidentiality, nondisclosure, or noncompete agreements that prohibit them from revealing that information to outsiders or using it to compete with their employer for a certain period of time after leaving the company. Restrictive covenants are usually enforced by the courts if they are reasonable with respect to time and place and do not unreasonably restrict the former employee's right to employment. In some cases the covenants are enforced only if the employee has gained proprietary information during the course of his or her employment.

In addition, the courts generally consider it unfair competition for one company to induce people who have acquired unique technical skills and secret knowledge at another company to terminate their employment and use their skills and knowledge for the benefit of the competing firm. In such a case the plaintiff can seek an injunction to prevent its former employees and its competitor from using the proprietary information.

In a 2010 article for the *Wall Street Journal*, Sarah Needleman wrote about the pros and cons of asking employees to sign noncompete agreements. The most obvious benefit is that trade secrets and proprietary information are kept within the company. However, a less obvious benefit, specifically for those business owners who intend to sell their company some day, is that any potential

buyer will know that the information they are buying along with the business is secure. One downside of small-business owners asking employees to sign noncompete agreements is that it may scare off potential employees. One way larger firms can more easily require employees to sign noncompete agreements is by offering good benefits and big salaries, but small businesses do not always have this advantage. Every company needs to weigh the pros and cons and make a decision based on what their company does and who they do business with.

Companies may also develop security systems to protect their proprietary information from being stolen by foreign or domestic competitors. Business and industrial espionage is an ongoing activity that clandestinely seeks to obtain trade secrets by illegal methods. A corporate system for protecting proprietary information would include a comprehensive plan ranging from restricting employee access, to data protection, to securing phone lines and meeting rooms. In some cases a chief information officer (CIO) would be responsible for implementing such a plan.

As Kay noted, other means of demonstrating reasonable efforts at secrecy include marking documents as "confidential," prohibiting people from making photocopies of trade secret documents or removing them from company premises, limiting the access of employees to sensitive materials, creating a written trade secret protection plan, and bringing suit for the theft of trade secrets as required.

On the other hand, small businesses are unlikely to prevail in cases involving trade secret protection if they sell a product or publish technical literature that discloses the trade secret, expose the secret to employees or colleagues who have not signed confidentiality agreements, publish information about the secret in professional journals or on the Internet, or disclose the trade secret in public documents such as court records and government filings.

PROTOTYPE

Prototypes are working models of entrepreneurial ideas for new products. With certain types of products, prototypes are almost indispensable, and funding and building them can be the first test of the enterprise. On the other hand, an entrepreneur armed with a good prototype is able to show potential investors and licensees how the proposed product will work without having to rely exclusively on diagrams and his or her powers of description. Just as a picture is worth a thousand words, a prototype is worth a thousand pictures.

TYPES OF PROTOTYPES

There are basic types or stages of prototype creation, each of which can be used by the enterprising entrepreneur in securing financing or a licensee.

1. Breadboard. This is basically a working model of an idea, intended to serve the basic function of showing how the product will *work* not how it will look. Aesthetics, in other words, are secondary. The basic idea here is to show mechanical functionality. The approach is not suitable to a product that is mechanically straightforward and relies more fundamentally on such aspects as pizzazz or romance.
2. Presentation Prototype. This type of prototype is a representation of the product as it will be manufactured. Often used for promotional purposes, it should be able to demonstrate what the product can do, but it is not necessarily an exact copy of the final product. Presentation prototypes are, of course, handmade. In actual practice, small changes may be introduced to fit the product for rapid and efficient manufacturing. Such prototypes are ideal in situations where a manufacturer is being sought or the product will be licensed.

3. Preproduction Prototype. This type of prototype is for all practical purposes the final version of the product. It should be just like the finished product in every way, from how it is manufactured to its appearance, packaging, and instructions. This final-stage prototype is typically expensive to produce. It is also far more expensive to make than the actual unit cost once the product is in full production. However, the added cost is often well worth it. It is most valuable because it enables inventors and producers to go over every aspect of the product in fine detail, which can head off potential trouble spots prior to product launch. Such prototypes, of course, also lend themselves for photographic reproduction in early promotion, or to show mockups of campaigns in order additionally to interest future participants in the venture.

THINGS TO CONSIDER IN CREATING A PROTOTYPE

Prospective entrepreneurs with a new product idea should make sure that they consider the following when putting together a prototype:

- Adequately research the requirements of the product prototype. Early planning will save a great deal of time and useless running around.
- Make sure the prototype is well-constructed and that it will stand up to rough handling if it has to be shipped to others. Be prepared to receive the prototype back broken or damaged.
- Do not skimp on presentation, even at the prototype stage.
- Recognize that complex product ideas may require outside assistance from professional prototype makers. Universities, engineering schools, local inventor organizations, and invention marketing companies are all potential sources of information on finding a good person to help make a prototype. But before hiring a prototype maker, entrepreneurs should make certain that they can meet expectations. To help ensure satisfaction, conduct research on the maker's business reputation and make certain to communicate the concept adequately.
- Consider making multiple submissions to potential licensees. Some inventors send prototypes to several manufacturers at the same time. This harks back to planning, above, in which it is best to anticipate making five instead of one.

RAPID PROTOTYPING

A relatively recent development in the creation of prototypes is rapid prototyping (RP). Also known as desktop manufacturing, RP takes advantage of computer technology to turn designs into three-dimensional objects. Some older RP systems work by printing multiple layers of plastic ink to create a model of a computer-generated image. Some systems are able to freeze water into a three-dimensional ice sculpture model; the most sophisticated systems can create metal molds. RP technology is changing the way small and large companies make prototypes. Desktop manufacturing is becoming more affordable and accessible to small-business owners and inventors alike. Prototypes made with 3-D printers are at the forefront of desktop manufacturing. While larger companies and laboratories have been using 3-D printers for some time, this technology is rapidly becoming a consumer product. These printers work by printing substances in powder form (resin, cornstarch, plastic) in layers to create each object. Inventors can upload designs to any company offering 3-D printing and the prototype will be sent directly to them. Or, as the printers become more affordable, inventors can buy their own 3-D printer. One of the most innovative companies in 3-D printing may be MakerBot Industries. Formed in 2009, MakerBot sells 3-D printer kits for less than $1,000. The MakerBot printer, CupCake CNC, can then print anything the owner can design, including MakerBot parts.

Another low tech yet highly innovative and affordable technique for forming 3-D objects is a substance called Shapelock. Shapelock can be heated in a microwave or with a hairdryer and then formed into whatever shape is needed. Shapelock becomes solid when cool and is strong enough to be machined or drilled.

In a 2010 article for ThomasNet, David Butcher summed up what this means for inventors and small-business owners, "As the tools of engineering and manufacturing become accessible and affordable to a wider public, hobbyists are better able to recapture the spirit of amateur innovation."

PROXY STATEMENTS

A proxy statement is, according to the Securities and Exchange Commission (SEC), "a document which is intended to provide security holders with the information necessary to enable them to vote in an informed manner on matters intended to be acted upon at security holders' meetings." Publicly traded companies are required to send proxy statements to all shareholders, each of whom has a vote in the operation of the business, in advance of annual and special meetings. It includes information pertaining to issues that require a shareholder vote as well as a ballot for voting. This ballot is used for the election of the board of directors for the next year and may be used for other issues requiring a vote as well.

Proxy statements also provide information on all other matters which will be discussed at the annual or special meeting, such as approval of company auditors, approval of employee bonus plans, and approval of changes in the company's preferred stock. In addition, proxy statements contain a wealth of financial information about a company's significant shareholders, composition of the board of directors (including background and investment holdings), and compensation (salary, bonuses, stock options) paid to its top executives.

Finally, proxy statements contain SEC-mandated performance graphs detailing the company's stock performance and shareholder return when stacked up against other industry indexes, such as a national market index (like the Standard & Poor's 500), and broad industry averages. This information, if studied with a discerning eye, can help stockholders discern the fortunes and priorities of a company's top management. It serves as a financial benchmark for comparing the relationship between executive compensation and company performance. For example, proxy statements are less likely to create controversy if the company is performing well and rewarding stockholders of publicly traded companies with profits, or if the company is struggling financially and the executives are limiting their compensation accordingly. However, if key executives are pulling in enormous compensation packages while the company founders, attentive shareholders will notice. This aspect of the proxy statement cannot be hidden from public view, so experts urge leaders of growing firms to exercise appropriate judgment when establishing executive compensation packages.

The global financial crises that began in 2008 and resulted in the bailout of many struggling U.S. companies led to increased scrutiny of executive pay. A 2010 article in the *Wall Street Journal* examined the year-end proxy statements of eighteen companies and determined that CEO pay for these companies in 2009 was down by 30 percent from the previous year. Steven Eckhaus, a lawyer who specializes in compensation, believes this is due to the fact that proxy statements are being so carefully studied. Eckhaus infers that executives are "taking much less than they could get."

In 2007 the SEC adapted the proxy delivery rules to encourage shareholders to view proxy statements online. The "e-proxy" or "notice and access" model was successfully implemented but did cause some confusion among shareholders who had to access the proxy information themselves either by viewing it online or by requesting a hardcopy. In 2010 the SEC amended the new system in an effort to simplify it and to increase shareholder participation, which is a priority for the SEC. It may not be until some time in the early 2010s before firms and shareholders adapt to an online proxy delivery method, which ultimately should lead to a more simplified system.

PSYCHOGRAPHICS

Psychographics is a tool used in consumer marketing to understand consumers on the basis of their lifestyles, including their attitudes, preferences, values, and opinions. It is used to capture the reasons why people act the way they do, and it does so usually in order to more effectively market a product or a service more effectively to them. Unlike demographics, which by its nature is usually a *quantitative* stratification (often on the basis of geographic location or ethnicity), psychographics is a field that concerns itself with more *qualitative* data those things with which a culture or a portion of culture identifies.

MARKET SEGMENTATION

A concept important to understanding psychographics is known as market segmentation, which holds that different portions of a market (or "segments") have similar wants and demands. Every market can be broken up into segments, and different bases are used for organizing these segments. Geographic segmentation breaks up a group of individuals on the basis of where they are located. Demographics take into account the physical and personal characteristics of a human population, from religion to sex to age. Psychographics differs from each of these in a key way. While the attitudes, interests, and opinions of a population may be heavily influenced by the population's location, there might be people of similar psychographic bents in multiple locations across the globe. Similarly, although one might be able to predict as a stereotypical whole how a culture may act on the basis of gender, race, or age, the personalities and lifestyles of the individuals within a demographic group often vary widely.

Traditional segmentation has been unable to predict consumer behavior on the basis of these attributes, since a smaller sample of a population will often behave very differently. Generalizations often do not work in marketing; for example, although hair dye is often marketed to individuals over the age of fifty, some individuals begin to "go gray" much earlier, creating a need for a marketing strategy geared toward younger gray-haired individuals. Some mothers may enjoy looking matronly and will dress the part, while others will want to purchase clothes that look younger and more modern, making marketing clothing toward this portion of the population extremely difficult.

Methods of Characterization. People are categorized using psychographics on the basis of many different attributes; in fact, the various fields into which people can be stratified and categorized using psychographics is seemingly endless. The categories are based upon the observable data that demonstrate how a portion of society lives and thinks. Once these fields are observed and tracked, marketers and advertisers can make predictions based on the reasoning and emotion of those to whom they wish to sell. For instance, some consumers might have more lifestyles. These individuals will be likely to buy a specific range of products and services food and beverages that provide energy, sports or hiking equipment, or a gym membership, to name just a few. A conservative Christian household is likely to buy books and movies with religious themes, products from Christian companies, and religious magazine subscriptions. Those who embrace countercultural trends might be found in stores such as Hot Topic, and their lifestyle will likely feature a certain type of music, dress, and literature.

While psychographics seems linked superficially to personality, the two are extremely different. When determining food acceptance, for instance, personality is not a very good indicator as to what an individual is likely to choose to eat. A psychographic analysis of an individual's attitudes, interests, and opinions is much likelier to predict consumer food behavior, even without a sensory analysis (that is, what tastes and textures they are more apt to choose). Personality is certainly linked to psychographics, but it is only one of many dimensions that may be considered when studying consumer behavior for advertorial and marketing purposes.

External Factors. Many external factors may influence a population, so while psychographics is unique, it is also inextricably linked with other types of market segmentation. Culture can have a tremendous influence on psychographics. Those from individualist societies are more likely to emphasize emotion, embrace uniqueness, and achieve their own needs and goals. On the other hand, individuals from more collectivist cultures are much less concerned with being individual and unique or with achieving personal goals. Their wants and needs as consumers are contingent upon normative behaviors (in short, "fitting in"). Income is also a huge factor when it comes to marketing, especially with technology. As technology tends to be prohibitively expensive, those with less income are less likely to purchase expensive technology even though their needs are often the same as those with more money to spend. Interestingly enough, the iPod, a rather expensive piece of technology, has been adopted by those of many economic

strata. The technology has been marketed to people on the basis of attitudes and values. The iPod is seen as a "must-have" and plays to the individual's need for entertainment in a fast-paced environment.

INDICATORS AND MEASUREMENTS

Different indicators of psychographics measure widely different concepts. The Values and Lifestyle System is one of the most popular, using psychology to determine the precise relationship between people's personalities and their habits as consumers. Individuals are stratified into psychographic groups on the basis of "resources," a combination of income, education, and other factors; and "self-orientation," which is essentially a reflection of the consumer's spending habits. Spending habits are further broken into subcategories: those who purchase things based on what others think, those who spend money based on the impact it creates, and those who do so on the basis of their deep-seated belief systems. The psychographic ladder in this and similar indicators is based primarily on the resources of an individual and secondarily on how such an individual chooses to spend those resources impulsively, deliberately, cautiously, and everything in between. It takes into account the implicit marriage between economic status, morals, personality, and culture.

Life Stages. Another system for psychographic study breaks individuals into groups based on their current stage of life, since most individuals experience some sort of social and personal mobility throughout their lifetimes. Purchasing power here is linked to personal preferences, age, and other indicators. Wealthy households in these indicators are usually entirely separate from those of lower income since purchasing priority is dramatically different. Some indicators even base their psychographic analysis on how many individuals are "in charge" in the family, who these individuals are (nannies, grandparents, single parents, etc.), and what their preferences and priorities are. While each of these systems can provide insight into a customer's spending habits, not a single one can predict perfectly what a consumer will buy, and different businesses employ different psychographic methodologies.

Psychogaphics and Importance in Business. Psychographics are important to businesses for a number of reasons. First, they demonstrate to businesses what habits and attitudes individuals are predisposed to. These individuals may be dispersed among a wide range of ages, economic strata, and even cultures, but their consumption habits are similar. In radio, for example, where age has historically been an indicator as to what an individual will choose to hear, psychographics have been able to pinpoint the type of person likely to listen to a particular station or program.

Second, this information helps to understand the spending and consumption habits of these attitude groups and allows businesses to market products to these individuals more effectively. Advertising especially can be made to appeal to their habits. When a leading car company realized that its products appealed most to individuals seeking adventure, in its advertising it likened an off-roading experience to the joy of a clean child jumping in the mud.

Instead of advertising inexpensive clothing as a "cheap" option, clothing advertising often targets customers by making budget-priced clothing seem chic, professional, and trendy. These companies are then able to make consumers out of college students looking for jobs, young professionals getting acclimated to the working environment, and low-income businesspeople. Gender roles also play into advertising when a company finds a way to make a product seem "sexy," "masculine," or "feminine." Old Spice commercials are famous for promoting manliness, while makeup products are aggressively marketed as being "feminine." Some products walk the line with marketing: Victoria's Secret products are seen as "sexy," making women into something they want to be and also what men want women to be, creating consumers of both groups. Hair products, chocolate, pudding, and yogurt are often marketed to women even though they might be consumed by men and women alike.

Another great benefit for businesses is that psychographics can help identify ways to reach prospective customer bases with the same product using different approaches. Culture has historically been one of the most difficult barriers for international corporations to transcend because of very deep-seated traditions and beliefs. Controversial sales practices are sometimes used in marketing products, but studies have demonstrated that the way controversy is used varies from nation to nation. Americans are less likely than Europeans to purchase products that are marketed in a controversial way, because of the difference in ethical judgment between these two cultures. In spite of this fact, however, individuals in each culture are likely to view controversial marketing tactics as being "slightly unethical." Psychographics is useful in helping a business to determine what marketing approaches work to court mass appeal.

It is now understood that personality, attitudes, opinions, and values cannot necessarily be linked to more conventional methods of determining consumer behavior. Although age, race, and income can be helpful predictors of consumer behavior in a very general way, marketing has become much more specific. In the Internet age, more and more businesses are turning to psychographics to determine purchase patterns and marketing strategies that support and grow those patterns.

PUBLIC RELATIONS

Public relations (PR) describes the various methods a company uses to disseminate messages about its products, services, or overall image to its customers, employees, stockholders, suppliers, or other interested members of the community. The point of public relations is to make the public think favorably about the company and its offerings. Commonly used tools of public relations include news releases, press conferences, speaking engagements, and community service programs.

Although advertising is closely related to public relations as it too is concerned with promoting and gaining public acceptance for the company's products the goal of advertising is generating sales, while the goal of public relations is generating goodwill. The effect of good public relations is to lessen the gap between how an organization sees itself and how others outside the organization perceive it. Further, public relations involves a broader range of activities than merely advertising. As PR consultant David Arvin puts it in his 2009 book *It-s Not Who You Know It-s Who Knows You!: The Small Business Guide to Raising Your Profits by Raising Your Profile*, "When it comes to building a successful business, your brand is everything literally. It is everything you do and everything you don't do. It is the smell of your lobby and the color of your menu. It is the friendliness of your staff and their response to customer problems. It is the quality of your widgets, the timeliness of your bill paying, and the cleanliness of your bathrooms. It's how you arrive and how you depart."

Public relations involves two-way communication between an organization and its public. It requires listening to the constituencies on which an organization depends as well as analyzing and understanding the attitudes and behaviors of those audiences. Only then can an organization undertake an effective public relations campaign.

Many small-business owners elect to handle the public relations activities for their own companies, while others choose to hire a public relations specialist. Managers of somewhat larger firms, on the other hand, frequently contract with external public relations or advertising agencies to enhance their corporate image. But whatever option is chosen, the head of a company is ultimately responsible for its public relations.

GOALS OF PUBLIC RELATIONS

Some of the main goals of public relations are to create, maintain, and protect the organization's reputation, enhance its prestige, and present a favorable image. Studies have shown that consumers often base their purchase decisions on a company's reputation, so public relations can have a definite impact on sales and revenue. Public relations can be an effective part of a company's overall marketing strategy. In the case of a for-profit company, public relations and marketing should be coordinated to be sure they are working to achieve the same objectives.

Another major public relations goal is to create goodwill for the organization. This involves such functions as employee relations, stockholder and investor relations, media relations, and community relations. Public relations may function to educate certain audiences about many things relevant to the organization, including the business in general, new legislation, and how to use a particular product, as well as to overcome misconceptions and prejudices. For example, a nonprofit organization may attempt to educate the public regarding a certain point of view, while trade associations may undertake educational programs regarding particular industries and their products and practices.

STEPS IN A PUBLIC RELATIONS CAMPAIGN

Effective public relations requires a knowledge, based on analysis and understanding, of all the factors that influence public attitudes toward the organization. While a specific public relations project or campaign may be undertaken proactively or reactively (to manage some sort of image crisis), the first basic step in either case involves analysis and research to identify all the relevant factors of the situation. In this first step, the organization gains an understanding of its various constituencies and the key factors that are influencing their perceptions of the organization.

In the second step, the organization establishes an overall policy with respect to the campaign. This involves defining goals and desired outcomes, as well as the constraints under which the campaign will operate. It is necessary to establish such policy guidelines in order to evaluate proposed strategies and tactics as well as the overall success of the campaign.

In step three, the organization outlines its strategies and tactics. Using its knowledge of the target audiences and its own established policies, the organization develops

specific programs to achieve the desired objectives. Step four involves actual communication with the targeted public. The organization then employs specific public relations techniques, such as press conferences or special events, to reach the intended audience.

Finally, in step five the organization receives feedback from its public. How have they reacted to the public relations campaign? Are there some unexpected developments? In the final step, the organization assesses the program and makes any necessary adjustments.

The rise of the Internet, and particularly social networking sites, has dramatically changed the media environment in which public relations campaigns are conducted. As Matthew Philips noted in his 2010 article about the public-relations problem faced by Toyota following deaths linked to sudden acceleration, "Back in 1982, even as people in Chicago were dying of cyanide poisoning from tampered Tylenol bottles, the drugmaker's parent company, Johnson & Johnson, didn't have to worry about Internet message boards inciting panic or fueling rumors and fear-mongering. The strategy of corporate crisis management hasn't necessarily changed, but in the Google, Twitter, and Facebook era, the execution has." As Brian Solis and Deidre Breakenridge, the authors of *Putting the Public Back in Public Relations*, put it, "User-generated content (UGC) has flipped traditional PR and media on its head.... Traditional influence flowed from a news or information gatherer (for example, a journalist) to his or her audience. Blogs, social networks, online forums, and other forms of Social Media have changed the dynamics of influence. New information is now readily shared among peers." Solis and Breakenridge point out that these changes present both challenges and opportunities for PR professionals. They note that peer-to-peer sharing "now affords communications professionals the opportunity to reach beyond their 'A-list' media when telling their story. We can now also reach the 'magic middle,' that group of ideal customers who directly reach their peers through Social Media channels."

AREAS OF PUBLIC RELATIONS

Public relations is a multifaceted activity involving different audiences as well as different types of organizations, all with different goals and objectives. As a result, there are several specific areas of public relations.

Product Public Relations. Public relations and marketing work together closely when it comes to promoting a new or existing product or service. Public relations plays an important role in new product introductions by creating awareness, differentiating the product from other similar products, and even changing consumer behavior. Public relations can help introduce new products through staging a variety of special events and handling sensitive situations. For example, when the Prince Matchabelli division of Chesebrough-Pond's USA introduced a new men's cologne, there were twenty-one other men's fragrances being introduced that year. To differentiate its new offering, called Hero, Prince Matchabelli created a National Hero Awards Program honoring authentic male heroes and enlisted the participation of Big Brothers/Big Sisters of America to lend credibility to the program.

Public relations is often called on to give existing products and services a boost by creating or renewing visibility. For example, the California Raisins Advisory Board organized a national tour featuring live performances by the California Dancing Raisins to maintain interest in raisins during a summer-long advertising hiatus. The tour generated national and local publicity through media events, advance publicity, trade promotions, and media interviews with performer Ray Charles. Other public relations programs for existing products involve stimulating secondary demand, as when Campbell Soup Co. increased overall demand for soup by publishing a recipe booklet, or identifying new uses for the product. Public relations can interest the media in familiar products and services in a number of ways, including holding seminars for journalists, staging a special media day, and supplying the media with printed materials ranging from "backgrounders" (in-depth news releases) to booklets and brochures. Changes in existing products offer additional public relations opportunities to focus consumers' attention. An effective public relations campaign can help to position a product properly and overcome negative perceptions on the part of the general public.

Employee Relations. Employees are one of the more important audiences a company has, and an ongoing public relations program is necessary to maintain employee goodwill as well as to uphold the company's image and reputation among its employees. The essence of a good employee relations program is keeping employees informed and providing them with channels of communication to upper levels of management. Bechtel Group, a privately held complex of operating companies, published an annual report for its employees to keep them informed about the company's operations. The company used surveys to determine what information employees considered useful. A range of other communication devices were used, including a monthly tabloid and magazine, a quarterly video magazine, local newsletters, bulletin boards, a call-in telephone service, and "brown bag" lunches where live presentations were made about the company. Suggestion systems are another effective way to improve employee-management communications.

Other public relations programs focusing on employees include training them as company public relations representatives; explaining benefits programs to them; offering them

educational, volunteer, and citizenship opportunities; and staging special events such as picnics or open houses for them. Other programs can improve performance and increase employee pride and motivation. Public relations can also play a role in recruiting new employees; handling reorganizations, relocations, and mergers; and resolving labor disputes.

Financial Relations. Financial relations involves communicating not only with a company's stockholders, but also with the wider community of financial analysts and potential investors. An effective investor relations plan can increase the value of a company's stock and make it easier to raise additional capital. In some cases special meetings with financial analysts are necessary to overcome adverse publicity, negative perceptions about a company, or investor indifference. Such meetings may take the form of full-day briefings, formal presentations, or luncheon meetings. A tour of a company's facilities may help generate interest among the financial community. Mailings and ongoing communications can help a company achieve visibility among potential investors and financial analysts.

Annual reports and stockholder meetings are the two most important public relations tools for maintaining good investor relations. Some companies hold regional or quarterly meetings in addition to the usual annual meeting. Other companies reach more stockholders by moving the location of their annual meeting from city to city. Annual reports can be complemented by quarterly reports and dividend check inserts. Companies that wish to provide additional communications with stockholders may send them a newsletter or company magazine. Personal letters to new stockholders and a quick response to inquiries insure an additional measure of goodwill.

Community Relations. A comprehensive, ongoing community relations program can help virtually any organization achieve visibility as a good community citizen and gain the goodwill of the community in which it operates. Banks, utilities, radio and television stations, and major retailers are some of the types of organizations most likely to have ongoing programs that might include supporting urban renewal, performing arts programs, social and educational programs, children's programs, community organizations, and construction projects. On a more limited scale, small businesses may achieve community visibility by sponsoring local sports teams or other events. Support may be financial or take the form of employee participation.

Organizations have the opportunity to improve goodwill and demonstrate a commitment to their communities when they open new offices, expand facilities, and open new factories. One company increased community awareness of its presence by converting a vacant building into a permanent meeting place. Another company built its new headquarters in an abandoned high school that it renovated. One of the more sensitive areas of community relations involves plant closings. A well-planned public relations campaign, combined with appropriate actions, can alleviate the tensions that such closings cause. Some elements of such a campaign might include offering special programs to laid-off workers, informing employees directly about proposed closings, and controlling rumors through candid and direct communications to the community and employees.

Organizations conduct a variety of special programs to improve community relations, including providing employee volunteers to work on community projects, sponsoring educational and literacy programs, staging open houses and conducting plant tours, celebrating anniversaries, and mounting special exhibits. Organizations are recognized as good community citizens when they support programs that improve the quality of life in their community, including crime prevention, employment, environmental programs, cleanup and beautification, recycling, and restoration.

Crisis Communications. Public relations practitioners become heavily involved in crisis communications whenever there is a major accident or natural disaster affecting an organization and its community. Other types of crises involve bankruptcy, product failures, and management wrongdoing. In some cases, crises call for an organization to become involved in helping potential victims; in other cases, the crisis may require rebuilding an organization's image. In any case, experts recommend that business owners prepare a plan in advance to deal with potential crises in an honest and forthright manner. The main objective of such a plan is to provide accurate information quickly in order to reduce uncertainty. After the San Francisco earthquake of 1989, for example, the Bank of America utilized its public relations department to quickly establish communications quickly with customers, the financial community, the media, and offices in forty-five countries to assure them the bank was still operating.

Government and Political Relations. Public relations in the political arena covers a wide range of activities, including staging debates, holding seminars for government leaders, influencing proposed legislation, and testifying before a congressional committee. Political candidates engage in public relations, as do government agencies at the federal, state, and local levels.

Trade associations and other types of organizations attempt to block unfavorable legislation and support favorable legislation in a number of ways. The liquor industry in California helped defeat a proposed tax increase by taking charge of the debate early, winning endorsements, recruiting spokespersons, and cultivating grassroots support. A speakers bureau trained some 240

industry volunteers, and key messages were communicated to the public through printed materials and radio and television commercials.

Public Relations in the Public Interest. Organizations attempt to generate goodwill and position themselves as responsible citizens through a variety of programs conducted in the public interest. Some examples are environmental programs (including water and energy conservation) and antipollution programs. Health and medical programs are sponsored by a wide range of nonprofit organizations, healthcare providers, and other businesses and industries. These range from encouraging other companies to develop AIDS-in-the-workplace policies to the American Cancer Society's Great American Smokeout. Other programs offer political education, leadership and self-improvement, recreational activities, contests, and safety instruction.

Consumer Education. Organizations have undertaken a variety of programs to educate consumers, building goodwill and helping avoid misunderstandings in the process. Opportunities for educating consumers might include sponsoring television and radio programs, producing manuals and other printed materials, producing materials for classroom use, and releasing the results of surveys. In addition to focusing on specific issues or industries, educational programs may seek to inform consumers about economic matters and business in general.

Other Public Relations Programs. Other types of programs that fall under the umbrella of public relations include corporate identity programs, ranging from name changes and new trademarks to changing a company's overall image. Special events may be held to call attention to an organization and focus the public's goodwill. These include anniversary celebrations, events related to trade shows, special exhibits, or fairs and festivals. Speakers bureaus and celebrity spokespersons are effective public relations tools for communicating an organization's point of view. Speakers bureaus may be organized by a trade association or an individual company. The face-to-face communication that speakers can deliver is often more effective than messages carried by printed materials, especially when the target audience is small and clearly defined.

PUBLIC RELATIONS FOR SMALL BUSINESSES

Like other types of organizations, small businesses can benefit from public relations in terms of their relationships with customers, employees, investors, suppliers, or other interested members of the community. Since small-business owners are the most visible representatives of their own companies, they frequently handle many of the public relations functions in person. If the activity is principally associated with public appearances and participation in public events, the owner's natural abilities will be to the fore. But if a campaign needs to be launched, and funds are available, professional help may well be needed.

Effective PR professionals will be, above all, knowledgeable about press relations. For ongoing and routine assistance, the small business is well served by engaging the services of an experienced freelance writer with an extensive journalism background now specializing in helping companies "tell their story." Such individuals, very often one-person operations, have wide contacts and know not only how to prepare but also how to get materials placed with the right media. If a large campaign looms ahead, such consultants are also the ideal contact for selecting the right firm for a major campaign.

While communication is the essence of public relations, an effective public relations campaign is based on action as well as words. Whether it is practiced formally or informally, public relations is an essential function for the survival of any organization. Small-business owners cannot afford to neglect public relations. But lavish parties and gifts are not necessary. It is possible vastly to improve a small business's image within its community while also controlling public relations expenditures. Sponsoring a local softball team, speaking at a chamber of commerce meeting, and volunteering at a neighborhood cleanup are among the wide variety of public relations activities readily available to small businesses.

PURCHASING

Purchasing is the act of buying the goods and services that a company needs to operate or manufacture products. Given that the purchasing department of an average company spends an estimated 50 to 70 percent of every revenue dollar on items ranging from raw materials to services, there has been greater focus on purchasing in recent years as firms look at ways to lower their operating costs. Purchasing is now seen as more of a strategic function that can be used to control bottom-line costs. Companies are also seeking to improve purchasing processes as a means of improving customer satisfaction.

THE TRADITIONAL PURCHASING PROCESS

The traditional purchasing process involved several steps requisition, soliciting bids, purchase order, shipping advice, invoice, and payment that have come to be increasingly regarded as unacceptably slow, expensive, and labor intensive. Each transaction generated its own paper trail, and the same process had to be followed whether the item being purchased was a box of paper clips or a new bulldozer.

In this traditional model, purchasing was seen as essentially a clerical function. It was focused on getting the right quantity and quality of goods to the right place at the right time at a decent cost. The typical buyer was a shrewd negotiator whose primary responsibility was to obtain the best possible price from suppliers and ensure that minimum quality standards were met. Instead of using one supplier, the purchaser would usually take a divide-and-conquer approach to purchasing, buying small amounts from many suppliers and playing one against the other to gain price concessions. Purchasing simply was not considered to be a high-profile or career fast-track position. When surveys were taken of organizational stature, purchasing routinely rated in the lowest quartile.

That attitude has changed in recent years, in part because of highly publicized cases wherein companies have achieved stunning bottom-line gains through revamped purchasing processes. In addition, increased competition on both the domestic and global levels has led many companies to recognize that purchasing can have important strategic functions. As a result, new strategies are being used in purchasing departments at companies of all sizes.

Analysts observe that in this new purchasing environment, a guideline known as the total cost of ownership (TCO), has come to be a paramount concern in purchasing decisions. Instead of buying the good or service that has the lowest price, the buyer instead weighs a series of additional factors when determining what the true cost of the good or service is to his or her company. TCO calls for closer attention to *what else* should be counted in addition to price. Categories include freight, warranty requirements, financing costs, tooling requirements, storage/inventory costs, disposal costs, and the like but netting out scrap values. As *The Procurement and Supply Manager's Desk Reference* notes, "TCO can be a useful tool when evaluating various alternative solutions to a particular acquisition requirement and when demonstrating or comparing return-on-investment alternatives."

To lower TCO, companies are taking a number of steps to improve purchasing.

STRATEGIC SOURCING

Strategic sourcing is one of the key methods that purchasing departments are using to lower costs and improve quality. Strategic sourcing involves analyzing what products the company buys in the highest volume, reviewing the marketplace for those products, understanding the economics and usage of the supplier of those products, developing a procurement strategy, and establishing working relationships with the suppliers that are much more integrated than such relationships were in the past. During this process, the team conducting the analysis should ask these questions:

- Why do we buy this product or service?
- What do we use it for?
- What market conditions do suppliers operate under?
- What profit margin do suppliers seek to obtain?
- What is the total price of purchasing from a particular vendor (in other words, the cost of the item plus the costs associated with quality problems)?
- Where is the good or service produced?
- What does the production process look like?

The products that are purchased in the highest volume will be the best candidates for cost reductions. That is because once those products are identified, the company can then justify the time and expense needed to closely study the industry that supplies that product. It can look at the ways key suppliers operate, study their business practices to see where the most money is added to the final cost of the product, and then work with the supplier to redesign processes and lower production costs. This maximizes the contribution that suppliers make to the process.

By knowing the market and knowing how much it costs for a supplier to do business, the purchasing department can set "target prices" on goods. If the supplier protests that the price is far too low, the purchasing company can offer to visit the supplier's site and study the matter. Such visits can occasionally spot problems in the supplier's operation that can help the vendor shave costs and thus lower price. Such "supplier alliances" can result in improved

buyer/seller communication, improved planning, reductions in lead time, concurrent engineering, decreased paperwork, and better customer service.

The alliances also can sometimes register significant improvements in product quality. Buyers can build clearly defined quality targets into their target prices. It will then work with the supplier to improve the manufacturing process until that quality target is met. Such a process can yield enormous benefits for buyers, including reduced inventory levels, faster time to market, significant cost savings, and reduced development costs.

Not all suppliers can meet the high standards demanded in this purchasing environment. Some studies indicate that companies that adapt strategic sourcing have lowered the number of suppliers they use by an average of nearly 40 percent. What characteristics make a good supplier, then? If the supplier is willing to partner, then analysts have identified several traits that good suppliers share:

- Commitment to continuous improvement
- Cost-competitive
- Cost-conscious
- Customer-oriented
- Encourages employee involvement
- Flexible
- Financially stable
- Abe to provide technical assistance

Analysts indicate that suppliers receive some benefits in the emerging purchasing dynamic as well. Reduced paperwork, lower overhead, faster payment, long-term agreements that lead to more accurate business forecasts, access to new designs, and input into future materials and product needs have all been cited as gains. Other observers, meanwhile, point out that some buyer-supplier relationships have become so close that suppliers have opened offices on the site of the buyer, an arrangement that can conceivably result in even greater improvements in productivity and savings. Of course, companies are not going to form such "partnerships" with all of their suppliers. Some form of the traditional purchasing process involving bidding and standard purchase orders and invoices will continue to exist at almost every company, and especially at smaller companies that do not have the financial weight to make large demands on their suppliers.

EMPOWERING TEAMS

In addition to strategic sourcing, there are other methods companies can use to improve purchasing. One is creating cross-functional teams that involve purchasing personnel in every stage of the product design process. In the past, purchasers were not involved at all in the design process. They were simply instructed to purchase the necessary materials once a new product had been created. Now, purchasers (and suppliers) are increasingly included from the start of the new product process to ensure that the products needed to create product are readily available and are not prone to quality problems. Suppliers tend to be experts in their field, so they bring a large knowledge base to the design process that would otherwise be missing. This can help prevent poor designs or manufacturing mistakes.

These teams have broken down barriers and helped abolish the old manufacturing method that was known as the "over the wall" method of productions each business unit would work on a project until its portion of the job was completed. It would then "throw the product over the wall" to the next functional team that was waiting to perform its part of the manufacturing process. The new cross-functional teams often include personnel from purchasing, manufacturing, engineering, and sales and marketing. This approach relies on the creation of strong and smooth relationships between the different employees involved in this process. Some purchasing experts note the importance of building relationships in this field. According toTom DePaoli, author of *Common Sense Purchasing: Hard Knock Lessons Learned From a Purchasing Pro*, "Purchasing is the art of building relationships. It is not about negotiations, transactions, industry knowledge, know-how or technology. It is all about building strong relationships and gaining the trust of suppliers, customers, and colleagues."

Purchasing teaches other members of the team how to deal directly with suppliers, cutting the purchasing personnel out of the loop. This is important in that it eliminates much of the time-consuming work that buyers had to deal with (soliciting bids, creating purchase orders, etc.) and frees them to concentrate on the part of their job where their expertise most pays off: finding suppliers and negotiating prices and quality standards.

JUST IN TIME PURCHASING

Just-in-time (JIT) manufacturing became one of the biggest trends in all facets of industry in the 1990s. JIT companies maintain only enough inventory to manufacture the products they need in the very near future. Parts are ordered on a near-continuous basis and often go directly from the loading dock to the assembly line. The benefits of this system include reduced inventory, improved quality, reduced lead time, reduced scrap and rework, and reduced equipment downtime. However, when a company shifts to JIT manufacturing, it must also shift to JIT purchasing.

JIT purchasing requires a nearly 180-degree change in purchasing philosophy. Traditional purchasing meant building a supplier list over time by constantly adding

new suppliers, spreading purchases around, and maintaining higher inventory levels in case demand for a product soared or quality from a supplier dipped suddenly. JIT purchasing demands that buyers *narrow* their supplier list to a chosen few who can deliver high-quality products on-demand and in a timely fashion.

The JIT purchasers pays a fairly high cost in homework and vendor relations to achieve the "just-in-time" optimum. In addition to meeting specifications, suppliers must have the ability to make frequent, on-time deliveries and to provide very large volume commitments or single sourcing arrangements. Quality may be the toughest of these standards for suppliers to meet; the JIT purchaser should deal only with companies that utilize statistical analysis to verify the quality of their output. Failure to do so should eliminate the supplier from even being asked to submit a bid.

For frequent, on-time deliveries, it often helps if the supplier is located in the same geographic region as the buyer. That way, it is easier for the supplier to react to a sudden, unexpected demand for its product, and it costs far less to make the frequent deliveries that are needed. Those lower costs can in part be passed on to the buyer.

In single sourcing arrangements, it is not uncommon for the buyer to exert some influence over the supplier's business processes. The buyer has made such a significant commitment to the supplier, and is such a large portion of the supplier's total business, that it has the right to expect some say in the supplier's business practices. For some suppliers, this is an uncomfortable arrangement.

PURCHASING CARDS

As transaction costs soar (some companies report spending as much as $300 per transaction in clerical and other costs), companies are looking to buy smarter and cut costs any way possible. One popular method is recent years is to supply selected employees with purchasing or corporate procurement cards. The cards are similar to credit cards; in fact the big three credit card companies VISA, MasterCard, and American Express are among the leaders in purchasing cards. In most cases, the cards are used to purchase small business items. A master bill is sent straight to the purchasing department. These cards are true credit cards, however. In some cases, they work only between a buyer and suppliers identified in advance, eliminating the bank that is involved with credit cards.

Additionally, the cards can be coded to include a variety of important transaction information that reduces the amount of paperwork needed to track the sale, including sales tax data, customer code (such as job number or cost center), taxpayer identification number, and more. This coding allows companies to receive valuable information about each transaction and greatly streamlines the purchasing process. The Visa Web site states that the Visa Purchasing card allows business to "significantly reduce the time and cost of paying for a variety of business-to-business goods and services" by eliminating paper-based purchase orders and invoice processing. "The Visa Purchasing card is one of the most widely held procurement cards in the industry and can be an effective, cost-saving alternative to initiating a check request or purchase requisition."

The cards are beneficial to suppliers as well. The most important advantage is that the vendor receives payment much more quickly than in the past, sometimes in as short a period as 2 or 3 days. Additionally, the supplier saves money by not having to issue and mail an invoice, and the supplier knows the creditworthiness of the customer before the transaction is even processed.

Q

QUALITY CIRCLES

A quality circle is a participatory management technique that enlists the help of employees in solving problems related to their own jobs. Circles are formed of employees working together in an operation who meet at intervals to discuss problems of quality and to devise solutions for improvements. Quality circles have an autonomous character, are usually small, and are led by a supervisor or a senior worker. Employees who participate in quality circles usually receive training in formal problem-solving methods, such as brainstorming, Pareto analysis, and cause-and-effect diagrams, and are then encouraged to apply these methods either to specific or general company problems. After completing an analysis, they often present their findings to management and then handle implementation of approved solutions. (Pareto analysis, by the way, is named after the Italian economist, Vilfredo Pareto]1848 1923], who observed that 20 percent of Italians received 80 percent of the income thus the principle that most results are determined by a few causes.)

The interest of U.S. manufacturers in quality circles was sparked by dramatic improvements in the quality and economic competitiveness of Japanese goods in the post-World War II years. The emphasis of Japanese quality circles was on preventing defects from arising in the first place rather than through culling during postproduction inspection. Japanese quality circles also attempted to minimize the scrap and downtime that resulted from part and product defects. In the United States, the quality circle movement evolved to encompass the broader goals of cost reduction, productivity improvement, employee involvement, and problem-solving activities.

The quality circle movement, along with total quality control, while embraced in a major way in the 1980s, has largely disappeared or undergone significant transformations for reasons discussed below.

BACKGROUND

Quality circles were originally associated with Japanese management and manufacturing techniques. The introduction of quality circles in Japan in the postwar years was inspired by the lectures of W. Edwards Deming (1900 1993), a statistician for the U.S. government. Deming based his proposals on the experience of U.S. firms operating under wartime industrial standards. Noting that American management had typically given line managers and engineers about 85 percent of the responsibility for quality control and line workers only about 15 percent, Deming argued that these shares should be reversed. He suggested redesigning production processes to account more fully for quality control, and continuously educating all employees in a firm from the top down in quality control techniques and statistical control technologies. Quality circles were the means by which this continuous education was to take place for production workers.

Deming predicted that if Japanese firms adopted the system of quality controls he advocated, nations around the world would be imposing import quotas on Japanese products within 5 years. His prediction was vindicated. Deming's ideas became very influential in Japan, and he received several prestigious awards for his contributions to the Japanese economy.

The principles of Deming's quality circles simply moved quality control to an earlier position in the production

process. Rather than relying upon postproduction inspections to catch errors and defects, quality circles attempted to prevent defects from occurring in the first place. As an added bonus, machine downtime and scrap materials that formerly occurred due to product defects were minimized. Deming's idea that improving quality could increase productivity led to the development in Japan of the Total Quality Control (TQC) concept, in which quality and productivity are viewed as two sides of a coin. TQC also required that a manufacturer's suppliers make use of quality circles.

Quality circles in Japan were part of a system of relatively cooperative labor-management relations, involving company unions and lifetime employment guarantees for many full-time permanent employees. Consistent with this decentralized, enterprise-oriented system, quality circles provided a means by which production workers were encouraged to participate in company matters and by which management could benefit from production workers' intimate knowledge of the production process. In 1980 alone, changes resulting from employee suggestions resulted in savings of $10 billion for Japanese firms and bonuses of $4 billion for Japanese employees.

Active American interest in Japanese quality control began in the early 1970s, when the U.S. aerospace manufacturer Lockheed organized a tour of Japanese industrial plants. This trip marked a turning point in the previously established pattern, in which Japanese managers had made educational tours of industrial plants in the United States. Thereafter quality circles spread rapidly in the United States; by 1980, more than one-half of firms in the *Fortune* 500 had implemented or were planning to implement quality circles. To be sure, these were not installed uniformly everywhere but introduced for experimental purposes and later selectively expanded   and also terminated.

In the early 1990s, the U.S. National Labor Relations Board (NLRB) made several important rulings regarding the legality of certain forms of quality circles. These rulings were based on the 1935 Wagner Act, which prohibited company unions and management-dominated labor organizations. One NLRB ruling found quality programs unlawful that were established by the firm, that featured agendas dominated by the firm, and addressed the conditions of employment within the firm. Another ruling held that a company's labor-management committees were in effect labor organizations used to bypass negotiations with a labor union. As a result of these rulings, a number of employer representatives expressed their concern that quality circles, as well as other kinds of labor-management cooperation programs, would be hindered. However, the NLRB stated that these rulings were not general indictments against quality circles and labor-management cooperation programs but were aimed specifically at the practices of the companies in question.

SILVER BULLETS AND MARKSMANSHIP

By the end of the first decade of the twenty-first century, quality circles are almost universally consigned to the dustbin of management techniques. James Zimmerman and Jamie Weiss, writing in *Quality*, summed the matter up as follows: "Quality and productivity initiatives have come and gone during the past few decades. The list of 'already rans' includes quality circles, statistical process control, total quality management, Baldrige protocol diagnostics, enterprise wide resource planning and lean manufacturing. Most have been sound in theory but inconsistent in implementation, not always delivering on their promises over the long run."

Nilewide Marketing Review expressed the same idea in similar words: "Management fads should be the curse of the business world   as inevitably as night follows day, the next fad follows the last. Nothing more typifies the disastrous nature of this following so-called excellence than the example of quality circles. They rose to faddish heights in the late 80s presenting the so-called secret of Japanese companies and how American companies such as Lockheed used them to their advantage. Amid all the new consultancies and management articles, everyone ignored the fact Lockheed had abandoned them in 1978 and less than 12% of the original companies still used them."

Harvey Robbins and Michael Finley, in their book, *Why The New Teams Don't Work,* put it most bluntly: "Now, we know what happened to quality circles nationwide   they failed, because they had no power and no one listened to them." Robbins and Finley cite the case of Honeywell which formed 625 quality circles but then, within 18 months, had abandoned 620 of them.

Japanese industry obviously embraced and applied quality circles (the idea of an American thinker) and QC has contributed to Japanese dominance in many sectors. If QC became a fad in the United States and failed to deliver, implementation was certainly one important reason, as Zimmerman and Weiss pointed out. U.S. adapters of QC may have seen the practice as a silver bullet and did not bother shooting straight. The reason why a succession of other no doubt sensible management techniques have also, seemingly, failed to get traction may be due to a tendency by modern management to embrace mechanical recipes for success without bothering to understand and to internalize them fully and to absorb their spirit.

REQUIREMENTS FOR SUCCESS

The problems of adaptation, which have caused quality circles to be abandoned, are made plain by a look at the conditions two experts think are necessary for the success

of quality circles. Ron Basu and J. Nevan Wright, in their book *Quality Beyond Six Sigma* (another quality management technique) specified seven conditions for successful implementation of quality circles. These are summarized below:

1. Quality circles must be staffed entirely by volunteers.
2. Each participant should be representative of a different functional activity.
3. The problem to be addressed by the QC should be chosen by the *circle*, not by management, and the choice honored even if it does not visibly lead to a management goal.
4. Management must be supportive of the circle and fund it appropriately even when requests are trivial and the expenditure is difficult to envision as helping toward real solutions.
5. Circle members must receive appropriate training in problem solving.
6. The circle must choose its own leader from within its own members.
7. Management should appoint a manager as the mentor of the team, charged with helping members of the circle achieve their objectives; but this person must not manage the QC.

"Quality circles have been tried in the USA and Europe, often with poor results," Basu and Wright write. "From our combined first-hand experience of quality circles in Australasia, the UK and Europe, South America, Africa, Asia and India, we believe that quality circles will work if [these] rules are applied." Any experienced manager, contemplating the rules shown above and the typical management environments in which he or she works or has worked in the past, will be able to discern quite readily why QC has not taken a firm hold in the U.S. environment.

