ABOUT THIS EDITION

Welcome to ***Management, 6e***! Please take a few minutes to read the preface and familiarize yourself with the approach (combining theory with specific stories and examples), features, pedagogy, and end-of-chapter assignments in ***Management***. This is time well spent. After all, besides your instructor, this book will be your primary learning tool.

THE APPROACH

Combining Theory with Specific, Up-to-Date Stories and Examples Say "theory" to college students and they assume that you're talking about complex, arcane ideas and terms that have nothing to do with the "real world," but which need to be memorized for a test and then forgotten (at least until the final exam). However, students needn't be wary of theoretical ideas and concepts. Theories are simply good ideas. And good theories are simply good ideas that have been tested through rigorous scientific study and analysis.

Where textbooks go wrong is that they stop at theory and read like dictionaries. Or, they focus on theoretical issues related to research rather than practice. However, good management theories (i.e., good ideas) needn't be complex, difficult to understand, or irrelevant. In fact, the late Rensis Likert, of the University of Michigan, once said that there is nothing as practical as a good theory.

So, to make sure you're exposed to good ideas (i.e., good theories) that you can refer to for practical, theory-driven advice, and which encourage you to put theory-driven knowledge into practice for yourselves, each chapter in this book contains 50 to 60 specific stories and examples that illustrate how managers are using management ideas in their organizations.

The stories and examples you'll read in each chapter are relevant and up-to-date. You'll read how IBM uses blogs, wikis, and widgets to help employee project teams stay connected, streamline development, and make best practices available throughout the organization. At IBM, 26,000 employees have blogs, and the company hosts 20,000 wikis for teams and projects that have 100,000 users. All of that information is plugged into a corporate employee directory, called the BluePages, that functions similarly to Facebook and allows employees to find one another and connect. You'll learn how companies are responding to sociological changes in the business environment by offering concierge services to employees. Employees at some companies can have the oil changed in their cars, their clothes dry cleaned, jewelry repaired, and packages mailed without leaving their desks. You'll also learn how major airlines began paying Pratt & Whitney to power wash the grime from the inside of their jets' engines 2 to 3 times a year at a cost of $3,000 per wash. Why? Cleaner engines reduce fuel consumption by 1.2 percent and can go 18 months longer before having

to be rebuilt for regular maintenance. These engine washes not only pay for themselves, they save airlines like Southwest an additional $5.1 million in annual fuel costs. You'll also read how Wal-Mart employees, empowered by former CEO Lee Scott during Hurricane Katrina, used a fork lift to crash through a warehouse door, broke into a locked pharmacy, and drove a bulldozer through a storefront—all to get needed supplies to the community. As these stories show, each chapter has been updated with dozens of new real world business examples, straight from the latest pages of *Business Week*, *Fortune*, *Forbes*, *Fast Company*, and *Inc.*, as well as the *Wall Street Journal*, the *New York Times*, and other leading newspapers, to help you understand how management concepts are being used.

In short, research and theory *and* stories and examples are important for effective learning. Therefore, this book contains over a thousand specific examples and stories to make management theories and ideas more interesting. So, to get more out of this book, read and understand the theories and theoretical ideas. Then read the stories or examples to learn how those ideas should or should not be used in practice. You'll find that both are current and up-to-date.

LEARNING SYSTEM

Chapter outline
Numbering system
Learning objectives
Section headings

Because of their busy schedules, very few students have the opportunity to read a chapter from beginning to end in one sitting. Typically, it takes students anywhere from two to five study sessions to completely read a chapter. Accordingly, at the beginning of each chapter, you'll find a detailed chapter outline in which each major part in the chapter is broken out into numbered sections and subsections. For example, the outline for the first part of Chapter 4, on ethics and social responsibility, looks like this:

What Is Ethical and Unethical Workplace Behavior?

1. Ethics and the Nature of Management Jobs
2. Workplace Deviance
3. U.S. Sentencing Commission Guidelines for Organizations
   - 3.1 Who, What, and Why?
   - 3.2 Determining the Punishment

The numbered information contained in the chapter outline is then repeated in the chapter as learning objectives (at the beginning of major parts of the chapter) and as numbered headings and subheadings (throughout the chapter) to help students remember precisely where they are in terms of the chapter outline.

Let's examine **3.1 to whom the guidelines apply and what they cover** and **3.2 how, according to the guidelines, an organization can be punished for the unethical behavior of its managers and employees.**

Finally, instead of a big summary at the end of the chapter, students will find detailed reviews at the end of each section.

U.S. Sentencing Commission Guidelines Under the U.S. Sentencing Commission Guidelines, companies can be prosecuted and fined up to $300 million for employees' illegal actions. Fines are computed by multiplying the base fine by a culpability score, which ranges from 0.05 to 4.0. Companies that establish compliance programs to encourage ethical behavior can reduce their culpability scores and their fines. Companies without compliance programs can face much heavier fines than companies with established programs. Compliance programs must establish standards and procedures, be run by top managers, encourage hiring and promotion of honest and ethical people, encourage employees to report violations, educate employees about compliance, punish violators, and find ways to improve the program after violations occur.

REVIEW 3

Together, the chapter outline, numbering system, learning objectives, section headings (which mark the beginning of a section), and section reviews (which mark the end of a section) allow students to break the chapter into smaller, self-contained sections that can be read in their entirety and digested during

a single study session if needed. Furthermore, the numbered headings and outline should make it easier for instructors and students to know what is being assigned or discussed in class ("In Section 3.1 of Chapter 3 . . .").

SO WHAT'S NEW?

If you are already familiar with the previous editions' approach of reinforcing research and theory with stories and examples you may be asking yourself, "So what's new?" The answer is quite a bit.

What's New Companies So many new examples are in the Sixth Edition that we've created a list of What's New Companies at the beginning of each chapter. Throughout the chapter, we've highlighted new examples with the design located in the margin.

What Would You Do? Each chapter opens with an engaging case outlining actual management problems facing a well-known company. After students read the case, they are presented several questions to help guide their thinking about the issues, and are ultimately asked, "If you were the manager at this company, what would you do?" Putting students in the place of the manager personalizes the dilemma and forces students to solve common managerial problems. The solution to the case, or "What Really Happened?" is in the Instructor Manual. Allowing students to compare what they would have done to what the managers really did provides a great learning opportunity.

For this edition, all eighteen of the "What Would You Do?" chapter-opening cases are new, and feature companies like Zappos, Starbucks, PepsiCo, JCPenney, Subaru, Ann Taylor, Novartis, Caterpillar, and Yahoo!, among others.

Study Tips Knowing how to study effectively is not an innate talent. So, to prepare students for studying the material, a detailed study tip appears in the chapter opener. Eighteen different tips give students many options for reviewing key concepts and mastering chapter content. Students are challenged to write their own tests and exchange them in a study group, explain the chapter concepts to a friend who is not in class, cut up the text glossary to make a quiz-bowl game, and much more.

Doing the Right Thing Numerous studies and well-known corporate scandals, make clear the distressing state of managerial ethics in today's business world. And, because managers set the standard for others in the workplace, unethical behavior and practices quickly spread when they don't do the right thing. Therefore, in each chapter, you'll find practical, useful advice to help you become a more ethical manager or businessperson by "Doing the Right Thing." Topics include ethical competitive analysis, avoiding the slippery slope of cheating, dealing with gifts from suppliers, avoiding conflicts of interest, not cheating on travel expenses, and many more.

What Really Works Understanding how to interpret data is important for every manager, but unfortunately, sometimes research findings on the same topic present exactly opposite results. That's why we introduce students to *meta-analysis*. Additionally, one primary advantage of meta-analysis over traditional significance tests is that you can convert meta-analysis statistics into intuitive numbers that anyone can easily understand. Indeed, each meta-analysis reported in the "What Really Works" sections of this textbook is accompanied by an easy-to-understand statistic called the *probability of*

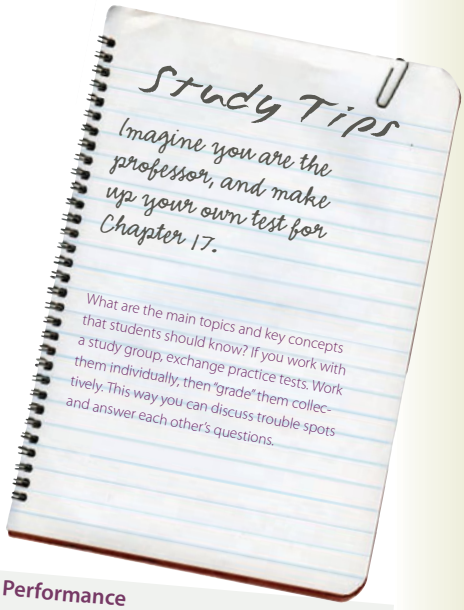
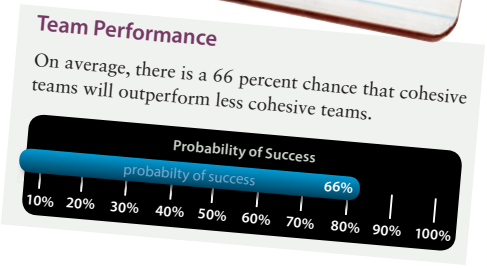
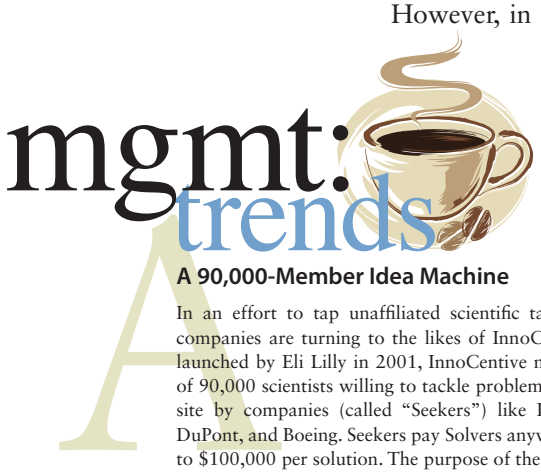
4 ACCESSING AND SHARING INFORMATION AND KNOWLEDGE

"Vendor Pulse," is a data sharing program started by grocery store chain Food Lion. **Food Lion** provides vendors, such as consumer goods company Unilever, with fourteen kinds of sales metrics, ranging from point-of-sale statistics (even down to each cash register), store inventory (how much of each item





success. Of course, no idea or technique works every time and in every circumstance. However, in today's competitive, fast-changing, global marketplace, few managers can afford to overlook proven management strategies like those discussed in the "What Really Works" feature of this book.



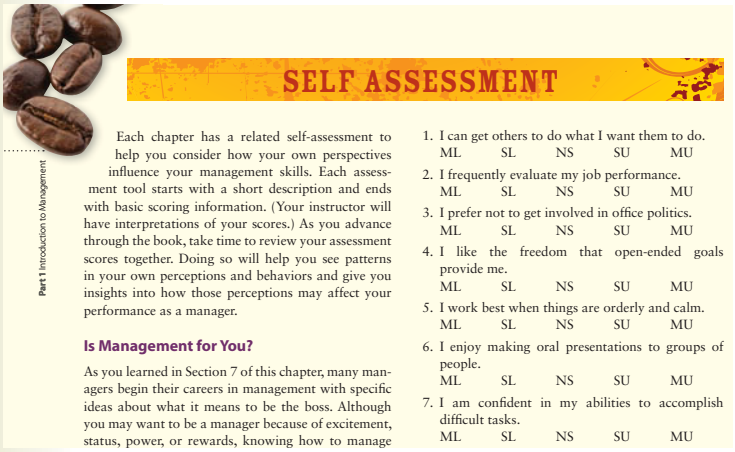
Management Facts and Trends Short boxes keep students up-to-date on current trends facing managers as well as interesting facts about managers and management. Chapters contain one or more of these interesting, focused, and concise examples.

Key Terms Key terms appear in boldface in the text, with definitions in the margins to make it easy for students to check their understanding. A complete alphabetical list of key terms appears at the end of each chapter as a study checklist, with page citations for easy reference.

END-OF-CHAPTER ASSIGNMENTS

In most textbooks, there are only two or three end-of-chapter assignments. By contrast, at the end of each chapter in ***Management 6e,*** there are five assignments from which to choose. (But if you count the opening case, "What Would You Do?", and its answer, "What Really Happened?", there are really six assignments.) This gives instructors more choice in selecting just the right assignment for their classes. It also gives students a greater variety of activities, making it less likely that they'll repeat the same kind of assignment chapter after chapter.

Self Assessments The chapter-ending cases and assignments begin with a related assessment questionnaire to help students consider how their own perspectives influence their management skills. Basic scoring information follows each questionnaire, and the Instructor Manual contains directions for using the assessment tools in class.



Management Decision "Management Decision" assignments are focused on a particular decision. Students must decide what to do in the given situation and then answer several questions to explain their choices. For example, students must decide how to manage cutting perks in difficult economic times, whether to mine employees' personal data to find out how to motivate them, and more. Some "Management Decision" features have optional extensions that turn the exercises into mini-projects. Information on how to do that is in the Instructor Manual.

Management Team Decision "Management Team Decision" assignments are similar to "Management Decision" assignments in that students face a problem, must decide what to do, and then answer several questions to explain their choices. The difference, however, is that "Management Team Decision" assignments are designed to be completed by student teams or groups. Teams have the opportunity to practice the group decision-making techniques outlined in Chapter 5 (Planning and Decision Making). Student management teams will decide the best way to prevent highly

qualified and knowledgeable employees from leaving the firm, consider the pros and cons of becoming a Wal-Mart supplier, build a balanced scorecard for H&R Block, map a strategy for video-game makers, recharging innovation sources at American automakers, and more.

Practice Being a Manager Working through management issues before you even get to the workplace can be a beneficial way to practice being a manager. Each exercise gives students the opportunity to role-play management scenarios, discuss management dilemmas, and resolve management problems. Some of the exercises have components that require individual, take-home preparation, but most are designed to be started and completed during the class session. Students can explore management issues and problems in context and with other students. The guided exercises are supported by detailed teaching notes and role-playing instructions in the Instructor Manual.

Develop Your Career Potential "Develop Your Career Potential" assignments have one purpose: To help students develop their present and future capabilities as managers. What students learn through these assignments is not traditional "book-learning" based on memorization and regurgitation, but practical knowledge and skills that help managers perform their jobs better. Assignments include interviewing managers, dealing with the press, conducting a personal SWOT analysis, learning from failure, developing leadership skills, 360-degree feedback, and more.

Reel to Real Videos Each chapter of ***Management, 6e*** contains two video options. The first is a film clip from a popular Hollywood movie that relates to the chapter content. For example, students will see a "Biz Flix" clip from *Charlie Wilson's War* for Chapter 3 on organizational culture, from *Inside Man* for Chapter 5 on planning, and from *Friday Night Lights* for Chapter 15 on managing service and manufacturing operations, to name a few. The second video option is comprised of longer segments, called "Management Workplace," that run approximately 10 minutes and provide a deeper look at a single company, its operations, and how it addresses various management issues everyday. In the Sixth Edition, we go inside Mitchell Gold + Bob Williams (furniture), Preserve (recycled products), Evo (winter-sports equipment retailer), City of Greensburg, Kansas, Flight 001 (retailer of travel gear), Scholfield Honda, and Maine Media Workshops (filmmaking workshops for amateurs). Both the "Biz Flix" and the "Management Workplace" features guide students on what to look for and think about as they watch the video.

Video clips Management Workplace clips are new in this edition!

INSTRUCTOR SUPPLEMENTS

Comprehensive Instructor Manual The instructor manual to accompany the Sixth Edition has been completely redone to help instructors with a variety of class types. In addition to the chapter outlines, additional activities, and solutions you expect, each chapter of the manual includes a grid detailing all of the pedagogy choices for the chapter and the companies and teaching points presented. A selection of lesson plans is also included as are detailed chapter outlines (lecture notes). The lecture notes include teaching notes for key concepts and for feature boxes, prompts where

relevant PowerPoint slides correspond to chapter content, as well as prompts for where to show the video. Solutions for chapter features are included.

In addition to all of these teaching tools, an appendix titled ***"Teaching Your First Management Course"*** can be found at the end of the instructor manual. This appendix is designed specifically to meet the needs and concerns of the first-time instructor.

Test Bank The Test Bank for the Sixth Edition of ***Management*** builds on the solid foundation of previous editions. Each test bank chapter contains at least 150 questions in a variety of types: true-false, multiple-choice, short-answer, critical-thinking questions, and a scenario section that asks students to answer questions based on detailed management situations. Difficulty ratings are provided, as are tags correlating to AASCB outcomes and page references for where solutions appear in the text.

ExamView A computerized version of the Test Bank (called ExamView) is available on your Instructor Resource CD-ROM and by special request. ExamView allows you to add or edit questions, instructions, and answers. You can create, edit, store, print, and otherwise customize all your quizzes, tests, and exams. The system is menu-driven, making it quick and easy to use.

Course Pre- and Post-Assessments To help you better determine your students' baseline understanding of management principles, we have created an assessment test for your use at the beginning of the term. The 200-question pre-test covers the basic management concepts that students need to understand. As a conclusion to your course, you can administer the 200-question post-test. These tests are designed to help you track your students' proficiency levels semester to semester. Pre- and post-assessments are also broken down by chapter, so if you prefer, you can administer throughout the semester for each chapter of the text. Assessment tests are available in both Word and ExamView formats.

Reel to Real Video Nothing helps students master management concepts like seeing them put into practice in the real world. Both the "Biz Flix" and "Management Workplace" videos are available on DVD. The Instructor Manual includes detailed teaching notes so that you can incorporate video into your class in a meaningful way.

PowerPoint® Slides A rich set of PowerPoint slides, with teaching notes, will make class preparations easy and interesting. The approximately 30 to 50 slides per chapter cover all key concepts, terms, features, cases, and even some exhibits from the text. Ample teaching notes offer additional insights and examples plus important points to cover in lectures. For instructors wishing to integrate various media, we have also created a set of video PowerPoint slides in which the "BizFlix" movie clips are embedded in appropriate slides.

Self Assessment PowerPoint® Slides To support the Self Assessment Appendix, we have created a separate set of PowerPoint files that enable professors to use the assessment inventories in the classroom setting. In each Self Assessment PowerPoint chapter, individual assessment items are placed on separate slides. Excel spreadsheets embedded on each slide allow instructors to use the data from a simple show of hands to create distributions for each assessment item. Students can see where they fit in the distribution, making the assessment tool more interesting and relevant.

Who Wants to Be a Manager? Games are an increasingly popular classroom review tool, so the Sixth Edition of ***Management*** includes a quiz game that uses JoinIn™ clicker technology. Each chapter has two rounds of 25 questions each,

organized into 5 categories. Category names are fun, but the questions in each category are serious review of chapter concepts. A mixture of true-false and multiple-choice questions keep students working through this enjoyable classroom review.

Instructor Resource CD-ROM (IRCD) For your convenience, the Instructor Manual, Test Bank, Course Pre- and Post- Assessments, ExamView Software, PowerPoint presentations, and Who Wants to Be a Manager? are available on a single CD-ROM, the IRCD.

ACKNOWLEDGMENTS

Let's face it, writing a textbook is a long and lonely process. It's surely the most difficult (and rewarding) project I've ever tackled. And, as I sat in front of my computer with a rough outline on the left side of my desk, a two-foot stack of journal articles on the floor, and a blank screen in front of me, it was easy at times to feel isolated. But, as I found out, a book like this doesn't get done without the help of many other talented people.

First, I'd like to thank the outstanding team of supplement authors: Amit Shah (Frostburg State University), for the outstanding test bank; Colin Grover (B-books, Ltd.), for the superb PowerPoint slide designs and the great content.

I'd like to thank the world-class team at Cengage for the outstanding support (and patience) they provided while I wrote this book: Scott Person, who heads the Management group at Cengage, was calm, collected, and continuously positive through the major ups and downs of this project; Clint Kernen, who was in charge of marketing the book, did an outstanding job of developing marketing themes and approaches; and Tamborah Moore, who managed the production process, was consistently upbeat and positive with me when I deserved otherwise. Authors are prone to complain about their publishers. But that hasn't been my experience at all. Pure and simple, everyone at Cengage has been great to work with throughout the entire project. However, special thanks on this team goes to Jamie Gleich Bryant, of B-books, Ltd., who was my developmental editor and with whom I had the most contact while writing the book. Jamie and her team worked with reviewers, edited the manuscript, managed the development of supplements, provided superb feedback and guidance at every stage of the book, and nudged and prodded me to write faster, make improvements, and maintain the high quality standards that were set when I began writing. Jamie's enthusiasm, professionalism, commitment, and attention to detail made me a better writer, made this a better book, and made me appreciate my good fortune to work with such an outstanding talent. Thanks, Jamie, and here's to many more editions.

I'd like to thank an excellent set of reviewers whose diligent and thoughtful comments helped shape the earlier editions and whose rigorous feedback improved the Sixth Edition.

Finally, my family deserves the greatest thanks of all for their love, patience, and support. Writing a textbook is an enormous project with incredible stresses and pressures on authors as well as their loved ones. However, throughout this project, my wife, Jenny, was unwavering in her support of my writing. She listened patiently, encouraged me when I was discouraged, read and commented on most of what I wrote, gave me the time to write, and took wonderful care of me and our family during this long process. My children, two in college and one in a business career, also deserve special thanks for their patience and for understanding why Dad was locked away at the computer for all of this time.

What would You Do?

Starbucks Headquarters, Seattle, Washington.[1]

Twenty years ago, if you had said, "Give me a venti, vanilla, nonfat latte, no room, three Splendas," people would have thought you were speaking a foreign language. And you would have been because Starbucks was just getting started. It began with 4 stores in Seattle in 1987, and today there are over 17,000 stores in 40 different countries. That means Starbucks has opened an average of 8 new stores per day! Unfortunately, with profits now a thing of the past, Starbucks has closed 800 stores and laid off 25,000 workers.

Starbucks clearly overexpanded, providing fodder for late-night TV comedians who have cracked jokes about Starbucks opening new stores inside existing stores. Customer Leslie Miller said, "Starbucks was stupid. They put them right next to each other." Because managers focused on opening new stores for new customers, they paid less attention to existing stores where same-store sales dropped by 3 percent. While that doesn't seem like much, Starbucks has to lose only 6 to 8 customers per store per day to see a 1 percent drop in a store's sales. In other words, small changes in customer buying habits make a big difference in Starbucks' growth and profitability.

Consumers are stretching their dollars, which means Starbucks is fighting the perception—some would say reality—that Starbucks is a luxury. McDonald's coffee is undoubtedly cheaper, but Starbucks points out that half of its coffee drinks are less than 3 dollars, while one-third are less than 2 dollars. Moreover, Starbucks coffee is actually less expensive than Dunkin' Donuts coffee after adjusting for the small serving sizes at Dunkin' Donuts. Most consumers, however, don't see it that way. Graduate student Amy Osbourne has cut her monthly Starbucks budget from $60 to $30. Said Osbourne, "I haven't been going as often. I've been making my tea at home."

When Starbucks' board of directors fired CEO James Donald, it asked founder Howard Schultz to take charge again. Even though he had stepped down as CEO to become the board's chair in 2000, he stayed involved in such operational details as deciding the color of holiday cups. Schultz has always been a detail-oriented, hands-on boss, a perfectionist who demands a lot of last-minute changes. When Starbucks launched its new Pike Place Roast coffee, he selected the logo and then had it redesigned right before going to market. He even rewrote the press release. Schultz is revered at Starbucks and workers sometimes applaud when he enters meeting rooms or stores. He is such a legend within the company that "What will Howard think?" drives nearly all decisions. Not surprisingly, that creates a tremendous amount of anxiety among managers and employees. Schultz recognizes that this isn't a good thing. Said Schulz, "It's not

Study Tips

Use your textbook more like a notebook and less like a reference book. The margins are a great place for writing questions on content you don't understand, highlighting important concepts, and adding examples to help you remember the material. Writing in your book makes it a more comprehensive resource for management and a better study tool.

Learning a new subject can be challenging. To help you master the principles in this textbook, each chapter opener contains a student resource list that alerts you to the materials outside your book that can help you better understand assignments, work on group projects, and study for tests and exams.

healthy for the organization if everyone's waiting for me to tell them what to do." Still, Stanley Hainsworth, who was a vice president under Schultz, would have to tell people, "You're not meeting with the king." Said Hainsworth, "A lot of people were nervous, so if Howard asked them what they thought, they would tell him what he wanted to hear."

Schultz's return has unfortunately not yet produced a turnaround in sales or profits. Shultz, who is feeling the pressure, told employees, "We have to defend our position; we have lots of companies small and large who want to take a piece of our business away." So, what does Starbucks need to do to return to growth and profitability? Should it lower prices? Should it expand its menu? What should be its strategy? As founder, Schultz brought enormous success to Starbucks. But is he the right leader for Starbucks now? Should he continue as CEO? Is he meeting his basic responsibilities as Starbucks' top manager? What key mistakes is he making? Finally, how should Starbucks counter its new competition, McDonald's and Dunkin' Donuts?

If you were the CEO of Starbucks, what would you do?

The management issues facing Starbucks are fundamental to any organization: What's our plan? What are top management's key responsibilities? How can we best position the company against key competitors? How can we get things done and put in place controls to make sure plans are followed and goals are met? Good management is basic to starting a business, growing a business, and maintaining a business once it has achieved some measure of success.

We begin this chapter by defining management and discussing the functions of management. Next, we look at what managers do by examining the four kinds of managers and reviewing the various roles that managers play. Then we investigate what it takes to be a manager by reviewing management skills, what companies look for in their managers, the most serious mistakes managers make, and what it is like to make the tough transition from being a worker to being a manager. We finish this chapter by examining the competitive advantage that companies gain from good management. In other words, we learn how to establish a competitive advantage through people.

WHAT IS MANAGEMENT?

To understand how important *good* management is, think about mistakes like these: Mistake #1. A high-level bank manager reduces a marketing manager to tears by angrily criticizing her in front of others for a mistake that wasn't hers.[2] Mistake #2. Guidant Corporation, which makes cardiovascular medical products, waited for 3 years, forty-five device failures, and two patient deaths before recalling 50,000 defective heart defibrillators, 77 percent of which were already implanted in patients. Patients were told that if they heard a beeping noise, their defibrillator was malfunctioning and they should see their doctor or go to an emergency room.[3]

Ah, bad managers and bad management. Is it any wonder that companies pay management consultants nearly $240 billion a year for advice on basic management issues such as how to lead people effectively, organize the company efficiently, and manage large-scale projects and processes?[4] This textbook will help you understand some of the basic issues that management consultants help companies resolve. (And it won't cost you billions of dollars.)

After reading the next two sections, you should be able to

1. describe what management is.
2. explain the four functions of management.

1 MANAGEMENT IS . . .

Many of today's managers got their start welding on the factory floor, clearing dishes off tables, helping customers fit a suit, or wiping up a spill in aisle 3. Similarly, lots of you will start at the bottom and work your way up. There's no better way to get to know your competition, your customers, and your business. But whether you begin your career at the entry level or as a supervisor, your job as a manager is not to do the work but to help others do theirs. **Management** is getting work done through others. Pat Carrigan, a former elementary school principal who became a manager at a General Motors car parts plant, says, "I've never made a part in my life, and I don't really have any plans to make one. That's not my job. My job is to create an environment where people who do make them can make them right, can make them right the first time, can make them at a competitive cost, and can do so with some sense of responsibility and pride in what they're doing. I don't have to know how to make a part to do any of those things."[5]

Pat Carrigan's description of managerial responsibilities suggests that managers also have to be concerned with efficiency and effectiveness in the work process. **Efficiency** is getting work done with a minimum of effort, expense, or waste. For example, how do millions of Girl Scouts from over 200 councils across the United States sell and deliver millions of boxes of cookies each year? In other words, what makes Girl Scouts so efficient? The national organization, **Girl Scouts of America (GSA)**, licenses only two bakers, so when GSA changes or improves its cookie offerings by adding new flavors or making healthier, sugar-free options, it can do so quickly and consistently nationwide. GSA has also designed Girl Scout cookie packages to maximize the number of boxes that can fit in a delivery truck. The national organization optimizes its overall cookie inventory by tracking sales by type of cookie and troop. Because GSA operates efficiently, 2.9 million scouts can sell and deliver over 50 million cookies in an 8-week period.[6]

© ISTOCKPHOTO.COM/MARK COFFEY

Efficiency alone, however, is not enough to ensure success. Managers must also strive for **effectiveness**, which is accomplishing tasks that help fulfill organizational objectives such as customer service and satisfaction. Wal-Mart's new computerized scheduling system is an example of efficiency and effectiveness. It typically takes a manager a full day to schedule the weekly shifts for a single store. But the computerized scheduling system calculates the schedules for Wal-Mart's 1.3 million workers in one day. The system also measures trends in store sales and customer traffic so it can have more employees on the job whenever its stores are busy. Tests in 39 stores indicated that 70 percent of customers reported improved checkout times and service using this scheduling system. Wal-Mart spokesperson Sarah Clark said, "The advantages are simple: We will benefit by improving the shopping experience by having the right number of associates to meet our customers' needs when they shop our stores."[7]

REVIEW 1

Management Is . . . Good management is working through others to accomplish tasks that help fulfill organizational objectives as efficiently as possible.

2 MANAGEMENT FUNCTIONS

Henri Fayol, who was a managing director (CEO) of a large steel company in the early 1900s, was one of the founders of the field of management. You'll learn more about Fayol and management's other key contributors when you read about the history of management in Chapter 2. Based on his 20 years of experience as a CEO, Fayol argued that "the success of an enterprise generally depends much more on the administrative ability of its leaders than on their technical ability."[8] Although Google CEO Eric Schmidt has extensive expertise and experience in computer technology, Google succeeds because of his capabilities as a manager and not because of his ability to write computer code.

Managers need to perform five managerial functions in order to be successful, according to Fayol: planning, organizing, coordinating, commanding, and controlling.[9] Most management textbooks today have updated this list by dropping the coordinating function and referring to Fayol's commanding function as "leading." Fayol's management functions are thus known today in this updated form as planning, organizing, leading, and controlling. Studies indicate that managers who perform these management functions well are more successful, gaining promotions for themselves and profits for their companies. For example, the more time CEOs spend planning, the more profitable their companies are.[10] A 25-year study at AT&T found that employees with better planning and decision-making skills were more likely to be promoted into management jobs, to be successful as managers, and to be promoted into upper levels of management.[11]

The evidence is clear. Managers serve their companies well when they plan, organize, lead, and control. So we've organized this textbook based on these functions of management, as shown in Exhibit 1.1. The major sections within each chapter of this textbook are numbered using a single digit: 1, 2, 3, and so on. The subsections are consecutively numbered, beginning with the major section number. For example, "2.1" indicates the first subsection under the second major section. This numbering system should help you easily see the relationships among topics and follow the topic sequence. It will also help your instructor refer to specific topics during class discussion.

Now let's take a closer look at each of the management functions: **2.1 planning, 2.2 organizing, 2.3 leading, and 2.4 controlling.**

2.1 Planning

Planning involves determining organizational goals and a means for achieving them. As you'll learn in Chapter 5, planning is one of the best ways to improve performance. It encourages people to work harder, to work hard for extended periods, to engage in behaviors directly related to goal accomplishment, and to think of better ways to do their jobs. But most importantly, companies that plan have larger profits and faster growth than companies that don't plan.

For example, the question "What business are we in?" is at the heart of strategic planning. You'll learn about this in Chapter 6. If you can answer the question "What business are you in?" in two sentences or less, chances are you have a very clear plan for your business. But getting a clear plan is not so easy. Sometimes even very successful companies stray from their core business. This happened when **eBay** paid $2.6 million to acquire Skype, which makes software for free phone and video calls over the Internet. EBay is now selling Skype. Why? Because eBay's new CEO realized it was a poor fit with its core e-commerce business, meaning eBay's Internet auction site and its PayPal online payment service business.[12] Likewise, Google, which makes its money from search-based Internet advertising, says that it is not in the advertising business. Its business is to "organize the world's information and make it universally accessible and useful."[13] Not only can you search Google for websites, images, books and scholarly articles, and shopping opportunities but you can also organize your personal life using Google's calendar, e-mail, photo and document sharing, and newsfeed reader applications. In contrast to eBay, Google's $1.65 billion purchase of YouTube fits with Google's core business by helping users access and organize video content. You'll learn more about planning in Chapter 5 on planning and decision making, Chapter 6 on organizational strategy, Chapter 7 on innovation and change, and Chapter 8 on global management.

2.2 Organizing

Organizing is deciding where decisions will be made, who will do what jobs and tasks, and who will work for whom in the company. On average, it costs more than $10 billion to bring a new pharmaceutical drug to market. So when **Pfizer**, the second-largest pharmaceutical firm in the world, acquired Wyeth, the eleventh

Meta-Analysis

Some studies show that having two drinks a day increases life expectancy by decreasing the chances of having a heart attack. Yet other studies show that having two drinks a day shortens life expectancy. For years, we've "buttered" our morning toast with margarine instead of butter because margarine was supposed to be better for our health. Now, however, new studies show that the trans-fatty acids in margarine may be just as bad for our arteries as butter. Confusing scientific results like these frustrate ordinary people who want to eat right and live right. They also make many people question just how useful most scientific research really is.

Managers also find themselves questioning the conflicting scientific research published in journals like the *Academy of Management Journal,* the Academy of Management Review, the *Strategic Management Journal*, the *Journal of Applied Psychology*, and *Administrative Science Quarterly.* The *Wall Street Journal* may quote a management research article from one of these journals that says that total quality management is the best thing since sliced bread (without butter or margarine). Then, just 6 months later, the *Wall Street Journal* will quote a different article from the same journal that says that total quality management doesn't work. If management professors and researchers have trouble deciding what works and what doesn't, how can practicing managers know?

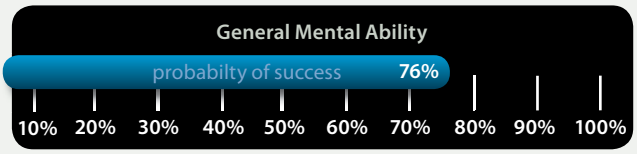
Thankfully, a research tool called **meta-analysis** is helping management scholars understand how well their research supports management theories. It is also useful for practicing managers because it shows what works and the conditions under which management techniques may work better or worse in the real world. Meta-analysis involves studying the scientific studies themselves. It is based on this simple idea: If one study shows that a management technique doesn't work and another study shows that it does, an average of those results is probably the best estimate of how well that management practice works (or doesn't work). For example, medical researchers Richard Peto and Rory Collins averaged all of the different results from several hundred studies investigating the relationship between aspirin and heart attacks. Their analysis, based on more than 120,000 patients from numerous studies, showed that aspirin lowered the incidence of heart attacks by an average of 4 percent. Prior to this study, doctors prescribed aspirin as a preventive measure for only 38 percent of heart-attack victims. Today, because of the meta-analysis results, doctors prescribe aspirin for 72 percent of heart-attack victims.

Fortunately, you don't need a Ph.D. to understand the statistics reported in a meta-analysis. In fact, one primary advantage of meta-analysis over traditional significance tests is that you can convert meta-analysis statistics into intuitive numbers that anyone can easily understand. Each meta-analysis reported in the "What Really Works" sections of this textbook is accompanied by an easy-to-understand statistic called the *probability of success*. As its name suggests, the probability of success shows how often a management technique will work.

For example, meta-analyses suggest that the best predictor of a job applicant's on-the-job performance is a test of general mental ability. In other words, smarter people tend to be better workers. The average correlation (one of those often misunderstood statistics) between scores on general mental ability tests and job performance is .60. However, very few people understand what a correlation of .60 means. What most managers want to know is how often they will hire the right person if they choose job applicants based on general mental ability test scores. Likewise, they want to know how much difference a cognitive ability test makes when hiring new workers. The probability of success may be high, but if the difference isn't really that large, is it worth a

manager's time to have job applicants take a general mental ability test?

Well, our user-friendly statistics indicate that it's wise to have job applicants take a general mental ability test. In fact, the probability of success, shown in graphical form here, is 76 percent. This means that an employee hired on the basis of a good score on a general mental ability test stands a 76 percent chance of being a better performer than someone picked at random from the pool of all job applicants. So chances are you're going to be right much more often than wrong if you use a general mental ability test to make hiring decisions.[15]



In summary, each "What Really Works" section in this textbook is based on meta-analysis research, which provides the best scientific evidence that management professors and researchers have about what works and what doesn't work in management. We will use the easy-to-understand index known as the *probability of success* to indicate how well a management idea or strategy is likely to work in the workplace. Of course, no idea or technique works every time and in every circumstance. Nevertheless, the management ideas and strategies discussed in the "What Really Works" sections can usually make a meaningful difference where you work. In today's competitive, fast-changing, global marketplace, few managers can afford to overlook proven management strategies like the ones discussed in "What Really Works."

largest, CEO Jeffrey Kindler decided to restructure Pfizer's research and development unit into two parts, one for small molecules or traditional pills and one for large molecules or drugs made from living cells. Kindler said, "Creating two distinct, but complementary, research organizations, led by the top scientist from each company, will provide sharper focus, less bureaucracy and clearer accountability in drug discovery."[14] In all, the new company will consist of nine businesses, including primary care, vaccines, oncology, consumer and nutritional products, and pharmaceuticals.

You'll learn more about organizing in Chapter 9 on designing organizations, Chapter 10 on managing teams, Chapter 11 on managing human resources, and Chapter 12 on managing individuals and a diverse work force.

2.3 Leading

Our third management function, **leading**, involves inspiring and motivating workers to work hard to achieve organizational goals. When Anne Mulcahy became Xerox's CEO, the company was on the brink of bankruptcy—it was $17.1 billion in debt and had only $154 million in cash. In addition, 3 years of steeply declining revenues and increasing losses had dropped the company's stock price from $64 a share to just $4.43. Mulcahy admitted that the responsibility of turning the company around frightened her: "Nothing spooked me as much as waking up in the middle of the night and thinking about 96,000 people and retirees and what would happen if this thing went south."[16] Still, she took the job.

Mulcahy, who traveled to two and sometimes three cities a day to talk to Xerox managers and employees, implored them to "save each dollar as if it were your own." And at each stop, she reminded them, "Remember, by my calculations, there are [she fills in the number] selling days left in the quarter."[17] Mulcahy said, "One of the things I care most about at Xerox is the morale and motivation at the company. I think it is absolutely critical to being able to deliver results. People have to feel engaged, motivated and feel they are making a contribution to something that is important. I spend the vast majority of my time with customers and employees, and there is nothing more important for any of us to do as leaders than communicate and engage with our two most important constituencies."[18]

You are never done. The next challenge is around the corner. You have to have an appetite for that.

Today, as a result of Mulcahy's leadership and the hard work of dedicated Xerox employees, Xerox is profitable and a leading developer of color digital printing technologies.[19] Still, says Mulcahy, "The paranoia never goes away. There is a never ending journey here. You are never done. The next challenge is around the corner. You have to have an appetite for that. . . . I always find something to worry about at night."[20]

2.4 Controlling

The last function of management, **controlling**, is monitoring progress toward goal achievement and taking corrective action when progress isn't being made. The basic control process involves setting standards to achieve goals, comparing actual performance to those standards, and then making changes to return performance to those standards. Needing to cut costs (the standard) to restore profitability (the goal), major airlines began paying **Pratt & Whitney** to power wash the grime from the inside of their jets' engines two to three times a year at a cost of $3,000 per wash. Why? Cleaner engines reduce fuel consumption by 1.2 percent and can go 18 months longer before having to be rebuilt for regular maintenance—at a high cost. Johnny Holly, who manages engine maintenance and engineering for Southwest Airlines, says "It's more than just a subtle improvement when they wash these engines. A phenomenal amount of fuel can be saved doing this."[21] Indeed, these engine washes will not only pay for themselves, they will save Southwest airlines an additional $5.1 million in fuel costs on an annual basis.

You'll learn more about the control function in Chapter 16 on control, Chapter 17 on managing information, and Chapter 18 on managing service and manufacturing operations.

[Controlling] monitoring progress toward goal achievement and taking corrective action when needed

REVIEW 2

Management Functions Henri Fayol's classic management functions are known today as planning, organizing, leading, and controlling. Planning is determining organizational goals and a means for achieving them. Organizing is deciding where decisions will be made, who will do what jobs and tasks, and who will work for whom. Leading is inspiring and motivating workers to work hard to achieve organizational goals. Controlling is monitoring progress toward goal achievement and taking corrective action when needed. Studies show that performing these management functions well leads to better managerial performance.

WHAT DO MANAGERS DO?

Not all managerial jobs are the same. The demands and requirements placed on the CEO of Sony are significantly different from those placed on the manager of your local Wendy's restaurant.

After reading the next two sections, you should be able to

3. describe different kinds of managers.
4. explain the major roles and subroles that managers perform in their jobs.

3 KINDS OF MANAGERS

As shown in Exhibit 1.2, there are four kinds of managers, each with different jobs and responsibilities: 3.1 top managers, 3.2 middle managers, 3.3 first-line managers, and 3.4 team leaders.

3.1 Top Managers

Top managers hold positions like chief executive officer (CEO), chief operating officer (COO), chief financial officer (CFO), and chief information officer (CIO) and are responsible for the overall direction of the organization. Top managers have the following responsibilities.[22] First, they are responsible for creating a context for change. In fact, the CEOs of CitiGroup, Merrill Lynch, Home Depot, Starbucks, Motorola, and Jet Blue Airways were all fired precisely because they had not moved fast enough to bring about significant changes in their companies.[23] Indeed, in both Europe and the United States, 35 percent of all CEOs are eventually fired because of their inability to successfully change their companies.[24] Creating a context for change includes forming a long-range vision or mission for the company. As one CEO said, "The CEO has to think about the future more than anyone."[25] Once that vision or mission is set, the second responsibility of top managers is to develop employees' commitment to and ownership of the company's performance. That is, top managers are responsible for creating employee buy-in. Trusting that his 61,000 employees could dramatically increase product innovation at Whirlpool appliances, then CEO David Whitwam put $135 million directly into their hands and told them to come up with new ideas. He also encouraged them to go to their bosses with ideas. And if their bosses wouldn't listen, they were to bring their new product ideas directly to him. Employees flocked to an in-house website with a course on innovation and a list of all the new suggestions and ideas, racking up 300,000 hits on the site each month. Of the commitment displayed by his workers, Whitwam says, "I had never seen a strategy that was so energizing to so many people." Today, revenue from innovative products has quadrupled. And instead of cutting prices to maintain sales, Whirlpool's prices are now rising 5 percent per year because customers are willing to pay

more for its innovative products, such as the Duet washer and dryer, which were designed based on employees' ideas.[26]

Third, top managers must create a positive organizational culture through language and action. Top managers impart company values, strategies, and lessons through what they do and say to others both inside and outside the company. One CEO said, "I write memos to the board and our operating committee. I'm sure they get the impression I dash them off, but usually they've been drafted 10 or 20 times. The bigger you get, the more your ability to communicate becomes important. So what I write, I write very carefully. I labor over it."[27] Above all, no matter what they communicate, it's critical for CEOs to send and reinforce clear, consistent messages.[28] A former *Fortune* 500 CEO said, "I tried to [use] exactly the same words every time so that I didn't produce a lot of, 'Last time you said this, this time you said that.' You've got to say the same thing over and over and over."[29]

Finally, top managers are responsible for monitoring their business environments. A. G. Lafley, former CEO of Procter & Gamble, believes that most people do not understand the CEO's responsibilities. Says Lafley, "Conventional wisdom suggests that the CEO was primarily a coach and a utility infielder, dropping in to solve [internal] problems where they crop up. In fact, however, the CEO has a very specific job that only he or she can do: Link the external world with the internal organization."[30] This means that top managers must closely monitor customer needs, competitors' moves, and long-term business, economic, and social trends.

3.2 Middle Managers

Middle managers hold positions like plant manager, regional manager, or divisional manager. They are responsible for setting objectives consistent with top management's goals and for planning and implementing subunit strategies for achieving those objectives.[31] One specific middle management responsibility is to plan and allocate resources to meet objectives.

A second major responsibility is to coordinate and link groups, departments, and divisions within a company. In February 2008, a tornado destroyed a **Caterpillar** plant in Oxford, Mississippi, the only plant in the company that produced a particular coupling required for many of Caterpillar's machines. The disaster threatened a worldwide production shutdown. Greg Folley, a middle manager in charge of the parts division that included the plant, gave workers 2 weeks to restore production to pre-tornado levels. He said, "I was betting on people to get it done." He contacted new vendors, sent engineers from other Caterpillar locations to Mississippi to check for quality, and set up distribution operations in another facility. Meanwhile, Kevin Kempa, the plant manager in Oxford, moved some employees to another plant, delivered new training

to employees during the production hiatus, and oversaw reconstruction of the plant. The day before the 2-week deadline, the Oxford plant was up and running and produced 8,000 parts.[32]

A third responsibility of middle management is to monitor and manage the performance of the subunits and individual managers who report to them. Graeme Betts is the manager of the Southwest region for Lloyds Pharmacy in England. While Betts works with people at all levels, from health-care assistants to board directors, he spends most of his time with the nine area managers who report to him. In terms of monitoring and managing the performance of his area managers and, in turn, the store managers who report to them, Betts says, "We have 231 pharmacies, and as a [management] team our task is to ensure that our pharmacies are as good as they can be, and are offering a great service to our customers. To this end we are focused on providing an efficient [drug] dispensing service, and continually developing new professional services such as . . . smoking cessation and medicines-use reviews."[34]

Finally, middle managers are also responsible for implementing the changes or strategies generated by top managers. Wal-Mart's strategy reflects its mission, "Saving people money so they can live better." When Wal-Mart began selling groceries in its new 200,000-square-foot supercenters, it made purchasing manager Brian Wilson responsible for buying perishable goods more cheaply than Wal-Mart's competitors. When small produce suppliers had trouble meeting Wal-Mart's needs, Wilson worked closely with them and connected them to RetailLink, Wal-Mart's computer network, "which allows our suppliers immediate access to all information needed to help run the business." Over time, these steps helped the produce suppliers lower costs and deliver the enormous quantities of fresh fruits and vegetables that Wal-Mart's supercenters need.[35] They also helped Wal-Mart become the world's largest grocer.[36]

3.3 First-Line Managers

First-line managers hold positions like office manager, shift supervisor, or department manager. The primary responsibility of first-line managers is to manage the

[First-line Managers] train and supervise the performance of nonmanagerial employees who are directly responsible for producing the company's products or services

doing the right thing

Tell and Show People That Ethics Matter

Because managers set the standard for others in the workplace, unethical behavior and practices quickly spread when they don't do the right thing. One of the most important things managers can do is to tell people that ethics matter. When DuPont CEO Charles Holliday, Jr., was a young manager, he was told by DuPont's then-CEO Dick Heckert, "This company lives by the letter of its contracts and the intent of those contracts." Says Holliday, "I still remember the expression on his face when he said those words, and I've lived by that philosophy ever since." In today's business world, however, with one-third of workers reporting that they've seen their bosses lie, steal from the company, or break the law, talk clearly isn't enough. Holliday says, "Just saying you're ethical isn't very useful. You have to earn trust by what you do every day." So, tell the people whom you manage that ethics matter. Then *show* them by doing the right thing yourself.[33]

performance of entry-level employees who are directly responsible for producing a company's goods and services. Thus, first-line managers are the only managers who don't supervise other managers. The responsibilities of first-line managers include monitoring, teaching, and short-term planning.

First-line managers encourage, monitor, and reward the performance of their workers. For example, Jeff Dexheimer requires the waiters and waitresses he supervises at the upscale Melting Pot restaurant in St. Louis to memorize a complex menu and a 400-item wine list. Says Dexheimer, "They've got to know every liquor, every beer, every food item, as well as the sauces it comes with." To reduce turnover and keep his 65 employees motivated, Dexheimer gives out $25 nightly rewards for having the best attitude or for selling the most wine. Since his employees are young and mostly single, he makes sure they work only one night each weekend. And once a week, after the restaurant closes, he takes his entire staff out for drinks. Says Dexheimer, as a manager, "I don't make myself successful. My employees make me successful."[37]

First-line managers also teach entry-level employees how to do their jobs. Damian Mogavero's company, Avero LLC, helps restaurants analyze sales data for each member of a restaurant's waitstaff. Restaurant managers who use these data, says Mogavero, will often take their top-selling server to lunch each week as a reward. The best managers, however, will also take their poorest-selling servers out to lunch to talk about what they can do to improve their performance.[38] Likewise, Coca-Cola manager Tom Mattia says, "I try to make every interaction I have with someone on my team a teaching experience. There are always specific work issues that need to get addressed, but then I try to explain my thinking behind an approach so people can get more experience."[39]

First-line managers also make detailed schedules and operating plans based on middle management's intermediate-range plans. By contrast to the long-term plans of top managers (3 to 5 years out) and the intermediate plans of middle managers (6 to 18 months out), first-line managers engage in plans and actions that typically produce results within 2 weeks.[40] Consider the typical convenience store manager (e.g., 7-Eleven) who starts the day by driving past competitors' stores to inspect their gasoline prices and then checks the outside of his or her store for anything that might need maintenance, such as burned-out lights or signs, or restocking, like windshield washer fluid and paper towels. Then comes an inside check, where the manager determines what needs to be done for that day. (Are there enough coffee and donuts for breakfast or enough sandwiches for lunch?) Once the day is planned, the manager turns to weekend orders. After accounting for the weather (hot or cold) and the sales trends at the same time last year, the manager makes sure the store will have enough beer, soft drinks, and Sunday papers on hand. Finally, the manager looks 7 to 10 days ahead for hiring needs. Because of strict hiring procedures (basic math tests, drug tests, and background checks), it can take that long to hire new employees. Said one convenience-store manager, "I have to continually interview, even if I am fully staffed."[41]

3.4 Team Leaders

The fourth kind of manager is a team leader. This relatively new kind of management job developed as companies shifted to self-managing teams, which, by definition, have no formal supervisor. In traditional management hierarchies, first-line managers are responsible for the performance of nonmanagerial employees and have the authority to hire and fire workers, make job assignments, and control resources.

In this new structure, the teams themselves perform nearly all of the functions performed by first-line managers under traditional hierarchies.[42]

Team leaders have a different set of responsibilities than traditional first-line managers.[43] **Team leaders** are primarily responsible for facilitating team activities toward accomplishing a goal. This doesn't mean team leaders are responsible for team performance. They aren't. The team is. Team leaders help their team members plan and schedule work, learn to solve problems, and work effectively with each other. Management consultant Franklin Jonath says, "The idea is for the team leader to be at the service of the group." It should be clear that the team members own the outcome. The leader is there to bring intellectual, emotional, and spiritual resources to the team. Through his or her actions, the leader should be able to show the others how to think about the work that they're doing in the context of their lives. It's a tall order, but the best teams have such leaders.[44]

> The idea is for the team leader to be at the service of the group.
>
> FRANKLIN JONATH, MANAGEMENT CONSULTANT

Relationships among team members and between different teams are crucial to good team performance and must be well managed by team leaders, who are responsible for fostering good relationships and addressing problematic ones within their teams. Getting along with others is much more important in team structures because team members can't get work done without the help of other teammates. For example, studies show that it's not the surgeon but the interactions between the surgeon and all operating room team members that determine surgical outcomes. However, at twenty hospitals, 60 percent of the operating room team members—nurses, technicians, and other doctors—agreed with the statement, "In the ORs here, it is difficult to speak up if I perceive a problem with patient care."[45] And when operating room team members don't speak up, serious mistakes can occur no matter how talented the surgeon. Consequently, surgeons are using "safety pauses" to better involve members of their surgical teams. The surgeon will pause, ask if anyone has concerns or comments, and address them if need be. Studies show that safety pauses reduce mistakes, such as operating on the wrong leg or beginning surgery with key surgical instruments missing.[46]

Team leaders are also responsible for managing external relationships. Team leaders act as the bridge or liaison between their teams and other teams, departments, and divisions in a company. For example, if a member of Team A complains about the quality of Team B's work, Team A's leader is responsible for solving the problem by initiating a meeting with Team B's leader. Together, these team leaders are responsible for getting members of both teams to work together to solve the problem. If it's done right, the problem is solved without involving company management or blaming members of the other team.[47]

So the team leader's job involves a different set of skills than traditional management jobs typically do. For example, a Hewlett-Packard ad for a team leader position says, "Job seeker must enjoy coaching, working with people, and bringing about improvement through hands-off guidance and leadership."[48] Team leaders who fail to understand how their roles are different from those of traditional managers often struggle in their jobs. A team leader at Texas Instruments said, "I didn't buy into teams, partly because there was no clear plan on what I was supposed to do.... I never let the operators [team members] do any scheduling or any ordering of parts because that was mine. I figured as long as I had that, I had a job."[49]

You will learn more about teams in Chapter 10.

REVIEW 3

Kinds of Managers There are four different kinds of managers. Top managers are responsible for creating a context for change, developing attitudes of commitment and ownership, creating a positive organizational culture through words and actions, and monitoring their company's business environments. Middle managers are responsible for planning and allocating resources, coordinating and linking groups and departments, monitoring and managing the performance of subunits and managers, and implementing the changes or strategies generated by top managers. First-line managers are responsible for managing the performance of nonmanagerial employees, teaching direct reports how to do their jobs, and making detailed schedules and operating plans based on middle management's intermediate-range plans. Team leaders are responsible for facilitating team performance, managing external relationships, and facilitating internal team relationships.

4 MANAGERIAL ROLES

Although all four types of managers engage in planning, organizing, leading, and controlling, if you were to follow them around during a typical day on the job, you would probably not use these terms to describe what they actually do. Rather, what you'd see are the various roles managers play. Professor Henry Mintzberg followed five American CEOs, shadowing each for a week and analyzing their mail, their conversations, and their actions. He concluded that managers fulfill three major roles while performing their jobs:[50]

- Interpersonal roles.
- Informational roles.
- Decisional roles.

In other words, managers talk to people, gather and give information, and make decisions. Furthermore, as shown in Exhibit 1.3, these three major roles can be subdivided into ten subroles. Let's examine each major role—**4.1 interpersonal, 4.2 informational, and 4.3 decisional roles—and their ten subroles**.

4.1 Interpersonal Roles

More than anything else, management jobs are people-intensive. Estimates vary with the level of management, but most managers spend between two-thirds and four-fifths of their time in face-to-face communication with others.[51] If you're a loner, or if you consider dealing with people a pain, then you may not be cut out for management work. In fulfilling the interpersonal role of management, managers perform three subroles: figurehead, leader, and liaison.

In the **figurehead role**, managers perform ceremonial duties like greeting company visitors, speaking at the opening of a new facility, or representing the company at a community luncheon to support local charities. Wichita, Kansas-based **Cessna** is the largest manufacturer of general aviation planes in the world. When Cessna opened a new 101,000-square-foot jet service facility employing 77 workers in Mesa, Arizona, CEO Jack Pelton flew in to join Mesa's mayor, Cessna managers, and local workers and their families to celebrate the grand opening.[52]

[Figurehead Role] the interpersonal role managers play when they perform ceremonial duties

In the **leader role**, managers motivate and encourage workers to accomplish organizational objectives. At **RedPeg Marketing**, cofounder Brad Nierenberg motivates his employees with company perks, such as a three-bedroom beach house that is available to all forty-eight employees for vacations, cold beer in the refrigerator, free breakfast at staff meetings, and trophies and awards for great performance. Once, after the company had met a critical goal, Nierenberg walked into the office with $38,000 in cash, or $1,000 each for his then thirty-eight employees. Said Nierenberg, "I thought, 'I've got to make a big deal out of this; I can't just put it in their checking account because that's not as fun.' I thought it would be cool for them to see $30,000 in cash."[53]

In the **liaison role**, managers deal with people outside their units. Studies consistently indicate that managers spend as much time with outsiders as they do with their own subordinates and their own bosses. In addition to his normal duties, Rajesh Hukku, board chair of j-Flex Solutions, a maker of financial services software, regularly goes on sales calls, helps close sales deals, and markets his product to potential customers at industry conventions and forums.[54] The same holds true for the convenience store managers discussed earlier. Even first-line managers spend much of their time dealing with outsiders as they deal with vendors who make store deliveries and set up product displays, work with computer technicians who help with computer glitches and satellite connections to headquarters, order from sales representatives who supply the mops and deli aprons used in the store, and even as they call the sheriff about stolen credit cards.[55]

4.2 Informational Roles

Not only do managers spend most of their time in face-to-face contact with others but they spend much of it obtaining and sharing information. Indeed, Mintzberg found that the managers in his study spent 40 percent of their time giving and getting information from others. In this regard, management can be viewed as processing information, gathering information by scanning the business environment and listening to others in face-to-face conversations, processing that information, and then sharing it with people both inside and outside the company. Mintzberg described three informational subroles: monitor, disseminator, and spokesperson.

In the **monitor role**, managers scan their environment for information, actively contact others for information, and, because of their personal contacts, receive a great deal of unsolicited information. Besides receiving firsthand information, managers monitor their environment by reading local newspapers and the *Wall Street Journal* to keep track of customers, competitors, and technological changes that may affect their businesses. Now, managers can also take advantage of electronic monitoring and distribution services that track the news wires (Associated Press, Reuters, and so on) for stories related to their businesses. These services deliver customized electronic newspapers that include only stories on topics the managers specify. Business Wire (**http://www.businesswire.com**) monitors and distributes daily news headlines from major industries (e.g., automotive, banking and financial, health, high tech).[56] CyberAlert (**http://www.cyberalert.com**) keeps round-the-clock track of new stories in categories chosen by each subscriber.[57] FNS NewsClips Online (**http://www.news-clips.com**) provides subscribers daily electronic newsclips from more than 5,000 online news sites.[58]

Because of their numerous personal contacts and their access to subordinates, managers are often hubs for the distribution of critical information. In the **disseminator role**,

[Leader Role] the interpersonal role managers play when they motivate and encourage workers to accomplish organizational objectives

[Liaison Role] the interpersonal role managers play when they deal with people outside their units

[Monitor role] the informational role managers play when they scan their environment for information

[Disseminator role] the informational role managers play when they share information with others in their departments or companies

managers share the information they have collected with their subordinates and others in the company. At **Telephonica 02**, a British-based telecommunications firm ranked as one of the best places to work in London, managers sit down twice a year with their employees to review a pocket-sized pamphlet outlining the company's goals and objectives. The discussions center around how the employees' personal development and growth plans can be linked to the company's goals.[59] Although there will never be a complete substitution for face-to-face dissemination of information, **Serena Software**, based in Redwood City, California, uses Facebook to communicate worldwide with its 850 employees. On "Facebook Fridays," employees are given an hour, should they choose, to spend time using Facebook to communicate about themselves or learn about others in the company. Serena Software relies on Facebook so much for recruiting new employees and marketing its products that it has become the company's de facto intranet.[60] (You'll read more about intranets in Chapter 15 on communication.)

In contrast to the disseminator role, in which managers distribute information to employees inside the company, managers in the **spokesperson role** share information with people outside their departments and companies. One of the most common ways CEOs serve as spokespeople for their companies is at annual meetings with company shareholders or the board of directors. CEOs also serve as spokespeople to the media when their companies are involved in major news stories. When **Toshiba** pulled the plug on its effort to position its HD-DVD technology as the dominant format for new high-definition players, ceding the market to Sony's Blu-ray, it was the company CEO Atsutoshi Nishida who explained this move to the public. Because Japanese companies value pride and tend to choose less high-profile strategies for backing out of a business deal, it was surprising that Nishida acted as the spokesperson in this situation. But Nishida emphasized, "We were in this to win," and explained Toshiba's decision to change its strategy and invest energy in alternative avenues of growth.[61]

[Spokesperson Role] the informational role managers play when they share information with people outside their departments or companies

[Entrepreneur Role] the decisional role managers play when they adapt themselves, their subordinates, and their units to change

4.3 Decisional Roles

Mintzberg found that obtaining and sharing information is not an end in itself. Obtaining and sharing information with people inside and outside the company is useful to managers because it helps them make good decisions. According to Mintzberg, managers engage in four decisional subroles: entrepreneur, disturbance handler, resource allocator, and negotiator.

© KIM WHITE/LANDOV

In the **entrepreneur role**, managers adapt themselves, their subordinates, and their units to change. Veterans Affairs (VA) hospitals long had a reputation for red tape, inefficiency, and second-class medical treatment. Today, though, independent groups rank VA hospitals as some of the best in the country. Fifteen years ago, the VA's leadership instituted a culture of accountability and change aimed at improving its entire system. Doctors, nurses, staffers, and administrators met regularly to review possible improvements.

After a VA nurse in Topeka, Kansas, noticed that rental car companies used handheld bar-code scanners to check in returned cars, she suggested using bar codes on patients' ID bracelets and their bottled medicines. Today, the VA's bar-code scanners are tied to an electronic records system that prevents nurses from handing out the wrong medicines and automatically alerts the hospital pharmacy to possibly harmful drug interactions or dangerous patient allergies.[62]

In the **disturbance handler role**, managers respond to pressures and problems so severe that they demand immediate attention and action. Top managers often play the role of disturbance handler, but shortly before Hurricane Katrina made landfall, **Wal-Mart's** then CEO Lee Scott realized that *all* of the company's top managers and store managers would have to be effective disturbance handlers in order to serve the company and the communities in which they worked. So Scott sent this message out: "A lot of you are going to have to make decisions above your level. Make the best decision that you can with the information that's available to you at the time, and above all, do the right thing."[63] Empowered by their CEO, employees used a forklift to crash through a warehouse door to get water, broke into a locked pharmacy to retrieve medicine for a hospital, and crashed a bulldozer through the front of a store so that supplies could be used to sustain the local community.

In the **resource allocator role**, managers decide who will get what resources and how many resources they will get. For instance, as the recession that began in the fall of 2008 deepened, companies slashed production by closing facilities, laying off workers, and cutting pay for surviving workers and managers. But when it came to research and development (R&D) spending, the largest firms spent as much on R&D as they did before, despite revenues falling by nearly 8 percent. Why did they allocate an even larger part of their budgets to R&D spending in the middle of a recession? Because in prior economic downturns, continued investments in R&D led to the development of successful products such as the iPod and fuel-efficient jet engines. Says Jim Andrew, of the Boston Consulting Group, "Companies by and large realized that large reductions in R&D are suicidal." Therefore, companies such as Intel, which saw a 90 percent drop in its net income, still spent $5.4 billion on R&D. Likewise, 3M, which cut capital spending by 30 percent and laid off 4,700 workers, slightly increased its R&D spending so as not to sacrifice future profits from new, innovative products.[64]

> "Companies by and large realized that large reductions in R&D are suicidal."
>
> JIM ANDREW, BCG

In the **negotiator role**, managers negotiate schedules, projects, goals, outcomes, resources, and employee raises. It was as a negotiator that Mike Zafirovski was able to address the $9 billion class-action lawsuit that could have put Nortel out of business. After three earnings restatements in 3 years, the value of **Nortel's** stock had declined by $30 billion, and fed-up shareholders brought two class-action lawsuits against the company seeking $9 billion in damages. Most managers would assume that there was only one option—to fight the lawsuit—because paying the $9 billion in damages would put Nortel out of business. Zafirovski, however, negotiated by inviting the five attorneys from the plaintiffs to work directly with him and his team by using a court-appointed mediator to achieve a settlement. Zafirovski apologized for Nortel's errors, saying, "We let you down." Then, he asked them to "not kill the company," because in doing so, "you would receive absolutely nothing." The apology worked. Attorney Max Berger said, "We were all very impressed by him." Nortel agreed to partially compensate shareholders for their losses by paying $2.4 billion in cash and stock. The settlement allowed Nortel to stay in business.[65]

Managerial Roles Managers perform interpersonal, informational, and decisional roles in their jobs. In fulfilling the interpersonal role, managers act as figureheads by performing ceremonial duties, as leaders by motivating and encouraging workers, and as liaisons by dealing with people outside their units. When managers perform their informational role, they act as monitors by scanning their environment for information, as disseminators by sharing information with others in the company, and as spokespeople by sharing information with people outside their departments or companies. In decisional roles, managers act as entrepreneurs by adapting their units to incremental change, as disturbance handlers by responding to larger problems that demand immediate action, as resource allocators by deciding resource recipients and amounts, and as negotiators by bargaining with others about schedules, projects, goals, outcomes, and resources.

WHAT DOES IT TAKE TO BE A MANAGER?

I didn't have the slightest idea what my job was. I walked in giggling and laughing because I had been promoted and had no idea what principles or style to be guided by. After the first day, I felt like I had run into a brick wall. (Sales Representative #1)

Suddenly, I found myself saying, boy, I can't be responsible for getting all that revenue. I don't have the time. Suddenly you've got to go from [taking care of] yourself and say now I'm the manager, and what does a manager do? It takes awhile thinking about it for it to really hit you . . . a manager gets things done through other people. That's a very, very hard transition to make. (Sales Representative #2)[66]

The preceding statements were made by two star sales representatives who, on the basis of their superior performance, were promoted to the position of sales manager. As their comments indicate, at first they did not feel confident about their ability to do their jobs as managers. Like most new managers, these sales managers suddenly realized that the knowledge, skills, and abilities that led to success early in their careers (and were probably responsible for their promotion into the ranks of management) would not necessarily help them succeed as managers. As sales representatives, they were responsible only for managing their own performance. But as sales managers, they were now directly responsible for supervising all of the sales representatives in their sales territories. Furthermore, they were now directly accountable for whether those sales representatives achieved their sales goals.

After reading the next three sections, you should be able to

5. explain what companies look for in managers.
6. discuss the top mistakes that managers make in their jobs.
7. describe the transition that employees go through when they are promoted to management.

If performance in nonmanagerial jobs doesn't necessarily prepare you for a managerial job, then what does it take to be a manager?

5 WHAT COMPANIES LOOK FOR IN MANAGERS

When companies look for employees who would be good managers, they look for individuals who have technical skills, human skills, conceptual skills, and the motivation to manage.[67] Exhibit 1.4 shows the relative importance of these four skills to the jobs of team leaders, first-line managers, middle managers, and top managers.

Technical skills are the specialized procedures, techniques, and knowledge required to get the job done. For the sales managers described above, technical skills involve the ability to find new sales prospects, develop accurate sales pitches based on customer needs, and close the sale. For a nurse supervisor, technical skills include being able to insert an IV or operate a crash cart if a patient goes into cardiac arrest.

Technical skills are most important for team leaders and lower-level managers because they supervise the workers who produce products or serve customers. Team leaders and first-line managers need technical knowledge and skills to train new employees and help employees solve problems. Technical knowledge and skills are also needed to troubleshoot problems that employees can't handle. Technical skills become less important as managers rise through the managerial ranks, but they are still important.

Human skills can be summarized as the ability to work well with others. Managers with human skills work effectively within groups, encourage others to express their thoughts and feelings, are sensitive to others' needs and viewpoints, and are good listeners and communicators. Human skills are equally important at all levels of management, from first-line supervisors to CEOs. However, because lower-level managers spend much of their time solving technical problems, upper-level managers may actually spend more time dealing directly with people. On average, first-line managers spend 57 percent of their time with people, but that percentage increases to 63 percent for middle managers and 78 percent for top managers.[68]

Conceptual skills are the ability to see the organization as a whole, to understand how the different parts of the company affect each other, and to recognize how the company fits into or is affected by its external environment such as the local community, social and economic forces, customers, and the competition. Good managers have to be able to recognize, understand, and reconcile multiple complex problems and perspectives. In other words, managers have to be smart! In fact, intelligence makes so much difference for managerial performance that managers with above-average intelligence typically outperform managers of average

Technical skills are most important at the lower levels of management, but even top managers need technical skills

intelligence by approximately 48 percent.[69] Clearly, companies need to be careful to promote smart workers into management. Conceptual skills increase in importance as managers rise through the management hierarchy.

Good management involves much more than intelligence, however. For example, making the department genius a manager can be disastrous if that genius lacks technical skills, human skills, or one other factor known as the motivation to manage. **Motivation to manage** is an assessment of how motivated employees are to interact with superiors, participate in competitive situations, behave assertively toward others, tell others what to do, reward good behavior and punish poor behavior, perform actions that are highly visible to others, and handle and organize administrative tasks. Managers typically have a stronger motivation to manage than their subordinates, and managers at higher levels usually have a stronger motivation to manage than managers at lower levels. Furthermore, managers with a stronger motivation to manage are promoted faster, are rated as better managers by their employees, and earn more money than managers with a weak motivation to manage.[70]

REVIEW 5

What Companies Look for in Managers Companies do not want one-dimensional managers. They want managers with a balance of skills. They want managers who know their stuff (technical skills), are equally comfortable working with blue-collar and white-collar employees (human skills), are able to assess the complexities of today's competitive marketplace and position their companies for success (conceptual skills), and want to assume positions of leadership and power (motivation to manage). Technical skills are most important for lower-level managers, human skills are equally important at all levels of management, and conceptual skills and motivation to manage increase in importance as managers rise through the managerial ranks.

6 MISTAKES MANAGERS MAKE

Another way to understand what it takes to be a manager is to look at the mistakes managers make. In other words, we can learn just as much from what managers shouldn't do as from what they should do. Exhibit 1.5 lists the top ten mistakes managers make.

Several studies of U.S. and British managers have compared "arrivers," or managers who made it all the way to the top of their companies, with "derailers," or managers who were successful early in their careers but were knocked off the fast track by the time they reached the middle to upper levels of management.[71] The researchers found that there were only a few differences between arrivers and derailers. For the most part, both groups were talented and both groups had weaknesses. But what distinguished derailers from arrivers was that derailers possessed two or more fatal flaws with respect to the way they managed people. Although arrivers were by no

[Motivation to Manage] an assessment of how enthusiastic employees are about managing the work of others

means perfect, they usually had no more than one fatal flaw or had found ways to minimize the effects of their flaws on the people with whom they worked.

The number-one mistake made by derailers was that they were insensitive to others by virtue of their abrasive, intimidating, and bullying management style. The authors of one study described a manager who walked into his subordinate's office and interrupted a meeting by saying, "I need to see you." When the subordinate tried to explain that he was not available because he was in the middle of a meeting, the manager barked, "I don't give a damn. I said I wanted to see you now."[72] Not surprisingly, only 25 percent of derailers were rated by others as being good with people, compared to 75 percent of arrivers.

EXHIBIT 1.5

Top 10 Mistakes That Managers Make

1.	Insensitive to others: abrasive, intimidating, bullying style.
2.	Cold, aloof, arrogant.
3.	Betrayal of trust.
4.	Overly ambitious: thinking of next job, playing politics.
5.	Specific performance problems with the business.
6.	Overmanaging: unable to delegate or build a team.
7.	Unable to staff effectively.
8.	Unable to think strategically.
9.	Unable to adapt to boss with different style.
10.	Overdependent on advocate or mentor.

The second mistake was that derailers were often cold, aloof, or arrogant. Although this sounds like insensitivity to others, it has more to do with derailed managers being so smart, so expert in their areas of knowledge, that they treated others with contempt because they weren't experts, too. For example, AT&T called in an industrial psychologist to counsel its vice president of human resources because she had been blamed for "ruffling too many feathers" at the company.[73] Interviews with the vice president's coworkers and subordinates revealed that they thought she was brilliant, was "smarter and faster than other people," "generates a lot of ideas," and "loves to deal with complex issues." Unfortunately, these smarts were accompanied by a cold, aloof, and arrogant management style. The people she worked with complained that she does "too much too fast," treats coworkers with "disdain," "impairs teamwork," "doesn't always show her warm side," and has "burned too many bridges."[74]

The third mistake made by derailers involved betraying a trust. Betraying a trust doesn't mean being dishonest. Instead, it means making others look bad by not doing what you said you would do when you said you would do it. That mistake, in itself, is not fatal because managers and their workers aren't machines. Tasks go undone in every company every single business day. There's always too much to do and not enough time, people, money, or resources to do it. The fatal betrayal of trust is failing to inform others when things will not be done on time. This failure to admit mistakes, quickly inform others of the mistakes, take responsibility for the mistakes, and then fix them without blaming others clearly distinguished the behavior of derailers from arrivers.

Managers who fail to delegate will not have enough time to do anything well.

The fourth mistake was being overly political and ambitious. Managers who always have their eye on their next job rarely establish more than superficial relationships with peers and coworkers. In their haste to gain credit for successes that would be noticed by upper management, they make the fatal mistake of treating people as though they don't matter. An employee with an overly ambitious boss described him this way: "He treats employees coldly, even cruelly. He assigns blame without regard to responsibility, and takes all the credit for himself. I once had such a boss, and he gave me a new definition of shared risk: If something I did was successful, he took the credit. If it wasn't, I got the blame."[75]

The fatal mistakes of being unable to delegate, build a team, and staff effectively indicate that many derailed managers were unable to make the most basic transition to managerial work: to quit being hands-on doers and get work done through others. Two things go wrong when managers make these mistakes. First, when managers meddle in decisions that their subordinates should be making—when they can't stop being doers—they alienate the people who work for them. Rich Dowd, founder of Dowd Associates, an executive search firm, admits to constantly monitoring and interrupting employees because they weren't doing the job "in the way I saw fit, even when their work was outstanding." According to Richard Kilburg of Johns Hopkins University, when managers interfere with workers decisions, "You . . . have a tendency to lose your most creative people. They're able to say, 'Screw this. I'm not staying here.'"[76] Indeed, one employee told Dowd that if he was going to do her job for her, she would quit. Second, because they are trying to do their subordinates' jobs in addition to their own, managers who fail to delegate will not have enough time to do much of anything well.

Mistakes Managers Make Another way to understand what it takes to be a manager is to look at the top mistakes managers make. Five of the most important mistakes made by managers are being abrasive and intimidating; being cold, aloof, or arrogant; betraying trust; being overly ambitious; and failing to build a team and then delegate to that team.

7 THE TRANSITION TO MANAGEMENT: THE FIRST YEAR

In her book *Becoming a Manager: Mastery of a New Identity*, Harvard Business School professor Linda Hill followed the development of nineteen people in their first year as managers. Her study found that becoming a manager produced a profound psychological transition that changed the way these managers viewed themselves and others. As shown in Exhibit 1.6, the evolution of the managers' thoughts, expectations, and realities over the course of their first year in management reveals the magnitude of the changes they experienced.

Initially, the managers in Hill's study believed that their job was to exercise formal authority and to manage tasks—basically being the boss, telling others what to do, making decisions, and getting things done. One of the managers Hill interviewed said, "Being the manager means running my own office, using my ideas and thoughts." Another said, "[The office is] my baby. It's my job to make sure it works."[77] In fact, most of the new managers were attracted to management positions because they wanted to be in charge. Surprisingly, the new managers did not believe that their job was to manage people. The only aspects of people management mentioned by the new managers were hiring and firing.

After 6 months, most of the new managers had concluded that their initial expectations about managerial work were wrong. Management wasn't just about being the boss, making decisions, and telling others what to do. The first surprise was the fast pace and heavy workload involved. Said one of Hill's managers, "This job

is much harder than you think. It is 40 to 50 percent more work than being a producer! Who would have ever guessed?" The pace of managerial work was startling, too. Another manager said, "You have eight or nine people looking for your time . . . coming into and out of your office all day long." A somewhat frustrated manager declared that management was "a job that never ended . . . a job you couldn't get your hands around."[78]

Informal descriptions like this are consistent with studies indicating that the average first-line manager spends no more than 2 minutes on a task before being interrupted by a request from a subordinate, a phone call, or an e-mail. The pace is somewhat less hurried for top managers, who spend an average of approximately 9 minutes on a task before having to switch to another. In practice, this means that supervisors may perform thirty different tasks per hour, while top managers perform seven different tasks per hour, with each task typically different from the one that preceded it. A manager described this frenetic level of activity by saying, "The only time you are in control is when you shut your door, and then I feel I am not doing the job I'm supposed to be doing, which is being with the people."[79]

The other major surprise after 6 months on the job was that the managers' expectations about what they should do as managers were very different from their subordinates' expectations. Initially, the managers defined their jobs as helping their subordinates perform their jobs well. For the managers, who still defined themselves as doers rather than managers, assisting their subordinates meant going out on sales calls or handling customer complaints. One manager said, "I like going out with the rep, who may need me to lend him my credibility as manager. I like the challenge, the joy in closing. I go out with the reps and we make the call and talk about the customer; it's fun."[80] But when the managers "assisted" in this way, their subordinates were resentful and viewed their help as interference. The subordinates wanted their managers to help them by solving problems that they couldn't solve. Once the managers realized this distinction, they embraced their role as problem-solver and troubleshooter. Thus, they could help without interfering with their subordinates' jobs.

After a year on the job, most of the managers thought of themselves as managers and no longer as doers. In making the transition, they finally realized that people management was the most important part of their job. One of Hill's interviewees summarized the lesson that had taken him a year to learn by saying, "As many demands as managers have on their time, I think their primary responsibility is people development. Not production, but people development."[81] Another indication of how much their views had changed was that most of the managers now regretted

EXHIBIT 1.6 **The Transition to Management: Initial Expectations, after Six Months, and after a Year**

MANAGERS' INITIAL EXPECTATIONS (JAN, FEB, MAR)	AFTER SIX MONTHS AS A MANAGER (APR, MAY, JUN)	AFTER A YEAR AS A MANAGER (JUL, AUG, SEP, OCT, NOV, DEC)
⊙ Be the boss	⊙ Initial expectations were wrong	⊙ No longer "doer"
⊙ Have formal authority	⊙ Fast pace	⊙ Communicating, listening, and giving positive reinforcement
⊙ Manage tasks	⊙ Heavy workload	⊙ Learning to adapt to and control stress
⊙ Job is not managing people	⊙ Job is to be problem-solver and troubleshooter for subordinates	⊙ Job is people development

the rather heavy-handed approach they had used in their early attempts to manage their subordinates. "I wasn't good at managing…, so I was bossy like a first-grade teacher." "Now I see that I started out as a drill sergeant. I was inflexible, just a lot of how-to's." By the end of the year, most of the managers had abandoned their authoritarian approach for one based on communication, listening, and positive reinforcement. One manager explained, "Last night at five I handed out an award in the boardroom just to the individual. It was the first time in his career that he had [earned] $100,000, and I gave him a piece of glass [a small award] and said I'd heard a rumor that somebody here just crossed over $100,000 and I said congratulations, shook his hand, and walked away. It was not public in the sense that I gathered everybody around. But I knew and he did too."[82]

Finally, after beginning their year as managers in frustration, the managers came to feel comfortable with their subordinates, with the demands of their jobs, and with their emerging managerial styles. While being managers had made them acutely aware of their limitations and their need to develop as people, it also provided them with an unexpected reward of coaching and developing the people who worked for them. One manager said, "It gives me the best feeling to see somebody do something well after I have helped them. I get excited." Another stated, "I realize now that when I accepted the position of branch manager that it is truly an exciting vocation. It is truly awesome, even at this level; it can be terribly challenging and terribly exciting."[83]

REVIEW 7

The Transition to Management: The First Year Managers often begin their jobs by using more formal authority and fewer people management skills. However, most find that being a manager has little to do with bossing their subordinates. After 6 months on the job, the managers were surprised at the fast pace and heavy workload and that "helping" their subordinates was viewed as interference. After a year on the job, most of the managers had come to think of themselves not as doers, but as managers who get things done through others. And because they finally realized that people management was the most important part of their job, most of them had abandoned their authoritarian approach for one based on communication, listening, and positive reinforcement.

WHY MANAGEMENT MATTERS

If you walk down the aisle of the business section in your local bookstore, you'll find hundreds of books that explain precisely what companies need to do to be successful. Unfortunately, the best-selling business books tend to be faddish, changing dramatically every few years. One thing that hasn't changed, though, is the importance of good people and good management: Companies can't succeed for long without them.

After reading the next section, you should be able to

8. explain how and why companies can create competitive advantage through people.

8 COMPETITIVE ADVANTAGE THROUGH PEOPLE

In his books *Competitive Advantage through People* and *The Human Equation: Building Profits by Putting People First*, Stanford University business professor Jeffrey Pfeffer contends that what separates top-performing companies from their competitors is the way they treat their work forces—in other words, their management style.[84]

Pfeffer found that managers in top-performing companies used ideas like employment security, selective hiring, self-managed teams and decentralization, high pay contingent on company performance, extensive training, reduced status distinctions (between managers and employees), and extensive sharing of financial information to achieve financial performance that, on average, was 40 percent higher than that of other companies. These ideas, which are explained in detail in Exhibit 1.7, help organizations develop work forces that are smarter, better trained, more motivated, and more committed than their competitors' work forces. And—as indicated by the phenomenal growth and return on investment earned by these companies—smarter, better trained, and more committed work forces provide superior products and service to customers. Such customers keep buying and, by telling others about their positive experiences, bring in new customers.

EXHIBIT 1.7 Competitive Advantage through People: Management Practices

1.	Employment Security—Employment security is the ultimate form of commitment that companies can make to their workers. Employees can innovate and increase company productivity without fearing the loss of their jobs.
2.	Selective Hiring—If employees are the basis for a company's competitive advantage, and those employees have employment security, then the company needs to aggressively recruit and selectively screen applicants in order to hire the most talented employees available.
3.	Self-Managed Teams and Decentralization—Self-managed teams are responsible for their own hiring, purchasing, job assignments, and production. Self-managed teams can often produce enormous increases in productivity through increased employee commitment and creativity. Decentralization allows employees who are closest to (and most knowledgeable about) problems, production, and customers to make timely decisions. Decentralization increases employee satisfaction and commitment.
4.	High Wages Contingent on Organizational Performance—High wages are needed to attract and retain talented workers and to indicate that the organization values its workers. Employees, like company founders, shareholders, and managers, need to share in the financial rewards when the company is successful. Why? Because employees who have a financial stake in their companies are more likely to take a long-run view of the business and think like business owners.
5.	Training and Skill Development—Like a high-tech company that spends millions of dollars to upgrade computers or research and development labs, a company whose competitive advantage is based on its people must invest in the training and skill development of its people.
6.	Reduction of Status Differences—These are fancy words that indicate that the company treats everyone, no matter what the job, as equal. There are no reserved parking spaces. Everyone eats in the same cafeteria and has similar benefits. The result: much improved communication as employees focus on problems and solutions rather than on how they are less valued than managers.
7.	Sharing Information—If employees are to make decisions that are good for the long-run health and success of the company, they need to be given information about costs, finances, productivity, development times, and strategies that was previously known only by company managers.