Although quality circles have largely fallen out of favor in large organizations, their guiding principles may continue to be relevant for small-businesses owners. An important element of success, confirmed by Basu and Wright, is that QC must be practiced in an environment of trust and empowerment. Small-business owners are often in a better position to create the necessary conditions, and the benefits of quality circles are more apparent in a smaller setting. As the third edition (2008) of *Small Business for Dummies* notes in reference to quality circles, "The appeal of the problem-solving tool inherent in quality circles is the age-old theory that two heads are better than one. This is especially true when those two (or more) heads are focused on solving a specific problem, and especially when those heads bring different perspectives to the problem-solving table."

QUALITY CONTROL

Quality control is a methodology employed in manufacturing to prevent defects in manufactured products. Abbreviated as QC, the method has been implemented in a number of ways each of which has its own name and following. Quality control is typically associated with statistical approaches. Quality management has strong philosophical aspects based on the insight that quality is as much the result of management approaches as it is of specific activities. The modern quality movement is a fusion of American know-how originally developed at Bell Laboratories and Japanese enterprise and implementation.

The several waves of quality control methods that have swept U.S. manufacturing since the 1950s are almost unthinkable except against the backdrop of Japanese industry achieving a world-class reputation and thus producing stimulus. The movement is very closely associated with an American mathematician and physicist, W. Edwards Deming (1900 1993), although Deming was one of two prominent individuals who helped the Japanese forge their approaches to manufacturing; the other was Joseph M. Juran (1904 2008), a Rumanian immigrant to the United States. America's embrace of QC followed its successful application in Japan. Some type of statistical quality control is practiced in connection with most demanding manufacturing processes, but the more "qualitative" aspects of QC have never been wholeheartedly embraced.

ORIGINS

Modern quality control originated with Walter A. Shewhart (1891 1967), then working at Bell Telephone Laboratories. Shewhart devised a control chart named after him in 1923, and in 1931 he published his method in *Economic Control of Quality of Manufactured Product.* Shewhart's method was introduced at Western Electric Company's Hawthorn plant in 1926. Juran was one of the people trained in the technique. In 1928 he wrote a pamphlet titled *Statistical Methods Applied to Manufacturing Problems,* which was later incorporated into the *AT&T Statistical Quality Control Handbook.* In 1951 Juran published his very influential *Quality Control Handbook.*.

Deming went to Japan to assist in the preparation of the 1951 Japanese Census. The Japanese Union of Scientists and Engineers (JUSE), having heard of Shewhart's techniques and knowing that Deming was an expert on statistical methods, invited Deming to lecture on statistical quality control. Deming gave a series of lectures in 1950 aimed at describing SQC and at motivating his audience of executives. He pointed out the link between quality, productivity, and potential gains in market share. He found an enthusiastic audience. JUSE also invited Juran to lecture in 1954 with similar success, but by that time Deming had achieved wide prominence in Japan. With the great success enjoyed by SQC in Japan, and through his own abilities as a teacher and promoter of quality control and related management approaches, Deming became the iconic figure in the field, the "father of quality control." (Later, JUSE established the prestigious Deming Prize for quality-related achievements by individuals and organizations.)

Japanese improvements in industrial performance eventually aroused interest in the United States in the early 1970s, led by Lockheed Corporation. Quality control then took on a life of its own in this country.

QUALITY CONTROL FUNDAMENTALS

Before the advent of statistical quality control, control was exercised by inspecting the output of manufacturing processes and removing defective items. The modern technique established an upstream method for detecting deviations from specified quality early detection used to trigger analysis of causes and then changes to manufacturing procedures.

SQC requires that the producer first identify several characteristics of a product to be measured, typically its dimensions, fit with other parts, smoothness, and reflectivity. Carefully conducted test runs are made first; every part is measured and its measurements are recorded. Upper and lower boundaries are set for every measurement from one or repeated test runs, with the idea that any part that falls within these boundaries conforms to the product's quality standard. The center line between the boundaries is then used as a baseline for measurement. Once this quality standard is set, production can begin.

The quality control activity during production consists of taking samples from the run continuously, taking measurements on the samples immediately, and then plotting them rapidly on a Shewhart Chart. During production, measurements typically fall close to the center line, some above it, some below it, some on the center line. A certain amount of divergence is natural and cannot be avoided. So long as the plotted points are within the accepted boundaries, the product conforms to the quality standard. But SQC demands that if the plotted points begin to show a trend away from the center, rather than clustering randomly around it or, worse yet, begin to fall outside the boundaries in either direction then production must stop. The incoming raw material, the production machinery, and other inputs, such as lubricants, must next be examined to discover why results are trending in the wrong direction or fall outside the acceptable range.

SQC thus provides early warning that quality is deteriorating. When the method is applied strictly, production cannot resume until problems are detected and fixed, as shown by brief test runs. Needless to say, money is saved by preventing wasteful production of parts later, products that fail to fit, or parts that result in product failure in use. In aircraft and autos, such failures can mean injury and death and massive lawsuits. Corrective actions taken early improve the process as a whole. In due time they lead to better equipment designs.

The technique also lends itself to the gradual ratcheting up of quality. This is accomplished by setting "acceptable boundaries" more narrowly and then modifying the production process until the new quality goal is met. This, of course, may require substantial changes to the process or the raw materials used. In Deming's conceptualization of the process, quality is thus "designed in" rather than "inspected out." The concept of "continuous improvement" arose in such efforts to raise quality. Its downstream consequences are lower cost in production and in warranty service, advantages in pricing, and higher customer satisfaction, leading to brand loyalty and market share.

RELATED ISSUES, PRACTICES, AND MEASURES

Statistical quality control, as described above, is the fundamental description of quality control in the modern context. It is centered on measuring deviations from a norm and then taking actions to eliminate such deviations. But quality control, almost from the outset, came to be surrounded by what might be called a "cultural" radiation, namely management approaches, philosophies, and practices aimed at creating the right environment for

a quality-driven industrial process. These radiations in part came from Japanese management culture (very different from U.S. practice), the ideas of Deming (which both influenced and reflected Japanese practice), and elaborations of Deming's ideas by others.

Deming, for instance, in his 1982 book *Out of the Crisis*, formulated "14 points for management" which generally urge greater collaboration of effort, a longer-range view, commitment to improvement, constancy of purpose, and humane treatment and involvement of people. Some of Deming's points were revolutionary (e.g., to cultivate a single supplier for a resource, to eliminate management by objectives, numerical goals, and annual reviews of employees) while others have been adopted, albeit not always in the spirit in which Deming proposed them (e.g., team approaches, continuous improvement). Deming also condemned managing for the short term, management mobility (job hopping), reliance on technology rather than real solutions, and running operations by available numbers rather than a feel for the whole.

JIT. Just-in-time (JIT) procurement, which is much facilitated by the selection of a single, well-qualified supplier, arose from Japanese practice aimed at taking cost out of inventory control while maintaining very high quality. Closely related to JIT is the practice of "supplier partnering," in which suppliers and their customers use the same quality standards.

TQM. Total Quality Management (TQM) was also a method promoted by Deming. TQM is a philosophy of management in which the operational elements are continuous quality improvement, quality circles, and strong management backing.

ISO 9000. ISO 9000 is yet another result of the "quality movement." It represents a series of standards developed by the International Organization for Standardization (ISO) which defined, for different industrial operations, managerial and operational standards that, if followed, will produce high quality. Companies can obtain ISO 9000 certification by showing that they follow the standards ISO has laid out. This certification, then, can be used in advertising to inform the public that the company meets the ISO standard. The measure, of course, is somewhat indirect in that it guarantees certain practices, not necessarily what results from their use.

Lean Manufacturing. Lean manufacturing is a practice pioneered by Toyota and widely imitated. It is called "lean" because it attempts to achieve results with minimum input of labor, space, cost, and time. The method relies heavily on JIT, cross-trained and highly motivated employees, and equipment arrangements that both save space and also cluster related tooling in close proximity. Layouts and arrangements are organized so that changes between production cycles can be accomplished swiftly. Lean manufacturing thus is well-suited to predictable production orders making a single item. Quality management is intense so that one-pass production is possible.

Six Sigma. Six Sigma is actually a quality goal in the achievement of which a variety of QC approaches may be applied. It was initially named by Motorola, and "six sigma" was achieved there. But the concept "developed legs" when Jack Welch, the larger-than-life ex-CEO of General Electric, adopted it at GE. So what is Six Sigma? It means production in which 1 million pieces made will have virtually no defects. "Sigma" is the Greek letter used to designate the standard deviation from a norm as measured in statistics. If every part of a 1 million production run is defective, the sigma measurement will be infinite. If 10 percent of parts are defective, sigma will be 2.8; with 1 percent defect, the sigma increases to 3.8. Thus *the higher the sigma, the greater the perfection.* A sigma of 6.0 is reached when defects are down to 3.4 items out of a million, representing 0.00034 percent in effect about as close to perfection as one can practically get. While Six Sigma is much discussed, it is not so much a *method* as the target of a QC effort or program.

Poka-yoke. The United States is not alone in generating ever-new buzzwords to be used in quality control. A phrase from Japan is *poka-yoke*, meaning "avoid error." The coinage of a Toyota engineer, the concept refers to "designing in" methods of preventing mistakes. An example is a guard put on a drill press to stop the press before it drills too deep. The practice of *poka-yoke* lies in the identification of opportunities for "mistake proofing" and then actions to make them happen. This approach is one variant for defect correction after the statistical charts show that something is amiss.

STATUS AND FUTURE

The concept of quality control is very much present in the dominant management doctrines of the twenty-first century. Quality control in the modern sense has come a long way since its initial formulation in the 1920s and its widespread adaptation in the 1950s, first in Japan, then across the world. The statistical approach to quality control has become a routine part of many manufacturing processes; present-day textbooks and manuals on quality control, such as the 8th edition of *Quality Control* (2008) and the 8th edition of *Managing for Quality and Performance Excellence* (2010), are largely focused on learning and applying statistical methods to the problem of reducing defects and errors. Approaches such as Six Sigma demonstrate that the goals of statistical quality control are becoming ever-more ambitious.

The more managerial and people-oriented aspects of the quality movement have a spottier history and have produced a series of initiatives that have come, have gone, and have resurfaced in various guises. Ever-new labels indicate attempts to capture something evidently difficult to hold for long: ''quality circles,'' ''teaming,'' the ''learning organization,'' ''knowledge management,'' ''empowerment,'' and the like. The social phenomenon appears to indicate that it is ultimately easier to produce defect-free gadgets than perfect humans.

R

RACIAL DISCRIMINATION

Racial discrimination is the practice of letting a person's race or skin color unfairly become a factor when deciding who receives a job, promotion, or other employment benefit. It most often affects minority individuals who feel they have been unfairly discriminated against in favor of a Caucasian (or white) individual, but there have been recent cases where whites have claimed that reverse discrimination has occurred that is, a minority received unfairly favorable treatment at the expense of a white individual.

Court rulings handed down through the years have determined that a company's responsibility not to discriminate based on race begins even before an individual is hired. Companies can be held liable if preemployment screening or testing is determined to be discriminatory, if applications ask unacceptable questions designed to screen for race, or if the overall selection process is deemed to be unfair. One of the main indicators that racial discrimination has occurred in the hiring process involves the qualifications of the job applicants. While a slight difference in qualifications between a minority and white candidate does not automatically indicate racial bias (if the lesser qualified white candidate is hired over the minority candidate), a substantial difference in qualifications has almost always been upheld by the courts as a sure sign of racial discrimination.

FEDERAL LAWS PROHIBIT DISCRIMINATION

Since the social unrest of the 1960s, the federal government has been actively involved in preventing racial discrimination in the workplace. The most important law covering racial discrimination on the job is the Civil Rights Act of 1964 specifically, Title VII of that act, which strictly prohibits all forms of discrimination on the basis of race, color, religion, sex, or national origin in all aspects of employment. Written during a tumultuous period in U.S. history when many people expected the federal government to right social wrongs, the law was a monumental piece of legislation that changed the American employment landscape.

The law stated that it was unlawful for an employer to "fail or refuse to hire or to discharge any individual, or otherwise discriminate against any individual with respect to his compensation, terms, conditions, or privileges of employment, because of such individual's race, color, religion, sex, or national origin." The law covers hiring, dismissals, compensation, and all other aspects of employment, while also covering actual employment opportunities that are available. Examples of racial discrimination that would fall under the scope of the act include:

1. An employee who alleges that his or her manager only promotes nonminority employees and keeps minorities in entry-level positions.

2. An employee who alleges that a manager or other person in power tells jokes or makes statements that are demeaning, insulting, or offensive to members of a minority group.

3. A manager who makes it clear that he or she believes in racial stereotypes by admitting that he or she refuses to promote a certain minority group because "all [members of that group] are lazy."

The law covers business with fifteen or more employees, and applies to all private, federal, state, and local employers.

In many states, businesses with fewer than fifteen employees face the same rules due to local or state statutes. In addition to the hiring provisions, the law dictates that employers cannot in any way limit or segregate employees based on race in any way that would adversely affect their chances at promotions. Businesses may use a *bona fide* seniority or merit system and measure performance and earnings based on a quantity or quality measuring system, and employers may use ability tests to determine the most qualified candidates for a job as long as the test does not discriminate racially in any way.

The 1964 law was significantly amended for the first time by the passage of the Civil Rights Act of 1991. The law was passed to override several Supreme Court decisions that had made it much more difficult for employees to prove that racial discrimination had occurred. One of the many changes of the 1991 law was that it closed a loophole in the 1964 act that also involved a Civil War-era statute known as 42 U.S.C. Section 1981. The Supreme Court had held that Section 1981 applied to hiring and sometimes to promotions but did not cover racial harassment that occurred in the workplace once a person was hired. The 1991 act stated that all racial discrimination was covered by U.S. law, including post-hire harassment.

The other major enhancement under the 1991 act involved monetary damages. Before the law was passed, employees who sued an employer for discrimination and won could only recover lost wages or salary, lost benefits, attorney fees, other legal costs, and the costs associated with reinstatement. The 1991 law stated that employees could also recover punitive monetary damages for pain and emotional suffering, mental anguish, future lost wages and benefits, and more. Those damages could only be collected if it was proven that the discrimination was intentional and there was clearly "malice" or "reckless indifference" exhibited, but this was a radical change from the previous legislation. To protect employers from overly large court settlements, the amount of punitive damages was capped at $300,000 for certain cases of discrimination, although no caps apply in cases of ethnic or racial discrimination.

Other changes in the 1991 law involved employment practices that had a "disparate impact" on racial groups (that is, affected them more than white groups). These changes made it easier for a plaintiff to receive damages in cases where a discriminatory practice *and* a nondiscriminatory practice both played a part in a hiring or promotion decision, and allowed employees to challenge seniority systems that were put into place if the systems were later determined to be discriminatory. (In the past, workers could only sue at the time the system was first put into place.) Together, all of these changes made it easier for workers to prove discrimination claims, which increased the number of lawsuits nationwide.

Another update to antidiscrimination law was the 2009 passage of the Lilly Ledbetter Fair Pay Act. This act, passed in response to the Supreme Court ruling in *Ledbetter v. Goodyear Tire & Rubber Co.* (2007), amended the statute of limitations for bringing a discrimination claim against an employer. The Supreme Court had ruled in *Ledbetter* that the 180-day statute of limitations in the Civil Rights Act of 1964 began on the date when the pay was agreed upon. The 2009 act of Congress amended the Civil Rights Act so that the statute of limitations began at the date of the most recent paycheck. This act made it easier for victims of discrimination to bring equal-pay lawsuits.

THE EQUAL EMPLOYMENT OPPOR TUNITY COMMISSION

To oversee the federal civil rights legislation, a separate administrative body was created as part of the Civil Rights Act of 1964. The Equal Employment Opportunity Commission (EEOC), was created to enforce laws that prevent discrimination based on race, sex, color, religion, national origin, disability, or age when hiring, firing, or promoting employees. Four categories of people by race, color, sex, and creed were given "protected status" under the law, which was to be upheld by the EEOC. The commission is an independent regulatory body that has the power to launch investigations, file lawsuits, and create programs to eliminate discrimination.

The EEOC has been a controversial organization throughout its history. Liberal politicians believe that the agency was long overdue and that it is absolutely imperative that the agency be proactive in identifying and fighting discrimination in the courts, while conservatives believe that the organization is an example of "big government" that intrudes far too deeply into citizens' lives. The agency's strong enforcement of affirmative action policies (which actively seek to promote minorities over equally qualified whites in order to address past discrimination) has been its most controversial action, as many Americans oppose affirmative action.

Even with political opposition, the EEOC continues to be effective in fighting racial discrimination. In fiscal year 2008 alone, for instance, the EEOC obtained more than $124 million in benefits for complainants through settlement and conciliation (excluding litigation awards). Litigation awards accounted for another $102 million in fiscal year 2008.

STEPS TAKEN BY EMPLOYERS TO END DISCRIMINATION

Because racial discrimination can have adverse consequences for a company including lower morale, a divided workplace, expensive lawsuits, and public embarrassment some companies take highly visible steps to curtail discrimination

in the workplace. These include in-house workshops and training sessions on racial sensitivity and diversity in the workplace, training on employment laws, and adopting strict new rules against discrimination.

Many other companies only become active when prodded by events and circumstances. In November 2000, the Coca-Cola Company agreed to settle a racial discrimination suit by paying a penalty of $192.5 million. Sara Lee Corporation was forced to make a large cash settlement to a former employee who claimed that he was the butt of racist jokes and disparaging remarks, and that he was even forced to view a noose hanging in his workplace. In addition to the cash settlement, the amount of which was confidential, Sara Lee also agreed to establish training programs to raise awareness of the company's antidiscrimination policies.

To make sure that it is on the cutting edge of preventing racial discrimination, IBM has established individual employee task forces for almost every group that is employed by the huge company, including men, women, African Americans, Hispanics, Asians, Native Americans, gays and lesbians, and disabled persons. The groups, which are established at many of the company's offices, meet regularly to discuss diversity and workplace concerns. This represents an extreme example of the steps companies are taking to prevent discrimination, but actions of this type are becoming more common.

AFFIRMATIVE ACTION

Affirmative action is a controversial policy intended to counteract racial discrimination. *West's Encyclopedia of American Law* defines affirmative action as referring "to both mandatory and voluntary programs intended to affirm the civil rights of designated classes of individuals by taking positive actions to protect them." In other words, affirmative action actively promotes the interest of minorities over the white majority in order to correct past discrimination. For example, in a situation where a test is required before starting a particular job or to earn a promotion, minorities may be given preference over nonminorities for that job or promotion even though they score lower on the test than the nonminority worker. While this may seem wrong to some people, those who support affirmative action argue that past acts of discrimination have been so blatant that extraordinary steps are required to overcome those acts. At the start of the twenty-first century, however, affirmative action programs were under fire in the United States, with numerous court challenges occurring across the country.

One effect of affirmative action has been an increase in "reverse discrimination" lawsuits, in which nonminority workers allege that they have been discriminated against. In situations where companies have used affirmative action to help undo decades of blatant discrimination, white workers have become upset over being passed over for jobs and promotions. They claim that, if it is unfair not to hire a qualified worker just because he or she is a minority, then it should be equally unfair not to hire a qualified worker just because he or she is white. White employees have argued that, even though they have higher qualifications, experience, and skill, they are being passed over for jobs in favor of less-qualified candidates who are minorities.

In response to reverse discrimination lawsuits involving affirmative action programs, courts have recognized the need to overcome past racial bias but have also sided with the white workers in many cases. For example, in an attempt to redress past problems, a public university ruled that women and minorities would no longer have to take a test to qualify for a special employment program. As a result, for 9 years, every job opening in the program went to a woman or a minority, even though white males represented half of the applicant pool. When the university's program was challenged in a lawsuit brought by white males, the courts ruled that the test exemption ensured that "the sole purpose of the affirmative action plan was to circumvent a lawful ... preference program" and that the exemption violated Title VII because it caused white men to be excluded from the job in question. The school was forced to pay $113,000 to settle the case and correct the reverse discrimination.

In two cases decided in 2003, the Supreme Court indicated a continuing shift in its thinking about affirmative action without an outright declaration that affirmative action programs were unconstitutional. In *Grutter v. Bollinger*, the Court upheld the University of Michigan Law School's use of race in making admissions decisions. However, in *Gratz v. Bollinger*, the Court ruled that the University of Michigan's undergraduate admissions policy, which awarded extra points to racial minorities, was an unconstitutional violation of the Equal Protection clause of the Fourteenth Amendment. In its 2006 ruling in *Parents Involved in Community Schools v. Seattle School District No. 1*, the Supreme Court struck down the Seattle school district's race-based system of assigning students to public schools, indicating that schools and employers would have an increasingly difficult time meeting the Court's "strict scrutiny" test for accepting racial classifications by government agencies.

RACIAL DISCRIMINATION TRENDS

While advances have been made to improve race relations, there is statistical evidence to suggest that racial discrimination in the workplace is still commonplace and might even be getting worse rather than better. Charges of racial discrimination brought to the EEOC rose by 12 percent between 2006 and 2007, from 27,238 to 30,510. The wage gap between white and black workers is also a persistent

feature of U.S. society. In 2006 the median annual earnings of African American men were only 72.1 percent of the median earnings for white men; for African American women the figure was even lower: 63.6 percent. These figures represent a decrease from 1999, the peak year for African American incomes, when African American men earned 80.6 percent of what white men earned, and African American women earned 65 percent. Unemployment statistics tell a similar story. In March 2010 the unemployment rate for whites was 9.3 percent, whereas it was 16.6 percent for African Americans.

REBATES

Rebates, widely known as refunds, are a popular tool used by businesses to promote their products and services. Rebates are distinct from coupons and other forms of discounting in that they reimburse a customer for part of the purchase price following, rather than at the time of, the sale. By offering consumers cash back on the purchase price, rebates provide an incentive to buy a particular product.

Rebating evolved from the marketing technique of offering coupons. They were initially offered by producers of grocery-store goods and subsequently by manufacturers of nonfood items. Currently, businesses making use of rebates are diverse and include the manufacturers of health and beauty aids, household and office supplies, and small and large appliances, as well as automakers, wine and liquor manufacturers, and segments of the computer industry.

The cash amounts these companies offer their customers is similarly wide-ranging; some rebates of less than a dollar are offered, while other rebates on "big ticket" items such as automobiles have reached several thousand dollars. The size of the rebate offered depends on the base retail price, the nature of the product being promoted, and the number of goods backed up in the production pipeline.

HOW REBATES WORK

A rebate is created when a manufacturer offers a rebate to all who purchase its product. Typically the offer carries an expiration date of 6 to 8 months. The purchaser completes a form provided by the manufacturer and mails it along with any other items the manufacturer may require, such as a cash-register receipt or the Universal Product Code (UPC) snipped from the packaging to the address specified on the form.

Most commonly, the purchaser sends the rebate form and related "proof of purchase" items not to the manufacturer but to one of several large clearinghouses hired by the manufacturer to handle these transactions. The clearinghouse then processes the form and sends the purchaser a check in the manufacturer's name, usually within 4 to 8 weeks from the time the purchaser mails in the required information.

Companies use a number of means to get their rebate forms into the hands of customers. Many companies supply a pad of tear-off rebate forms to the stores selling their products; others print the form directly on the packaging or on a tag hanging from the merchandise. To announce the rebate offer and distribute the forms, companies may also place advertisements in newspapers and magazines and on the Internet, utilize home mailers, and place ads in the myriad refunders' newsletters developed by consumers to avail themselves of these offers. In addition, companies frequently use television and radio advertisements to publicize their rebate promotions. There are several Internet sites, such as Ebates.com, MrRebates.com, and RebatePlace.com, that direct consumers to rebate offers. Jillian Badanes discussed this new trend in rebating in her 2009 article about Ebates.com. When consumers set up an

account with Ebates.com they gain access to rebates for products from companies that have also set up an account on the company's Web site. As consumers utilize these rebates their refunds are automatically deposited into their Ebates.com account. This system coincides with the general trend toward online rebate submissions, which reduces the possibility of human error in the rebate process and leads to greater customer satisfaction.

PROS AND CONS

Rebates are highly attractive to most consumers. They provide a partial and tax-free cash reimbursement for their purchases; the Internal Revenue Service views rebates as a reduction in the price paid for a product, rather than as income. For manufacturers, rebating provides numerous advantages: it induces prospective customers to try their products; it boosts company sales and visibility; it relieves problems of excess inventory; and it attracts interest from retailers, who often help promote the offer and expand the shelf space allotted to the manufacturer's goods accordingly. Rebate promotions can thus help a company increase its leverage with retailers and develop brand loyalty and repeat business among consumers over the long run. Indeed, a study conducted by United Marketing Services (UMS) found that rebates are an effective means of establishing product awareness with consumers. In addition, the information consumers provide on rebate forms can be used to target future promotions.

As rebates have increased in popularity, however, several common problems have emerged. For example, many companies have experienced problems honoring their rebate offers, largely due to an inability to keep up with demand. In fact, some companies offer rebates with the knowledge that only a small percentage of consumers bother to take advantage of them. Collecting on a rebate takes some trouble and concentration; consumers are forgetful, mislay the rebate coupon or the proof of purchase, and thus pay a bonus for the product. Companies relying on such probabilities sometimes fail to anticipate the level of interest the product or the rebate may generate; they plan rebate processing poorly, produce long delays, lose good will and may even run out of money. This problem may be abating as more business move to online fulfillment of rebates.

Due to the frequent mix-ups and delays that have historically been associated with rebate processing, some consumers now tend to view rebate offers as a sleazy marketing tactic. This means that fewer consumers will base their purchase decisions on the availability of a rebate. Experts note that consumers can increase their chances of receiving rebates due by sending all the documentation requested in the rebate offer; keeping copies of all forms and receipts; checking on the status of overdue rebates with the company; and reporting any problems to the Federal Trade Commission, the Better Business Bureaus, or the state attorneys general. Finally, experts advise consumers never to buy anything just for the rebate.

RECIPROCAL MARKETING

Reciprocal marketing describes a situation in which two businesses promote each other in order to gain a mutual benefit. Such marketing, common in the tourism industry, emerged in a new form in the 1990s and continued in the 2010s in electronic retail. In the online business world, reciprocal marketing is also known as reciprocal linking: the most common application involves placing links on another company's Web site. A similar concept for Internet businesses is affiliate marketing, which occurs when one of the businesses involved in a reciprocal marketing arrangement pays the other for traffic or sales generated through a link. In the brick-and-mortar business world, reciprocal marketing is more commonly known as co-op marketing, cross-promotion, or collaborative marketing.

Reciprocal marketing is equally popular among small, entrepreneurial Web sites and large, well-established ones. Writing in *Entrepreneur*, Melissa Campanelli described reciprocal marketing as "a reliable strategy employed by the most innovative dotcoms." The sponsored links on sites such as Google.com are a high-profile example of the use of reciprocal marketing by the Internet's largest and busiest

Web sites, but the use of reciprocal marketing can be seen on the Web sites of businesses of all sizes. As it is a no- or low-cost option, reciprocal marketing is particularly popular among small businesses and Internet start-ups.

Reciprocal marketing offers a number of potential benefits for small-business owners. For example, it helps reduce the cost of attracting new customers, adds value to customers' shopping experience, and is inexpensive to implement compared with many traditional marketing schemes. As Hollis Thomases explained in an article for the *Baltimore Business Journal*, the key to successful reciprocal marketing is to find the right partners. The most suitable companies will be complementary in terms of philosophy, product line, and brand image. *SEO Made Simple: Strategies For Dominating The World's Largest Search Engine*, a 2009 book on strategies for generating greater Web traffic notes that "When you're developing reciprocal links, seek out Web sites that are contextually relevant to yours. In other words, if your site is about clothing, seek out other sites dedicated to apparel. These sites will tend to have similar content (keywords) as your site embedded in title tags, body copy, on-page links, and so on. Google favors links from sites that share the same or similar theme as your Web site, increasing the value of each incoming link." Reciprocal links can increase a Web site's traffic by maximizing search-engine hits. In addition, reciprocal linking often lasts longer than other forms of advertising.

While small-business owners can find potential partners for reciprocal marketing arrangements through traditional forms of networking, such as attending conferences, the use of online networking has become an increasingly popular trend. Social networking sites such as Facebook and MySpace have made reciprocal marketing even easier for independent artists and small businesses. As one discussion posting on Facebook noted, reciprocal marketing "is very simple. You send me an article about your business and I will post it on my blog. In return I will send you an article about my business and you will post it on your blog. We will both benefit from broadening our audience. There is no guarantee of sales, but it is free advertising and gives us a chance to make new connections." One expert recommends that before approaching potential partners, it is helpful to define the value your site has to offer.

Although reciprocal marketing is a valuable way for e-businesses to grow, Internet entrepreneurs should not depend on reciprocal marketing as their only form of promotion. There is also the danger of putting up too many links offering alternatives and discounts. In addition to cluttering a Web site and confusing customers, including too many links might cause traffic to leave the owner's site before making a purchase.

RECORD RETENTION

Record retention refers to the storage of records no longer active. Depending on the industry a small business is in, how long a record is active or how long it should be retained varies. Some records, such as birth and marriage certificates, discharge papers from the armed services, naturalization papers, wills, property titles, insurance policies, and other important records are typically held for life by individuals. Such vital documents are also generally available from where they were generated. They may be held as hard copies or in virtual files ready to be printed and dispatched upon request. Businesses retain financial records for tax reasons or to maintain historical information; certain other records must be kept because it is required by law. Records typically fall into four categories: those securing property such as titles or shares; those that mark certain crucial events such as business incorporations; those used for assessing operations; and those collected or retained in compliance with government regulation.

For the small business, retention of financial records on income, expenses, and withholdings and payment of taxes are those most commonly retained. Under Internal Revenue Service (IRS) guidelines, these should be held for at least 3 years or until the statute of limitations on an IRS audit expires.

Important legal records are normally retained as documents, but may also be held as both hard copies and virtual

copies, such as on Internet storage space, in an external hard drive, or on a server. By contrast, many types of business records, such as accounts receivable and payable, client histories, employee reviews, and inventory spreadsheets, may all be stored and accessed from a virtual file for as long as the business owner deems appropriate. In 1997 the IRS issued new rulings related to storage of business records, essentially approving of the practice of virtual file storage if such storage is accompanied by appropriate safeguards.

TYPES OF RECORDS

Businesses generate three main kinds of records: income, expenses, and capital expenditures. Income includes the revenue from sales of products or services, including both cash receipts and the collection of receivables. Expenses include cash disbursements and accounts payable that cover all operating expenses. These records should be maintained continuously, and certain bookkeeping programs make this extremely simple by updating themselves based on a predetermined schedule designed by the business owner or manager, or whenever the user manually updates with just the click of a mouse. Two of these programs are Avanquest and QuickBooks. Regardless of the brand of software the business owner uses to balance the books, he or she will always want to have downloaded the most recent versions as this will allow for updates in tax codes for the federal and state governments to be applied to any accounting.

In terms of expenses, the records must not only prove that an expense was incurred but also show how it was related to business. This is particularly important in the case of meals and entertainment expenses, for which the records must indicate the date, place, amount, and purpose of the expenses, as well as the type of business relationship with the person entertained. When filing taxes, these numbers must be exact for the purposes of a potential IRS audit and for determining exactly the amount of deductions to take. Companies filing on a quarterly basis will have an easier time tracking down all these expense records and will be able to archive them more quickly. While it is always a good idea to keep these records on hand for as long as possible, it is equally important to ensure that copies are kept in the office of a CPA or tax attorney.

It is also important for small-business owners to keep records for major capital purchases to determine depreciation for tax purposes. These records must include the date and place of purchase, a complete description of the item, the amount paid, how it was purchased, and the date when it was put into service for the business. Keeping these basic business records enables business owners to track their progress, identify problems, and take advantage of all possible tax deductions.

Small businesses that employ people other than the owner or partners are required by the IRS to keep detailed payroll records. In fact, there are a total of twenty different types of records that must be kept for income tax withholding, FICA (Social Security) tax withholding, and FUTA (federal unemployment) taxes. These records which include employees' names, addresses, and Social Security numbers, the amount and date of wages paid and withheld, and the amount of each type of tax paid, among other things must be retained for at least 4 years from the time the relevant taxes were due or were paid, whichever was later. Experts also recommend that small businesses keep careful records regarding any automobile, life, fire, health, and other insurance coverage they hold. These records should list policy numbers and carriers, amounts of premiums and dates paid, and information on claims.

A variety of government requirements for record storage exist for specific cases. Under the Sarbanes-Oxley Act of 2002, which enacted accounting and auditing reforms for publicly traded companies, record retention requirements relating to all manner of insider dealings has imposed new costs on public companies, including stringent requirements to safeguard electronic records. Companies that work as federal contractors are bound by employment rules similar to those of the federal government itself and must retain records on hiring, firing, and other personnel actions not least, resumes received over the Internet. Environmental regulations require record keeping on process effluents and hazardous waste disposal events. Record-keeping regulations also apply under the Occupational Safety and Health Act (OSHA). Keeping up with all the rules is difficult for the small-business owner unless he or she carefully reads the industry's trade publications which typically report changes in such rules. A sensible alternative is simply to retain all records related to money, people, property, safety, technology, law, and the environment.

OSHA AND THE SEC

A 2010 *Safety.BLR.com* article stated, "Most employers with eleven or more workers, including part-time, temporary, or seasonal employees, at any establishment at any time during the year must prepare and maintain records of all occupational fatalities, injuries, and illnesses." While businesses in certain industries will not have to worry about this, it is best to check with OSHA or a local OSHA-approved subsidiary to find out if a given company needs to concern itself with this kind of record keeping and retention. Those who must comply and track such employee records will need to use "The OSHA 300 Log, OSHA 301 Incident Report, and OSHA 300A Summary forms." In addition, these forms and documents must be kept up to date after all, an OSHA audit can occur anytime.

The Securities and Exchange Commission (SEC) has set up some guidelines and regulations for the retention

of electronic records. Randolph Kahn and Barclay Blair, in their 2009 book *Information Nation: Seven Keys to Information Management Compliance*, give a basic idea of what the mission of these regulations is. "The key element of the storage system used to comply with the regulation is that it must protect the integrity, accuracy, authenticity, and accessibility of electronic records." Kahn and Blair discuss elements that a system must have in order to be trustworthy while also meeting the demands of the SEC. These elements include the use of electronic storage in a format that cannot be written over, and in a format that cannot be erased over any period of time.

RECORD RETENTION USING CLOUD COMPUTING

Cloud computing is a type of online hosting that is bought and sold on demand. Those who use it for record retention will generally use a type of cloud computing known as Software as a Service (SaaS). Entrepreneurs can use cloud computing to access any of their retained records at anytime from anywhere. Cloud computing offers the distinct advantage of being managed by the cloud computing provider, which means a business owner or manager needs nothing more than his or her own computer and an Internet connection to check up on data. It also means that records on the cloud can be accessed from a handheld device such as a Blackberry, iPhone, or HTC. In Tim Lohman's 2010 article, "Managing the Cloud," he discusses the importance of understanding security levels when using cloud computing systems for record retention. Lohman quotes Robert Yue, the HP software and solutions manager who states, "The cloud raises risks that some service providers may not address. For example, a cloud service provider's logging and record retention schemes may not meet company-specific regulatory obligations, which may cause an organization to fail a security audit. Many cloud service providers offer no service level agreements. That means companies have no guarantees about data availability, privacy, or data protection." Lohman adds, "A myriad of standards need to be supported, such as ISO 27001 for information security, ISO 9000 for quality, compliance to privacy laws, the introduction of ITIL for the operations and quality of service. To do this, IT mangers must implement a robust governance structure."

While cloud computing for retaining records offers many advantages, especially where accessibility is concerned, the business owner will need to hire an experienced IT expert who is just as available as the cloud computing system being used. Before making any final decisions about using this or any other virtual platform, small-business owners should consider a consultation with an IT analyst to make sure they need this kind of system and what its pros and cons are for their venture.

RECORD RETENTION FOR E MAILS

The legal ramifications for small businesses and large corporations that do not abide by the regulations for e-mail correspondence can be quite severe, so it is important to know the rules for this form of record retention.

Probably the best first step for the small-business owner is to hire an IT professional who is well-versed in all of the current laws for archiving e-mail communications, networks in which e-mails are sent and received, and what options are available and acceptable based on the laws and guidelines of legal compliance. The experienced IT person who has a seasoned history of working with business networks and servers will be able to offer the business owner a variety of options that will still maintain legal compliance.

Good record retention on a network server is also good for organization of information. This means that it helps manage files and e-mails for the good of the company's record management system while also organizing records for in the most efficient manner possible to avoid litigation. Since courts can hold a company in contempt or charge it with spoliation (the withholding of information, which can be considered contempt of court), it is best to design a company policy that maintains e-mail records for 180 days or more. This is asking a lot for firms that use e-mail all day every day. For those who can only retain e-mails on a server for 30 days because of the amount of space that is being used, moving e-mails that are 31 days old and older onto a separate storage device may be best. Not having any record at all of an important e-mail could be evidence in a lawsuit that puts the small business in a most precarious situation.

RECYCLING

Beginning in the mid-1960s and growing alongside the environmental movement, recycling became an important aspect of municipal waste management and symbolic of personal actions to help clean up the environment. In earlier times, various kinds of recycling took place; they consisted in diverting products from the waste stream before discard. Boy and Girl Scout troops collected old newspapers to raise funds as those old enough may still remember. Beer, sodas, and milk moved in returnable glass bottles; and because most of these containers finally broke in centralized facilities like bottling plants, the residues were also collected and sold to glass companies. During World War II the government solicited metals, and the public set these aside to help the war effort. Finally, automobiles that had reached their final hour were recycled, as they still are, in scrapyards by far the most massive consumer products, alongside appliances, thus disposed.

According to the Online Etymology Dictionary, the word "environment" was first used in its current sense in 1956. It did not become a household word until the 1960s. Long before that time, however, recycling was a major *industrial* activity carried out for economic reasons but under different names: in metals it was the scrap trade, in paper the waste paper trade in two branches newsprint gathered by volunteers and cardboard gathered from offices and warehouses. There was also a trade in broken glass ("cullet"), in rags, and in waste oil. Farmers collected restaurant wastes to feed to pigs and recycled the fertilizer value of farm animal wastes as manure. Farm and garden wastes have always been composted. None of these activities has changed and, in fact, are the recipients of wastes today extracted from the municipal waste stream. Certain forms of recycling, however, are relatively new. They include reprocessing of auto tires into rubber, synthetic fuels, or paving materials; the recovery of lead from batteries; plastics recycling; and relatively experimental methods of converting organic wastes to fuel ("bio diesel"). Then, as still today, manufacturing wastes were either immediately recycled if suitable or used for fuel to power production activities common in wood- and fiber-using operations.

MUNICIPAL SOLID WASTE RECYCLING

The movement toward municipal solid waste (MSW) recycling was probably sparked by the introduction of steel cans to package soft drinks and beer in 1953. These containers made a contrast with the returnable bottle, at that time still the dominant mode of beverage packaging; cans did not bear a deposit and were soon littering roads. Keep America Beautiful (KAB), a business-sponsored organization, began operation in 1953 as well and attempted to persuade the public not to litter. KAB's most memorable ad image was the Native American chief with the tear in his eye sad over the despoliation of the countryside. The public noticed that packaging was proliferating and turning into a form of marketing, and that solid waste tonnage was growing more rapidly than population. The "throwaway" society was born. In 1965 the first federal law on solid waste, the Solid Waste Disposal Act, passed Congress, coinciding with the introduction of aluminum beverage containers that year. Amended versions of the act gave recycling more and more prominence until the Resource Conservation and Recovery Act (RCRA) of 1976 made recycling of MSW a national policy. However, RCRA had no mandatory provisions. With the exception of mandatory deposit bills at the state level and local laws mandating separate collection of recyclables from waste, recycling at the national level continued in the twenty-first century as an injunction rather than as a regulatory program.

Quantitative Trends. Based on data from the U.S. Environmental Protection Agency (EPA) in 2009, MSW generation was 250 million tons in 2008, of which 176.4 million tons (75%) was in the form of potentially recoverable materials. Of this subtotal 33.2 percent was recovered for recycling in 2008, most of it in the form of paper (71%, or 4.2 million tons).The bulk of recovered paper was in the form of what the EPA calls "office-type paper". Of all MSW , about 31 percent was paper and board, 13.2 percent yard trimmings, 12.7 food scraps, 12 percent plastics, 8.4 percent metals, 7.9 percent rubber, leather, and textiles, 6.6 percent wood, and 4.9 percent glass.

In 2008 60.8 million tons of waste were recovered for recycling, and 22.1 million tons were recovered for composting, for a total of 82.9 million tons of waste recovered for reuse before hitting the landfill. In addition, 31.6 million tons of waste was considered "combustion with energy recovery"; this includes energy left off during mass

burning of solid waste, and any fuels derived from refuse. The EPA noted that in 2008, "Recycling and composting 83 million tons of MSW saved 1.3 quadrillion Btu of energy, the equivalent of more than 10.2 billion gallons of gasoline."

The 2009 EPA report stated, "While solid waste generation has increased, from 3.66 to 4.50 pounds per person per day between 1980 and 2008, the recycling rate has also increased from less than 10 percent of MSW generated in 1980 to over 33 percent in 2008. Disposal of waste to a landfill has decreased from 89 percent of the amount generated in 1980 to 54 percent of MSW in 2008." The upward trend can be noticed uniformly across the first decade of the twenty-first century, and many feel that this can be attributed to a newfound concern about the health of the planet and the long-term effects of poor environmental choices. In 1980 89 percent of all waste generated ended up in landfills across the country. In the EPA's 2009 report, that percentage had fallen to just 54 percent in 2008.

INDUSTRIAL RECYCLING

Commercial recycling, as distinct from industrial recycling, tends to be reported as part MSW, which EPA defines as consisting of residential, commercial, and institutional sources. Commercial operations in which bulk packaging is routinely handled have always routinely collected corrugated board for sale to waste paper dealers: it is the highest grade of waste paper available and demand for it tends to be fairly steady. With the radical spike in environmental consciousness that spurred the green movement in the twenty-first century, offices have also participated in occasional programs of collecting waste paper used in business operations. Not only is this practice good for the environment, it is also good for corporate relations (many vendors and buyers only want to work with environmentally responsible firms) as well as marketing a company (consumers support companies that care for their childrens' futures by caring for the planet). These recycling programs have had a mixed history, intensifying in times of high waste paper prices and slacking off in others. Unlike corrugated collection systems, which are strongly institutionalized and integrated into operations, employee programs in which two separate waste cans are used, one for paper, one for all other waste, require constant management attention. Such attention is not always sustained, with the result that programs fade away until once more reinstituted with a new initiative.

Like cardboard recovery in retail and warehousing operations, industrial recycling is strongly supported by economic motives and is hence both routine and well-managed. In industry recycling takes three basic forms: 1) reuse of production wastes in the course of normal operations; 2) use of scrap as the principal or only raw material input; and 3) the reuse of postconsumption waste products.

In the first case, reusing production wastes, the waste may be trimmings or residues from production runs which are simply collected and reintroduced at the beginning of the process. An example might be a forging operation in which defective forgings are simply remelted. Another distinct instance is an operation which uses a portion of its raw materials, namely a waste product, as a fuel. An example is a saw mill that collects wood bark in debarking operations and uses it, with other wood-wastes, as fuel to power a boiler house which runs the sawing operations.

Electric steel mills that convert scrap metal into new steel products are one of the best-known examples of an industry which runs exclusively on scrap. Waste-oil refineries are another example: they receive spent lubricants, filter out impurities, and blend the results into various low-end products.

The steel, paper, and glass industries are examples of operations which use both "virgin" materials and waste to make new products. Certain paper mills that produce paperboard (used in folding boxes, as backings for writing pads, and in other stiffening applications sometimes coated on one or both sides by virgin sheets) and some mills that make newsprint also rely exclusively on waste paper. Others blend in portions of waste paper with new fiber. In glass, cullet is segregated by color and if clean enough is used in clear glass; if of dark color, cullet is used in dark-colored glass.

By far the largest recycler of postconsumption scrap is the steel industry. Its products are very durable and widely used in products that are readily collected for recycling (like auto wrecks and appliances). According to the Steel Recycling Institute (SRI), the industry routinely recovers more than 70 percent of its output as scrap; the industry reached a 75.7 percent recycling rate in 2005. Rates vary from year-to-year reflecting economic conditions. The lowest apparent recovery rates in steel coincide with the greatest dispersion of the product. Thus recycled can recovery accounted for 63 percent of steel used in cans, and reinforcing bar recovery accounted for 65 percent of re-bar production in 2005, but rates were 102 percent for autos, 96 percent for appliances, and 87.5 percent for structural beams and parts. These rates are calculated by expressing scrap collected from a category (e.g., appliances) with total steel consumed by that category; hence, in the case of autos, more steel was recovered from cars in 2005 than used in cars that year.

REFINANCING

Refinancing is the refunding or restructuring of debt with new debt, equity, or a combination of these. According to the 2010 definition by *Dun and Bradstreet Small Business Solutions*, "The basis of business debt refinancing is the conversion of original debt, including outstanding or overdue amounts, into a new debt instrument. By paying off the current debt obligations with the new debt instrument, businesses can consolidate their debt and obtain better interest rates." Businesses refinance their debts when interest rates drop. Since this tends to happen in times when money is readily available from banks or other sources of lending, the business can lower its overall costs of financing by reworking its loan portfolio. Sometimes refinancing involves the issuance of equity in order to decrease the proportion of debt in the borrower's capital structure. As a result of refinancing, the maturity of the debt may be extended or reduced, or the new debt may carry a lower interest rate, or some combination of these options.

Refinancing may be done by any issuer of debt, such as corporations and governmental bodies, as well as holders of real estate, including home owners. When a borrower retires a debt issue, the payment is made in cash, and no new security takes the place of the one being paid off. The term "refunding" is used when a borrower issues new debt to refinance an existing one.

WHEN THE SMALL BUSINESS OWNER SHOULD CONSIDER REFINANCING

In the wake of the subprime mortgage crisis that began in 2007, many financial dilemmas followed, not the least of which was the failure or near failure of many small businesses. Those that did stay afloat used various measures to do so, including layoffs, outsourcing to non-U.S. manufacturers, and moving operations to smaller spaces. In 2008 and 2009, refinancing was more difficult because many of the banking institutions that would typically lend to small-business owners or modify their loans were themselves in precarious financial situations.

In a June 2009 article in *BusinessWeek*, Karen E. Klein made some suggestions about what business owners should look for in refinancing, and she noted that interest rates are not the only thing they should be concerned about. "Do not make a decision based on interest rates alone: Ask about ongoing reporting, financial covenants, and personal guarantees for business loans," wrote Klein.

CORPORATE OR GOVERNMENT DEBT REFINANCING

The most common incentive for corporations or governmental bodies to refinance their outstanding debt is to take advantage of a decline in interest rates from the time when the original debt was issued. Another trigger for corporate debt refinancing is when the price of a company's common stock reaches a level which makes it attractive for a firm to replace its outstanding debt with equity. Aside from reducing interest costs, this latter move gives a firm additional flexibility for future financing; by retiring debt, the firm will have some unused debt capacity. Regardless of the reason for the refinancing, the issuer has to answer two questions: 1) Is the time right to refinance? and 2) What type of security should be issued to replace the one being refinanced?

If a corporation or governmental body wishes to refinance before the maturity date of the outstanding issue, they

will need to exercise the call provision of the debt. The call provision gives the borrower the right to retire outstanding bonds at a stipulated price, usually at a premium over face amount, but never less than face value. The specific price that an issuer will need to pay for a call appears in the bond's indenture. The existence of a call premium is designed to compensate the bond holder for the firm's right to pay off the debt earlier than the holder expected. Many bond issues have a deferred call, which means the firm cannot call in the bond until the expiration of the deferment period, usually between 5 and 10 years.

The cash outlay required by exercising the call provision includes payment to the holder of the bond for any interest that has accrued to the date of the call, and the call price, including premium (if any). In addition, the firm will need to pay a variety of administrative costs, including a fee to the bond's trustee. Of course, there will also be flotation costs for any new debt or equity that is issued as part of the refinancing.

Sometimes an issuer may be prohibited from calling in the bonds (e.g., during the deferred call period). In these instances, the issuer always has the opportunity to purchase its bonds on the open market. This strategy may also be advantageous if the outstanding bond is selling in the market at a price lower than the call price. Open market purchases involve few administrative costs. The corporation will recognize a gain on the repurchase if the market value is below the amount at which the corporation is carrying the bonds on its books (face value plus or minus unamortized premium or discount), or a loss on the repurchase if the market value is above the book value.

The major difficulty with open market purchases to effect a refinancing is that typically the market for bonds is "thin." This means that a relatively small percentage of an entire issue may be available on the market over any period of time. As a result, if a firm is intent on refinancing a bond issue, it almost always needs to resort to a call. This is why virtually every new bond that is issued contains a call provision. If an outstanding issue does not permit a call, another option available to the issuer is to seek tenders (offers to sell at a predetermined price) from current bond holders.

The new debt instrument issued in refinancing can be simple or complex. A corporation could replace an existing bond with traditional bonds, serial bonds (which have various maturity dates), zero-coupon bonds (which have no periodic interest payments), or corporate shares (which have no maturity date, but which may have associated dividend payments). One factor that a firm needs to consider is that the administrative and flotation costs of issuing either common or preferred shares are higher than for new debt. Furthermore, dividend payments, if any, are not tax deductible.

The decision to refinance is a very practical matter involving time and money. Over time, the opportunity to refinance varies with changing interest rates and economic conditions. When a corporation anticipates an advantageous interest rate climate, it analyzes the cash flows associated with the refinancing. Calculating the present value of all the cash outflows and the interest savings assists in comparing refinancing alternatives that have different maturity dates and capitalization schemes.

REGULATION D

Regulation D is a section of the U.S. federal securities law that provides the means for businesses to sell stock through direct public offerings (DPOs). A DPO is a financial tool that enables a company to issue stock directly to investors without using a broker or underwriter as an intermediary and avoid many of the costs associated with "going public" through an initial public offering (IPO). Regulation D exempts companies choosing this form of offering from many of the registration and reporting requirements of the Securities and Exchange Commission (SEC).

DPOs, private placements of stock, and other exempt offerings provide businesses with a quicker, less expensive way to raise capital than IPOs. The primary advantage of

DPOs over IPOs is a dramatic reduction in cost. IPO underwriters typically charge a commission of 13 percent of the proceeds of the sale of securities, whereas the costs associated with a DPO are closer to 3 percent. DPOs also can be completed within a shorter period and without extensive disclosure of confidential information. Finally, since the stock sold through a DPO goes to a limited number of investors who tend to have a long-term orientation, there is often less pressure on the company's management to deliver short-term results.

DPOs and other exempt offerings also involve disadvantages, however. For example, the amount that a company can raise through a DPO within any 12-month period is limited. In addition, the stock is usually sold at a lower price than it might command through an IPO. Stock sold through exempt offerings is not usually freely traded, so no market price is established for the shares or for the overall company. This lack of a market price may make it difficult for the company to use equity as loan collateral. Finally, DPO investors are likely to demand a larger share of ownership in the company to offset the lack of liquidity in their position. Investors eventually may pressure the company to go public through an IPO so that they can realize their profits.

COMMON MISTAKES BUSINESS OWNERS MAKE WITH DPOS

While there are advantages and disadvantages with DPOs, some of the disadvantages can be directly caused by some common errors business owners make. *GoPublicToday.com* lists four of these errors.

- Entrepreneurs new to the world of IPOs, SEC regulations, and DPOs commonly assume they can coast through the process and do homework later. This is a recipe for disaster, and a small-business owner should enter the process armed with knowledge of the necessary terminology.
- Another blunder is trying to go public before the business is mature enough to handle it. Unless the company has a decent record of accomplishment and growth, it may not be viable. Dissatisfied shareholders are not an asset to the company future.
- Issuing stock is an enormous undertaking associated with extremely high costs. Before delving too deeply into the process, the business owner needs to have a firm grasp of these expenses.
- Many business owners think that going public is a linear process that neatly flows on a timeline. The truth is that many of the processes of going public run concurrently and can be quite chaotic.

RULES 504, 505, AND 506

Regulation D, which was adopted in 1982 and has been revised several times since, consists of a set of rules numbered 501 through 508. Rules 504, 505, and 506 describe three different types of exempt offerings and set forth guidelines covering the amount of stock that can be sold, and the number and type of investors that are allowed under each one. The most common type of DPO is the Small Corporate Offering Registration, or SCOR, which is included in Rule 504. SCOR gives an exemption to private companies that raise no more than $1 million in any 12-month period through the sale of stock. There are no restrictions on the number or types of investors, and the stock may be freely traded. The SCOR process is easy enough for a small-business owner to complete with the assistance of a knowledgeable accountant and attorney. It is available in all states except Delaware, Florida, Hawaii, and Nebraska.

A related type of DPO is outlined in Rule 505. This option enables a small business to sell up to $5 million in stock during a 12-month period to an unlimited number of investors, provided that no more than thirty-five of them are nonaccredited. To be accredited, an investor must have sufficient assets or income to make such an investment. According to the SEC rules, individual investors must have either $1 million in assets (other than their home and car) or $200,000 in net annual personal income, while institutions must hold $5 million in assets. Finally, a DPO conducted under Rule 506 allows a company to sell unlimited securities to an unlimited number of investors, provided that no more than thirty-five of them are nonaccredited. Under Rule 506, investors must be able to evaluate the merits and understand the risks of the transaction. In both of these options, the securities cannot be freely traded.

REGULATORY FLEXIBILITY ACT

The Regulatory Flexibility Act (RFA) of 1980 is a law designed to make government agencies review all regulations that they impose to ensure that they do not place a disproportionate economic burden on small-business owners and other small entities. The Regulatory Flexibility Act was intended to extend protection to three different types of small entities in the United States: small businesses (as defined by the Small Business Administration); small organizations (nonprofit establishments that are independently owned and operated and not dominant in their field); and small governmental jurisdictions (defined as governments of cities, counties, towns, townships, villages, school districts, and other districts with populations of less than 50,000).

In the years following the enactment of the RFA, however, many small-business owners contended that agencies too often ignored the law. Periodic attempts to revise the RFA failed until March 1996, when the Small Business Regulatory Enforcement Fairness Act (SBREFA) became law. This new legislation cast the Regulatory Flexibility Act in an entirely new light, for it amended the 1980 law to allow for judicial review of government agencies' compliance with it.

Before the 1996 law was passed, small-business owners had had no legal recourse when faced with regulations that they felt were unfair to smaller companies. "There was no statutory requirement that forces an agency to do an analysis," explained one spokesman for the Senate Committee on Small Business in *Nation's Restaurant News*. With the passage of the Small Business Regulatory Enforcement Fairness Act, however, "a small entity, including businesses   if an agency rule seems unfair   can challenge it in court. And if they prevail, they can modify it or strike it to reduce the impact on that entity."

LEGISLATIVE HISTORY OF THE RFA

Prior to 1980, American small businesses were forced to adhere to the same regulations as far larger companies, even though they did not have nearly the same resources to bring to bear. Entrepreneurs and directors of nonprofits repeatedly charged that when regulations put forth by the Environmental Protection Agency (EPA), the Occupational Safety and Health Administration (OSHA), and other agencies were applied evenly, without regard to the size of the enterprises affected, they sometimes did serious damage to smaller organizations. Such regulations had to do with taxes, workplace safety, and the environment, among other issues.

As the Small Business Administration noted in its *Guide to the Regulatory Flexibility Act*, "the costs of complying with a particular regulation ... may be manageable for a business with 500 or more employees, or revenue in the millions of dollars. On the other hand, a smaller company may not have the ability to absorb the expenses as easily, to set competitive prices, to devise innovations or even to continue as a viable entity." The *Guide* added that as more businesspeople and politicians investigated the situation, "evidence indicated that uniform application of federal regulatory requirements imposed increases in the economies of scale and affected small entities' ability to compete effectively. Reports ... cited these disproportionate economic burdens on small business as contributing to declines in productivity, competition, innovation, and the relative market shares of small business."

The passage of the RFA in 1980, then, was meant to blunt much of the burden that regulatory changes were laying on the shoulders of small businesses. According to the RFA, each agency was supposed to analyze how its regulations affected the ability of small businesses to compete. In addition, the RFA directed agencies to balance the needs of small business with the benefits of the regulation being considered. The law called for agencies to propose regulatory alternatives for smaller companies that would be unduly hurt if forced to adhere to the original regulations. The Regulatory Flexibility Act still allowed agencies to put together needed regulatory measures in such realms as workplace safety and environmental protection, but it meant to give a greater voice to small businesses by encouraging agencies to listen to small-business concerns and study ways in which regulations could be adjusted for them.

During the 1980s, however, many entrepreneurs and other members of the business community came to feel that the RFA was an unacceptably weak law. The law   which went into effect on January 1, 1981   included no legal penalties that could be imposed on agencies that did not follow the act's guidelines, so some agencies paid little attention to the RFA. Observers felt that some agencies were simply recalcitrant, while others, burdened by inadequate budgets, did not have the resources satisfactorily to address the issues laid out in the RFA. Most observers granted that the Regulatory Flexibility Act was valuable in certain cases, but by the early 1990s there was a growing clamor in the small-business community and Congress for an amended RFA.

In September 1993, President Bill Clinton signed Executive Order 12866, which highlighted the responsibilities of government agencies to adhere to the principles of RFA. That same year, the Clinton administration's National Performance Review task force formally recommended that agency compliance with the RFA be subject to judicial review. Less than 3 years later, in March 1996, a number of major amendments to the RFA   including provisions adding judicial review   became law with the passage of the Small Business Regulatory Enforcement Fairness Act.

In July 2002 President George W. Bush signed Executive Order 13272, which federally requires and regulates procedures in written format. The policies set forth in Executive Order 13272 are meant to qualitatively and quantitatively measure how small businesses are affected by new regulatory procedures, and those that are amended. Executive Order 13272 requires that small-business owners receive any necessary training and education to keep up with changes in procedures and regulations of the RFA. In addition, small-business owners must be notified of changes in regulations by the Office of Advocacy. In essence, the order is meant to further protect the small-business owner through better communication with both the state and federal governments.

SMALL BUSINESS REGULATORY ENFORCEMENT FAIRNESS ACT

The Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA) included several components that drew praise from small-business owners. While the addition of judicial review of agency compliance with the RFA received the bulk of attention, the amendments also gave agencies additional responsibilities in the areas of policy review and outreach, and gave nonagency entities (small businesses, Congress) more influence in the regulatory process.

Judicial Review. SBREFA amended the RFA so that small businesses finally had legal recourse when confronted with regulations that they felt did not adhere to the RFA. It created a complaint process whereby small businesses can seek review of the rule in court. Under the 1996 amendments, noted the SBA, "the court may review the final regulatory flexibility analysis, the agency's certification that the rule has no impact on small entities, and the agency's compliance with periodic reviews of current rules. Under the amendment, judicial review also applies to interpretative rulemakings promulgated by the IRS." Prior to the 1996 legislation, interpretative rulemakings of the Internal Revenue Service had been exempt from the RFA because of provisions of the Administrative Procedure Act. In addition, the RFA now includes a provision that reimburses small-business operators for legal fees incurred if they successfully challenge a regulation as overly harsh.

Periodic Reviews. SBREFA reinforced RFA review guidelines for government agencies. Under the amended RFA, agencies are required to review all existing regulations to see if they have a significant economic impact on meaningful numbers of small entities (businesses, nonprofits, and small-government bodies). In situations where a "significant" impact is found, the agency in question is directed to review the regulations and determine whether they should remain in place, be revised, or be rescinded. Factors to be evaluated include continued need for the regulation; impact of industry and economic trends on the regulation; public comments on the regulation's strengths and weaknesses; complexity of the regulation; and extent to which the regulation overlaps, duplicates, or conflicts with already existing federal, state, or local laws.

In their 2008 book, *Public Policy in an Entrepreneurial Economy*, Zoltan J. Acs and Roger R. Stough write, "SBREFA recognized that Agencies often ignored the RFAs mandate to consider how their regulatory requirements would affect small businesses, 'resulting in greater regulatory burdens on small entities than necessitated by statute.'" Acs and Stough go on to note that according to the most recently gathered data, small businesses that employ twenty or fewer workers will spend an estimated $7,647 for each employee in order to stay compliant with the regulations set forth by the U.S. federal government. This amount is sizably more than what larger firms have to pay $5,282 per employee for those companies with 500 or more employed workers.

Outreach. RFA now requires both OSHA and EPA to put together small-business advocacy review panels every time they propose a regulation that is likely to have a big economic impact on a large number of small businesses. This information-gathering step is designed to solicit small business input on both the likely compliance costs of the regulations and possible mutually acceptable regulatory alternatives. A report reflecting the results of the review panel meetings is then prepared.

In addition, federal agencies are directed under RFA to publish a listing of all proposed or final regulations expected to be implemented during the following year. This requirement, say proponents, provides small-business owners with more time to study the regulations and their likely impact on their establishments. Finally, the RFA now requires agencies to prepare easily understandable guidebooks to help businesses comply with regulations.

Expanded Authority for Chief Counsel for Advocacy. The 1996 amendments to the RFA expanded the authority of the SBA's chief counsel for advocacy. The RFA now allows the chief counsel   who has been formally designated to monitor agency compliance with the law   to file amicus briefs in situations where regulations are being reviewed in court.

Legislative Review. A provision of the 1996 legislation established a 60-day review period during which Congress will be able to reject any new regulations that are held to be unnecessary.

Despite these changes, however, some critics contend that SBREFA has not lived up to expectations in the initial years of its existence. Detractors argued that Congress showed little inclination to exercise its increased powers of legislative review, and they claimed that other review panels called for in SBREFA have been slow to take shape. Others have criticized the law for giving Congress little-noticed powers to override federal regulations.

In 2010 the SBA' Office of Advocacy published an article that discusses r3, also known as the "Small Business Regulatory Review and Reform Initiative." The article states, "The r3 program is intended to help small businesses address the cumulative Federal regulatory burden, which is now estimated to exceed $1.1 trillion. Through the r3 program, we believe federal agencies will do a better job of identifying and revising rules that need to be reformed." The Office of Advocacy notes that many of the current regulations are outdated, and r3 will help to rectify this by combing through regulations to determine which of them may be obsolete or otherwise unnecessary. Reasons for obsolescence may include, but not be limited to, changes in technology, economic changes such as the fallout caused by the subprime mortgage crisis, and other variables that could change the way that small businesses are run and how they ought to be regulated.

RELOCATION

Businesses move for many the same reason that families do: they outgrow their space or shrink in size; they need to follow those who provide their income; or they perceive new opportunities. Sometimes businesses move for more personal reasons, such as being closer to family.

Business relocation is never simple, but its expenses, complexity, and the time horizon needed to do it well will depend on the type of business it is, its size, and the distance moved. Rent and lease agreements can produce serious financial strain if a business owner is locked into a contract with a property owner and business is not doing well enough to cover the rent and other costs associated with operations.

In the April 2010 edition of the *North Bay Business Journal*, Al Statz explains how leases can add or decrease the overall value of a business. "In the case of a distressed business or a business with an undesirable facility, a short lease can have a positive affect on value, if a buyer can eliminate the facility or has a better place to relocate the business. Of course, an astute buyer will consider the cost and risks of relocation." Statz explains that while a very long lease, say 15 years, may seem like an overwhelming commitment, it may be worth it for the kind of business that has a strong record of stability. For those in less stable industries, a shorter term lease with the option to extend may be a better business decision.

The easiest relocations will involve those enterprises that are sole proprietorships that sell small inventories of products or services provided via the Internet. In many cases, these types of operations can survive regardless of physical location because their storefront is on the Web, and not on Main Street. Other easy moves will be associated with a service business which provides intellectual or information products to its clients from an office setting provided it is relatively small and moves within the same metropolitan area. But even in such a situation, moving the company's computer network and servers will present special issues, and managers will typically worry about the commuting distances imposed on some of the employees.

The most inherently difficult and potentially risky relocation is associated with a retail operation, unless the business sells a line of unusual, rare, and difficult-to-get products so that customers will find the way to the store no matter what, or unless the retail business is mostly Web-based. A well-known phrase associated with real estate applies to retail: location, location, location. For this reason also, retail stores are often forced to move if the "location" where they find themselves suddenly or gradually loses its value, as may happen because of changes in the highway system or gradual loss of customers. Many businesses have moved from decaying urban centers to suburbs and sometimes from decaying suburbs to areas

of urban gentrification. An example of a necessary move would be a business located in an area where its target demographic migrates elsewhere. For example, a lunch-time restaurant located near a closed down auto plant would likely shut down and relocate to another area where workers will be looking for something to eat at noon.

The move of a manufacturing operation is typically the most complex. For that reason production facilities are usually moved as part of long-range corporate modernization plans, take place in stages to minimize downtime, and extend over longer periods. While it may be more complicated, many manufacturers have and will continue to move operations wherever the cost of doing business and worker wages are the lowest. This is the main driving factor behind relocating manufacturing operations abroad to China, India, Mexico, and other countries where labor and industrial space are cheapest.

Businesses that relocate from one market to another a retail store or a locally oriented consultancy, for instance, moving a significant distance, city to city are in effect restarting their businesses and must view the relocation as a new start-up. But every relocation has some impact on customers and suppliers and will signal gains and losses in these categories.

A special category of move sometimes faced by managers is the "consolidation," under which, for instance, departments must absorb one or more operations located in different cities. These tend to have additional dimensions in that all the usual aspects of a move are involved along with reorganization and integration of new staff and equipment in an existing function.

THE PROCESS

In an article in the *Austin Business Journal* Shelley Seale wrote about retail relocations: "The most important aspect of relocation is allowing yourself enough time to plan for the move. Most retail stores should plan at least six months in advance possibly as much as 12 months if your business is large or is moving a long distance. Proper planning is vital for both the logistics involved and your marketing plan. It can make the difference between your business growing and thriving or withering after a relocation." Seale's words apply equally well to most relocations. She describes the process under five commands: 1) be prepared; 2) be focused; 3) be timely; 4) be realistic; and 5) be customer focused. The first command relates to planning, the second emphasizes that the relocation must be under the single command of an individual who ties the project together and delegates all other work. Timeliness refers to the scheduling and staging of the move itself. Things can go wrong, and a realistic expectation of disaster suggests that fallback plans must be in place. Finally, no business moves effectively unless its constituencies are informed well in advance and helped to make the transition with the company.

Moves have a way of looming ahead for a long time before the first steps are actually taken with all those directly concerned with management well aware that a move will be necessary sooner or later. The process tends to begin with looking for a new office, commercial, or industrial space. By the time this begins, usually with discussions with real estate agents, the general area has already been fixed upon. Depending on the business, targeting itself may have been preceded by market analysis and visits to different areas by management. In parallel with finding the location, the business will typically begin planning on a technical level. Moves tend to be periods of renewal. Old equipment and systems are replaced; acquisition steps begin early and well before the new site is found. Difficult operations are analyzed and logistical issues examined. In many professional service businesses possibilities exist for temporarily operating from dispersed locations and early staging of computers and people to their homes for temporary work will begin. In retail operations inventory will be sold out to reduce the amounts of goods that must be moved. In manufacturing operations, production may be increased to have inventory to sell even as the factory is moved. In an operation of any scale, these many activities become complicated and need coordination. It is good practice to establish a "move committee" which regularly meets to keep the action organized.

Detailed plans for the move itself tend to be nailed down once two dates are fixed. The first is access to the new quarters and the second is the move-in date. The latter is fixed after site improvements are completed and service installations (like telephone and computer networks and special power and gas facilities) have been made. Moving plans involve employees who typically assist in packing, internal and external specialists required to prepare equipment for moves, the sourcing of moving specialist, and arrangements with landlords at either end. In parallel with these activities, fallback strategies will be tested, including communications, emergency service of selected customers, and the actual provision of services from temporary locations. A public relations campaign is always involved, even if the company is too small to call it that: customers and vendors must be notified in advance and provided with points of contact.

The move itself, for most small businesses, may be accomplished rapidly, usually over a weekend. In larger operations, of course, the move may take several weeks with different centers and departments moved in logical sequence, brought on stream and then assisting from the new location. Following the move itself, most relocations require a period of start-up at the new quarters and "mop-up" operations at the previous site. The mop-up operation can sometimes be complicated and involve the sale and movement of excess furniture or equipment. The reopening of the business at its new location is often a

significant event for a retail business, long planned, and launched with appropriate hoopla. In the case of service businesses, the celebration may take the form of a formal reception to which important buyers are invited.

VIRTUAL RELOCATION

Many business owners started their ventures online and have been on nothing but the Internet since day one. Even so, sometimes the need may arise to change locations virtually. This means a change in Web address because of a change in products or services, inventory, workers, or a physical change that requires a change in url. For example, a solo attorney who practices estate planning in Minnesota may have a Web site called www.MinnesotaEstateplanAttorney.com. If he moves to Savannah, Georgia, this url will no longer be relevant to his practice, and the traffic it has earned, local to Minnesota, will no longer work to attract clients in Georgia. This attorney will be forced to buy a new domain name. Some sole proprietors in his position may choose simply to change a few words of text on the page to reflect the new location and redirect the old site to the new one, perhaps www.SavannahEstatePlanner.com. However, a business owner who does this rarely benefits from maintaining the old site when geography has changed. If the former site, www.MinnesotaEstatePlanAttorney.com, ranks well and enjoys a positive and long-standing history on search engines, the forward-thinking entrepreneur will sell the domain name to a competitor in the region who could use a site with good search engine rankings. Such domain names can fetch a handsome sum.

The virtual move from one Web site to another can be less disruptive if there is a mirror site that offers all the same information, goods, and services. Small-business owners that offer services to only a specific region who think they may need to move at some point are wise to have a blog associated with what they do, the name of the company, and their own name. In this way, if they do have to move physically or virtually, there will be another place on the Internet where consumers can find them. The blog can always have its links redirected to a new Web site, or even multiple sites. For example, if the Minnesota estate planner discussed earlier decided to go to Georgia but partnered with another lawyer who was still located in Minnesota, he could keep the old Web site, make the new Web site for Georgia, and the blog could be linked to both sites to offer legal advice to clients, increase Web popularity and PageRank of both Web sites as well as the blog itself.

STRATEGY AND ADMINISTRATION

Relocations may have a predominantly strategic motivation or the strategic purpose may be minimal. Retail stores are almost always moved for strategic reasons, but office-based operations or those that deliver services to customers directly often simply move because they need more space. In either case, successful relocation is above all an exercise in well-planned, disciplined, and therefore effective administration an art that tends to be undervalued in an era of online marketing, social media networking, and the use of Blackberries and iPhones to run a business from anywhere the entrepreneur chooses. To be sure, poor strategic choices can doom a relocation. Bad outcomes are due to neglect of necessary research of the chosen location, its demographics, and cultural traits. But the actual movement of a business from one place to another is one of the most exacting management tasks any business will undertake, requiring foresight, anticipation, and attention to the most minute details. Timing is very important, especially an ability to predict how long something will take. Unusual circumstances must be envisioned in advance and planned for, thus all manner of comfortable assumptions must be questioned. The effective manager of a relocation will *not* assume that all employees will make the move, even within the city, and have temporaries at least on call in case they are needed. Alternative systems of communications will be in place and will have been tested. Zoning ordinances and permit requirements in the new location will have been consulted. Systems will have been tested early enough to be reliable. The business that relocates well manages well. And nothing is as important as good plans, long ''to do'' lists, intensive attention to detail, and rigorous follow-through.

REMANUFACTURING

Remanufacturing is a process where a particular product is taken apart, cleaned, repaired, and then reassembled to be used again. Remanufacturing has long been associated with expensive technical products, but the technique is spreading. C. Franke and his coauthors, writing in *Omega*, made the point as follows: "Today, the remanufacturing of expensive, long-living investment goods, e.g., machine tools, jet fans, military equipment or automobile engines, is extended to a large number of consumer goods with short life cycles and relatively low values. Reuse is an alternative to material recycling to comply with recovery rates and quantities as well as special treatment requirements" mandated by regulatory authorities. The list also includes mobile phones and other handheld units, tires, furniture, laser toner cartridges, desktop computers, laptops, digital tablets, and electrical equipment. Essentially any product that can be manufactured can also be remanufactured. In order for a product to be considered remanufactured, most of its components must be used, although some of them can be new if the older parts are too defective to be salvaged. It is important for consumers to know that the reuse of a material or component does not make a remanufactured product any less effective or durable in most cases. Reuse can mean anything from cleaning to being completely melted down and recreated.

Remanufacturing has two underpinnings. One is economic, and the other is public or governmental regulatory pressure. From an environmental viewpoint, remanufactured goods are held out of the waste stream. This can potentially conserve energy, reduce greenhouse gases, and protect groundwater from potentially toxic leachates especially important in the context of electronic goods. The economic motive is obvious in the case of very massive and expensive products such as machine tools and ocean-going vessels; they can also be quite real if public participation in the return of the products in part subsidizes the costs of their return to a remanufacturing facility.

While the basic concept of remanufacturing is simple, the activity is complex. It requires that a used product be completely disassembled in order to assess its actual condition. If it is determined that remanufacturing is worthwhile, various parts of the product are cleaned, restored, repaired, and replaced. Further refinements are then performed and the product is reassembled so that it once again operates in the way it was originally intended to function. The product is then ready to be used again. Each step in this process is essential to the entire concept of remanufacturing, and careful precautions must be taken to ensure that each step is carried out correctly.

RELATED PROCESSES

The reuse of an object can take place after application of different kinds of processes and in various forms. The simplest form of fundamental reuse is recycling, represented by steel or aluminum beverage cans extracted from waste or separately collected which are then reintroduced into steel or aluminum furnaces scrap and may return in some other kind of form to the market.

Similar to recycling is a process of disassembly sometimes referred to as "demanufacturing" after which the components thus obtained may be handled by recycling processes, remanufacturing methods, direct sale to end users, or by disposal. Many automobiles delivered to junk yards are demanufactured. Engines are removed and sometimes sold to remanufacturers, components pars are sold as found to individuals or repair shows, seats are removed and sold or disposed of as waste, structural components are separated and sold as scrap steel. Ship-breaking follows a similar cycle. In his 2009 book, *The Money Makers: Crisis & Opportunity*, Frankki Oh wrote about the huge potential for profit in demanufacturing looking for hidden valuables in a seemingly worthless old machine or appliance. Oh noted that demanufacturing can be done with cheap labor and a variety of tools. Oh commented that demanufacturing can be somewhat of a treasure hunt, but the potential for a good find is well worth it if small-business owners can keep the cost for the hunt down.

Certain products seen by the consumer as single entities may have the distinct roles of "container" and "content." The classical case is a returnable bottle which ends up, without its closure, at the bottling plant again to be cleaned, refilled with soda, and closed with a new cap. Toner cartridges used in laser printers are such container-content combinations, the cartridge itself designed for reuse, the toner used in printing. Many consumers and sole proprietors who use printers at home for various and mostly low-volume printing used to use cartridges that could be thrown out, but the cost for the next new cartridge was often high. As more and more people came to understand what they were paying for, demand was created for the ink cartridge refill store, as well as cartridge refilling tools that consumers could use themselves to inject fresh ink into an old cartridge. The Cartridge World company became a massive enterprise by the end of the first decade of the twenty-first century. People could now go to a Cartridge World in their hometown and refill their ink at a fraction of the cost. Some existing companies also woke up to the possibilities for generating revenue with ink refills. Of these, the Walgreens venture became the most successful customers dropped off their empty cartridges, just as they would drop off film to be developed, and pick them up later, all at a cost of less than half the price of a new ink cartridge.

In instances where the product is remanufactured, after a more or less intensive remanufacturing process the product will once again end up performing the same function it performed before. To meet the "remanufactured" definition, the product must undergo some extensive process that is significantly more than "repair." A simple example of remanufacturing is the retreaded tire in which the basic inner core of the tire is retained, the remaining tread is cut off, and new rubber is applied and bonded to the core. In essence, remanufactured products undergo significant processing beyond cleaning, repair, and maintenance. They are thus restored to a much higher functionality as a "used" product. Many auto parts must be remanufactured for sustained use and represent a major element of the remanufacturing industry.

REMANUFACTURING AND SMALL BUSINESSES

Aside from environmental benefits, there are many other reasons why remanufactured goods exist. Like many good business decisions, remanufacturing simply saves money by prolonging the economic life of a product. A small business with a tight budget can save money by using remanufactured products because they often cost less (anywhere between 40 and 60 percent less) and come with warranties and extra services that guarantee their performance.

Remanufacturing is also a business opportunity for small businesses with the appropriate technical skills and equipment deployments. For example, an auto repair business can potentially branch out and begin to offer remanufactured goods as part of its services, or a small business that repairs office machines may be able to gain the necessary knowledge to remanufacture related products at the same time as it conducts its normal business activities.

Smaller, boutique operations in manufacturing now compete with the giants that once dominated the industry. National Power Supply is a network of independent remanufacturers. By working together, these small businesses make themselves competitive in arenas they could never have entered before. Because they are made up of a conglomerate of small businesses, they can afford to sell the same or similar remanufactured engines for a much lower cost than big players like Caterpillar, Detroit Diesel, Cummins, and Deutz. In addition, these collectives of independent firms in remanufactured goods are able to offer more localized and often more personalized customer service. They are able to refer clients to one another's shops depending on where a potential customer is, and they can share the cost of shipping and receiving. When appropriate and advantageous, these smaller firms can also share inventory to serve the needs of the consumer better. In some instances, one of the remanufacturing firms may have a whole engine but lack one part that another firm has. Partnering up means building a system of trade where one business owner can get something he or she needs while the other can offer it at an unmatchable cost, given, of course, that the favor will be returned when the time comes.

If a small business decides to get into the remanufacturing industry, it must first study and understand the market. Despite the recent success of remanufacturing, there is still a negative perception among some consumers regarding products that contain used parts. Some consumers feel that a remanufactured product is not as durable as a brand new one and may require additional maintenance in the future. This is a serious issue that must be addressed before a small business decides whether it is worth it to pursue remanufacturing as a vocation. The intelligent business owner who goes into the field of remanufacturing will calculate the cost of offering warranties into his or her business plan. Consumers are much more likely to buy a remanufactured item when it has a warranty, even if only for 30 days.

There are many legal and regulatory issues that affect the remanufacturing industry that businesses must be aware of. Intellectual property and antitrust matters; federal, state and local recycling procedures; and government economic incentives are just a few of these issues. The Remanufacturing Institute is the watchdog organization for the entire industry and it is constantly monitoring these issues and representing the views of the businesses that are involved in remanufacturing. In addition, the federal government requires that all remanufactured goods must be labeled as such so that they cannot be passed off as new products, but if this is done with the right touch, customers may often be happier to buy the remanufactured product not just for the smaller price tag, but because it makes them feel like environmentally responsible consumers.

RENOVATION

Renovation describes a series of planned changes and updates made to a facility where business is conducted. Office and building renovation will take place now and again in the environment of most business, at their own or at others' initiative, in response to new needs, technological pressures, or simply the need for maintenance and renewal. Renovation, for a business, may be a response to declining sales. As an ancient Chinese saying has it: "When business slows, paint the counter red." As the first decade of the twenty-first century drew to a close, it was more apparent than ever that a storefront, office, or warehouse may not be the only work environments that needed to be renovated from time to time; Web sites and Internet storefronts also need updating for many of the same reasons that their concrete counterparts do.

A well-conceived and carefully planned renovation effort can revitalize a business and provide it with much-needed room to grow. But periods of renovation also have a downside: they can reduce productivity, create inconveniences for customers, cost money, and affect the bottom line. The inconveniences associated with office and building renovation often make it practically impossible for businesses to maintain the exact same level of operations they have during nonrenovation periods. But owners can take several steps to ensure that the negative aspects of renovation are minimized.

SMALL BUSINESS TENANTS AND RENOVATION

Many small-business owners are co-tenants of a building with other businesses. These entrepreneurs may well find themselves faced with an impending renovation. This is especially true if they are operating their businesses in older buildings. Sometimes these renovations take place within the physical space of the business itself; on other occasions, the renovation may be limited to common areas lobbies, outer building areas, stairways/elevator systems that are shared by all the tenants. In either case, the impending arrival of a renovation crew should signal a period of preparation on the part of the small-business owner. Tenants normally welcome renewal projects that make the facility more convenient and attractive, but during the period when the renovation is actually taking place, owners may find themselves feeling everything from anxiety to deep anger about the impact that it is (or seems to be) having on their company. The most effective way a small business can minimize these negatives is by establishing and maintaining good lines of communication with the building owner before and during the renovation process. In addition, using the time toward growing the business in other ways is a good idea during this kind of downtime.

Some business owners inhabiting facilities that are undergoing renovation adopt a fatalistic sort of attitude toward the process, surrendering meekly to renovation strategies without offering any workable alternatives to plans that might unnecessarily hinder their operations. Other entrepreneurs, meanwhile, err on the other end of the spectrum by making unreasonable demands that may ultimately drag out the renovation process for several extra days or weeks. Small-business experts counsel owners to instead adopt a middle ground. They have to recognize that renovation efforts almost inevitably bring about some measure of inconvenience for tenants and their customers, but that they ultimately increase the value of the location for business operation. On the other hand, if a business owner spots a problem during a review of upcoming or ongoing renovation plans, he or she should bring it to the attention of building management. A renovation strategy that would render a key loading dock unavailable during a big delivery period, for example, should immediately be brought to the attention of the landlord.

Small-business owners should recognize that many facility managers want to help tenants out in whatever way they reasonably can. After all, they do not want to lose tenants and go to the trouble of finding new ones. Most will bend over backwards to help the tenant get past difficulties by making accommodations.

THE HOME OFFICE RENOVATION

Often, the small-business owner who works from his or her home will work in an office space dedicated specifically to the functions of the work. This is the best idea for at-home entrepreneurs because it allows for a tax write-off. But sometimes, it is not until something goes wrong with the business that the sole proprietor realizes a lot of the problem was the office. Perhaps the "office" doubles as the kids' playroom, the family room, the bedroom, or is in an area that is not temperature regulated, like a garage or basement. If there is no one else working with the owner in his or her home office, he or she may have a hard time knowing when the right time to expand, renovate, or even leave the house for a commercial office space has come. Some of the signs it may be time to remodel the home office include an escalating disorganization, a lack of space for files or other items needed to complete tasks, an inability to focus caused by

too many disruptions, or an inability to focus caused by physical discomfort (not enough space to lean back, too hot, too cold, etc.).

RENOVATING TO "GO GREEN"

There's more than meets the eye when it comes to renovating in the twenty-first century. For many people, a much-needed renovation opportunity comes along, and the smart business owner opts to do it with energy efficiency in mind. Not only is this good to keep business costs down, but it works very well as a tool of marketing too. Consumers who were going to one retailer for a product or service may suddenly decide to try a new business because they feel they are supporting a small business that cares for the environment. Retrofitting an office or storefront can be done quite cheaply in many instances, and in some cases can be done more cheaply than using materials that are harmful to the environment. Double and triple-paned glass, environmentally friendly paint, recycled, refurbished, and reused materials, a digital thermostat, and if reasonable, some source of renewable energy like solar panels will all lower overhead and are all an investment in the physical structure that increase its value.

RENOVATING PROFESSIONAL OFFICES

Office and facility renovations may also be undertaken by small business enterprises that either own or are the sole tenants of the building in which they operate. Business owners that provide professional services are especially likely to renovate to meet changing internal demands, attract new clients, and keep existing ones. Indeed, doctors, dentists, attorneys, architects, engineers, and the like recognize that the appearance of their offices can be a significant component in their overall success.

Analysts note that professional offices are more likely to renovate than relocate for two fundamental reasons: cost and client retention. Even a major renovation of an existing facility is likely to be considerably less expensive than the total costs associated with relocating to another facility. Perhaps even more importantly, existing patients and clients are accustomed to finding the office at a given location. To move may mean to lose a following.

Renovation strategies can vary considerably, depending on the needs and concerns of the office in question. A medical practice or architectural firm may be amply equipped to integrate new technology with existing operations, only to recognize that its growth has been hampered because it is saddled with an unattractive waiting area. In this situation, the renovation may amount to little more than some new carpeting, wallpaper, and furniture. Other firms, however, may find that only a major rehabilitation effort will be sufficient to correct long-standing problems with infrastructure such as an ineffective floor plan, poor wiring to support information technology needs, or cramped office space.

Professional service firms (and many other businesses) have to meet legislated requirements as part of renovation plans. For example, businesses have to be in compliance with the Americans with Disabilities Act of 1990 (ADA). Much of the renovation work that took place in the early 1990s was undertaken specifically to address this law, which called on facilities to become fully accessible by widening hallways, installing ramps, and adapting drinking fountains and bathrooms for use by people in wheelchairs. Most buildings are now in compliance with the ADA, but building owners looking to renovate need to make sure that their new plans adhere to ADA parameters. In addition, professional service firms need to factor in their attractiveness to recent graduates when weighing their renovation strategies.

Finally, before committing to a major renovation effort, professional service firms should discuss matters with appropriate experts, including architects, accountants, and lenders. Selecting a contractor should be done carefully as well; business owners are urged to check into the contractor's reputation for quality, timeliness, and financial soundness before making an agreement. Finally, firms should call in legal representation before signing a contract.

REQUEST FOR PROPOSAL

A Request for Proposal (RFP) is the process by which a corporate department or government agency prepares bid documents to acquire equipment or services. RFPs are frequently published in the legal documents section of pertinent newspapers and online news sources, or in trade journals covering the industry in which the department operates. Some corporations or government agencies may also post RFPs on the news release page of their Web site or on a company or public relations blog. The RFP can also be distributed to a list of qualified potential bidders that have already been contacted and prequalified as eligible by the agency or department. This will generally be done via e-mail, but for certain very sensitive circumstances, RFPs may be sent and received via certified mail or to and from secure servers (using the https:// prefix as opposed to the http:// prefix). "Qualified" is a key word in answering or preparing any RFP. Qualification frequently depends on follow-up investigation on the part of the hopeful bidder and careful wording of the original RFP.

RFPs are primarily associated with government agencies, since their responsibility to get equipment and consulting talent under the most beneficial circumstances possible is closely monitored by the press and tax watchdogs. Some private companies also employ RFPs, though, usually when purchasing commodities or services that do not bear directly on the company's own products or services.

While some entrepreneurs will handle their own RFP writing and design, others may do well to hire a consultant. In their 2008 book, *Preparing Requests for Proposals and Specifications for Design-Build Projects*, the Committee on Specifications notes, "For more complex projects, the owner may outsource preparation of the conceptual design through the schematic design stage, including providing performance specifications for the major items of work." Chances are, if the small-business owner thinks he or she does not understand an RFP well enough to write it, he or she should not "wing it" on the first go around.

ELEMENTS OF AN ATTRACTIVE RFP

Some RFP work requests are of a scale beyond the scope of small or mid-sized companies, but others provide such businesses with valuable opportunities to expand their client base and operations. Before bidding on an RFP, however, entrepreneurs and business owners should make sure they fully understand the nature of the work request.

For instance, some RFPs are decidedly more informative than others. When scanning an RFP, vendors should make certain that it specifically describes what needs to be delivered or executed to fulfill the needs of the company or agency that posted the notice. In order to do so, it is often necessary for potential vendors to educate themselves about the nature of the agency or corporation that has issued the RFP. Vendors should also inquire whether the work request could translate into additional work on associated projects down the line. For instance, if the equipment will eventually be networked to a building that is not yet built but is in the long range plans of the agency or company, a vendor may decide that a low price on the initial RFP is viable if it advances its prospects for a more long-term arrangement down the line.

Before making any bid, vendors should also check the RFP for other factors that might influence their response. Some possible questions follow:

- Will the asked-for equipment be subject to notable environmental conditions or regulations?
- If the equipment will be used in foreign countries, is the equipment compatible with the standards of those nations?
- Will ancillary costs associated with design, production, transportation, or some other aspect of delivery eat into the profit margin to an unacceptable extent?
- Are the RFP and the equipment or services it seeks legal under local, state, and federal laws?
- Is the RFP asking for both equipment and service? (Companies that sell equipment might not be able to service it adequately, yet that service performance may be written into the RFP in a separate section from the equipment specifications; responders must know they can fulfill the entire contract before answering it.)
- Are deadlines and performance clauses contained within the RFP reasonable?
- Will the RFP agency require the winning vendor to sign a performance bond that guarantees delivery of goods or services by a certain date?

Most companies and agencies that submit work requests provide prospective bidders with ample time to study the RFP before the deadline. Sometimes a good

idea may be to submit an outline or abstract of the proposed RFP ahead of time to give vendors an idea of what they can expect when the finalized RFP arrives. Some companies give vendors as much as one month from the time the RFP is published before the bids are due. This allows bidders time to tinker with their bids, possibly allowing them to seek out new vendors of their own to help meet the needs of the RFP.

STAYING ON THE BID LIST

Companies wishing to bid on RFPs should monitor the legal notices in local newspapers and trade magazines and contact the purchasing departments of corporations and government agencies likely to request services and equipment. They should investigate the requirements to be added to the "bid list." Finally, once the company has fulfilled all obligations necessary to be added to the list, the company's leadership needs to make certain that it stays on that list. This may mean sending frequent e-mail reminders to show a serious interest; creating a relationship with someone on the "inside" who can make checking in less awkward and facilitate more frequent communications.

KEEPING UP ONLINE

Government agencies, corporations, and those seeking RFPs and looking to get on (and stay on) bid lists should make use of the Internet to check on lists. RFPs, bids, and bid lists are generated across hundreds of industries, and getting on bid lists is easier than ever; that is, as long as the RFP bidder is qualified enough to keep up with others on the list. A great bid does not necessarily mean a landed contract, and price is not everything. Showing that the operation has a firm grasp on RFPs and how to maintain a good standing on bid lists makes it clear to the government agency or corporation that the bidder is serious, seasoned, and a strong competitor.

Business owners looking to get on bid lists that will actually give them a chance at landing a contract should use Web sites like GovernmentBids.com. The bid lists are updated every day and can be browsed by region or industry. Business owners can sign up for free and also receive e-mail updates right to their smartphone when a bid or RFP that suits their specifications pops up. GovernmentBids.com also offers an advice column for bidders and keeps up with current events that affect bids and RFPs, such as government stimulus packages and changes in certain regulations.

Government agencies and corporate departments are sometimes reluctant to delete vendors from bid lists because of fears that such cuts will elicit charges of favoritism. Nonetheless, establishments issuing RFPs do seek to keep bid lists to manageable size, since every bid requires scrutiny. One favored way to keep the bid list down is to require potential vendors to refile every few years. Another is to ask vendors to provide certain information about their companies, such as past sales and experience or number of employees available to service the account. Such requirements cull the number of bidders down, eliminating companies that are too disorganized or feeble to keep up. Conversely, a small business that meets all such requirements in a timely fashion is essentially serving notice that it is a viable candidate for RFP business.

Companies seeking RFP business should also be cognizant of the fact that winning bids are not always exclusively a matter of providing the lowest cost or the highest level of customer service. Some corporations and government agencies give special consideration on their bid lists to minority- and women-owned companies.

RESEARCH AND DEVELOPMENT

Research and development (R&D) is a process intended to create new or improved technology that can provide a competitive advantage at the business, industry, or national level. While the rewards can be very high, the process of technological innovation (of which R&D is the first phase) is complex and risky. The majority of R&D projects fail to provide the expected financial results, and the successful projects (25 to 50%) must also pay for the projects that are unsuccessful or terminated early by management. In addition, the originator of R&D cannot appropriate all the benefits of its innovations and must share them with customers, the public, and even competitors. For these reasons,

a company's R&D efforts must be carefully organized, controlled, evaluated, and managed.

OBJECTIVES AND TYPES OF R&D

The objective of academic and institutional R&D is to obtain new knowledge, which may or may not be applied to practical uses. In contrast, the objective of industrial R&D is to obtain new knowledge, applicable to the company's business needs, that eventually will result in new or improved products, processes, systems, or services that can increase the company's sales and profits.

The National Science Foundation (NSF) defines three types of R&D: basic research, applied research, and development. Basic research has as its objectives a fuller knowledge or understanding of the subject under study, rather than a practical application thereof. As applied to the industrial sector, basic research is defined as research that advances scientific knowledge but does not have specific commercial objectives, although such investigation may be in the fields of present or potential interest to the company.

Applied research is directed towards gaining knowledge or understanding necessary for determining the means by which a recognized and specific need may be met. In industry, applied research includes investigations directed to the discovery of new knowledge having specific commercial objectives with respect to products, processes, or services. Development is the systematic utilization of the knowledge or understanding gained from research toward the production of useful materials, devices, systems, or methods, including design and development of prototypes and processes.

At this point, it is important to differentiate development from engineering. Engineering is the application of state-of-the-art knowledge to the design and production of marketable goods. Research creates knowledge, and development designs and builds prototypes and proves their feasibility. Engineering converts these prototypes into products that can be offered to the marketplace or into processes that can be used to produce commercial products and services.

R&D AND TECHNOLOGY ACQUISITION

In many cases, technology required for industrial purposes is available in the marketplace for a price. Before embarking on the lengthy and risky process of performing its own R&D, a company can perform a "make or buy" analysis and decide whether or not the new R&D project is justified. Factors that influence the decision include the ability to protect the innovation, its timing, risk, and cost.

Proprietary Character. If a technology can be safeguarded as proprietary and protected by patents, trade secrets, and nondisclosure agreements the technology becomes exclusive property of the company and its value is much higher. In fact, a valid patent grants a company a temporary monopoly for 17 years to use the technology as it sees fit, usually to maximize sales and profits. In this case, a high-level of R&D effort is justified for a relatively long period (up to 10 years) with an acceptable risk of failure.

In contrast, if the technology cannot be protected, as is the case with certain software programs, expensive in-house R&D is not justified since the software may be copied by a competitor or "stolen" by a disloyal employee. In this case, the secret of commercial success is staying ahead of competition by developing continuously improved software packages, supported by a strong marketing effort.

Recent changes to patent law made by the Supreme Court have also raised the bar for the grant of patents, making it more difficult to get patents for certain products and inventions. In a case called *KSR International Co. v. Teleflex*, the Court mandated that no patent could be granted for a concept that was "obvious to try" by a "person having ordinary skill in the art." This means that if a software program or invention was so obvious that anyone in the industry could think to create it, that invention is not patentable under U.S. law. This decision may make it harder both to get new patents and to enforce existing ones.

Timing. If the market growth rate is slow or moderate, in-house or contracted R&D may be the best means to obtain the technology. On the other hand, if the market is growing very fast and competitors are rushing in, the "window of opportunity" may close before the technology has been developed by the new entrant. In this case, it is better to acquire the technology and related know-how, in order to enter the market before it is too late.

Risk. Inherently, technology development is always riskier than technology acquisition because the technical success of R&D cannot be guaranteed. There is always the risk that the planned performance specifications will not be met, that the time to project completion will be stretched out, and that the R&D and manufacturing costs will be higher than forecasted. On the other hand, acquiring technology entails a much lower risk, since the product, process, or service, can be seen and tested before the contract is signed.

Regardless of whether the technology is acquired or developed, there is always the risk that it will soon become obsolete and be displaced by a superior technology. This risk cannot be entirely removed, but it can be considerably reduced by careful technology forecasting and planning. If market growth is slow, and no winner has emerged among the various competing technologies, it may be wiser to monitor these technologies through

"technology gatekeepers" and be ready to jump in as the winner emerges.