Source: J. Pfeffer, *The Human Equation: Building Profits by Putting People First* (Boston: Harvard Business School Press, 1996).

According to Pfeffer, companies that invest in their people will create long-lasting competitive advantages that are difficult for other companies to duplicate. Indeed, other studies clearly demonstrate that sound management practices can produce substantial advantages in four critical areas of organizational performance: sales revenues, profits, stock market returns, and customer satisfaction.

In terms of sales revenues and profits, a study of nearly 1,000 U.S. firms found that companies that use *just some* of the ideas shown in Exhibit 1.7 had $27,044 more sales per employee and $3,814 more profit per employee than companies that didn't. For a 100-person company, these differences amount to $2.7 million more in sales and nearly $400,000 more in annual profit! For a 1,000-person company, the difference grows to $27 million more in sales and $4 million more in annual profit![85]

Another study that considers the effect of investing in people on company sales found that poorly performing companies were able to improve their average return on investment from 5.1 percent to 19.7 percent and increase sales by $94,000 per employee. They did this by adopting management techniques as simple as setting performance expectations (establishing goals, results, and schedules), coaching (informal, ongoing discussions between managers and subordinates about what is being done well and what could be done better), reviewing (annual, formal discussion about results), and rewarding employee performance (adjusting salaries and bonuses based on employee performance and results).[86] So, in addition to significantly improving the profitability of healthy companies, sound management practices can turn around failing companies.

To determine how investing in people affects stock market performance, researchers matched companies on *Fortune* magazine's list of "100 Best Companies to Work for in America" with companies that were similar in industry, size, and—this is key—operating performance. Both sets of companies were equally good performers; the key difference was how well they treated their employees. For both sets of companies, the researchers found that employee attitudes such as job satisfaction changed little from year to year. The people who worked for the "100 Best" companies were consistently much more satisfied with their jobs and employers year after year than were employees in the matched companies. More importantly, those stable

differences in employee attitudes were strongly related to differences in stock market performance. Over a 3-year period, an investment in the "100 Best Companies to Work for" would have resulted in an 82 percent cumulative stock return compared with just 37 percent for the matched companies.[87] This difference is remarkable given that both sets of companies were equally good performers at the beginning of the period.

Finally, research also indicates that managers have an important effect on customer satisfaction. Many people find this surprising. They don't understand how managers, who are largely responsible for what goes on inside the company, can affect what goes on outside the company. They wonder how managers, who often interact with customers under negative conditions (when customers are angry or dissatisfied), can actually improve customer satisfaction. It turns out that managers influence customer satisfaction through employee satisfaction. When employees are satisfied with their jobs, their bosses, and the companies they work for, they provide much better service to customers.[88] In turn, customers are more satisfied, too. Indeed, customers of companies on *Fortune*'s list of "100 Best Companies to Work for," where employees are much more satisfied with their jobs and their companies, have much higher customer satisfaction scores than do customers of comparable companies who are not on *Fortune*'s list. That difference in customer satisfaction also resulted in a 1.6 percent higher return on company assets.[89]

You will learn more about the service-profit chain in Chapter 18 on managing service and manufacturing operations.

Competitive Advantage through People Why does management matter? Well-managed companies are competitive because their work forces are smarter, better trained, more motivated, and more committed. Furthermore, companies that practice good management consistently have greater sales revenues, profits, and stock market performance than companies that don't. Finally, good management matters because it leads to satisfied employees who, in turn, provide better service to customers. Because employees tend to treat customers the same way that their managers treat them, good management can improve customer satisfaction.

History of Management

Management as a field of study may be just 125 years old, but management ideas and practices have actually been used from the earliest times of recorded history. Early on, the Greeks learned that they could improve the productivity of repetitious tasks by performing them to music. The basic idea was to use a flute, drum, or song lyrics to pace people to work in unison using the same efficient motion, stimulate them to work faster and longer, and make the boring work more fun.

SELF ASSESSMENT

Each chapter has a related self-assessment to help you consider how your own perspectives influence your management skills. Each assessment tool starts with a short description and ends with basic scoring information. (Your instructor will have interpretations of your scores.) As you advance through the book, take time to review your assessment scores together. Doing so will help you see patterns in your own perceptions and behaviors and give you insights into how those perceptions may affect your performance as a manager.

Is Management for You?

As you learned in Section 7 of this chapter, many managers begin their careers in management with specific ideas about what it means to be the boss. Although you may want to be a manager because of excitement, status, power, or rewards, knowing how to manage is not automatic; it requires specific skills and competencies, as well as a desire to manage. This assessment is meant to establish your baseline ability in the skills covered in the chapter. It will not tell you whether you should or should not be a manager, or whether you have "what it takes" to be a manager. It will, however, give you feedback on general skills that influence your overall managerial style.[90]

Be candid as you complete the assessment by circling the appropriate responses.

MANAGEMENT DECISION

Making decisions is part of every manager's job. To give you practice at managerial decision making, each chapter contains a "Management Decision" assignment focused on a particular decision. You'll need to decide what to do in the given situation and then answer several questions to explain your choices.

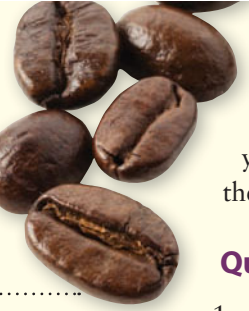
Managing Company Perks

You're in charge of a great company, and you love going to work every day.[91] Why wouldn't you? Your employees get to do work they enjoy because you give them freedom to be creative and let them use whatever software and tools work best for them to be productive. Best of all, though, is being the person who gives out the perks. Your employees are happy overall because they can use flextime and the company daycare, and the insurance and retirement benefits are excellent—onsite access to basic health care doesn't hurt, either. What's more, they can get a healthy lunch for free in the company cafeteria or a massage when they're stressed out, and you've made a company-owned four-bedroom beach house available to employees to use on vacations. When things were going really well, you got to hand each employee $1,000 in cold hard cash, as a bonus.

But the economic downturn has hurt your company. You're not exactly in danger of bankruptcy, but the number of new clients decreased steadily during the last quarter and you're having a hard time matching employees' contributions to their retirement funds. It's your job to figure out how to streamline the company's expenses and see it through the tough times. Every job has its downsides, but you dread this one. You're proud of your employees and want to keep them happy and productive. The last thing you want to be is the bad guy who takes away all the perks.

So you come in to work early and shut your office door, determined to buy yourself some time to think through how to handle this difficult situation. You know that morale is important if you want your employees to be productive and loyal, and these perks are a real morale booster. You know that employees are going to be upset if you take something away. On the other hand, they might not be *so* upset if they have some say in the process. You're also worried about how to even break the news that cuts are needed. Will employees worry about the health of the company and the security of their jobs? That would certainly be a productivity-killer. As you think about what perks to cut and what perks to keep, you're very aware that some—such as health insurance and onsite daycare—are critical for some employees and would really affect their well-being at work, while others—like access to the company BMW for business trips—are more like icing on the cake. So you're relieved to have some start at sorting out the wheat from the chaff.

But this situation has also made you think more seriously about perks in general. You recognize that perks are generally a great thing for employees and for the company. But have you created a culture of entitlement by giving them to everyone and not directly linking at least some of them to performance?[92] Maybe you can view this difficult situation as an opportunity not just to trim the fat but to actually make your perks system work better for you.



You have to make cuts. But what cuts do you make that will keep your bottom line in the black *and* keep your employees happy?

Questions

1. How is this decision emblematic of your job as a manager and your transition into that position?
2. What do you think is the best way to break the news that some perks will have to be cut without causing undue alarm among your employees?
3. How do you give employees a say in the process of deciding what gets cut? How much of a say do they get? What kind of employee feedback would be most helpful to you in making a decision?
4. What cuts would you make? Would you replace some perks with less-expensive perks? Would you restructure the perks system to link some to performance? Come up with a new (hypothetical) perks package for your employees. Explain your decisions.

MANAGEMENT TEAM DECISION

From sports to school to work to civic involvement, working in teams is increasingly part of our experience. But although working in teams is more and more common, making decisions as teams is not necessarily any easier. You will learn more about managing teams in Chapter 10, but to give you more experience with teamwork, a "Management Team Decision" exercise designed for a group of three to five students is included in each chapter. As a group, you must come to a mutually agreeable decision on the scenario presented. Each "Management Team Decision" will focus on a management topic presented in the chapter. For Chapter 1, you'll work with the management function of planning and organizing as you decide whether to implement RFID at the airport.

Baggage Claims—Is RFID the Ticket?

What a trip![93] You're exhausted from changing planes (three times because of cancellations) and trying to corral your colleagues as well as their luggage. And after all the cramped seats, complaining travelers, long lines, and marginal food, your team still hasn't come to a decision about what do to—at your own airport.

Last month, you and your management team from Hartsfield-Jackson Atlanta International Airport began discussing using radio-frequency identification (RFID) tags in the airport's baggage-handling operations. Recent reports on lost luggage have caused more than a ripple of concern, with roughly 1 in every 150 U.S. passengers losing a bag in any given year. U.S. airlines spent an estimated $400 million to replace mishandled luggage in a recent year, yet passengers are regularly incensed that the airlines give only partial reimbursements for lost bags and belongings. The cost of lost luggage, however, is not just the $400 million in reimbursements. There's the time and expense of staffing large customer-service departments to take complaints, process claims, track down and identify missing baggage, and deliver found bags to either the owner's travel destination or home. Multiple deliveries are often made, as the bag arrives at the passenger's destination after he or she has left for another destination or returned home. The International Air Transport Association estimates that airlines worldwide could save $760 million a year by reducing lost luggage.

Your team would love to reduce the costs associated with lost luggage at Hartsfield-Jackson (ATL), which consistently wins the title of world's busiest passenger airport. Nearly 6.5 million travelers pass through the airport in a given month and bring about 75 metric tons of luggage with them. That's more than the either the monthly amount of mail or commercial freight (think FedEx and UPS) that passes through the airport's facilities!

Thirty-one airlines take off and land at ATL, but Delta accounts for over 58 percent of passenger volume. As (bad) luck would have it, Delta has a dismal ranking for lost luggage, reporting 6.8 mishandled bags per 1,000, second only to US Airways' 7.7 losses per 1,000. Company-wide, Delta handles 1.3 bags per passenger, and there's no reason to think this number is any lower in Atlanta, its biggest hub. That means Delta alone puts over 160,000 bags into the ATL system each day!

To manage this tremendous flow of personal belongings, ATL uses the bar-coding system in use at the majority of U.S. airports. Adhesive paper tags are very economical at 4 cents each, but they also rip, smudge, get misread, or get torn off completely. Scanners even have trouble with twisted tags. Baggage sorting with bar-coded tags is only 80 to 90 percent accurate. And

once they're printed, that's it. If a passenger's destination changes due to, say, inclement weather, flight cancellations, or being rerouted, the bar-code label can't change to reflect the new itinerary.

Armed with all this, well, baggage, your team went on a trip to Las Vegas' McCarran International Airport, which has been using radio-frequency identification tags to manage its bag handling. McCarran is the fifth-busiest airport in the United States, and it handles more than 70,000 outbound bags per day. Using bar-code readers, as many as 7,000 bags per day were not read properly and tossed into an "unknown" pile to be hand sorted. There was also the headache of lost luggage for passengers on quick 3- and 4-day excursions to consider. In the end, the airport decided to invest in a system based on RFID tags. Tags costs 21 cents apiece, or five times the cost of a bar-code tag, but the accuracy of the RFID system has cut the number of hand-sorted bags by 90 percent, and the tags can be rewritten electronically midtravel if itineraries change. The RFID system has enabled the airport to let inbound passengers on long flights check their bags all the way to their casino or hotel so that their luggage is waiting for them when they arrive.

What to do? ATL is already in the middle of a $5.4 billion campaign to improve facilities. Management does a great job managing the finances of the airport, and Hartsfield-Jackson is considered a good risk (meaning a safe bet) for lenders. The hardware required to start using RFID is cheaper than maintaining the hardware that manages the system of traditional bar-code tags, but the difference in the cost of the tags is substantial, if decreasing. And who's going to foot the bill? Should the airlines, which are nearly all suffering financially, be expected to pay for the program that will ultimately benefit them as well? Delta already stopped paying its $3.4 million annual rent to the airport as part of its bankruptcy restructuring. If they don't pay for the hardware required to read the tags, should airlines at least pay for the tags themselves?

Maybe you need to take another trip, this time to Furth, Germany, where Siemens, a provider of industrial software, has built a mock airport to demonstrate how automated technology can help airports improve efficiencies in nearly every aspect of their organization. Siemens's automated luggage belts equipped with RFID readers can move at up to 30 feet per second, which means that passengers wouldn't have to wait hours for their bags to show up at the carousel, as they often do now. Even though the people at McCarran were helpful, their airport has less than half the traffic of Hartsfield-Jackson. Perhaps consulting with the folks at Siemens will help you better frame the issues for your massive operations. Or maybe you'd be better off visiting Denver International Airport, which is known for its notoriously flawed—and inefficient—automated baggage-handling system.

Form a team of four or five students to act as the management team of Hartsfield-Jackson International Airport to determine if the trade-offs of implementing RFID are worth the costs.

Questions

1. Implementing RFID is a complex situation that draws on many managerial roles. Describe the ways that the management team from Hartsfield-Jackson will fulfill Mintzberg's managerial roles and subroles (see Exhibit 1.3) as it thinks through the decision.
2. Additional information gathering at Siemens's mock airport is a good idea, but who to send? Identify how many and which type of managers to recommend for a fact-finding team and to tour the facility at Furth, Germany. Estimate how much money will be required to fund such a trip.
3. Do you implement RFID at Hartsfield-Jackson immediately, or do you schedule a trip to Furth, Germany, before deciding? Or do you decide not to implement RFID at all?

PRACTICE BEING A MANAGER

Finding a Management Job

Management is a wide-ranging and exciting area of work. One way to gain a sense of the possibilities is to study the advertisements for management job openings. Companies advertise their management openings in a variety of ways, including print advertisements in such newspapers as the *Wall Street Journal* (especially its Friday career section) and online ads at job sites like Monster.com and CareerBuilder.com.

Step 1: Find a job you'd like to have. Search through the newspaper and online ads and locate several detailed job descriptions for management positions. Select the one that you find most appealing—a job that you could picture yourself interviewing for either in the

near future or later in your career. Do not be too concerned about your current qualifications in making your selection, but you should see realistic prospects of meeting the qualifications over time (if a job requires an MBA, for example, you should see yourself completing this degree sometime in the future). Print your selected detailed job description and bring it to your next class session.

Step 2: Share your job description. In class, your professor will assign you to a pair or group of three. Write your name on your selected management job description, and exchange your job description with your partner(s). Each member of the pair or triad should now have a job description other than their own.

Step 3: Think like a hiring manager. Read the job description you received from your partner. Imagine that you are the manager responsible for hiring someone to fill this position. A human resources specialist in your company has already screened the applicants' resume and background. Thus, you may assume that your partner has met all the basic qualifications for the job. Your job as a senior manager is to ask questions that might get beyond the resume to the person—what might you ask to learn if someone is well suited to thrive in this management job and in your company?

Step 4: Take turns interviewing. Each member of the group should be briefly interviewed (5–10 minutes) for the job he or she selected.

Step 5: Debrief. Discuss your experiences with your partner(s). What was it like to be interviewed for your selected position? What was it like to role-play interviewing someone for a management position? Now imagine the real thing. Brainstorm about how you might prepare yourself over time to be the top candidate for an attractive management position and to be a senior manager responsible for hiring the best-qualified managers for your company.

Step 6: Discuss with the class. Share your interview experiences and brainstorming ideas with the class. Do you hear any similarities across the pairs/triads? What ideas or questions are most significant to you as you consider management job interviews?

DEVELOP YOUR CAREER POTENTIAL

Interview Two Managers

Welcome to the first "Develop Your Career Potential" activity! These assignments have one purpose: to help you develop your present and future capabilities as a manager. What you will learn through these assignments is not traditional "book learning" based on memorization and regurgitation, but practical knowledge and skills that help managers perform their jobs better. Lessons from some of the assignments—for example, goal setting—can be used for immediate benefit. Other lessons will obviously take time to accomplish, but you can still benefit now by making specific plans for future improvement.

Step 1: Interview two practicing managers. In her book *Becoming a Manager: Mastery of a New Identity*, Harvard Business School professor Linda Hill conducted extensive interviews with 19 people in their first year as managers.[94] To learn firsthand what it's like to be a manager, interview two managers whom you know, asking them some of the same questions, listed below, that Hill asked her managers. Be sure to interview managers with different levels of experience. Interview one person with at least 5 years' experience as a manager and then interview another person with no more than 2 years' experience as a manager.

Ask the managers these questions:

1. Briefly describe your current position and responsibilities.
2. What do your subordinates expect from you on the job?
3. What are the major stresses and challenges you face on the job?
4. What, if anything, do you dislike about the job?
5. What do you like best about your job?
6. What are the critical differences between average managers and top-performing managers?
7. Think about the skills and knowledge that you need to be effective in your job. What are they, and how did you acquire them?
8. What have been your biggest mistakes thus far? Could you have avoided them? If so, how?

Step 2: Prepare to discuss your findings. Prepare to discuss your findings in class or write a report (if assigned by your instructor). What conclusions can you draw from your interview data?

In Good Company

When a sports magazine gets taken over by a media conglomerate, a seasoned and successful ad sales executive named Dan Foreman (Dennis Quaid) is stunned by his demotion. Carter Duryea (Topher Grace)—a business school prodigy who is half Dan's age and talks a lot about "corporate synergy"—is brought in as his new boss. Dan spent years developing good relationships with his clients, but Carter thinks it's more expedient to cross-promote the magazine with the corporation's cell phone division. In this clip from the film, Carter has come to appreciate Dan's work ethic and relationship skills, but his superior, Mark Steckle (Clark Gregg), wants to fire him. Carter stands up for Dan, even though it may mean he has to follow him out the door. Carter and Dan will have to work together if they're going to find a way to save their jobs.

What to Watch for and Ask Yourself

1. Which management skills discussed in this chapter does the character Mark Steckle seem to lack?
2. The sequence shows three people who represent different hierarchical levels in the company. Based on this scene, which of the four kinds of managers do you think each of them might be?
3. Which of the characters in this clip exhibited the strongest human skills?

Numi Organic Tea

When Danielle Oviedo became the manager of the Distribution Center at Numi Organic Tea in Oakland, California, her new direct reports were not happy about the change. They missed Oviedo's predecessor, who had treated them like her friends. But Numi was growing so fast that the company needed more than just a friendly face to manage its growing pains. The director of operations, Brian Durkee, hired Oviedo because her previous work experience showed she was someone who could help the company respond to the demands of rapid expansion. Oviedo says her first challenge at Numi was to get the employees to stop simply focusing on their individual tasks each day and work as a team toward common goals. In this video we see how she improved the way the company functioned to make it more efficient and competitive in a short amount of time.

What to Watch for and Ask Yourself

1. Which type of decisional role did Danielle Oviedo have to play at Numi in order to help the other employees adapt to changes she was instituting within the company?
2. Why did Brian Durkee believe Danielle Oviedo had what it took to be an effective manager at Numi?
3. What role did Danielle Oviedo's conceptual skills play when she took over as the manager of the distribution center at Numi? How did she use these skills to make improvements in the way the company runs?

What would You Do?

ISG Steelton–International Steel Group, Steelton, Pennsylvania.[1]

As the day-shift supervisor at the steel plant, you summon the six college students who are working for you this summer doing whatever you need done (sweeping up, sandblasting the inside of boilers that are down for maintenance, running errands, and so forth). You walk them across the plant to a field where the company stores scrap metal. The area, about the size of a football field, is stacked with organized piles of metal. You explain that everything they see has just been sold. Metal prices, which have been depressed, have finally risen enough that the company can earn a small profit by selling its scrap.

You point out that railroad tracks divide the field into parallel sectors, like the lines on a football field, so that each stack of metal is no more than 15 feet from a track. Each stack contains 390 pieces of metal. Each piece weighs 92 pounds and is about a yard long and just over 4 inches high and 4 inches wide. You tell the students that, working as a team, they are to pick up each piece, walk up a ramp to a railroad car that will be positioned next to each stack, and then neatly position and stack the metal for shipment. That's right, you repeat, ***92*** pounds, ***walk*** up the ramp, and ***carry*** the metal onto the rail car. Anticipating their questions, you explain that a forklift could be used only if the metal was stored on wooden pallets (it isn't), if the pallets could withstand the weight of the metal (they would be crushed), and if you, as their supervisor, had forklifts and people trained to run them (you don't). In other words, the only way to get the metal into the rail cars is for the students to carry it.

Based on an old report from the last time the company sold some of the metal, you know that workers typically loaded about 30 pieces of metal parts per hour over an 8-hour shift. At that pace, though, it will take your six students ***6 weeks*** to load all of the metal. But the purchasing manager who sold it says it must be shipped in ***2*** weeks. Without more workers (there's a hiring freeze) and without forklifts, all of the metal has to be loaded by hand by these six workers in 2 weeks. But how do you do that? What would motivate the students to work much, much harder than they have all summer? They've gotten used to a leisurely pace and easy job assignments. Motivation might help, but motivation will only get so much done. After all, short of illegal steroids, nothing is going to work once muscle fatigue kicks in from carrying those 92-pound pieces of metal up a ramp all day long. What can you change about the way the work is done to deal with the unavoidable physical fatigue?

If you were the supervisor in charge, what would you do?

Study Tips

Build a management time line. On a blank sheet of paper, construct a time line that shows the evolution of management theory. Draw a line that divides the paper down the middle. Then, place management theories on one side and overall historical events on the other.

This will help you see what was happening in management as a part of what was happening in the world in general. Examining theories in context can help you identify trends that are likely to emerge in the future.

The problems that the ISG steel plant supervisor is facing in the "What Would You Do?" case are certainly difficult, but they aren't unique. Each day, managers are asked to solve challenging problems and are given only a limited amount of time, people, or resources. Yet it's still their responsibility to get things done on time and within budget. Most of the management ideas and practices that today's managers use to solve their daily problems have their roots in the people and ideas you'll read about in this chapter on the history of management. Indeed, reading the theories in this chapter will enable you to figure out a solution to the ISG supervisor's problems.

We begin this chapter by reviewing the origins of management ideas and practice throughout history and the historical changes that produced the need for managers. Next, you'll learn about various schools of management thought. Beginning with scientific management, you'll learn about the key contributions made by Frederick Taylor, Frank and Lillian Gilbreth, and Henry Gantt. Next, you'll read about Max Weber and bureaucratic management and then about Henri Fayol and administrative management. Following that, you'll learn about human relations management and the ideas of Mary Parker Follett (constructive conflict and coordination), Elton Mayo (Hawthorne Studies), and Chester Barnard (cooperation and acceptance of authority). Finally, you'll learn about the history of operations management, information management, systems management, and contingency management.

IN THE BEGINNING

In this textbook, you've already learned that *management* is getting work done through others, that *strategic* plans are overall plans that clarify how a company will serve customers and position itself against competitors over the next 2 to 5 years, and that *just-in-time inventory* is a system in which the parts needed to make something arrive from suppliers just as they are needed at each stage of production. Today's managers would undoubtedly view those ideas and many of the others presented in the book as self-evident. For example, tell today's managers to "reward workers for improved production or performance," "set specific goals to increase motivation," or "innovate to create and sustain a competitive advantage," and they'll respond, "Duh! Who doesn't know that?" A mere 125 years ago, however, business ideas and practices were so different that today's widely accepted management ideas would have been as self-evident as space travel, cell phones, and the Internet. In fact, management jobs and careers didn't exist 125 years ago, so management was not yet a field of study. Now, of course, managers and management are such an important part of the business world that it's hard to imagine organizations without them. So if there were no managers 125 years ago, but you can't walk down the hall today without bumping into one, where did management come from?

After reading the next section, you should be able to

1. explain the origins of management.

1 THE ORIGINS OF MANAGEMENT

Management as a field of study may be just 125 years old, but management ideas and practices have actually been used from the earliest times of recorded history. For example, 2,500 years before management researchers called it *job enrichment*, the Greeks learned that they could improve the productivity of boring, repetitious tasks by performing them to music. The basic idea was to use a

flute, drum, or song lyrics to pace people to work in unison using the same efficient motions, stimulate them to work faster and longer, and make the boring work more fun.[2] Although we can find the seeds of many of today's management ideas throughout history, not until the last two centuries did systematic changes in the nature of work and organizations create a compelling need for managers.

1.1 Management Ideas and Practices throughout History

Examples of management thought and practice can be found throughout history.[3] For example, the earliest recorded instance of information management dates to ancient Sumer (modern Iraq), ca. 8000–3000 B.C.E. Sumerian businessmen used small clay tokens to calculate quantities of grain and livestock—and later value-added goods like perfume or pottery—they owned and traded in temples and at city gates. Different shapes and sizes represented different types and quantities of goods. The tokens were also used to store data. They were kept in small clay envelopes, and the token shapes were impressed on the outside of the envelope to indicate what was inside. Eventually, someone figured out that it was easier to just write these symbols with a stylus on a tablet instead of using the tokens. In the end, the new technology of *writing* led to more efficient management of the business of Sumerian temples.[4]

A task as enormous as building the great pyramids in Egypt was bound to present practical problems that would lead to the development of management ideas. Egyptians recognized the need for planning, organizing, and controlling; for submitting written requests; and for consulting staff for advice before making decisions. The enormity of the task they faced is evident in the pyramid of King Khufu, which contains 2.3 million blocks of stone. Each block had to be quarried, cut to precise size and shape, cured (hardened in the sun), transported by boat for 2 to 3 days, moved onto the construction site, numbered to identify where it would be placed, and then shaped and smoothed so that it would fit perfectly into place. It took 20,000 workers 23 years to complete this pyramid; more than 8,000 were needed just to quarry the stones and transport them. A typical quarry expedition might include 100 army officers, 50 government and religious officials, and 200 members of the king's court to lead the expedition; 130 stonemasons to cut the stones; and 5,000 soldiers, 800 barbarians, and 2,000 bond servants to transport the stones on and off the ships.[5]

Exhibit 2.1 shows how other management ideas and practices throughout history relate to the management functions in the textbook. Besides the achievements of the Sumerians and Egyptians, we might note the Babylonian King Hammurabi, who established controls by using witnesses and written documents; King Nebuchadnezzar, who over a millennium later pioneered techniques for producing goods and using wages to motivate workers; Sun Tzu,

1.2 Why We Need Managers Today

Working from 8 am to 5 pm, coffee breaks, lunch hours, crushing rush hour traffic, and punching a time clock are things we associate with today's working world. Work hasn't always been this way, however. In fact, the design of jobs and organizations has changed dramatically over the last 500 years. For most of humankind's history, for example, people didn't commute to work.[6] Work usually occurred in homes or on farms. In 1720, almost 80 percent of the 5.5 million people in England lived and worked in the country. And as recently as 1870, two-thirds of Americans earned their living from agriculture. Even most of those who didn't earn their living from agriculture didn't commute to work. Blacksmiths, furniture makers, leather goods makers, and other skilled tradespeople or craftspeople who formed trade guilds (the historical predecessors of labor unions) in England as early as 1093, typically worked out of shops in or next to their homes.[7] Likewise, cottage workers worked with each other out of small homes that were often built in a semicircle. A family in each cottage would complete a different production step, and work passed from one cottage to the next until production was complete. For example, textile work was a common cottage industry: Families in different cottages would shear the sheep; clean the wool; comb, bleach, and dye it; spin it into yarn; and weave the yarn into cloth. With no commute, no bosses (workers determined the amount and pace of their work), and no common building (from the time of the ancient Egyptians, Greeks, and Romans through the middle of the 19th century, it was rare for more than twelve people to work together under one roof), cottage work was very different from today's jobs and companies.[8] And because these work groups were small and typically self-organized, there wasn't a strong need for management.

During the Industrial Revolution (1750–1900), however, jobs and organizations changed dramatically.[9] First, unskilled laborers running machines began to replace high-paid, skilled artisans. What made this possible? The availability of power (steam engines and later electricity) as well as numerous related inventions, including Darby's coke-smelting process and Cort's puddling and rolling process (both for making iron), as well as Hargreave's spinning jenny and Arkwright's water frame (both for spinning cotton). Whereas artisans made entire goods by themselves by hand, this new production system was based on a division of labor: Each worker, interacting with machines, performed separate, highly specialized tasks that were but a small part of all the steps required to make manufactured goods. Mass production was born as rope- and chain-driven assembly lines moved work to stationary workers who concentrated on performing one small task over and over again. While workers focused on their singular tasks, managers were needed to coordinate the different parts of the production system and optimize its overall performance. Productivity skyrocketed at companies that understood this. At **Ford Motor Company**, where the assembly line was developed, the time required to assemble a car dropped from 12.5 man-hours to just 93 minutes after switching to mass production.[10]

Second, instead of being performed in fields, homes, or small shops, jobs occurred in large, formal organizations where hundreds, if not thousands, of people

worked under one roof.[11] In 1849, for example **Chicago Harvester** (the predecessor of International Harvester) ran the largest factory in the United States with just 123 workers. In 1870, the **Pullman Company**, a manufacturer of railroad sleeping cars, was the largest factory, with only 200 employees. Yet by 1913, Henry Ford employed 12,000 employees in his Highland Park, Michigan, factory alone. Because "the number of people working in manufacturing quintupled from 1860 to 1890", and individual factories employed so many workers under one roof, companies now had a strong need for disciplinary rules to impose order and structure. For the first time, they needed managers who knew how to organize large groups, work with employees, and make good decisions.

"The number of people working in manufacturing quintupled from 1860 to 1890."

The Origins of Management Management as a field of study may be just 125 years old, but management ideas and practices have actually been used since the beginning of recorded history. From the Sumerians as early as 8000 B.C.E. to 16th-century Europe, there are historical antecedents for each of the functions of management discussed in this textbook: planning, organizing, leading, and controlling. Despite these early examples of management ideas, there was no compelling need for managers until systematic changes in the nature of work and organizations occurred in the 19th and 20th centuries. During this time, work shifted from families to factories; from skilled laborers to specialized, unskilled laborers; from small, self-organized groups to large factories employing thousands under one roof; and from unique, small batches of production to large standardized mass production. Consequently, managers were needed to impose order and structure, to motivate and direct large groups of workers, and to plan and make decisions that optimized overall company performance by effectively coordinating the different parts of organizational systems.

THE EVOLUTION OF MANAGEMENT

Before 1880, business educators taught only basic bookkeeping and secretarial skills, and no one published books or articles about management.[12] Over the next 25 years, however, things changed dramatically. In 1881, Joseph Wharton gave the University of Pennsylvania $100,000 to establish a department to educate students for careers in management. By 1911, 30 business schools—including those at Harvard, the University of Chicago, and the University of California—had been established to teach managers how to run businesses.[13] In 1886, Henry Towne, president of the Yale and Towne Manufacturing Company, presented his ideas about management to the American Society of Engineers. In his talk, entitled "The Engineer as Economist," he emphasized that managing people and work processes was just as important as engineering work that focused on machines.[14] Towne also argued that management should be recognized as a separate field of study with its own professional associations, journals, and literature where management ideas could be exchanged and developed.

Today, because of the forethought and efforts of Joseph Wharton and Henry Towne, you can turn to dozens of academic journals (such as the Academy of

Management's *Journal* or *Review*, *Administrative Science Quarterly*, the *Strategic Management Journal*, and the *Journal of Applied Psychology*), hundreds of business school and practitioner journals (such as *Harvard Business Review*, *Sloan Management Review*, and the *Academy of Management Perspectives*), and thousands of books and articles if you have a question about management. In the next four sections, you will learn about other important contributors to the field of management and how their ideas shaped our current understanding of management theory and practice.

After reading the next four sections, which review the different schools of management thought, you should be able to

2. explain the history of scientific management.
3. discuss the history of bureaucratic and administrative management.
4. explain the history of human relations management.
5. discuss the history of operations, information, systems, and contingency management.

2 SCIENTIFIC MANAGEMENT

Bosses, who were hired by the company owner or founder, used to make decisions by the seat of their pants—haphazardly, without any systematic study, thought, or collection of information. If the bosses decided that workers should work twice as fast, little or no thought was given to worker motivation. If workers resisted, the bosses often resorted to physical beatings to get workers to work faster, harder, or longer. With no incentives for bosses and workers to cooperate with one another, both groups played the system by trying to take advantage of each other. Moreover, each worker did the same job in his or her own way with different methods and different tools. In short, there were no procedures to standardize operations, no standards by which to judge whether performance was good or bad, and no follow-up to determine if productivity or quality actually improved when changes were made.[15]

This all changed, however, with the advent of **scientific management**, which involved thorough study and testing of different work methods to identify the best, most efficient ways to complete a job. Let's find out more about scientific management by learning about **2.1 Frederick W. Taylor, the father of scientific management; 2.2 Frank and Lillian Gilbreth and motion studies; and 2.3 Henry Gantt and his Gantt charts**.

2.1 Father of Scientific Management: Frederick W. Taylor

Frederick W. Taylor (1856–1915), the father of scientific management, began his career as a worker at **Midvale Steel Company**. He was later promoted to pattern-maker, supervisor, and then chief engineer. At Midvale, Taylor was deeply affected by his 3-year struggle to get the men who worked for him to do, as he called it, "a fair day's work." Taylor, who had worked alongside the men as a coworker before becoming their boss, said, "We who were the workmen of that shop had the quantity output carefully agreed upon for everything that was turned out in the shop. We limited the output to about, I should think, one-third of what we could very well have done." Taylor explained that, as soon as he became the boss, "the men who

"Almost every act of the workman should be preceded by one or more preparatory acts of the management."

were working under me . . . knew that I was onto the whole game of **soldiering**, or deliberately restricting output."[16] When Taylor told his workers, "I have accepted a job under the management of this company and I am on the other side of the fence . . . I am going to try to get a bigger output," the workers responded, "We warn you, Fred, if you try to bust any of these rates [a **rate buster** was someone who worked faster than the group] we will have you over the fence in six weeks."[17]

Over the next 3 years, Taylor tried everything he could think of to improve output. By doing the job himself, he showed workers that it was possible to produce more output. He hired new workers and trained them himself, hoping they would produce more. But "very heavy social pressure" from the other workers kept them from doing so. Pushed by Taylor, the workers began breaking their machines so that they couldn't produce. Taylor responded by fining them every time they broke a machine and for any violation of the rules, no matter how small, such as being late to work. Tensions became so severe that some of the workers threatened to shoot him. Looking back at the situation, Taylor reflected, "It is a horrid life for any man to live, not to be able to look any workman in the face all day long without seeing hostility there and feeling that every man around one is his virtual enemy." He said, "I made up my mind either to get out of the business entirely and go into some other line of work, or to find some remedy for this unbearable condition."[18]

The remedy that Taylor eventually developed was scientific management. Taylor, who once described scientific management as "seventy-five percent science and twenty-five percent common sense," emphasized that the goal of scientific management was to use systematic study to find the "one best way" of doing each task. To do that, managers had to follow the four principles shown in Exhibit 2.2.[19] The first principle was to "develop a science" for each element of work. Study it. Analyze it. Determine the "one best way" to do the work. For example, one of Taylor's controversial proposals at the time was to give rest breaks to factory workers doing physical labor. We take morning, lunch, and afternoon breaks for granted, but in Taylor's day, factory workers were expected to work without stopping.[20] When Taylor said that breaks would increase worker productivity, no one believed him. Nonetheless, through systematic experiments, he showed that workers receiving frequent rest breaks were able to greatly increase their daily output.

EXHIBIT 2.2 Taylor's Four Principles of Scientific Management

First	Develop a science for each element of a man's work, which replaces the old rule-of-thumb method.
Second	Scientifically select and then train, teach, and develop the workman, whereas in the past he chose his own work and trained himself as best he could.
Third	Heartily cooperate with the men so as to ensure all of the work being done is in accordance with the principles of the science which has been developed.
Fourth	There is an almost equal division of the work and the responsibility between the management and the workmen. The management take over all the work for which they are better fitted than the workmen, while in the past almost all of the work and the greater part of the responsibility were thrown upon the men.

Source: F. W. Taylor, *The Principles of Scientific Management* (New York: Harper, 1911).

Second, managers had to scientifically select, train, teach, and develop workers to help them reach their full potential. Before Taylor, supervisors often hired on the basis of favoritism and nepotism. Who you knew was often more important than what you could do. By contrast, Taylor instructed supervisors to hire "first-class" workers on the basis of their aptitude to do a job well. In one of the first applications of this principle, physical reaction times were used to select bicycle ball-bearing inspectors who had to be able to examine and reject poor-quality ball bearings as fast as they were produced on a production line. For similar reasons, Taylor also recommended that companies train and develop their workers—a rare practice at the time.

The third principle instructed managers to cooperate with employees to ensure that the scientific principles were actually implemented. Labor unrest was widespread at the time; the number of labor strikes against companies doubled between 1893 and 1904. As Taylor knew from personal experience, workers and management more often than not viewed each other as enemies. Taylor's advice ran contrary to the common wisdom of the day. He said, "The majority of these men believe that the fundamental interests of employees and employers are necessarily antagonistic. Scientific management, on the contrary, has for its very foundation the firm conviction that the true interests of the two are one and the same; that prosperity for the employer cannot exist through a long term of years unless it is accompanied by prosperity for the employee and vice versa; and that it is possible to give the workman what he most wants—high wages—and the employer what he wants—a low labor cost—for his manufactures."[21]

The fourth principle of scientific management was to divide the work and the responsibility equally between management and workers. Prior to Taylor, workers alone were held responsible for productivity and performance. But, said Taylor, "Almost every act of the workman should be preceded by one or more preparatory acts of the management" which enable him to do his work better and quicker than he otherwise could. And each man should daily be taught by and receive the most friendly help from those who are over him, instead of being, at the one extreme, driven or coerced by his, bosses, and at the other left to his own unaided devices."[22]

Above all, Taylor felt these principles could be used to determine a "fair day's work," that is, what an average worker could produce at a reasonable pace, day in and day out. Once that was determined, it was management's responsibility to pay workers fairly for that fair day's work. In essence, Taylor was trying to align management and employees so that what was good for employees was also good for management. In this way, he felt, workers and managers could avoid the conflicts he had experienced

at Midvale Steel. And one of the best ways, according to Taylor, to align management and employees was to use incentives to motivate workers. As Taylor wrote:

> *In order to have any hope of obtaining the initiative of his workmen the manager must give some special incentive to his men beyond that which is given to the average of the trade. This incentive can be given in several different ways, as, for example, the hope of rapid promotion or advancement; higher wages, either in the form of generous piecework prices or of a premium or bonus of some kind for good and rapid work; shorter hours of labor; better surroundings and working conditions than are ordinarily given, etc., and, above all, this special incentive should be accompanied by that personal consideration for, and friendly contact with, his workmen which comes only from a genuine and kindly interest in the welfare of those under him. It is only by giving a special inducement or "incentive" of this kind that the employer can hope even approximately to get the "initiative" of his workmen.*[23]

In other words, Taylor believed in piece-rate incentives in which work pay was directly tied to how much workers produced.

Although Taylor remains a controversial figure among some academics who believe that his ideas were bad for workers, his key ideas have stood the test of time.[24] These include using systematic analysis to identify the best methods; scientifically selecting, training, and developing workers; promoting cooperation between management and labor; developing standardized approaches and tools; setting specific tasks or goals and then rewarding workers with financial incentives; and giving workers shorter work hours and frequent breaks. In fact, his ideas are so well accepted and widely used that we take most of them for granted. As eminent management scholar Edwin Locke says, "The point is not, as is often claimed, that he was 'right in the context of his time,' but is now outdated, but that *most of his insights are still valid today*."[25]

2.2 Motion Studies: Frank and Lillian Gilbreth

The husband and wife team Frank and Lillian Gilbreth are best known for their use of motion studies to simplify work, but they also made significant contributions to the employment of disabled workers and industrial psychology. Like Frederick Taylor, their early experiences significantly shaped their interests and contributions to management.

Though admitted to MIT, Frank Gilbreth (1868–1924) began his career as an apprentice bricklayer. While learning the trade, he noticed the bricklayers using three different sets of motions—one to teach others how to lay bricks, a second to work at a slow pace, and a third to work at a fast pace.[26] Wondering which was best, he studied the various approaches and began eliminating unnecessary motions. For example, by designing a stand that could be raised to waist height, he eliminated the need to bend over to pick up each brick. Turning to grab a brick was faster and easier than bending down. By having lower-paid workers place all the bricks with their most attractive side up, bricklayers didn't waste time turning a brick over to find it. By mixing a more consistent mortar, bricklayers no longer had to tap each brick numerous times to put it in the right position. Together, Gilbreth's improvements raised productivity from 120 to 350 bricks per hour and from 1,000 bricks to 2,700 bricks per day.