Cost. For a successful product line with relatively long life, acquisition of technology is more costly, but less risky, than technology development. Normally, royalties are paid in the form of a relatively low initial payment as "earnest money," and as periodic payments tied to sales. These payments continue throughout the period of validity of the license agreement. Since these royalties may amount to 2 to 5 percent of sales, this creates an undue burden of continuing higher cost to the licensee, everything else being equal.

On the other hand, R&D requires a high front-end investment and therefore a longer period of negative cash flow. There are also intangible costs involved in acquiring technology the license agreements may have restrictive geographic or application clauses, and other businesses may have access to the same technology and compete with lower prices or stronger marketing. Finally, the licensee is dependent upon the licensor for technological advances, or even for keeping up to date, and this may be dangerous.

MOVING AHEAD WITH R&D

R&D can be conducted in-house, under contract, or jointly with others. In-house R&D commands a strategic advantage: the company is the sole owner of the know-how created and can protect it from unauthorized use. R&D is also basically a learning process; in-house research thus trains the company's own research people who may go on to ever better things.

External R&D is usually contracted out to specialized nonprofit research institutions or to universities. These institutions often already have experienced personnel in the disciplines to be applied and are well-equipped. The disadvantages are that the company will not benefit from the learning experience and may become overly dependent on the contractor. The trans for the technology may turn out to be difficult and leaks to competitors may develop. Using university research is sometimes slightly less expensive than engaging institutes because graduate students rather than professionals do some of the work.

Joint R&D became popular in the United States after antitrust laws were relaxed and tax incentives were offered to R&D consortia. In a consortium, several companies with congruent interests join together to perform R&D, either in a separate organization or in a university. The advantages are lower costs, since each company does not have to invest in similar equipment; a critical mass of researchers; and interchange of information among the sponsors. The disadvantages are that all the sponsors have access to the same R&D results. However, because of antitrust considerations, the R&D performed must be "precompetitive," legalese meaning that it must be basic or preliminary. A company must take joint research beyond the "joint" stage to make money on it; it can use this type of result as the foundation, not as the innovation itself.

R&D PROJECT SELECTION, MANAGEMENT, AND TERMINATION

Industrial R&D is generally performed according to projects (i.e., separate work activities) with specific technical and business goals, assigned personnel, and time and money budgets. These projects can either originate "top down" (for instance, from a management decision to develop a new product) or "bottom up" (from an idea originated by an individual researcher). The size of a project may vary from a part-time effort of one researcher for a few months with a budget of thousands of dollars, to major 5- or 10-year projects with large, multidisciplinary teams of researchers and budgets of millions of dollars. Therefore, project selection and evaluation is one of the more critical and difficult subjects of R&D management. Of equal importance, although less emphasized in practice, is the subject of project termination, particularly in the case of unsuccessful or marginal projects.

Selection of R&D Projects. Normally, a company or a laboratory will have requests for a higher number of projects than can be effectively implemented. Therefore, R&D managers are faced with the problem of allocating scarce resources of personnel, equipment, laboratory space, and funds to a broad spectrum of competing projects. Since the decision to start on an R&D project is both a technical and a business decision, R&D managers should select projects on the basis of the following objectives, in order of importance:

1. Maximize the long-term return on investment;
2. Make optimum use of the available human and physical resources;
3. Maintain a balanced R&D portfolio and control risk;
4. Foster a favorable climate for creativity and innovation.

Project selection is usually done once a year, by listing all ongoing projects and the proposals for new projects, evaluating and comparing all these projects according to quantitative and qualitative criteria, and prioritizing the projects in "totem pole" order. The funds requested by all the projects are compared with the laboratory budget for the following year and the project list is cut off at the budgeted amount. Projects above the line are funded, those below the line delayed to the following year or tabled indefinitely. Some experienced R&D managers do not allocate all the budgeted funds, but keep a small

percentage on reserve to take care of new projects that may be proposed during the year, after the laboratory official budget has been approved.

Evaluation of R&D Projects. Since R&D projects are subject to the risk of failure, the expected value of a project can be evaluated according to a statistical formula. The value is the payoff anticipated but discounted by probabilities. These are the probability of technical success, the probability of commercial success, and the probability of financial success. Assuming a payoff of $100 million and a fifty-fifty rate of technical success, a commercial success rate of 90 percent, and a financial probability of 80 percent, then the expected value will be $36 million 100 discounted by 50, 90, and 80 percent respectively.

Consequently, project evaluation must be performed along two separate dimensions: technical evaluation, to establish the probability of technical success; and business evaluation, to establish the payoff and the probabilities of commercial and financial success. Once the expected value of a project has been determined it can be compared with the projected cost of the technical effort. Given a company's usual rate of return on investment, the cost may not be worth the expected value given the risks.

Needless to say, such statistical approaches to evaluation are not silver bullets but as good as the guesses that go into the formula. Businesses use such evaluations, however, when many projects compete for money and some kind of disciplined approach is needed to make choices.

Management of R&D Projects. The management of R&D projects follows basically the principles and methods of project management. There is, however, one significant caveat in relation to normal engineering projects: R&D projects are risky, and it is difficult to develop an accurate budget, in terms of technical milestones, costs, and time to completion of the various tasks. Therefore, R&D budgets should be considered initially as tentative and should be gradually refined as more information becomes available as a result of preliminary work and the learning process. Historically, many R&D projects have exceeded, sometimes with disastrous consequences, the forecasted and budgeted times to completion and funds to be expended. In the case of R&D, measuring technical progress and completion of milestones is generally more important than measuring expenditures over time.

Termination of R&D Projects. Termination of projects is a difficult subject because of the political repercussions on the laboratory. Theoretically, a project should be discontinued for one of the following three reasons:

1. There is a change in the environment for instance, new government regulations, new competitive offerings, or price declines that make the new product less attractive to the company.
2. Unforeseen technical obstacles are encountered and the laboratory does not have the resources to overcome them.
3. The project falls hopelessly behind schedule and corrective actions are not forthcoming.

Due to organizational inertia, and the fear of antagonizing senior researchers or executives with pet projects, there is often the tendency to let a project continue, hoping for a miraculous breakthrough that seldom happens.

In theory, an optimal number of projects should be initiated and this number should be gradually reduced over time to make room for more deserving projects. Also, the monthly cost of a project is much lower in the early stages than in the later stages, when more personnel and equipment have been committed. Thus, from a financial risk management viewpoint, it is better to waste money on several promising young projects than on a few maturing "dogs" with low payoff and high expense. In practice, in many laboratories it is difficult to start a new project because all the resources have already been committed and just as difficult to terminate a project, for the reasons given above. Thus, an able and astute R&D manager should continuously evaluate his or her project portfolio in relation to changes in company strategy, should continuously and objectively monitor the progress of each R&D project, and should not hesitate to terminate projects that have lost their value to the company in terms of payoff and probability of success.

TAX ADVANTAGES FOR R&D

In the period 1981 through 2004, corporations had a R&D tax credit that is, they were allowed to deduct research and development expenditures from income. The tax credit was renewed in 2004 and lasted through 2005, but the tax bill signed in May 2006 left the provision out. This outcome no doubt pleased those who thought that government subsidies of corporate development were out of place, and energized those who saw the credit as nationally important to attempt to have the credit reinstated. In 2008 the U.S. Senate passed an extension to the R&D tax credits, tacking the provision onto the Renewable Energy and Job Creation Act. The tax credits cover up to 20 percent of qualified research and development expenses, approximately 70 percent of which are used to fund employee salaries. The tax credit costs the U.S. government an estimated $7 billion annually, which explains in part why many politicians resist making the tax credit permanent despite pressure from business advocates to do so. As of 2010, President Barack Obama wished to make the tax

credit permanent and hoped to add this as a provision to his 2011 budget so businesses can count on the credit.

SMALL BUSINESS AND R&D

Research and development in the public mind as well as in the media conjures up notions of big business, huge labs, vast testing fields, wind tunnels, and crash dummies flailing around as autos are crashed into walls. R&D is associated with the pharmaceutical industry, miracle cures, laser eye surgery, and super-fast jet travel. To be sure, a vast amount of the money expended on formal research is expended by large corporations often on relatively trivial improvements of products already doing quite a good job and by government on weapons systems and space exploration. The glory and the power thus displayed before people's eyes on television do not reveal the fact that the crucial research and development on which much else is based has been and continues to be the work of small entrepreneurs.

The explosive development of the oil industry was triggered by the invention of an effective kerosene lamp by Michael Dietz in 1859. Dietz ran a small lamp production business. Oil drilling began in earnest to support such lighting applications. An unwanted residue of kerosene refining was gasoline, which was burned off as useless waste until the first cars came along. The story of Thomas Edison is worth rereading occasionally to correct one's vision of modern R&D. Chester Carlson, the inventor of xerography, perfected his invention in part-time labors in a makeshift lab while working as a patent attorney. The computer revolution came about because two young men, Steve Wozniak and Steve Jobs, put together a personal computer in a garage and thus triggered the Information Age. Countless innovations large and small were made by tinkering individuals or small-business people trying something new. The fact that many of these entrepreneurial, inventive, innovative, and persistent individuals are the fathers and mothers of great companies indeed of whole industries that now dominate formal R&D should not obscure their humble beginnings and catch-as-catch-can methods of discovering the new.

RÉSUMÉS

A résumé is a document presented by a job applicant to a prospective employer outlining and summarizing that person's qualifications for employment. A résumé generally includes data on education, previous work experience, and personal information. Well-crafted résumés are concise and composed in such a way as to maximize the applicant's attractiveness as a potential employee. A résumé is generally accompanied by a cover letter which introduces the applicant and the résumé to the employer. The purpose of a résumé is to obtain an interview, not to land a job. This is an important distinction. Whether or not a person is hired is largely determined by what transpires during the job interview, not by the résumé. A résumé is extremely important, however, because it provides the employer with a first impression of the job applicant. From this first impression a decision will be made as to whether or not an interview will be granted.

RÉSUMÉ APPEARANCE AND CONTENT

Résumés are read from two perspectives: the appearance of the physical document itself and the content of the résumé. Résumé appearance concerns the presence (or absence) of typographical errors, poor grammar usage, sloppy sentence structure, garish colors, unconventional typefaces, paper stains, and so on.

The content of the résumé is the actual information included in the document. The content of most résumés falls into four broad categories: education, previous work experience, personal data, and social data. The first two are self-explanatory. Personal data includes such things as address and telephone number. Social data includes things like marital status, club memberships, military status, and references.

Handbooks that provide detailed advice on compiling résumés are available in most bookstores and libraries. These guides generally agree on the types of information to include on a résumé but sometimes differ on the format

and hierarchical arrangement of the résumé. Some authors feel that educational information should be presented first while others feel previous work experience should be foremost. Other authors of such handbooks offer advice on tailoring a résumé to fit one's particular employment situation (looking for an entry-level position, reentering the job market, or changing fields or vocations). Most of these handbooks, however, have one thing in common: they generally lack empirical data on what a prospective employer is looking for in a résumé. References in these handbooks to this aspect of the applicant, résumé, and employer scenario are often anecdotal.

EMPLOYERS AND RÉSUMÉS

When reading résumés, employers are usually looking for the facts. Functional résumés (résumés with no dates) are often viewed as indicators of excessive job movement or attempts to hide large gaps in one's career. Nebulous phrases such as "exposure to" sometimes indicate a lack of depth of work experience, as does excess space devoted to education, personal, and social data. Obviously, recent college or high school graduates and other people relatively new to the workforce often have little choice but to highlight such information, and the discerning employer will take this factor into account.

Many small-business consultants urge their clients to study résumés closely, citing the unfortunate frequency with which some applicants include outright lies. A Massachusetts-based management consultant, for instance, told *Nation's Business* writer Peter Weaver that a résumé should only be used as a starting point for launching a thorough examination of an applicant's business, professional, and interpersonal skills. "Hiring someone based on false claims in a résumé not only weakens a firm's workforce but also can lead to costly legal action," said Weaver, who noted that many businesses are held legally responsible for the actions of all employees even those who may have been placed in positions on the basis of fraudulent information.

Some employers have turned to automated résumé banks or reference checking firms to help them fill their workforce needs. Banks will, for a fee, mail out copies of résumés to prospective employers. Using technical terminology and job-related phrases a computer will match the résumés it stores in its data bank with job descriptions supplied by its clients. Résumé banks, however, are not professional recruiters; the latter are compensated for their services in terms of a percentage of a recruit's salary. Résumé banks charge a sliding fee for their services.

ELECTRONIC RÉSUMÉS

An article posted on the Web site of a job search service, Quintessential Careers, offers the following statistics that highlight the reason why a print résumé, although still important, can no longer be the only résumé tool in a job-seeker's kit. "More than 80 percent of employers are now placing résumé directly into searchable databases, and an equal percentage of employers prefer to receive resumes by e-mail. An iLogos study also revealed that 81 percent of *Fortune* 500 companies place their career opportunities and job postings on their own Web sites, while many other companies place the job listings on various job-seeking Web sites.

Some job applicants have found that the trend toward e-mailed résumés makes it more difficult for them to differentiate themselves in the eyes of prospective employers. As a result, many people have begun adding graphics and interactive elements to their electronic résumés. In fact, several Web sites exist to help users create such résumés. While including graphics and interactive elements can sometimes help applicants for some creative and technology-oriented positions, hiring executives emphasize that these features cannot make up for a lack of experience and achievements.

Job applicants who decide to create an electronic résumé and send it to potential employers via e-mail should keep a few factors in mind. First, it is generally considered bad form to use a current employer's e-mail system to send out résumés. Second, job applicants should make sure that their e-mail user name is professional and appropriate before sending out résumés. Third, applicants should consider using a standard ASCII format with a predictable layout and plain fonts, since fancy text may not be readable on some potential employers' computer systems. It may be helpful to send a test résumé to yourself and to several friends in order to check how the document appears on several systems. Fourth, experts recommend including a name, phone number, and e-mail address at the top of every page so the sender's identity will not get lost if the résumé is printed out or entered into a database. Finally, job applicants should be careful to include keywords referring to their job interests and experience in case hiring companies scan in résumés and search them to find candidates for later job openings.

POSTING RÉSUMÉS ON AN ELECTRONIC BULLETIN BOARD

One of the reasons it is important to have an electronic résumé for job seekers in today's market is because they can be used to participate in online job bulletin boards. Some of the most popular such services are Monster.com, CareerBuilder.com, HotJobs.com to name the largest. Industry specific job posting services offer to assist both job seekers and employers looking for the right candidates. These electronic job posting sites are a useful tool but any job-seeker should use them as but one avenue through which to search for employment. According to

an article by Tom Jackson in *CareerJournal*, "only 7 percent of 2,500 job hunters who receive outplacement counseling found new positions through the Internet, compared to 35 percent who were hired through networking."

However résumés are used, the key to their success is their ability to communicate the most essential information about a candidate that will pique the interest of prospective employers who have a position that will make a good fit for the job-seeker.

While these online job boards can provide a helpful way for employees and employers to connect, there are unfortunately some risks associated with posting résumés online. The risks stem from the fact that individuals who post those résumés are generally putting a large amount of personal information, including addresses, e-mail information, and telephone numbers online. In August 2008 Monster.com revealed that 1.3 million résumés with personal information had been diverted to a server in Ukraine run by hackers. Other attacks on Monster involved hackers redirecting Monster users attempting to apply with big-name clients such as Best Buy and Toyota toward their own servers where they were able to collect personal information. The information contained in such online résumés can provide a wealth of useful data to those engaged in identity theft.

Online applicants should thus ensure they take steps to protect their safety. For example, it is advisable to provide limited contact information on a publicly posted résumé and consider using an e-mail address, telephone number, or post office box created just for the online posting. Services such as Google Voice allow a person to create a new phone number, and this number can be used as an alternative to regular contact information for publicly posted Web sites. In addition, applicants should be wary of potential scams and of revealing too much information without confirming the identity of the employer.

RETAIL TRADE

Retailers are business firms engaged in offering goods and services directly to consumers. In most but not all cases, retail outlets are primarily concerned with selling merchandise. Typically, such businesses sell individual units or small groupings of products to large numbers of customers. A minority of retailers, however, also garner income through rentals rather than outright sales of goods (as in the case of enterprises that offer furniture or gardening tools for rent) or through a combination of products and services (as in the case of a clothing store that might offer free alterations with the purchase of a suit).

The retail industry is a massive part of the overall U.S. economy. In 2008, for example, approximately 4.5 million people were employed in retail jobs, and retail sales topped $3.9 trillion in 2008. Moreover, many retail niches are characterized by a healthy population of smaller enterprises; indeed, the vast majority of retail employees in the United States work at establishments with fewer than twenty employees.

Retail trade is widely known as a very competitive area of commercial endeavor, and observers note that many fledgling retail establishments do not survive for more than a few years. Indeed, competition for sales has become so great that consumers have seen a marked blurring of product lines among retailers. Increasingly, retailers have taken to stocking a much greater variety of goods than their basic industry classification would indicate (bookstores, for example, increasingly stock music products, while food, liquor, office supplies, automotive supplies, and other wares can all be found in contemporary drug stores). This development further complicates efforts to establish and maintain a healthy presence in the marketplace. But for the small-business owner who launches a retail store on an adequate foundation of capital, business acumen, and

attractive merchandise, involvement in the trade can be rewarding on both financial and personal fulfillment levels.

With the tightening of credit and recession that occurred in 2008 and 2009, analysts suggest that knowing the consumer will be key to continued retail success. Experts suggest that the aging baby boomer market will be changing the retail landscape, and that other shifts such as increased coupon usage, frugality, and a movement towards "buying local" may also change the retail landscape in years to come.

PRIMARY RETAIL TYPES

Retail enterprises can be either independently owned and operated or part of a "chain," a group of two or more stores whose activities are determined and coordinated by a single management group. Stores that are part of a chain may all be owned by a single company, but in other cases, the individual stores may be franchises that are independently owned by a small businessperson.

Many different types of retail establishments exist, and, as noted above, the overall industry has seen a significant blurring of the boundaries that had long separated the wide range of companies operating under the retail umbrella. Nonetheless, retailing establishments still generally fall into one of the following general categories:

- Specialty Stores These establishments typically concentrate their efforts on selling a single type or very limited range of merchandise. Clothing stores, musical instrument stores, sewing shops, and party supply stores all fall within this category.
- Department Stores These establishments consist of a series of departments, each of which specializes in selling a particular grouping of products. Under this compartmentalized arrangement, consumers go to one area of the store to purchase tableware and another area to acquire bedding, for example.
- Supermarkets These retail establishments, which are primarily involved in providing food to consumers but have increasingly ventured into other product areas in recent years, account for the vast majority of total food-store sales in the United States.
- Discount Stores These retail outlets offer consumers a trade-off: lower prices (typically on a broad range of products) in exchange for lower levels of service. Indeed, many discount stores operate under a basic "self-service" philosophy.
- Mail-Order Businesses and other Nonstore Retailing Establishments Mail-order sales have become a ubiquitous part of the American retail landscape; indeed, some retail establishments subsist entirely on mail order, forsaking traditional stores entirely, while other companies maintain operations on both levels. In addition, this category includes sales made to end consumers through telemarketing, vending machines, the Internet, and other nonstore avenues.

Electronic retail has been growing at a significantly higher rate than retail trade as a whole.

RETIREMENT PLANNING

Retirement planning describes the financial strategies individuals employ during their working years to ensure that they will be able to meet their goals for financial security upon retirement. Making sound decisions about retirement is particularly important for self-employed persons and small-business owners. Unlike employees of some large companies, who can simply participate in the pension plans and investment programs offered by their

employers, entrepreneurs must set up and administer plans for themselves and for their employees.

There has been a shift away from company-funded, defined-benefit pension plans. These plans were common within large firms during the 1950s through 1970s and into the 1980s. A defined-benefit pension plan is one in which the employer pays into and manages a plan based on calculations of how much the fund will need in order to provide an employee with a particular, defined post-retirement income. Such a plan guarantees all qualified employees with a predetermined retirement benefit. Many things have combined to cause a shift away from defined-benefit plans and towards defined-contribution plans. One of the more important of these, other than substantial demographic pressure that the retirement of the baby boom generation is having on all retirement issues, was the passage of an obscure provision in the Tax Revenue Act of 1978, the 401(k) provision. This provision went largely unnoticed for 2 years until Ted Benna, a Pennsylvania benefits consultant, devised a creative and rewarding application of the law, an application which became what is known today at the 401(k) plan.

A 401(k) plan is just one of various types of plans which fall under the umbrella of defined-contribution plans, as opposed to defined-benefit plans. A defined-contribution plan is one in which there is no guaranteed postretirement benefit but rather a defined monthly or yearly contribution to a plan. How the plan's assets are invested and how much they are worth at retirement is not defined by the plans. Employees are responsible, in most cases, for investment decisions and the level of contribution made to the plan. With defined-contribution pension plans employees pay into the plan on a tax-deferred basis, and in most cases, the employer agrees to a minimum contribution or agrees to match some percentage of the contribution made by the employee. Many business writers believe that this shift from defined-benefit plan to defined-contribution plan has helped to level the playing field for small businesses. Smaller companies are now able to offer the same type of retirement benefits as many larger employers.

Though establishing and funding retirement plans can be costly for small businesses, such programs also offer a number of advantages. In most cases, for example, employer contributions to retirement plans are tax-deductible expenses. In addition, offering employees a comprehensive retirement plan can help small businesses attract and retain qualified people who might otherwise seek the security of working for a larger company. The number of small firms establishing retirement plans grew during the 1990s, but small employers still lag far behind larger ones in providing this type of benefit for employees. In fact, approximately 72 percent of workers in small companies do not have access to any type of retirement plan available through their work, and only 16.1 of business owners with fewer than ten employees offered a 401(k) or other retirement savings plan. In fact, more than 58 million workers or just over half of the U.S. workforce has no access to any type of retirement plan through employers at all, including defined benefit plans.

Retirement planning is a topic of interest to all Americans, not only to small-business owners and entrepreneurs. The debate over whether Social Security will be available for the younger members of the current workforce adds legitimacy to the need for early retirement planning. Longer life expectancies mean that more money must be set aside for retirement, while the uncertainty of investment returns and inflation rates makes careful planning essential. In fact, some experts recommend that individuals invest a minimum of 14 percent of their gross income from the time they enter the workforce to guarantee a comfortable retirement.

Unfortunately, most people are not doing this. In fact, according to a 2009 survey, only 13 percent of individuals reported they were comfortable about saving enough money for retirement, a record low since the survey began in 1993. These Americans are right to be concerned: in a 2009 survey, 53 percent reported having less than $25,000 in total savings and investments while the average home headed by a forty-three-year-old had slightly over $18,000. Jack VanDerhei, Senior Research Fellow at the Employee Benefit Research Institute (EBRI) explained how much individuals need to retire. In response to an interviewer's question on the Public Broadcasting System's *Frontline* show, VanDerhei explained that, as of 2005, most people approaching retirement had about three times their annual salary saved for the postretirement period. The EBRI recommends that a man have 6.3 times his annual salary available for postretirement living and a woman 6.7 times her annual salary. (Women have a longer life expectancy than men and therefore need slightly more retirement savings.) Financial planners and insurance analysts recommend even higher retirement savings goals ten to fifteen times annual salary as necessary for a reasonable retirement. What is clear in all studies on this subject is the fact that Americans are not saving adequately for retirement.

LAWS GOVERNING RETIREMENT PLANS

The Social Security Administration was created in the 1930s as part of President Franklin Roosevelt's New Deal. Private pension plans mushroomed shortly thereafter, offering coverage to millions of employees. In 1962 the Self-Employed Individuals Retirement Act established tax-deferred retirement plans from which account holders could withdrawals starting between the ages of 59 ½ and 70 ½. These plans also known as Keogh plans, after their originator, New York

Congressman Eugene J. Keogh were intended for the self-employed and for those who have income from self-employment on the side. Embezzlement from pension plans by trustees led to the passage of the Employee Retirement Income Security Act of 1974 (ERISA). One of the main provisions of ERISA was to set forth vesting requirements time periods over which employees gain full rights to the money invested by employers on their behalf. ERISA governs most large-employer-sponsored pension plans, but does not apply to those sponsored by businesses with fewer than twenty-five employees.

OPTIONS FOR SMALL BUSINESSES

Small-business owners can set up a wide variety of retirement plans by filling out the necessary forms at any financial institution (a bank, mutual fund, insurance company, brokerage firm, etc.). The fees vary depending on the plan's complexity and the number of participants. Some employer-sponsored plans are required to file Form 5500 annually to disclose plan activities to the Internal Revenue Service (IRS). The preparation and filing of this complicated document can increase the administrative costs associated with a plan, as the business owner may require help from a tax advisor or plan administration professional. In addition, all the information reported on Form 5500 is open to public inspection.

The most important thing to remember is that small-business owners who want to establish a qualified plan for themselves must also include all other company employees who meet minimum participation standards. As an employer, the small-business owner can establish retirement plans like any other business. As an employee, the small-business owner can then make contributions to the plan he or she has established in order to set aside tax-deferred funds for retirement, like any other employee. The difference is that a small-business owner must include all nonowner employees in any company-sponsored retirement plans and make equivalent contributions to their accounts. Unfortunately, this requirement has the effect of reducing the allowable contributions that the owner of a proprietorship or partnership can make on his or her own behalf.

For self-employed individuals, contributions to a retirement plan are based upon the net earnings of their business. The net earnings consist of the company's gross income less deductions for business expenses, salaries paid to nonowner employees, the employer's 50 percent of the Social Security tax, and significantly the employer's contribution to retirement plans on behalf of employees. Therefore, rather than receiving pre-tax contributions to the retirement account as a percentage of gross salary, like nonowner employees, the small business owner receives contributions as a smaller percentage of net earnings. Employing other people thus detracts from the owner's ability to build up a sizeable before-tax retirement account of his or her own. For this reason, some experts recommend that the owners of proprietorships and partnerships who sponsor plans for their employees supplement their own retirement funds through a personal after-tax savings plan.

Nevertheless, many small businesses sponsor retirement plans in order to gain tax advantages and increase the loyalty of employees. A number of different types of plans are available. The most popular plans for small businesses all fall under the category of defined-contribution plans. In nearly every case, withdrawals made before the age of 59 ½ are subject to an IRS penalty in addition to ordinary income tax. The plans differ in terms of administrative costs, eligibility requirements, employee participation, degree of discretion in making contributions, and amount of allowable contributions. Brief descriptions of some of the most common types of plans follow:>

Simplified Employee Pension (SEP) Plans. SEP plans are employer-funded retirement accounts that allow small businesses to direct at least 3 percent and up to 25 percent of each employee's annual salary, to a maximum of $49,000 in 2009 and 2010, into tax-deferred individual retirement accounts (IRAs) on a discretionary basis. SEP plans are easy to set up and inexpensive to administer, as the employer simply makes contributions to IRAs that are established by employees. The employees then take responsibility for making investment decisions regarding their own IRAs. Employers thus avoid the risk and cost involved in accounting for employee retirement funds. In addition, employers have the flexibility to make large percentage contributions during good financial years and to reduce contributions during hard times. SEP plans are available to all types of business entities, including proprietorships, partnerships, and corporations. In general, eligibility is limited to employees twenty-one or older with at least 3 years of service to the company and a minimum level of compensation. The maximum level of compensation for SEP eligibility was $245,000 in 2009 and 2010.

Profit Sharing Plans. Profit-sharing plans enable employers to make a discretionary, tax-deductible contribution on behalf of employees each year, based on the level of profits achieved by the business. The total annual contribution is generally allocated among employees as a percentage of their compensation. Plan costs are tax deductible for the employer, and plan earnings are tax deferred for employees. Profit-sharing plans are easy to implement, offer design flexibility, and provide a wide range of investment choices. Eligibility is typically limited to employees who are at least twenty-one years of age and who have at least 1 year of

service. The employer's maximum deduction is 25 percent of the total annual salaries paid to nonowner employees.

A common variation is the age-based profit-sharing plan, in which contributions are based on an allocation formula that factors in the age or number of years to retirement of participants. Age-based profit sharing allows employers to reward valued older employees for their length of service. Another variation is the new comparability profit-sharing plan, which allows employers to define classes of employees and set up the retirement plan so that certain classes benefit the most in terms of allocation. These types of profit-sharing plans are similar to defined-benefit plans, but the employer contributions are discretionary.

Money Purchase Pension Plans. Money purchase pension plans are similar to regular profit-sharing plans, but the employer contributions are mandatory rather than discretionary. The main advantage of money purchase plans is that they allow larger employer contributions than regular profit-sharing plans. The employer determines a fixed percentage of profits that will be allocated to employee retirement accounts according to a formula. The maximum employer contribution jumps to the lesser of 25 percent of payroll for nonowner employees (adjusted to 20 percent for the small-business owner) or $45,000 per employee. There are also combination money purchase-profit-sharing plans that allow employers to select a fixed percentage for mandatory contribution and also retain the option of contributing additional funds on a discretionary basis when cash flow permits.

401(k) Profit-Sharing Plans. The popular 401(k) plans are profit-sharing plans that include a provision for employees to defer part of their salaries for retirement. The employer can make annual profit-sharing contributions on behalf of employees, the employees can contribute up to $16,500 of pre-tax income themselves as of 2009 and 2010, and the employer can choose to match some portion of employee contributions. 401(k) plans offer a number of advantages. First, they allow both employer and employee to make contributions and gain tax advantages. Second, they can be set up in such a way that employees can borrow money from the plan. Third, 401(k) plans enable employees to become active participants in saving and investing for their retirement, which raises the level of perceived benefits provided by the employer. The main disadvantages are relatively high set-up and administrative costs. Eligibility for 401(k) plans is typically limited to employees at least twenty-one years of age who have at least 1 year of service with the company.

Small businesses that establish 401(k)s must be careful to avoid liability for losses employees might suffer due to fluctuations in the value of plan investments. Under ERISA, plan sponsors can avoid liability by ensuring that their 401(k) meets three criteria: offering a broad range of investment options to employees; communicating sufficient financial information to employees; and allowing employees to exercise independent control over their accounts.

Nonqualified Deferred Compensation Plans. Finally, there is a type of plan often used by businesses to supplement existing qualified plans and provide an extra benefit to key personnel and highly compensated employees. In small businesses, this usually includes the owner and founder. Broadly defined, a nonqualified deferred compensation plan (NDCP) is a contractual agreement in which a participant agrees to be paid in a future year for services rendered this year.

There are two broad categories of nonqualified deferred compensation plans: elective and nonelective. In an elective NDCP an employee chooses to receive less current salary and bonus compensation than he or she would otherwise receive, postponing the receipt of that compensation until a future tax year. Nonelective NDCPs are plans in which the employer funds the benefit and does not reduce current compensation in order to fund future payments. Such plans are, in essence, posttermination salary continuation plans. The argument behind such nonelective plans, funded by employers, is the retention of key employees.

One feature in particular of nonqualified deferred compensation plans that has made them a very popular tool for use by large corporations and some small businesses, is the fact that they are not limited by the same nondiscrimination rules imposed on qualified plans. NDCPs may be offered to a select group of employees only, unlike qualified plans to which all employees are eligible by definition. Consequently, the cost of this benefit is lower since it accrues to fewer people. NDCPs are a type of plan that is particularly useful for small-business owners in augmenting their own retirement savings plans.

WHICH PLAN TO CHOOSE

Small-business owners must carefully examine their priorities when selecting a retirement plan for themselves and their employees. If the main priority is to minimize administrative costs, a SEP plan may be the best choice. If it is important to have the flexibility of discretionary contributions, a profit-sharing plan might be the answer. A money purchase plan would enable a small-business owner to maximize contributions, but it would require an assurance of stable income, since contributions are mandatory. If the small business counts upon key older employees, an age-based profit-sharing plan or a defined-benefit plan would help reward and retain them. Conversely, an employer with a long time horizon until retirement would probably do best with a defined-contribution

plan. Finally, a small-business owner who wants employees to be able to fund part of their own retirement should select a SIMPLE or a 401(k) plan. There are also many possibilities for combination plans that might provide a closer fit with a small business's goals. Free information on retirement plans is available through the Department of Labor at 800-998-7542, or on the Internet at http://www.dol.gov/ebsa/savingmatters.html.

RETURN ON ASSETS (ROA)

Return on assets (ROA) is a financial ratio that shows the percentage of profit a company earns in relation to its overall resources. It is commonly defined as net income divided by total assets. Net income is derived from the income statement of the company and is the profit after taxes. The assets are read from the balance sheet and include cash and cash-equivalent items such as receivables, inventories, land, capital equipment as depreciated, and the value of intellectual property such as patents. Companies that have been acquired may also have a category called "good will" representing the extra money paid for the company over and above its actual book value at the time of acquisition. Because assets will tend to have swings over time, an average of assets over the period to be measured should be used. Thus the ROA for a quarter should be based on net income for the quarter divided by average assets in that quarter. ROA is a ratio but usually presented as a percentage.

ROA answers the question: "What can you do with the assets that you have available?" The higher the ROA, the better the management. But this measure is best applied in comparing companies with the same level of capitalization. The more capital-intensive a business is, the more difficult it will be to achieve a high ROA. A major equipment manufacturer, for instance, will require very substantial assets simply to do what it does; the same will be true for a power plant or a pipeline. A fashion designer, an ad agency, a software firm, or a publisher may require only minimal capital equipment and will thus produce a high ROA. To compare a media outlet with a clothing store is like comparing apples to oranges.

The difference between a highly capitalized business and one running largely on intellectual property or creative assets is that, in the case of failure, the capital-intensive company will still have major assets that can be turned into real money whereas a concept-based enterprise will fail when its art is no longer favored; it will leave a few computers and furniture behind. Therefore ROA is used by investors as one of several ways of measuring a company *within* an industry, comparing it with others playing by the same rules.

USES FOR ROA

Unlike other profitability ratios, such as return on equity (ROE), ROA measurements include all of a business's assets those which arise out of liabilities to creditors as well as capital paid in by investors. Total assets are used rather than net assets. Thus, for instance, the cash holdings of a company have been borrowed and are thus balanced by a liability. Similarly, the company's receivables are definitely an asset but are balanced by its payables, a liability. For this reason, ROA is usually of less interest to shareholders than some other financial ratios; stockholders are more interested in return on *their* input. But the inclusion of all assets, whether derived from debt or equity, is of more interest to management which wants to assess the use of all money put to work.

ROA is used internally by companies to track asset-use over time, to monitor the company's performance in light of industry performance, and to look at different operations or divisions by comparing them one to the other. For this to be accomplished effectively, however, accounting systems must be in place to allocate assets accurately to different operations. ROA can signal both effective use of assets as well as undercapitalization. If the ROA begins to grow in relation to the industry's as a whole, and management cannot pinpoint the unique efficiencies that produce the profitability, the favorable signal may be negative: investment in new equipment may be overdue.

Another common internal use for ROA involves evaluating the benefits of investing in a new system versus expanding a current operation. The best choice will ideally increase productivity and income as well as reduce asset costs, resulting in an improved ROA ratio. For example, say that a small manufacturing company with a current sales volume of $50,000, average assets of $30,000, and a net profit of $6,000 (giving it an ROA of $6,000 / $30,000 or 20 percent) must decide whether to improve its current inventory management system or install a new one. Expanding the current system would allow an increase in sales volume to $65,000 and in net profit to $7,800, but would also increase average assets to $39,000. Although sales would increase, the ROA of this option would be the same 20 percent. On the other hand, installing a new system would increase sales to $70,000 and net profit to $12,250. Because the new system would allow the company to manage its inventory more efficiently, the average assets would increase only to $35,000. As a result, the ROA for this option would increase to 35 percent, meaning that the company should choose to install the new system.

Return on assets data also suggests a shocking decline in the average return on assets in the United States over the past four decades. According to a 2009 shift index report by Deloitte's Center for the Edge, the return on assets on an economy-wide level in the United States has fallen more than 75 percent since 1965. Over this four-decade period, every sector, with the exception of health care, aerospace, and defense experienced a decline in return on assets. This indicates that companies as a whole have experienced decreased profitability in comparison to spending. This fall comes in part as a result of extreme corporate performance pressure, a relaxation of regulations, and an increase in competitive intensity.

RETURN ON INVESTMENT (ROI)

Return on investment (ROI) is a financial ratio intended to measure the benefit obtained from an investment. Time is usually of the essence in this measurement because it takes time for an investment to realize a benefit. An ROI calculation can be illustrated by the purchase and subsequent sale of a house. Assume a cash purchase of a residence for $100,000. The house is held for 10 years and is then sold for $150,000; during its 10 years of ownership, maintenance costs have been $1,000 per year, so that the net sales value is $140,000. This sum, less the purchase price, nets out to $40,000. That $40,000 divided by the purchase price produces 0.4 or 40 percent. The ROI of this transaction has therefore been 40 percent. ROIs are typically calculated in different ways. In this example, for instance, the owner may have rented the house for $200 per month and realized a 10-year income stream of $24,000 as well. If that income is factored in, the net benefit will be $64,000 rather than $40,000, and the ROI will be 64 percent.

The general rule to keep in mind is that ROI is the ratio produced when all gains from a transaction, less the

costs associated with that transaction, are divided by the initial investment. The most common use of ROI is to assess the profitability of a company (or an operation within a company) based on investment. There are other measures of profitability as a percentage of *sales*, for instance, or as a percentage of total *assets* used. ROI is of special interest to those who put their money into stocks or invest their savings into their own business: they have different choices available, and ROI can help to guide them to where to put their money.

ALTERNATIVE WAYS OF CALCULATING ROI

The general formula for computing the ROI of a business is to divide the company's net income for a period by its invested capital. But the term "invested capital" does not have a universally or uniformly accepted definition. It is sometimes defined as net work or owners' equity. Other definitions include the company's long-term debt on the principle that, for operational purposes, money derived from debt is equivalent to paid-in capital. Barron's *Dictionary of Finance and Investment Terms* (1985), for instance, includes long-term debt in its definition of "return on invested capital," which it uses synonymously with ROI. When the company has no long-term debt, the measure becomes Return on Equity. *MSN Money* uses the same definition as Barron's and showed, in mid-2010, that the average return on capital (ROI including long-term debt) of the S&P 500 companies was 8.84 percent.

The small business can, thus, calculate its ROI simply by dividing its after-tax income by its net worth (the residue after total liabilities are deducted from total assets on the balance sheet) or can use net worth *plus* long-term debt. Consistency in the use of the formula is, of course, advisable. When asked by a lender or investor for the company's ROI, the owner might be well advised to find out the party's own definition. ROI will be lower if long-term debt is present.

ROI calculations are also typically employed to monitor the performance of divisions or of product lines within a company. The approaches used tend to be varied, but a common form of measurement is to use operating income for the division (income before taxes) as the "gain" and a composite measure to represent investment funds expended on behalf of the division's operations including the depreciated value of capital equipment, the value of inventories carried, and the net value of receivables less payables. When all divisions are measured the same way, comparisons are possible across the board.

ROI can also be used to evaluate a proposed investment in new equipment by dividing the increase in profit attributable to the new equipment by the increase in invested capital needed to acquire it. For example, a small business may be able to save $5,000 in operating expenses (and thus raise profit by the same amount) by spending $25,000 on a piece of new equipment. This yields an ROI of $5,000 divided by $25,000, or 20 percent. If this figure is higher than the company's cost of capital (the interest paid on debt and the dividends paid to investors) prior to the investment, and no better investment opportunities exist for those funds, it may make sense to purchase the equipment.

In recent years, the use of ROI has expanded to also determine the return on investment for other activities not directly related to marketing or development of a product. For example, one hospital conducted a return-on-investment analysis on sexual harassment training it had provided. Another CEO conducted an ROI study to determine what effect his hosting of a golf tournament had. These types of studies allow business owners to understand the bottom-line impact of various endeavors and expenses that cannot neatly be categorized.

In addition to the various uses ROI holds for small-business managers, it is routinely used by investors in the stock market to compare the performance of different companies and by people buying and selling companies in merger and acquisition activity.

RETURN POLICIES

Return policies are the rules retail merchants establish to manage the process by which customers return or exchange unwanted or defective merchandise that they have purchased. According to a 2007 Harris Poll, 91 percent of consumers reported that a store's return policy was an

important factor in their buying decisions. As such, return policies are an extension of the customer service retailers provide, and they often tend to be fairly liberal. For this reason many consumers hold the mistaken belief that they can always return merchandise for a full refund regardless of the circumstances. In reality, both regular and online merchants enjoy great leeway in establishing individual policies. As returns have become more prevalent and more costly, some merchants have imposed tighter restrictions on merchandise returns.

The most generous return policies which are usually found at large, upscale retailers permit customers to return any merchandise at any time for a full refund, with or without a receipt. But most retailers place restrictions on one or more aspects of this process. For example, many merchants will not accept merchandise for return unless the customer can produce a dated receipt proving that he or she purchased the item at that store within a reasonable amount of time. Other merchants have slightly more liberal return policies and will accept items without a receipt as long as the sale tag is still attached. Still others will provide a store credit rather than a cash refund when no receipt is forthcoming. Some retailers have even tighter return policies and prohibit returns on sale merchandise or on certain types of items, like bathing suits, or impose a limited period of time during which returns are accepted.

The goal for retailers is to balance the need to satisfy customers against the cost and hassle associated with merchandise returns. Setting too liberal policies may encourage customers to abuse the system. For example, a customer might purchase a dress for a formal occasion, wear it once, and then return it. Similarly, a consumer might purchase a top-of-the line computer, use it for several months until an even faster model becomes available, and then return it. Finding the right balance between self-protection and customer service can be a particularly important issue for small-business owners. Much more than big retailers, they depend on superior customer service to keep people coming back to their shops and Web sites. Larger merchants can generally afford to be more liberal in allowing returns; smaller outfits may need to raise prices in order to compensate for the added expense. After all, returned items that cannot be resold must either be returned to the manufacturer or sold to a jobber, which costs the retailer extra in transaction and transportation fees.

The state of the economy may also affect a retailer's attitude toward returns. In the economic slowdown of 2008 and 2009, many retailers reported loosening their return policies, especially during the holiday season, in an effort to attract more customers in the tough economic climate. In fact, 52 percent of retailers responded to a 2008 study that they would be more lenient in holiday returns for that coming shopping year, as compared with 35 percent of stores that had relaxed their policies around the holidays in 2007. This increased leniency took the form of permitting more time for returns and being more accepting of returns without receipts.

There are several steps brick-and-mortar retailers can take to discourage abuse of their return policies. For example, they can attempt to reduce the volume of sales returns by posting their policy for customers to see. Although some types of products are easier to resell after being returned, it is advisable to have a single policy and to adhere to it rather than attempt to attach different rules to different types of items sold in a store.

RETURNS IN E COMMERCE

Establishing fair return policies while limiting the cost of returns is of particular importance to online retailers. After all, returns are a fact of life in electronic commerce. "How well you handle online returns will likely determine your future success or failure in the dotcom world," Melissa Campanelli wrote in *Entrepreneur*. "Unfortunately, returned merchandise is a major byproduct of increased Internet growth, especially as consumers become much more comfortable purchasing items over the Net." Some experts claim that the nature of electronic commerce invites large numbers of merchandise returns because consumers are not able to see and touch the items they purchase online.

A survey by e-BuyersGuide.com found that 86 percent of online shoppers rated return policies of significant importance in choosing an online merchant. Consumers were especially concerned about whether the policies permitted them to receive a refund immediately after items were returned, return online purchases to a brick-and-mortar store, exchange items as needed, and have the convenience of postal pickup at their homes. But the number-one priority of online shoppers was not having to pay return postage for items they ship back to "e-tailers." In a survey of the top fifty online merchants, however, 85 percent said that they required customers to pay return postage. Requiring customers to pay for shipping tends to discourage frivolous returns, according to some online retailers. This may in part explain why a 2007 survey demonstrated that 40 percet of online shoppers were dissatisfied with online return policies.

According to the e-BuyersGuide.com survey reported in *Entrepreneur*, the main reasons online shoppers returned their purchases included: that the product was not what they expected (25%); that the product did not fit properly (17%); that the merchandise was damaged (17%); that the wrong items were delivered (16%); that the products were of poor quality (10%); and that they simply changed their minds and did not want the product (15%). Of the consumers who returned items purchased online, 78 percent said they were satisfied with the experience, while

only 6 percent described it as unsatisfactory. Of those who had a bad experience returning merchandise, however, 62 percent said they would not return to the offending Web site.

The most popular way to handle online returns is to provide postage-paid return labels. Both the U.S. Postal Service and United Parcel Service (UPS) provide merchants with a service where customers can generate labels online and print them on their home computers. Retailers can open an account at a local post office to use the U.S. Postal Service's easy return system. There is a minimum charge of ¢30 per return for the merchant. The UPS system is similar but also separates merchandise that is returned because it is faulty or damaged from that returned because the customer changed his or her mind. Both systems allow retailers to track packages online.

Another option for electronic retailers is outsourcing returns to a return management solution (RMS) company, like Return.com. These firms handle all aspects of merchandise returns, from generating labels and return authorizations to the physical handling and processing of merchandise. Some RMS companies integrate their computer systems with retailers' in order to facilitate tracking and routing of packages. According to Campanelli, using an RMS firm generally involves an installation fee of around $10,000 plus a transaction fee for each package handled.

RIGHT-TO-KNOW (RTK) LAWS

Right-to-know laws are a group of rules and regulations at the state and national levels that mandate that employers share scientific information with workers and local communities about the toxicity and other characteristics of chemicals and materials used in business processes. This information encompasses all substances to which workers might be exposed in the workplace, including materials and chemicals utilized in producing goods or providing services, chemical releases into the environment, waste management, and long-term exposure to substances. Right-to-know laws place special emphasis on maintaining and disseminating information on the potential long-term health effects (cancer, infertility, etc.) sometimes associated with longtime work exposure to high concentrations of industrial materials.

Experts in the fields of risk management and hazardous materials management generally separate employer obligations under "right-to-know" (RTK) into four broad categories: obligation to compile and retain relevant records; obligation to disclose any available information to workers, community members, or organizations on any potentially hazardous materials and processes used; obligation to provide adequate training to employees working with potentially dangerous materials; and obligation to disclose information on sudden health risks. This information, which must be presented even if it is not formally requested, should cover the potential risks of sudden and accidental chemical releases, explain the scope of the company's technological and human resources effectively to address such events; and identify other options that could also be considered.

THE MOVEMENT TOWARD RIGHT TO KNOW

The first U.S. efforts to inform workers and communities about hazardous substances used in the workplace were voluntary industry labeling practices. These labeling practices now incorporated into the Federal Hazardous Substances Labeling Act provided workers with basic information on hazardous materials, including descriptions of the nature of the hazard and instructions for safe handling (and medical treatment in case of exposure to the chemical in question). But as recognition increased of the potential long-term health effects of prolonged exposure to certain chemicals and materials, employee groups, companies, and government agencies all recognized that these safety measures needed to be bolstered.

In 1970 the federal Occupational Safety and Health Administration (OSHA) was formed to help assure that American workers enjoyed safe and healthy working environments. In subsequent years, the agency established a body of regulations designed to ensure that workers were

adequately informed about workplace risks (both short- and long-term) through training programs, labeling, and material safety data sheets (MSDS), in which original manufacturers provide complete information on all hazardous substances shipped to customers (downstream users are also required to supply end-users with MSDSs.) Contents of material safety data sheets must include the following for each chemical: identity, physical and chemical characteristics; primary routes of entry; health hazards; permissible exposure limits and control measures for reducing exposure; instructions for safe use, handling, and storage; emergency and first aid steps; name and address of manufacturer; date of production; and date at which the information contained in the MSDS was last changed. This bounty of centralized information makes the MSDS a cornerstone of all right-to-know programs. Moreover, during the 1990s some states initiated efforts to make these information-crammed forms more concise and understandable to lay readers, making them even more valuable.

OSHA's mandate remains in place in the 2010s. It requires employers to maintain safe workplaces and jobs for their workers and maintains exposure standards for a wide variety of substances that are used in all industry sectors. In addition, many states have also developed their own right-to-know programs. These programs, if certified by the OSHA, allow individual states to assume responsibility for administration and enforcement.