As a result of his experience with bricklaying, Gilbreth and his wife Lillian developed a long-term interest in using motion study to simplify work, improve productivity, and reduce the level of effort required to safely perform a job. Indeed, Frank

Gilbreth said, "The greatest waste in the world comes from needless, ill-directed, and ineffective motions."[27] **Motion study** broke each task or job into separate motions and then eliminated those that were unnecessary or repetitive. Because many motions were completed very quickly, the Gilbreths used motion-picture films, then a relatively new technology, to analyze jobs. Most film cameras at that time were hand cranked and thus variable in their film speed, so Frank Gilbreth invented the micro chronometer, a large clock that could record time to 1/2,000th of a second. By placing the micro chronometer next to the worker in the camera's field of vision and attaching a flashing strobe light to the worker's hands to better identify the direction and sequence of key movements, the Gilbreths could use film to detect and precisely time even the slightest, fastest movements. Motion study typically yielded production increases of 25 to 300 percent.[28] It was even used in hospitals to clearly identify the large amount of time that surgeons wasted looking for the next surgical instrument they needed. Frank Gilbreth improved this process by making a nurse responsible for organizing, retrieving, and handing surgical instruments to surgeons, a process still in use today.[29]

Frederick W. Taylor also strove to simplify work, but he did so by managing time rather than motion as the Gilbreths did.[30] Taylor developed time study to put an end to soldiering and to determine what could be considered a fair day's work. **Time study** worked by timing how long it took a "first-class man" to complete each part of his job. A standard time was established after allowing for rest periods, and a worker's pay would increase or decrease depending on whether the worker exceeded or fell below that standard.

One of the Gilbreths' most overlooked accomplishments was the critical role they played in rehabilitating and employing disabled workers.[31] After World War I, there were 13 million wounded and disabled soldiers in the United States and Europe. Frank Gilbreth worried, "What is to be done with the millions of cripples, when their injuries have been remedied as far as possible, and when they are obliged to become again a part of the working community?"[32] The Gilbreths were particularly sensitive to this issue because Frank himself had recovered from a rheumatism attack that had left him temporarily paralyzed from the neck down. So they applied motion study to identify the kinds of tasks that disabled workers could effectively perform. Nearly 75 years before the Americans with Disabilities Act became law (see Chapter 12 for more information), the Gilbreths argued that the government, employers, and engineers had an important role to play in employing disabled workers. The government's job, they said, was to provide vocational training. Indeed, in 1918, the U.S. Congress passed the Vocational Rehabilitation Act, adopting most of the Gilbreths' key recommendations. Employers, they said, should identify jobs that disabled people could perform. To help employers do this, the Gilbreths created a large slide show of pictures documenting the hundreds of ways in which disabled people could effectively perform jobs. Also, according to the Gilbreths, engineers had a responsibility to adapt and design machines so that disabled workers could use them.

Lillian Gilbreth (1878–1972) was an important contributor to management in her own right. She was the first woman to receive a Ph.D. in industrial psychology as well as the first woman to become a member of the Society of Industrial Engineers and the American Society of Mechanical Engineers. When Frank died in 1924, she continued the work of their management consulting company (which they had shared for over a dozen years) on her own. Lillian, who was concerned with the human side of work, was one of the first contributors to industrial psychology, originating ways to improve office communication, incentive programs, job satisfaction, and management training. Her work also convinced the government to enact laws regarding workplace safety, ergonomics, and child labor.

2.3 Charts: Henry Gantt

Henry Gantt (1861–1919) was first a protégé and then an associate of Frederick Taylor. Gantt is best known for the Gantt chart, but he also made significant contributions to management with respect to pay-for-performance plans and the training and development of workers. As shown in Exhibit 2.3, a **Gantt chart** visually indicates what tasks must be completed at which times in order to complete a project. It accomplishes this by showing time in various units on the *x*-axis and tasks on the *y*-axis. For example, Exhibit 2.3 shows that the following tasks must be completed by the following dates: In order to start construction on a new company headquarters by the week of November 18, the architectural firm must be selected by October 7, architectural planning done by November 4, permits obtained from the city by November 11, site preparation finished by November 18, and loans and financing finalized by November 18.

Though simple and straightforward, Gantt charts were revolutionary in the era of seat-of-the-pants management because of the detailed planning information they provided to managers. As Gantt wrote, "By using the graphical forms its [the Gantt chart's] value is very much increased, for the general appearance of the sheet is sufficient to tell how closely the schedule is being lived up to; in other words, whether the plant is being run efficiently or not."[33] Gantt said, "Such sheets show at a glance where the delays occur, and indicate what must have our attention in order to keep up the proper output." The use of Gantt charts is so widespread today that nearly all project management software and computer spreadsheets have the capability to create charts that track and visually display the progress being made on a project.

Gantt was much more sympathetic toward workers than Frederick Taylor was, and he introduced a significant change to Taylor's well-known piece-rate reward system. Unlike Taylor's system, in which payment was completely dependent on

production—if you produced at substandard levels, you got substandard pay—Gantt's task and bonus system did not punish workers for not achieving higher levels of production. Workers who produced more received a daily bonus, but those who didn't simply received their standard daily pay. The key, according to Gantt, was that his task and bonus system didn't punish workers for lower production as they took time to learn how to increase their production efficiency. Production usually doubled under Gantt's system.[34]

Finally, Gantt, along with Taylor, was one of the first to strongly recommend that companies train and develop their workers.[35] In his work with companies, he found that workers achieved their best performance levels if they were trained first. At the time, however, supervisors were reluctant to teach workers what they knew for fear that they could lose their jobs to more knowledgeable workers. Gantt overcame the supervisors' resistance by rewarding them with bonuses for properly training all of their workers. Said Gantt, "This is the first recorded attempt to make it in the financial interest of the foreman to teach the individual worker, and the importance of it cannot be overestimated, for it changes the foreman from a driver of men to their friend and helper."[36] Gantt's approach to training was straightforward: "(1) a scientific investigation in detail of each piece of work, and the determination of the best method and the shortest time in which the work can be done. (2) A teacher capable of teaching the best method and the shortest time. (3) Reward for both teacher and pupil when the latter is successful."[37]

Scientific Management In contrast to an unsystematic, seat-of-the-pants approach to management, scientific management recommended studying and testing different work methods to identify the best, most efficient ways to complete a job. According to Frederick W. Taylor, the father of scientific management, managers should follow four scientific management principles: (1) study each element of work to determine the "one best way" to do it; (2) scientifically select, train, teach, and develop workers to reach their full potential; (3) cooperate with employees to ensure implementation of the scientific principles; (4) divide the work and the responsibility equally between management and workers. Above all, Taylor felt these principles could be used to align managers and employees by determining a fair day's work, or what an average worker could produce at a reasonable pace, and a fair day's pay, or what management should pay workers for that effort. Taylor felt that incentives were one of the best ways to align management and employees.

The husband and wife team of Frank and Lillian Gilbreth are best known for their use of motion studies to simplify work. Whereas Taylor used time study to determine a fair day's work, based on how long it took a "first-class man" to complete each part of his job, Frank Gilbreth used film cameras and micro chronometers to conduct motion study to improve efficiency by categorizing and eliminating unnecessary or repetitive motions. The Gilbreths also made significant contributions to the employment of disabled workers, encouraging the government to rehabilitate them, employers to identify jobs that they could perform, and engineers to adapt and design machines they could use. Lillian Gilbreth, one of the first contributors to industrial psychology, originated ways to improve office communication, incentive programs, job satisfaction, and management training. She also convinced the government to enact laws regarding workplace safety, ergonomics, and child labor. Henry Gantt is best known for the Gantt chart, which graphically indicates when a series of tasks must be completed to perform a job or project, but he also developed ideas regarding pay-for-performance plans (where workers were rewarded for producing more but were not punished if they didn't) and worker training (all workers should be trained and their managers should be rewarded for training them).

3 BUREAUCRATIC AND ADMINISTRATIVE MANAGEMENT

The field of scientific management developed quickly in the United States between 1895 and 1920 and focused on improving the efficiency of manufacturing facilities and their workers. At about the same time, equally important ideas about bureaucratic and administrative management were developing in Europe. German sociologist Max Weber presented a new way to run entire organizations (bureaucratic management) in *The Theory of Economic and Social Organization*, published in 1922. Henri Fayol, an experienced French CEO, published his ideas about how and what managers should do in their jobs (administrative management) in *General and Industrial Management* in 1916. Although they were developed at the same time as scientific management, the ideas of Weber and Fayol would not begin to influence American ideas about management until after World War II, when their books were translated into English and published in the United States in 1947 and 1949, respectively.

Let's find out more about the contributions Weber and Fayol made to management by learning about **3.1 bureaucratic management and 3.2 administrative management**.

3.1 Bureaucratic Management: Max Weber

Today, when we hear the term *bureaucracy*, we think of inefficiency and red tape, incompetence and ineffectiveness, and rigid administrators blindly enforcing nonsensical rules. When German sociologist Max Weber (1864–1920) first proposed the idea of bureaucratic organizations, however, these problems were associated with monarchies and patriarchies rather than bureaucracies. In monarchies, where kings, queens, sultans, and emperors ruled, and patriarchies, where a council of elders, wise men, or male heads of extended families ruled, the top leaders typically achieved their positions by virtue of birthright. For example, when the queen died, her oldest son became king regardless of his intelligence, experience, education, or desire. Likewise, promotion to prominent positions of authority in monarchies and patriarchies was based on who you knew (politics), who you were (heredity), or ancient rules and traditions.

It was against this historical background of monarchical and patriarchic rule that Weber proposed the then new idea of bureaucracy. *Bureaucracy* comes from the French word *bureaucratie*. Since *bureau* means desk or office and *cratie* or *cracy* means to rule, *bureaucracy* literally means to rule from a desk or office. According to Weber, **bureaucracy** is "the exercise of control on the basis of knowledge."[38] Rather than ruling by virtue of favoritism or personal or family connections, people in a bureaucracy would lead by virtue of their rational-legal authority—in other words, their knowledge, expertise, or experience. Furthermore, the aim of bureaucracy is not to protect authority, but to achieve an organization's goals in the most efficient way possible.

Exhibit 2.4 shows the seven elements that, according to Weber, characterize bureaucracies. First, instead of hiring people because of their family or political connections or personal loyalty, they should be hired because their technical training or education qualifies them to do the job well. Second, along the same lines, promotion within the company should no longer be based on who you knew (politics) or who you were (heredity), but on your experience or achievements.

[Bureaucracy] the exercise of control on the basis of knowledge, expertise, or experience

And to further limit the influence of personal connections in the promotion process, *managers* rather than organizational owners should decide who gets promoted. Third, each position or job is part of a chain of command that clarifies who reports to whom throughout the organization. Those higher in the chain of command have the right, if they so choose, to give commands, take action, and make decisions concerning activities occurring anywhere below them in the chain. Unlike many monarchies or patriarchies, however, those lower in the chain of command are protected by a grievance procedure that gives them the right to appeal the decisions of those in higher positions. Fourth, to increase efficiency and effectiveness, tasks and responsibilities should be separated and assigned to those best qualified to complete them. Authority is vested in these task-defined positions rather than in people, and the authority of each position is clearly defined in order to reduce confusion and conflict. If you move to a different job in a bureaucracy, your authority increases or decreases commensurate with the responsibilities of that job. Fifth, because of his strong distaste for favoritism, Weber felt that an organization's rules and procedures should apply to all members regardless of their position or status. Sixth, to ensure consistency and fairness over time and across different leaders and supervisors, all rules, procedures, and decisions should be recorded in writing. Finally, to reduce favoritism, "professional" managers rather than company owners should manage or supervise the organization.

When viewed in historical context, Weber's ideas about bureaucracy represent a tremendous improvement in how organizations should be run. Fairness supplanted favoritism, the goal of efficiency replaced the goal of personal gain, and logical rules and procedures took the place of traditions or arbitrary decision making. Today, however, after more than a century of experience, we recognize that bureaucracy has limitations as well. Weber called bureaucracy the "iron cage" and said, "Once fully established, bureaucracy is among those social structures which are the hardest to destroy."[39] In bureaucracies, managers

are supposed to influence employee behavior by fairly rewarding or punishing employees for compliance or noncompliance with organizational policies, rules, and procedures. In reality, however, most employees would argue that bureaucratic managers emphasize punishment for noncompliance much more than rewards for compliance. Ironically, bureaucratic management was created to prevent just this type of managerial behavior. By encouraging managers to apply well-thought-out rules, policies, and procedures impartially and consistently to everyone in the organization, bureaucratic control is supposed to make companies more efficient, effective, and fair. But, as you'll read in Chapter 16 on control, it can sometimes have just the opposite effect. Managers who use bureaucratic control often put following the rules above all else. Too much emphasis on rule- and policy-driven decision making can make companies highly resistant to change and slow to respond to customers and competitors.

3.2 Administrative Management: Henri Fayol

Though his work was not translated and widely recognized in the United States until 1949, Frenchman Henri Fayol (1841–1925) was as important a contributor to the field of management as Frederick Taylor. Like Taylor and the Gilbreths, Fayol's work experience significantly shaped his thoughts and ideas about management. But, whereas Taylor's ideas changed companies from the shop floor up, Fayol's ideas were shaped by his experience as a managing director (CEO) and generally changed companies from the board of directors down.[40] Fayol is best known for developing five functions of managers and fourteen principles of management as well as for his belief that management can and should be taught to others.

Like his father, Henri Fayol enrolled in France's National School of Mines, graduating with an engineering degree at the age of 19.[41] His first job as a mining engineer was spent learning how to contain and put out underground fires. In this job, he began the valuable habit of recording notes about actions or happenings that either improved or decreased the productivity of the mine and its workers.[42] For instance, he wrote this note to himself about the cause of a work stoppage that occurred when his boss, the managing director, was gone: "May 1861. The horse on the sixth level of the St. Edmund pits broke its leg this morning. I made out an order for its replacement. The stableman refused to accept the order because it did not bear the Director's signature. The Director was absent. No one was designated to replace him. Despite my entreaties, the stableman persisted in his refusal. He had express orders, he said [not to provide a replacement horse unless the managing director ordered]. The injured horse was not replaced and production at the sixth level was lost."[43] It's very possible that this experience helped him form the now widely accepted management principle that a manager's authority should equal his or her responsibility.[44] In other words, because he was responsible for the productivity and production of coal at the St. Edmund's pit, his boss, the managing director, should have given him the authority to take actions commensurate with that responsibility, such as signing for a replacement horse. (See Chapter 9 for more on delegation, authority, and responsibility.)

The most formative events in Fayol's business career came during his 20-plus years as the managing director (CEO) of Compagnie de Commentry-Fourchambault-Decazeville, commonly known as **Comambault**, a vertically integrated steel company

that owned several coal and iron ore mines and employed 10,000 to 13,000 workers. Fayol was initially hired by the board of directors to shut down the "hopeless" steel company. The company was facing increased competition from English and German steel companies, which had lower costs, and from new steel mills in northern and eastern France, which were closer to major markets and thus could avoid the large shipping costs incurred by Fayol's company, located in central France.[45] In the 5 years before Fayol became CEO, production had dropped more than 60 percent, from 38,000 to 15,000 annual metric tons. Commambault had exhausted a key supply of coal needed for steel production, had already shut one steel mill down, and was losing money at another.[46] The company had quit paying dividends to shareholders and had no cash to invest in new technology, such as blast furnaces, that could lower its costs and increase productivity.

Henri Fayol conceived of the principles that today have been distilled into the four functions of management.

So the board hired Fayol as CEO to quickly dissolve and liquidate the business. But, after "four months of reflection and study," he presented the board with a plan, backed by detailed facts and figures, to save the company.[47] With little to lose, the board agreed. Fayol then began the process of turning the company around by obtaining supplies of key resources such as coal and iron ore; using research to develop new steel alloy products; carefully selecting key subordinates in research, purchasing, manufacturing, and sales and then delegating responsibility to them; and cutting costs by moving the company to a better location closer to key markets.[48] Looking back 10 years later, Fayol attributed his and the company's success to changes in management practices. He wrote, "When I assumed the responsibility for the restoration of Decazeville, I did not rely on my technical superiority. . . . I relied on my ability as an organizer [and my] skill in handling men."[49] Fayol concluded, "With the same [coal] mines, the same [steel] mills, the same financial resources, the same markets, the same Board of Directors and the same personnel, solely *with the application of a new way of running the company* [italics added], the firm experienced a rise [in its performance] comparable to its earlier decline."[50]

Based on his experience as a CEO, Fayol argued that "the success of an enterprise generally depends much more on the administrative ability of its leaders than on their technical ability."[51] And, as you learned in Chapter 1, Fayol argued that managers need to perform five managerial functions if they are to be successful: planning, organizing, coordinating, commanding, and controlling.[52] Because most management textbooks have dropped the coordinating function and now refer to Fayol's commanding function as "leading," these functions are widely known as planning (determining organizational goals and a means for achieving them), organizing (deciding where decisions will be made, who will do what jobs and tasks, and who will work for whom), leading (inspiring and motivating workers to work hard to achieve organizational goals), and controlling (monitoring progress toward goal achievement and taking corrective action when needed). In addition, according to Fayol, effective management is based on the fourteen principles in Exhibit 2.5.

EXHIBIT 2.5 Fayol's 14 Principles of Management

1.	**Division of work**	Increase production by dividing work so that each worker completes smaller tasks or job elements.
2.	**Authority and responsibility**	A manager's authority, which is the "right to give orders," should be commensurate with the manager's responsibility. However, organizations should enact controls to prevent managers from abusing their authority.
3.	**Discipline**	Clearly defined rules and procedures are needed at all organizational levels to ensure order and proper behavior.
4.	**Unity of command**	To avoid confusion and conflict, each employee should report to and receive orders from just one boss.
5.	**Unity of direction**	One person and one plan should be used in deciding the activities to be used to accomplish each organizational objective.
6.	**Subordination of individual interests to the general interest**	Employees must put the organization's interests and goals before their own.
7.	**Remuneration**	Compensation should be fair and satisfactory to both the employees and the organization; that is, don't overpay or underpay employees.
8.	**Centralization**	Avoid too much centralization or decentralization. Strike a balance depending on the circumstances and employees involved.
9.	**Scalar chain**	From the top to the bottom of an organization, each position is part of a vertical chain of authority in which each worker reports to just one boss. For the sake of simplicity, communication outside normal work groups or departments should follow the vertical chain of authority.
10.	**Order**	To avoid conflicts and confusion, order can be obtained by having a place for everyone and having everyone in their place; in other words, there should be no overlapping responsibilities.
11.	**Equity**	Kind, fair, and just treatment for all will develop devotion and loyalty. This does not exclude discipline, if warranted, and consideration of the broader general interest of the organization.
12.	**Stability of tenure of personnel**	Low turnover, meaning a stable work force with high tenure, benefits an organization by improving performance, lowering costs, and giving employees, especially managers, time to learn their jobs.
13.	**Initiative**	Because it is a "great source of strength for business," managers should encourage the development of initiative, the ability to develop and implement a plan, in others.
14.	**Esprit de corps**	Develop a strong sense of morale and unity among workers that encourages coordination of efforts.

Rodrigues, "Fayol's 14 Principles of Management Then and Now: A Framework for Managing Today's Organizations Effectively," *Management Decision* 39 (2001): 880–889.

Finally, Fayol, along with Joseph Wharton, was one of the first to argue that management could and should be taught to others. In short, Fayol believed that the principles of management could be taught in colleges and universities and that managers are not born but can be made through a combination of education and experience.

Bureaucratic and Administrative Management Today, when we hear the word *bureaucracy*, we think of inefficiency and red tape. Yet according to German sociologist Max Weber, bureaucracy—or running organizations on the basis of knowledge, fairness, and logical rules and procedures—would accomplish organizational goals much more efficiently than monarchies and patriarchies, where decisions were made on the basis of personal or family connections, personal gain, and arbitrary decision making. Bureaucracies are characterized by seven elements: qualification-based hiring; merit-based promotion; chain of command; division of labor; impartial application of rules and procedures; recording rules, procedures, and decisions in writing; and separating managers from owners. Nonetheless, bureaucracies are often inefficient and can be highly resistant to change.

The Frenchman Henri Fayol, whose ideas were shaped by his 20-plus years of experience as a CEO, is best known for developing five management functions (planning, organizing, coordinating, commanding, and controlling) and fourteen principles of management (division of work, authority and responsibility, discipline, unity of command, unity of direction, subordination of individual interests to the general interest, remuneration, centralization, scalar chain, order, equity, stability of tenure of personnel, initiative, and esprit de corps). He is also known for his belief that management can and should be taught to others.

4 HUMAN RELATIONS MANAGEMENT

As we have seen, scientific management focuses on improving efficiency; bureaucratic management focuses on using knowledge, fairness, and logical rules and procedures; and administrative management focuses on how and what managers should do in their jobs. The human relations approach to management focuses on *people*, particularly the psychological and social aspects of work. This approach to management sees people not as just extensions of machines but as valuable organizational resources in their own right. Human relations management holds that people's needs are important and understands that their efforts, motivation, and performance are affected by the work they do and their relationships with their bosses, coworkers, and work groups. In other words, efficiency alone is not enough. Organizational success also depends on treating workers well.

Let's find out more about human relations management by learning about **4.1 Mary Parker Follett's theories of constructive conflict and coordination; 4.2 Elton Mayo's Hawthorne Studies; and 4.3 Chester Barnard's theories of cooperation and acceptance of authority.**

4.1 Constructive Conflict and Coordination: Mary Parker Follett

Mary Parker Follett (1868–1933) was a social worker with a degree in political science who, in her fifties, after 25 years of working with schools and nonprofit organizations, began lecturing and writing about management and working extensively as a consultant for business and government leaders in the United States and Europe. Although her contributions were overlooked for decades, perhaps because she was a

woman or perhaps because they were so different, many of today's "new" management ideas can clearly be traced to her work.

Follett is known for developing ideas regarding constructive conflict and coordination. Constructive conflict, also called cognitive conflict, is one of Follett's most important contributions and is discussed further in Chapter 5 on decision making and Chapter 10 on teams. Unlike most people, then and now, who view conflict as bad, Follett believed that conflict could be beneficial. She said that conflict is "the appearance of difference, difference of opinions, of interests. For that is what conflict means—difference." She went on to say, "As conflict—difference—is here in this world, as we cannot avoid it, we should, I think, use it to work for us. Instead of condemning it, we should set it to work for us. Thus we shall not be afraid of conflict, but shall recognize that there is a destructive way of dealing with such moments and a constructive way."[53]

Follett believed that managers could deal with conflict in three ways: domination, compromise, and integration. She said, "**Domination**, obviously, is a victory of one side over the other. This is the easiest way of dealing with conflict, the easiest for the moment but not usually successful in the long run. . . . As for the second way of dealing with conflict, that of **compromise**, we understand [it] well, for it is the way we settle most of our controversies; each side gives up a little in order to have peace, or, to speak more accurately, in order that the activity which has been interrupted by the conflict may go on."[54] Follett continued, "Yet no one really wants to compromise, because that means a giving up of something. Is there then any other method of ending conflict? There is a way beginning now to be recognized at least, and even occasionally followed: when two desires are *integrated*, that means that a solution has been found in which both desires have found a place that neither side has had to sacrifice anything."[55]

So, rather than one side dominating the other or both sides compromising, the point of **integrative conflict resolution** is to have both parties indicate their preferences and then work together to find an alternative that meets the needs of both. According to Follett, "Integration involves invention, and the clever thing is to recognize this, and not to let one's thinking stay within the boundaries of two alternatives which are mutually exclusive." Indeed, Follett's ideas about the positive use of conflict and an integrative approach to conflict resolution predate accepted thinking in the negotiation and conflict resolution literature by six decades (see the best-selling book *Getting to Yes: Negotiating Agreement without Giving In* by Roger Fisher, William Ury, and Bruce Patton).

Follett's writing on the role of coordination in organizations is another of her important contributions. She lists four fundamental principles of organizations:

1. Coordination as reciprocal relating all the factors in a situation.
2. Coordination by direct contact of the responsible people concerned.
3. Coordination in the early stages.
4. Coordination as a continuing process.

Follett's first principle recognizes that most activities and events in an organization are interrelated. Make just one change, and other changes, some expected but some not, will occur. Cut costs, and quality may be affected. Change the raw ingredients used to make a product, and manufacturing procedures may no longer work. Marketing offers customers special incentives to buy more products, and operations has to work overtime to keep up with the increased demand. Because of these interrelations, leaders at different levels and in different parts of the organization must

[Domination] an approach to dealing with conflict in which one party satisfies its desires and objectives at the expense of the other party's desires and objectives

[Compromise] an approach to dealing with conflict in which both parties give up some of what they want in order to reach agreement on a plan to reduce or settle the conflict

[Integrative conflict resolution] an approach to dealing with conflict in which both parties indicate their preferences and then work together to find an alternative the meets the needs of both

coordinate their efforts to solve problems and produce the best overall outcomes in an integrative way. In short, managers cannot manage their part of the organization while ignoring its other parts. What each manager does affects other parts of the organization and vice versa.

Follett explains her second principle, coordination by direct contact of the people concerned, and her third principle, coordination in the early stages, this way: "Direct contact must begin in the earliest stages of the process. . . . If the heads of departments confront each other with finished policies, agreement will be found difficult. . . . But if these heads meet while they are forming their policies, meet and discuss the questions involved, a successful co-relation is far more likely to be reached. Their thinking has not become crystallized. They can still modify one another."[56] In other words, better outcomes will be achieved if the people affected by organizational issues and problems meet early and directly to address them. Working with those involved or affected will produce more effective solutions than will isolating or ignoring them.

With respect to her fourth principle, coordination as a continuing process, Follett said: "It is a fallacy to think that we can solve problems—in any final sense. The belief that we can do so is a drag upon our thinking. What we need is a process for meeting problems. When we think we have solved one, well, by the very process of solving, new elements or forces come into the situation and you have a new problem on your hands to be solved."[57] Consequently, there is always a need for early, integrative coordination of the people affected by organizational situations, problems, or issues. The need for coordination never goes away.

Exhibit 2.6 summarizes Follett's contributions to management in her own words. She casts power as "with" rather than "over" others. Giving orders involves discussing instructions and resentment. Authority flows from job knowledge and experience rather than position. Leadership involves setting the tone for the team rather than being aggressive and dominating, which may be harmful. Coordination and control should be based on facts and information. In the end, Follett's contributions added significantly to our understanding of the human, social, and psychological sides of management. Peter Parker, the former chair of the London School of Economics, said about Follett: "People often puzzle about who is the father of management. I don't know who the father was, but I have no doubt about who was the mother."[58]

4.2 Hawthorne Studies: Elton Mayo

Australian-born Elton Mayo (1880–1948) is best known for his role in the famous Hawthorne Studies at the **Western Electric Company**. His ideas became popular during the early 20th century when labor unrest, dissatisfaction, and protests (some of them violent) were widespread in the United States, Europe, and Asia. In 1919 alone, for example, more than 4 million American workers went on strike.[59]

Working conditions contributed to the unrest. Millions of workers in large factories toiled at boring, repetitive, unsafe jobs for low pay. Employee turnover was high and absenteeism was rampant. With employee turnover approaching 380 percent in his automobile factories, Henry Ford had to double the daily wage of his manufacturing workers from $2.50, the going wage at the time, to $5.00 to keep enough workers at their jobs. Workers joined labor unions to force companies to improve their pay and working conditions.

In 1913, the federal government created the U.S. Department of Labor "to foster, promote and develop the welfare of working people, to improve their working conditions and to enhance their opportunities for profitable employment." In 1935, Congress passed the National Labor Relations Act (also known as the Wagner Act),

EXHIBIT 2.6 Some of Mary Parker Follett's Key Contributions to Management

Constructive conflict	• "As conflict—difference—is here in this world, as we cannot avoid it, we should, I think, use it to work for us. Instead of condemning it, we should set it to work for us."
Power	• "Power might be defined as simply the ability to make things happen, to be a causal agent, to initiate change." • "It seems to me that whereas power usually means power-over, the power of some person or group over some other person or group, it is possible to develop the conception of power-with, a jointly developed power, a co-active, not a coercive power."
The giving of orders	• "Probably more industrial trouble has been caused by the manner in which orders have been given than in any other way." • "But even if instructions are properly framed, are not given in an overbearing manner, there are many people who react violently against anything that they feel is a command. It is often the command that is resented, not the thing commanded." • "An advantage of not exacting blind obedience, of discussing your instructions with your subordinates, is that if there is any resentment, any come-back, you get it out into the open, and when it is in the open you can deal with it."
Authority	• "Indeed there are many indications in the present reorganization of industry that we are beginning to rid ourselves of the over and under idea, that we are coming to a different conception of authority, many indications that there is an increasing tendency to let the job itself, rather than the position occupied in a hierarchy, dictate the kind and amount of authority." • "Authority should go with knowledge and experience, that is where obedience is due, no matter whether it is up the line or down."
Leadership	• "Of the greatest importance is the ability to grasp a total situation.... Out of a welter of facts, experience, desires, aims, the leader must find the unifying thread. He must see a whole, not a mere kaleidoscope of pieces.... The higher up you go, the more ability you have to have of this kind." • "The leader makes the team. This is pre-eminently the leadership quality—the ability to organize all the forces there are in an enterprise and make them serve a common purpose." • "[It is wrong to assume] that you cannot be a good leader unless you are aggressive, masterful, dominating. But I think not only that these characteristics are not the qualities essential to leadership but, on the contrary, that they often militate directly against leadership."
Coordination	• "One which I consider a very important trend in business management is a system of cross-functioning between the different departments.... Each department is expected to get in touch with certain others." • "Many businesses are now organized in such a way that you do not have an ascending and descending ladder of authority. You have a degree of cross-functioning, of inter-relation of departments, which means a horizontal rather than a vertical authority." • "The most important thing to remember about unity is—that there is no such thing. There is only unifying. You cannot get unity and expect it to last a day—or five minutes. Every man in a business should be taking part in a certain process and that process is unifying."
Control	• "Control is coming more and more to mean fact-control rather than man-control." • "Central control is coming more and more to mean the co-relation of many controls rather than a superimposed control."

which gave workers the legal right to form unions and collectively bargain with their employers but prevented companies from engaging in unfair labor practices to "bust" unions. In this historical context, Mayo's work on the Hawthorne Studies proved highly relevant as managers looked for ways to increase productivity as well as improve worker satisfaction and working conditions.[60]

The Hawthorne Studies were conducted in several stages between 1924 and 1932 at a Western Electric plant in Chicago. Although Mayo didn't join the studies until

1928, he played a significant role thereafter, writing about the results in his book *The Human Problems of an Industrial Civilization*.[61] The first stage of the Hawthorne Studies investigated the effects of lighting levels and incentives on employee productivity in the Relay Test Assembly Room, where workers took approximately a minute to put "together a coil, armature, contact springs, and insulators in a fixture and secure the parts by means of four machine screws."[62]

Two groups of six experienced female workers, five to do the work and one to supply needed parts, were separated from the main part of the factory by a 10-foot partition and placed at a standard work bench with the necessary parts and tools. Over the next 5 years, the experimenters introduced various levels and combinations of lighting, financial incentives, and rest pauses (work breaks) to study the effect on productivity. Curiously, however, production levels increased whether the experimenters increased or decreased the lighting, paid workers based on individual production or group production, or increased or decreased the number and length of rest pauses. In fact, Mayo and his fellow researchers were surprised that production steadily increased from 2,400 relays per day at the beginning of the study to 3,000 relays per day 5 years later. The question was: Why?

Mayo and his colleagues eventually concluded that two things accounted for the results. First, substantially more attention was paid to these workers than to workers in the rest of the plant. Mayo wrote, "Before every change of program [in the study], the group is consulted. Their comments are listened to and discussed; sometimes their objections are allowed to negate a suggestion. The group unquestionably develops a sense of participation in the critical determinations and becomes something of a social unit."[63]

© BETTMAN/CORBIS

Although Mayo's studies used several variables, like lighting and incentives to increase productivity, it turned out that productivity increased no matter what changes were made. Mayo concluded that paying more attention to the workers and the development of the workers into a cohesive group produced higher levels of productivity and job satisfaction.

For years, the "Hawthorne Effect" has been *incorrectly* defined as increasing productivity by paying more attention to workers.[64] But it is not simply about attention from management. The Hawthorne Effect cannot be understood without giving equal importance to the social units, which became intensely cohesive groups. Mayo said, "What actually happened was that six individuals became a team and the team gave itself wholeheartedly and spontaneously to cooperation in the experiment. The consequence was that they felt themselves to be participating freely and without afterthought, and were happy in the knowledge that they were working without coercion from above or limits from below."[65] Together, the increased attention from management and the development of a cohesive work group led to significantly higher levels of job satisfaction *and* productivity.

Mayo and his research colleagues concluded:

- "There has been an important increase in contentment among the girls working in the test-room conditions."
- "There has been a decrease in absences of about 80 percent among the girls since entering the test-room group."
- "The changed working conditions have resulted in creating an eagerness on the part of the operators to come to work in the morning."
- "The operators have no clear idea as to why they are able to produce more in the test room; but as shown in the replies to the questionnaires . . . there is the feeling that better output is in some way related to the distinctly pleasanter, freer, and happier work conditions."[66]

"Workers' feelings and attitudes affected their work."

For the first time, human factors related to work were found to be more important than the physical conditions or design of the work. In short, the Hawthorne Studies found that workers' feelings and attitudes affected their work.

The next stage of the Hawthorne Studies was conducted in the Bank Wiring Room, where "the group consisted of nine wiremen, three solderers, and two inspectors. Each of these groups performed a specific task and collaborated with the other two in completion of each unit of equipment. The task consisted of setting up the banks of terminals side-by-side on frames, wiring the corresponding terminals from bank to bank, soldering the connections, and inspecting with a test set for short circuits or breaks in the wire. One solderman serviced the work of the three wireman."[67] While productivity increased in the Relay Test Assembly Room no matter what the researchers did, productivity dropped in the Bank Wiring Room. Again, the question was: Why?

Mayo and his colleagues found that group effects were just as responsible for the decline in performance in the Bank Wiring Room as they were for the increased performance in the Relay Test Assembly Room. The difference was that the workers in the Bank Wiring Room had been an existing work group for some time and had already developed strong negative norms that governed their behavior. For instance, despite a group financial incentive for production, the group members decided that they would wire only 6,000 to 6,600 connections a day (depending on the kind of equipment they were wiring), well below the production goal of 7,300 connections that management had set for them. Individual workers who worked at a faster pace were socially ostracized from the group or "binged" (hit on the arm) until they slowed their work pace. Thus, the group's behavior was reminiscent of the soldiering that Frederick Taylor had observed. Mayo concluded, "Work [was] done in accord with the group's conception of a day's work; this was exceeded by only one individual who was cordially disliked."[68]

In the end, the Hawthorne Studies demonstrated that the workplace was more complex than previously thought, that workers were not just extensions of machines, and that financial incentives weren't necessarily the most important motivator for workers. By highlighting the crucial role, positive or negative, that groups, group norms, and group behavior play at work, Mayo strengthened Mary Parker Follett's point about coordination—make just one change in an organization and others, some expected and some unexpected, will occur. Thanks to Mayo and his colleagues and their work on the Hawthorne Studies, managers better understood the effect that group social interactions, employee satisfaction, and attitudes had on individual and group performance.

4.3 Cooperation and Acceptance of Authority: Chester Barnard

Like Henri Fayol, Chester Barnard (1886–1961) had experiences as a top executive that shaped his views of management. Barnard began his career in 1909 as an engineer and translator for AT&T, becoming a general manager at Pennsylvania Bell Telephone in 1922 and then president of **New Jersey Bell Telephone** in 1927.[69] Barnard's ideas, published in his classic book, *The Functions of the Executive*, influenced companies from the board of directors down. He is best known for his ideas about cooperation and the acceptance of authority.

Barnard proposed a comprehensive theory of cooperation in formal organizations. In fact, he defines an **organization** as a "system of consciously coordinated activities or forces of two or more persons."[70] In other words, organization occurs whenever two people work together for some purpose, whether it be classmates working together to complete a class project, Habitat for Humanity volunteers donating their time to build a house, or managers working with subordinates to reduce costs, improve quality, or increase sales. Why did Barnard place so much emphasis on cooperation? Because cooperation is *not* the normal state of affairs: "Failure to cooperate, failure of cooperation, failure of organization, disorganization, disintegration, destruction of organization—and reorganization—are characteristic facts of human history."[71]

Barnard argued that managers can gain others' cooperation by completing three executive functions: securing essential services from individuals, formulating an organization's purpose and objectives, and providing a system of communication. By "securing essential services from individuals," Barnard meant that managers must find ways to encourage workers to *willingly* cooperate with each other and management to achieve organizational goals. According to Barnard, managers can gain workers' willing cooperation by offering them *material incentives* such as money or tangible rewards; *nonmaterial incentives* such as recognition, prestige, personal power, improved working conditions, or satisfaction of personal ideals or needs; and *associational incentives* such as the chance to work with people they like or to be more directly involved or associated with key events or processes in the organization.[72]

Top executives unify people in the company by "formulating an organization's purpose and objectives," or making clear what needs to be accomplished. If the organization's purpose is clear, then each person in each job at each level of the company should understand how his or her daily activities, behaviors, and choices contribute to the accomplishment of that purpose. This is the ultimate form of cooperation in an organization. If, however, the organization's purpose is not clear, then departmental or personal objectives may become more important than organizational objectives.

[Organization] a system of consciously coordinated activities or forces created by two or more people

doing the right thing

A Dangerous Mix: Power, Authority, and Autonomy

Because of their authority to hire, fire, and reward employees, nearly all managers have the power to influence those who work for them. With jobs, promotions, or pay raises on the line, few will challenge what the boss wants, unless, as Chester Barnard suggested, they're asked to do something wrong. Even then, the boss's power and authority can be enough to get some subordinates to comply. Most dangerous of all, though, are managers who have power, authority, and autonomy. Adding the freedom and independence of autonomy to power and authority is like dropping a tank of gasoline on an already burning fire. An explosion is sure to result. Why? The reason is that managers with autonomy may begin to believe that the rules don't apply to them. When that happens, they're much more likely to engage in questionable, unethical, or illegal behavior. Wake Forest University Professors John Dunkelberg and Debra Ragin Jessup studied six managers who engaged in spectacular cases of unethical and illegal behavior. Here's what they found: "The desire to commit unethical acts is nothing without the autonomy to do so. Autonomy is the factor in the equation that sends intelligent successful people over the ethical edge. They believe they are invincible because no one is looking over their shoulder." The solution, according to Dunkelberg and Jessup, is to make sure that even the most powerful people in the company have checks, balances, and controls on their autonomy.[73]

The result is a less cohesive organization in which workers are less likely to cooperate to accomplish the organization's goals.

By "providing a system of communication," Barnard meant that managers must create an organizational structure with a clear hierarchy (one that delineates responsibilities, tasks, and jobs) and hire and promote the right people into management—that is, talented people with the right skills and education who will put the organization's needs before their own. Those managers, in turn, are responsible for promoting cooperation by effectively communicating the organization's purpose and objectives and by minimizing organizational politics.

Finally, the extent to which people willingly cooperate in an organization depends on how workers perceive executive authority and whether they're willing to accept it. According to Barnard, there is a *zone of indifference* for many managerial requests or directives in which acceptance of managerial authority is automatic. For example, if your boss asks you for a copy of the monthly inventory report, and compiling and writing that report is part of your job, you think nothing of the request and automatically send it. In general, people will be indifferent to managerial directives or orders if they (1) are understood, (2) are consistent with the purpose of the organization, (3) are compatible with the people's personal interests, and (4) can actually be carried out by those people.

Acceptance of managerial authority (i.e., cooperation) is not automatic, however. Ask people to do things contrary to the organization's purpose or to their own

benefit and they'll put up a fight. So, while many people assume that managers have the authority to do whatever they want, Barnard, referring to the "fiction of superior authority," believed that workers ultimately grant managers their authority. Consequently, Barnard maintained that it is more effective to induce workers' willing cooperation through incentives, clearly formulated organizational objectives, and effective communication throughout the organization than it is to threaten them into cooperation.

Human Relations Management Unlike most people who view conflict as bad, Mary Parker Follett, the mother of modern management, believed that conflict could be a good thing and that it should be embraced rather than avoided. She noted three ways of dealing with conflict—domination, compromise, and integration—and argued that the latter was best because it focuses on developing creative methods for meeting conflicting parties' needs. Follett also used four principles to emphasize the importance of coordination in organizations. She believed that the best overall outcomes are achieved when leaders and workers at different levels and in different parts of the organization directly coordinate their efforts to solve problems in an integrative way.

Elton Mayo is best known for his role in the Hawthorne Studies at the Western Electric Company. In the first stage of the Hawthorne Studies, production went up because the increased attention paid to the workers in the study and their development into a cohesive work group led to significantly higher levels of job satisfaction and productivity. In the second stage, productivity dropped because the workers had already developed strong negative norms in which individual "rate busters" who worked faster than the rest of the team or cooperated with management were ostracized or "binged." The Hawthorne Studies demonstrated that workers' feelings and attitudes affected their work, that financial incentives weren't necessarily the most important motivator for workers, and that group norms and behavior play a critical role in behavior at work.