In 2010 the Environmental Protection Agency (EPA) made available on the Web the list of chemicals on the Toxic Substances Control Act Chemical Substance Inventory. This marked the first time the list had been available free of charge and was part of an effort by the EPA to increase the transparency of information on chemicals. The list can be found at http://www.data.gov.

The initiative to make additional data available is part of a broad joint effort between the administration of President Barack Obama and EPA administrator Lisa Jackson to provide more public education. However, as the administration moved forward with efforts such as increased openness about chemicals and toxic substances, OSHA aimed to take a step in the other direction with efforts to eliminate the requirement that chemical manufacturers include threshold limit values from the American Conference of Governmental Industrial Hygienists, as well as cancer hazard evaluations from the International Agency for Research on Cancer, from data sheets accompanying chemicals. With this move, OSHA aimed to change the regulation that had been in place for 27 years.

COMPLIANCE WITH RTK PROGRAMS

Many employers erroneously believe that the nature of their business operation renders them immune to right-to-know regulations. Typical misconceptions include the belief that the workplace does not have any hazardous chemicals or that the quantities used in the workplace are so small that RTK rules do not apply. In reality, however, these regulations do not distinguish between quantity or size, and nearly every place of employment in the United States contains some substance that meets the definition of a hazardous chemical. For example, many paints, cleaning solutions, solvents, corrosives, compressed gases, glues, and other common substances fall under RTK regulations.

Business owners, though, can take a number of steps to ensure that they are in compliance with right-to-know rules and are promoting safety and healthy working conditions for all of their employees. Many of these steps can be undertaken quickly, and none requires the knowledge or skills of a chemist or materials expert.

Inventory. Employers are encouraged to complete a comprehensive written inventory of all materials in the workplace that may be hazardous, irrespective of the quantity or size of the materials on hand. The written inventory should include chemicals used or stored in work areas outside the building proper. This inventory should also include by-products and intermediate products resulting from workplace processes. These materials inventories should include the name of the product, contact information for the manufacturer and distributor, and general work area in which the material is used or stored (chemicals used throughout the facility can be so designated). The written inventories can become large and quite comprehensive; as a result, more and more companies are moving to storing these inventories digitally. As long as the data is still available, keeping detailed digital records is still considered as being in compliance with OSHA regulations.

Material Safety Data Sheets. Each substance noted as a result of the materials inventory should have a corresponding material safety data sheet, for manufacturers must provide MSDSs to each purchaser of a hazardous chemical when making the initial shipment (recipients of these information sheets, whether distributors or purchasers, must provide updated information with the first shipment after each update). Some businesses even stipulate delivery of an MSDS as a condition of purchase when ordering hazardous chemicals.

Chemical Information List. Once all material safety data sheets have been gathered, they should be reviewed to identify the substance and understand specific hazards associated with the material. The MSDS can also be used to prepare a chemical information list for the workplace. This list, required by law, must be: 1) arranged in alphabetical order according to common name; 2) contain the chemical name; and 3) identify the area of the workplace

in which it can be found. According to right-to-know regulations, employers must provide access to and copies of the chemical information list to employees and their representatives, OSHA inspectors, and other employers sharing the same workplace.

Not all chemicals used in the workplace are required on these information lists. For example, a chemical list is not required in situations where employees handle chemicals only in sealed, unopened containers under normal working conditions, such as in warehousing or retail sales.

Clear Labeling. Businesses should make certain that all containers used to hold hazardous materials, whether on the factory floor or in the office, are labeled, tagged, or otherwise identified. This includes temporary portable containers if the container is going to be used by more than one person, utilized for an extended period of time (for example, more than one shift), or left unattended for any period of time. All hazardous substance container labels should clearly identify the material and detail potential hazards. Employers who receive unlabeled containers should either obtain an accurate label from the manufacturer or gather pertinent information from the manufacturer so that they can ready their own label.

Some businesses utilize commercially available labeling systems that use nontext methods to convey hazard warnings. These alternative systems may use icons, color coded numbers, or pictographs to describe levels of hazard and required personal protection equipment.

Institute Updating System. Employers should develop a system that allows them efficiently to update their chemical information list and MSDS holdings as each new substance arrives in their workplace. Updates should take place within 30 days of receiving the materials in question, as state and federal right-to-know programs require chemical lists to be updated regularly.

Hazard Assessment. Many employers use the hazard information contained in each MSDS to review carefully all processes in which the material is used. At this time, business owners can decide whether current workplace practices are adequate to ensure the safety and health of employees. Specific elements to review include level of engineering controls, adequacy of personal protective equipment, emergency procedures, and work practices.

Hazard Communication Program. Employers should put together a written hazard communication program for their employees. This program should explain how the company is meeting state/federal right-to-know requirements. Effective hazard communication programs will also include detailed explanations of the company's system of identifying and labeling hazardous substances; information about the company's material safety data sheets and chemical information lists, including how they are maintained and how they can be accessed by workers; and details on policies and procedures that employees should follow when engaged in non-routine tasks that require usage of hazardous chemicals and other potentially dangerous materials.

Training. Effective training programs must be implemented in conjunction with RTK laws. Right-to-know training programs should provide guidance and information in several key areas, including the purpose and content of the law; the nature of the hazardous substances in the workplace; protection from hazards; location and usage of information on these workplace materials, including material safety data sheets, labels, and chemical information lists; and overall employee rights. In essence, all right-to-know training programs should be based on the knowledge that information that is not understood by workers will be of little utility to them in preventing or limiting their exposure to hazardous chemicals in the workplace.

Business experts and state and federal administrators cite several keys to shaping and implementing an effective training program for a workforce:

- Identify who needs training. Employers should utilize organizational charts and personnel records to identify the training needs of various staff. Assess each employee's actual and potential exposure to hazardous chemicals during normal working situations and in potential emergencies. (For example, production and custodial workers are likely to have a higher level of training than salespeople and secretaries.)
- Determine which chemicals employees may be exposed to, either under normal working conditions or emergency situations.
- Ensure that employees are aware of the location of chemical information lists and material safety data sheets.
- Make sure that employees know how to use labels, MSDSs, and chemical information lists to obtain information on hazardous materials.
- Make sure that employees understand control programs and personal protective equipment.
- Institute measures to ensure that new and transferred workers receive training. Many businesses integrate Right-to-Know training into general orientation programs or existing departmental safety programs.
- Make contingency plans to provide additional training if new hazards are introduced into the workplace.
- Evaluate effectiveness of training programs after workers have completed them. This can be done through written tests, one-on-one meetings with

employees who completed the program, or employee demonstrations of acquired skills and knowledge. Employee feedback on the training program should also be encouraged. Business owners and managers should ask workers which aspects of the program were most valuable and informative, and which aspects were least useful. In some cases, this feedback phase may reveal that the training program did not provide staff with the necessary level of knowledge to deal safely and effectively with hazardous materials they encounter in the workplace. In those cases, programs should be revised until they meet expectations.

Experts note that many facilities utilize thousands of chemicals in their operations. Training all employees about the characteristics of each one is an unrealistic burden for any employer. Over the years, OSHA policies have shown a general recognition of this reality. According to OSHA, "information and training may be designed to cover categories of hazards (e.g., flammability, carcinogenicity) or specific chemicals. Chemical-specific information must always be available through labels and material safety data sheets.... If there are only a few chemicals in the workplace, then you may want to discuss each one individually. Where there are large numbers of chemicals, or the chemicals change frequently, you will probably want to train generally based on the hazard categories (e.g., flammable liquids, corrosive materials, carcinogens)." The market has also responded with helpful products. Thus Del Williams reported, in *Medical Laboratory Observer*, on Windows-based right-to-know labeling software which enables OSHA compliance officers to prepare labels on ordinary printers having done so by hand before. Williams' report was based on an interview with a supplier servicing 200 hospitals indicating the often massive size of the compliance task. Suzanne Shelley, reporting on the same product (called RTKV2 HazCom) in *Chemical Engineering* made the point that the product comes with online access to a database of 160,000 MSDS records thus making the job significantly easier.

RISK MANAGEMENT

Risk management involves identifying, analyzing, and taking steps to reduce or eliminate the exposures to loss faced by an organization or individual. The practice utilizes many tools and techniques, including insurance, to manage a wide variety of risks. Every business encounters risks, some of which are predictable and under management's control; others are unpredictable and uncontrollable. Risk management is particularly vital for small businesses, since some common types of losses such as theft, fire, flood, legal liability, injury, or disability can destroy in a few minutes what may have taken an entrepreneur years to build. Such losses and liabilities can affect day-to-day operations, reduce profits, and cause financial hardship severe enough to cripple or bankrupt a small business. But while many large companies employ a full-time risk manager to identify risks and take the necessary steps to protect the firm against them, small companies rarely have that luxury. Instead, the responsibility for risk management is likely to fall on the small-business owner.

The term is an evolution of the term "insurance management." The concept of risk management encompasses a much broader scope of activities and responsibilities than does insurance management. Risk management is now a widely accepted description of a discipline within most large organizations. Basic risks such as fire, windstorm, employee injuries, and automobile accidents, as well as more sophisticated exposures such as product liability, environmental impairment, and employment practices, are the province of the risk management department in a typical corporation. Although risk management has usually pertained to property and casualty exposures to loss, it has recently been expanded to include financial risk management such as interest rates, foreign exchange rates, and derivatives as well as the unique threats to businesses engaged in e-commerce. As the role of risk management has increased, some large companies have begun implementing large-scale, organization-wide programs known as enterprise risk management.

THE PROCESS

Businesses have several alternatives for the management of risk, including avoiding, assuming, reducing, or transferring the risks. Avoiding risks, or loss prevention, involves taking steps to prevent a loss from occurring by such methods as employee safety training. As another example, a pharmaceutical company may decide not to market a drug because of the potential liability. Assuming risks simply means accepting the possibility that a loss may occur and being prepared to pay the consequences. Reducing risks, or loss reduction, involves taking steps to reduce the probability or the severity of a loss, for example by installing fire sprinklers.

The importance of risk management has given rise to new tools designed to help companies cope with and manage risks. One such initiative is Risk Television, a free service available online through MashTV that provides risk management research and news available to companies in video format at no cost. As of 2007, more than 300,000 risk compliance professionals across all sectors had subscriptions to the TV network. Programs and offerings from MashTV are available at risk.mashnetworks.com.

Transferring risk refers to the practice of placing responsibility for a loss on another party by contract. The most common example of risk transference is insurance; it allows a company to pay a small monthly premium in exchange for protection against automobile accidents, theft or destruction of property, employee disability, or a variety of other risks. Because of its costs, the insurance option is usually chosen when the other options do not provide sufficient protection. Awareness of, and familiarity with, various types of insurance policies is a necessary part of the risk management process. A final risk management tool is self-retention of risks sometimes referred to as "self-insurance." Companies that choose this option set up a special account or fund to be used in the event of a loss.

Any combination of these risk management tools may be applied in the last step of the process, implementation. This step, monitoring, involves a regular review of the company's risk management tools to determine if they have obtained the desired result or if they require modification. Tools in that process include maintaining a high quality of work; training employees well and maintaining equipment properly; installing strong locks, smoke detectors, and fire extinguishers; keeping the office clean and free of hazards; backing up computer data often; and storing records securely off-site.

RISK MANAGEMENT IN THE INTERNET AGE

Small businesses encounter a number of risks when they use the Internet. According to the *Financial Express*, the Internet has bred a type of criminal that businesses especially those in the financial sector or other industries in which sensitive data is transmitted online must be aware of. Increased reliance on Web-based operations demands that small-business owners decide how much risk to accept and implement security systems to manage the risk associated with online business activities. Conducting business online exposes a company to a variety of hazards: liability due to infringement on copyrights, patents, or trademarks; charges of defamation due to statements made on a Web site or by e-mail; charges of invasion of privacy due to unauthorized use of personal information or excessive monitoring of employee communications; liability for harassment due to employee behavior online; and legal issues due to accidental noncompliance with foreign laws. In addition, businesses connected to the Internet also face a number of potential threats from computer hackers and viruses, including a loss of business and productivity due to computer system damage, and the theft of customer information or intellectual property. If the small business is publicly traded, the requirements of the Sarbanes-Oxley Act, specifically record retention, including the archiving of computer-based records, apply as well.

ENTERPRISE RISK MANAGEMENT

In the 1990s the field of risk management expanded to include managing financial risks as well as those associated with changing technology and Internet commerce. In the early twenty-first century, the role of risk management began to expand even further to protect entire companies during periods of change and growth. As businesses grow, they experience rapid changes in nearly every aspect of their operations, including production, marketing, distribution, and human resources. Such rapid change also exposes the business to increased risk. In response, risk management professionals created the concept of enterprise risk management, which was intended to implement risk awareness and prevention programs on a company-wide basis.

Enterprise Risk Management (ERM) has become an essential component of the financial health of insurance companies. In fact, ERM has become so important that the S&P 500 now evaluates an insurance company's ERM program as an important metric in determining the financial health of the insurance company. In 2007 the S&P completed a review of the adequacy of ERM programs in 274 insurance companies, finding that most had an adequate ERM program. The S&P surmised that insurance companies with adequate ERM programs will have lower losses relative to long-term average income in adverse and bad times than companies without adequate ERM programs.

The main focus of enterprise risk management is to establish a culture of risk management throughout a company to handle the risks associated with growth and a rapidly changing business environment. Writing in *Best's Review*, Tim Tongson recommended that business owners

take the following steps in implementing an enterprise-wide risk management program: 1) incorporate risk management into the core values of the company; 2) support those values with actions; 3) conduct a risk analysis; 4) implement specific strategies to reduce risk; 5) develop monitoring systems to provide early warnings about potential risks; and 6) perform periodic reviews of the program.

Finally, it is important that the small-business owner and top managers show their support for employee efforts at managing risk. "To bring together the various disciplines and implement integrated risk management, ensuring the buy-in of top-level executives is vital," Luis Ramiro Hernandez wrote in *Risk Management.* "These executives can institute the processes that enable people and resources across the company to participate in identifying and assessing risks, and tracking the actions taken to mitigate or eliminate those risks."

RISK AND RETURN

It is an axiom of financial transactions that the highest returns go with the highest risks and, conversely, the safest investments have the lowest returns. The only real difference between buying something and investing in something is the level of uncertainty involved.

The investment world has developed a rich array of instruments to enable those who lack money but have ideas for creating new wealth to obtain money from those who have the funds but either lack the time, skill, or enterprise to go venturing themselves. The fundamental divisions are described by the common phrase of "stocks and bonds." In a general sense stocks are risky and have high yield, and bonds are safe but produce low returns. Yet this formulation is far too broad for general use. Sorting out the nuances of risk and return requires a closer look. Financial markets are both innovative and competitive. For this reason virtually every conceivable niche available has been populated by financial instruments that attempt to minimize the negatives involved and to hedge the risks.

BASIC DIVISIONS

As of 2010, more than 37.9 percent of investments were held in debt instruments, with approximately $31 trillion invested in bonds, while over $14 trillion was invested in stocks according to the *Asset Allocation Advisor*. The allocation of money between these two major categories is itself a reflection of risk: in periods of expansion money is drawn to stocks; in times of decline, money is invested in bonds. The recession of 2008 and 2009 was a factor in the large sum of money in bonds.

Stocks. Stocks are typically classified by market capitalization and divided into large, medium or mid, and small capitalizations ("large-caps," "mid-caps," etc.). Large-caps have $10 to $200 billion in capitalization, mid-caps $2 to $10 billion, small-caps $300 million to $2 billion. The market capitalization is the value per share multiplied by the shares outstanding. Risks are greatest with small-caps but upward potential is greatest as well so that financial journals routinely report on the exciting promise of small-caps. The great and massive large-caps, however, are unlikely to surprise anyone except perhaps by spectacular and sudden failure.

Most ordinary people participate in the stock market by buying mutual funds offered by fund managers. Funds come in a great many varieties but have the common feature of combining different kinds of stocks to maximize returns, stock appreciation, safety, and even stockholder aspirations. Some funds favor "green" companies, others avoid tobacco or alcohol or favor companies owned or controlled by religious affiliations. In that they combine many companies into a single instrument, a mutual fund is often less risky

than the stock of a single company. Fund managers are rewarded for closely tracking trends in the market and making swift changes to maintain the fund's value.

BONDS

It is useful to remember that "bonds" whatever name they might actually bear are ultimately loans. Thus in a sense all loans are bonds and all bonds are loans. A certificate of deposit (CD), a private placement, a savings account, a corporate bond, a treasury bill, a bank loan all can be clustered under the generic "bond" designation because all types of loan instruments are ultimately bought, sold, and traded.

Bond debt is reported under seven major categories by the Bond Market Association. In order of magnitude the categories are mortgage-backed securities (26.08%), Treasury notes (20.19%), corporate bonds (19.75%), money market funds (10%), federal agency bonds (8.66%), municipal bonds (7.95%), and asset-backed instruments (public and private placements 7.38% of total). Money market funds are commercial loans, bankers' acceptances, and large time deposits. These instruments represent different mixtures of security, time commitment, and return. Mortgage-backed securities are long-term debt on homes and other real estate and thus well-secured. Corporate bonds depend on the bond rating and may be quite secure or risky ("junk bonds"). Treasury notes are considered the most secure debt instruments of all; they are short-term instruments. Municipal bond yields are tax-free and hence desirable for that reason.

Bonds carry a rating set by rating agencies such as Moody's Investor Service, Standard & Poors, Fitch Bond Rating Agency, and others. Using Moody's ratings, a bond rated Aaa has the highest quality; Aa is high quality, A is strong, and Baa is medium grade; all of the above are "investment grade." Bonds rated Ba, or B are speculative "junk grade" bonds, those classified as Caa/Ca/C are highly speculative junk bonds, and a rating of C means that a junk bond is in default. S&P and Fitch use D to indicate a bond in default. The label "junk" in all cases indicates that the bond holder is in some kind of financial difficulty. Investors, therefore, are not left to fend for themselves.

LONGER TERM TRACKING

Data published in the *Statistical Abstract of the United States*, based on research conducted by Global Financial Data (GFD), clearly show the longer-range differences between stocks and bonds and between Treasury notes and other bonds. In the 1970 through 2004 time frame, GFD calculated total return on stocks and bonds by periods, expressed as percentages based on real (inflation-adjusted) dollars. In the period 1970 to 1979 and 2000 to 2004, returns on stocks were negative producing a loss of 1.38 percent in the first period and 4.67 percent in the second. In the 1980 to 1989 and 1990 to 1999 periods, however, stocks had very nice returns of 11.85 and 14.85 percent, respectively. During these same decades, Treasuries and bonds invariably provided positive returns. In 2008, on the other hand, a portfolio made up 100 percent of bonds would have returned 26 percent, while a portfolio comprised 100 percent of stocks had a return of −36 percent.

Investors, of course, have the option to put their money where they expect the best return. Therefore money tends to move between investment vehicles depending on the economic weather. In the world of "risk and return" as in so many other areas change is a constant, alertness is rewarded, no system of gambling ever works, and there are no silver bullets.

ROBOTICS

The Robotic Industries Association (RIA) defines *robot* as "a reprogrammable, multifunctional manipulator designed to move material, parts, tools or specialized devices through variable programmed motions for the performance of a variety of tasks." However, the industry's working definition of a robot has come to be understood as any piece of equipment that has three or more degrees of movement or freedom.

According to RIA, some 194,000 robots were installed and operating in the United States in 2009. In 2009 9,451 robots valued at $569.2 million were shipped to North American companies. However, there has been a significant decline in robot orders from a peak in 2005, when 19,594 robots, worth $1.18 billion, were manufactured for North American buyers. At the beginning of 2010, the RIA reported that new orders from robot suppliers during 2009 were 25 percent lower than in 2008. Industry analysts attribute much of this decline to problems in the automobile industry, one of the robotics industry"s largest customers. Orders from suppliers to the automotive industry fell 49 percent from 2008 to 2009.

Despite the recent overall downward trend, long-term prospects for the industry remain positive, particularly as robotics branches out into other areas. In 2009 orders in the life sciences, pharmaceutical, and biomedical fields rose by 43 percent, and orders in the food and consumer goods sector rose 7 percent. These gains had the potential to make up for the slack created by problems in the automobile industry, and robotics companies remained optimistic that renewed growth was on the horizion. Robotics continues to be a well-established and mature industry with a future market that is potentially very large and diverse.

TECHNOLOGY

Today's robotics systems operate like most machines by way of hydraulic, pneumatic, and electrical power. Electric motors have become progressively smaller, with high power-to-weight ratios, enabling them to become the dominant means by which robots are powered. The crucial element in robotics is the artificial intelligence carried in the programmable circuitry of the machines.

Robots are made up of elements that differ depending on end use. The hand of a robot, for instance, is referred to in the industry as an "end effector." End effectors may be specialized tools, such as spot welders or spray guns, or more general-purpose grippers. Common grippers include fingered and vacuum types. Another central element of robotics control technology is the sensor. It is through sensors that a robotic system receives knowledge of its environment, to which subsequent actions of the robot can be adjusted. Sensors are used to enable a robot to adjust to variations in the position of objects to be picked up, to inspect objects, and to monitor proper operation (although some robots are able to adjust to variations in object placement without the use of sensors, provided they have sufficient end effector flexibility). Important sensor types include visual, force and torque, speed and acceleration, tactile, and distance sensors. The majority of industrial robots use simple binary sensing, analogous to an on/off switch. This does not permit sophisticated feedback to the robot as to how successfully an operation was performed. Lack of adequate feedback also often requires the use of guides and fixtures to constrain the motions of a robot through an operation, which implies substantial inflexibility in changing operations.

Robots are programmed either by guiding or by offline programming. Most industrial robots are programmed by the former method. This involves manually guiding a robot from point to point through the phases of an operation, with each point stored in the robotic control system. With offline programming, the points of an operation are defined through computer commands. This is referred to as manipulator level offline programming. An important area of research is the development of offline programming that makes use of higher-level languages, in which robotic actions are defined by tasks or objectives.

Robots may be programmed to move through a specified continuous path instead of from point to point. Continuous path control is necessary for operations such as spray painting or arc welding a curved joint. Programming also requires that a robot be synchronized with the automated machine tools or other robots with which it is working. Thus robot control systems are generally interfaced with a more centralized control system.

COMMON USES OF ROBOTICS

Industrial robotics has emerged as a popular manufacturing methodology in several areas in recent years, including welding, materials transport, assembly, and spray finishing operations.

Spot and Electric Arc Welding. Welding guns are heavy, and the speed of assembly lines requires precise movement, thus creating an ideal niche for robotics. Parts can be welded either through the movement of the robot or by keeping the robot relatively stationary and moving the part past the robot. The latter method has come into widespread use since it generally requires less expensive conveyor systems. The control system of the robot must synchronize the robot with the speed of the assembly line and with other robots working on the line. Control systems may also count the number of welds completed and derive productivity data.

Pick-and-Place Operations. Industrial robots also perform what are referred to as pick-and-place operations. Among the most common of these operations is loading and unloading pallets, used across a broad range of industries. This requires relatively complex programming, as the robot must sense how full a pallet is and adjust its placements or removals accordingly. Robots have been vital in pick-and-place operations in the casting of metals and plastics. In the die casting of metals, for instance, productivity using the same die-casting machinery has increased up to three times, the result of robots' greater speed, strength, and ability to withstand heat in parts removal operations.

Assembly. Assembly is one of the most demanding operations for industrial robots. A number of conditions must be met for robotic assembly to be viable, among them that the overall production system be highly coordinated and that the product be designed with robotic assembly in mind. The sophistication of the control system required implies a large initial capital outlay, which generally requires production of 100,000 to one million units per year in order to be profitable. Robotic assembly has come to be used in the production of a wide range of goods, including circuit boards, electronic components and equipment, household appliances, and automotive subassemblies.

Spray Finishing Operations. Industrial robots are widely used in spray finishing operations, particularly in the automobile industry. One of the reasons these operations are cost-effective is that they minimize the need for environmental control to protect workers from fumes.

Robots are also used for quality control inspections, since they can be programmed to quantitatively measure various aspects of a product's creation. In addition, the use of robots in environmental applications, such as the cleaning of contaminated sites and the handling and analysis of hazardous materials, represents an important growth market for robotics producers. Nonindustrial applications for robots in security, commercial cleaning, food service, and health care are also on the rise.

FUTURE OF ROBOTICS

Recent research and development has addressed a number of aspects of robotics. Robotic hands have been developed which offer greater dexterity and flexibility, and improvements have been made in visual sensors as well (earlier generations of visual sensors were designed for use with television and home video, and did not process information quickly for optimal performance in many robotics applications; as a consequence, solid-state vision sensors came into increased use, and developments were also made with fiber optics). The use of superconducting materials, meanwhile, offers the possibility of substantial improvements in the electric motors that drive robotic arms. Attempts have also been made to develop lighter robotic arms and increase their rigidity. Standardization of software and hardware to facilitate the centralization of control systems has also been an important area of development in recent years.

Research in robotics is a large and thriving enterprise ranging at one end from artificial intelligence studies attempting to decompose the processes of human thought so that these can be mechanized and put into robots to complex and independent movement needed to turn industrial robots into walking, talking, and manipulating human look-alikes the way ordinary people picture robots. Communication between people and robots and robot-to-robot dialogue fit into this spectrum somewhere. Motivations for creating robots arise from the field of medicine where robots are being developed to act as nursing aides on the one hand and as intelligent miniaturized agents on the other. Environmental issues have engaged robotics designers. Examples include the demanufacturing of electronic equipment, which is a form of toxic waste, and the handling of nuclear wastes. Robot miners may someday replace humans in dangerous environments. Robotics is also a major area of research in defense applications.

One of the areas in which robotics companies are making bold, futuristic steps is personal service. While robot servants and companions may seem like a far-fetched science- fiction dream, major companies are working in exactly this area. In an 2010 article titled, "Toyota Sees Robotic Nurses in Your Lonely Final Years," *Wired* reported that both Toyota and Honda are envisioning a large emerging market for robots, particularly as companions and helpers for the elderly. According to Toyota's *Global Vision 2020*, the company soon expects "Live-in partner robot as a core business."

Participation in robotics by small business has centered around research and development either directly in developing applications or in providing support services. High levels of engineering, electronics, and computer science skills are the keys of entry and not least an interest in what is a genuinely fascinating subject.

ROYALTIES

Royalties are payments made by one company (the licensee) to another company (the licensor) in exchange for the right to use intellectual property or physical assets owned by the licensor. For example, software giant Microsoft invented the Windows operating system for personal computers as a means of managing files and performing operations. Computer manufacturers such as IBM and Compaq pay a royalty to Microsoft in exchange for being allowed to use the Windows operating system in their computers. Other common situations in which royalties are paid include the following:

1. In the fashion industry, designers such as Ralph Lauren and Calvin Klein license the right to use their names on items of clothing in exchange for royalties. For example, they may sign a contract with a company that makes jeans that allows the company to place the designer's name on the jeans.
2. In book publishing, authors are commonly paid an advance on future royalties based on percentage of sales price; after sufficient sales have been made to "pay back" the advance, the authors receive additional royalties paid periodically.
3. In the music industry, royalties are paid to music copyright holders and to songwriters by radio stations and anyone else who derives a commercial benefit from the copyrighted material.
4. In the television industry, popular satellite TV services such as Direct TV and cable television services pay network stations and superstations a royalty rate so that they can broadcast those channels over their systems.
5. In the oil and gas industry, companies pay landowners a royalty rate for the right to extract natural resources, such as petroleum and natural gas, from the landowner's property. Similar agreements exist in the mining industry for minerals such as copper and silver.

HOW RATES ARE ESTABLISHED

Royalty agreements are intended to benefit both the licensor (the person receiving the royalty) and the licensee (the person paying the royalty). For the licensor, signing a royalty agreement to allow another company to use its product or intellectual property can mean expanding into a new market or increasing market share in an existing market. For the licensee, the agreement can mean gaining access to products that may have been too expensive or too difficult to produce on its own, or that were protected by patents it did not own. If done right, the royalty arrangement is a win-win situation.

Royalty agreements generally are of two types. The fixed price-per-unit agreement pays the licensor a set price for every one of its products sold by the licensee. Often, this type of agreement is used when the licensor's product is one that will be a small part of a larger product produced by the licensee. An example of this might be a new type of windshield wiper motor developed by Company A. The motor drastically changes the way windshield wipers work and is granted a patent by the U.S. Patent Office. Company A approaches BBB Autos and offers to license the motor to the automaker so that it can be included in all BBB cars and trucks. In return, BBB agrees to pay Company A $10 per unit for every motor it purchases. This price would cover the materials and labor needed to produce the motor, as well as include an extra sum to cover Company's A investment in developing the motor. In fixed price arrangements, the amount per unit can be adjusted for inflation, or a minimum royalty amount can be specified.

The second type of agreement is a royalty that pays a percentage of revenues or operating profit that results from the sale of the licensed product. This is more likely to be used when the item covered by the royalty agreement stands alone or when the cost of using the item can be clearly itemized. Percentage agreements are generally more intricate than fixed price agreements because more terms must be defined what rate will be paid for discounted items, what happens to items that are returned, whether sales commissions affect the percentage paid, whether updated versions of the item are covered by the agreement, and more. Agreements based on a percentage of the operating profit generally result in a more equitable settlement for both parties, but those agreements are also more complicated. As a result, it is more common for companies to agree on a percentage of revenues.

In percentage agreements, it is essential that the percentage chosen be fair to both sides. There are three areas to consider when determining a rate: 1) the specifications of the actual product or intellectual property being licensed; 2) the length and the geographic scope of the agreement; and 3) the capabilities of the licensor and licensee to live up to the agreement.

Factors related to the product that can affect the agreement include the uniqueness of the product, including any patents that may be included as well as any new versions of the product that may or may not be included in the agreement; the markets in which the product will be sold; and whether or not the product needs to be customized to meet the needs of the licensee. If customization is required, then the licensee should pay the licensor a higher percentage to cover additional manufacturing costs.

As for the agreement itself, it should clearly state the duration and should include the terms under which termination will occur. Whether or not the agreement can be renewed if certain goals are met should also be clearly spelled out. If a contract is too restrictive, the licensor may find at the end of the contract that it has limited itself in such a way that it can only renew the agreement with the current licensee, at less desirable financial terms. To try to find a new partner would be too cost intensive, so the licensor must renew with the original licensee. In addition to duration, the agreement should spell out the geographic rights granted to the licensee does the agreement cover U.S. sales only, or are international rights included? Finally, the agreement should have a provision to handle "third-party assignment." That is, what happens if the licensee assigns the rights to the product to a third party, possibly as a means to lower production costs? In some cases, the contract is invalidated if a third-party assignment occurs, so it is an important area to cover.

When approaching a licensor, a licensee should examine the company's business practices before signing an agreement. Things to watch for include the licensor's ability to keep up with technological advances and its financial stability. If the licensee feels there is a chance the licensor may not be able to keep up with industry shifts and may even go out of business during the life of the agreement, then the licensee should seek to negotiate more favorable royalty terms. The licensee should also expect the licensor to have a clear plan outlining research and development plans, goals for the product, and plans to develop new or related products that could possibly expand the agreement. Evidence of planning and clear goals for the future by the licensor should instill confidence in the licensee. Finally, does the licensor have the ability to provide the licensee (and consumers) with needed levels of customer service and support? This is especially important for high-tech products or for complex products. The better the support that is in place, the better the terms the licensor can expect to receive.

Conversely, the licensor should expect certain things from the licensee. Can the licensee live up to its promises as far as units sold and territory covered? Has the licensee sold products of this nature before, and does it have a strong history? Is the company financially viable, and does it show clear plans for future growth? Can the licensee offer something other than cash as part of the agreement for example, does the licensee have the ability to enhance the original product with its own products, or does it offer the licensor a market credibility that was previously lacking? All of these situations can affect how much money the licensor expects in the royalty contract.

LICENSING INTELLECTUAL PROPERTY

Intellectual property owned by one company is considered to be an intangible asset of that company. An intangible asset is something abstract, such as a patent or copyright, as opposed to a tangible asset, such as a factory or manufacturing equipment, or even cash. Intellectual property will, of course, have a physical form. It is structured information which can be and is recorded. Xerography or the chemical content of an important drug are examples. They reflect real wealth.

Not all intangible assets are intellectual property, however. For example, a company's workforce has skills that make it an intangible asset, but it is not intellectual property. Intellectual property is protected by law and may be sold, licensed, or transferred. Patents are perhaps the most common form of intellectual property. A patent is essentially a license granted by the U.S. Patent Office that gives one company the exclusive right to make and sell a patented invention for a period of 17 years. Any other company that desires to use that invention must negotiate terms of use with the company that receives the patent. Most often, those terms of use will involve a royalty agreement.

The Internal Revenue Service (IRS) has developed definitions of what qualifies as intellectual property and oversees the regulation of royalty payments involving intellectual property. Among the intangible assets that are considered to be intellectual property are:

- Patents, inventions, formulas, processes, or designs;
- Copyrights and artistic compositions, including books and music;
- Trademarks, trade names, or brand names;
- Franchises, licenses, or contracts;
- Items specifically compiled or created by a company, such as methods, programs, systems, procedures, campaigns, surveys, studies, forecasts, estimates, customer lists, or technical data; and
- Any other items that are not physical in nature, but rather intellectual.

Whenever any intangible assets that fit these criteria are sold or licensed from one company to another, a royalty must be paid. There are two types of transactions that may occur. The first involves the sale or license from one company to another, which is called a third-party transaction. In this type of transaction, Company A licenses the rights to its product or process to Company B, which pays a royalty rate for the right to use the product or process. This is the type of transaction that is most commonly thought of when royalties are considered. However, the second type of transaction, the intercompany transfer, is actually more common. The law in the United States makes it illegal for an American firm to transfer intellectual property rights to a foreign subsidiary unless royalties are paid. The IRS has very strict rules that it applies to all intercompany situations and has come up with a number of formulas that it uses to determine if a fair royalty rate is being paid.

The simplest formula used by the IRS is called the cost-based method. Using the cost-based method, a company can establish a royalty rate that recaptures the costs of developing the item that is being licensed while also providing a fair rate of return on the item. To use the cost-based method, a company must determine what it cost to develop the intellectual property, the life expectancy of the property, the total revenue generated by products that use the property, and a fair rate of return that will cover the risks the company took in developing the property.

The cost-based method is the most straightforward, but it has flaws that limit its effectiveness. In most cases, the costs of developing the intellectual property do not have a direct correlation to the actual value of the property, so the method will not produce accurate results. As a result, the most commonly used formula for determining a royalty rate is the "comparable uncontrolled transaction" (CUT) method. This method relies on historical data and the performance results for products or processes that are similar to the intellectual property that is being licensed. For example, a book publisher lining up an author to write a book may look at the rates that were paid to other authors to write similar books when they determine how much to pay an author for the new project. Similarly, a clothing designer may look at other licensing deals in the industry when it comes time to license his name for use on a line of handbags or accessories.

When applying the CUT method, the intellectual property in question can only be measured against other intellectual property that was used in similar products within the same basic industry or market, and that has similar profit potential. Additional factors, such as the length of the agreement, geographic restrictions, and the right to receive updates, also factor into determining if the CUT method can be utilized. The CUT method is preferred by the IRS and is used in most third-party licensing agreements.

Beyond the two most common methods of evaluating royalty rates, the IRS uses four other formulas that are less common. These are the comparable profits method (CPM), which compares the profits of companies that use the intellectual property in question to the profits of similar companies that do not use the intellectual property; the hybrid CPM, which uses a combination of the CUT method and the CPM method in order to take the profit-making potential of the intellectual property into account; the profit split method (PSM), which accounts for situations where the licensor takes the intellectual property and adds value to it through its own processes, thereby enhancing the profitability of the property at its own expense; and the residual market value (RMV) method, which recognizes that a company's financial performance can affect the value of intellectual property and thus uses stock market data to determine the estimated value of the intellectual property that is being licensed.

COPYRIGHTS, PATENTS, AND ROYALTIES

Perhaps the most common day-to-day application of royalties involves those paid for the use of copyrighted material. Every time a song is played on the radio, a royalty fee is paid by the station for playing that song. Every time a cable television provider transmits the signal of a broadcast television channel, such as TBS, it pays that station a royalty for the right to show it. Every book, magazine, and newspaper published in the United States is protected by a copyright, and royalties must be paid any time a portion of a print product is reproduced by anyone other than the publisher.

In the United States, several organizations are involved in the oversight and management of royalty agreements

involving copyrighted material. These primarily consist of government agencies and nonprofit associations that monitor intellectual property rights and, in some cases, actually collect royalties due to member companies.

The primary government agencies that are involved in royalty situations are the U.S. Copyright Office and the U.S. Patent and Trademark Office. Neither agency is directly involved in royalty payments, but both play an important role in the process. The Copyright Office provides all original authored works (including literary, dramatic, musical, and artistic works) with full protection under the law. When an author, artist, or publisher applies for a copyright, he or she receives the right to reproduce the work, to prepare derivative works based upon the work, to distribute copies of the work, to perform the work publicly, to display the work publicly, and, in the case of records, to perform the works by way of digital audio transmission. The length of time that a copyright lasts varies depending on the work and when it was published, but it is a minimum of several decades in every case. This means that only the person or company that holds the copyright for a work can license that work and receive royalties for it.

Similarly, the Patent Office protects inventors and their inventions. Whenever a person or company invents a new product or process, he or she can apply for a patent to indicate that he or she did invent that product or process, which grants him or her full protection under the law. If the work submitted is found to already exist or to be too derivative of an existing patent, then the new patent is not granted. Like a copyright, a patent gives the holder of that patent the right to license the product or service under royalty agreements, in this case for 17 years.

In the private sector, one of the major royalty organizations is the American Society of Composers, Authors, and Publishers (ASCAP), an association that protects the rights of its members working in the music industry (primarily composers, songwriters, lyricists, and music publishers). ASCAP monitors all public venues where music is played and collects royalties for its members by negotiating licensing agreements and fees with those venues, mainly radio stations. In addition to radio, however, ASCAP also closely monitors network, local, and cable television; live concert venues; college radio stations; bars, clubs, and restaurants; and background music services such as MUZAK. Every single time a songwriter's song is played, ASCAP collects money for the songwriter. This greatly simplifies the process of collecting royalties for creative works, and other similar organizations exist for writers and other creative professionals.

Another example of an umbrella organization that gathers royalty payments for a large number of clients is the Copyright Clearance Center, Inc. (CCC). Created at the suggestion of Congress in 1978, the CCC is a central body for licensing, recording, and collecting royalty fees. The CCC represents nearly two million works, thousands of publishers, and hundreds of thousands of authors and other creators. The company's streamlined, convenient compliance solutions enables more than 10,000 corporations and subsidiaries, including most of the *Fortune* 500, and thousands of government agencies, law firms, document suppliers, libraries, academic institutions, copy shops and bookstores to respect the rights of copyright holders and lawfully reuse the copyright-protected information they need to drive their business." This service is not necessarily intended to capture royalties from the average person when they make a copy of an article at their local library; instead, the CCC is intended to ensure that large-scale copying is monitored so that publishers can be fairly compensated for their work. More than 3,500 high-volume users are registered with the CCC as part of its Transactional Reporting Service so that their payments for copying materials can be easily processed (the alternative would be to contact each publisher individually and negotiate separate royalty agreements with each). The CCC faces a number of significant challenges to the concept of ownership and royalty collection, but the organization remains focused on a mission of "creating innovative licensing solutions for the seamless sharing of knowledge."

A CHANGING ENVIRONMENT

Royalties have long compensated authors, artists, composers, and other creative producers as copyrights have protected their creations from piracy. The Internet has introduced a formidable new factor into the old equation both by making the electronic duplication of works easy and rendering such works readily searchable using programmatic means. These changes have made royalty collection more difficult, as works that traditionally generate royalties are more easily accessed in ways that bypass payment.

This trend, which had already begun in the late-1990s, has accelerated in recent years. In 2006 Kevin Kelly reported in *New York Times Magazine* that massive ventures were underway to digitize the world's books in efforts led by Google but also carried out by Amazon.com, Superstar (in China, on Chinese books), and others. With major libraries, such as the New York Public Library, and universities also participating, Kelly predicted a weakening of the old model based on copyright and royalties as the Internet appears irresistibly to swallow all information. Royalty and licensing agencies, however, are attempting to keep up with changes, and they appear to be having some success. Even with the significant challenges it faces, the CCC has managed to remain if not ahead of the curve, at least at pace with changes. According to the CCC Web site, "In Fiscal Year 2009, CCC paid $144 million in

royalties to rights holders, which represents 8% growth over the previous year. In the last 15 years, CCC has paid out over a billion dollars in royalties to rights holders. Of its total licensing business today, about 60% is from the digital sharing of copyrighted materials such as intranet postings, wiki usage, and electronic coursepacks and e-reserves."

However, the long-term trend appears to be the replacement of royalties with other forms of compensation, such as direct Internet sales by artists, micropayments, and ad revenues.

ROYALTY FINANCING

Royalty financing is a relatively new concept that offers an alternative to regular debt financing (loans and trade credit) and equity financing (venture capital and stock sales). In a royalty financing arrangement, a business receives a specific amount of money from an investor or group of investors. The money might be put toward launching a new product or expanding the company's marketing efforts. In exchange, the investor receives a percentage of the company's future revenues over a certain period of time, up to a specific amount. The investment can be considered an "advance" to the company, and the periodic percentage payments can be considered "royalties" to the investors.

Royalty financing arrangements offer a number of advantages to small businesses. Compared to equity financing, royalty financing enables entrepreneurs to obtain capital without giving up a significant ownership position in the company to outside investors. The founders of the company are thus able to preserve their equity position, which may help motivate them toward continued success. In addition, royalty financing arrangements since they most resemble loans are not subject to state and federal securities laws as some equity financing deals are. Thus the company is able to save the time and money it might otherwise devote to complex filings and legal fees. Royalty financing also increases a company's ability to structure deals with individual investors, who might be attracted to the idea of receiving a monthly or quarterly yield over the life of their investment. In contrast, equity financing arrangements often show no yield until the stock is sold.

Compared to debt financing, royalty financing provides more convenient payback terms and less severe penalties for default. In addition, the infusion of cash may help the company increase sales, which may make it a better candidate to obtain more financing later. Finally, royalty financing enables a small business to keep its options open for later financing rounds. In contrast, a company that incurs significant debt or sells a great deal of equity in its early stages may find it difficult to attract investment later.

For some start-ups or small businesses, getting investors through royalty financing may prove to be easier than getting venture capital or angel investors, especially in an economy still recovering from a deep recession. In a 2010 article in *Noobpreneur.com,* Chris Birk notes that "entrepreneurs who are thinking about soliciting venture capital or angel investment funding face an uphill climb VCs dismiss about 98 percent of all investment proposals. Small business owners putting together those proposals should do their homework and hunt for some investors open to exploring royalty based financing." Some firms, such as Royalty Capital and Rockwater Capital, focus solely on royalty based financing.

DETAILS OF ROYALTY FINANCING

As an example, suppose that a small business obtains an "advance" of $100,000 against future sales from individual investors or an economic development organization. In exchange, the investors would receive 3 percent of the company's total sales for a 10-year period, to a maximum of $300,000. If the company repaid the investment over 10 years, then the investors would earn a compound annual return of 11.6 percent. However, if the investors reached their maximum royalties of $300,000 in half that time, the initial investment would yield an annual return of 24.5 percent.

A small business interested in royalty financing may be able to negotiate a grace period so that royalties will not begin to accrue for a quarter or more following the close of the deal. It may also be possible to establish a lag between the time revenues are realized by the company and the time royalties are paid to investors. This sort of arrangement can give the small business time to put the capital to work and increase sales before paying a percentage of sales as royalties. In most cases, these arrangements are acceptable to investors since they still offer a better deal than most equity financing arrangements, which only pay when the stock is sold.

Royalty financing may tend to work best for small businesses that have some elasticity in pricing, so that they can raise prices to cover the percentage of royalties without losing customers. Royalty financing is also suitable for companies for which increased marketing efforts have an immediate impact on sales. However, royalty financing may not be a good option for companies with very tight profit margins. In summary, the capital gained through royalty financing can enable a fledgling business to launch a new product or expand its marketing efforts without having to give up too much equity in the early stages. In royalty financing, investors own a piece of the company's revenue stream rather than a piece of the company itself.

RURAL BUSINESSES

According to the 2000 U.S. Census, just under a fifth of the U.S. population lived in rural areas. More recent data compiled by the U.S. Department of Agriculture (USDA) Economic Research Service shows that "Nearly 50 million Americans live in nonmetropolitan (nonmetro) areas, as currently defined. The nonmetro classification covers approximately 2,000 counties outside the primary daily commuting range of urbanized areas with 50,000 or more people, and is widely used to define "rural" for research and policymaking. Nonmetro areas contain 17 percent of the U.S. population but extend across 80 percent of the land area."

Until 1920, a crossover year, more people in the United States lived in rural areas than in cities. For city dwellers dealing with commutes, bureaucracy, crowding, and decay, life out on the farm or in small towns carries an aura of romance and of nostalgia. Traditional American value systems were shaped by a rural past and are in the process of transformation. In reflection of public sentiment, substantial efforts continue to be made by the federal and state governments to preserve the family farm and to foster life in rural areas by various support programs. For these reasons, perhaps, a certain sentimental flavor attaches to rural business activity which happens not to be shared by the people actually engaged in such activities. For them the old adage still applies: business is business.

Rural business, in other words, encompasses exactly the same types of activities as business in general, although there are some important differences. Rural areas are the location of agricultural and mining activities. Agriculture, in this context, includes forestry, animal husbandry, and fishing and, in addition to the output and employment already mentioned often also employs additional people in first-stage processing in rural settings. Mining includes, along with metals and minerals, oil and gas extraction, including some refining and certain transportation services located in rural areas such as pipeline compressor and pumping stations.

The distribution of farming products has also produced a unique form of institution, the farmers' cooperative. Data from 2006 on this institutional form, from the USDA, shows that there were 2,675 farm cooperatives in operation with a total net income of $3.2 billion. These cooperatives employed 123,000 full-time and 57,000 part-time and seasonal workers. The statistics for 2003 show a decline in farm cooperative activities. In 2003 there were 3,086 cooperatives employing 165,000 full-time and 62,000 part-time workers.

In addition to the important sectors of agriculture and mining which are more or less monopolized by rural areas, employ a lot of people, and together represent a large number of small businesses rural areas also have a high share of tourism. Rural areas house travel service businesses in large number. Found in rural areas are most ski resorts and all dude ranches. Rural hospitality businesses attract hunting and fishing enthusiasts, hold snowmobile, bicycle, and other races, and operate many small hotels, restaurants, and bars.

Finally, rural areas also have every other type of activity present in major cities except those most specialized (like stock exchanges, research hospitals, etc.), including manufacturing operations of the most sophisticated character.

SMALL BUSINESS

In the United States as a whole, total company counts indicate that roughly 98 percent of 5.8 million companies, *not* counting farms, were small business. The same proportion must hold for rural businesses as well. No data breaking down businesses by rural or urban locations are available, but assuming that small businesses are distributed based on population, about 1.1 million small businesses operate in rural areas, including small towns. According to the USDA, there were just under 2.1 million farms operating in the United States in 2007. As with other trends in rural statistics, this represented a decrease in the number of farms. The number of acres under cultivation has also been steadily declining. As the *Delta Farm Press* noted in a 2008 editorial, "The decline in the number of farms and land in farms reflects a continuing consolidation in farming operations and diversion of agricultural land to non-agricultural uses."

The federal government heavily subsidizes rural business activities, most notably in the form of farm subsidies. According to a 2008 report, in 2006 the federal government sent $13.4 billion in subsidies to farms, making payments to more than 1.4 million recipients. The federal government also operates programs to aid rural businesses by providing rural business enterprise grants, loan guarantees, opportunity grants, relending programs, development loans, development grants, renewal energy loans, and renewal energy grants.

In recent decades, the growth of the rural population has been slower than the growth of population in the United States. From 2000 to 2005, rural population increased by just over one million, a 2.2 percent increase, compared with 5.3 percent for the nation as a whole. More recently, however, there has been a flow of small business enterprise out of cities and suburbs to rural places as individuals leave urban corporate life and migrate to the countryside. The evidence for this is anecdotal but apparently real. This shift is driven, in part, by corporate downsizing that provides an impulse to many to establish their own businesses. The Internet is another contributing factor because it enables people to set up many of those new businesses wherever they would like. For a service business that uses the Internet to communicate and coordinate with suppliers and customers, location of its physical premises is a matter of less concern than for a goods-producing business. Many small businesses that exit the urban arena physically still service clients in the cities. Also influential in this shift towards rural areas has been the plethora of government programs that offer financial support to those willing to set up businesses in rural areas. These programs are part of efforts to foster rural development.

Additionally, the federal government is making a major push to integrate rural areas into the nation'high-technology infrastructure. Beginning in the early twenty-first century, various groups began initiatives to spread wireless and high-speed Internet access to rural areas. The Federal Communications Commission (FCC) has recently announced its commitment to developing and implementing plans to ensure universal coverage of high-speed Internet access, an effort that would require spreading and subsidizing broadband service to many rural areas currently not covered. In an April 2010 message to Congress, the chairman of the FCC stated that "The goal is for every American consumer and business, large and small, whether they live in a rural town and urban city . . . [to have] access to high-speed broadband service."

S

S CORPORATION

A small business may operate under various legal forms. The most common of these, particularly for new start-ups, is the sole proprietorship. The individual who owns the business receives all of its income and is responsible for all of the business's debts including other liabilities to which the business may be subject (e.g., a customer slipping on that banana peel in the store). Under a sole proprietorship, the individual and the business are the same thing. If the business fails, the owner may have to sell his or her house and other goods to satisfy its debts. The principal advantage of incorporation is that the owner as a person is separated from the corporation, the latter viewed as an artificial "person." They are now two, not one. The corporation carries its own liabilities. When the corporation fails, the liability of its owners is limited to whatever they have invested, and no more. The business owner who started a business with $10,000 may lose the $10,000 but not the $300,000 he or she owns in other assets. The downside of incorporation is that the income of the corporation is taxed separately and the owner gets his or her share only *after* the corporate tax has been deducted. The owner also then owes *additional* taxes on his or her earnings. Thus double taxation is involved. As a sole proprietor, the owner is taxed once but is personally exposed to all of the liabilities of the business. As a corporate entity, the owner is shielded from liabilities but is taxed twice. The goal of an S corporation is to have the best of both worlds.

The S corporation derives its name from Subchapter S of the Internal Revenue Code which provides corporations a "tax election" option a choice on how they want to be taxed. Under Subchapter S, a company may elect to pass all of its profits to its shareholders directly. The shareholders are then responsible for paying taxes on this income stream. The corporation itself is not taxed. Meanwhile the limited liability benefits of the regular corporate form continue. Not all corporations, however, qualify for the Subchapter S tax election. The company may only have a maximum of seventy-five investors. They must all agree to this choice. All must be residents of the United States or U.S. citizens. The Internal Revenue Service (IRS) also excludes certain types of companies described below.

BECOMING AN S CORPORATION

Once a business has incorporated in the usual way and has filed its articles of incorporation, it can elect S corporation status by filing Form 2553 with the IRS. All of the corporation's shareholders must sign this form or file special shareholder consent forms. The rules apply to anyone who has held stock in the company during the current tax year. To be eligible for S corporation status for the current tax year, a corporation must file the form by the fifteenth day of the third month of the corporation's tax year. Once the form has been filed, it is not necessary to file every year.

Eligibility. For a corporation to be eligible for S corporation status, the following conditions must be met and maintained:

- The business must have become a corporation prior to filing for S corporation status.
- The business must also have no more than seventy-five stockholders.

- All of the business's stock must be owned by individuals who reside in or are citizens of the United States. Estates or trusts may be allowed as stockholders, but corporate or foreign investors are not allowed. This includes other businesses that are not corporations, such as partnerships or sole proprietorships. This provision, therefore, excludes corporate subsidiaries from claiming S corporation status.
- The business must issue only one class of stock. This means that with the purchase of stock must come the same economic rights, such as receiving dividends or compensation in the event of liquidation at the same time and in the same amount per share as all other shareholders. Voting rights may differ amongst the shareholders without being considered a sign of the possession of different classes of stock.

Ineligible Businesses. Those businesses that are ineligible for S corporation status include:

- All financial institutions, such as banks and savings and loans
- Insurance companies
- Businesses that receive 95 percent or more of their gross income from exports (also known as DISCs, Domestic International Sales Corporations)
- Corporations that use the possessions tax credit (a type of foreign tax credit)
- C Corporations that have been S corporations within the last 5 years

ADVANTAGES

The chief advantage of the S corporation is its treatment under the tax law, particularly if the company routinely pays high dividends. Under the C form, stockholders actually "feel" the double taxation of corporate profits only when they get dividends: under an S form, they would get more money. S corporation stockholders also get assigned losses if the company sustains them. These losses do not require stockholders to pay any money to the company but allow them to factor the reported losses into their own income taxes and thus reduce their taxes on other income. The tax advantages of the S corporation have made this form of ownership extremely popular, particularly after the passage of the Small Business Job Protection Act of 1996, which raised the maximum number of shareholders an S corporation could have from thirty-five to seventy-five. Until the Small Business Job Protection Act of 1996 was passed, corporations with more than thirty-five shareholders were disqualified. According to the IRS, S corporations became the most common corporate entity type in 1997, and as of 2010, they continued to be the most prevalent type of corporation.

DISADVANTAGES

Most healthy corporations reinvest all or substantial portions of their profits into operations to fund growth. Dividends paid are therefore just a portion of all profits. In C corporations, stockholders only pay taxes on dividends, year to year, and are not liable for taxes on the total profit made. But when the S corporation retains its profits for growth, stockholders must pay taxes on that profit even though they do not get a check in the mail. This structural arrangement can thus produce tensions between stockholder and the corporation stockholders either required to keep "investing" in a going concern indirectly by paying its taxes or, conversely, pressuring the corporation to distribute more of its profits and thus potentially slowing the company's growth.

Taxed Fringe Benefits. Unlike C corporations but like partnerships S corporations may not deduct fringe benefits, given to shareholders who are also employees, as a business expense. As a result, shareholder-employees must pay taxes on those benefits. These rules apply to all shareholders who own more than 2 percent of the corporation's stock and are employees of the corporation. But all employees who are not stockholders may receive benefits without paying taxes.

Pay versus Profit Sharing. S corporations must be careful to pay stockholders who work for the corporation salaries "deemed reasonable" by industry standards. The temptation exists to pay stockholders low salaries and to compensate them, instead, from profits thus avoiding payroll taxes. But if the stockholder-employee is not paid at a reasonable rate, the IRS may require the stockholder to pay payroll taxes on the totality of the income received from the S corporation which may be substantial.

State and Local Taxes. S corporations are sanctioned under federal tax laws which may not be matched by local and state governments. Thus S corporations may still have to pay taxes as corporations to states and localities.

Record Keeping. S corporations must act like S corporations and maintain careful records. This is not, per se, a disadvantage of the form: after all, *all* businesses should keep good records. But some business owners see the S corporation as merely one way to escape liabilities by gaining the benefits of limited liability while continuing to operate as sole proprietorships. Under prevailing law, a corporation (S or C) must adhere to regular forms: it must separate personal from corporate accounts, hold regular directors' and shareholders' meetings, take minutes, and also use the appropriate corporate designation on its documents and stationary. Failing to adhere to these requirements, the S corporation may not prevail in court in the case of a

liability action, with the result that the stockholders are severally and individually held to be liable.

Furthermore, small-business owners may not be able successfully to navigate the accounting rules to take full advantage of S corporation tax law. According to Stephen Nelson, "the S corporation's extra accounting complexity sometimes means that small business owners don't get all the savings they're legally entitled to." In a 2009 article titled, "S Corporation Tax Planning Tips," Nelson recommended adhering to the following advice in order to maximize savings:

Set a reasonable but low salary: When profits are paid out as wages, the money is subject to Social Security and Medicare taxes, whereas profits paid out as dividends are not.

Minimize distributions. Since the IRS can recategorize distributions as wages, minimizing distributions minimizes the money that can, in theory, be reclassified.

Move deductions to the S Corporation tax return. This may not save the shareholder-employee on income taxes, but this deduction reduces the distributions made to shareholders (see item above).

TERMINATING S CORPORATION STATUS

An S corporation may voluntarily revoke its status if it finds that S status is no longer beneficial; it may also lose the status involuntarily. In the first case, a majority of the stockholders is required to make the decision, and a simple notice to the IRS is all that is required. In the second case, any act which disqualifies the corporation's eligibility for S status will result in the termination of that status effective on the date that the infraction occurs. An example of such a disqualification would be acquiring a single foreign stockholder living abroad. In either case, the corporation becomes a C corporation in the absence of S corporation status.

SALES COMMISSIONS

Paying a sales commission is a way of compensating salespeople. Under "straight" commission arrangements, the salesperson receives an agreed-upon percentage of the revenue brought in by a sale that he or she makes. Companies use commission arrangements to sell products as well as services. But some employers choose to pay salespeople a straight salary instead. The most common form of sales compensation other than in retail sales is to combine a salary with commissions.

The chief advantage cited for straight commission is that commissions cause salespeople to work harder. Detractors contend that uncertainties surrounding such a form of compensation may drive off good salespeople. Furthermore, their complete dependence on commissions may lead them to develop bad business habits. But even detractors admit that pure commissions incentivize and move people to try harder. As a consequence the majority of businesses that employ a sales force use some combination of base pay and commission also known as incentive pay to compensate their salespeople. Sales clerks, however, tend to be paid salaries or wages.

BASIC COMPENSATION PLANS

Under straight commission arrangements, the seller gets a percentage of the sales price. The percentage may vary from product to product. Observers of the sales function estimate or guess that fewer than 15 percent of American firms pay their salespeople a straight commission but those that do are satisfied with it: it motivates people to work hard enough to get the sales such companies need. Salespeople prosper in good times but are not a cost during a downturn. When the economy suffers, as it did

during the global recession that began in 2008, salespeople on straight commission can be a useful way to boost sales while not adding to a businesses costs. However, the business has to make sure sales are strong enough and compensation is sufficient to keep the sales staff satisfied.

The straight salary route has its disadvantages as well. Some very able salespeople may also be lazy: they may work hard until they have what they need and then tend to sit back. They cherry-pick what they sell, moving high-commission product at the neglect of other lines. They bypass difficult-to-reach customers when traveling or favor large buyers over small. Other, highly motivated salespeople view straight-commission selling as demeaning and cannot be attracted. Others view themselves as independents and move at frequent intervals, able to secure new jobs relatively easily. Pure commission salespeople tend not to develop high loyalties to the company that employs them: the company, after all, is not sharing the risk of the downside with them. Thus many also resist doing necessary work that is in the nonselling category, such as, attendance at trade fairs, participation in promotional visits, and providing follow-up work or technical assistance. A good deal of the sales management effort in companies that use straight-commission forces is devoted to get around problems of this type by a succession of tinkerings with incentives, supervision, and attempts at motivation. In such organizations the sales function is also often in a permanent recruiting mode.

Straight Salary. The most frequent criticism of compensation plans that pay sales representatives a straight salary is that they eliminate the employees' incentive to perform. But such criticism is rarely heard in situations where, for instance, the sales function is performed by principals or executives common in consulting, engineering, and service operations or in organizations where professional level individuals are engaged in selling, the sales activity itself has significant technical complexity, and the sales function is valued and well compensated.

Salary Plus Commission or Other Incentives. This arrangement is by far the most common one employed by organizations that use salespeople. Proponents tout several meaningful advantages associated with compensation plans that combine base salaries with commissions:

- Motivates sales force to expend greater effort
- Provides company with a way to extend additional rewards to its best sales performers
- Ties compensation to performance (though not to the same degree as straight commission arrangements)
- Makes administration of employee earnings easier.
- Bestows increased security to employees, allowing company to take greater percentage of sales profits

Criticisms of compensation plans that combine salary with commissions or other incentives are usually framed not as rebukes of its philosophical underpinnings but as laments concerning its execution. For example, some companies may offer only token commissions, which do little to foster aggressive salesmanship.

In addition to commissions, some companies choose to provide nonsalary compensation to their sales force through expense accounts, automobile leasing, advances against future earnings (usually commission), or sales contests.

Expense accounts are common features in many industries. Indeed, salespeople in a wide range of industry sectors depend a great deal on business lunches to close deals. Moreover, salespeople are often responsible for large territories, which makes long hours of travel a fundamental element of their job description. Organizations that do not compensate such individuals with expense accounts or free use of leased automobiles are likely to have considerable difficulty finding and retaining gifted salespeople. Indeed, most prospective hires will view refusal to take care of expenses as a sure sign of company stinginess and an indication that the company's ownership may not be cognizant of basic business realities.

Sales contests are another popular tool used by business owners to encourage sales activities. Under these programs, sales personnel who meet certain sales goals are rewarded with cash bonuses, paid vacations, or other perks. But business experts contend that sales contests can have unintended consequences for organizations if they are poorly defined or structured so that only a small segment of the sales force is rewarded. Indeed, some organizations provide incentives only to a certain percentage of top-level performers. Such programs whether commissions or sales contests are usually implemented in hopes of creating a competitive environment, but all too often they have the opposite effect. After all, if twenty-five people participate in a contest that only one person can win, twenty-four must also lose. In order to counteract the negative characteristics associated with traditional sales contests, sales consultants recommend that businesses instead institute "open-ended" incentive programs. Such programs are designed so that participants compete against their own past performances rather than their fellow salespeople.

Open-ended programs can be shaped in two-tiered fashion so that a business's very best sales performers receive some extra recognition. For example, salespeople who increase their sales by 10 percent might receive a nice prize, while those that increase their sales by 20 percent would receive an even better one. Two objections are commonly raised to open-ended sales incentives. The first is that such initiatives cast greater uncertainty on sales budgeting efforts. After all, companies that offer an

open program cannot know how many prizes to budget for. In addition, some observers contend that open programs can actually detract from the performance of a business's top salespeople, who might reach a goal too early and therefore slack off. But the impact of both of these negative attributes can be neutralized by careful planning (such as studying multitiered programs) and continuous monitoring. A 2009 article in *Business Week* warns that "the most common mistake entrepreneurs make is simply to copy a competitor's plan, tweaking it slightly to fit his or her own budget. But compensation plans should be unique to your products or services, to individual reps' experience, and to your sales goals or profit margins."

SALES CONTRACTS

A sales contract is an agreement between a buyer and seller covering the sale and delivery of goods, securities, and other personal property. In the United States, domestic sales contracts are governed by the Uniform Commercial Code (UCC). International sales contracts fall under the United Nations Convention on Contracts for the International Sale of Goods (CISG), also known as the Vienna Sale Convention. The United Nations Commission on International Trade Law (UNCITRAL) reported in January 2010 that seventy-four countries have approved CISG.

Under Article 2 of the UCC, a contract for the sale of goods for more than $500 must be in writing in order to be enforceable (UCC 2-201). The sale of securities is a special case covered in Article 8 (UCC 8-319); to be enforceable a contract for the sale of securities must be in writing regardless of the amount involved. For the sale of other kinds of personal property, a minimum of $5,000 must be involved before an enforceable contract must be in writing. Otherwise, an oral agreement is enforceable as a binding contract.

Contracts that must be in writing to be enforceable are said to be within the Statute of Frauds. The Statute of Frauds dates back to 1677, when the English Parliament decreed that certain types of contracts must be in writing. The applicable parts of the UCC effectively define the types of sales contracts that must be in writing. In addition, every state has its own version of the Statute of Frauds.

Under the UCC a written sales contract should specify the parties involved, the subject matter to be sold, and any material or special terms or conditions. Some states also require that the consideration the amount and type of payment be specified. But the UCC does not require a formal sales contract. In many cases a memorandum or collection of papers is sufficient compliance. The courts have held that a written check can be considered a written memorandum of a sales agreement. The UCC allows a written sales contract to be enforced even if it leaves out material terms and is not signed by both parties. However, one party may not create a sales contract on its own that is binding against another party, and an enforceable contract must be signed by the defendant or the one against whom the contract is sought to be enforced.

In many cases a purchase order, pro forma invoice, or order acknowledgment may serve in place of a formal sales contract. A purchase order is issued by the buyer and sent to the seller, stating the type and amount of goods to be purchased, the price, and any other material terms such as a time limit on filling the order. A pro forma invoice is issued by the seller and sent to the buyer, often in response to a purchase order or oral agreement. In international transactions, the pro forma invoice may enable the buyer to open a line of credit with which to pay for the goods ordered. The pro forma invoice typically includes relevant terms and conditions that apply to the sale.

A formal order acknowledgment is useful for establishing the seller's position in case a dispute should arise. The order acknowledgment is drawn up by the seller in response to a received purchase order. It does not necessarily repeat the details of the purchase order, but it may

clarify details such as delivery schedules. When a formal order acknowledgment is countersigned by the buyer, it becomes a type of sales contract.

For international transactions, the Vienna Sale Convention is binding on signatory countries, of which the United States is one. Each of the nations that has signed the convention may state up to five reservations. For example, the United States has stipulated that it shall apply to U.S. companies only when the transaction involves another signatory country. Much of the convention parallels the UCC, with these notable exceptions:

- Acceptance of an offer that includes a request for additions or modifications constitutes a counteroffer.
- There is no provision requiring a contract be written in order to be enforceable.
- The period for discovering defective merchandise may be as long as 2 years.

Sales contracts are useful in providing for a common understanding between buyer and seller, thus minimizing disputes. When a dispute does occur, the sales contract can help provide for a fair settlement.

SALES FORCE

A company's sales force consists of its staff of salespeople. The role of the sales force depends to a large extent on whether a company is selling directly to consumers or to other businesses. In consumer sales, the sales force is typically concerned simply with taking and closing orders. These salespeople are not responsible for creating demand for the product, since, theoretically, demand for the product has already been created by marketing efforts such as advertising campaigns and promotional activities. Salespeople may provide the consumer with some product information, but individuals involved in consumer sales are often not concerned with maintaining long-term customer relationships. Examples of consumer sales forces include automobile salespersons and the sales staffs found in a variety of retail stores.

The sales force takes on a completely different role in business-to-business sales. Industrial sales forces, for example, may be required to perform a variety of functions. These include prospecting for new customers and qualifying leads, explaining who the company is and what its products can do, closing orders, negotiating prices, servicing accounts, gathering competitive and market information, and allocating products during times of shortages.

Within the business-to-business market, a distinction can be made between selling to retailers, industrial sales, and other types of business-to-business sales and marketing. The concerns and activities of the sales force tend to vary in each type of business market. What they have in common, however, is the desire of the sales force to establish a long-term relationship with each of its customers and to provide service in a variety of ways.

In selling to retailers, for example, the sales force is not concerned with creating demand. Since consumer demand is more a function of advertising and promotion, the sales force is more concerned with obtaining shelf space in the retailer's store. The sales force may also attempt to obtain more promotion support from the retailer. The sales force relies on sophisticated marketing data to make a convincing presentation to the retailer in order to achieve its sales and marketing objectives.

The largest sales forces are involved in industrial selling. An average industrial field sales force ranges in size from twenty to sixty people and is responsible for selling throughout the United States. The sales force may be organized around traditional geographic territories or around specific customers, markets, and products. An effective sales force consists of individuals who can relate well to decision makers and help them solve their problems. A sales manager or supervisor typically provides the sales force with guidance and discipline. Within the company the sales force may receive support in the form of specialized training, technical backup, inside sales staff, and product literature. Direct mail and other types of marketing efforts can be employed to provide the sales force with qualified leads. E-mail and the Internet are important sales tools as well. While meetings and phone calls will always be the most personal way for a salesperson

to make contact, e-mail has become an essential part of the sales equation.

Sales managers and supervisors can measure the efficiency of their sales force using several criteria. These include the average number of sales calls per salesperson per day, the average sales-call time per contact, the average revenue and cost per sales call, the entertainment cost per sales call, and the percentage of orders per 100 sales calls. The sales force can also be evaluated in terms of how many new customers were acquired and how many customers were lost during a specific period. The expense of a salesforce can be measured by monitoring the sales-force-to-sales ratio, or sales force cost as a percentage of total sales.

Using such criteria to evaluate the effectiveness of the sales force allows companies to make adjustments to improve their efficiency. If the sales force is calling on customers too often, for example, it may be possible to reduce the size of the sales force. If the sales force is servicing customers as well as selling to them, it may be possible to shift the service function to lower-paid personnel.

In industrial and other business-to-business sales, the sales force represents a key link between the manufacturer and the buyer. The sales force is often involved in selling technical applications and must work with several different contacts within a customer's organization. Industrial salespeople tend, on average, to be better educated than their consumer counterparts, and to be better paid. However, their cost as a percentage of sales is lower than in consumer sales, because industrial and business-to-business sales generally involve higher-ticket items or a larger volume of goods and services.

The sales force may be compensated in one of three ways: straight salary, straight commission, or a combination of salary plus commission. The majority of businesses utilize a combination of salary plus commission to compensate their sales forces, and fewer companies base their sales force compensation on straight commission. It appears that, as a percentage of all sales forces, the use of straight salaries remains constant. Many companies chose to alter their sales compensation plans during the recession that began in 2008 as a way to motivate the sales force and to boost sales. These compensation plans are flexible and can be altered again as the economy improves. Whatever type of compensation system is used for the sales force, the important consideration is that the compensation adequately motivates the sales force to perform its best.

SALES FORECASTS

Companies large and small engage in forecasting their sales in order to decide with the greatest accuracy possible what and how much to build or what and how much to buy. Sales forecasts support operational planning and supply chain management not marketing or sales efforts. Forecasts are made to project the business into the future accurately in order to avoid costly mistakes.

A classic example of sales forecasting is the determination of "the build." This phrase is used in industries where production falls in one season and sales in another. Thus snowmobiles are manufactured in the summer and sold in late fall and winter. How many sleds to build, how many of the low end and how many of the expensive models "the build," in other words must be decided long before the winter season actually arrives, before likely snowfall is predictable, before economic conditions influencing sales *then* can be known with certainty *now.* In "bad snow years" demand tends to drop, in "good snow years" it spikes. Snowmobiles are big-ticket items. Overbuilding can hurt the company and its dealer structure for longer than one season; underbuilding leaves substantial money on the table and may lead to a loss of market share if the competitor made a better forecast. Builders of boats and similar "water toys" have the reverse problem: they build in the winter for spring and summer sales. Boat builders, like snowmobile manufacturers, require positive economic times in that they sell high-end recreational products users can do without.

Both are influenced by weather. Boat sellers can also be hurt by high prices for fuels.

"The build" serves as an easy illustration of the need for good sales forecasts, but every producer and every merchant faces exactly the same problem in looking ahead. In every case more or less irreversible actions must be taken in advance of actual sales; in every case multiple factors influence future demand which may change in response to yet other factors; in every case bad forecasts may mean being saddled by large inventories or having to turn customers away. Not surprisingly, every business, even the smallest, engages in some kind of sales forecasting. It may be quite instinctive and informal a gut feel by the owner that more or less should be purchased or made, based simply on experience leading up to the purchasing decision. Sales forecasting is often a process involving contact with the sales channel. In many large companies producing for mass markets, sales forecasting is a very complex, formal, and highly structured activity involving expensive surveys, computer modeling, and statistical analyses.

BASIC TECHNIQUES

Fundamental approaches to forecasting sales rely on: 1) looking at the company's own history (internal numbers); 2) looking at the product's or category's market history (external numbers); 3) soliciting external opinion (channel surveys); and 4) examining other sources of information which indirectly influence the future.

In the first case the company will look at its own past sales and determine a trend, ideally based on units rather than on dollars to eliminate the effect of price changes. If the item is growing at 2 percent a year, the company may feel safe in increasing its production/purchasing by 2 percent for the next period. Such a forecast is typically just the start of a process of review. The company may wish to eliminate the product because its margin is low and decreasing, its warranty service requirements are too great, or because of other factors. Alternatively, the company may wish to increase its growth in the category by additional promotional, discount, and sales efforts and, betting on success, may order above its historical trend projection. Quite complicated formulas are sometimes applied. An example is production of replacement parts for outdated models of a product in which the forecast is dated on an estimate of the models still remaining "out there" in active use with the production reduced each year.

The second case, looking at the total market for the item, requires access to data on such sales. If these are available, the company can compare its own performance against the product's growth/decline as a whole and make adjustments accordingly. Suppose the category, for example, a certain type of garden tool, has been declining as a whole in the gardening field while the company's own sales of that product have been increasing at 5 percent a year. This may mean that the company may have become the last active supplier of a product in its locality thus drawing a segment of the public that still wants the product. Such a finding may lead to energetic stocking *up*. Conversely, if the company's sales are poor but the product as a whole is making waves, adjustments in price, promotion, display, and the like may justify much more ambitious stocking. In practice it is often very difficult to get objective data on the performance of a specific item for comparison. Similarly, even if overall sales data can be found, it may be very difficult for a merchant to discover why he or she is selling more or less of an item. The merchant's location, clientele, region of operation, and many other factors may influence the result. The small business typically lacks the time and money to go deeply into such a subject unless the product is rather expensive and central, as in the case of farm equipment, for example.

Many small manufacturers make heavy use of the third basic technique (along with the others): asking the channel what it expects to purchase in the coming planning period (quarter, year). Companies typically survey their distributors, dealers, or major customers at regular intervals to get a feel for what they plan on buying. In many fields such surveys are routine the buyers are as anxious as the sellers in getting the production numbers right so that, in the future, shortages on the one hand and pressure to buy on the other can be avoided. These types of surveys are usually conducted outside the usual "selling" context the channel made to understand that these estimates are intended for planning production. To be sure, the channel will nevertheless feel a certain pressure. Unless there is a known shortage in a field, buyers will thus typically somewhat understate their buying intentions; they do not want to have the numbers misunderstood as commitments to buy; they hedge in the lower direction. Producers in turn typically plan on slightly higher production rates, all else being equal.

The fourth technique of developing forecasts eyeballing indirect forces is often the most tricky and occasionally the most important. This, in the snowmobile business, for instance, is guessing at the weather, but it takes innumerable other forms. Indicators of the economy are the most closely watched: almost all businesses are affected by rising or declining economies. Hot economies lift costs of supplies and of labor and also lift sales. Consumer durables turn sluggish in times of decline, as do capital goods bought by industry. Interest rates powerfully influence new home construction as does the demographic phenomenon of new family formation which, in turn, depends on the age structure of the population and the average age of marriage, among other factors. Energy and fuel prices influence virtually every sector,

and these, in turn, are influenced by international events. Sociological trends are more subtle and difficult to exploit effectively. The small business that at least attempts consciously to look for and to analyze such trends using the broadly available statistical sources as well as its own experience with the public will outperform a company that simply looks at past sales and uses these to predict future sales.

FORECASTING SOFTWARE

Nearly all companies use computers to produce sales forecasts, and an in recent years, a number of software companies have begun producing specialized sales forecasting programs such as IBM's Cognos TM1, NetSuite's Sales Force Automation (SFA), and Landslide's CRM Solution, just to name a few. Additionally, there are a number of general-purpose programs that can be adapted for use in sales forecasting. Microsoft Excel is a commonly used general purpose program that many experts recommend for this purpose. A number of books, such as *Fundamentals of Forecasting Using Excel* and *Microsoft Office Excel 2007: Data Analysis and Business Modeling*, offer practical advice on using Excel to produce sales forecasts.

FORECASTS, OUTCOMES, AND LIMITATIONS

Well-conducted sales forecasting programs have an impact on every aspect of the business on financial performance first of all, of course, but also on market share, channel relations, and consumer satisfaction. An accurate forecast buys the company time and time is money. If the market is projected to experience a sharp decline and the forecast is correct, the company can scale back its production and purchases early, will have more time to adjust to these changes, and will be able to retain its place in the market with a properly priced product. The downward adjustment will be no less painful when taken early rather than later, but if taken later, it will be more costly: the company will be sitting on and required to finance a large inventory; it will have to move goods at large discounts, eroding its margins; at the same time it will bear high costs of severance from layoffs. Companies, however, are rarely able to get themselves to shrink deliberately in advance of facts clear and evident on the ground. For this reason, even very effective managements will compromise and simply scale back a little. But even that will be more adaptive than projecting lasts year's sales with a small increase.

Companies, similarly, are rarely able to believe a forecast that predicts a sudden surge in sales. Such things are rare and therefore too good to be true. But the company that has a decent sales forecasting program and dares to act on it, at least up to a point, will find itself with product in the channel when everyone else is out. It will thus garner new buyers and, if the new customers are pleased, it will gain market share as well as channel loyalties.

These two cases illustrate the benefits as well as limitations of sales forecasting. The technique works best when projected changes are relatively small. Both sharp down and up adjustments from a company's or a market's history will tend to be resisted. But those with the best techniques, combining every major approach, are likely to go furthest in the right direction and will ultimately emerge as the winners.

SALES MANAGEMENT

Sales management refers to the administration of the personnel selling a company's product line(s). It includes the planning, implementation, and control of sales programs, as well as recruiting, training, motivating, and evaluating members of the sales force. In a small business, these various functions may be performed by the owner or by the sales manager. The fundamental role of the sales manager is to develop and administer a selling program that effectively contributes to the organization's goals. The sales manager for a small business would likely decide how many salespeople to employ, how best to select and train them,

what sort of compensation and incentives to use to motivate them, what type of presentation they should make, and how the sales function should be structured for maximum contact with customers.

Sales management is just one facet of a company's overall marketing mix, which encompasses strategies related to the "four Ps": products, pricing, promotion, and place (distribution). Objectives related to promotion are achieved through three supporting functions: 1) advertising, which includes direct mail, radio, television, Internet, and print advertisements, among other media; 2) sales promotion, which includes tools such as coupons, rebates, contests, and samples; and (3) personal selling, which is the domain of the sales manager.

Although the role of sales managers is multidisciplinary in scope, their primary responsibilities are: 1) setting goals for a sales force; 2) planning, budgeting, and organizing a program to achieve those goals; 3) implementing the program; and 4) controlling and evaluating the results. Even when a sales force is already in place, the sales manager will likely view these responsibilities as an ongoing process necessary to adapt to both internal and external changes.

GOAL SETTING

Goal setting is usually based on a company's overall sales goals, modified by the mix of products to be moved. Overall sales goals must be met, of course, but balance must also be maintained. With a company that makes three different types of boats, for instance, in which the highest-priced model has the highest profit margins, the goal will be structured to move as many of the highest-priced models as possible. Balance between regions also enters the goal-setting process. Sales to some regions may be more difficult (far fewer lakes) but necessary to maintain the company's total volume. If multiple lines are sold (tenting and trailers, for instance), different goals will apply to each category. Goal setting will depend on product mix. In the usual case, past history will be a guide, and goals will be set in light of that history and desire to change past performance by lifting all sales, high-margin sales, creating sales for new products, and so forth.

PLANNING, BUDGETING, AND ORGANIZING

After goals are set, the sales manager may accept, or be required to modify, the general approach to sales in the current year. Both ongoing patterns and new ones require budgeting and, occasionally, changes to the organization. Fundamental structural issues are involved, such as the distribution channel, the forces to be deployed, and the sales program (incentives, pricing schedules, cooperative advertising programs, etc.) that will be used. A company, for instance, may be engaged in making a transition from direct sales using its own sales branches as distributors to using independent distributors. The planning process in the first year may involve finding and starting three new distributors and closing two company branches and relocating its best salespeople. In another operation, the goal may simply require adding four new salespeople and training them. In yet another case, the company may have decided to distribute some of its production through a "Big Box" retail store, thus creating ill-will among its servicing retailers and in consequence has decided to offer the retailers a more attractive sales program, higher co-op advertising participation, and high discounts on four occasions if they hold seasonal sales. Finally, in yet another case, no big changes are in the offing, but budgets must be formulated anyway, retiring salespeople replaced, and programs launched in the past continued.

For start-ups, of course, the sales organization must be built from scratch after its general structure has been determined. In such situations planning, budgeting, and organizing take on rather formidable dimensions. The ideal approach is to concentrate on hiring the best possible salespeople, bringing them on board as rapidly as possible, and then using them to help with the process.

Implementation. Implementation of the plan will have different emphases depending on whether the operation is up and running or required to be built or rebuilt. Recruiting, training, and setting compensation are primary implementation activities of start-ups or expansions. So are designing sales territories and assigning sales goals to each.

Recruiting. Recruiting salespeople ideally requires understanding of the customers and the market, not least its physical aspects; travel time needed to reach targeted points; and the type of selling involved. Experienced sales managers typically bring such skills to the job or, if brought in from a different field, will make some preliminary field trips to become familiar with the new area.

The manager may seek candidates through advertising, college recruiting, company sources, and employment agencies. Another excellent source of salespeople is other salespeople. Sales recruiting has special characteristics difficult to describe in analytical terms, especially in the small business environment where relationships tend to be closer. Indeed, in all areas of sales, managers rely a great deal on their experience to find people who have the special knack. Generalizations are dangerous, but good salespeople have good communications skills, enjoy human contact, are disciplined, can tolerate rejection with good humor, respond to rewards, and have a high level of energy. In technical sales, an engineering background is often required in addition to favorable personality traits.

Training. After recruiting a suitable sales force, the manager must determine how much and what type of training to provide. Most sales training emphasizes product, company, and industry knowledge. Only about 25 percent of the average company training program, in fact, addresses selling techniques. Because of the high cost, many small businesses try to limit the amount of training they provide. The average cost of training a person to sell industrial products, for example, commonly exceeds $30,000. Sales managers can achieve many benefits with competent training programs, however. For instance, research indicates that training reduces employee turnover, thereby lowering the effective cost of hiring new workers. Good training can also improve customer relations, increase employee morale, and boost sales. Common training methods include lectures, cases studies, role playing, demonstrations, on-the-job training, and self-study courses. Ideally, training should be an ongoing process that continually reinforces the company's goals.

Compensation. After the sales force is in place, the manager must devise a means of compensating individuals. The ideal system of compensation reaches a balance between the needs of the person (income, recognition, prestige, etc.) and the goals of the company (controlling costs, boosting market share, increasing cash flow, etc.), so that a salesperson may achieve both through the same means. Most approaches to sales force compensation utilize a combination of salary and commission or salary and bonus. Salary gives a sales manager added control over the salesperson's activities, while commission provides the salesperson with greater motivation to sell.

Although financial rewards are the primary means of motivating workers, most sales organizations also employ other motivational techniques. Good sales managers recognize that salespeople have needs other than the basic ones satisfied by money. For example, they want to feel they are part of a winning team, that their jobs are secure, and that their efforts and contributions to the organization are recognized. Methods of meeting those needs include contests, vacations, and other performance-based prizes, in addition to self-improvement benefits such as tuition for graduate school. Another tool managers commonly use to stimulate their salespeople is quotas. Quotas, which can be set for factors such as the number of calls made per day, expenses consumed per month, or the number of new customers added annually, give salespeople a standard against which they can measure success.

Designing Territories and Allocating Sales Efforts. In addition to recruiting, training, and motivating a sales force to achieve the company's goals, sales managers at most small businesses must decide how to designate sales territories and allocate the efforts of the sales team. Territories are geographic areas assigned to individual salespeople. The advantages of establishing territories are that they improve coverage of the market, reduce wasteful overlap of sales efforts, and allow each salesperson to define personal responsibility and judge individual success. However, many types of businesses, such as real estate and insurance companies, do not use territories.

Allocating people to different territories is an important sales management task. Typically, the top few territories produce a disproportionately high sales volume. This occurs because managers usually create smaller areas for trainees, medium-sized territories for more experienced team members, and larger areas for senior sellers. A drawback of that strategy, however, is that it becomes difficult to compare performance across territories. An alternate approach is to divide regions by existing and potential customer base. A number of computer programs exist to help sales managers effectively create territories according to their goals. Good scheduling and routing of sales calls can reduce waiting and travel time. Other common methods of reducing the costs associated with sales calls include contacting numerous customers at once during trade shows, and using telemarketing to qualify prospects before sending a salesperson to make a personal call.

CONTROLLING AND EVALUATING

After the sales plan has been implemented, the sales manager's responsibility becomes controlling and evaluating the program. During this stage, the sales manager compares the original goals and objectives with the actual accomplishments of the sales force. The performance of each individual is compared with goals or quotas, looking at elements such as expenses, sales volume, customer satisfaction, and cash flow.

An important consideration for the sales manager is profitability. Indeed, simple sales figures may not reflect an accurate image of the performance of the sales force. The manager must dig deeper by analyzing expenses, price-cutting initiatives, and long-term contracts with customers that will impact future income. An in-depth analysis of these and related influences will help the manager to determine true performance based on profits. For use in future goal-setting and planning efforts, the manager may also evaluate sales trends by different factors, such as product line, volume, territory, and market. After the manager analyzes and evaluates the achievements of the sales force, that information is used to make corrections to the current strategy and sales program. In other words, the sales manager returns to the initial goal-setting stage.

ENVIRONMENTS AND STRATEGIES

The goals and plans adopted by the sales manager will be greatly influenced by the company's industry orientation, competitive position, and market strategy. The basic industry orientations available to a firm include industrial goods, consumer durables, consumer nondurables, and services. Companies that manufacture industrial goods or sell highly technical services tend to be heavily dependent on personal selling as a marketing tool. Sales managers in those organizations characteristically focus on customer service and education and employ and train a relatively high-level sales force. In contrast, sales managers that sell consumer durables will likely integrate the efforts of their sales force into related advertising and promotional initiatives. Sales management efforts related to consumer nondurables and consumer services will generally emphasize volume sales, a comparatively low-caliber sales force, and an emphasis on high-volume customers. In certain types of service activities, such as consulting, market research, and advertising, sales are very often conducted by high-level executives or the principals who actually supervise the work to be performed for example, senior researchers or account executives.

The recession that began in 2008 had a significant and potentially long-term impact on sales operations. With consumption reduced, sales managers found a much more competitive environment, and with a credit crunch, both consumers and businesses, particularly small businesses, had to engage in belt-tightening, which affected sales levels.

REGULATION

Besides markets and industries, another chief environmental influence on the sales management process is government regulation. Indeed, selling activities at companies are regulated by a multitude of state and federal laws designed to protect consumers, foster competitive markets, and discourage unfair business practices.

Federal regulation affecting sales activities dates back to 1890, when the Sherman Antitrust Act was passed. This wide-ranging law makes it illegal for a seller to force a buyer to purchase one product (or service) in order to get the opportunity to purchase another product a practice referred to as a "tying agreement." A long-distance telephone company, for instance, cannot require its customers to purchase its telephone equipment as a prerequisite to buying its long-distance service. The Sherman Act also regulates reciprocal dealing arrangements, whereby companies agree to buy products from each other. Reciprocal dealing is considered anticompetitive because large buyers and sellers tend to have an unfair advantage over their smaller competitors.

Another antitrust provision affecting sales managers is the Robinson-Patman Act, originally passed in 1936. This act prohibits companies from engaging in price or service discrimination. In other words, a firm cannot offer special incentives to large customers based solely on volume, because such practices tend to hurt smaller customers. Companies can give discounts to buyers, but only if those incentives are based on real savings gleaned from manufacturing and distribution processes.

Beginning in the 1960s, the federal government began enacting more broadly targeted consumer protection laws which also impact sales managers. The Fair Packaging and Labeling Act of 1966, for example, restricts deceptive labeling, and the Truth in Lending Act of 1968 requires sellers fully to disclose all finance charges incorporated into consumer credit agreements. Cooling-off laws, which commonly exist at the state level, allow buyers to cancel contracts made with door-to-door sellers within a certain time frame. Additionally, the Federal Trade Commission (FTC) requires door-to-door sellers who work for companies engaged in interstate trade to announce their purpose clearly when calling on prospects.

As of 2010, Congress is considering a wide range of new consumer protections and financial regulations that will potentially impact the operations of sales managers, particularly in the financial industry, including home mortgages. It is widely expected that there will be new restrictions and disclosure requirements, and greater federal oversight of certain transactions. Sales managers in more traditional industries such as manufacturing and commodities are unlikely to be directly affected by these changes, however.

SALES PROMOTION

Sales promotion is a type of marketing aimed at consumers and other business in the distribution channel. It is used to introduce new products, clear out inventory, and attract more customers. Sales promotion tends to be defined by specific marketing techniques used for a limited period of time to raise interest in a particular product or service. Businesses choose sales promotion strategies based on their need for customer interest and the deals they are able to offer. Coupons, discounts, free samples, contests, and limited premiums or rebates are all common sales promotion tools. The marketing techniques used tend to fall into three broad categories: appeals using new information or awareness, appeals using economic incentive, and appeals using emotion. These techniques may be used with either individual consumers or with resellers and wholesalers who look for promotions at trade shows.

Sales promotion is a balancing act. Unless a business depends on advertising information alone while keeping prices stable, the discounts and other deals used in the promotion will cost the company money. In order to recoup this loss, the business must raise sales volume to bring in enough revenue to make a profit in addition to covering the cost of the promotion. Holding promotions too frequently will habituate customers to buy only when promotions are in effect. Avoiding promotions altogether will let competitors draw customers away.

ONLINE SALES PROMOTION

Small businesses are able to create comprehensive sales promotion strategies today due to the availability of Internet access. Online sales promotions are both effective and far less costly than using traditional forms of marketing media such as billboards or newspaper ads. If the business has a Web site, sales can be advertised on the home page, with discounts and timelines clearly outlined. Digital trade booths can be created to appeal to other businesses for those offering business-to-business products or services.

Social media can also be useful to small businesses with every new promotion. While social media sights are not conducive to drawn-out marketing campaigns, they are made for short, high-powered sales promotions. A day of deals or a week-long discount can be effectively advertised on a business Twitter page, or used as a status update for Facebook. If the sales promotion cannot be distilled to a couple meaningful lines, it is likely too complicated to be effective.

CONSUMER PROMOTIONS

Consumer promotions take a variety of forms, including price deals, contests, sweepstakes, special events, premiums, continuity programs, and sampling.

Price Deals. A consumer price deal saves the buyer money when a product is purchased. The main types of price deals include discounts, bonus pack deals, refunds, and coupons. Price deals are usually intended to encourage trial use of a new product or line extension, to recruit new buyers for a mature product, or to convince existing customers to increase their purchases. Price deals work most effectively when price is the consumer's foremost criterion or when brand loyalty is low.

Marketing techniques for price deals are twofold: online and local advertising inform consumers of upcoming deals, while packaging and point-of-sale advertising display the discount while it is in place. Existing customers perceive discounts as rewards and often respond by buying in larger quantities. Price discounts alone, however, usually do not induce first-time buyers.

If small businesses receive their products from a manufacturer or another retailer, they must receive permission to offer discounts or coupons of their own. Large manufacturers will often have discount programs of their own that small-business owners can (or must) use for sales promotion purposes. Many businesses are allowed to add further discounts on top of manufacturer promotions but must shoulder the cost themselves. If coupons are used, the manufacturers may offer their own coupons for the business to use. Companies are gravitating to online coupons that customers can print out because of the lower costs associated with Web discounts.

Contests/Sweepstakes. Contests are games that consumers can enter where their entries will be judged according to specific qualities and awarded accordingly, while sweepstakes are random drawings that award customers prizes based on chance. Small businesses can use contests if they have a strong local customer base that centers around a specific product or lifestyle, but sweepstakes tend to be less expensive and appeal to a wider range of consumers.

Special Events. According to the consulting firm International Events Group (IEG), businesses spend over $2 billion annually to link their products with everything from jazz festivals to golf tournaments to stock car races. Large companies like RJR Nabisco and Anheuser-Busch have divisions that handle only special events. These events tend to attract a homogeneous audience that is very appreciative of the sponsors, allowing companies to make positive associations with their products. Event promotion strategies also require less planning time and can be quickly executed if necessary. Special events marketing is available to small businesses through sponsorship of events on the community level.

Premiums. A premium is tangible compensation that is given as an incentive for buying a product. The premium

may be given for free, or may be offered to consumers for a significantly reduced price. Some examples of premiums include receiving a prize in a cereal box or a free garden tool for visiting the grand opening of a hardware store. Incentives that are given for free at the time of purchase are called direct premiums.

Other types of direct premiums include traffic builders, door openers, and referral premiums. The garden tool is an example of a traffic-builder premium an incentive to lure a prospective buyer to a store. A door-opener premium is directed to customers at home or to business people in their offices who may be more willing to listen to a salesperson in exchange for a free sample. Referral premiums award other businesses and individuals for referring customers.

Mail premiums, unlike direct premiums, require the customer save up points or tabs to obtain a premium through return mail. The premium is still valuable to the consumer because he or she cannot readily buy the item for the same amount.

Continuity Programs. Continuity programs reward customers for their loyalty to the business and are typically based on purchases. Airline frequent-flyer clubs, hotel frequent-traveler plans, and retailer frequent-shopper programs are common continuity programs. By rewarding long-standing customers for their loyalty, continuity programs also reduce the threat of new competitors entering a market.

Sampling. When a product is new or is not a market leader, giving free samples to consumers can be an effective strategy. In order for sampling to change people's future purchase decisions, the product must have benefits or features that will be obvious during the trial.

Small businesses that sell products often find it easiest to offer samples in the store, where customers who enter can easily find them. Businesses that use mailers can include coupons for free samples or scratch-and-sniff cards to advertise their products. Others can specialize in sampling packages for certain groups of consumers, such as students, new parents, or newlyweds who may be interested in several different samples made available together. Small-business owners should always ensure manufacturer consent before offering free samples.

TRADE PROMOTIONS

A trade sales promotion is targeted at resellers who distribute manufacturers' products to the ultimate consumers. The objectives of trade promotions differ from those directed at consumers. Trade sales promotions hope to accomplish four goals: 1) develop in-store merchandising support; 2) control inventory by increasing or depleting inventory levels; 3) expand or improve distribution by opening up new sales areas; and 4) generate excitement about the product among those responsible for selling it.

Point-of-Purchase (POP) Displays. Manufacturers provide point-of-purchase (POP) display units free to retailers in order to promote a particular brand or group of products. These are special racks, display cartons, banners, signs, price cards, and mechanical product dispensers designed to generate sales for the retailer. High product visibility is the basic goal of POP displays. In industries such as the grocery field, where a shopper spends about three-tenths of a second viewing a product, anything increasing product visibility is valuable. POP displays also provide or remind consumers about important decision information, such as the product's name or appearance.

Trade Shows. Trade shows allow businesses to write immediate orders for products being demonstrated and explained on the trade show floor. Trade shows can attract hundreds of major manufacturers and retailers from around the world, or be simple sales meetings at the local chamber of commerce. These events motivate sales agents and are often used to introduce new products. Online trade shows are common among businesses that can create effective online booths for their products.

Push Money. Push money (PM) also known as a spiff is an extra payment given to salespeople for meeting a specified sales goal. For example, a manufacturer of refrigerators might pay a $30 bonus for each unit of model A, and a $20 bonus for each unit of model B, sold between March 1 and September 1. At the end of that period, the salesperson would send evidence of these sales to the manufacturer and receive a check in return.

Deal Loaders. A deal loader is a premium given by a manufacturer to a retailer for ordering a certain quantity of product. Two types of deal loaders are most typical. The first is a buying loader, which is a gift given for making a specified order size. The second is a display loader, which gives products on display to the business if it has managed to sell a certain number of those products to consumers.

Trade Deals. Trade deals are arrangements made between sellers and manufacturers over specific products. The manufacturer might receive special displays, larger-than-usual orders, superior in-store locations, or greater advertising effort. In exchange, the retailer might receive special allowances, discounts, goods, or money. In many industries, trade deals are the primary expectation for retail support, and the marketing funds spent in this area are considerable. There are two main types of trade deals: buying allowances and advertising/display allowances.