Chester Barnard, president of New Jersey Bell Telephone, emphasized the critical importance of willing cooperation in organizations and said that managers could gain workers' willing cooperation through three executive functions: securing essential services from individuals (through material, nonmaterial, and associational incentives), unifying the people in the organization by clearly formulating the organization's purpose and objectives, and providing a system of communication. Finally, although most managerial requests or directives will be accepted because they fall within the zone of indifference, Barnard maintains that it is more effective to induce cooperation through incentives, clearly formulating organizational objectives, and effective communication throughout the organization. Ultimately, he says, workers grant managers their authority, not the other way around.

5 OPERATIONS, INFORMATION, SYSTEMS, AND CONTINGENCY MANAGEMENT

In this last section, we review four other significant historical approaches to management that have influenced how today's managers produce goods and services on a daily basis, gather and manage the information they need to understand their businesses and make good decisions, understand how the

different parts of the company work together as a whole, and recognize when and where particular management practices are likely to work.

To better understand these ideas, let's learn about **5.1 operations management, 5.2 information management, 5.3 systems management, and 5.4 contingency management.**

5.1 Operations Management

In Chapter 18, you will learn about *operations management*, which involves managing the daily production of goods and services. In general, operations management uses a quantitative or mathematical approach to find ways to increase productivity, improve quality, and manage or reduce costly inventories. The most commonly used operations management tools and methods are quality control, forecasting techniques, capacity planning, productivity measurement and improvement, linear programming, scheduling systems, inventory systems, work measurement techniques (similar to the Gilbreths' motion studies), project management (similar to Gantt's charts), and cost-benefit analysis.[74]

Today, with those tools and techniques, we take it for granted that manufactured goods will be made with standardized, interchangeable parts; that the design of those parts will be based on specific, detailed plans; and that manufacturing companies will aggressively manage inventories to keep costs low and increase productivity. These key elements of operations management have some rather strange origins: guns, geometry, and fire.

Since 1526, in Gardone, Italy, the descendants of Bartolomeo Beretta have been making world-renowned **Beretta** firearms and gun barrels. Throughout most of the company's history, skilled craftspeople made the lock, stock, and barrel of a Beretta gun by hand. After each part was made, a skilled gun finisher assembled the parts into a complete gun. But the gun finisher did not simply screw the different parts of a gun together, as is done today. Instead, each handmade part required extensive finishing and adjusting so that it would fit together with the other handmade gun parts. Hand-fitting was necessary because, even when made by the same skilled crafts people no two parts were alike. In fact, gun finishers played a role similar to that of fine watchmakers who meticulously assembled expensive watches—without them, the product simply wouldn't work. Today, we would say that these parts were low quality because they varied so much from one part to another. You'll learn more about variation and quality in Chapter 18 on managing service and manufacturing operations.

All this changed in 1791 when the U.S. government, worried about a possible war with France, ordered 40,000 muskets from private gun contractors. Like Beretta, all but one contractor built handmade muskets assembled by skilled gun finishers who made sure that all the parts fit together. Thus, each musket was unique. If a part broke, a replacement part had to be handcrafted. But one contractor, Eli Whitney of New Haven, Connecticut (who is better known for his invention of the cotton gin) determined that if gun parts were made accurately enough, guns could be made with standardized, interchangeable parts. So he designed machine tools that allowed unskilled workers to make each gun part the same as the next. Said Whitney, "The tools which I contemplate to make are similar to an engraving on copper plate from which may be taken a great number of impressions perceptibly alike."[75] Years passed before Whitney delivered his 10,000 muskets to the U.S. government. But he demonstrated the superiority of interchangeable parts to President-elect Thomas Jefferson in 1801 by quickly and easily assembling complete

muskets from randomly picked piles of musket parts. Today, because of Whitney's ideas, most products, from cars to toasters to space shuttles, are manufactured using standardized, interchangeable parts.

But even with this advance, manufacturers still could not produce a part unless they had seen or examined it firsthand. Thanks to Gaspard Monge, a Frenchman of modest beginnings, this soon changed. In Monge's time, maps were crude, often inaccurate, and almost never up-to-date. In 1762, however, the 16-year-old Monge drew a large-scale map of the town of Beaune, France. He developed new surveying tools and systematic methods of observation so that every feature on the map was in proportion and correctly placed. Monge's advanced skills as a draftsperson led to his appointment to the prestigious École Militaire de Mézières, a military institute, where one of his first assignments was to determine the proper placement of cannons for a military fortress. This task normally involved long, complicated mathematical computations. But Monge used the geometrical principles he had developed as a draftsperson to calculate his estimates so quickly that, at first, commanders refused to believe they were accurate. Soon, however, they realized the importance of his breakthrough and protected it as a military secret for more than a decade.[76]

Monge's greatest achievement was his book *Descriptive Geometry*. In it, he explained techniques for drawing three-dimensional objects on paper. For the first time, precise drawings permitted manufacturers to make standardized, interchangeable parts without first examining a prototype. Today, thanks to Monge, manufacturers rely on CAD (computer-aided design) and CAM (computer-aided manufacturing) to take three-dimensional designs straight from the computer to the factory floor.

Once standardized, interchangeable parts became the norm, and once parts could be made from design drawings alone, manufacturers ran into a costly problem that they had never faced before: too much inventory. *Inventory* is the amount and number of raw materials, parts, and finished products that a company has in its possession. In fact, large factories were accumulating parts inventories sufficient for 2 to 3 months, much more than they needed on a daily basis to run their manufacturing operations.

"Once standardized, interchangeable parts became the norm, and once parts could be made from design drawings alone, manufacturers ran into a costly problem that they had never faced before: too much inventory."

A solution to this problem was found in 1905 when the **Oldsmobile Motor Works** in Detroit burned down. At a time when cars were far too expensive for most Americans, Oldsmobile had become the leading automobile manufacturer in the United States by being the first to produce an affordable car. When the Oldsmobile factory burned down, management rented a new production facility to get production up and running as quickly as possible. But because the new facility was much smaller, there was no room to store large stockpiles of inventory (which the company couldn't afford anyway as it was short on funds). Therefore, the company made do with what it called "hand-to-mouth inventories," in which each production station had only enough parts on hand to do a short production run. Fortunately, since all of its parts suppliers were close by, Oldsmobile could place orders in the morning and receive them in the afternoon (even without telephones), just like today's computerized, just-in-time inventory systems.

So, contrary to common belief, just-in-time inventory systems were not invented by Japanese manufacturers. Instead, they were invented out of necessity a century ago because of a fire. You can learn more about just-in-time inventory management in Chapter 18.

5.2 Information Management

The earliest known use of written information occurred nearly 60,000 years ago when Cro-Magnons, from whom modern humans descended, created and recorded a lunar calendar. The calendar consisted of 28 symbols carved into a reindeer antler and indicated when the waters would be high. The calendar was used to track and kill deer, bison, and elk that would gather at river crossings.[77] For most of recorded history, information has been costly, difficult to obtain, and slow to spread. Because of the immense labor and time it took to hand-copy information, books, manuscripts, and written documents of any kind were rare and extremely expensive. Word of Joan of Arc's death in 1431 took 18 months to travel from France across Europe to Constantinople (now Istanbul, Turkey). Most people literally heard news and information from the town crier (Hear ye! Hear ye!) or from minstrel and acting groups who relayed information as they traveled from town to town.

Yet, as you will learn in Chapter 17, accurate, timely, relevant, and complete information has been important to businesses throughout history. Indeed, as we discussed at the beginning of this chapter, most of the clay tablets unearthed in our earliest cities are business and economic texts. Consequently, throughout history, organizations have pushed for and quickly adopted new information technologies that reduce the cost or increase the speed with which they can acquire, store, retrieve, or communicate information.

The first technologies to truly revolutionize the business use of information were paper and the printing press. In the 14th century, water-powered machines were created to pulverize rags into pulp to make paper. Paper prices, which were already lower than those of animal-skin parchments, dropped dramatically. Less than a half-century later, Johannes Gutenberg invented the printing press, which greatly reduced the cost and time needed to copy written information. In 15th-century Florence, Italy, a scribe would charge 1 florin (an Italian unit of money) to hand-copy one document page. By contrast, a printer would set up and print 1,025 copies of the same document for just 3 florins. Within 50 years of its invention, Gutenberg's printing press cut the cost of information by 99.8 percent!

What Gutenberg's printing press did for publishing, the manual typewriter did for daily communication. Before 1850, most business correspondence was written by hand and copied using the letter press. With the ink still wet, the letter would be placed into a tissue-paper book. A hand press would then be used to squeeze the book and copy the still-wet ink onto the tissue paper. By the 1870s, manual typewriters made it cheaper, easier, and faster to produce and copy business correspondence. Of course, in the 1980s, slightly more than a century later, typewriters were replaced by personal computers and word processing software for identical reasons.

As the volume of printed information increased, businesses needed new ways to organize and make sense of it. Vertical file cabinets and the Woodruff file, invented in 1868, represented major advances in information storage and retrieval. Once sales orders or business correspondence were put in the proper file drawer, they could be found easily and quickly by anyone familiar with the system. The cash register, invented in 1879, kept salesclerks honest by recording all sales transactions on a roll of paper securely locked inside the machine. But managers soon realized that its most important contribution was better management and control of their business. For example, department stores could track performance and sales by installing separate cash registers in the food, clothing, and hardware departments. Time clocks, introduced in the 1890s, helped businesses keep track of worker hours and costs.

Finally, businesses have always looked for information technologies that would speed access to timely information. The Medici family, which opened banks throughout Europe in the early 1400s, used posting messengers to keep in contact with their more than 40 branch managers. The post messengers, who predated the U.S. Postal Service Pony Express by 400 years, could travel 90 miles per day, twice what average riders could cover, because the Medicis were willing to pay for the expense of providing them with fresh horses. This need for timely information also led companies to quickly adopt the telegraph in the 1860s, the telephone in the 1880s, and, of course, Internet technologies in the last decade. See Chapter 17 for more on how companies are using today's technologies to lower the cost and increase the speed with which accurate, timely, relevant, and complete information is acquired.

5.3 Systems Management

Today's companies are much more complex than they used to be. They are larger and employ more people. They most likely manufacture, service, *and* finance what they sell, not only in their home markets but in foreign markets throughout the world, too. They also operate in complex, fast-changing, competitive, global environments that can quickly turn competitive advantages into competitive disadvantages. How, then, can managers make sense of this complexity, both within and outside their organizations?

One way to deal with organizational and environmental complexity is to take a systems view of organizations. The systems approach is derived from theoretical models in biology and social psychology in the 1950s and 1960s.[78] A **system** is a set of interrelated elements or parts that function as a whole. Rather than viewing one part of an organization as separate from the other parts, a systems approach encourages managers to complicate their thinking by looking for connections between the different parts of the organization. Indeed, one of the more important ideas in the systems approach to management is that organizational systems are composed of parts or **subsystems**, which are simply smaller systems within larger systems. Subsystems and their connections matter in systems theory because of the possibility for managers to create synergy. **Synergy** occurs when two or more subsystems working together can produce more than they can working apart. In other words, synergy occurs when 1 + 1 = 3.

Systems can be open or closed. **Closed systems** can function without interacting with their environments. But nearly all organizations should be viewed as **open systems** that interact with their environments and depend on them for survival. Therefore, rather than viewing what goes on within the organization as separate from what goes on outside it, the systems approach also encourages managers to look for connections between the different parts of the organization and the different parts of its environment. Successful interaction with organizational environments is critical because open systems tend toward **entropy**, which is the inevitable and steady deterioration of a system.

As shown in Exhibit 2.7, organizations operate in two kinds of complex environments. The *general environment* consists of the economy and the technological, sociocultural, and political/legal trends that indirectly affect all organizations. Changes in any sector of the general environment eventually affect most organizations. In addition, each organization has a specific environment that is unique to that firm's industry and directly affects the way it conducts day-to-day business. The *specific environment* includes customers, competitors, suppliers, industry regulation, and

advocacy groups. Both the general and specific environments are discussed in detail in Chapter 3. As Exhibit 2.7 shows, organizational systems obtain inputs from both the general and specific environments. Managers and workers then use their management knowledge and manufacturing techniques to transform those inputs into outputs, such as products and services. These outputs are then consumed by persons or organizations in the environment, which, in turn, provide feedback to the organization, allowing managers and workers to modify and improve their products or services.

A systems view of organizations offers several advantages. First, it forces managers to view their organizations as part of and subject to the competitive, economic, social, technological, and legal/regulatory forces in their environments.[79] Second, it also forces managers to be aware of how the environment affects specific parts of the organization. Third, because of the complexity and difficulty of trying to achieve synergies among different parts of the organization, the systems view encourages managers to focus on better communication and cooperation within the organization. Finally, it makes managers acutely aware that good internal management of the organization may not be enough to ensure survival. Survival also depends on making sure that the organization continues to satisfy critical environmental stakeholders such as shareholders, employees, customers, suppliers, governments, and local communities. For more on ideas related to the systems view of management, see Chapter 3 on environments and cultures, Chapter 4 on ethics and social responsibility, Chapter 6 on organizational strategy, and Chapter 8 on global management.

5.4 Contingency Management

Earlier, you learned that the goal of scientific management was to use systematic study to find the one best way of doing each task and then use that one best way everywhere. The problem, as you may have gathered from reading about the various

approaches to management, is that no one in management seems to agree on what that one best way is. Furthermore, more than 100 years of management research has shown that there are clear boundaries or limitations to most management theories and practices. No management ideas or practices are universal. Although any theory or practice may work much of the time, none works all the time. How, then, is a manager to decide what theory to use? Well, it depends on the situation. The **contingency approach** to management clearly states that there are no universal management theories and that the most effective management theory or idea depends on the kinds of problems or situations that managers or organizations are facing at a particular time.[80] In short, the best way depends on the situation.

One of the practical implications of the contingency approach to management is that management is much harder than it looks. In fact, because of the clarity and obviousness of management theories (OK, most of them), students and workers often wrongly assume that a company's problems would be quickly and easily solved if management would take just a few simple steps. If this were true, few companies would have problems.

A second implication of the contingency approach is that managers need to look for key contingencies that differentiate today's situation or problems from yesterday's situation or problems. Moreover, it means that managers need to spend more time analyzing problems, situations, and employees before taking action to fix them. Finally, it means that as you read this text and learn about management ideas and practices, you need to pay particular attention to qualifying phrases such as "usually," "in these situations," "for this to work," and "under these circumstances." Doing so will help you identify the key contingencies that will help you become a better manager.

[Contingency approach] holds that there are no universal management theories and that the most effective management theory or idea depends on the kinds of problems or situations that managers are facing at a particular time and place

Operations, Information, Systems, and Contingency Management Operations management uses a quantitative or mathematical approach to find ways to increase productivity, improve quality, and manage or reduce costly inventories. The manufacture of standardized, interchangeable parts, the graphical and computerized design of parts, and the accidental discovery of just-in-time management were some of the most important historical events in operations management.

For most of recorded history, information has been costly, difficult to obtain, and slow to spread. Consequently, throughout history, organizations have pushed for and quickly adopted new information technologies that reduce the cost or increase the speed with which they can acquire, store, retrieve, or communicate information. Historically, some of the most important technologies that have revolutionized information management were the use of horses in Italy in the 1400s, the creation of paper and the printing press in the 14th and 15th centuries, the manual typewriter in 1850, vertical file cabinets for storage of information and the telegraph in the 1860s, cash registers in 1879, the telephone in the 1880s, time clocks in the 1890s, the personal computer in the 1980s, and the Internet in the 1990s.

A system is a set of interrelated elements or parts that function as a whole. Organizational systems obtain inputs from the general and specific environments. Managers and workers then use their management knowledge and manufacturing techniques to transform those inputs into outputs, such as products and services, which are then consumed by persons or organizations in the environment, which, in turn, provide feedback to the organization, allowing managers and workers to modify and improve their products or services. Organizational systems must also address the issues of synergy, open versus closed systems, and entropy.

REVIEW 5

Finally, the contingency approach to management precisely states that there are no universal management theories. The most effective management theory or idea depends on the kinds of problems or situations that managers or organizations are facing at a particular time. This means that management is much harder than it looks and that managers need to look for key contingencies by spending more time analyzing problems and situations before they take action to fix them.

Fad Jumping

Management consultants are seemingly everywhere, and many make a living trying to convince companies that the latest management idea holds the key to previously unattainable success. Managers may be tempted to adopt these ideas and implement them across their organizations without considering their company's industry, business model, financials, work force, or culture. But embracing one-stop, quick-fix management programs can be detrimental to a business and its employees. That's not to say all of the latest management ideas are bunk. Instead of jumping from fad to fad to fad, however, try cherry-picking the best ideas that are the most appropriate for your business. And really, just learn to manage.

SELF ASSESSMENT

Dealing with Conflict

Conflict is an inevitable part of work life (and life in general), and the success of individual employees, teams, and entire organizations depends on how they manage interpersonal conflict. How do you deal with conflict? Do you look for it, avoid it, or something in between? This twenty-question assessment is designed to provide insight into how you manage conflict.[81] This information will provide you with a baseline for future development of conflict-management skills.

You can also use this self-assessment as a precursor to the Management Team Decision exercise that follows. At a minimum, it will raise your awareness of how you handle differences of opinion before you begin working in a team. It may even inspire you to make conscious changes in your conflict-management style, helping you—and your team—be more effective.

MANAGEMENT DECISION

Scripted Service

It has been two years since you took over your family's chain of specialty neighborhood bakeries located in areas with high foot traffic.[82] Throughout the city, your stores are *the* choice for birthday cakes, Christmas cookies, Valentine's Day cupcakes, and the daily doughnut. Even though sales are steady, you want to grow and are having a difficult time figuring out exactly how to increase revenues. For the past three weeks, you have spent each day in a different store, stocking cases, slicing bread, and generally pitching in where needed, but mostly you have been observing.

As luck would have it, about 80 percent of your stores are located near or next to a Starbucks. On your way to the stores each morning, you have stopped to get your morning coffee, and at each Starbucks, you have been greeted quickly, chatted with the clerk, ordered, heard your order repeated across the bar, used a loaded Starbucks card to pay, been asked if you want your balance, and been told to have a nice day. Today is the same. As you wait for your coffee, you think about the contrast between this prescribed sequence and what you have been seeing in your own stores. Even though your clerks serve customers efficiently, they do so in various ways. Some clerks are outgoing, talking and laughing with the customer while assembling the order. Other clerks are more reserved, filling the order quickly but with little conversation and barely a smile.

Now that you have noticed these differences, everywhere you shop you've been paying attention to sales speech patterns, which appear scripted and repetitive but pleasantly predictable. From the grocery ("Do you have any coupons?" and "Paper or plastic?") to the fast-food restaurant ("Do you want fries with that?" and "For here or to go?"), the patterns are most noticeable during busy periods. Clerks follow the same speech sequence with every customer.

A little research reveals that numerous companies require employees to follow a script. At McDonald's, the script is concerned with speech: for example, workers must say "May I help you, ma'am?" instead of "Can I help someone?" At Olive Garden, the script adds actions to the words: greet the table within 30 seconds of sit-down; take the drink order within three minutes; during ordering, suggest five items (drink, side dish, dessert, specials, and special offers); after food arrives, check back within three minutes. At Starbucks, things are more relaxed, but there is still a script to guide employee interactions with customers looking for a latte.

After a week of observing these scripted encounters, you begin to wonder if you should write a sales script for your bakery staff. If interactions were standardized, you might be able to increase efficiency and sales revenue. A script might be a great help during the morning and the after-school rush, as well as a useful training tool for new hires; it might help them feel more confident behind the counter. Since you want to grow, a script could also help you get up and running faster in new locations. But how would your current employees feel about it? They all have different ways of working with customers. About half of them have been with you or many years and know the ropes already. And how would your customers respond? The bakery could lose some of its neighborly appeal when customers recognize the canned speech.

You hear the barista call out, "Triple-shot venti extra hot latte," so you go collect your coffee. She looks you right in the eye, smiles, and says, "Have a nice day!"

Questions

1. Which historical management technique best describes scripted service speech and scripted employee behavior? Explain your choice.
2. Do you implement a customer-encounter script at your bakeries? Why or why not?
3. Imagine that you have decided to implement a script for your frontline employees. Write the service script for bakery clerks.

MANAGEMENT TEAM DECISION

Peer Review for Conflict Resolution

Your troubles began when the teenage clerk at one of your convenience stores wrestled a gun away from a would-be robber. On hearing the story, your friends said, "How brave!" and "Did you give him an award?" but you and the other managers in the company all had a very different reaction. You know you will have to fire the employee for violating a long-standing and well-known company policy against heroism. Convenience store robberies are a common occurrence, and if your (mostly young) workers, manning dozens of stores, begin to attempt behind-the-counter vigilantism, you will have a serious problem on your hands.

Despite the unanimous mind-set of your management team, you realize that firing the employee outright may create negative fallout among the other employees. At least one employee in particular is likely to vocally protest the firing. As you sit with your team trying to decide how to resolve this issue, one of your managers proposes implementing a peer review process at the company. A panel of employees would be responsible for arbitrating disputes and resolving any disagreements between how managers enforce the rules and how employees experience those rules being enforced.

Advocates trumpet the benefits of peer review systems. Peer reviews are practical and cost-effective, particularly compared with formal legal arbitration, and they allow disputes to be resolved internally. Because peer reviews give employees some say in the outcome of disputes, the employees are more likely to find the decisions credible and acceptable. Many managers also like peer reviews because they help to avert the backlash that a manager may experience for unilaterally disciplining an employee who has violated company rules.

Detractors, however, say that peer reviews may give employees too much control over the management decision process. Review panels effectively diffuse the decision-making function throughout the organization in a way that is counter to the centralized decision making of traditionally structured companies. In addition, creating and maintaining peer review systems requires a commitment of time and resources. Employees lose work hours (and thus productivity) when they participate on panels. And management should consult with a knowledgeable attorney to make sure that review panel procedures conform to National Labor Relations Board (NLRB) dictates about work teams. The process must be shared with all employees, who also must be trained in the process. And what will you do if employees reverse a management decision?

Nonetheless, the number of companies using peer review systems is increasing as their popularity grows. One consultant alone has over 500 companies, including Kodak, Hooters, Marriott, and Red Lobster, using his peer review process.

For this exercise, assemble a team of five students to act as the management team for the convenience store chain in this scenario.

Questions

1. Which historical management theory gives the best justification for implementing peer review systems? Which theory would not support peer reviews?
2. Do you implement a peer review process in the convenience store scenario? Explain your decision.
3. Regardless of your answer in question 2, as a team draw up guidelines for a peer review process. What would you need to consider if you were to create a review panel? For example, do you need to set restrictions on the ratio of employees to managers on the panel—will there even be managers on the panel? How many years of service should an

employee have to participate? Should the panel include a mix of employees from different departments?

4. Now, following the guidelines you established in question 3, imagine that your team is the review panel for the convenience store clerk who foiled a robbery. Discuss the situation and come to a decision regarding the outcome. Do you fire the employee, warn the employee, or commend his actions?

PRACTICE BEING A MANAGER

Observing History Today

The topic of management history may sound like old news, but many of the issues and problems addressed by Max Weber, Chester Barnard, and other management theorists still challenge managers today. *How can we structure an organization for maximum efficiency and just treatment of individuals? What is the basis for, and limits to, authority in organizations?* It is rather amazing that these thinkers of the late 19th and early 20th centuries generated such a wealth of theory that still influences our discussion of management and leadership challenges in the 21st century. This exercise will give you the opportunity to draw upon some ideas that trace their roots back to the pioneers of management thinking.

Preparing in Advance for Class Discussion

Step 1: Find an observation point. Identify a place where you can unobtrusively observe a group of people as they go about their work. You might select a coffee shop, bookstore, or restaurant.

Step 2: Settle in and observe. Go to your selected workplace and observe the people working there for at least 20 minutes. You should take along something like a notebook or PDA so that you can jot down a few notes. It is a good idea to go during a busy time, so long as it is not so crowded that you will be unable to easily observe the workers.

Step 3: Observe employees at work. Observe the process of work and the interaction among the employees. Consider some of the following issues:

- Identify the steps that employees follow in completing a work cycle (e.g., from taking an order to delivering a product). Can you see improvements that might be made, particularly steps that might be eliminated or streamlined?
- Observe the interaction and mood of the workers. Are they stressed? Or are they more relaxed? Does it seem to you that these workers like working with each other?
- Listen for signs of conflict. If you see signs of conflict, is the conflict resolved? If so, how did the workers resolve their conflict? If not, do you think that these workers suppress (bottle up) conflict?
- Can you tell who is in charge here? If so, how do the other workers respond to this person's directions? If not, how does the work group sort out who should be doing each task, and in what order?

Step 4: Consider what you saw. Immediately after your observation session, look through this chapter on management history for connections to your observations. For example, do you see any signs of the "Hawthorne Effect"? Would Frederick Taylor approve of the work process you observed, or might he have suggested improvements? What might Chester Barnard's theory have to say about how the workers you observed responded to instructions from their "boss"? Write a one-page paper of bullet-point notes describing possible connections between your observations and the thinking of management pioneers such as Mary Parker Follett.

Class Discussion

Step 5: Share your findings as a class. Discuss the various points of connection that you found between pioneering management thinkers and your own observations of people at work. Are some of the issues of management "timeless"? If so, what do you see as timeless issues of management? What are some ways in which work and management *have changed* since the days of the management pioneers?

DEVELOP YOUR CAREER POTENTIAL

Know Where Management Is Going

As you read in the chapter, management theories are dynamic. In other words, they change over time, sometimes very rapidly. In addition, management theories have often been cumulative, meaning that later theorists tend to build on theories previously advanced by other scholars. Thus, a new theory becomes the starting point for yet another theory that can either refine or refute the management thinking of the day.

One way to prepare for your career as a manager is by becoming aware of management trends today. The best (and easiest) way to do that is by regularly combing through business newspapers and periodicals. You will always find at least one article that relates to management concepts, and as you scan the business press over time, you will see which theories are influencing current management thinking the most. By understanding management history and management today, you will be better able to anticipate changes to management ideas in the future. This exercise is designed to introduce you to the business press and to help you make the connection between the concepts you learn in the classroom and real-world management activities. Done regularly, it will provide you with invaluable insights into business activities at all types of organizations around the world.

Activities

1. Find a current article of substance in the business press (for example, the *Wall Street Journal*, the *Financial Times, Fortune, BusinessWeek, Inc.*) that discusses topics covered in this course. Although this is only Chapter 2, you will be surprised by the amount of terminology you have already learned. If you are having trouble finding an article, read through the table of contents on pages v–viii to familiarize yourself with the names of concepts that will be presented later in the term. Read your article carefully, making notes about relevant content.
2. Write a one-paragraph summary of the key points in your article. List the terms or concepts critical to understanding the article, and provide definitions of those terms. If you are unfamiliar with a term or concept that is central to the article, do some research in your textbook or see your professor during office hours. Relate these key points to the concepts in your text by citing page numbers.
3. How does your article relate to the management theories covered in this chapter? Explain the situation detailed in your article in terms of the history of management.

Martin Scorcese's film ***Casino*** is a complex and beautifully photographed study of Las Vegas gambling casinos and their organized crime connections during the 1970s. It completes his trilogy that began with ***Mean Streets*** (1973) and continued with ***Goodfellas*** (1990). In ***Casino***, ambition, greed, drugs, and sex ultimately destroy the mob's gambling empire. The film includes a memorable performance by Robert De Niro as Sam Rothstein. This scene, which comes from the beginning of "The Truth about Las Vegas" sequence, opens the film and establishes important background about casino operations. Listen carefully to Rothstein's voice-over as he describes the casino's operation and explains how it tries to reach its goals.

What to Watch for and Ask Yourself

1. Do you think the casino owners make discipline (clearly defined rules and procedures) a high priority in the way they run their business? Why?
2. Mary Parker Follett believed that managers could deal with conflict in three ways: domination, compromise, and integration. Which of these is most likely employed by the casino management in this film?
3. How important is employee order (having a place for everyone and having everyone in their place) in this clip?

Mitchell Gold + Bob Williams

© CENGAGE

Mitchell Gold and Bob Williams have a mantra: "Break the rules whenever possible!" When they started The Mitchell Gold Co. in 1989, they set out to change the old, outdated business practices that were governing the furniture industry. Since then, their ideas for improving things like customer service and supply chain management have helped company sales reach in excess of $100 million. The company's mission includes ideas such as "Guarantee comfort" and "Manufacture products in a way that preserves our rich environment for future generations." They also believe it's important to treat both your customers ***and*** your employees well. In this video you will hear why they chose to go into the furniture industry to begin with and how they became the kind of company that sets the rules that their competition plays by.

What to Watch for and Ask Yourself:

1. Do you think their philosophy about the way their employees should be treated contributes to their company's success? Why or why not?
2. How would you describe the company's vision?
3. Does the company's culture seem to be adaptable? In what ways?

What would You Do?

Wal-Mart Headquarters, Bentonville, Arkansas.[1]

With annual revenue of $430 billion, 2 million employees, and 7,300 stores worldwide (and even larger numbers by the time you read this), **Wal-Mart** is the largest company in the world and has held the number-one spot on the *Fortune* 500 list 6 out of the last 7 years. But, as the world's largest company, Wal-Mart is also one of the world's largest targets for anti-corporate groups and lawsuits. Indeed, to its critics, over the last decade Wal-Mart has become the default symbol of corporate evil.

On the issue of employee pay, Wal-Mart has been accused of forcing employees to work off the clock (working overtime and during breaks without pay) and of paying Wal-Mart employees wages that fall below the poverty line. In terms of health-care benefits, critics such as **http://www.wake-upWalMart.com** complain that Wal-Mart provides health insurance for only 43 percent of its employees compared to 66 percent for most other companies; that although managers receive health benefits their first day on the job, full-time and part-time employees must wait 6 months and 12 months, respectively, before enrolling in Wal-Mart's health insurance program; and finally, that average Wal-Mart employees must spend a disproportionate share of their income, approximately 22 to 40 percent, to cover their health insurance premiums and medical deductibles. Wal-Mart, of course, disputes these facts and allegations and argues that many of these critical organizations and websites are financed by unions that have tried unsuccessfully for two decades to organize Wal-Mart's employees, who represent the largest work force in the world.

Environmental groups, like the Sierra Club, have also been highly critical of Wal-Mart. According to the Sierra Club, "Big Box" stores like Wal-Mart "threaten our landscape, our communities, and the environment by building on the fringe of town, paving vast areas for stores and parking lots, and undermining the economic health of existing downtown shopping areas." The Sierra Club also opposes new Wal-Mart stores because it believes their development destroys wetlands and increases the risk of flooding-based pollution.

With the average footprint of a Wal-Mart supercenter running about 18 acres, the Sierra Club believes that Wal-Mart is a major contributor to "non-point source water pollution," which it says is the leading cause of water pollution in the U.S." According to the Sierra Club, an undeveloped acre with trees and grass and flowers and bushes only produces 2,700 gallons of rainwater runoff for each inch of precipitation. In other words, most of the rainwater is absorbed into the ground. By contrast, a developed acre, meaning an acre that has been paved and has buildings, produces 25,000 gallons of rainwater runoff for each inch of precipitation. Since the average Wal-Mart supercenter is 18 acres, an inch of precipitation leads to 450,000 gallons of rainwater

runoff filled with pollutants such as oil, chemicals, and bacteria.

Unrelenting attacks have undoubtedly affected how people view Wal-Mart. Gerald Baron, founder and president of a corporate relations consulting company, says, "Wal-Mart has a reputation crisis." Ironically, though, this has had little effect on Wal-Mart's sales. Indeed, Wal-Mart's internal research shows that less than 0.1 percent of the people who are familiar with these criticisms would not shop or have stopped shopping at Wal-Mart.

So, with almost no impact on its sales and little concern among its customers, should Wal-Mart take on its critics and fight back, or should it focus on its business and let its results speak for themselves? What should Wal-Mart do, if anything, in regard to highly publicized criticisms about the pay and benefits it awards to its employees? Should it ignore them or address them? Finally, should Wal-Mart view environmentalists' complaints as a threat or an opportunity for the company?

If you were the CEO of Wal-Mart, what would you do?

Anti-Wal-Mart websites, critical environmental groups, class-action lawsuits, and unions that want to unionize the largest work force in the world create a challenging backdrop for Wal-Mart. Wherever Wal-Mart's top managers look, they see changes and forces outside the company that directly affect how they do business.

This chapter examines the internal and external forces that affect business. We begin by explaining how the changes in external organizational environments affect the decisions and performance of a company. Next, we examine the two types of external organizational environments: the general environment that affects all organizations and the specific environment unique to each company. Then, we learn how managers make sense of their changing general and specific environments. The chapter finishes with a discussion of internal organizational environments by focusing on organizational culture.

EXTERNAL ENVIRONMENTS

External environments are the forces and events outside a company that have the potential to influence or affect it. From **Sony** Walkmans to PlayStation video games and consoles to its top-of-the-line televisions, Sony's ability to innovate made it one of the world's top electronics companies. However, because of intense competition in its external environment from Apple (iPod and iPhones), Microsoft (Xbox 3), Samsung and Vizio (high-definition TVs), Sony has been forced to cut costs, lay off workers, and try to change its internal culture in order to restore profits (more on that later in the chapter).[2]

After reading the next four sections, you should be able to

1. discuss how changing environments affect organizations.
2. describe the four components of the general environment.
3. explain the five components of the specific environment.
4. describe the process that companies use to make sense of their changing environments.

1 CHANGING ENVIRONMENTS

Let's examine the three basic characteristics of changing external environments: **1.1 environmental change; 1.2 environmental complexity; 1.3 resource scarcity; and 1.4 the uncertainty that environmental change, complexity, and resource scarcity can create for organizational managers.**

[External environments] all events outside a company that have the potential to influence or affect it

1.1 Environmental Change

Environmental change is the rate at which a company's general and specific environments change. In **stable environments**, the rate of environmental change is slow. For instance, apart from the fact that ovens are more efficient, bread is baked, wrapped, and delivered fresh to stores each day much as it was decades ago. Although some new breads have become popular, the white and wheat breads that customers bought 20 years ago are still today's best sellers. So after two decades of consistent double-digit growth, Natural Ovens, which makes preservative-free breads, spent $10 million to build a second baking facility. Soon after it was built, however, sales unexpectedly dropped. According to owner Paul Stitt, "We couldn't figure out what was going on because we have been accustomed, on average, to having a 15 percent sales growth in each of the last 25 years." What happened? The Atkins Diet. The popularity of this diet plan, which restricts carbohydrates, caused nationwide bread sales to drop for the first time in decades. Fortunately, the company adjusted to the first major change in its business in years by developing a very difficult to bake low-carb bread, whose sales have increased from 1,200 to 60,000 loaves a week. Ironically, says Stitt, "We have a higher profit margin on our low-carb breads than on most of our other breads."[3]

While baking companies have stable environments, **EA Sports**, whose best-selling products are sports games like *Madden NFL* (football), *NBA Live* (basketball), *NHL* (hockey), *Tiger Woods PGA Tour* (golf), and *FIFA* (soccer), competes in an extremely dynamic external environment: video games. In **dynamic environments**, the rate of environmental change is fast. EA Sports's business environment is dynamic primarily because of changes in gaming technology and competition. In terms of gaming technology, EA produces games for the Xbox 360, Nintendo Wii and DS, Sony PSP and PlayStations 2 and 3, PC and Mac computers, and online, mobile, and iPhone platforms. Other than PC and Mac computers, none of those devices existed 10 years ago. And, while EA Sports has an exclusive deal with the National Football League for *Madden NFL*, for which it pays $400 million over 5 years, the NBA sells video-game licenses to EA sports and four other companies, Take-Two Interactive Software, Sony, Midway Games, and Atari.[4] With multiple gaming platforms, high development and marketing costs, and intense competition, if EA Sports guesses wrong and develops games that are unpopular or technologically poor, it could join the dozens of game companies that have already closed their doors.

Although you might think that a company's external environment would be either stable or dynamic, research suggests that companies often experience both. According to **punctuated equilibrium theory**, companies go through long periods of stability (equilibrium) during which incremental changes occur, followed by short, complex periods of dynamic, fundamental change (revolutionary periods), finishing with a return to stability (new equilibrium).[5]

Exhibit 3.1 shows one example of punctuated equilibrium—the U.S. airline industry. Three times in the last 30 years, the U.S. airline industry has experienced revolutionary periods. The first, from mid-1979 to mid-1982, occurred immediately after airline deregulation in 1978. Prior to deregulation, the federal government controlled where airlines could fly, how much could be charged, when they could fly, and the number of flights they could have on a particular route. After deregulation, these choices were left to the airlines. The large financial losses during this period clearly indicate that the airlines had trouble adjusting to the intense competition that occurred after deregulation. By mid-1982, however, profits returned to the industry and held steady until mid-1989.

Then, after experiencing record growth and profits, U.S. airlines lost billions of dollars between 1989 and 1993 as the industry went through dramatic changes. Key expenses, including jet fuel and employee salaries, which had held steady for years, suddenly increased. Furthermore, revenues, which had grown steadily year after year,

Although you might think that a company's external environment would be *either* stable *or* dynamic, research suggests that companies often experience both.

Punctuated Equilibrium: U.S. Airline Profits since 1979

suddenly dropped because of dramatic changes in the airlines' customer base. Business travelers, who had typically paid full-price fares, comprised more than half of all passengers during the 1980s. However, by the late 1980s, the largest customer base had changed to leisure travelers, who wanted the cheapest flights they could get.[6] With expenses suddenly up and revenues suddenly down, the airlines responded to these changes in their business environment by laying off 5 to 10 percent of their workers, canceling orders for new planes, and eliminating unprofitable routes. Starting in 1993 and lasting till 1998, these changes helped the airline industry achieve profits far in excess of their historical levels. The industry began to stabilize, if not flourish, just as punctuated equilibrium theory predicts.[7]

The third revolutionary period for the U.S. airline industry began with the terrorist attacks of September 11, 2001, in which planes were used as missiles to bring down the World Trade Center towers and damage the Pentagon. The immediate effect was a 20 percent drop in scheduled flights, a 40 percent drop in passengers, and losses so large that the U.S. government approved a $15 billion bailout to keep the airlines in business. Heightened airport security also affected airports, the airlines themselves, and airline customers. Five years after the 9/11 attacks, United Airlines, U.S. Airways, Delta, and American Airlines had reduced staffing by 169,000 full-time jobs to cut costs after losing a combined $42 billion.[8] Due to their financially weaker position, the airlines restructured operations to take advantage of the combined effect of increased passenger travel, a sharply reduced cost structure, and a 23 percent reduction in the fleet to return their businesses to profitability.[9] But, just as the airlines were heading toward a more stable period of equilibrium in 2006 and 2007, the price of oil jumped dramatically, doubling, if not tripling the price of jet fuel, which prompted the airlines to charge for luggage (to increase revenues and discourage heavy baggage) and cut flights using older, fuel-inefficient jets.

1.2 Environmental Complexity

[Environmental complexity] the number and the intensity of external factors in the environment that affect organizations

[Simple environment] an environment with few environmental factors

[Complex environment] an environment with many environmental factors

Environmental complexity refers to the number and the intensity of external factors in the environment that affect organizations. **Simple environments** have few environmental factors, whereas **complex environments** have many environmental factors. The dairy industry is an excellent example of a relatively simple external environment. Even accounting for decades-old advances in processing and automatic milking machines, milk is produced the same way today as it was 100 years ago. And although food manufacturers introduce dozens of new dairy-based products each year, U.S. milk production has grown a meager

1.25 percent per year over the last decade. In short, producing milk is a highly competitive but simple business that has experienced few changes.[10]

At the other end of the spectrum, few industries have dealt with more change in their environment than the recording industry. The first 12-inch-diameter records were released in the early 1900s and were virtually the only format for music delivery until the 1960s. In the next few decades came new formats, including 8-track tapes, cassette tapes, and, in the early 1980s, the compact disc. The record labels balanced their shipments to handle the changing desires of their customers, and in 1988 CDs outsold the vinyl-record album format for the first time. The MP3 format was patented in Germany in 1989 and over the next 10 years became a standard format for compressing high-quality digital sound to CDs or other storage devices.

But things got much more complex when, in 1999, a company called Napster created a peer-to-peer network that allowed users to easily (and, at first, illegally) share digital files with each other. Within a year, 30 percent of all PCs were running this software program, and the recording industry blamed illegal file sharing for the sharp declines in CD sales. In an effort to create a legal downloading mechanism that would support the rights of the recording industry, **Apple Computer** developed iTunes.com, where individual songs could be legally purchased and downloaded for 99 cents per song. Apple followed this up with the October 2001 release of the iPod, the now-ubiquitous MP3 player that uses an internal hard drive to hold up to thousands of songs. More than 6 billion songs have been downloaded from iTunes since the inception of the iTunes/iPod model, clearly changing the way the recording industry distributes and profits from music.[11]

1.3 Resource Scarcity

The third characteristic of external environments is resource scarcity. **Resource scarcity** is the abundance or shortage of critical organizational resources in an organization's external environment. For example, the primary reason that flat-screen LCD (liquid crystal display) televisions with lifelike pictures were initially six times more expensive per inch than regular TVs, and 25 percent more expensive than plasma TVs, was that there weren't enough LCD screen factories to meet demand. At $2 billion to $4 billion each, LCD factories were at first a scarce resource in this industry.[12] But as sales of LCD TVs soared, more LCD factories were built to meet demand, so prices came down. For example, with sales of their own LCD TVs rising, **Samsung** and Sony formed a joint venture to build a $3 billion eighth-generation LCD factory capable of making 52-inch screens.[13] In turn, Japanese-based Tokyo Electron and Ulvac, the manufacturers of the flat-panel display-making equipment sold to Samsung and Sony (to make flat screens for high-definition TVs), also built new production facilities to keep up with rising demand.[14] So as the external environment changed, these resources became less scarce.

1.4 Uncertainty

As Exhibit 3.2 shows on the next page, environmental change, environmental complexity, and resource scarcity affect environmental **uncertainty**, which is how well managers can understand or predict the external changes and trends affecting their businesses. Starting at the left side of the figure, environmental uncertainty is lowest when environmental change and environmental complexity are at low levels and resource scarcity is small (i.e., resources are plentiful). In these environments, managers feel confident that they can understand, predict, and react to the external forces that affect their businesses. By contrast, the right side of the figure shows that environmental uncertainty is highest when environmental change and complexity are extensive and resource scarcity is a problem. In these environments, managers may not be confident that they can understand, predict, and handle the external forces affecting their businesses.

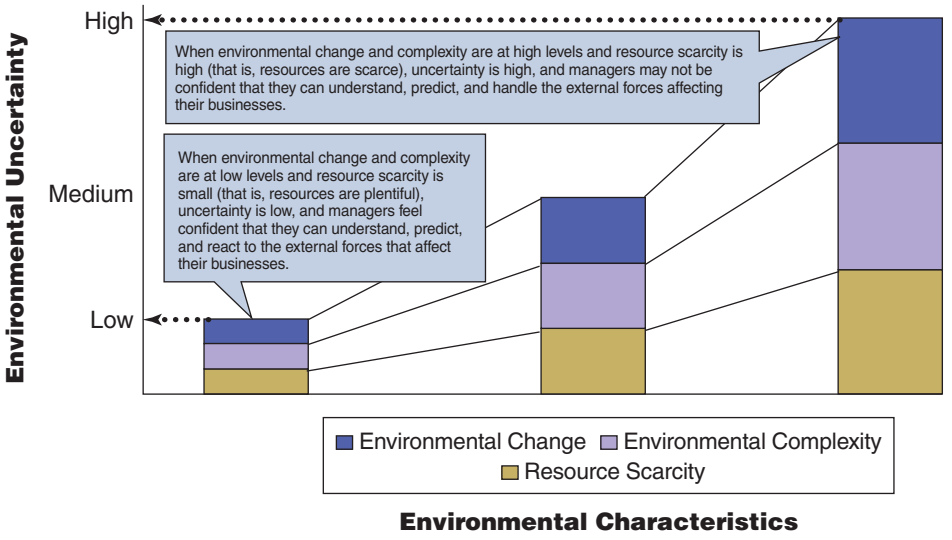
EXHIBIT 3.2

Environmental Change, Environmental Complexity, and Resource Scarcity



REVIEW 1

Changing Environments Environmental change, complexity, and resource scarcity are the basic components of external environments. Environmental change is the rate at which conditions or events affecting a business change. Environmental complexity is the number and intensity of external factors in an external environment. Resource scarcity is the scarcity or abundance of resources available in the external environment. The greater the degree of environmental change, environmental complexity, and resource scarcity, the less confident managers are that they can understand, predict, and effectively react to the trends affecting their businesses. According to punctuated equilibrium theory, companies experience periods of stability followed by short periods of dynamic, fundamental change, followed by a return to periods of stability.

2 GENERAL ENVIRONMENT

As Exhibit 3.3 shows, two kinds of external environments influence organizations: the general environment and the specific environment. The **general environment** consists of the economy and the technological, sociocultural, and political/legal trends that indirectly affect *all* organizations. Changes in any sector of the general environment eventually affect most organizations. For example, when the Federal Reserve lowers its prime lending rate, most businesses benefit because banks and credit card companies often lower the interest rates they charge for loans. Consumers, who can then borrow money more cheaply, might borrow more to buy homes, cars, refrigerators, and plasma or LCD large-screen TVs.

By contrast, each organization also has a **specific environment** that is unique to that firm's industry and directly affects the way it conducts day-to-day business. After more than 20 million unsafe toys, many of them produced in Chinese factories, were recalled, the toy industry spent $200 million to increase the safety of its products.[15] But because that change came from the specific environment (which only influences this industry) and not the general environment (which influences all businesses), only toy manufacturers and retailers, such as Toys "R" Us, were affected. The specific environment, which will be discussed in detail in Section 3 of this chapter, includes customers, competitors, suppliers, industry regulation, and advocacy groups.

[General environment] the economic, technological, sociocultural, and political trends that indirectly affect all organizations

[Specific environment] the customers, competitors, suppliers, industry regulations, and advocacy groups that are unique to an industry and directly affect how a company does business

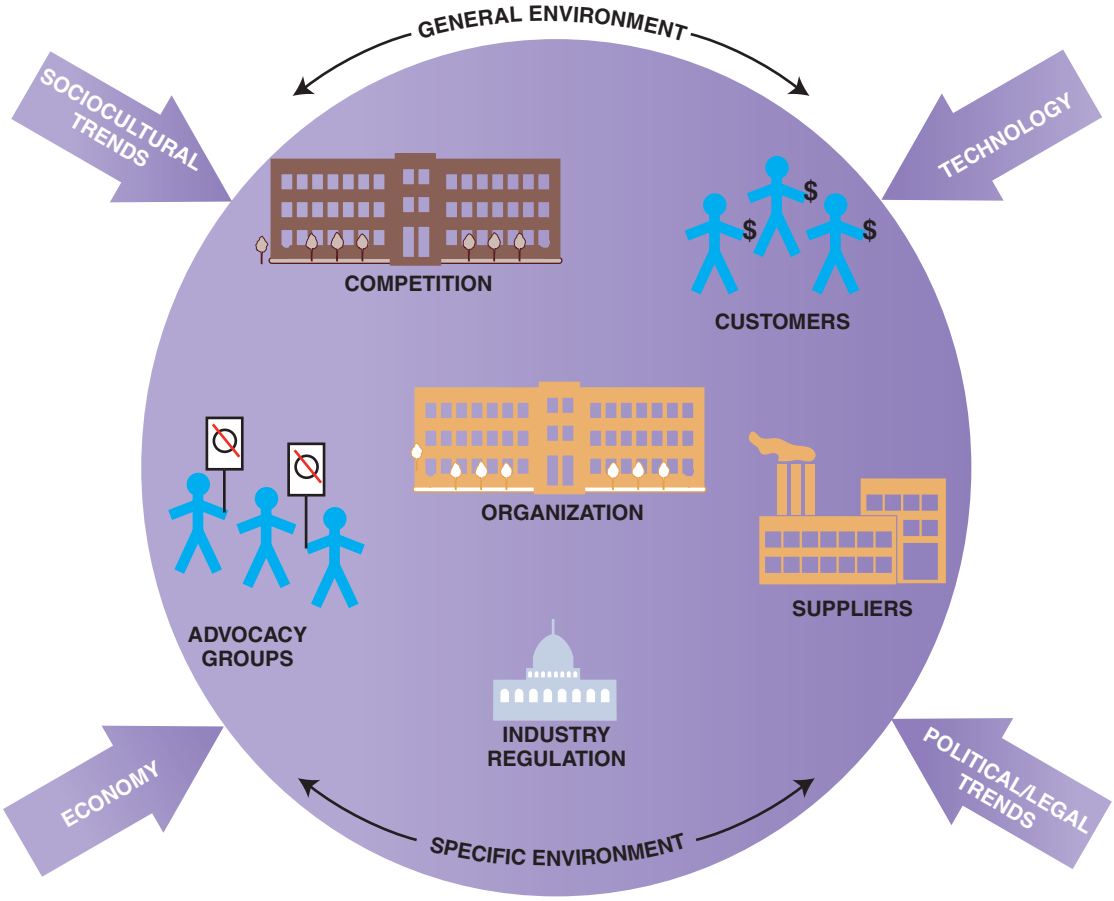


EXHIBIT 3.3

General and Specific Environments

But first let's take a closer look at the four components of the general environment: **2.1 the economy and 2.2 the technological, 2.3 sociocultural, and 2.4 political/legal trends that indirectly affect all organizations.**

2.1 Economy

The current state of a country's economy affects virtually every organization doing business there. In general, in a growing economy, more people are working and wages are growing, and therefore consumers have relatively more money to spend. More products are bought and sold in a growing economy than in a static or shrinking economy. Though an individual firm's sales will not necessarily increase, a growing economy does provide an environment favorable to business growth. In contrast, in a shrinking economy, consumers have less money to spend and relatively fewer products are bought and sold. Thus, a shrinking economy makes growth for individual businesses more difficult.

"The current state of a country's economy affects virtually every organization doing business there."

Because the economy influences basic business decisions, such as whether to hire more employees, expand production, or take out loans to purchase equipment, managers scan their economic environments for signs of significant change. Unfortunately, the economic statistics that managers rely on when making these decisions are notoriously poor predictors of *future* economic activity. A manager who decides to hire ten more employees because economic data suggest future growth could very well have to lay off those newly hired workers when the economic growth does not occur. In fact, a famous economic study found that at the beginning of a business quarter (a period of only 3 months), even the best economic forecasters could not accurately predict whether economic activity would grow or shrink *in that same quarter*![16]

Because economic statistics can be poor predictors, some managers try to predict future economic activity by keeping track of business confidence. **Business confidence indices** show how confident actual managers are about future business growth. For example, the Conference Board's CEO Confidence Index is a quarterly survey of 100 CEOS in large companies across a variety of different industries that examines attitudes regarding future growth in the economy or particular industries.[17] Another widely cited measure is the Small Business Research Board's Business Confidence Index, which asks 500 small business owners and managers to express their optimism (or pessimism) about future business sales and prospects.[18] Managers often prefer business confidence indices to economic statistics because they know that other managers make business decisions that are in line with their expectations concerning the economy's future. So if the Conference Board or Small Business Research Board business confidence indices are dropping, a manager might decide against hiring new employees, increasing production, or taking out additional loans to expand the business.

2.2 Technological Component

Technology is the knowledge, tools, and techniques used to transform inputs (raw materials, information, and so on) into outputs (products and services). For example, the inputs of authors, editors, and artists (knowledge) and the use of equipment like computers and printing presses (technology) transformed paper, ink, and glue (raw materials) into this book (the finished product). In the case of a service company such as an airline, the technology consists of equipment, including airplanes, repair tools, and computers, as well as the knowledge of mechanics, ticketers, and flight crews. The output is the service of transporting people from one place to another.

Changes in technology can help companies provide better products or produce their products more efficiently. For example, advances in surgical techniques and imaging equipment have made open-heart surgery much faster and safer in recent years. Although technological changes can benefit a business, they can also threaten it. Companies must embrace new technology and find effective ways to use it to improve their products and services or decrease costs. If they don't, they will lose out to those companies that do.

For example, over-the-counter medications have traditionally been available in either pill or liquid form. Now the new technology is edible film. Like those little, thin strips of breath freshener, medicinal edible film dissolves instantly on the tongue, allowing the medicine to enter the bloodstream more quickly. This new technology has applications in areas where administering oral medication can be challenging, such as to children and pets. Novartis has added edible film to many of its product lines, and its Triaminic line of cold medicines now sells multiple flavors of film in children's strength. The Triaminic franchise has grown from nothing to claim a 20 percent share of the pediatric cough and cold market. "Most of the growth has been driven by the Thin Strip [edible film]," says Brian McNamara, a vice president at Novartis Consumer Health in Parsippany, New Jersey. Pet-care company Hartz Mountain Corp., which already produces breath-freshening strips for dogs, is investigating using edible film for delivering pet medication, an annual market valued at over $1 billion. Imagine: Instead of wrestling your pet to force pills down its throat, you'll simply place the edible medicine film on its tongue. Sales of edible film are estimated to increase from under $1 million to $350 million in the next few years.[19]

Chapter 7, on organizational change and innovation, provides a more in-depth discussion of how technology affects a company's competitive advantage.

[Business confidence indices] indices that show managers' level of confidence about future business growth

[Technology] the knowledge, tools, and techniques used to transform input into output

2.3 Sociocultural Component

The sociocultural component of the general environment refers to the demographic characteristics, general behavior, attitudes, and beliefs of people in a particular society. Sociocultural changes and trends influence organizations in two important ways.

First, changes in demographic characteristics, such as the number of people with particular skills or the growth/decline in particular population segments (marital status, age, gender, ethnicity), affect how companies staff their businesses. Married women with children are much more likely to work today than four decades ago, as illustrated in Exhibit 3.4. In 1960, only 18.6 percent of women with children under 6 years old and 39 percent of women with children between the ages of 6 and 17 worked. By 2007, those percentages had risen to 61.5 percent and 76.2 percent, respectively.

Second, sociocultural changes in behavior, attitudes, and beliefs also affect the demand for a business's products and services. Today, with more married women with children in the work force, traffic congestion creating longer commutes, and both parents working longer hours, employees are much more likely to value products and services that allow them to recapture free time with their families, and families are deliberately selective about how they spend their free time. Thus people—especially working mothers—use numerous services to help reduce the amount of time they spend doing chores and household management tasks.

Priscilla La Barbera, a marketing professor at New York University, says, "People are beginning to realize that their time has real value."[20] Brian Wheeler, who runs a concierge service in Washington D.C., that performs personal tasks for company employees, said, "Many households have two adults working full time, people are working longer hours, and traffic in our region gets worse each year. When you combine these things, there isn't much time for anything outside of work and life maintenance stuff. We give them a hand and magically get things done for them during the day so that when they get home they can actually unwind or spend quality time with their family."[21] For example, at Memorial Health Care Systems,

employees can get the oil changed in their cars or have their clothes dry-cleaned without leaving their desks; at General Mills, employees can have someone else mail their packages or repair their jewelry; and at Ernst and Young, workplace concierges plan employee vacations or help research nursing home options for employees' elderly parents.[22]

2.4 Political/Legal Component

The political/legal component of the general environment includes the legislation, regulations, and court decisions that govern and regulate business behavior. New laws and regulations continue to impose additional responsibilities on companies. Unfortunately, many managers are unaware of these new responsibilities. For example, under the 1991 Civil Rights Act (**http://www.eeoc.gov/policy/cra91.html**), if an employee is sexually harassed by anyone at work (a supervisor, a coworker, or even a customer), the company—not just the harasser—is potentially liable for damages, attorneys' fees, and back pay.[23] Under the Family and Medical Leave Act (**http://www.dol.gov/esa/whd/fmla**), employees who have been on the job 1 year are guaranteed 12 weeks of unpaid leave per year to tend to their own illnesses or to their elderly parents, a newborn baby, or a newly adopted child. Employees are guaranteed the same job, pay, and benefits when they return to work.[24]

Many managers are also unaware of the potential legal risks associated with traditional managerial decisions like recruiting, hiring, and firing employees. Increasingly, businesses and managers are being sued for negligent hiring and supervision, defamation, invasion of privacy, emotional distress, fraud, and misrepresentation during employee recruitment.[25] More than 14,000 suits for wrongful termination (unfairly firing employees) are filed each year.[26] In fact, wrongful termination lawsuits increased by 77 percent during the 1990s.[27] One in four employers will at some point be sued for wrongful termination. It can cost $300,000 to settle such a case once it goes to court, but employers lose 70 percent of court cases, and the former employee is awarded, on average, $1 million or more.[28] On the other hand, employers who settle before going to court typically pay just $10,000 to $100,000 per case.[29]

Companies also face a variety of potential legal risks from customer-initiated lawsuits. For example, under product-liability law, manufacturers are liable for products made decades ago. Also, the law, as it is now written, does not consider whether manufactured products have been properly maintained and used by the customer. A Texas jury awarded $37 million in damages against Goodyear Tire and Rubber Company after concluding that one of its tires caused a traffic death. The tire in question was 9 years old, twice the normal 4- to 5-year lifespan of most tires, and had been patched four times (once incorrectly).[30] Still, the jury required Goodyear to pay $37 million in damages. Why? Under product-liability law, plaintiffs only have to demonstrate that they were injured by the manufacturer's product. Under the concept of "strict liability," the burden of proof is shifted to the company, which must prove that the product was safe and not defective.[31] Thus, once injuries have been shown, the company is assumed guilty until it proves its innocence. Today, jury verdicts in product-liability cases cost companies an average of $6.8 million per case.[32]

Not everyone agrees that companies' legal risks are too severe. Indeed, many believe that the government should do more to regulate and restrict business behavior and that it should be easier for average citizens to sue dishonest or negligent corporations. From a managerial perspective, the best medicine against legal risk is prevention. As a manager, it is your responsibility to educate yourself about the

laws, regulations, and potential lawsuits that could affect your business. Failure to do so may put you and your company at risk of sizable penalties, fines, or legal charges.

General Environment The general environment consists of economic, technological, sociocultural, and political/legal events and trends that affect all organizations. Because the economy influences basic business decisions, managers often use economic statistics and business confidence indices to predict future economic activity. Changes in technology, which transforms inputs into outputs, can be a benefit or a threat to a business. Sociocultural trends, like changing demographic characteristics, affect how companies run their businesses. Similarly, sociocultural changes in behavior, attitudes, and beliefs affect the demand for a business's products and services. Court decisions and new federal and state laws have imposed much greater political/legal responsibilities on companies. The best way to manage legal responsibilities is to educate managers and employees about laws and regulations and potential lawsuits that could affect a business.

REVIEW 2

3 SPECIFIC ENVIRONMENT

As you just learned, changes in any sector of the general environment (economic, technological, sociocultural, and political/legal) eventually affect most organizations. Each organization also has a specific environment that is unique to that firm's industry and directly affects the way it conducts day-to-day business. For instance, if your customers decide to use another product, your main competitor cuts prices 10 percent, your best supplier can't deliver raw materials, federal regulators mandate reductions in pollutants in your industry, or environmental groups accuse your company of selling unsafe products, the impact from the specific environment on your business is immediate.

Let's examine how the **3.1 customer, 3.2 competitor, 3.3 supplier, 3.4 industry regulation, and 3.5 advocacy group components of the specific environment affect businesses.**

3.1 Customer Component

Customers purchase products and services. Companies cannot exist without customer support. Monitoring customers' changing wants and needs is critical to business success. There are two basic strategies for monitoring customers: reactive and proactive.

Reactive customer monitoring involves identifying and addressing customer trends and problems after they occur. One reactive strategy is to listen closely to customer complaints and respond to customer concerns. For example, Larry Dague owns **ScubaToys.com**, an online retail store for scuba gear. Dague spends an hour a day reading and responding to the postings in the customer forum. When a customer posts a complaint in the forum, Dague responds immediately with an apology and an explanation of how he's fixing the problem—for example, by shipping the correct product before the customer returns the incorrect product that was mistakenly sent. Says Dague, "If you're buying a $2,000 [piece of] equipment and diving 100-feet down, with your life depending on it, you want to trust the person who is selling it to you."[33]

© ISTOCKPHOTO.COM/THOMAS MOENS

Companies like ScubaToys.com that respond quickly to customer letters of complaint (i.e., reactive customer monitoring) are viewed much more favorably than companies that are slow to respond or never respond.[34] In particular, studies have shown that when a company's follow-up letter thanks the customer for writing, offers a sincere, specific response to the complaint (not a form letter, but an explanation of how the problem will be handled), and contains a small gift, coupons, or a refund to make up for the problem, customers are much more likely to purchase products or services again from that company.[35]

Companies that *don't* respond promptly to customer complaints are instead likely to find customer rants and tirades posted publicly on places like **http://www.planetfeedback.com**. Customers hope that posting complaints on these sites will force someone to address their problems. It worked for Lena West. The day after she posted a complaint against Budget Rent-a-Car, she received an e-mail containing an apology and a promise to resolve her problem.[36]

Proactive monitoring of customers means identifying and addressing customer needs, trends, and issues *before* they occur. Every month, **Travelocity**, one of the leading web travel sites, reviews 30,000 customer surveys, 50,000 e-mails, and notes from 500,000 phone calls! By using special software from Attensity Corporation that quickly analyzes and identifies trends in mountains of text-based data, it found that customers who purchased airline tickets on their website were blaming Travelocity when airlines canceled their flights (for example, when not enough tickets have been sold). As a result, Travelocity's website actively prevents this problem beforehand by steering customers away from flights with small flight loads that have sold only a small portion of available tickets.[37]

3.2 Competitor Component

Competitors are companies in the same industry that sell similar products or services to customers. Ford, Toyota, Honda, Nissan, Hyundai, and Kia all compete for automobile customers. NBC, ABC, CBS, and Fox (along with hundreds of cable channels) compete for TV viewers' attention. McDonald's, Burger King, Wendy's, Hardee's, Chick-fil-A, and a host of others compete for fast-food customers' dollars. Often the difference between business success and failure comes down to whether your company is doing a better job of satisfying customer wants and needs than the competition. Consequently, companies need to keep close track of what their competitors are doing. To do this, managers perform a **competitive analysis**, which

[Competitors] companies in the same industry that sell similar products or services to customers

[Competitive analysis] a process for monitoring the competition that involves identifying competition, anticipating their moves, and determining their strengths and weaknesses

involves deciding who your competitors are, anticipating competitors' moves, and determining competitors' strengths and weaknesses.

Surprisingly, managers often do a poor job of identifying potential competitors because they tend to focus on only two or three well-known competitors with similar goals and resources.[38] Historically, Coke and Pepsi spent more time keeping track of each other than they spent on other competitors, but when they each started losing ground to start-up energy drinks, bottled water, and fruit juices, both giants began to buy businesses to help them compete in these growing markets.[39] Likewise, Hoover, Dirt Devil, and, more recently, Oreck competed fiercely in the market for vacuum cleaners. Because these companies produced relatively similar vacuum cleaners, they mostly competed on price. When Dyson entered the market with its radically different vacuum that developed and maintained significantly more suction power, the company garnered 20 percent market share within its first months on the shelves.[40] Only then did Hoover and Dirt Devil design their own bagless vacuums.

Another mistake managers may make when analyzing the competition is to underestimate potential competitors' capabilities. When this happens, managers don't take the steps they should to continue to improve their products or services. The result can be significant decreases in both market share and profits. For nearly a decade, traditional phone companies ignored the threat to their business from VoIP (Voice over Internet Protocol). Early on, software products like Cool Talk, Internet Phone, and Web Phone made it possible to make inexpensive long-distance phone calls using VoIP. Aside from the software, the only requirements were an Internet service provider and a computer that had a sound card, speakers, and a microphone. The sound quality was only as good as AM radio, but people who were used to poor-quality sound on their cell phones didn't care because the calls were so much cheaper.[41]

Today, because phone companies themselves were slow to adopt VoIP capabilities, they're facing a rash of new, unexpected VoIP competitors, all of which have slashed prices and taken market share using high-speed Internet service. For example, **Comcast**, a cable-TV provider that also offers high-speed Internet service, gains ten phone subscribers—at the expense of phone companies like Verizon and AT&T—for every cable TV subscriber that it loses.[42] VoIP is also threatening the phone companies' wireless services, which now account for most of their profits. When their cell phones are connected to a Wi-Fi hotspot, consumers can use Skype or TruPhone software to make VoIP-based telephone calls. For example, iPhone users can avoid cell phone charges by using Skype to make free phone calls to other Skype users on computers or cell phones.[43]

Furthermore, calls to landline phones, including international calls, cost only a few cents per minute. With international cell phone traffic growing 16 percent per year, VoIP-based international calls originating from cell phones represent another threat to traditional phone companies. Scott Mesch, of Boulder, Colorado, used to pay $3.50 a minute to call relatives in Australia. Now he uses the TruPhone application on his iPhone to call his relatives in Brisbane for just a few cents a minute. Says Mesch, "A lot of times I didn't even think of using my cell phone to make calls out of the country. Now I don't hesitate. If I want to call from my cell phone, it's no different from any other local call."[44]

3.3 Supplier Component

Suppliers are companies that provide material, human, financial, and informational resources to other companies. U.S. Steel buys iron ore from suppliers to make steel products. When IBM sells a mainframe computer, it also provides support staff,

[Suppliers] companies that provide material, human, financial, and informational resources to other companies

engineers, and other technical consultants to the company that bought the computer. If you're shopping for desks, chairs, and office supplies, chances are Office Depot will be glad to help your business open a revolving charge account to pay for your purchases. When a clothing manufacturer has spent $100,000 to purchase new high-pressure "water drills" to cut shirt and pants patterns to precise sizes, the water drill manufacturer, as part of the purchase, will usually train the workers on the machinery.

A key factor influencing the impact and quality of the relationship between companies and their suppliers is how dependent they are on each other.[45] **Supplier dependence** is the degree to which a company relies on that supplier because of the importance of the supplier's product to the company and the difficulty of finding other sources for that product.

Supplier dependence is very strong in the diamond business, given that De Beers Consolidated Mines provides 66 percent of the wholesale diamonds in the world. De Beers has dominated the diamond industry for more than a century, controlling the supply, price, and quality of the best diamonds on the market. The company's 125 customers, or "sightholders," as they're known in the industry, are summoned to De Beers's London office ten times a year and given a shoebox of diamonds that they are required to buy. If they refuse, they lose the opportunity to purchase any more diamonds. De Beers initiated a Supplier of Choice (SoC) program that requires sightholders to pay more of the marketing, advertising, and branding costs for De Beers diamonds. SoC sightholders sign 2-year contracts that spell out their responsibilities to develop marketing plans and advertising initiatives and to adhere to ethical guidelines. Just two-thirds of De Beers sightholders, however, qualified as SoCs. The one-third who didn't qualify as SoCs are no longer permitted to sell De Beers diamonds and must now get their diamonds from less prestigious diamond suppliers.[46] Sightholders agree to all this because they are dependent on their supplier, De Beers.

[Supplier dependence] the degree to which a company relies on a supplier because of the importance of the supplier's product to the company and the difficulty of finding other sources of that product

[Buyer dependence] the degree to which a supplier relies on a buyer because of the importance of that buyer to the supplier and the difficulty of finding other buyers for its products

Buyer dependence is the degree to which a supplier relies on a buyer because of the importance of that buyer to the supplier's sales and the difficulty of finding other buyers of its products. For example, when **InBev** purchased Anheuser-Busch and renamed itself AB InBev, it became the world's largest brewer, controlling over 25 percent of global beer sales. This gave AB InBev tremendous bargaining power over its suppliers. One of the ways in which it leveraged that bargaining power was to tell its suppliers, who provide everything from malt to hops to yeast, that it would pay them for their product shipments 120 days after being invoiced. With existing contracts providing payment 30 days after being invoiced, that meant that AB InBev's suppliers would have to wait an extra 3 months to be paid. Delaying payments gives AB InBev an additional $1.2 billion in cash flow per year, but it did so at the expense of its suppliers. According to Elisavet Kinsey, who is commercial and procurement director at MaltEurop, which is one of the world's largest malt producers, those changes were simply "unacceptable."[47] There was little, however, that most AB InBev suppliers could do about this change.

© ISTOCKPHOTO.COM/ERIC ROBINSON

As the De Beers and AB InBev examples show, a high degree of buyer or seller dependence can lead to **opportunistic behavior**, in which one party benefits at the expense of the other. Although opportunistic behavior between buyers and suppliers will never be completely eliminated, many companies believe that both buyers and suppliers can benefit by improving the buyer-supplier relationship.[48]

In contrast to opportunistic behavior, **relationship behavior** focuses on establishing a mutually beneficial, long-term relationship between buyers and suppliers.[49] Toyota is well known for developing positive long-term relationships with its key suppliers. Donald Esmond, who runs Toyota's U.S. division, says, "I think what they [suppliers] appreciate . . . is we don't go in and say, 'Reduce the costs by 6 percent; if you don't, somebody else is going to get the business.' We go in and say we want to come in and help you [figure out] where you can save costs so we can reduce our overall price. So it's a different approach."[50]

3.4 Industry Regulation Component

Whereas the political/legal component of the general environment affects all businesses, the **industry regulation** component consists of regulations and rules that govern the practices and procedures of specific industries, businesses, and professions. If your neighbor decides to make a little extra money selling homemade baked goods and sells you two apple pies, your neighbor could be fined. Why? In most states, it is illegal to sell food from your home. State regulations typically require a food business to obtain a license and a state certificate of inspection that indicates that the food is stored properly; that insects have not infested the premises; that ovens are state approved; that electrical wiring, lighting, and smoke detectors are up to code; and so on.[51] Likewise, the auto industry is subject to CAFE (Corporate Average Fuel Economy) regulations that currently require cars and sport utility vehicles (SUVs) to average 27.5 and 22.5 miles per gallon (mpg), respectively.[52] Both cars and SUVs, however, must average 35 mpg by 2020.[53]

Regulatory agencies affect businesses by creating and enforcing rules and regulations to protect consumers, workers, or society as a whole. For example, the U.S. Department of Agriculture and the Food and Drug Administration regulate the safety of seafood (as well as meat and poultry) through the science-based Hazard Analysis and Critical Control Points program. Seafood processors are required to identify hazards (toxins, chemicals, pesticides, and decomposition) that could cause the fish they process to be unsafe. They must also establish critical control points to control hazards both inside and outside their fish-processing plants and then establish monitoring, corrective action, and verification procedures to certify that the fish they process is safe to consume.[54]

The nearly 100 federal agencies and regulatory commissions can affect almost any kind of business. For example, earlier in the chapter we described how the toy industry spent $200 million to increase the safety of its products after 20 million unsafe toys produced in China were recalled because of the presence of harmful chemicals. In addition to the voluntary recall by toy retailers and manufacturers, new federal regulations embodied in the Consumer Product Safety Improvement Act of 2008 ban phthalates from children's products and now require products to be tested for the presence of phthalates before they are sold.[55]

federal regulations has nearly tripled in the last 25 years. Today, for every $1 the federal government spends creating regulations, businesses spend $45 to comply with them.[56] In addition to federal regulations, businesses are also subject to state, county, and city regulations. Complying with all of these regulations costs businesses an estimated $1.1 trillion per year, or $5,633 per employee.[57] Surveys indicate that managers rank dealing with government regulation as one of the most demanding and frustrating parts of their jobs.[58]

3.5 Advocacy Groups

Advocacy groups are groups of concerned citizens who band together to try to influence the business practices of specific industries, businesses, and professions. The members of a group generally share the same point of view on a particular issue. For example, environmental advocacy groups might try to get manufacturers to reduce smokestack pollution emissions. Unlike the industry regulation component of the specific environment, advocacy groups cannot force organizations to change their practices. Nevertheless, they can use a number of techniques to try to influence companies, including public communications, media advocacy, web pages, blogs, and product boycotts.

[Advocacy groups] concerned citizens who band together to try to influence the business practices of specific industries, businesses, and professions

[Public communications] an advocacy group tactic that relies on voluntary participation by the news media and the advertising industry to get the advocacy group's message out

[Media advocacy] an advocacy group tactic that involves framing issues as public issues; exposing questionable, exploitative, or unethical practices; and forcing media coverage by buying media time or creating controversy that is likely to receive extensive news coverage

The **public communications** approach relies on *voluntary* participation by the news media and the advertising industry to send out an advocacy group's message. For example, a public service campaign to encourage people to quit smoking ran the following ads in newspapers and magazines throughout Europe: a photo showing the foot of a young person with a toe tag (indicating the person was dead), with the caption "Smokers die younger"; a picture showing clean lungs next to brown- and black-stained lungs, with the caption "Smoking causes fatal lung cancer"; and a photo of a baby in an intensive care unit hooked up to a respirator, with the caption "Smoking when pregnant harms your baby."[59]

Media advocacy is much more aggressive than the public communications approach. A **media advocacy** approach typically involves framing the group's concerns as public issues (affecting everyone); exposing questionable, exploitative, or unethical practices; and creating controversy that is likely to receive extensive news coverage. **PETA** (People for the Ethical Treatment of Animals), which has offices in the United States, England, Italy, and Germany, uses controversial publicity stunts and advertisements to try to change the behavior of large organizations, fashion designers,

doing the right thing

Dealing with Gifts and Suppliers

In hopes of getting a buyer's business or getting more business, suppliers sometimes offer buyers trips to exotic locations, dinners at expensive restaurants, or luxurious gifts. Excessive gift giving and receiving creates a conflict of interest between what's best for the company (purchasing items of the optimal quality and cost) and what's personally best for the buyer who receives the gifts. Follow these general guidelines to avoid conflicts of interest:

- Remember that there is no such thing as a free lunch.
- Make sure that business meals and entertainment (parties, outings, sporting events) have a valid business purpose and that the buyer and the supplier take turns paying for or hosting them.
- Don't accept gifts worth more than $25. If you are offered a gift worth more than $25, ask your manager if the gift is appropriate.
- Never accept cash or cash equivalents, such as gift certificates.
- Don't accept discounts on goods and services, unless the discounts are generally available to others.
- Don't accept offers of stock in suppliers' companies.
- Don't allow personal friendships with suppliers to influence buying decisions. [60]

medical researchers, and anyone else it believes is hurting or mistreating animals. PETA cofounder and president Ingrid Newkirk says, "People now know that if they do something ghastly to an animal, they can't necessarily get away with it. When we started, nobody knew what animal rights meant. . . . Now, it's an issue." PETA protesters have stripped naked in front of the White House in front of a banner reading "I'd rather go naked than wear fur." In one of its latest protests, called "McCruelty: I'm Hatin' It," PETA is protesting that McDonald's, which uses 290 million chickens a year, tolerates its chicken suppliers using inhumane killing methods—hanging the birds upside down, stunning them in water that has an electrical current, and then cutting their throats. PETA wants McDonald's suppliers to use gas to kill the birds, which it believes is more humane. Paul Shapiro, who heads the Humane Society's factory farming initiative, said, "It causes less suffering than the conventional method, which is archaic and inhumane." However, Marie Wheatley, president of the American Humane Association, disagrees, saying, "There is not definite proof either is more humane. Both technologies are acceptable in minimizing pain and suffering."[61] A McDonald's spokesperson said the company is committed to "humane treatment of animals by our suppliers in every part of the world where we do business."[62]

A **product boycott** is a tactic in which an advocacy group actively tries to persuade consumers not to purchase a company's product or service. One example of this is the Rainforest Action Network (RAN), whose members have chained themselves to wood piles at select Home Depot stores to get the company to stop selling old-growth lumber. Members also shadowed Citigroup's then CEO Sandy Weill until he agreed to implement environmentally friendly lending policies. In 2006, the group targeted Ford Motor Company as the automobile manufacturer with the worst record of fuel efficiency. When Ford stated that RAN would have no impact upon the company, RAN's executive director Michael Brune responded, "Every company says we are not having an effect—straight up to the time they make their policy change."[63]

[Product boycott] an advocacy group tactic that involves protesting a company's actions by persuading consumers not to purchase its product or service

Specific Environment The specific environment is made up of five components: customers, competitors, suppliers, industry regulation, and advocacy groups. Companies can monitor customers' needs by identifying customer problems after they occur or by anticipating problems before they occur. Because they tend to focus on well-known competitors, managers often underestimate their competition or do a poor job of identifying future competitors. Suppliers and buyers are dependent on each other, and that dependence sometimes leads to opportunistic behavior, in which one benefits at the expense of the other. Regulatory agencies affect businesses by creating rules and then enforcing them. Overall, the level of industry regulation has nearly tripled in the last 25 years. Advocacy groups cannot regulate organizations' practices. Nevertheless, through public communications, media advocacy, and product boycotts, they try to convince companies to change their practices.

4 MAKING SENSE OF CHANGING ENVIRONMENTS

In Chapter 1, you learned that managers are responsible for making sense of their business environments. As our discussions of the general and specific environments have indicated, however, making sense of business environments is not an easy task. Because external environments can be dynamic,

confusing, and complex, managers use a three-step process to make sense of the changes in their external environments:

4.1 environmental scanning, 4.2 interpreting environmental factors, and 4.3 acting on threats and opportunities.

4.1 Environmental Scanning

Environmental scanning involves searching the environment for important events or issues that might affect an organization. Managers scan the environment to stay up-to-date on important factors in their industry. The **American Hospital Association**, for instance, publishes an "Environmental Scan" annually to help hospital and health system managers understand the trends and market forces that have a "high probability of affecting the healthcare field." In its latest environmental scan, it indicated that consumers are receptive to receiving medical treatment at walk-in clinics and pharmacies or shopping centers; that 80 percent of consumers would like to have online access to information about their medical test results, doctor visits, and hospital stays; that a growing number of physicians will choose to be employed by hospitals rather than go into private practice; and that regenerative medicine, where medical techniques allow organs and body parts to heal themselves, may be the next major medical treatment.[64]

Managers also scan their environments to reduce uncertainty. Faced with the responsibility of developing the marketing campaigns that sell their companies' most important products, the chief marketing officers (CMOs) of the world's best organizations willingly pay $50,000 a year to join the "Marketing 50," an exclusive group of CMOs who meet several times a year to exchange ideas and pick one anothers' brains. Richard Smith, founder of the group, says, "It's a noncompetitive group with just one executive from a particular industry, so they have a chance to get ideas they can use that their competitors may not know about and also try to figure out some of their common problems." Michael Linton, Best Buy's CMO, believes the "Marketing 50" is fantastic for finding out what other companies and CMOs are doing, which helps him reduce uncertainty. He says, "It's impossible for any one company to know about every new tool, so hearing what is working for others helps."[65]

Organizational strategies also affect environmental scanning. In other words, managers pay close attention to trends and events that are directly related to their company's ability to compete in the marketplace.[66] Microsoft used to take software hackers to court to prosecute them for the damage caused by their efforts. However, since company founder Bill Gates declared that security is Microsoft's top priority, the company is actively trying to engage the services of friendly hackers. Though companies like Microsoft long considered computer hackers to be the enemy, they are now a source of competitive advantage. One hacker who has seen his fortunes with respect to Microsoft improve is H. D. Moore, the director of security for BreakingPoint Systems in Austin, Texas, who was wined and dined by Microsoft employees during a hacker convention in Las Vegas. He says that Microsoft has "been on a hacker buying spree" as the company tries to convince so-called security researchers to work with it rather than against it. From Microsoft's perspective, teaming up with the hacker community to solve software problems prior to release simply makes good business sense. Microsoft security-program manager Steven Toulouse stated that with the assistance of these hackers-become-researchers, "we have discovered things during the development of these products that we might not have discovered otherwise."[67]

Finally, environmental scanning is important because it contributes to organizational performance. Environmental scanning helps managers detect environmental changes and problems before they become organizational crises.[68]

[Environmental scanning] searching the environment for important events or issues that might affect an organization

Furthermore, companies whose CEOs do more environmental scanning have higher profits.[69] CEOs in better-performing firms scan their firm's environments more frequently and scan more key factors in their environments in more depth and detail than do CEOs in poorer-performing firms.[70]

4.2 Interpreting Environmental Factors

After scanning, managers determine what environmental events and issues mean to the organization. Typically, managers view environmental events and issues as either threats or opportunities. When managers interpret environmental events as threats, they take steps to protect the company from further harm. For example, now that Internet phone service (VoIP) has emerged as a threat, traditional phone companies have responded by spending billions to expand their fiber-optic networks so that they can offer phone (using VoIP), Internet service, and TV packages just like those the cable and satellite companies offer. For example, when this was being written, Comcast was losing 233,000 cable TV subscribers per quarter, while U-Verse, AT&T's digital TV service, and FiOS, Verizon's digital TV service, were adding 264,00 and 303,000 subscribers, respectively, during the same period.[71]

[Cognitive maps] graphic depictions of how managers believe environmental factors relate to possible organizational actions

By contrast, when managers interpret environmental events as opportunities, they consider strategic alternatives for taking advantage of those events to improve company performance. Apple is known for recognizing opportunities and capitalizing on them. The market for high-end "smart" phones, full-featured mobile phones that also function as a handheld personal computer, is growing roughly 2 percent per year. Because of opportunities in this market, Apple developed its own smart phone—the iPhone. CEO Steve Jobs announced the release more than 6 months in advance to generate hype, stimulate demand, and dampen sales of competitors. The iPhone features a wider screen, intuitive touch-screen controls, and the ability to use faster Wi-Fi networks so that users can e-mail, surf the web, and communicate with Bluetooth-enabled devices—plus, of course, download and play iTunes music. Apple sold 21 million iPhones in its first 18 months on the market, far exceeding its goal of 10 million. Likewise, another sign of Apple's success with the iPhone is that the one-billionth iPhone application was downloaded just 9 months after Apple opened its App Store for the iPhone and iPod Touch.[72]

4.3 Acting on Threats and Opportunities

After scanning for information on environmental events and issues and interpreting them as threats or opportunities, managers have to decide how to respond to these environmental factors. Deciding what to do under conditions of uncertainty is always difficult. Managers can never be completely confident that they have all the information they need or that they correctly understand the information they have.