A buying allowance is a bonus paid by a manufacturer to a reseller when a certain amount of product is purchased during a specific time period, similar to a buying deal loader. If the deal is good enough, a business may buy more inventory than usual to receive the allowance, then store it for later use. Slotting allowances, a hybrid form of the buying allowance, are fees retailers charge manufacturers for each space or slot on the shelf or in the warehouse that new products will occupy. This tactic may discourage some manufacturers from attempting to sell with retailers who practice it. The third type of buying allowance, a free goods allowance, replaces the monetary bonus with a number of free products if a certain sales level is reached.

Advertising Allowances. An advertising allowance is a dividend paid by a manufacturer to a reseller for advertising its product. The money can only be used to purchase advertising for example, to print flyers or run ads in a local newspaper. Sometimes display allowances are used, when a manufacturer pays a specific amount to have its display highlighted in the store. Businesses must usually produce certification that proves they have fulfilled their advertising portion of the deal before the dividend is granted.

SARBANES-OXLEY

On December 2, 2001, the Enron Corporation, a growing energy-trading company, filed for the largest bankruptcy in U.S. history at that time. Investors lost billions of dollars due to the company's earning inflation and fraudulant representation of financial status. The fate of Enron and other companies led to the Public Company Accounting Reform and Investor Protection Act of 2002. The act's two chief sponsors were Senator Paul Sarbanes (D-MD) and Representative Michael G. Oxley (R-OH), giving it the name Sarbanes-Oxley, subsequently abbreviated as SOX or SarbOx.

Examination of Enron and other corporations showed that more complete disclosure of transactions and greater transparency of financial statements would have prevented the large-scale fraud, bribery, and insider trading responsible for ruining these businesses. Sarbanes-Oxley was principally a reaction to this failure, dealing with: 1) reform of auditing and accounting procedures, including internal controls; 2) the oversight responsibilities of corporate directors and officers and regulation of conflicts of interest, insider dealings, and the disclosure of special compensation and bonuses; 3) conflicts of interest by stock analysts; 4) earlier and more complete disclosure of information on anything that directly and indirectly influences or might influence financial results; 5) criminalization of fraudulent handling of documents, interference with investigations, and violation of disclosure rules; and 6) requirements for chief executive certification of financial results and federal income tax documents.

SUMMARY OF PROVISIONS

Sarbanes-Oxley governs the activities of *publicly traded* companies. It aims at protecting investors who, unlike those in privately held corporations, are presumed to be at a greater distance from management and therefore more vulnerable. This means that most small businesses are exempt from many requirements of Sarbanes-Oxley. The Act is divided into eleven main sections.

Title I Public Accounting Oversight Board. Title I creates an independent Public Accounting Oversight Board under the general oversight of the Securities and Exchange Commission. PAOB is charged with newly registering, regulating, inspecting, and generally overseeing companies that audit publicly traded companies.

Title II Auditor Independence. Title II legislates the behavior of auditing firms, restricting public firms from carrying out compensated activities for their auditing clients that fall outside the boundaries of auditing. Such "outside" activities include the provision of bookkeeping, accounting, financial information system and appraisal

services. This prohibition restricts audit firms from being influenced in their *audit* practices *in favor* of long-standing and clients.

Title III Corporate Responsibility. Title III requires that companies establish audit committees made up of independent board members who have no financial ties to the company. The chief executive and the chief financial officer both must certify the material correctness of financial statements underlying the audit reports produced by the committees. If financial statements must be revised because of misconduct, the CEO and CFO forfeit bonuses, incentives, or profits from securities sales. Directors and officers may be barred from service for violating certain SEC requirements.

Title IV Enhanced Financial Disclosures. Title IV requires corporations to make certain transactions public knowledge, especially those not previously shown on balance sheets or transactions involving unconsolidated entities. Executives and stakeholders with 10 percent or more of the company holdings must also reveal any special bonuses or stock grants that they receive, and they cannot receive loans from their own companies. Necessary changes to financial documents should be made in real time, and the business must show that it has internal controls and a code of ethics to prevent fraudulant activity.

Title V Analyst Conflicts of Interest. Securities analysts who recommend the purchase of securities to the public are addressed by Title V. It requires that National Securities Exchanges and associations of registered securities formulate and adopt rules governing conflicts of interest for analysts.

Titles VI and VII SEC Role and Studies. These titles address the SEC's role.

Title VIII - Corporate and Criminal Fraud Accountability. Title VIII makes it a felony to destroy documents or to create fraudulent documents in order to thwart federal investigations. Auditors must keep all paperwork related to an audit for 5 years. It changes the statute of limitations on securities fraud claims and extends whistleblower protections to those who disclose closely held company information to parties in a lawsuit. Title VIII also establishes a new crime for securities frauds punishable by up to 10 years in prison and fines.

Title IX - White Collar Crime Penalty Enhancements. Expanding on Title IV requirements, Title IX requires the CEO and CFO to state that financial reports comply with new regulations and include all material aspects of the company's finances. Violations of this provision carry a fine of $500,000 and up to 5 years in prison. The Title then specifies actions and consequences that the SEC can take against executives convicted of securities fraud.

Title X Corporate Tax Returns. This Title requires that the CEO sign corporate income tax returns.

Title XI Corporate Fraud and Accountability. This Title, known as the "Corporate Fraud Accountability Act of 2002," specifically amends the U.S. Code to make tampering with records and interfering with official proceedings a crime with a penalty of a fine or imprisonment for no more than 20 years. It gives the SEC authority temporarily to freeze extraordinary payments to directors, officers, agents and employees of a company during investigations of security law violations, and codifies the SEC's right to prohibit persons convicted of securities fraud from serving as a director or officer of a public company.

MAJOR DOS AND DON'TS

Sarbanes-Oxley can be summarized in part as thirteen basic principles, which make a good reference for small businesses to examine if they are considering going public.

1. Audit firms shall be registered. If they do other work for a company, they must *not* do audits for that company.
2. The company's audit committee members shall be independent board members.
3. Stock analysts shall be subject to conflict of interest rules.
4. Companies must disclose *all* pertinent information that may in any way affect company finances, whether on or off the balance sheet.
5. Companies shall not lend money to executive officers or directors.
6. CEO and CFO compensation, bonuses, and profit sharing shall be reported to the public.
7. Insider trades must be made public immediately.
8. Insiders shall not trade company stock during periods of pension fund blackouts.
9. Financial reports must be certified by the CEO and CFO.
10. Financial reports must be accompanied by a special report on internal controls and an assessment on how well they work.
11. Federal income tax filings must be signed by the CEO.
12. Whistleblowers shall be protected.
13. Violators shall pay higher fines and spend longer periods in prison than heretofore.

SARBANES OXLEY AND SMALL BUSINESSES

Sarbanes-Oxley was created with exemptions for smaller business which are rated at less than $75 million market value. These SEC exemptions were temporary and set to expire in June 2010, but in 2009 Congress, although divided on the subject, began to approve legislation for making the exemptions permanent. The exemption helps smaller public companies not only avoid the time-consuming requirements of Sarbanes-Oxley but also helps them save millions of dollars that would otherwise need to be invested in internal controls.

Even without these exemptions, Sarbanes-Oxley touches only a small fraction of American businesses, and most small businesses are not affected directly by the legislation. Indirectly, small businesses must face two challenges that Sarbanes-Oxley has presented. First, the legislation has made both investors and entrepreneurs much more wary of investment. One of a business's primary goals is to grow large enough to go public, but with the intense requirements of Sarbanes-Oxley this has become a more expensive endeavor. Fewer investors are willing to spend money on businesses trying to go public because of the risk that expenditures related to Sarbanes-Oxley will be too costly and the business will fail. Entrepreneurs, in turn, may be less likely to start businesses, decreasing interest in small business investment. In the end, venture capital funds become more difficult to raise.

Second, small businesses may not be required by law to meet Sarbanes-Oxley standards, but a trickle-down effect is evident. As Sarbanes-Oxley has become accepted throughout the largest businesses in the United States, investors and even consumers expect to see the same practices in all businesses. This has put pressure on small businesses and even nonprofit organizations to develop new standards similar to Sarbanes-Oxley laws. Accountants, especially, are being trained to meet Sarbanes-Oxley specifications and tend to scrutinize all businesses more carefully as a result. Small business financial reporting is slowly mirroring the required changes of public corporation.

SCALABILITY

The word "scalability" refers generally to the ability to increase the size of any system in a linear manner without changing its fundamental properties. In business, scalability refers to the ability to grow online services to match the growth of demand and service use. Since all of the work on a Web site must be performed by central processing units (CPUs), the idea ofscalability became a central concern in the dot-com industry because popular Web sites can exhibit explosive growth. If they are poorly designed or difficult to scale up (because they slow down substantially as more nodes are added) demand is difficult to satisfy and traffic will decline.

While specialized software exists for those who want to attempt scalability projects on their own, many firms offer this service and help businesses design their sites with built-in scalability. These firms also help larger sites set up subdirectories within the domain directory to help serve a large number of accounts simultaneously. By performing these functions, scalability experts can help prevent Web site crashes and save the company lost revenue and damaged reputations.

While scalability is a critical issue for dot-coms, the actual advantage that comes with becoming a large Web site can still be debated. A larger site can appear to be more of a threat to a possible competitor that is thinking about entering the market, and larger businesses may attempt to buy out smaller sites in the same industry to cut down on competition. The integration of these small sites can pose scalability difficulties for the larger companies.

Key Scalability Points for Small Businesses. Small businesses that have begun Web sites for their products or services need to consider several different aspects of online growth. Building on an existing Web site structure, even a small one, is much easier than replacing it with a new system. The small business should examine how many page views it receives per day, and how the numbers could grow. Page views are a good indication of how many users are on

the Web site at one time. At first a small business may receive only a few dozen or a few hundred page views. But if interest builds, the business may be looking at millions of page hits per day. Can the structure and servers the business uses keep up with so many people logged on at the same time? A scalable system can be adapted to the sudden growth conditions seen on the Internet.

If the small business has forums, they should also be scalable, easily moved from a post or two a day to thousands of posts or more. Likewise, if the business allows users to register on the site, the registration structure should make room for hundreds of thousands of registered users if such growth occurs.

Specifics will depend on the small business itself. Consultants can offer valuable advice when a business is building an online structure. Some scripting languages and hardware lend themselves to holding large amounts of data for consumers who want to store information online. Others are made to help customers complete online transactions quickly and accurately. Which scalable language and software the business chooses will depend on what tasks it needs to accomplish. Storage capacity, server processor RAM, network bandwidth, and storage input/output operations should all be chosen with expansion in mind.

SEARCH ENGINES

Search engines are software systems that associate search words entered by a user with Web sites on the World Wide Web that contain the words of the query. To accomplish this linking, search engines must be backed by databases that hold words that Web sites use as linked lists. Search words may produce just a handful or a very large number of Web sites. This wealth of hits makes it necessary for search engines to store additional information about every Web site in order to enable the engine to present results in some kind of rationally ranked order. Complex algorithms are used to rank hits and place the most frequented or applicable Web sites first.

Since search engines must grow along with the information available on the Internet, they have a massive data acquisition function. Most of this work is accomplished by searching programs, known as robots or crawlers, that index Web sites so search engines can include their information in searches. Some engines require Web site owners to sign up in order to become part of this indexing function.

Search engines are: 1) technologies of searching; 2) databases in support of searching; and 3) services provided to users. Search engine owners can cover their costs by all three means. The technology they own can be licensed or deployed for others at a fee; the databases can be made available for money; and the services provided can be paid for using advertising. Google, for instance, uses Adwords, which displays ads according to certain words found in the Web site. Advertisers pay by the word they want linked with their ad. Similar techniques make use of search words or phrases and display closely matching spot ads on the Web page.

ENGINES AND THE INTERNET

The Internet owes its dramatic growth to the development of search engines. The first such engine was Lycos, launched in mid-1994 with 54,000 documents. Using its crawler technology, it had expanded its database to 1.5 million documents by early 1995 and had 60 million by the end of 1996. AltaVista, another early search engine, was introduced in 1995. Until Lycos and AltaVista appeared, access to the Internet required advanced knowledge of Web addresses, and roaming the Internet involved following links from site to site as these referred to each other.

Google, Yahoo, and Ask.com are among the top search engines used on the Internet in the early 2010s. All three of these leaders began with proprietary methods and technologies. Google's search engine is the most widely used by others under license. Yahoo, which began by using human indexers, began to shift its data acquisition processes to crawlers in October 2002 after a period of using Google technology. Ask.com's basic search engine was developed by Teoma, a company that it owns, but Ask.com also developed an expert-based indexing technique that, in the past, enabled it to serve more "human language" queries.

Metacrawlers. Metacrawlers use existing search engines to do their searches for them, then assemble the information returned and sort it according to various parameters. Popular metacrawlers include Dogpile, Vivisimo, and Kartoo.

OPTIMIZATION

Small businesses that maintain Web sites in addition to their physical storefronts are interested primarily in becoming accessible to users. The higher the Web site is ranked, the greater the flow of customers will be, and since many users do not look beyond the first several pages of search engine results, linking the Web site to specific keywords is very important.

Businesses can structure their Web sites to display attractive or popular elements for easier indexing by searchbots, and they can raise their standing by linking to a variety of other related sites and blogs. Small businesses that do not have experience in building Web sites for maximum exposure can enlist the services of a Web site consultant or design firm. Larger companies hire Web designers to focus solely on visibility.

As search engines become more complex, they integrate with other Web applications that small businesses can also utilize. A business trying to rise in the ranks of a Google search can maximize visibility by creating a profile in Google Local, which shows businesses in the area where the computer conducting the search is located. This allows local businesses to become visible quickly to nearby consumers using the Google Maps function, which is displayed at the beginning of Google searches that return Google Local results. Entering information in all free search engine directories and sitemap accounts will also help raise visibility. In a more general way, tagging each page with basic business information, including location and phone number, can help produce more helpful search information for consumers.

A small business with a significant Web site component should also use an analytics program to keep track of how many people visit the site and what searches they use to find it. This allows a business to make basic improvements to Web page titles and keywords.

SEASONAL BUSINESSES

Seasonal business is a term that refers to the fluctuations in business that correspond to changes in season. Season can be understood in this context to include: 1) seasons of the year and their weather-related changes; 2) holidays; and 3) events like the summer school holiday, the fall return to school, or the Super Bowl. Although most businesses experience some seasonal business change, some experience severe fluctuations and may even limit their operations to particular seasons. Examples of such businesses include operators of vacation cottages, lawn care service businesses, and businesses that contract to do snow removal. Many retail businesses have a strong seasonal component and see the majority of their profits generated in one or two seasons of the year, the year-end or Christmas season being a typically busy period.

Small businesses can learn to prepare for upcoming months by recognizing how consumer demands will shift due to the season. For example, January is a good month for health club memberships as well as self-help books and programs. February is generally the slowest month of the year except for Valentine's Day business. In March, attendance at church and other religious activities jumps 60 percent. April is the month to market household cleaners and other spring-cleaning products, while May begins the warmer months and includes Mother's Day celebrations. The summer months are marked by increased travel, family activities, and outdoor activities of all kinds. Fall months lead to a greater focus on shopping and festivities for the series of holidays in October, November, and December.

SEASONAL EFFECTS

Not all seasonal businesses are resorts, summer camps, and landscaping firms. Other business also see significant changes in demand throughout the year. Pool-cleaning services, ice-cream stands, golf courses, and outdoor restaurants all struggle in the off-season. Seasonal differences create a ripple effect that continues through most business industries.

Strictly seasonal businesses either do not operate in off-seasons or switch operations to a different front where profit is feasible. Landscaping service companies, for instance, can switch from lawn care to the winterization of sprinkler systems and then the removal of snow and ice, if the business incorporates these aspects. Other semi-seasonal businesses stay open in off-seasons but shed temporary employees to save costs, shrinking and growing again as needed. The film industry uses this system to deal with off-seasons, along with real estate companies and other businesses indirectly affected by the seasons.

SEASONAL VARIABLES

Seasonal businesses must also adapt to specific variables in their seasons of operation. Winter businesses, for example, must continually deal with the amount of snowfall in the area. A ski shop will experience far less business with a low snowfall and may also suffer if the winter is filled with snowstorms. Likewise, if the summer heat falls a beach store will lose customers, but abnormally high temperatures can also cause the business to suffer. Businesses may deal with these variables by incorporating them into discounts for their sales promotions. A ski lodge, for instance, may charge for passes using a formula that takes into account not only the amount of snowfall but its quality and the days on which it falls.

SUCCEEDING AT A TRULY SEASONAL BUSINESSES

Seasonal small businesses must take care to manage cash flow correctly and use the right employee structure to compensate for fluctuations. A seasonal business must anticipate changes in the coming months and adjust money spent on inventory and advertising accordingly to continue making a profit, or at least lowering losses to a manageable level.

The employee structure must allow for temporary employees that can be hired in the busy seasons and released when the season ends. Small businesses should encourage a core of permanent employees who are highly skilled at finding good temp employers and quickly training them to complete necessary tasks.

Seasonal businesses must also balance out their tax years correctly. The business should choose a tax year that represents the success of their business most accurately. This means including the months in which the business realizes most of its income, as well as the months in which it spends the most on expenses. Dividing profits and expenses into two different tax years will give a false representation of business solvency.

EVENT OR HOLIDAY BASED SEASONAL BUSINESS

Small businesses that sell products or services in demand during specific holidays must be prepared to create a competitive shopping experience for customers. Holidays such as Halloween, Thanksgiving, and Christmas are used by all businesses to increase profits: discounts and deals are common practice. A small business will not be able to appeal to customers by keeping off-season or nondiscounted prices. Instead, small businesses should aim to meet discounted prices and add value to the customer experience through effective service.

SEC DISCLOSURE LAWS AND REGULATIONS

Privately owned companies are not required to disclose detailed financial and operating information on a regular basis. Companies that are publicly owned, on the other hand, are subject to detailed disclosure laws concerning their financial condition, operating results, management compensation, and other areas of their business. While these disclosure obligations are primarily linked with large publicly traded companies, many smaller companies choose to raise capital by making shares in the company available to investors. In such instances, the small business is subject to many of the same disclosure laws that apply to large corporations. Disclosure laws and regulations are monitored and enforced by the U.S. Securities and Exchange Commission (SEC).

All of the SEC's disclosure requirements have statutory authority, and these rules and regulations are subject to changes and amendments over time. Some changes are made as the result of new accounting rules adopted by the principal rule-making bodies of the accounting profession. In other cases, changes in accounting rules follow changes in SEC guidelines. Sweeping amendments were made to the SEC's disclosure rules in the summer of 2002 with the passage of the Sarbanes-Oxley Act, often referred to simply as Sarbanes-Oxley, Sarbanes, or SOX.

The Sarbanes-Oxley Act was a response to the fraudulent activities of large corporations such as Enron and WorldCom. Analysts came to believe that losses causes by these failing companies could have been prevented with more stringent accounting regulations and antifraud polices. Sarbanes-Oxley instituted new accounting practices governing the internal controls large companies used and how companies disclosed information to the general public. Regulations were also made requiring executives to authenticate financial documents, together with severe consequences for those convicted of fraud. These new laws increased the SEC's power and responsibilities.

SEC DISCLOSURE OBLIGATIONS

SEC regulations require publicly owned companies to disclose certain types of business and financial data on a regular basis to the SEC and to the company's stockholders. The SEC also requires disclosure of relevant business and financial information to potential investors when new securities, such as stocks and bonds, are issued to the public. This is known as the integrated disclosure system. Publicly owned companies prepare two annual reports, one for the SEC and one for their shareholders. Form 10-K is the annual report made to the SEC, and its content and form are strictly governed by federal statutes. It contains detailed financial and operating information, as well as a management response to specific questions about the company's operations.

SEC regulations also require that annual reports to stockholders contain certified financial statements and other specific items. The certified financial statement must include a 2-year audited balance sheet and a 3-year audited statement of income and cash flows. In addition, annual reports must contain 5 years of selected financial data, including net sales or operating revenues, income or loss from continuing operations, total assets, long-term obligations and redeemable preferred stock, and cash dividends declared per common share. Annual reports to stockholders must also contain an executive discussion and analysis of the firm's financial condition and how liquidity, resources, and industry trends have affected business operations.

These regulations only apply to publicly traded companies, and in some cases only to companies of a certain size. In order to help these large corporations deals with the Sarbanes-Oxley increase in paperwork, the SEC has created standard forms and templates for these businesses to use. The SEC also continues to monitor its regulations and make additions when necessary to improve the process of disclosure. In 2009 the SEC approved laws to limit brokers from voting on behalf of investors who did not make their wishes known in uncontested corporate board elections. Other laws are intended to act as time-savers for larger companies. For example, in 2009 the SEC allowed businesses to e-mail links to investors to access their full disclosure, thereby saving time, money, and paper.

Registration of New Securities. Private companies that wish to become publicly owned must comply with the registration requirements of the SEC. In addition, companies floating new securities must follow similar disclosure requirements. The required disclosures are made in a two-part registration statement that consists of a prospectus and an addendum.

The prospectus, which contains all information to be presented to potential investors, must include such items as audited financial statements, a summary of selected financial data, and management's description of the company's business and financial condition. The statement should also include a summary of the company's material business contracts and list all forms of cash and noncash

compensation given to the chief executive officer and the top five officers. Compensation paid to all officers and directors as a group must also be disclosed.

Securities Industry Regulations. Additional disclosure laws apply to the securities industry and to the ownership of securities. Officers, directors, and principal stockholders, defined as holding 10 percent or more of the company's stock must submit two reports to the SEC, Form 3 and Form 4. Form 3 is a personal statement of beneficial ownership of securities of their company. Form 4 records changes in such ownership. These reporting requirements also apply to the immediate families of the company's officers, directors, and principal stockholders.

Securities broker-dealers must provide their customers with a confirmation form as soon as possible providing customers with minimum basic information required for every trade. Broker-dealers are also responsible for presenting the prospectus to each customer for new securities issues. Finally, members of the securities industry are subject to reporting requirements of their own self-regulating organizations. These organizations include the New York Stock Exchange (for listed securities transactions) and the National Association of Securities Dealers (for over-the-counter traded securities).

SMALL BUSINESSES AND THE SEC

The SEC is primarily a governing body for larger, publicly traded corporations, and small businesses must meet more simple SEC requirements until they grow enough to go public. Even public businesses rated at less than $75 million market value were exempt until June 2010 from most Sarbanes-Oxley legislation, and in early 2010 Congress was working to pass a permanent exemption to make growth easier for these large businesses.

However, small businesses must still abide by Generally Accepted Accounting Principles (GAAP), and GAAP in turn are affected by federal legislation like Sarbanes-Oxley and other SEC regulations. The new standards find their way down to small businesses over time as investors of all sizes come to expect the same financial accuracy and disclosure from all companies, large or small. As new accountants are trained in SEC requirements, they tend to pass these lessons on into GAAP and use them even when working for small businesses.

SECURITIES AND EXCHANGE COMMISSION (SEC)

The U.S. Securities and Exchange Commission (SEC) is a federal agency responsible for administering federal securities laws that protect investors. The SEC also ensures that securities markets are fair and honest and, if necessary, enforces securities laws through the appropriate sanctions. It also advises federal courts on matters of Chapter 11 bankruptcy and similar situations. Small businesses must follow SEC guidelines when they decide to make a public offering of debt or securities.

ORGANIZATION AND RESPONSIBILITIES OF THE SEC

The SEC was created by Congress in 1934 under the Securities Exchange Act as an independent, nonpartisan, quasi-judicial regulatory agency. The commission is made up of five members: one chairman and four commissioners. Each member is appointed by the president to a 5-year term, with the terms staggered. The commission's staff is made up of lawyers, accountants, financial analysts, engineers, investigators, economists, and other professionals. The SEC staff is

divided into divisions and offices, which includes twelve regional and branch offices, each directed by officials appointed by the SEC chairman.

The SEC does not make any evaluations of the quality of the company making the initial public offering (IPO); it is concerned only with assuring that the registration statement and prospectus documents contain the information necessary for potential investors to make informed decisions. However, the SEC can delay IPOs and initiate legal penalties against companies that fail to meet the requirements, especially in the case of willful falsification or omissions.

There are seven major laws that the SEC is responsible for administering:

- Securities Act of 1933
- Securities Exchange Act of 1934
- Public Utility Holding Company Act of 1935
- Trust Indenture Act of 1939
- Investment Company Act of 1940
- Investment Advisers Act of 1940
- Sarbanes-Oxley Act of 2002

These acts deal primarily with business disclosure and investor relations. The Securities Act of 1933, for instance, requires that investors be provided with accurate and honest information concerning publicly offered securities,The Securities Exchange Act of 1934 and the Trust Indenture Act of 1939 extended these requirements to other types of security trading as the SEC continued to create basic rules for public companies and their investors. The Public Utility Holding Company Act of 1935 set down specific requirements for power companies and the detailed information they had to provide in their reports to the SEC.

The SEC also ensures compliance with the Investment Company Act of 1940. This act seeks to regulate the activities of companies engaged primarily in investing, reinvesting, and trading in securities, and whose own securities are publicly offered. It is important for potential investors to understand that although the SEC serves as a regulatory agency in these cases, the SEC does not supervise a company's investment activities, and the mere presence of the SEC as a regulatory agency does not guarantee a safe investment.

The Investment Advisers Act of 1940 also overseen by the SEC establishes a system of regulating investment advisers, requiring all those compensated for advising about securities and investment opportunities to be registered with the SEC. The SEC has the power and ability to strip an investment adviser of his or her registration if a statutory violation has occurred.

In 2002 Congress passed the Sarbanes-Oxley Act, increasing both the power of the SEC and the requirements for large, publicly traded corporations. Executives were required to confirm the authenticity of financial reports, with severe consequences set in place for fraudulent activity. Companies were required to establish internal controls and ethical codes to prevent mismanagement of accounting information. External audits were required to confirm company reports. Reports to investors were expanded to include more information about management, finances, and the condition of the company. An exemption was originally set in place for companies worth below $75 million in market value, then extended in 2009 to last until June 2010. In early 2010 Congress was working to approve a permanent exemption.

SEC legislation, especially Sarbanes-Oxley, creates a large amount of extra work for companies, and for businesses that want to go public these requirements can be a costly roadblock to expansion. In order to simplify the process for businesses, the SEC also works to standardize basic forms and style guidelines for executives and accountants to use when meeting the requirements. In 2009 the SEC allowed companies to e-mail investors links to their annual reports, saving significantly on the costs and time involved in disclosing information. The SEC also makes and suggests frequent legislation amendments governing how brokers, investors, and corporations interact.

SEED MONEY

Seed money, or seed capital, is the first round of capital for a start-up business. Although obtaining financing can be difficult for any small business, it is particularly hard for new ventures. Since new ventures lack a track record, potential lenders and investors are often skeptical about their prospects for success. Entrepreneurs seek out friendly banks, angel investors, and friends and family for seed money.

Seed money usually takes the form of equity financing, so investors receive partial ownership of the fledgling company in exchange for their funds. Other arrangements are possible depending on the source of the funds, but private investors will usually demand a directorship or similar position. Business entrepreneurs should be careful when entering into these contracts, since the aims of the business will be influenced by the new investor.

Entrepreneurs looking for seed money must develop a comprehensive and informative business plan to attract investors. This plan should examine all aspects of the business and provide accurate forecasts of profit and loss for the first several years, using similar models as an example. In addition to setting out the business plan, the entrepreneur should also define precisely how much seed money is required to begin the business, and what the seed money will be spent on.

Given its risk, seed capital is usually more expensive for the firm than later stage financing. Ideally, an arrangement can be made that links seed money to launch financing, so the entrepreneur can go back to the same investors for future funding needs. For example, the entrepreneur might set goals for a successful market test of a new product. If the goals are met, then the original investors agree to provide additional funds for a product launch. Venture capitalists who agree to provide seed capital expect a high rate of return, often 50 to 100 percent more than a common venture investment.

Angel Investors. Successful business owners looking to invest in new enterprises are known as angel investors, and they are a good potential source of start-up capital or seed money. New start-up companies often turn to the private equity market for seed money because the formal equity market is reluctant to fund risky undertakings. Angel investors specialize in start-ups and can often provide useful advice or recommend consultants for new entrepreneurs.

Although angel investors usually work on an individual basis there has been a trend towards the formation of angel investor groups. These angel investment groups usually meet on a regular basis and invite prospective entrepreneurs to present their business ideas for consideration. These are sessions where a series of entrepreneurs give 10- to 30-minute presentations before an informal group of angel investors.

Bank and Government Loans. Entrepreneurs struggle to get seed money from large lenders and the government. Large banks are not interested in funding risky start-ups, and the government offers few, if any, grants for beginning businesses. However, small and local banks will often consider investing in an appealing start-up business, especially banks that have a policy of encouraging local business growth. Entrepreneurs with accurate and impressive business plans can also find funding with government loans, such as those offered by the Small Business Administration. Minorities and those in developing communities can access this seed money more easily than others.

Friends and Family. Another primary sources of seed money are friends and family of the entrepreneur. In many cases, the entrepreneurs can approach friends and family more easily than large lenders. Those close to the entrepreneur may be more willing to listen to the business proposal and better able to judge the enterprise's chances of success. Unless family members are also investors, they cannot contribute large sums of seed money but can often be counted on for small investments.

SELF-ASSESSMENT

In business, self-assessment is a critical analysis of one's own goals, interests, skills, and experience. It is also used by organizations as a business evaluation tool. Self-assessment tools are used in employee development, team performance, and organizational change efforts. Is also a common step for entrepreneurs considering starting a new business. The self-assessment examines personality traits and personal goals to give a profile of the entrepreneur as a business owner and help identify key traits or useful attributes.

Entrepreneurial self-assessment tests vary. Some are profile programs or methods designed to place the entrepreneur in a particular emotional or leadership group. Other methods are more free in form: an entrepreneur may simply list education, previous experience, personality traits, and business skills. Examining the list can help people create a business image and brand themselves, a marketing exercise that can help entrepreneurs raise funds or impress clients more easily.

When conducting self-assessment tests, it is important for entrepreneurs to be completely honest and, when necessary, critical. Personal self-evaluation can incorporate a "leniency effect" that will distort the results unless the assessment is standardized or fully objective. The Small Business Administration has an online test designed for entrepreneurs to examine their own qualities, available at www.sba.gov/assessmenttool/index.html.

The tool of self-assessment can be applied to a wide variety of other business situations. Company performance evaluation methods, such as 360-degree feedback, often included self-assessment practices in addition to other types of evaluation. Self-assessment can also be applied to teams of workers or even overall organizations to help identify strengths and weaknesses and improve performance. Teams might evaluate such elements of team performance as goal setting, communication, decision making, problem solving, and conflict management. At the organizational level, self-assessment performed with the participation of employees can help clarify a company's mission and goals, identify shortcomings, and generate ideas to increase competitiveness.

Small businesses are more likely to use self-assessment tests when looking for benchmark data or considering an important internal change. These self-assessment tests tend to be very specific. Tests are available for companies to examine their carbon footprint and energy efficiency, while others deal with accounting methods and accuracy. Some self-assessment tests examine specific situations, such as disaster preparedness.

SELF-EMPLOYMENT

Self-employment is a common form of work throughout many industries; in 2007 the self-employment rate in the United States was approximately 10 percent.

LEGAL DEFINITIONS

Individuals are typically classified into two primary self-employment categories: small-business owners who employ themselves along with other employees, and independent contractors who work for other employers but on a contractual basis. Some overlap applies. Independent contractors are defined by the latitude they have in completing their tasks. Employers do not typically define working hours or methods for contractors, and the financial risk falls directly on the contractor, who loses money personally if the work is not done, instead of the loss being absorbed by the company in the case of permanent employees. Independent contractors do not

participate in benefit programs or payroll taxes unless they enter third-party programs themselves. The Internal Revenue Service (IRS) applies a multipart test in order to determine whether a certain worker should be classified as an employee or an independent contractor, including assessment of resources and connection to the employer.

An individual's status as a self-employed, independent contractor can be reinforced by having multiple clients, being paid by the amount of work done rather than by the hour, or obtaining an employer identification number from the IRS. Working under a business name also helps reinforce this status. Printing invoices, business cards, and stationery can also help identify someone as a self-employed person.

CHARACTERISTICS

In general, self-employment tends to grow as the economy slows, as those who struggle to find jobs begin to start businesses themselves. In 2005, for instance, about 2,356 people attempted self-employment daily, on average. In the past several years, Web search portal businesses and other Internet service providers have been the most common types of start-up businesses with self-employed owners. Reasons for self-employment vary. Mothers may choose self-employment to be closer to their young children. The retired may wish to continue working on at least a part-time basis. Others need income to survive and turn to self-employment options out of necessity.

CONSIDERATIONS IN SELF EMPLOYMENT

Self-employed individuals as a whole tend to work longer (an additional 17.5 hours per week, according to one study) and harder than their colleagues who are organizationally employed. Moreover, self-employed people often operate under uncertain payment schedules and must make outlays from personal earnings for insurance and retirement. In addition, their salaries and assets are dependent on their work contributions in a more intimate way than are those of their colleagues.

Isolation and Networking. Isolation often proves to be a significant source of psychological strain for self-employed individuals. Contact with supportive colleagues becomes crucial. Mentors can provide advice regarding business aspects of a new business owner's operation. Trade and professional organizations can be an excellent way to establish contacts with peers. Tenacity in networking has been cited as a key to survival for business owners, some of whom maintain databases of thousands of contacts. These contacts are also vital in referring clients and providing market information.

As they begin their enterprises, many self-employed individuals feel compelled to accept a variety of assignments due to sheer scarcity of work. However, specialization can help ensure their long-term survival. Corporate clients are able to look in-house for general skills, while specialization allows independent contractors to increase their value to a specific set of employers, leadings to better fees and referrals.

Tax Implications. Individuals who are classified as independent contractors can deduct work-related expenses for tax purposes. These deductions include vehicles, equipment, and office space used for self-employment work. Independent contractors also can claim significant deductions for medical insurance, transportation, office supplies, and a host of other operating costs.

The main tax disadvantage for self-employed persons is the payment required for employer programs such as Social Security and Medicare, known collectively as self-employment taxes, which tend to be higher than the payroll taxes automatically deducted from traditional employee wages. Self-employed individuals also file quarterly taxes.

INCREASING THE CHANCE OF SUCCESS IN SELF EMPLOYMENT

Self-employment, whether by choice or necessity, does not guarantee success. In fact, nearly two out of every three new businesses fail within 5 years. Chances of success can be improved with careful planning, prior savings, and a sound marketing strategy. It may also be helpful to make the transition to full-time self-employment gradually. Some entrepreneurs work as employed individuals while setting up a self-employment position to ensure they have enough funds and a fallback option if the business abruptly fails.

Other prospective new business owners try to establish one stable client relationship that will provide steady income during the search for additional clients. Some are able to connect with their previous employers and arrange a contractual relationship. Although one stable client relationship can help establish a new business, it is also important that the self-employed person develop a marketing strategy to find new clients and grow. Many new business owners become so busy serving their existing clients that they do not devote sufficient time to marketing. Sending out brochures, networking, and joining professional organizations are possible marketing strategies.

Finally, self-employed individuals should take an organized approach to all business activities in order to increase their chances of success. A business plan, however rudimentary, is often helpful to set the path ahead with some consciousness and formality. It is also important to keep careful records of income and expenses, set aside money for taxes, and insist upon contracts for all work performed.

TRENDS

Self-employment rates are expected to increase in coming years due to increased interest from the baby boomer sector.

Baby boomers are expected to stay in the workforce past retirement age but run into difficulties finding traditional employment. To compensate (and pay off continuing loans) many are turning to and will continue to seek self-employment options. Generation Y workers (those born between the mid-1970s and 2000, according to some definitions) are also expressing more interest in small, personalized business opportunities than previous generations. The proliferation of online communities and business portals makes setting up or seeking self-employment easier for these sectors.

SELF-EMPLOYMENT CONTRIBUTIONS ACT (SECA)

The Self-Employment Contributions Act (SECA) of 1954 is a tax law that requires the owners of small businesses to pay a tax of 15.3 percent of their net income from self-employment to cover their own Social Security, Medicare, and Old Age Survivors and Disability Insurance (OASDI) costs. In effect, SECA requires self-employed persons to pay both the employer and employee portions of the Federal Insurance Contributions Act (FICA) tax (a combination of Social Security and Medicare). To make this situation more equitable, small-business owners subject to SECA are allowed to deduct half of their SECA tax amount on their personal federal tax returns.

SECA taxes are paid on self-employment income after costs associated with the activity have been deducted. The Internal Revenue Service (IRS) refers to this as net profit (or loss), usually reported on Schedule C of Form 1040. Thus the base amount used for SECA calculation is profit before taxes. The first step in calculating the SECA is to multiply this value by .9235 (taking 92.35 percent of it). IRS calls the result "net earnings from self-employment." If this amount is under $400, no tax is owed at all. As of 2009, only the first $106,800 that self-employed individuals make can be taxed by the Social Security taxes, although all net earnings are used for the Medicare tax.

The 15.3 percent self-employed (SE) tax rate is divided into 12.4 percent and 2.9 percent categories. The 12.4 percent category is the Social Security tax, twice that of the employee payroll tax of 6.2 percent. Likewise, the 2.9 percent is double the Medicare tax that traditional employees must pay.

Each individual must calculate his or her self-employment tax separately even when filing a joint return with another self-employed person. For example, a wife and a husband may both operate sole proprietorships, in which case they would each have to pay separate SE taxes on their separate net earnings.

When a person has income from an employer as well as from self-employment, however, the person may combine the two incomes for purposes of calculating SE taxes, often reaching a lower taxed amount by reaching the $106,800 maximum net earnings based for Social Security faster by adding the employer wages.

There are certain rare exceptions to the SECA tax requirement. One of the most common is the ministerial exemption. Members of the clergy or qualifying religious order can use a Form 4361 to apply for an exemption if they are conscientiously opposed to accepting public insurance. This exemption applies only to net earnings derived from their ministerial duties.

SELLING A BUSINESS

Many small-business owners eventually decide to sell their companies. Some wish to retire, while others are impatient to investigate new challenges whether in business or in some other sector or they have grown weary of the frustrations that come with business. Others decide to sell for reasons more closely associated with the health of the business itself. Disputes with partners, incapacitation or death of principals, or downturns in the company's financial performance can all spur business owners to ponder putting the business on the block. Whatever their ultimate reason, business owners can get the most out of selling their company by carefully considering a number of factors.

TIMING THE SALE

The financial performance and history of the company in question are often the most important factors in determining price at the time of sale. A business owner who chooses to sell after posting several years of steady growth will naturally command a higher price than will the business owner who decides to sell only a year or two into that growth trend, even if the environment continues to appear friendly to the business for the foreseeable future.

The business environment in which the company operates is also an important factor in determining the asking price that the market will bear. If the company in question operates in an industry struggling through a downturn, the owner should wait for better times if possible. Few companies are able to buck the tide when the industry in which they operate is stuck in a sluggish cycle, and even attractive businesses will lose their luster in such times. Of course, some industries never post a recovery; business owners engaged in underperforming industries need to determine whether the downturns they experience are simply an inevitable part of the business cycle within a basically healthy industry or whether times are leaving an industry behind.

The stock market is a third factor that can signal good and bad times to sell. A surging market tends to produce energetic buying activity because others are ambitious to expand. A slumping market is a good time to hunker down.

Finally, the availability of credit can also play an important role in whether the time is right to sell. Few investors purchasing a company can afford to do so without a loan, and as such, a tight credit market in which banks are reluctant to lend can have a significant impact on whether a company can be sold. To illustrate this point, one can look to what occurred during the financial crisis in 2008. Lenders were reluctant to issue loans as defaults on mortgages reached record numbers, and as a result, in the Los Angeles market alone, sales of small and medium-sized businesses were down by one-third in the first six months of 2008 as compared to the same time period in 2007.

STOCK SALES AND ASSET SALES

Business owners need to decide early whether to sell stock or assets a choice available if the company is incorporated. Sole proprietorships and partnerships undergo asset sales. Under the terms of a stock sale, the seller receives an agreed-upon price for his or her shares in the company. After ownership of the stock changes hands, the buyer steps in and operates the still-running business. Typically, such a purchase means that the buyer receives not only all company assets, but all company liabilities as well. This arrangement is often appealing to the seller because of its tax advantages. The sale of stock qualifies as a capital gain, and it enables the seller to avoid double taxation, since sale proceeds flow directly to the seller without passing through the corporation. In addition, a stock sale frees the seller from any future legal action that might be leveled against the company. Lawsuits and claims against the company become the sole responsibility of the new stock owner(s).

Partnerships and sole proprietorships must change hands by means of asset sale arrangements; stock is not a part of the picture. Under asset sale agreements, the seller hands over business equipment, inventory, trademarks and patents, trade names, "goodwill," and other assets for an agreed-upon price. The seller then uses the money to pay off any debts; the remainder is his or her profit. Changes in ownership accomplished through asset transactions are generally favored by buyers. First, the transaction sometimes allows the buyer to claim larger depreciation deductions on his or her taxes. Second, an asset sale provides the buyer with greater protection from unknown or undisclosed liabilities such as lawsuits or problems with income taxes or payroll withholding taxes incurred by the previous owner. However, Stan

Crow, of S. Crow Collateral, warns that "an asset sale requires careful planning, however, to minimize or avoid tax disadvantages for you as seller."

PREPARING TO SELL

When preparing to sell a business, owners need to gather a wide variety of information for potential buyers to review. Financial, legal, marketing, and operations information all need to be prepared for examination.

Financial Information. Most privately held businesses are operated in ways that serve to minimize the seller's tax liability. As John A. Johansen observed in the Small Business Administration brochure *How to Buy or Sell a Business*, however, "the same operating techniques and accounting practices that minimize tax liability also minimize the value of a business.... It is possible to reconstruct financial statements to reflect the actual operating performance of the business, [but] this process may also put the owner in a position of having to pay back income taxes and penalties. Therefore, plans to sell a business should be made years in advance of the actual sale." Such a period of time allows the owner to make the accounting changes that will put his or her business in the best financial light. Certainly, a business venture that can point to several years of optimum fiscal success is apt to receive more inquiries than a business whose accounting practices blunt the bottom line financial numbers.

Would-be business sellers also need to prepare financial statements and other documents for potential buyers to review. These include a complete balance sheet (with detailed information on accounts receivable and payable, inventory, real estate, machinery and other equipment, liabilities, marketable securities, and schedules of notes payable and mortgages payable), an income statement, and a valuation report. The latter is an appraisal of the business's market value.

Legal Information. The seller should also prepare the necessary information on legal issues pertaining to the company. These range from such basic operating documents as articles of incorporation, bylaws, partnership agreements, supplier agreements, and franchise agreements to data on regulatory requirements (and whether they are being adhered to), current or pending legal actions against the company, zoning requirements, lease terms, and stock status.

Marketing Information. Intelligent buyers will want detailed marketing information on the company as well, including data on the business's chief market area, its market share, and marketing expenditures (on advertising, consultants, etc.). In addition, product line information will also be expected. Buyers, for instance, will want to know whether any of the company's products are proprietary, or whether there are potentially valuable new goods in the production pipeline. Descriptions of pricing strategies, customer demographics, and competition should also be available for potential buyers to review.

Operations Information. Finally, business owners looking to sell their companies should be prepared to provide detailed information on various aspects of the business's day-to-day operations. The "operations" umbrella encompasses everything from company policies to historical hours of operation to personnel listings, including organizational chart (if applicable), job descriptions, rates of pay, and benefits. Other factors that can potentially impact one or more aspects of the company's operations, such as the presence or absence of an employee union, will also have to be detailed.

Once information on all facets of the business has been gathered, it should be organized into a comprehensive business presentation package. A complete business presentation package, remarked Johansen, should include the following:

- History of the business
- Description of business operations
- Description of physical facilities
- Discussion of suppliers (if any) and agreements with those suppliers
- Review of current and historical marketing practices
- Description of competition
- Coverage of personnel and employee issues
- Identification of owners
- Description of insurance coverage for business
- Discussion of pending legal issues or contingent liabilities
- Financial statements for the past 3 to 5 years

LOCATING PROSPECTIVE BUYERS

Most business owners sell their companies to external buyers buyers other than current partners or employees in the organization. The seller can advertise the business, use his or her industry contacts to the get the word out, or engage intermediaries. Increasingly, online services with many options are available for advertising the business.

Industry sources also can be valuable when a business owner decides to sell his or her business. Suppliers may know of potential buyers elsewhere in the industry or the community. In addition, trade associations and trade

journals can be used to get the word out about a company's availability.

A third option is to secure the services of a business broker or merger and acquisition consultant. Business brokers, who generally handle the sale of smaller companies (though this is by no means an absolute rule), typically charge the seller a fee of about 10 percent of the final purchase price. Merger and acquisition consultants typically specialize in handling larger middle-market companies. Payments to "M&A" consultants are usually less than 10 percent, but this is in part because of the larger scale of the deals in which they are typically involved. In addition, many consultants ask for a monthly retainer fee. One of the benefits of securing the services of a merger and acquisition consultant is that he or she will typically provide help in preparing presentation packages, valuing businesses, and negotiating with prospective buyers.

A well-chosen business broker or merger and acquisition consultant can save the seller of a business a considerable amount of time and effort. However, both groups include hucksters who prey on unwary business owners, so it is important for sellers to conduct the appropriate background research before soliciting services in these areas.

Another option sometimes available to business owners is to sell the company to "internal" buyers employees, business partners, or family members. Selling to employees through employee stock ownership plans (ESOPs) or other arrangements are particularly attractive because they accrue significant tax advantages for owners through such sales. Employees interested in assuming ownership of the company by a management buyout (MBO) could range from a single key employee, such as a general manager who already has a good grasp on many aspects of the enterprise, to a group of employees (or even all of the company's employees). MBOs that rely on external financing typically require that one or more members of the purchasing group have management training in all aspects of the business; if such expertise is lacking, the seller will need to implement a training schedule for one or more employees to fulfill this requirement.

Business partners, meanwhile, are often ideal business buyers when an owner is ready to get out. Indeed, many business owners especially in professional practices bring in partners for this express purpose. The advantages of selling to a partner are numerous: the need to search for a buyer or to use an intermediary is obviated; terms of payment are often easier to arrange; and the business transition is eased because of the familiarity that already exists between the partner and the enterprise's suppliers, clients, and customers. Small-business owners looking to hand over the reins of a company to a partner, however, need to prepare for such a step adequately. Locating a suitable partner, structuring a partnership buyout, and financing a partnership buyout are all important and complex issues that require care and attention.

Finally, business owners also groom people within their organization to take over the business upon their retirement (or death or disability). Family-owned businesses often hand over the reins from generation to generation in this fashion. In many cases this transfer of ownership is made as a gift or included as part of the owner's estate.

MAKING THE SALE

Once the seller has found a buyer for his or her company, the next step is to arrange the structure of the transaction. In addition to determining whether to make a stock or asset sale (in the case of corporations), the seller and the buyer need to reach agreement on other terms of the sale as well.

Earn-Outs. An earn-out is an agreement wherein the seller takes a portion of the selling price each year for a fixed period of time out of the earnings of the company under its new ownership. These agreements are sometimes employed when a seller cannot get his or her full asking price because of buyer concerns about some aspect of the business. As a result, some sellers insist on minimum payment amounts. In addition, since the seller's total compensation under this arrangement depends on the company's performance during the specified earn-out period, sellers often require that they be involved in management decisions during this period. Earn-outs can be calculated as a percentage of gross profit, net profit, sales, or some other mutually agreed-upon figure. Sellers, however, need to make sure that the measurement used is fair and easily verifiable.

Installment Sales. Under this common arrangement, the seller of the business receives some cash, but the majority of the purchase price is received over a period of years. The down payment for small businesses may range from as little as 10 percent to as much as 40 percent or more, with the rest paid out with interest over a period of 3 to 15 years.