Because it is impossible to comprehend all the factors and changes, managers often rely on simplified models of external environments called cognitive maps. **Cognitive maps** summarize the perceived relationships between environmental factors and possible organizational actions. For example, the cognitive map shown in Exhibit 3.6 represents a small clothing-store owner's interpretation of her business environment. The map shows three kinds of variables. The first variables, shown as rectangles, are environmental factors, such as a Wal-Mart or a large mall 20 minutes

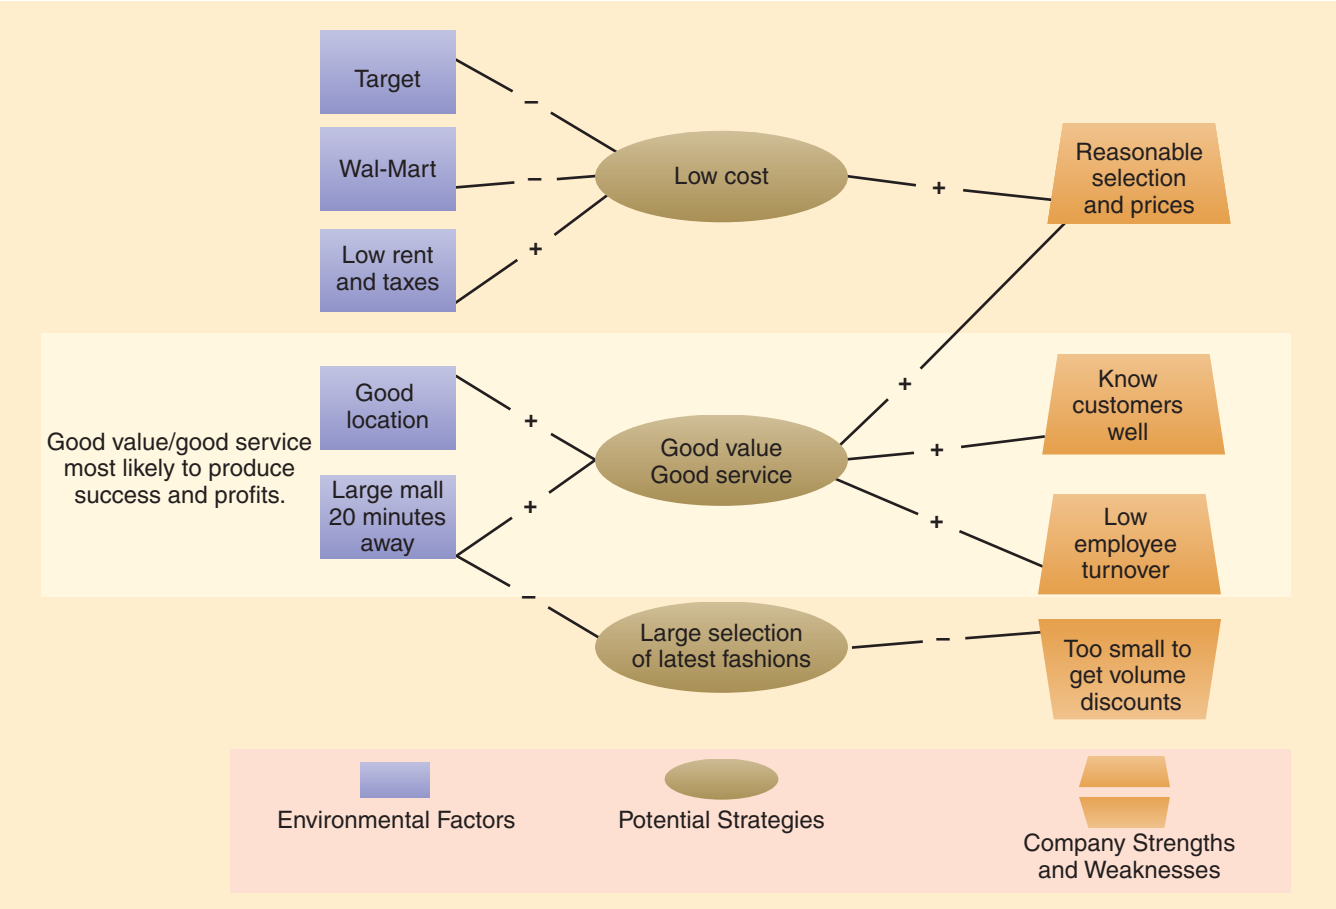

EXHIBIT 3.6

Cognitive Maps

away. The second variables, shown in ovals, are potential actions that the store owner might take, such as a low-cost strategy; a good-value, good-service strategy; or a "large selection of the latest fashions" strategy. The third variables, shown as trapezoids, are company strengths, such as low employee turnover, and weaknesses, such as small size.

The plus and minus signs on the map indicate whether the manager believes there is a positive or negative relationship between variables. For example, the manager believes that a low-cost strategy won't work because Wal-Mart and Target are nearby. Offering a large selection of the latest fashions would not work either—not with the small size of the store and that large nearby mall. However, the manager believes that a good-value, good-service strategy would lead to success and profits because of the store's low employee turnover, good knowledge of customers, reasonable selection of clothes at reasonable prices, and good location.

In the end, managers must complete all three steps—environmental scanning, interpreting environmental factors, and acting on threats and opportunities—to make sense of changing external environments. Environmental scanning helps managers more accurately interpret their environments and take actions that improve company performance. Through scanning, managers keep tabs on what competitors are doing, identify market trends, and stay alert to current events that affect their company's operations. Armed with the environmental information they have gathered, managers can then minimize the impact of threats and turn opportunities into increased profits.

REVIEW 4

Making Sense of Changing Environments Managers use a three-step process to make sense of external environments: environmental scanning, interpreting information, and acting on threats and opportunities. Managers scan their environments based on their organizational strategies, their need for up-to-date information, and their need to reduce uncertainty. When managers identify environmental events as threats, they take steps to protect the company from harm. When managers identify environmental events as opportunities, they formulate alternatives for taking advantage of them to improve company performance. Using cognitive maps can help managers visually summarize the relationships between environmental factors and the actions they might take to deal with them.

INTERNAL ENVIRONMENTS

We have been looking at trends and events outside of companies that have the potential to affect them. By contrast, the **internal environment** consists of the trends and events *within* an organization that affect the management, employees, and organizational culture. Internal environments are important because they affect what people think, feel, and do at work.

Earlier in the chapter, you learned that innovative new products such as the iPod, iPhone, and Xbox 360, as well as aggressive cost-cutting in the booming market for high-definition TVs (i.e., Sony's external environment), had hurt **Sony's** market share and profitability. Sony's problems, however, were directly linked to its hypercompetitive culture where people in different parts of the company did not communicate with each other and where designing innovative, high-priced products no matter the cost was seen as the most important contribution to the company.

Now, thanks to programs such as "Sony United," which encourage Sony employees in different divisions and locations to work with each other, Sony's culture has begun to change. One example of that change is Sony's Webbie HD, a basic high-definition digital camcorder that sells for under $200 for recording video to post on the Internet. In contrast to its old culture where the Webbie would have been designed by Tokyo engineers and produced in Sony factories, the idea for the Webbie came from Sony's American marketing team and is produced by a contract manufacturer in China.[73] Likewise, Sony's Mexican engineers worked with its U.S. marketing team to design Sony's new, inexpensive Bravia high-definition TV for the cost-competitive U.S. market. The Bravia sold so well at Wal-Mart that Best Buy asked for Bravias in its stores.[74]

After reading the next section, you should be able to

5. explain how organizational cultures are created and how they can help companies be successful.

The key component in internal environments is **organizational culture**, or the set of key values, beliefs, and attitudes shared by members of the organization.

[Internal environment] the events and trends inside an organization that affect management, employees, and organizational culture

[Organizational culture] the values, beliefs, and attitudes shared by organizational members

5 ORGANIZATIONAL CULTURES: CREATION, SUCCESS, AND CHANGE

Let's take a closer look at **5.1 how organizational cultures are created and maintained, 5.2 the characteristics of successful organizational cultures, and 5.3 how companies can accomplish the difficult task of changing organizational cultures.**

5.1 Creation and Maintenance of Organizational Cultures

A primary source of organizational culture is the company founder. Founders like Thomas J. Watson, Sr. (IBM), Sam Walton (Wal-Mart), and Bill Gates (Microsoft) create organizations in their own images and imprint them with their beliefs, attitudes, and values. For example, Thomas J. Watson proclaimed that IBM's three basic beliefs were the pursuit of excellence, customer service, and showing respect for the individual, meaning company employees. Microsoft employees share founder Bill Gates' determination to stay ahead of software competitors. Says a Microsoft vice president, "No matter how good your product, you are only 18 months away from failure."[75] Although company founders are instrumental in the creation of organizational cultures, eventually founders retire, die, or choose to leave their companies. When the founders are gone, how are their values, attitudes, and beliefs sustained in the organizational culture? Answer: stories and heroes.

"When the founders are gone, how are their values, attitudes, and beliefs sustained in the organizational culture?"

Organizational members tell **organizational stories** to make sense of organizational events and changes and to emphasize culturally consistent assumptions, decisions, and actions.[76] At Wal-Mart, stories abound about founder Sam Walton's thriftiness as he strove to make Wal-Mart the low-cost retailer that it is today.

> *In those days, we would go on buying trips with Sam, and we'd all stay, as much as we could, in one room or two. I remember one time in Chicago when we stayed eight of us to a room. And the room wasn't very big to begin with. You might say we were on a pretty restricted budget. (Gary Reinboth, one of Wal-Mart's first store managers)*[77]

Sam Walton's thriftiness still permeates Wal-Mart today. Everyone, including top executives and the CEO, flies coach rather than business or first class. When employees travel on business, it's still the norm to share rooms (though two to a room, not eight!) at inexpensive motels like Motel 6 and Super 8 instead of Holiday Inns. Likewise, Wal-Mart will reimburse only up to $15 per meal on business travel, which is half to one-third the reimbursement rate at similar-sized companies (remember, Wal-Mart is one of the largest companies in the world). At one of its annual meetings, former CEO Lee Scott reinforced Sam Walton's beliefs by exhorting Wal-Mart employees to bring back and use the free pencils and pens from their travels. Most people in the audience didn't think he was kidding, and he probably wasn't.[78]

A second way in which organizational culture is sustained is by recognizing and celebrating heroes. By definition, **organizational heroes** are organizational people admired for their qualities and achievements within the organization. Bowa Builders is a full-service construction company in Virginia. When it was renovating a large auto dealership, its carpet subcontractor mistakenly scheduled the new carpet to be delivered 2 weeks *after* it was to be installed. Rather than allow construction to be delayed, a Bowa employee kept the project on schedule by immediately reordering the carpet, flying to the carpet manufacturer's factory, renting a truck, and then

driving the carpet back to the auto dealership, all within 48 hours of learning about the problem. CEO and company cofounder Larry Weinberg says this story is told and retold within Bowa Builders as an example of heroic customer service. Moreover, the car dealership was so delighted with this extraordinary service that it has referred $10–$12 million in new business to Bowa Builders.[79]

5.2 Successful Organizational Cultures

Preliminary research shows that organizational culture is related to organizational success. As shown in Exhibit 3.7, cultures based on adaptability, involvement, a clear mission, and consistency can help companies achieve higher sales growth, return on assets, profits, quality, and employee satisfaction.[80]

Adaptability is the ability to notice and respond to changes in the organization's environment. Cultures need to reinforce important values and behaviors, but a culture becomes dysfunctional if it prevents change. One of the surest ways to do that is to discourage open discussion and disagreement. Organizational psychologist Kathleen Miller began working with a company that recognized the need to change its nonadaptive culture. However, she didn't realize how dysfunctional the culture was until she tried to start an honest discussion about the company's problems at one of her first meetings. The top managers simply would not speak up. They were so afraid to disagree with each other that they wrote their comments and questions anonymously on note cards and had them read aloud to the rest of the group.[81]

In cultures that promote higher levels of *employee involvement* in decision making, employees feel a greater sense of ownership and responsibility. Employee involvement has been a hallmark of Genencor since its creation as a joint venture between Genentech and Corning in 1982. Genencor designs its human resources programs by regularly polling employees about which benefits they enjoy and which they would like the company to offer. Most dramatically, when Genencor built its headquarters, it gave its employees a say in the design. Scientists requested that the labs be placed along the building's exterior so they could receive natural light. "I've worked in labs without windows," says staff scientist Fiona Harding, "and seeing the sun makes the time spent in the lab much more pleasant." The building also features a "main street," where employees congregate to collaborate and interact throughout the day. CEO Jean-Jacques Bienaime believes that these employee-driven design features lead to a more stimulating workplace. "If you want employees to be productive, you have to create a nurturing environment and let them be creative," he says. Such a commitment to employee involvement in decision making is definitely paying off for the company. Its turnover rate was less than 4 percent (the national industry average is 18.5 percent), and its employees generate approximately $60,000 more revenue per employee than its largest competitor, Novozymes.[82]

Company mission is the business's purpose or reason for existing. In organizational cultures with a clear company mission, the organization's strategic purpose and direction are apparent to everyone in the company. When managers are uncertain about their business environments, the mission helps guide the discussions, decisions, and behavior of the people in the company. For example, before **Google** became Google, Sergey Brin and Larry Page were doctoral students in Stanford's computer science department. When they walked into Sequoia Capital seeking funding to start, they shared their initial vision for the company, "Google provides access to the world's information in one click."[83] When **Microsoft** CEO Steve Ballmer dropped out of Stanford to join Microsoft, it wasn't long before he thought he had made a mistake. But that was because he didn't yet understand Microsoft's mission. When founder

[Company mission] a company's purpose or reason for existing

Bill Gates and Gates's father took Ballmer out for a drink, they told him, "You don't get it. You said you just joined to become the bookkeeper of a 30-person company. But we're going to put a computer on every desk in every home."[84] That mission—a computer on every desk—drove Microsoft for nearly two decades.

Specific mission statements strengthen organizational cultures by letting everyone know why the company is in business, what really matters (i.e., the company's values), and how those values can be used to guide daily actions and behaviors.[85] For example, Google's emphasizes its core business and its values, that is, what really matters, in a document called, "Ten things we know to be true," (**http://www.google.com/corporate/tenthings.html**).

The first item in that document is "Focus on the user and all else will follow." Google follows these criteria to make sure that its website and services benefit the people who use them: "The interface is clear and simple. Pages load instantly. Placement in search results is never sold to anyone. Advertising on the site must offer relevant content and not be a distraction." These criteria guide the daily actions and behavior of Google's employees as they improve and create Google's products and services.

The second item, "It's best to do one thing really, really well," makes clear what business Google is in, and that's search. Google explains it this way, "Our dedication to improving search has also allowed us to apply what we've learned to new products, including Gmail, Google Desktop, and Google Maps. As we continue to build new products while making search better, our hope is to bring the power of search to previously unexplored areas, and to help users access and use even more of the ever-expanding information in their lives."

You will learn more about mission statements (i.e., purpose statements) in Chapter 5 on planning and decision making.

Finally, in **consistent organizational cultures**, the company actively defines and teaches organizational values, beliefs, and attitudes. McDonald's helps preserve its history and culture by having its executives work in its restaurants one day each year, on founder Ray Kroc's birthday. According to Kroc, this is to remind McDonald's executives that "if it's below [their] dignity to mop floors, clean toilets, and roll up [their] sleeves, then [they] are not going to succeed: [Their] attitude is wrong." McDonald's also has an exhibit called "Talk to Ray," in which, thanks to messages videotaped before his death, anyone can "ask" Ray questions about McDonald's values and history.[86] Consistent organizational cultures are also called *strong cultures* because the core beliefs are widely shared and strongly held. Everyone who has ever worked at McDonald's has been taught its four core values: quality, service, cleanliness, and value. Studies show that companies with consistent or strong corporate cultures will outperform those with inconsistent or weak cultures most of the time.[87] Why? The reason is that when core beliefs are widely shared and strongly held, it is easy for everyone to figure out what to do and what *not* to do to achieve organizational goals.

Having a consistent or strong organizational culture doesn't guarantee good company performance. When core beliefs are widely shared and strongly held, it is very difficult to bring about needed change. Consequently, companies with strong cultures tend to perform poorly when they need to adapt to dramatic changes in their external environments. Their consistency sometimes prevents them from adapting to those changes.[88] Indeed, McDonald's saw its sales and profits decline in the late 1990s as customer eating patterns began to change. To rescue falling performance, the company introduced its "Plan to Win," which focuses on the five elements that drive its business: people, products, place, price, and promotion. McDonald's developed hospitality and multilingual computer-training programs and expanded its menu to include more healthful and snack-oriented selections. Over 5,000 McDonald's restaurants were remodeled in a 3-year period and now feature warmer lighting, upbeat music, flat-screen TVs, and Wi-Fi networks. And the company's promotional message "I'm lovin'

[Consistent organizational culture] a company culture in which the company actively defines and teaches organizational values, beliefs, and attitudes

it" went from being derided by advertising executives to one of the most recognizable jingles in any market. Now 7 years into the plan, McDonald's achieved 68 consecutive months of positive sales (its longest streak in 25 years), reached record annual revenues of more than $23 billion, and returned record cash dividends to its stockholders.[89]

5.3 Changing Organizational Cultures

As shown in Exhibit 3.8, organizational cultures exist on three levels.[90] On the first, or surface, level are the reflections of an organization's culture that can be seen and observed, such as symbolic artifacts (such as dress codes and office layouts) and workers' and managers' behaviors. Next, just below the surface, are the values and beliefs expressed by people in the company. You can't see these values and beliefs, but they become clear if you carefully listen to what people say and observe how decisions are made or explained. Finally, unconsciously held assumptions and beliefs about the company are buried deep below the surface. These are the unwritten views and rules that are so strongly held and so widely shared that they are rarely discussed or even thought about unless someone attempts to change them or unknowingly violates them. Changing such assumptions and beliefs can be very difficult. Instead, managers should focus on the parts of the organizational culture they can control. These include observable surface-level items, such as workers' behaviors and symbolic artifacts, and expressed values and beliefs, which can be influenced through employee selection. Let's see how these can be used to change organizational cultures.

EXHIBIT 3.8

Three Levels of Organizational Culture

One way of changing a corporate culture is to use behavioral addition or behavioral substitution to establish new patterns of behavior among managers and employees. **Behavioral addition** is the process of having managers and employees perform a new behavior, while **behavioral substitution** is having managers and employees perform a new behavior in place of another behavior. The key in both instances is to choose behaviors that are central to and symbolic of the old culture you're changing and the new culture that you want to create. When Mike Ullman became the CEO of JCPenney, he thought the company's culture was stuck in the 19th century (when the company was started). Employees called each other Mr. and Mrs., casual attire was unacceptable even on Fridays, and any elaborate decoration of office cubicles was reported to a team of office police charged with enforcing corporate décor guidelines. Ullman quickly determined that the company's stringent code of conduct was, among other things, keeping it from recruiting the talent it needed. Mike Theilmann, the human resources officer, drafted a list of what he called "quick hits," small changes that would have a big impact on the culture. The first of Theilmann's initiatives was a campaign titled "Just Call Me Mike," which he hoped would cure employees of the entrenched practice of calling executives and managers Mr. and Mrs. Three JCPenney officers are named Mike, along with nearly 400 other employees at headquarters. Theilmann created posters containing photos of the three executive Mikes along with a list of all the advantages of being on a first-name basis. Top of the list? "First names create a friendly place to shop and work."[91]

Another way in which managers can begin to change corporate culture is to change the **visible artifacts** of their old culture, such as the office design and layout, company dress code, and recipients (or nonrecipients) of company benefits and perks like stock options, personal parking spaces, or the private company dining room. To help anchor the internal culture change at JCPenney, Ullman issued new name badges to all 150,000 JCPenney employees. First names appeared in a large typeface; last names were printed much smaller. He also disbanded the office police, declared that suitable work attire was business casual, and sold or donated most of the 300 pieces in the company's art collection. (He replaced them with pictures of Penney's employees and other company-oriented art.) Most strikingly, Ullman updated founder James Cash Penney's code of conduct and replaced it with one that allows all employees—not just management—to receive the company's traditional Honor, Confidence, Service, Cooperation award for employee loyalty.[92]

Cultures can also be changed by hiring and selecting people with values and beliefs consistent with the company's desired culture. *Selection* is the process of gathering information about job applicants to decide who should be offered a job. As discussed in Chapter 11 on human resources, most selection instruments measure whether job applicants have the knowledge, skills, and abilities needed to succeed in their jobs. But companies are increasingly testing job applicants to determine how they fit with the company's desired culture (i.e., values and beliefs). Management consultant Ram Charan says, "A poor job match is not only harmful to the individual but also to the company."[93] At Bristol-Myers Squibb, people who didn't fit the culture tended to leave. According to Ben Dowell, who runs Bristol-Myers Squibb's Center for Leadership Development, "What came through was, those who left were uncomfortable in our culture or violated some core area of our value system."[94] The first step in hiring people who have values consistent with the desired culture is to define and describe that culture. Bristol-Myers Squibb hired an organizational psychologist who spent 4 months interviewing senior managers. He concluded that the company had a team-driven culture that focused on research and development, which meant that it valued self-motivated, intellectually curious people.

The second step is to ensure that applicants fit with the culture by using selection tests, instruments, and exercises to measure these values and beliefs in job applicants. (See Chapter 11 for a complete review of applicant and managerial selection.) At Southwest Airlines, humor and a good attitude are two of the most important requirements in its new hires. Cofounder and former CEO and board chair Herb Kelleher says, "What's important is that a customer should get off the airplane feeling: 'I didn't just get from A to B. I had one of the most pleasant experiences I ever had and I'll be back for that reason.'"[95] For instance, a flight attendant on a flight from Houston to Dallas addresses passengers over the speaker system, saying, "Could y'all lean in a little toward the center aisle, please?" Met with confused looks from passengers, he continues, "Just a bit, please. That's it. No, the other way, sir. Thanks. You see, the pilot has to pull out of this space here, and he needs to be

[Visible artifacts] visible signs of an organization's culture, such as the office design and layout, company dress code, and company benefits and perks, like stock options, personal parking spaces, or the private company dining room

able to check the rearview mirrors." On another Southwest plane, Yvonne Masters jokingly introduced her fellow flight attendants as her "former husband and his new girlfriend."[96] Southwest passenger Mark Rafferty said his favorite Southwest flight attendant joke was when "they told everyone on the plane's left side, toward the terminal, to put their faces in the window and smile so our competitors can see what a full flight looks like."[97] Corny, yes, but the humor is exactly what Southwest and its customers want, and the airline gets it by hiring people consistent with its hard-working, fun-loving culture. Says Kelleher, "We draft great attitudes. If you don't have a good attitude, we don't want you, no matter how skilled you are. We can change skill level through training. We can't change attitude."[98]

Corporate cultures are very difficult to change. Consequently, there is no guarantee that any one approach—changing visible cultural artifacts, using behavioral substitution, or hiring people with values consistent with a company's desired culture—will change a company's organizational culture. The best results are obtained by combining these methods. Together, these are some of the best tools managers have for changing culture because they send the clear message to managers and employees that "the accepted way of doing things" has changed.

REVIEW 5

Organizational Cultures: Creation, Success, and Change Organizational culture is the set of key values, beliefs, and attitudes shared by organizational members. Organizational cultures are often created by company founders and then sustained through the telling of organizational stories and the celebration of organizational heroes. Adaptable cultures that promote employee involvement, make clear the organization's strategic purpose and direction, and actively define and teach organizational values and beliefs can help companies achieve higher sales growth, return on assets, profits, quality, and employee satisfaction. Organizational cultures exist on three levels: the surface level, where cultural artifacts and behaviors can be observed; just below the surface, where values and beliefs are expressed; and deep below the surface, where unconsciously held assumptions and beliefs exist. Managers can begin to change company cultures by focusing on the top two levels and by using behavioral substitution and behavioral addition, changing visible artifacts, and selecting job applicants with values and beliefs consistent with the desired company culture.

States, Employers, and Health Care

Although health care is not a new issue, state-mandated employee coverage is. In 2006, Massachusetts began requiring businesses with more than 10 employees to provide health insurance or pay fines of $295 per employee per year. New York, Vermont, Washington, and Wisconsin quickly began examining the Massachusetts plan as a framework for crafting their own. Keep your eyes open for more states considering business-funded health insurance requirements.

SELF ASSESSMENT

Check Your Tolerance For Ambiguity

Think of the difference between playing chess (where you can see all the pieces and anticipate attacks and plan counterattacks) and playing poker (where no one knows anyone else's hand, and you have to make guesses based on your interpretation of opponents' betting patterns). In chess, there is little ambiguity, whereas in poker there is tremendous ambiguity. Although many people liken business to a game of chess, probably because of the strategic aspects of the game, business is actually more like poker. The business environment is complex and uncertain, and managers never *really* know all the cards the opposition is holding. Managers must learn to adapt to environmental shifts and new developments—sometimes on a daily basis. For some managers, however, this can be a challenging task because everyone has a different comfort level when it comes to ambiguity. For some, not knowing all the details can be a source of significant stress, whereas for others uncertainty can be energizing.

As a manager, you will need to develop an appropriate tolerance for ambiguity. For example, being stressed out every time interest rates change can be counterproductive, but completely ignoring the economic environment can be detrimental to your company's performance.

Complete the following questionnaire to get a sense of your tolerance for ambiguity.[99] Indicate the extent to which you agree with the statements using the following scale:

Determine your score by entering your response to each survey item below, as follows. In blanks that say *regular score*, simply enter your response for that item. If your response was a 6, place a 6 in the *regular score* blank. In blanks that say *reverse score*, subtract your response from 8 and enter the result. So if your response was a 6, place a 2 (8 − 6 = 2) in the *reverse score* blank. Add up your total score.

MANAGEMENT DECISION

Creating an Organizational Culture

It's the end of a long day in the kitchen. Your floor is mopped, dishes are clean, and your waitstaff has gone home for the night. You sit down in a corner of your restaurant to finally enjoy your own dinner. As you savor the locally cured salmon in your salad, you take a moment to survey the new business you've created and think about how to sustain and grow it.

Trying to marry the value of locally produced food prepared in interesting ways with the goal of a quick, inexpensive meal that makes fast-food restaurants so popular among customers may seem like trying to mix oil and water. But the popularity of books like *The Omnivore's Dilemma* that have raised awareness about problems in the food industry and increasing dissatisfaction with the unhealthy choices offered by many fast-food restaurants have you convinced that more and more customers want a sustainable, tasty alternative to fast food. And you know you can provide it. An important part of what you need to do now is create a culture in your company that supports your mission for the restaurant.

Ironically, as you finish your last bite of salad, you consider taking a page from a fast-food playbook. As you were browsing the shelves at the local bookstore recently, you picked up a copy of *In-N-Out Burger: A Behind-the-Counter Look at the Fast-Food Chain That Breaks All the Rules*. Sure, it's fast food, but it's beloved by some of the most famous foodies around. And apparently they're doing something right. Like your business, In-N-Out started small. And it's still small compared to the big chains, yet it leaves McDonald's in the dust when it comes to sales per store. Quality is the key value for In-N-Out. Their burgers are certainly good, or five-star chefs wouldn't be eating there. But the real secret seems to be that quality food is coupled with quality workers. While many fast-food chains shuffle unskilled workers in and out of low-paying jobs, In-N-Out Burger selects employees who show initiative, are able to make good decisions, and have good people skills and trains them for a *career* in management with the company. And once they've made it, the company treats them like any blue-chip manager, with a six-figure salary and performance-based bonuses.

You wish you could pay your employees that well—after all, many of them came to work for you because they already share the values of sustainable food production and gourmet cooking that drove you to start this business. But, as the owner of a single restaurant (for now . . .), you've got to think a bit smaller. What can you actively do to create a consistent organizational culture that is in line with your mission and values and that will help you attract the employees and customers needed for your business to grow?

Questions

1. What things are you already doing and what things do you already have in place to create a consistent organizational culture?
2. What do you think might already be seen, heard, and believed among the employees and customers in your restaurant?
3. Create a list of things you could do to grow and strengthen the organizational culture in your restaurant. Consider factors discussed in the text as you make your list: What stories could you tell? Who are your heroes? What visible artifacts could you create? How might you select employees?

MANAGEMENT TEAM DECISION

Dog Day Blues

One of the reasons you accepted a management position at MicroTek several years ago was the company's laidback culture.[100] A loose organizational structure enables employees to move freely between projects, and the open office space encourages informal encounters and generates a feeling of teamwork. And among the very generous corporate perks is a policy allowing employees to bring their pets to work. It is not uncommon to see a small animal sitting in an employee's inbox drinking from a hamster lick. Several employees bring their dogs, large and small, to the office.

As the company has grown, thanks in part to its informal culture, more and more people are taking advantage of the pet policy, and problems are arising. Food is swiped from desks, animals are rooting through trash bins, and dogs are marking territory on the partitions that surround their owners' desks. Visiting customers often try to mask startled (at best) or disapproving (at worst) looks when they tour your facility for the first time—and even the second and third times. During a recent breakfast meeting, when a board member refused to share her bagel with the CFO's dog, the dog relieved itself on her briefcase. At least one employee has complained of allergic reactions due to the high levels of pet dander in the office air, but rather than change the policy, you installed a high-power air cleaner.

Despite the challenges, you have resisted changing the pet policy because it symbolizes both the company's relaxed culture and MicroTek's commitment to its employees' work-life balance. This afternoon, however, you were notified by the federal Occupational Safety and Health Administration (OSHA) that your office does not meet the required indoor air quality standards. Apparently, the cleaner you installed can't handle all the pet dander. To meet the standards, you'll need an even more powerful air cleaner that costs between $100,000 and $200,000. That would be a significant investment in the pet policy! And who knows if it would solve the allergy problem. Is the policy worth the cost?

In 2003, only 5,000 offices participated in "Bring Your Pet to Work Day," but the number doubled the very next year. Companies bigger than MicroTek have figured out how to make pet policies work: IAMS Pet Food; Replacements Ltd., the world's largest supplier of old and new china; and Netscape, to name a few. A quarter of Burton Snowboards' 230 employees bring

their dogs to work every day! Anecdotal evidence from those companies indicates that pets can spur creativity and lower occupational stress. You ask yourself, "How committed am I to the pet policy?" Is the pet policy just trendy (or avant-garde), or does it say something deeper about your company?

For this Management Team Decision, assemble three or four students to act as the management team for MicroTek. Include both pet owners and people without pets to avoid any bias. Before you begin the exercise, have each team member privately write down answers to each of the following questions. By sharing your individual responses, you may be able to have a more varied and rounded discussion.

Questions

1. Do you buy the expensive air cleaner, or eliminate the pet policy? Why?
2. If you choose to stop allowing animals at the office, what effect, if any, do you think the change will have on the company's culture?
3. Can you think of a way to allow people to bring pets to work without upgrading the air cleaner or running afoul of OSHA?

PRACTICE BEING A MANAGER

Navigating Different Organizational Cultures

Effective managers recognize that organizational culture is an important, often critical, element of organizational health and performance. But recognizing and understanding culture, especially its less visible aspects, is often quite challenging. This exercise will give you some practice in recognizing cultural differences and the challenges and opportunities that managers face as they work with diverse cultures.

Suppose that major music recording company SonyBMG has announced plans to hire several college students to form a team that will invest in the "next big things in music." The selected students will be paid $50,000 per year for working part-time. SonyBMG will also allocate up to $10 million for hiring artists, producing records, and so on based on the team's recommendations.

The new team has been dubbed the Top Wave Team (TWT). If TWT's recommendations are fruitful, the company will sign each member of the team to $150,000 full-time contracts. The company also plans to keep the team together and to give members bonuses and promotions based on their group performance.

Your class has been chosen as the representative college class. The music company is now asking you to form affinity groups by musical preferences in your class (e.g., a Country Music group, an Urban/Hip-Hop group). Each group will nominate one of its members to receive the first $50,000 internship as a TWT team member at SonyBMG. The new TWT group will meet and discuss initial plans and investment recommendations, and then your class will discuss the process and outcomes.

Step 1: Choose your musical affinity. In the class session before this exercise, your professor will ask you to submit a survey form or sheet of paper with your name and your preferred musical genre/identity.

Identify yourself with one of the following musical genres based on (a) preference/affinity ("I prefer this music") and (b) knowledge/understanding ("Of all types of music, I know the most about _____ music/musicians"):

1. Rock
2. Country
3. Religious/Spiritual
4. Urban/Hip-Hop
5. Rap
6. Jazz/R&B
7. Pop/Mainstream
8. Classical
9. Folk/Bluegrass

Your professor will review your submitted preferences, and organize affinity groups for the next class session.

Step 2: Organize into groups. Your professor will organize you by musical affinity. If your class is heavily concentrated in one or a few of the musical genres, you may be asked to further divide into smaller groups by subcategories (such as Rock—Heavy Metal and Rock—Popular/Hit).

Step 3: Prepare your recommendations. In groups, discuss what is important about your type of music and what investments should be made by the TWT team. Keep in mind that the investments made by the

TWT team could have a big impact on the future of your favorite music. Recommend a dollar amount or percentage of the $10 million that your representative ought to secure for investment in your genre.

Each group should then select one of its members to receive the internship from SonyBMG and represent the group on the TWT team.

Step 4: Discuss recommendations before the class. Nominees from the musical affinity groups should discuss their recommendations before the class. Those not on the TWT should observe the process and take notes on what happens in this meeting.

Step 5: Hold the team meeting. Your professor will allocate a short time for the initial meeting of the TWT. It may occur before or during the class meeting. After the TWT reaches agreement on how it might allocate its investments by genre (or by some alternative approach), reaches impasse, or reaches the time limit, your professor will call an end to the TWT meeting.

Step 6: Debrief and discuss. As a class, discuss the process and outcomes of this exercise. Consider the following questions and/or others posed by your professor:

- Did you sense some cultural affinity with others who shared your musical tastes? Why or why not?
- What expectations might be associated with choosing someone to "represent" a group on a team such as the TWT?
- What tensions and challenges might face each member of the TWT in a real-life setting of serving on a group that represents various cultures?

DEVELOP YOUR CAREER POTENTIAL

Dealing with the Press

In this age of 24-hour cable news channels, tabloid news shows, and aggressive local and national news reporters intent on exposing corporate wrongdoing, one of the most important skills for a manager to learn is how to deal effectively with the press.[101] Test your ability to deal effectively with the press by putting yourself in the following situations. To make the situation more realistic, read the scenario and then give yourself 2 minutes to write a response to each question.

Rats Take Over Manhattan Taco Bell

The release of Internet footage showed large rats running across the floors, over tables, and climbing onto countertops of a Manhattan Taco Bell. What is most surprising is that the day before the television crew filmed the rats through the restaurant window, New York City health inspectors had given the restaurant a passing grade! The broadcast prompted parent company Yum! Brands to temporarily close that and several other Taco Bell stores owned by franchisee ADF Companies. Based in New Jersey, ADF owns over 350 fast-food franchises in several states.

A TV reporter from Channel 5 has arrived with his camera crew at the Taco Bell you manage in Brooklyn. It's lunchtime, the restaurant is bustling, and the reporter walks right in with his crew and puts you on the spot, asking you if you would grant a short interview and let him ask questions of a few of your patrons. When you agree, he starts right in with these questions:

1. "Yesterday's filming of rats at an ADF-owned Taco Bell has caused consumers to question the cleanliness of the restaurants where they eat. This restaurant is also owned by ADF Companies. Do you also have problems with rodents?"
2. "Recent outbreaks of *E. coli* at other Taco Bells in the Northeast were finally attributed to contaminated lettuce, so Taco Bell changed suppliers." [To the cameraman:] "Get the camera in close here [camera zooms into the kitchen area, the slop sink, and the handwashing station] because I want our viewers to see the kitchen." [Back to you:] "How can consumers be sure that contamination occurred at the produce supplier and not inside filthy restaurants?"
3. "The health inspectors gave a passing grade to the rat-infested Taco Bell just a day before television crews filmed the rats running all over the restaurant. That doesn't instill our viewers with great confidence in the system. Would you be willing to let our camera crews accompany the health inspector during a full inspection of your restaurant so that viewers can see what an inspection entails?"

"Good-Time *Charlie Wilson's War* (Tom Hanks) is a Democratic Congressman from East Texas with a reputation for partying, drinking, and womanizing. When Afghanistan rebels against the Soviet troop invasion in the 1980s, Wilson becomes the unlikely champion of the Afghan cause through his role in two major congressional committees that deal with foreign policy and covert operations. Julia Roberts plays the Houston socialite and conservative political activist Joanne Herring, who urges Wilson to help the rebels. Wilson's covert dealings with the rebels have some unforeseen and long-reaching effects, however. In this clip from the beginning of the movie, Charlie Wilson is at work in the Capitol Building, on his way to chambers where he's about to cast a vote.

What to Watch for and Ask Yourself

1. This chapter discussed organizational culture as having three levels of visibility. Visible artifacts are at the first level and are the easiest to see. Which visible artifacts did you observe in this sequence?
2. Values appear at the next level of organizational culture. You can infer a culture's values from the behavior of organizational members. Which values appear in this sequence?
3. Organizational members will unconsciously behave according to the basic assumptions of an organization's culture. You also infer these from observed behavior. Which basic assumptions appear in this sequence?

Eric Hudson had earned his MBA and wanted to put it to use by starting his own company when he saw an opportunity that others were missing—a "green" one. He noticed that more and more consumers were recycling and that recycled materials were plentiful, but few people ever saw what became of it. What if they were able to purchase new products made with recycled materials? Hudson broke into the natural product arena with the Preserve Toothbrush made from recycled materials in 1996, and his company was born. The product line grew to feature razors, colanders, cutting boards, tableware, and more. In this video, Hudson and his small team of employees discuss the challenges of marketing recycled products, how they practice what they preach about environmental consciousness, and ways they think the "green industry" might be different in the future.

What to Watch for and Ask Yourself

1. How would you describe the rate of Preserve's environmental change? Do you think it's more stable or more dynamic? Why?
2. How do Eric Hudson and his employees practice what they preach when it comes to environmental consciousness?
3. What aspects of the general environment are relevant to Preserve?

San Diego Chargers Offices, San Diego, California.[1]

Say "Vick," "Stallworth," and "Burress" to any National Football League (NFL) fan, and they'll know that Atlanta Falcon's quarterback Michael Vick pleaded guilty for dog fighting, served eighteen months in prison, and was suspended by the NFL for two seasons; that after accidentally hitting and killing a pedestrian, Cleveland Browns wide receiver Donte Stallworth pleaded guilty to drunken driving and manslaughter, served a month in jail, and was suspended for one year; and, that New York Giants receiver Plaxico Burress acciden-tally shot himself in the leg in a crowded nightclub with an unlicensed handgun, pleaded guilty, agreed to serve two years in prison, and was suspended for two years. High- profile cases like these have harmed the NFL's carefully managed reputation, but as the General Manager (GM) of the San Diego Chargers, you know that the problems go much deeper. From public intoxication, to drunken driving (29 percent of all incidents), to public urination, to assault and battery, to resisting arrest, to drug possession, approximately 10 percent of active players have been arrested, and two-thirds of those have been convicted. Indeed, the president of the NFL Players Association (NFLPA) felt that off-the-field conduct threatened NFL's success and popularity.

As a result of these incidents, the NFL, in conjunction with the NFLPA, developed a stricter personal-conduct policy where NFL Commissioner Roger Goodell has the authority to investigate, fine, and suspend players without pay, including banishing them from league play. Teams are also fined since they must return a portion of a suspended player's salary to the league under the new policy. Although it's too early to know if the policy will work, twice as many players have been suspended under the stricter guidelines.

Not surprisingly, teams have responded to these problems with several different approaches. First, hoping that education makes a difference, all NFL teams now require their rookies to participate in an eight-hour class on "conduct-management." Second, because players are an attractive target for troublemakers, teams have hired security directors, usually former FBI agents, who do everything from running background checks on players' friends and associates to working with local police, to protecting players from scam artists. Third, following the "bad apple" theory, teams intensified the background checks they conduct on draft prospects, hoping to avoid selecting "problem" players. Dolphins GM Jeff Ireland says, "We check

Study Tips

everything. We've got guys checking academics, guys calling the local sheriff. We've got security people and [we] talk to trainers and strength coaches." Another GM commented that background checks will "track a prospect as far back as middle school to determine patterns of behavior."

Even though many of those steps make sense to you, the Chargers' security director is pushing you to consider several more aggressive options, such as placing guards in hotel hallways (to make sure players are in their rooms the night before games), restricting where players can go in their free time (so they will stay out of bars or clubs that are known trouble spots), and even following players after practice to monitor how they behave in public (and intervene if problems occur). It's clear how those policies could reduce violations of the NFL's personal conduct policy, but you wonder if your fans would find them objectionable? Moreover, would they tolerate similar steps in their workplaces from their employers? As you decide what to do, what issues should you and the Chargers pay most attention to, economic (player and team fines), legal (charges and sentences associated with violent or illegal activities), or ethical (right versus wrong)? Which is more important and why? Finally, is it fair for the commissioner to play "judge, jury, and executioner" on personal-conduct issues that can result in lifetime banishment from the game? Should attorneys or the NFLPA be involved in this process? What's the fairest method of handling these issues?