Leveraged Buyout. A leveraged buyout or LBO is the purchase of a company through a loan secured by using the assets of the business as collateral. This option, however, places a greater debt burden on the company than do other types of financing.

Stock Exchanges. In instances where a large, publicly held company is the purchaser, business owners sometimes ask to be compensated with stock in the purchasing corporation. In such cases, the seller is usually required to hold on to the stock for a certain period of time usually 2 years before he or she has the option to resell it.

Buyers sometimes insist on a noncompetition clause as well. Such a covenant, which can be incorporated into the purchase and sale agreement or created as a separate document, usually stipulates a market area and/or a period of time (3 to 5 years is common) in which the seller may not open a business that would compete with the enterprise that he or she previously sold.

CLOSING THE DEAL

Once a deal has been struck between the seller and the buyer of the business, various conditions of sale often have to be addressed before the deal is closed. These include verification of financial statements, transfer of licenses, obtaining financing, and other conditions. Most contracts call for these conditions of sale to be addressed by a specified date; if one or more of these conditions is not taken care of by that time, the agreement is no longer valid.

Provided that these conditions have been attended to, however, the parties can move on to the closing. Closings are generally done either via an escrow settlement or via an attorney who performs settlement. In an escrow settlement, the money to be deposited, the bill of sale, and other relevant documents are placed with a neutral third party known as an escrow agent until all conditions of sale have been met. The escrow agent then distributes the held documents and funds in accordance with the terms of the contract.

If an attorney performs settlement, meanwhile, he or she acting on behalf of both buyer or seller, or for the buyer draws up a contract and acts as an escrow agent until all stipulated conditions of sale have been met. Whereas escrow settlements do not require the buyer and the seller to get together to sign the final documents, an attorney who performs settlements does include this step.

Several documents are required to complete the transaction between business seller and business buyer. The purchase and sale agreement is the most important of these, but other documents often used in closings include the escrow agreement, bill of sale, promissory note, security agreement, settlement sheet, financing statement, and employment agreement.

SENIORITY

Seniority, defined broadly, means the length of service with an employer. Historically, those who had more experience with a task or in a job position managed those with less experience. Formal seniority policies grew out of this natural state of affairs. Based on an employee's seniority, preference can be accorded him or her in such areas as promotion, transfer, shift assignment, scheduling, vacation accrual, layoff, and recall after temporary layoff. Seniority is used as a means of gauging the relative status of one employee with respect to another based on length of service. As an employee's seniority grows, he or she accrues certain rights and privileges.

How exactly seniority is defined will differ from company to company. Some will track longevity without concern for the position worked while others will restart the clock every time an employee changes positions within the company. For some companies, seniority measurement is indifferent to whether an employee holds a part-time or a full-time job. Other companies only measure seniority based on time worked in a full-time position. What all seniority calculations have in common is that they measure, in some fashion, an employee's longevity with a company. Collective bargaining agreements usually calculate seniority by total length of service, sometimes with consideration for length of service within a particular craft or department.

The rights that accrue to senior employees also differ from company to company. Seniority may be used in making determinations about the order in which to hire back from a layoff list. It is often used to allocate vacation time providing those with more seniority a greater number of vacation days. It may also be used to determine pay in organizations instead of or in addition to a merit-based pay system. If organizations do not pay employees on the basis of doing the same work and holding the same level or rank in the organization, they must determine a basis to make a pay distinction or differentiation. In a large organization, compensation specialists within the human resources area

may make these determinations and may consider an employee's seniority in the pay decision.

Seniority may be especially important among union workers; clear seniority lists often exist, and the unions may demand that these lists and the respective benefits associated with higher seniority be honored, no matter what. In fact, in 2008, the conflict over combining two airlines' seniority lists caused problems in merger talks between Delta and Northwest Airlines as union members of each airline demanded their seniority list be honored.

SENIORITY'S DECLINING ROLE

As the economy has changed over the past 40 to 60 years shifting from a manufacturing economy to an economy based on services, absorbing large numbers of women into the workforce, and becoming more globally interdependent expectations of work have changed. In the past it was far more likely that a person would work much, if not all, of his or her career with a single employer. This in no longer the case. As mobility has increased in the workforce, the role of seniority has diminished. Declining union membership as a percentage of the workforce has also contributed to the reduced role of seniority as an important factor in employment decisions.

While seniority was valued in the past, for many people today, the longer they have been with a company, the more their job may be in jeopardy. Technology is cited as a primary reason for this change. Younger workers are perceived as more creative and innovative and may have more relevant educational experiences and training. Just as the product life cycle has shortened, so too has the career cycle of employees. Today job change and diversity of experiences is valued more than seniority. Companies are under great competitive pressure and have less tolerance for employees who are earning in excess of their output, a situation more common among the most senior members of an organization. Today an older employee can be replaced by someone younger earning less than half as much salary.

The new attitude toward seniority can have a serious impact on the financial lives of high-seniority individuals who lose their positions. According to a study conducted by Statistics Canada in 2007, those employees in Canada with high seniority who lost their jobs in the 1990s continued to suffer losses even 5 years after the layoffs. According to the study, men who had at least 5 years of seniority before being laid off were earning less in their new jobs; their salaries 5 years later were typically much smaller than what they had earned at their old jobs.

But will that always be the case? As the influential baby boom generation begins to depart the workforce, most observers see a shortage of skills and a potentially serious shortfall in the supply of labor looming in the very near future. The conclusion of a report on a human resource director's survey, conducted by IBM and reported in the *Economist*, states the situation this way: "When the baby-boom generation retires, many companies will find out too late that a career's worth of experience has walked out the door, leaving insufficient talent to fill the void."

In anticipation of this demographic shift, efforts are being made by some foresighted firms to maintain those with seniority and experience. Employees who are reaching retirement age are being encouraged to consider a phased withdrawal from the labor force. The use of job-sharing arrangements and part-time work schedules are two ways that are becoming more common for senior personnel in the stage of phased retirement. These flexible work arrangements allow an employee to ease out of the work habit while providing the company with an opportunity to use the senior employee's skills to train newer employees before the departure of senior employees.

SENIORITY IN JAPAN

Japan has long been known for its cradle-to-grave employment relationship. But even in Japan things are changing. In the past, the seniority system in organizations was a measure of job security in the employment relationship. Many companies are abandoning traditional employment relationships and no longer offering lifetime employment.

Employment practices in Japan which were once characterized by seniority, company unions, and lifetime employment have been undergoing a structural transformation as the nation struggles to cope with an ever more competitive economy. Since the collapse of the Japanese bubble economy early in the 1990s, Japanese companies, like their U.S. counterparts, have been forced to restructure and have adopted a system of determining promotions and salaries based not on seniority but on merit. This has dramatically changed their once-treasured code of seniority, according to *Focus Japan*.

In addition, just as has happened in the United States, the percentage of workers belonging to labor unions has steadily dropped, eroding the influence of the once-powerful Japanese company unions. Today's younger workers and new entrants to the job market are becoming less interested in the prospect of lifetime employment. As a result, many are considering entrepreneurship and self-employment as a more viable career choice.

SERVICE BUSINESSES

INDUSTRIAL CLASSIFICATION

Industries are broadly classified as goods-producing and services-producing, but in the gradual evolution of industrial classification, ever new definitions of the services-producing sectors have emerged, indeed continue to emerge. Thus, for example, until 1997 U.S. industry was classified using the Standard Industrial Classification (SIC) system. It broke down industrial activity into nine major divisions: Agriculture; Mining; Construction; Manufacturing; Transportation and Utilities; Wholesale Trade, Retail Trade; Finance, Insurance, and Real Estate (FIRE); and Services. At that point the "services" component at least had a division of its own although, in common parlance, people tended to include the Retail and the FIRE categories as part of the services sector.

Then came the North American Industrial Classification System (NAICS). It greatly expanded the divisional breakdown of industry, creating some nineteen sectors. For example, Utilities were separated from Transportation; an Information sector was cut out of Manufacturing. FIRE lost Real Estate, which came to stand alone. Most importantly, the Services Sector, which had become very important over the decades, was split apart into eight separate categories: Professional and Technical Services (which include law and engineering, for instance); Management Services (including holding companies); Administrative Support and Waste and Remediation Services; Educational Services; Health Services; Arts and Entertainment; Accommodations and Food Services; and Other Services (including household services, for instance).

The transition from SIC to NAICS, which had been a difficult path for industrial analysts in any case, was still not entirely traveled early in the twenty-first century. As a result, a detailed conversion between the SIC and the NAICS was available in 2002 from the NAICS Web site.

During this same period, the Census Bureau, working with Canada and Mexico (co-authors of NAICS), also developed the NAPCS (for North American Product Classification System). Although the NACPS addresses both goods and services, the primary focus is on service industries, as the U.S. Census reports that over 70 percent of economic activity is in the service sector, and the Census Bureau believes there is an imbalance in the amount of information available about this "new economy." As a consequence of this new initiative, certain elements of other industries have come to be classified as "services," as indicated by the Census Bureau's *Services Annual Survey: 2004*, issued in April 2006. Important additions to the list included Truck Transportation; Couriers and Messengers; Warehousing and Storage; all of Information (which includes communications and publishing among others); Securities Brokerage (taken from Finance and Insurance); and Rental and Leasing (taken from Real Estate).

DEFINITION, CHARACTERISTICS, AND EXTENT

Given this still dynamically changing structure of classification, defining with any precision just exactly what a "service business" is presents some challenges. Service businesses include major movie studios, gigantic telecommunications firms, major publishers, enormous engineering concerns, the shoe repair shop down the street, the law firm, the payroll service, the auto rental organization, the apartment house, the fast-food chain, the dental clinic, and so on.

Given the great diversity that the term "service business" encompasses, its characteristics must, by definition, be rather broad. A service business is not primarily engaged in extractive, harvesting, and goods-producing activities but in delivering results, often based on symbolical processes or the rearrangement of physical environments (landscaping, redecorating, waste handling, repairing), on personal services (healing, counseling, litigating, advising, persuading, amusing, caring for, teaching, etc.), on transporting goods and messages, and in structuring and managing ongoing or future activities by others (planning, engineering, management).

A service business, however, may also, if only incidentally, sell and deliver goods: people in the entertainment business sell DVDs although it is the films that

people are buying; in the information sector businesses sell newspapers and books although it is the content of these media consumers are paying for.

According to the Bureau of Economic Analysis (BEA), which produces the Gross Domestic Product estimates, the goods-producing sectors represented 21.3 percent, the service-producing sectors 74.5 percent, and the information, communications, and technology producing sectors 4.2 percent of GDP in 2004. In 2008 the goods-producing sector's share of the gross domestic product fell to 18.9 percent, the lowest since 1947 when the bureau first began compiling statistics. BEA uses the "value added" measure, meaning the difference between a sector's outlays for input and receipts for sales. The Census Bureau, in 2004 also estimated that nongoods-producing sectors accounted for 70 percent of business activity (using revenues, this time); services, more narrowly viewed, that is, based on the categories presented above, accounted for 55 percent of the economy. By 2009, however, it was estimated that services accounted for 76.9 percent of the GDP. Thus by any measure, a company in the "service business" could count itself as a member of the majority.

MASSIVE AND GROWING

The services sectors however defined, whatever industries happen to be parts of it today are the consequence of a mature and wealthy economy, as illustrated by historical statistics provided by the Census Bureau. In 1900 services represented 25.4 percent of all employment (business and other but excluding government); this percentage had changed to 50.6 percent by 1980, 57.7 percent by 1990, and stood at 62.5 percent in the census year of 2000. In 2008 the service sector accounted for 77.2 percent of jobs. The goods-producing sector, on the other hand, accounted for only 12.9 percent of employment.

SMALL BUSINESS IN THE SERVICES SECTORS

In terms of sheer numbers, small business has always dominated the corporate population, with well over 90 percent of all business firms being small, even when excluding the tiny operations that do not employ people, the owner alone participating. The usual but not the formal definition of a small business is one with fewer than 100 employees. A look at small business in the services sectors shows that these not only dominate services but very small companies, those with fewer than twenty employees, are the overwhelming majority.

These data, for the year 2006 and provided by the Census Bureau, include only the traditional services sectors, thus Professional and Technical, Management, Administrative and Waste Handling, Educational, and Health Services. Also included are Arts and Entertainment, Accommodations and Food Service, and the "Other" category. In the aggregate 87.2 percent of all firms participating in these industries had fewer than twenty employees but those counted all had some paid employees. The two sectors with the most "under-twenty-employee" firms were Professional and Technical Services and Other Services; in Professional Services, for example, 90 percent of all companies had fewer than twenty employees. Management firms (which include holding companies) had the fewest only 18 percent were companies with under twenty employees.

In terms of employment, the largest of these sectors was Health Care and Social Assistance, with 16.45 million employees, followed by Accommodation and Food Services, with some 11.38 million employees in the aggregate. The smallest sector was Arts, Entertainment, and Recreation, with 1.93 million workers.

TRENDS LIKELY TO CONTINUE

With services a dominant expression of the U.S. economy, with manufacturing productivity still growing, and outsourcing of function a favorite activity of very large organizations almost always outsourcing service functions the service sectors are likely to continue growing. With the majority of people employed in services industries, moreover, those thinking of striking out on their own will also, on average, be experienced in services activities and start up service businesses themselves. Entry into the services sector requires more education and know-how than capital resources, which favors the entrepreneur with limited means. He or she, looking "to be of service" to society, will find a rather favorable environment for venturing out.

SERVICE CORPS OF RETIRED EXECUTIVES (SCORE)

The Service Corps of Retired Executives (SCORE), now referred to as Counselors to America's Small Business, is a national nonprofit organization that counsels business owners and aspiring entrepreneurs. In 2010 there were 364 SCORE chapters throughout the United States offering counseling services to small businesses in all areas at no charge to the client. There is no membership requirement to receive SCORE counseling a phone call to make an appointment with a local SCORE chapter is sufficient to put the small-business owner in touch with this valuable organization.

History. SCORE was founded in 1964 to provide business counseling to entrepreneurs. SCORE is funded primarily by the U.S. Small Business Administration (founded in 1953). The group is made up of more than 12,400 active and retired business executives familiar with all areas of business management. This group donates its services, conducting one-to-one counseling as well as team counseling and training sessions. SCORE provides assistance to an estimated 300,000 plus would-be entrepreneurs and business owners annually. According to the SCORE Web site, the organization has worked with more than 8.5 million entrepreneurs as of 2010. SCORE is responsible for helping entrepreneurs launch several major companies, including Vera Bradley Designs and Jelly Bean Candy.

Mission and Programs. SCORE counselors provide general business advice on all aspects of business formation and management. This service is provided free of charge and in confidential fashion. Counselors may assist in anything from investigating market potential for a product or service to providing guidance on cash flow management. They may provide insight into how to start or operate a business, how to buy a business or franchise, or how to sell a business. Volunteers also review business plans, often offering suggestions before the plans are submitted to a bank for financing consideration. (In one survey of SCORE offices in fourteen states, 27 percent of respondents indicated they delayed or canceled plans to start their own business after talking with a SCORE counselor, usually because the meetings illuminated shortcomings in training or strategy.) Finally, individual SCORE offices offer free and confidential counseling and business advice via e-mail, and in 2007, added Ask Score online counseling. Today, the Webinars offered online and online counseling services are SCORE's most popular offerings.

SCORE also holds workshops throughout the country. Workshops and seminars on specialized areas of business training such as writing business plans, inventory control, advertising, financing and international trade are available at reduced cost (usually a nominal fee of $100 or so, to cover cost of facilities and materials). SCORE maintains a Web site (www.score.org) that provides more information about all its services.

SCORE Volunteers. SCORE volunteers are usually between the ages of sixty and seventy, but there is no age limit for a volunteer. Retired executives interested in joining SCORE fill out a formal application and usually supply a résumé for consideration by their local chapter. There is a 90-day probation period during which performance is monitored. To insure quality, SCORE counselors are matched to cases according to the type of business or client seeking advice and the counselor's area of specialty. SCORE is not an employment service, however. Members may give advice but may not accept positions with client companies, nor may they direct a business owner to individuals or firms which may provide employees. SCORE's main function is to provide free advice to small businesses.

SERVICE MARKS

A service mark (SM) is a legally protected symbolic display that is used to identify the uniqueness of a given service. Service marks fall under the category of patents and intellectual property rights in trade and commerce activities. In the United States, the acquisition and administration of service marks are regulated and monitored by the Patent and Trademark Office (PTO). Service marks are issued to business entities which not only render services at a state level, national level, or in international markets, but which also engage in commercial activities that are connected to the services. A service mark must be registered either at the state or federal level in accordance with the state and federal legal provisions.

The vested rights of a state registered service mark is limited to the legal provisions of the particular state while the vested rights for a federal registered service mark are spread nationally and are subject to both state and federal legal provisions. Additional resources for registration requirements and procedures for registration and filing of service marks can be accessed from the PTO Web site at www.uspto.gov.

The rights to use a particular name is gained the very first moment it is claimed publicly as a service mark, at which point no other person in a similar line of business can adopt the same service mark. As such, the rights to a service mark designation are acquired before registration of the mark. However, it is always prudent to register a service mark because it provides the owner with the opportunities to notify the public of ownership claims to a service mark; seek legal redress for infringements in state and federal courts; and gain legal basis for international registration of a service mark.

In his article titled *Trademarks and Service Marks 101*, Scott Allen emphasized that service marks must demonstrate name, slogan, or logo distinction by virtue of their uniqueness, potential to be associated with strong brands, and the potential consumer familiarity that a service mark may draw from marketing campaigns. Therefore, according to Allen, a distinctive service mark should bear the following characteristics:

1. Consist of evocative words that suggest quality standards of a service (for example, Slim-fast).
2. Be coined by using arbitrary make up of letters (for example, Exxon).
3. Have contextually arbitrary words that depict the element of surprise (for example, Amazon Online Bookstore).
4. Use of typographically unique symbols (for example, McDonald's Golden Arches).

Small-business entrepreneurs must be very careful when choosing service marks because those marks which represent service feature descriptions (such as airline), those which are drawn from the names of persons (such as Arlington & George Advocates), or those which are names of geographical places (such as Washington Travel Agents) cannot be registered. The owners of such service marks can enhance public identification of their businesses to their specific services through advertisements or service offers in order to derive secondary meaning that can be protected. Other types of service marks that cannot be registered include service marks that can potentially be confused with existing marks; terms that depict generic names of product; and abandoned service marks.

SERVICE MARKS AND TRADEMARKS

Service marks and trademarks share quite a number of similar characteristics with regards to the protection of patent and intellectual property rights. In fact, it is very easy to confuse the contextual application of service marks and trademarks because of the close relationship between the two forms of commercial patents. For example, *West's Encyclopedia of American Law*, defines a service mark as a "trademark that is used in relation to a service." The definition simply demonstrates that service marks and trademarks are one and the same thing, except that the former is used in reference to intangible activities of commerce while the latter is used in reference to tangible products. Some of the similarities between service marks and trademarks include:

- Both require that services or goods under definition must be subject to participation in ordinary course of trade and commerce.
- Discontinuation of the usage of either a service mark or a trademark and the absence of intent to resume usage translates to abandonment.
- The conversion of either a trademark or service mark into the generic reference for a product or service would constitute irregularities and therefore warrant dilution and eventual loss of a mark's significance.

These two forms of legally protected patent marks for trade and commerce are equally different in several ways. Basically, whereas service marks are limited to intangible

products in the form of services, trademarks are limited to tangible products in the form of physical goods.

COLLECTIVE SERVICE MARKS

Service marks can be used by individual entrepreneurs or legal entities consisting of membership, such as cooperative organizations, trade unions, or professional associations. Service marks used collectively by members of organizations are known as collective service marks. The PTO regulations require that the intent for collective service marks for associations or cooperative organizations must be backed by adequate commercial purposes. As such, the use of service marks by collective organizations must demonstrate a *bona fide* commitment to use in trade and commerce activities and should not be acquired for the mere purpose of reserving the rights to a mark.

LEGAL PROVISIONS FOR SERVICE MARK INFRINGEMENTS

Service mark laws are governed by the Lanham Act of 1946. Small business enterprises may encounter service mark infringements from unscrupulous persons or business entities. An infringement of a service mark usually takes the form of confusion of a service mark that is already established in a particular sphere of commerce with similar marks that are designed to deceive unsuspecting consumers in a particular target market. Indeed, the infringement of a service mark can deal a heavy blow to the image and reputation of a business. Notably, though, the use of similar marks by business entities running business in fields that are completely unrelated and which target completely different consumer markets do not constitute service mark infringements. For example, such would be the case for a consultancy firm and a tourist hotel sharing a similar service mark.

Small business enterprises can seek legal redress for service mark infringements from the courts because the other businesses are legally forbidden from the deceptive use of a particular service mark over which a particular business has vested rights. As such, a plaintiff (complainant) can be awarded money damages, and injunctive relief once it is proven beyond reasonable doubt that there is evidence of service mark infringement by the defendant. Money damages are monetary compensation for reputation damages or financial and investment losses suffered by a business from service mark infringements. Injunctive relief, on the other hand, involves restraining the defendant from using a plaintiff's service mark. Business enterprises can pursue infringement claims for service marks using either federal or state law provisions, although federal regulations provide the opportunity for recovering substantive damages for a service mark registered at the federal level compared to recoverable damages supported by state legislation for such a business.

Ingati, Anaxos

SEXUAL HARASSMENT

Sexual harassment is a term used to describe actions that make use of sexual comments or acts in order to intimidate those with whom one works. Sexual harassment is illegal. As a form of sex discrimination, it is a violation of Title VII of the Civil Rights Act of 1964. Title VII applies to all employers with fifteen or more employees. Many actions can be legally shown to be either sexual harassment or to contribute to a hostile or offensive work environment. The Equal Employment Opportunity Commission (EEOC) defines sexual harassment as follows: "Unwelcome sexual advances, requests for sexual favors, and other verbal or physical contact of a sexual nature constitute sexual harassment when: 1) Submission to such conduct is made either explicitly or implicitly a term or condition of an individual's employment. 2) Submission to or rejection of such conduct by an individual is used as the basis for employment decisions affecting such individuals. 3) Such conduct has the purpose or effect of unreasonably interfering with an individual's work performance or creating an intimidating, hostile, or offensive working environment." But legal experts warn managers and business owners that definitions of sexual harassment extend beyond these boundaries. Although most people think that sexual harassment involves conduct of a sexual nature, based on a study of case law, this is not true. Sexual harassment includes acts that are not overtly sexual but rather are directed at individuals based on their gender. Therefore, profanity or rude behavior that is gender-specific may create a work environment that legally supports claims of sexual harassment.

Some observers believe that small businesses are particularly susceptible to sexual harassment problems. This is because small businesses often have an informal office atmosphere that may seem to allow sexual banter and innuendo. Small businesses are also less likely to have an official sexual harassment policy and training program than are larger firms. Savvy small-business owners adopt proactive stances to make certain that their employees know that inappropriate behavior whether it takes the form of displaying sexually explicit photographs, using offensive language, making suggestive or otherwise inappropriate comments, badgering an employee for dates or other interactions outside the workplace, or suggesting that one gender is inferior to another will not be tolerated in their company. Indeed, firms that do not do so leave themselves open to financial loss via lawsuits as well as other problems like low morale, employee turnover, and absenteeism. These negative side effects can ultimately impact on financial performance. As EEOC guidelines state, "with respect to conduct between fellow employees, an employer is responsible for acts of sexual harassment in the workplace where the employer (or its agents or supervisory employees) knows or should have known of the conduct, unless it can show that it took immediate and appropriate corrective action."

HARASSMENT AND EMPLOYEE RIGHTS

Over the past several years, sexual harassment has become a subject of considerable discussion. Previous generations of business owners and managers rarely had to address the issue. Business historians and social observers point to several possible factors for this. Some note that women used to comprise a much smaller component of the workforce, and that various societal pressures may have made them less likely to come forward with complaints. Others point out that many of the legal protections that are now in place against harassment have only developed over the last 25 to 35 years. Still other observers contend that the rise in sexual harassment claims simply reflects a general decline in civility in American society. Whatever the reasons, sexual harassment complaints have risen throughout the 1990s and remained fairly steady up to 2009. Interestingly, however, there was a shift in the types of complaints, with more men filing complaints then ever before. In addition, there has been a rise in the filing of same-sex harassment charges, in part because of men's increased reporting of harassing comments directed at them by other men.

The Equal Employment Opportunity Commission is the governing body that is authorized to administer laws prohibiting sexual harassment. Charges of harassment are filed with the EEOC. In 2009 12,696 claims were filed, with 16 percent filed by males. That same year, 11,948 claims were resolved, with a total of $51.5 million for charging parties. This figures does not including monetary benefits obtained through litigation. To these totals, it should be understood that many charges of sexual harassment are resolved quietly, some at substantial cost, before they ever reach the point at which the charge is officially made with the EEOC. Clearly, the potential for losses, both financial and in terms of reputation, as a result of sexual harassment are great, and it is a subject that should be dealt with in a very visible and up-front manner within companies of all sizes.

However, small-business owners and corporate executives alike need to make sure that in their zeal to protect the legitimate rights of employees not to be harassed in the workplace, they do not trample on the rights of those accused of misbehavior. Just because sexual harassment is a significant social and business problem does not mean it has in fact occurred in a particular instance. Indeed, an employee who is punished or dismissed on the basis of a frivolous sexual harassment claim has the same recourse to the law as the victim of sexual harassment who is left unprotected by indifferent managers or owners. Business owners and managers thus need to consider the rights of all parties involved when investigating sexual harassment complaints.

DEVELOPING AND MAINTAINING SEXUAL HARASSMENT POLICIES

A well-drafted, carefully thought-out policy statement on sexual harassment is an important human resource policy for all companies. It is valuable in at least three major ways:

1. As an employee relations tool
2. As basic education for both managers and employees on the subject of sexual harassment
3. As a way of minimizing legal liability to the organization in hostile-environment sexual harassment cases.

Such a policy statement is evidence of a company's good-faith effort to provide a work environment that is free of harassment. When coupled with a proper investigation that successfully ends illegal or inappropriate conduct, it can also provide a major offensive weapon in employer efforts to demonstrate that all reasonable steps were taken and that they were effective in the case of a sexual harassment charge. In *Faragher v. City of Boca Raton*, the Supreme Court affirmed the importance of a sexual harassment policy when it held that an employer may be exempt from liability if an employee unreasonably failed to take advantage of protective measures offered to an employee in a written or stated policy.

Indeed, business consultants universally counsel both small businesses and multinational corporations to establish formal written policies that make it explicitly clear that no forms of sexual harassment will be tolerated. Some companies prefer to disseminate this information as part of their larger general policy statements because of their sensitivity to giving extra attention to a sometimes awkward subject. But others believe that doing so can have the effect of burying the company's sexual harassment policies under the weight of all its other statements. These observers claim that dissemination of a separate policy statement not only better informs employees of the policy itself, but also underlines the company's serious approach to the subject.

Whether a business chooses to distribute its policies on sexual harassment via general information sources (employee handbook) or separate statements, its policies should list all the various forms that sexual harassment can take (sexually loaded "compliments," sexual advances, denigration of a person's gender, etc.) and explain how the company proceeds when confronted with a sexual harassment complaint. The policy statement should also discuss possible disciplinary consequences for workers who are found guilty of engaging in harassment.

Other steps that businesses can take to establish a harassment-free workplace include establishing internal procedures that address complaints promptly and thoroughly; establishing training programs that educate workers and especially managers, supervisors, and other people wielding power about components of sexual harassment and their responsibilities when exposed to such behavior; establishing alternative routes for workers to lodge complaints (in instances where his or her supervisor is the alleged harasser, for instance).

BUILDING A COMPREHENSIVE POLICY

Legal experts warn businesses that they need to make certain that their policies reflect a true understanding of the legal responsibilities of the employer and a full recognition of the multitude of forms that sexual harassment can take. They point out that some companies have put together policies that, while sensible and effective in some or even most areas, are flawed in other areas, either because their policies did not adequately cover all the ways in which sexual harassment can occur, or because their understanding of sexual harassment was incomplete from the outset. For example, many people have long operated under the misconception that for sexual harassment to occur, the harasser must have a bad intent. The reality, however, is that what may be viewed as perfectly harmless by some people may be viewed as offensive by others. Courts have dealt with this difference by developing a new standard for analyzing claims of sexual harassment. The old standard was the traditional gender-neutral reasonable person standard, which is thought to be biased toward the male viewpoint. Sexual harassment claims are now analyzed in many jurisdictions from the perspective of a reasonable person of the same sex as the complainant, so as to eliminate the potential for differences in perspective that are based on gender.

Another important factor that is not always sufficiently appreciated by employers is that they can be held liable for harassing conduct by a third party such as a customer or vendor. Cases of this type are rare. Nonetheless, business owners should be aware of their responsibility to address complaints of this type. Just as an employer is responsible to provide employees with a safe work environment, it is responsible to confront customers, clients or other third parties if they harass employees in any way.

Sexual harassment complaints often arise after the failure of a romantic liaison between employees. As a result, many companies attempt to limit such romantic involvement between employees by establishing antinepotism and antidating policies. Assessments of the dangers of office romance vary dramatically. Some observers view it as a wholly undesirable condition that should be avoided by business owners and managers if at all possible, while others view it as a potential positive development, provided that the relationship lies within certain parameters. But what happens when a philanderer dates and discards casually within a company, leaving angry, litigation-prone employees in his or her wake? Reasons for dating policies to address supervisors, subordinates, and clients, not to mention patients and vendors, are understandable.

The risks that a deteriorating romance poses for a company that employs both parties are undeniable. Perhaps, however, the benefits of happily partnered employees is another possible outcome to an office romance. Famous cases abound: Microsoft's founder Bill Gates and opera impresario Luciano Pavarotti both married employees of their organizations. Obviously, businesses create dating policies to try and manage the negative aspects of office romances, and those that crash and burn. However, since perfectly happy relationships may result from office romances, policies that are clear and specific about exactly what they prohibit are best. The subject is complex, the potential threats serious, and the need for clarity is essential.

INVESTIGATING SEXUAL HARASSMENT COMPLAINTS

Companies must investigate every sexual harassment complaint seriously and thoroughly, and take action accordingly. A key foundation of this process is to make certain that the person who will investigate the complaint has credibility with the workforce. Ideally, the individual will

be knowledgeable about the legal dimensions of sexual harassment, experienced in handling employee issues, familiar with the organization's policies, and socially and organizationally distant from both the alleged victim and the alleged harasser. (The investigator should not be friends with the alleged victim nor directly report to the alleged harasser, or vice versa.) With smaller companies, however, it can be more difficult to adhere to such guidelines. If a small-business owner has only four employees, and two of them become embroiled in a harassment case, finding an investigator with the above qualities is next to impossible. Owners may be tempted to look into the complaint themselves in such instances, but business advisors often counsel against this. Instead, they recommend that the owner turn to an outside counsel or external consultant to pursue the complaint.

Whether the person doing the investigating is a third party, an employee, or the owner of the business, he or she should have a focused, carefully thought-out investigation plan designed to settle the issue in as timely a fashion as possible. This typically includes a review of relevant organizational records, including complainant's personnel file, alleged harasser's personnel file, performance reviews, and promotional and salary records. Such reviews can turn up everything from prior disciplinary warnings aimed at the accused to possibly relevant indications that the involved parties had previously competed against one another for promotions or other job opportunities. Such data may well be irrelevant to the legitimacy of the complaint, but it is the investigator's duty to check into all possible aspects of the complaint.

Every claim should be treated seriously, no matter how unusual or seemingly frivolous it might first appear, until an informed decision can be made. Conversely, an investigator should also suspend judgment on complaints that seem obviously legitimate until a thorough investigation has been completed. This may seem obvious advice but it may often be difficult to adhere to.

The first step in an investigation usually involves an in-depth interview of the complainant. Areas that should be pursued during this interview include the cultural background of the complainant (if dramatically different from that of the accused), a detailed reconstruction of the incident(s) that prompted the complaint, the context and circumstances in which it occurred, the involved parties' prior relationship (if any), the nature of the allegations against each individual in instances where incidents involved the participation of more than one person (common in hostile workplace complaints), and the complainant's expectations regarding how the alleged offender should be disciplined.

The investigation then turns to getting the accused's account of events. This step has different nuances, depending on whether the alleged harasser is a supervisor, a co-worker, or a third party such as a customer, but basically this part of the investigation aims to secure the accused's perspective. In some instances, the accused may appear angry or shocked when confronted with a sexual harassment charge, so the investigator needs to allow time for the return of some measure of emotional equilibrium. When the initial reaction has subsided the investigator should ask the worker to relate what he or she believed happened during the incidents cited. The accused must be allowed to relate his or her understanding of the situation completely once, then return to it for specific, step-by-step review. As with the complainant, the investigator should make sure the discussion is specific and detailed enough to provide the necessary information for later decision making. Dates, times, places, circumstances, dress, words exchanged, as well as the specifics of the alleged acts should be noted. Again, issues such as prevailing work environment, prior relationships, and any other relevant factors, should be discussed.

Once the investigator has finished gathering information from the principal parties, he or she should then turn to possible witnesses. These could range from co-workers who were present when the alleged incident took place to those who have relevant information on either or both of the parties involved. The investigator should not be concerned with unsubstantiated rumors at this juncture; rather, he or she should concentrate on gathering factual data. This can be a very important part of the investigation, for accusations that turn into basic "he said, she said" disputes can be profoundly difficult for employers to resolve. Immediate action may be almost impossible when an employer is faced with unsubstantiated accusation on one side and a categorical denial on the other. But experts point out that workplace behavior often can be corroborated by other staffers. Employers need to interview these witnesses carefully, being careful not to fuel rumors or be seen to have taken sides. The objective of these interviews is to gather factual data, nothing more. It does offer the opportunity, however, to show that the company is handling the investigation seriously, professionally, and carefully. Securing written statements is helpful.

Once the investigation into the sexual harassment complaint has been completed, corrective action (if any) needs to be implemented. When corrective action is warranted, it can range from counseling to transfer to dismissal. The key factors that usually determine the severity of the corrective action are: 1) the nature of the offense; 2) the desires of the complainant; and 3) the impact that the incident had on the workplace as a whole.

HARASSMENT OF THE SELF EMPLOYED

Self-employed individuals who work as independent contractors enjoy fewer legal protections from sexual harassment at the hands of clients. Experts recommend that self-employed people confronted with such unpleasantness react strongly and decisively. They should make it immediately clear that the harassment (which in these situations typically takes the form of unwanted sexual advances) is unwelcome, and that they would prefer to keep their association with their client a professional one. If this line of defense does not work, the self-employed worker may wish to consult an attorney about his or her state's tort law, which regulates conduct between people and provides monetary damages. In addition, national women's organizations can often provide guidance and legal assistance in these matters.

SHARED SERVICES

"Shared services" is a term defining an operational philosophy that involves centralizing those administrative functions of a company that were once performed in separate divisions or locations. Services that can be shared among the various business units of a company include finance, purchasing, inventory, payroll, hiring, and information technology. For example, a central headquarters might control all the hiring for an entire chain of retail stores. The term "shared services" can also apply to partnerships formed between separate businesses. In this case, the tenants of an office building might share telecommunications or maintenance service. Shared services are also available on the Internet. An example of this form of shared services is Application Service Providers (ASPs) who offer numerous business clients access to online applications so they can avoid purchasing special systems and software.

Ideally, companies that implement shared services enjoy significant cost savings by standardizing practices and procedures and by creating economies of scale. Proponents argue that performing a function in one location usually requires less investment in technology and office space, as well as up to 30 percent fewer employees, than performing the function in multiple locations. "Under shared services, a company centralizes back-office functions, such as accounting, warehousing, and even information technology, and treats them as internal vendors," Erik Sherman explained in *Computerworld.* "The rest of the company can use outside service providers instead, so competitive pressures promote responsive service, and reduced staffing saves money." In some cases, the centralized functions or shared services organizations charge the different divisions for the use of their services. Other shared services organizations even offer their services to outside firms on the open market.

The application of shared services is a popular business strategy. In fact, Elizabeth Ferrarini noted in *Computerworld* that it has been adopted by half of all *Fortune* 500 companies. "Centralizing company functions in a manner now known as the 'shared services' model is one of the hottest trends in business today," Mark Henricks wrote in *Entrepreneur.* "Those who practice it say they can cut costs while improving the quality of the

services shared." Similar figures have also been reported by the English Institute of Chartered Accountants, which estimates that more than 30 percent of *Fortune* 500 companies in the United States use shared services, achieving a savings of 46 percent or more in costs. The phenomenon is not confined to the United States; the numbers are similar in Singapore, where an estimated 30 percent of companies use Shared Services, according to a 2007 study. The concept of shared services was introduced in the 1980s, when a number of large companies with multiple business units began looking for ways to reduce their administrative costs. Since then, Henricks noted, "shared services has evolved into a more comprehensive and flexible tool for improving processes, enabling technology investment, generating profits, and reducing costs."

There are a number of potential drawbacks associated with shared services, however. For example, companies switching to a shared services model often incur the cost of hiring new people and installing new technology. In addition, implementing shared services takes time often more than one year. Furthermore, as Henricks warned, centralization is not appropriate for every function. Companies should not centralize their core competencies or functions that involve direct customer contact, particularly if outside firms also use the shared services.

The implementation of shared services can also create problems within a company. For example, the employees who used to provide the services in various business units might be upset with the loss of control they experience under the new arrangement. In addition, the headquarters employees who provide shared services from a central location might be uncomfortable treating business units as customers. In fact, switching to a shared services environment requires employees to develop new skills, with an increased emphasis on flexibility and customer service. "To be the preferred supplier and even to have a secure corporate existence the shared service has to cost-effectively deliver superior results," Sherman stated. As a result, a shared services system is not appropriate for every business. "For many companies, shared services will remain an intriguing concept that just doesn't fit their needs," Henricks noted. "For others, it will represent exactly the right model to take advantage of a promising opportunity to make the most of home-office skills that other divisions, locations, and even other companies can also use."

SHOPLIFTING

Shoplifting is the practice of stealing merchandise from retail establishments. Unfortunately, shoplifting is a serious and persistent problem for most retailers. According to the National Association for Shoplifting Prevention, more than $13 billion in goods are stolen each year from retailers, or $35 million per day. Professional shoplifters, or those who steal primarily for resale, account for approximately 10 percent of the total dollar value losses. These professional shoplifters are of concern to retailers because they tend to steal higher-priced items or work from the inside, through employees. Nonetheless, the fact that 73 percent of shoplifting losses result from stealing that occurs without premeditation means that attempts to stop these losses must focus on both professional as well as casual shoplifters. Among the most commonly stolen items are tobacco products, athletic shoes, brand-name clothing, small appliances, jewelry, leather goods, and food items.

The costs of shoplifting are many. Most obvious of these costs are the losses suffered by retailers. The inventory lost to shoplifters is only part of the retailer's costs. They also absorb the costs of increased security measures and higher legal expenses associated with prosecuting the

thieves. An estimated one in forty-eight shoplifters are caught, and 50 percent of the time, those caught are turned over to the police. But shoplifting also costs the community in which it takes place by affecting store location decision. Stores in high-theft areas will often relocate, and in so doing they end up contributing to the deterioration of these troubled areas. Finally, shoplifting costs consumers in terms of higher-priced goods. "The cost [of shoplifting] is very high," said business professor Ed Mazze in *Providence Business News*. "It cuts into the profit margin of the retailer and is paid for by the consumer. It requires stores to invest in more complex security devices."

PREVENTING THEFT

The first step for retailers hoping to reduce their losses to shoplifting is to create a strong antitheft policy and publicize it among customers and employees alike. In preparing a policy, it is important to note that deterring theft is usually less expensive than apprehending and prosecuting thieves. In addition, retailers must be familiar with the shoplifting laws in their states, particularly in light of incidents involving the assault of alleged shoplifters by store security guards. Some states require individuals to exit a store before they can be accused of shoplifting, for example. Furthermore, privacy laws and video surveillance rules may also impact a shoplifting policy that includes video cameras, and should be understood before installing such a system. Experts suggest that small-business owners consult with local police or their insurance company to obtain assistance in setting up an antitheft program.

In order to address the problem of employee theft, retailers can use integrity questionnaires and conduct reference checks when hiring new employees. In addition, software solutions exist to help retailers detect point-of-sale errors and fraud. Another way that small retailers can help prevent shoplifting is to buy merchandise from established sources. In many cases, professional shoplifters steal from major retail chains and then resell the merchandise to small, local stores.

SECURITY MEASURES

Retailers have a number of security measures available to them to help deter potential shoplifters. A good place to start is by training employees to recognize and report suspicious behavior. Visible security measures are another valuable way to deter shoplifters. Security gates in doorways, security cameras in obvious locations, and uniformed security guards patrolling the store are all strong deterrents. Many retailers choose to reduce the temptation to steal by putting items that have high theft rates behind counters or giving them electronic article surveillance (EAS) tags. These methods have drawbacks, however, because limiting customer access to items reduces sales, while applying antitheft tags to items is labor intensive.

A relatively new weapon in the fight against shoplifting is the use of source tags. A source tag is a type of EAS tag that is applied by the manufacturer usually inside the container or packaging rather than by the retailer. The usage of source tags is growing, particularly in the areas of health and beauty aids and over-the-counter drugs. Some source tags can be used for both security and inventory control. In the future, the technology might even be used for tracing stolen merchandise that is resold to other stores. "Source tagging helps us provide our valued customers with low-cost products and the perpetual inventory they are looking for," Tom Coughlin, CEO of Wal-Mart USA, told Hallie Forcinio in *Pharmaceutical Technology*. "It allows us to enhance sales and focus our resources on how we can better serve our customers."

SICK LEAVE AND PERSONAL DAYS

Sick leave and personal days are a form of employment benefit by providing paid time off for an illness or to deal with a personal/private matter. Since nearly everyone occasionally needs such time off, all businesses should have a clear policy established regarding sick leave and personal days. A sick day is fairly self-explanatory and can be used

for everything from a common cold to a more serious illness that could require hospitalization or even surgery. Personal days can cover things like the illness of a child, a death in the family, jury duty, military obligations, or religious holidays. Most companies also allow vacation time for employees in addition to their set amount of sick leave and personal days.

Most companies allocate only a certain number of days for sick leave and personal time. For example, in a calendar year an employee could have 5 sick days and 3 personal days. If the employee fails to use them all in the given amount of time, the company must decide whether to allow employees to roll them over (that is, add or bank them to the number of sick days for the following year). The company could also reward the employee for not taking all available sick and personal days by offering cash bonuses, perks, or additional vacation days.

In an article for *Business First*, James D. Levy discussed employee attendance issues and described the three employee types that most businesses have to contend with. "On average, a small portion of employees will rarely, if ever, be absent because of illness. They pride themselves on being the iron man or iron woman and prove that people can, and do fulfill their responsibilities even when they don't feel well," he explained. "A second group, the great majority, will use a few sick days a year, well within most organizations' guidelines. The third group, usually only 5 percent or so, use their sick days plus most or all of their vacation time and additional lost time because of illness. It's this group that blurs the line between actual illness and the kind of 'not feeling well' that can be an excuse for poor performance or absences. Improvement in the attendance and performance of that small group would pay big dividends to organizations."

PROBLEMS WITH SICK LEAVE AND PERSONAL DAYS

From a business standpoint, the main problem that companies face when an employee takes time off because of an illness or personal matter is the loss of production. This in turn leads to a loss of money (in most instances, an employee is paid when he or she takes a sick or personal day). The loss of productivity occurs simply because the work that the employee was supposed to do that particular day has to be done by one or more other employees or by a temporary employee. There is also the chance that the work could not get done at all.

The existence of sick and personal days also leaves the door wide open for them to be abused by employees who are less than honest about their health or personal lives. Most everyone has played hooky by calling in sick to work at one time or another, but those who make a habit of it are costing their employers a lot of money over the long run. In addition, the other employees who have to cover for them while they are taking time off may start to build up resentment if this situation occurs over and over again with the same individuals. This dip in morale can also hurt the company over a long period of time.

WAYS TO COMBAT ABUSE OF SICK LEAVE AND PERSONAL DAYS

There are many ways employers can fight back and make sure that their employees are not abusing the sick and personal days that they have been allotted. The first step would be to examine the existing policy and determine if it encourages unscheduled absenteeism. Management and supervisors can also force themselves to become more aware of their employees' habits and be on the lookout for things like stress or specific types of lifestyles that may force an employee to take more time off. Single parents or recent divorcees would fall into this category.

In some instances, the company could consider providing counseling or other assistance to employees who suffer from problems that cause them to miss work (including alcoholism, drug abuse, and psychological problems). In addition, many employers can combat an attendance problem before it gets out of hand simply by confronting the employee and discussing the reasons why he or she has missed so much work. An official attendance record could be kept just in case the employee disputes the employer's claims. Policies requiring an employee to file a report stating why they missed work can also be helpful in these types of situations. Also, since many employees spend a lot of time in the workplace, an employer can also reduce the chances of them getting sick in the first place by promoting a clean, safe, and healthy office environment.

Another concept that many employers have found useful in cutting down on unscheduled absences is known either as a paid leave bank (PLB) or a paid time off program (PTO). This program requires employees to consider all of their vacation, sick, and personal days as one unit to be used either for PTO or serious catastrophic situations. This system forces an employee who is abusing his or her sick day privileges to subtract them from vacation time or personal days if he or she continues to do so. Since the time that falls under the PTO plan is essentially the employee's time, he or she would be less likely to abuse it. This plan also helps to cut down on unscheduled absences that disrupt the workplace. On the positive side, a company is better able to control costs under this system while still allowing an employee to take additional time if something catastrophic happens. A reward system can also be built into this plan to encourage employees from taking unscheduled absences off.

If a company offers employment options like flextime or the opportunity to work from home, they also stand the chance of cutting back on unscheduled absences. With a flexible schedule, employees can rearrange their work times to attend to a personal situation like taking their child to the doctor in the morning. After their personal business is taken care of, they can still come in and put in a full day at the office and not have to use a personal day. The option to work at home can also cut down on an unscheduled absence if employees are too sick to report to work but healthy enough to perform their duties. Many such duties can be done at home with the help of a laptop or other device that is useful in telecommuting. Another benefit to this option is that other employees will stand less of a chance of coming down with an illness if the employee who is already sick just works from home.

Rewarding employees for not taking sick leave may be another positive method of combating the problems associated with excessive use of sick days. For example, in 2008 the federal government proposed a bill permitting federal employees to receive partial pay for unused sick days. The bill was an effort to combat the practice of taking extensive sick days in the months leading up to retirement; a practice that was estimated to cost tax payers $68 million per year.

If constant abuse of sick and personal days continues to be a problem between a company and a particular employee, more drastic measures can be taken. One tried and true method requires that the employer insist on a note from a doctor before allowing an employee who has been out for more than several days to return to work. Policies regarding raises or other rewards can also be tied directly to employees' attendance records, therefore encouraging them not to take an unscheduled absence.

In serious circumstances, an employee can be fired for taking too many days off. Employers should make sure that they have a legitimate case against the employee in this instance because many situations are covered by the Family and Medical Leave Act (FMLA) and other laws that protect employees. If an employer is found to have wrongfully terminated an employee under one of these laws, the company could stand to lose a considerable amount of money in a settlement.

But the best policies for reducing employee absenteeism have to do with creating a healthy workplace. Stephen Moir put it this way in an article that appeared in *Personnel Today*. "Staff wellbeing is about providing an environment that is conducive to people wanting to come to work and doing a good job. It is about having managers who manage well, and an organizational culture that is mature enough to recognize that a degree of absence is a natural side effect of employing real people. It is also about creating greater access to flexible working, and a broad range of benefits that motivate and encourage individuals. A truly successful approach to absence management is a holistic one that doesn't just do the hard stuff, but also thinks about the total package that you offer as an employer friendly colleagues, access to learning opportunities, work-life balance, fair pay and rewards and so on."

SICK LEAVE AND PERSONAL DAY POLICIES FOR SMALL BUSINESSES