If you were the GM of the San Diego Chargers, what would you do?

The dilemma facing the GM of the San Diego Chargers is an example of the tough decisions involving ethics and social responsibility that managers face. Unfortunately, no matter what you decide to do, someone or some group will be unhappy with the outcome. Managers don't have the luxury of choosing theoretically optimal, win-win solutions that are obviously desirable to everyone involved. In practice, solutions to ethics and social responsibility problems aren't optimal. Often, managers must be satisfied with a solution that just makes do or does the least harm. Rights and wrongs are rarely crystal clear to managers charged with doing the right thing. The business world is much messier than that.

We begin this chapter by examining ethical behavior in the workplace and explaining how unethical behavior can expose a business to penalties under the U.S. Sentencing Commission Guidelines for Organizations. Second, we examine the influences on ethical decision making and review practical steps managers can take to improve ethical decision making. We finish by considering to whom organizations are socially responsible, for what organizations are socially responsible, how organizations can respond to societal expectations for social responsibility, and whether social responsibility hurts or helps an organization's economic performance.

WHAT IS ETHICAL AND UNETHICAL WORKPLACE BEHAVIOR?

Ethics is the set of moral principles or values that defines right and wrong for a person or group. Unfortunately, numerous studies have consistently produced distressing results about the state of ethics in today's business world. A Society of Human Resources Management Survey found that only 27 percent of employees felt that their organization's leadership was ethical.[2] In a study of 1,324 randomly selected workers, managers, and executives across multiple industries, 48 percent of the respondents admitted to actually committing an unethical or illegal act in the past year! These acts included cheating on an expense account, discriminating against coworkers, forging signatures, paying or accepting kickbacks, and looking the other way when environmental laws were broken.[3] Clearly, with widely publicized corporate scandals, such as at Madoff Investment Securities LLC (where Bernie Madoff used a pyramid scheme, taking money from new investors to pay to old investors as bogus returns, bilking 1,341 investors out of $13 billion), and with companies losing 7 percent of their annual revenues on average to corporate fraud, business ethics is a serious and widespread problem.[4]

Bernie Madoff

Other studies contain good news. When people believe their work environment is ethical, they are six times more likely to stay with that company than if they believe they work in an unethical environment.[5] One study asked 570 white-collar workers which of 28 qualities were important in company leaders. The results? Honesty (24 percent) and integrity/morals/ethics (16 percent) ranked by far the highest. (Caring/compassion was third at 7 percent.)[6] According to Dwight Reighard, the chief people officer at HomeBanc Mortgage Corp. in Atlanta, "people want to work for leaders they trust."[7] In short, much needs to be done to make workplaces more ethical, but—and this is very important—most managers and employees want this to happen.

After reading the next three sections, you should be able to

1. discuss how the nature of management jobs creates the possibility for ethical abuses.
2. identify common kinds of workplace deviance.
3. describe the U.S. Sentencing Commission Guidelines for Organizations, and explain how they both encourage ethical behavior and punish unethical behavior by businesses.

[Ethics] the set of moral principles or values that defines right and wrong for a person or group

1 ETHICS AND THE NATURE OF MANAGEMENT JOBS

Ethical behavior follows accepted principles of right and wrong. By contrast, unethical management behavior occurs when managers personally violate accepted principles of right and wrong—for example, by lying about company profits or knowingly producing an unsafe product—or encourage others to do so. Because of the nature of their jobs, managers can be tempted to engage in unethical managerial behavior in four areas: authority and power, handling information, influencing the behavior of others, and setting goals.

The *authority and power* inherent in some management positions can tempt managers to engage in unethical practices. Because they often control company resources, there is a risk that some managers will cross the line from legitimate use to personal use of these resources. For example, treating a client to dinner is a common and legitimate business practice in many companies. But what about treating a client to a ski trip? Taking the company jet to attend a business meeting in San Diego is legitimate. But how about using the jet to come home to Chicago by way of Honolulu? Human resources can be misused as well. For example, unless it's in an employee's job description, using an employee to do personal chores, like picking up the manager's dry cleaning, is unethical behavior. Even worse, though, is using one's managerial authority and power for direct personal gain as some managers have done by using corporate funds to pay for extravagant personal parties, lavish home decorating, jewelry, or expensive works of art.

Handling information is another area in which managers must be careful to behave ethically. Information is a key part of management work, since managers collect it, analyze it, act on it, and disseminate it. In doing so, they are expected to be truthful and, when necessary, to keep confidential information confidential. Leaking company secrets to competitors, doctoring the numbers, wrongfully withholding information, and lying are some of the ways managers may misuse information entrusted to them. **Satyam Computer** is a leading Indian outsourcing and software company that serves more than a third of the *Fortune* 500 companies and the U.S. government. After years of "doctoring" the books, chairman and cofounder Ramalinga Raju finally admitted that he overstated profits and revenues and created a fake cash balance of $1 billion in hopes of making the company appear more successful than it was so it could attract more business and investment.[8]

Managers must also be careful to behave ethically in the way they *influence the behavior of others*, especially those they supervise. Managerial work gives managers significant power to influence others. If managers tell employees to perform unethical acts (or face punishment), such as faking the numbers to get results, they are abusing their managerial power. This is sometimes called the "move it or lose it" syndrome. "Move it or lose it" managers tell employees, "Do it. You're paid to do it. If you can't do it, we'll find somebody who can."[9] A study of 400 managers found that the "move it or lose it" syndrome even affects top managers. Forty-seven percent of the corporate executives in this study said they would be willing to commit financial fraud by understating accounting write-offs that reduced company profits. Tulane University business professor Art Brief, who conducted the study, says, "People in subordinate roles will comply with their superiors even when that includes wrongdoing that goes against their individual moral code. I thought they would stick with their values, but most organizations are structured to produce obedience."[10]

[Ethical behavior] behavior that conforms to a society's accepted principles of right and wrong

Although managers can influence their employees' behavior through direct order, they can also do so more indirectly through the *goals they set*. If managers set

unrealistic goals, the pressure to perform and achieve those goals can influence employees to engage in unethical business behaviors, especially if they are just short of meeting their goals or a deadline.[11] When **Safety-Kleen**, which recycles millions of gallons of used motor oil each year into reusable motor oil and provides environmentally friendly cleaning equipment for all kinds of industrial uses, was acquired by Rollins Environmental Services, company managers told investors that profits would soon be $500 million a year because of synergies and cost savings from combining the companies. When the company couldn't meet that aggressive goal, the chief financial officer (CFO), "made and directed other Safety-Kleen employees to make a series of false accounting entries, commonly known as 'top side adjustments,' to artificially inflate earnings for the quarter."[12] The CFO later pleaded guilty. The indictment charging him with these crimes "alleged that the fraud was part of an attempt to meet earnings targets," which, in this case, were highly unrealistic goals.[13]

Ethics and the Nature of Management Jobs Ethics is the set of moral principles or values that define right and wrong. Ethical behavior occurs when managers follow those principles and values. Because they set the standard for others in the workplace, managers can model ethical behavior by using resources for company business and not for personal gain. Furthermore, managers can encourage ethical behavior by handling information in a confidential and honest fashion, by not using their authority to influence others to engage in unethical behavior, and by setting reasonable rather than unreasonable goals.

REVIEW 1

2 WORKPLACE DEVIANCE

Depending on which study you look at, one-third to three-quarters of all employees admit that they have stolen from their employers, committed computer fraud, embezzled funds, vandalized company property, sabotaged company projects, faked injuries to receive workers' compensation benefits or insurance, or been "sick" from work when they weren't really sick. Experts estimate that unethical behaviors like these, which researchers call *workplace deviance*, may cost companies as much as $1 trillion a year, or roughly 7 percent of their revenues.[14] **Workplace deviance** is unethical behavior that violates organizational norms about right and wrong. As Exhibit 4.1 shows, workplace deviance can be categorized by how deviant the behavior is, from minor to serious, and by the target of the deviant behavior, either the organization or particular people in the workplace.[15] One kind of workplace deviance, called **production deviance**, hurts the quality and quantity of work produced. Examples include leaving early, taking excessively long work breaks, intentionally working slower, or wasting resources.

Property deviance is unethical behavior aimed at company property or products. Examples include sabotaging, stealing, or damaging equipment or products and overcharging for services and then pocketing the difference. For example, Karin Wilson, who owns the Page and Palette bookstore in Fairhope, Alaska, found that her bookkeeper was using the bookstore's company credit card to pay off her personal credit card and also wrote checks to herself instead of paying publishers for books. In all, Wilson estimates that her bookkeeper made off with $150,000.[16] Employee stealing is more widespread than you'd think. A survey of 24 large retailers employing 2.3 million workers found that 1 out of 28 employees were caught stealing each

year.[17] Likewise, 58 percent of office workers acknowledge taking company property for personal use, according to a survey conducted for Lawyers.com.[18]

Sometimes, property deviance involves the sabotage of company property. Vitek Boden worked for the information technology company that installed a computer system for Maroochy Shire sewage control, a local waste management company in Australia. After he applied for a job at Maroochy and was turned down, he used his technology skills and inside information (from installing their computer system) to release millions of gallons of raw sewage into local park and rivers and a nearby hotel.[19] Boden, who admitted to conducting the "electronic revenge attacks," was sentenced to two years in jail.

Theft of company merchandise by employees, called **employee shrinkage**, is another common form of property deviance. Employee shrinkage costs U.S. retailers more than $15.8 billion a year and typically reduces store profits by 2 to 3 percent and takes many forms.[20] "Sweethearting" occurs when employees discount or don't ring up merchandise their family or friends bring to the cash register. In "dumpster diving," employees unload trucks, stash merchandise in a dumpster, and then retrieve it after work.[21] To help jewelry stores reduce employee shrinkage, there are systems that give jewelry sales associates limited and timed access to drawers which are used to store and display jewelry. Stanley Oppenheim, of DGA Security Systems, explains, "You can program the system so that only one drawer can be opened at a time, or so that different sales agents have different access levels, or to make an alarm go off if a drawer has stayed open too long."[22] Likewise, camera systems now contain advanced security features. According to Paula Rosenblum of Retail Systems Research, "With some of these cameras you can measure 'dwell-time,' how long a person is standing in a particular place. A camera might capture a theft, but when do you have time to look at the whole video? By building intelligence into these cameras, you can be alerted early, and perhaps stop the crime."[23] Workers' compensation fraud is

[Employee shrinkage] employee theft of company merchandise

another example of property deviance aimed at defrauding and hurting a company. According to the National Insurance Crime Bureau (NICB), about 10 percent of insurance claims are fraudulent, resulting in $5 billion in sham workers' compensation claims annually. Abuses range from people who fake an injury while on the job in order to collect workers' compensation insurance to "organized criminal conspiracies of crooked physicians, attorneys, and patients who submit false and exaggerated medical claims to insurance companies."[24]

Whereas production and property deviance harm companies, political deviance and personal aggression are unethical behaviors that hurt particular people within companies. **Political deviance** is using one's influence to harm others in the company. Examples include making decisions based on favoritism rather than performance, spreading rumors about coworkers, or blaming others for mistakes they didn't make. **Personal aggression** is hostile or aggressive behavior toward others. Examples include sexual harassment, verbal abuse, stealing from coworkers, or personally threatening coworkers. One of the fastest-growing kinds of personal aggression is workplace violence. For example, an employee at **SiPort**, a software startup company in Santa Clara, California, who had been fired from his job, returned to company headquarters and asked for a meeting with three company executives. When they entered a conference room to meet with him, he shot and killed all three.[25] Violence in the workplace isn't just committed by employees. A client entered a law firm on the 38th floor of a downtown Chicago office building and shot three people dead before he was killed by a SWAT officer.[26]

More than 2 million Americans are victims of some form of workplace violence each year. According to a U.S. Bureau of Labor Statistics (BLS) survey of 7.4 million U.S. companies, 5.4 percent of all employees suffered an incident of workplace violence each year.[27] Between 650 and 1,000 people are actually killed at work each year.[28] Of those, 450 to 550 are treated as homicides.[29] Store owners and company managers are killed most often, although many victims, as might be expected, are police officers, security guards, or taxi drivers.[30] For more information on workplace violence, see the BLS website, **http://www.bls.gov/iif/osh_wpvs.htm**.

Workplace Deviance Workplace deviance is behavior that violates important organizational norms about right and wrong and harms the organization or its workers. Production deviance and property deviance harm the company, whereas political deviance and personal aggression harm individuals within the company.

3 U.S. SENTENCING COMMISSION GUIDELINES FOR ORGANIZATIONS

A male supervisor is sexually harassing female coworkers. A sales representative offers a $10,000 kickback to persuade an indecisive customer to do business with his company. A company president secretly meets with the CEO of her biggest competitor, and they agree not to compete in markets where the other has already established customers. Each of these behaviors is clearly unethical (and, in these cases, also illegal). Historically, if management was unaware of such activities, the company could not be held responsible for an employee's unethical acts. Since 1991, however, when the U.S. Sentencing Commission Guidelines for Organizations were established, companies can be prosecuted and punished *even if*

[Political deviance] using one's influence to harm others in the company

management didn't know about the unethical behavior. Penalties can be substantial, with maximum fines approaching a whopping $300 million.[31] An amendment made in 2004 outlines much stricter ethics training requirements and emphasizes creating a legal and ethical company culture.[32]

Let's examine **3.1 to whom the guidelines apply and what they cover** and **3.2 how, according to the guidelines, an organization can be punished for the unethical behavior of its managers and employees.**

3.1 Who, What, and Why?

Nearly all businesses are covered by the U.S. Sentencing Commission's guidelines. This includes nonprofits, partnerships, labor unions, unincorporated organizations and associations, incorporated organizations, and even pension funds, trusts, and joint stock companies. If your organization can be characterized as a business (remember, nonprofits count, too), then it is subject to the guidelines.[33]

The guidelines cover offenses defined by federal laws such as invasion of privacy, price fixing, fraud, customs violations, antitrust violations, civil rights violations, theft, money laundering, conflicts of interest, embezzlement, dealing in stolen goods, copyright infringements, extortion, and more. But it's not enough merely to stay within the law. The purpose of the guidelines is not just to punish companies *after* they or their employees break the law, but rather to encourage companies to take proactive steps that will discourage or prevent white-collar crime *before* it happens. The guidelines also give companies an incentive to cooperate with and disclose illegal activities to federal authorities.[34]

3.2 Determining the Punishment

The guidelines impose smaller fines on companies that take proactive steps to encourage ethical behavior or voluntarily disclose illegal activities to federal authorities. Essentially, the law uses a carrot-and-stick approach. The stick is the threat of heavy fines that can total millions of dollars. The carrot is a greatly reduced fine, but only if the company has started an effective compliance program (discussed below) to encourage ethical behavior *before* the illegal activity occurs.[35] The method used to determine a company's punishment illustrates the importance of establishing a compliance program, as illustrated in Exhibit 4.2.

The first step is to compute the *base fine* by determining what *level of offense* has occurred. The level of the offense (i.e., its seriousness) varies depending on the kind of crime, the loss incurred by the victims, and how much planning went into the crime. For example, simple fraud is a level 6 offense (there are 38 levels in all). But if the victims of that fraud lost more than $5 million, that level 6 offense becomes a level 22 offense. Moreover, anything beyond minimal planning to commit the fraud results in an increase of two levels to a level 24 offense. How much difference would this make to the company? As Exhibit 4.2 shows, crimes at or below level 6 incur a base fine of $5,000, whereas the base fine for level 24 is $2.1 million. So the difference is $2.095 million! The base fine for level 38, the top-level offense, is a hefty $72.5 million.

After assessing a *base fine*, the judge computes a culpability score, which is a way of assigning blame to the company. The culpability score can range from a minimum of 0.05 to a maximum of 4.0. The greater the corporate responsibility in conducting,

encouraging, or sanctioning illegal or unethical activity, the higher the culpability score. A company that already has a compliance program and voluntarily reports the offense to authorities will incur a culpability score of 0.05. By contrast, a company whose management secretly plans, approves, and participates in illegal or unethical activity will receive the maximum score of 4.0.

The culpability score is critical because the total fine is computed by multiplying the base fine by the culpability score. Going back to our level 24 fraud offense, the left point of the upper arrow in Exhibit 4.2 shows that a company with a compliance

program that turns itself in will be fined only $105,000 ($2,100,000 × 0.05). In contrast, a company that secretly planned, approved, and participated in illegal activity will be fined $8.4 million ($2,100,000 × 4.0), as shown by the right point of the upper arrow. The difference is even greater for level 38 offenses. As shown by the left point of the bottom arrow, a company with a compliance program and a 0.05 culpability score is fined only $3.625 million, whereas a company with the maximum 4.0 culpability score is fined a whopping $290 million, as indicated by the right point of the bottom arrow. These differences clearly show the importance of having a compliance program in place. Over the last decade, 1,494 companies have been charged under the U.S. Sentencing Guidelines. Seventy-six percent of those charged were fined, with the average fine exceeding $2 million. Company fines are on average 20 times larger now than before the implementation of the guidelines in 1991.[36]

Fortunately for companies that want to avoid paying these stiff fines, the U.S. Sentencing Guidelines clearly spell out the seven necessary components of an effective compliance program.[37] Exhibit 4.3 lists those components. Caremark International, a managed-care service provider in Delaware, pleaded guilty to criminal charges related to its physician contracts and improper patient referrals. When it was then sued by shareholders for negligence and poor management, the Delaware court dismissed the case, ruling that the company's ethics compliance program, built on the components described in Exhibit 4.3, was a good-faith attempt to monitor

employees and that the company did not knowingly allow illegal and unethical behavior to occur. The court went on to rule that a compliance program based on the U.S. Sentencing Guidelines was enough to shield the company from liability.[38]

U.S. Sentencing Commission Guidelines Under the U.S. Sentencing Commission Guidelines, companies can be prosecuted and fined up to $300 million for employees' illegal actions. Fines are computed by multiplying the base fine by a culpability score, which ranges from 0.05 to 4.0. Companies that establish compliance programs to encourage ethical behavior can reduce their culpability scores and their fines. Companies without compliance programs can face much heavier fines than companies with established programs. Compliance programs must establish standards and procedures, be run by top managers, encourage hiring and promotion of honest and ethical people, encourage employees to report violations, educate employees about compliance, punish violators, and find ways to improve the program after violations occur.

HOW DO YOU MAKE ETHICAL DECISIONS?

On a cold morning in the midst of a winter storm, schools were closed and most people had decided to stay home from work. Nevertheless, Richard Addessi had already showered, shaved, and dressed for the office. He kissed his wife Joan goodbye, but before he could get to his car, he fell dead on the garage floor of a sudden heart attack. Addessi was 4 months short of his 30-year anniversary with the company. Having begun work at IBM at the age of 18, he was just 48 years old.[39]

You're the vice president in charge of benefits at IBM. Given that he was only 4 months short of full retirement, do you award full retirement benefits to Richard Addessi's wife and daughters? If the answer is yes, they will receive his full retirement benefits of $1,800 a month and free lifetime medical coverage. If you say no, his widow and two daughters will receive only $340 a month. They will also have to pay $473 a month just to continue their current medical coverage. As the VP in charge of benefits at IBM, what would be the ethical thing for you to do?

After reading the next two sections, you should be able to

4. describe what influences ethical decision making.
5. explain what practical steps managers can take to improve ethical decision making.

4 INFLUENCES ON ETHICAL DECISION MAKING

Although some ethical issues are easily solved, many do not have clearly right or wrong answers. So, what did IBM decide to do? Since Richard Addessi had not completed 30 full years with the company, IBM officials

Managers don't treat all ethical decisions the same.

felt they had no choice but to give Joan Addessi and her two daughters the smaller, partial retirement benefits. Do you think IBM's decision was ethical? Probably many of you don't. You wonder how the company could be so heartless as to deny Richard Addessi's family the full benefits to which you believe they were entitled. Yet others might argue that IBM did the ethical thing by strictly following the rules laid out in its pension benefit plan. After all, being fair means applying the rules to everyone. Although the answers are rarely clear, managers do need to have a clear sense of how to arrive at an answer in order to manage this ethical ambiguity. The ethical answers that managers choose depend on **4.1 the ethical intensity of the decision, 4.2 the moral development of the manager,** and **4.3 the ethical principles used to solve the problem.**

4.1 Ethical Intensity of the Decision

Managers don't treat all ethical decisions the same. The manager who has to decide whether to deny or extend full benefits to Joan Addessi and her family is going to treat that decision much more seriously than the decision of how to deal with an assistant who has been taking computer paper home for personal use. These decisions differ in their **ethical intensity**, or the degree of concern people have about an ethical issue. When addressing an issue of high ethical intensity, managers are more aware of the impact their decision will have on others. They are more likely to view the decision as an ethical or moral decision rather than as an economic decision. They are also more likely to worry about doing the right thing.

Six factors must be taken into account when determining the ethical intensity of an action. These include:

- magnitude of consequences
- social consensus
- probability of effect
- temporal immediacy
- proximity of effect
- concentration of effect.[40]

[Ethical intensity] the degree of concern people have about an ethical issue

[Magnitude of consequences] the total harm or benefit derived from an ethical decision

[Social consensus] agreement on whether behavior is bad or good

[Probability of effect] the chance that something will happen and then harm others

[Temporal immediacy] the time between an act and the consequences the act produces

[Proximity of effect] the social, psychological, cultural, or physical distance between a decision maker and those affected by his or her decisions

[Concentration of effect] the total harm or benefit that an act produces on the average person

Magnitude of consequences is the total harm or benefit derived from an ethical decision. The more people who are harmed or the greater the harm to those people, the larger the consequences. **Social consensus** is agreement on whether behavior is bad or good. **Probability of effect** is the chance that something will happen and then result in harm to others. If we combine these factors, we can see the effect they can have on ethical intensity. For example, if there is *clear agreement* (social consensus) that a managerial decision or action is *certain* (probability of effect) to have *large negative consequences* (magnitude of consequences) in some way, then people will be highly concerned about that managerial decision or action, and ethical intensity will be high.

Temporal immediacy is the time between an act and the consequences the act produces. Temporal immediacy is stronger if a manager has to lay off workers next week as opposed to 3 months from now. **Proximity of effect** is the social, psychological, cultural, or physical distance of a decision maker from those affected by his or her decisions. Thus, proximity of effect is greater when a manager lays off employees he knows than when he lays off employees that he doesn't know. Finally, whereas the magnitude of consequences is the total effect across all people, **concentration of effect** is how much an act affects the average person. Temporarily laying off 100 employees for 10 months without pay is a greater concentration of effect than temporarily laying off 1,000 employees for 1 month.

Which of these six factors has the most impact on ethical intensity? Studies indicate that managers are much more likely to view decisions as ethical issues when the magnitude of consequences (total harm) is high and there is a social consensus (agreement) that a behavior or action is bad.[41] Many people will likely feel IBM was wrong to deny full benefits to Joan Addessi. Why? IBM's decision met five of the six characteristics of ethical intensity. The difference in benefits, more than $23,000 per year, was likely to have serious and immediate consequences for the family, especially in terms of their monthly benefits ($1,800 and free medical coverage if full benefits were awarded versus $340 a month and medical care that costs $473 per month if they weren't). We can closely identify with Joan Addessi and her daughters as opposed to IBM's faceless, nameless corporate identity. The exception, as we will discuss below, is social consensus. Not everyone will agree that IBM's decision was unethical. The judgment also depends on your level of moral development and which ethical principles you use to decide.

4.2 Moral Development

A friend of yours has given you the latest version of Microsoft Office. She stuffed the software disks in your backpack with a note saying that you should install it on your computer and get it back to her in a couple of days. You're tempted. You have papers to write, notes to take, and presentations to plan. Besides, all of your friends have the same version of Microsoft Office. They didn't pay for it either. Copying the software to your hard drive without buying your own copy clearly violates copyright laws. But no one would find out. Even if someone does, Microsoft probably isn't going to come after you. Microsoft goes after the big fish—companies that illegally copy and distribute software to their workers and pirates that illegally sell cheap unauthorized copies.[42] Your computer has booted up, and you've got your mouse in one hand and the installation disk in the other. What are you going to do?

In part, according to psychologist Lawrence Kohlberg, your decision will be based on your level of moral development. Kohlberg identified three phases of moral development, with two stages in each phase (see Exhibit 4.4).[43] At the **preconventional level of moral development**, people decide based on selfish reasons. For example, if you are in Stage 1, the punishment and obedience stage, your primary concern will be to avoid trouble for yourself. So you won't copy the software because you are afraid of being caught and punished. Yet, in Stage 2, the instrumental exchange stage, you worry less about punishment and more about doing things that directly advance your wants and needs. So you copy the software.

People at the **conventional level of moral development** make decisions that conform to societal expectations. In other words, they look outside themselves to others for guidance on ethical issues. In Stage 3, the "good boy, nice girl" stage, you normally do what the other "good boys" and "nice girls" are doing. If everyone else is illegally copying software, you will, too. But if they aren't, you won't either. In the law and order stage, Stage 4, you again look for external guidance and do whatever the law permits, so you won't copy the software.

EXHIBIT 4.4 Kohlberg's Stages of Moral Development

[Preconventional level of moral development] the first level of moral development, in which people make decisions based on selfish reasons

[Conventional level of moral development] the second level of moral development, in which people make decisions that conform to societal expectations

People at the **postconventional level of moral development** use internalized ethical principles to solve ethical dilemmas. In Stage 5, the social contract stage, you will refuse to copy the software because, as a whole, society is better off when the rights of others—in this case, the rights of software authors and manufacturers—are not violated. In Stage 6, the universal principle stage, you might or might not copy the software, depending on your principles of right and wrong. Moreover, you will stick to your principles even if your decision conflicts with the law (Stage 4) or what others believe is best for society (Stage 5). For example, those with socialist or communist beliefs would probably choose to copy the software because they believe goods and services should be owned by society rather than by individuals and corporations. (For information about the dos, don'ts, and legal issues concerning software piracy, see the Software & Information Industry Association's website at **http://www.siia.net/piracy/default.asp**.)

Kohlberg believed that people would progress sequentially from earlier stages to later stages as they became more educated and mature. But only 20 percent of adults ever reach the postconventional stage of moral development where internal principles guide their decisions. Most adults are in the conventional stage of moral development in which they look outside themselves to others for guidance on ethical issues. This means that most people in the workplace look to and need leadership when it comes to ethical decision making.[44]

4.3 Principles of Ethical Decision Making

Beyond an issue's ethical intensity and a manager's level of moral maturity, the particular ethical principles that managers use will also affect how they solve ethical dilemmas. Unfortunately, there is no one ideal principle to use in making ethical business decisions.

Unfortunately, there is no one ideal principle to use in making ethical business decisions.

According to professor LaRue Hosmer, a number of different ethical principles can be used to make business decisions: long-term self-interest, personal virtue, religious injunctions, government requirements, utilitarian benefits, individual rights, and distributive justice.[45] All of these ethical principles encourage managers and employees to take others' interests into account when making ethical decisions. At the same time, however, these principles can lead to very different ethical actions, as we can see by using these principles to decide whether to award full benefits to Joan Addessi and her children.

According to the **principle of long-term self-interest**, you should never take any action that is not in your or your organization's long-term self-interest. Although this sounds as if the principle promotes selfishness, it doesn't. What we do to maximize our long-term interests (save more, spend less, exercise every day, watch what we eat) is often very different from what we do to maximize short-term interests (max out our credit cards, be couch potatoes, eat whatever we want). At any given time, IBM has nearly 1,000 employees who are just months away from retirement. Thus, because of the costs involved, it serves IBM's long-term interest to pay full benefits only after employees have put in their 30 years.

The **principle of personal virtue** holds that you should never do anything that is not honest, open, and truthful and that you would not be glad to see reported in the newspapers or on TV. Using the principle of personal virtue, IBM might have quietly awarded Joan Addessi her husband's full benefits. Had it done so, it could have avoided the publication of an embarrassing *Wall Street Journal* article on this topic.

[Postconventional level of moral development] the third level of moral development, in which people make decisions based on internalized principles

[Principle of long-term self-interest] an ethical principle that holds that you should never take any action that is not in your or your organization's long-term self-interest

[Principle of personal virtue] an ethical principle that holds that you should never do anything that is not honest, open, and truthful and that you would not be glad to see reported in the newspapers or on TV

The **principle of religious injunctions** holds that you should never take an action that is unkind or that harms a sense of community, such as the positive feelings that come from working together to accomplish a commonly accepted goal. Using this principle, IBM would have been concerned foremost with compassion and kindness, and it would have awarded full benefits to Joan Addessi.

According to the **principle of government requirements**, the law represents the minimal moral standards of society, so you should never take any action that violates the law. Using this principle, IBM would deny full benefits to Joan Addessi because her husband did not work for the company for 30 years. Indeed, making exceptions would violate the federal Employee Retirement Income Security Act of 1974.

The **principle of utilitarian benefits** states that you should never take an action that does not result in greater good for society. In short, you should do whatever creates the greatest good for the greatest number. At first, this principle seems to suggest that IBM should award full benefits to Joan Addessi. If IBM did this with any regularity, however, the costs would be enormous, profits would shrink, and IBM would have to cut its stock dividend, harming countless shareholders, many of whom rely on IBM dividends for retirement income. In this case, the principle does not lead to a clear choice.

The **principle of individual rights** holds that you should never take an action that infringes on others' agreed-upon rights. Using this principle, IBM would deny Joan Addessi full benefits. If it carefully followed the rules specified in its pension plan and granted Mrs. Addessi due process, meaning the right to appeal the decision, then IBM would not be violating her rights. In fact, it could be argued that providing full benefits to Mrs. Addessi would violate the rights of employees who had to wait 30 years to receive full benefits.

Finally, under the **principle of distributive justice**, you should never take any action that harms the least fortunate among us in some way. This principle is designed to protect the poor, the uneducated, and the unemployed. Although Joan Addessi could probably find a job, it's unlikely that she could easily find one that would support her and her daughters in the manner to which they were accustomed after 20 years as a stay-at-home mom. Using the principle of distributive justice, IBM would award her full benefits.

As mentioned at the beginning of this chapter, one of the "real-world" aspects of ethical decisions is that no matter *what* you decide, someone or some group will be unhappy. This corollary is also true: No matter *how* you decide, someone or some group will be unhappy and will argue that you should have used a different principle or weighed concerns differently. Consequently, although all of these ethical principles encourage managers to balance others' needs against their own, they can also lead to very different ethical actions. So even when managers strive to be ethical, there are often no clear answers when it comes to doing the right thing.

[Principle of religious injunctions] an ethical principle that holds that you should never take any action that is not kind and that does not build a sense of community

[Principle of government requirements] an ethical principle that holds that you should never take any action that violates the law, for the law represents the minimal moral standard

[Principle of utilitarian benefits] an ethical principle that holds that you should never take any action that does not result in greater good for society

[Principle of individual rights] an ethical principle that holds that you should never take any action that infringes on others' agreed-upon rights

[Principle of distributive justice] an ethical principle that holds that you should never take any action that harms the least fortunate among us: the poor, the uneducated, the unemployed

Influences on Ethical Decision Making Three factors influence ethical decisions: the ethical intensity of the decision, the moral development of the decision maker, and the ethical principles used to solve the problem. Ethical intensity is strong when decisions have large, certain, immediate consequences and when we are physically or psychologically close to those affected by the decision. There are three levels of moral maturity, each with two stages. At the preconventional level, decisions are made for selfish reasons. At the conventional level, decisions conform to societal expectations. At the postconventional level, internalized principles are used to make ethical decisions. Finally, managers can use a number of different principles when making ethical decisions: self-interest, personal virtue, religious injunctions, government requirements, utilitarian benefits, individual rights, and distributive justice.

5 PRACTICAL STEPS TO ETHICAL DECISION MAKING

Managers can encourage more ethical decision making in their organizations by **5.1 carefully selecting and hiring ethical employees, 5.2 establishing a specific code of ethics, 5.3 training employees to make ethical decisions,** and **5.4 creating an ethical climate.**

5.1 Selecting and Hiring Ethical Employees

"Would you ever consider buying something from somebody if you knew the person had stolen the item?"

If you found a wallet containing $100, would you return it with the money? Informal studies typically show that 57 to 80 percent of people would, and that women and people in small towns are more likely to return the wallet with the money.[46] As an employer, you can increase your chances of hiring the honest person who would return the wallet with the money if you give job applicants integrity tests. **Overt integrity tests** estimate job applicants' honesty by directly asking them what they think or feel about theft or about punishment of unethical behaviors.[47] For example, an employer might ask an applicant, "Would you ever consider buying something from somebody if you knew the person had stolen the item?" or "Don't most people steal from their companies?" Surprisingly, unethical people will usually answer "yes" to such questions, because they believe that the world is basically dishonest and that dishonest behavior is normal.[48]

Personality-based integrity tests indirectly estimate job applicants' honesty by measuring psychological traits such as dependability and conscientiousness. For example, prison inmates serving time for white-collar crimes (counterfeiting, embezzlement, and fraud) scored much lower than a comparison group of middle-level managers on scales measuring reliability, dependability, honesty, conscientiousness, and abiding by rules.[49] These results show that companies can selectively hire and promote people who will be more ethical.[50] For more on integrity testing, see the "What Really Works" feature in this chapter.

5.2 Codes of Ethics

Today, almost all large corporations have an ethics code in place. Exhibit 4.5 displays the ethical code of conduct for **Caterpillar Incorporated**, a large manufacturing company with corporate offices headquartered in Peoria, Illinois. Even if a company has a code of ethics like this, two things must still happen if those codes are to encourage ethical decision making and behavior.[53] First, a company must communicate its code to others both inside and outside the company. With the click of a computer mouse, anyone inside or outside Caterpillar can obtain detailed information about the company's core values, specific ethical business practices, and much more.

Second, in addition to having an ethics code with general guidelines like "do unto others as you would have others do unto you," management must also develop practical ethical standards and procedures specific to the company's line of business. Visitors to NORTEL's website at **http://www.nortel.com/corporate/community/ethics/guide.html** can instantly access references to very specific ethical standards on topics ranging from bribes and kickbacks to expense vouchers and illegal copying of software. For example, most businesspeople believe that it is wrong to take bribes or other gifts from a company that wants your business. Therefore, one of Nortel's ethical guidelines is "Directly or indirectly offering or receiving any gift or entertainment that might be perceived to improperly influence a business interac-

doing the right thing

If You Cheat in College, Will You Cheat in the Workplace?

Studies show that college students who cheat once are likely to cheat again. Students who cheat on exams are likely to cheat on assignments and projects. Furthermore, tolerance of cheating is widespread, as 70 percent of college students don't see cheating as a problem. Given these relaxed attitudes toward cheating, and with on-campus cheating at all-time highs, employers want to know whether someone who cheated in college will cheat in the workplace.

Studies generally indicate that the answer is yes. Likewise, students who cheated in school were much more likely to cheat on their taxes, in politics (by committing voter fraud or accepting illegal campaign contributions), in sports, and on the job. Why is this the case? Apparently, people who cheat and then cheat again come to see their behavior as normal and to rationalize it by telling themselves that cheating isn't wrong. In fact, 60 percent of the people who cheat their employers don't feel guilty about doing so. Cheating isn't situation-specific. Once you decide that cheating is acceptable, you're likely to cheat in most areas of your life.[51]

Robert Hogan, a renowned personality psychologist, says there is an intrinsic link between cheating, embezzling, marital infidelity, public drunkenness, getting traffic tickets, fighting, vandalism, and so on. "All these things involve breaking the rules, and they're all motivated by hostility toward or disregard for authority."[52] If you want to do the right thing, don't cheat in college or tolerate cheating by others. Don't slide down the slippery slope of cheating.

tion violates our commitment to maintaining objectivity and transparency in our relationships."[54] And just to be sure there's no confusion over what constitutes, say, a gift, the guidelines are even more specific: "Certain types of gifts may not be given to or received from persons doing business or seeking to do business with Nortel: Cash, gift certificates, or any other cash equivalent; Stock, stock options, or 'friends and family stock'; Discounts not generally available to the public."[55] Specific codes of ethics such as this make it much easier for employees to decide what to do when they want to do the right thing.

5.3 Ethics Training

In addition to establishing ethical standards for the company, managers must sponsor and be involved in ethics and compliance training in order to create an ethical company culture.[56] The first objective of ethics training is to develop employees' awareness of ethics.[57] This means helping employees recognize which issues are ethical issues and then avoid rationalizing unethical behavior by thinking, "This isn't really illegal or immoral" or "No one will ever find out." Several companies have created board games to improve awareness of ethical issues.[58] At **Weyerhauser**, when employees pushed for more specific guidance on ethics, the ethics department added a series of multiple-choice answers to the ethics scenarios that it used in its training

programs. Each question has four answers from which to choose, two of which are typically good choices. In a scenario called "Pulp Friction," for example, an employee is asked by the plant manager to recommend a new maintenance contractor to replace the current outside contractor who is always late and has lots of turnover in his staff. The employee later learns that the son of his plant's maintenance manager works for that poor-performing contractor, suggesting that nepotism and favoritism are possible issues. The four options are:

a. Ask a coworker if he or she knows whether the man working for the poor-performing contractor is the plant maintenance manager's son.
b. Tell the plant manager that there is possibly a conflict of interest.
c. Ask the contractor whether the son is working for him.
d. Ask the maintenance manager whether her son works for the contractor.

Weyerhauser says that telling the plant manager is the best choice.[59] Specific company-related questions and scenarios like this make it easier for managers and employees to recognize and be aware of ethical issues and situations.

The second objective for ethics training programs is to achieve credibility with employees. Not surprisingly, employees can be highly suspicious of management's reasons for offering ethics training. Some companies have hurt the credibility of their ethics programs by having outside instructors and consultants conduct the classes.[61] Employees often complain that outside instructors and consultants are teaching theory that has nothing to do with their jobs and the practical dilemmas they actually face on a daily basis. This is why **Lockheed Martin**, a defense and aerospace company, frequently has its top managers teach ethics classes. For instance, Manny Zuleuta, a senior vice president of shared services, led seven employees through a DVD-based scenario in which they viewed a worker complaining to his boss's manager that his boss yells at him all of the time. Later, the boss apologizes. But then, according to the employee, the boss retaliates against him by giving him bad assignments.

Ethics training becomes even more credible when top managers teach the initial ethics classes to their subordinates who in turn teach their subordinates.[62] Michael Hoffman, executive director for the Center for Business Ethics at Bentley College, says that having managers teach ethics courses greatly reinforces the seriousness with which employees treat ethics in the workplace.[63] Unfortunately, though, 25 percent of large companies don't require top managers to attend, much less teach, ethics training.[64] The good news is that this scenario is changing thanks to the 2004 amendment to the Sentencing Guidelines. Indeed, a recent survey shows that board involvement in ethics and compliance programs jumped from 21 percent in 1987 to 96 percent in 2005.[65]

The third objective of ethics training is to teach employees a practical model of ethical decision making. A basic model should help them think about the consequences their choices will have on others and consider how they will choose between different solutions. Exhibit 4.6 presents a basic model of ethical decision making.

5.4 Ethical Climate

Organizational culture is key to fostering ethical decision making. The 2007 National Business Ethics Survey reported that only 24 percent of employees who work at companies with a strong ethical culture (where core beliefs are widely shared and strongly held) have observed others engaging in unethical behavior, whereas 98 percent of those who work in organizations with weak ethical cultures (where core beliefs are not widely shared or strongly held) have observed others engage in unethical behavior. Employees in strong ethical cultures are also more likely to report violations, because they expect that management wants them reported and won't retaliate against them for doing so.[66]

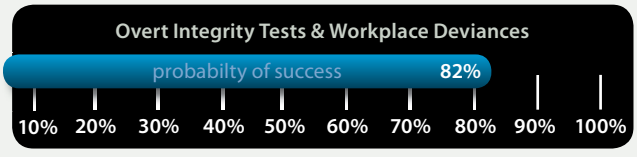
Integrity Tests

Under the 1991 and 2004 U.S. Sentencing Commission Guidelines, unethical employee behavior can lead to multimillion-dollar fines for corporations, and fraudulent behavior of executives can lead to criminal prosecution. Moreover, workplace deviance like stealing, fraud, and vandalism costs companies an estimated $660 billion a year. One way to reduce workplace deviance and the chances of a large fine for unethical employee behavior is to use overt and personality-based integrity tests to screen job applicants.

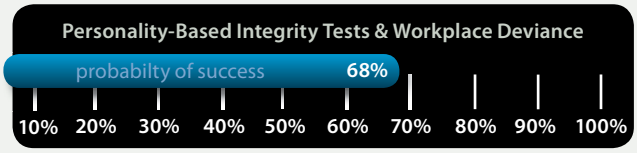
One hundred eighty-one studies, with a combined total of 576,460 study participants, have examined how well integrity tests can predict job performance and various kinds of workplace deviance. These studies show that not only can integrity tests help companies reduce workplace deviance but they also provide the added bonus of helping companies hire workers who are better performers in their jobs.

Workplace Deviance (Counterproductive Behaviors)

Compared with job applicants who score poorly, there is an 82 percent chance that job applicants who score well on overt integrity tests will participate in less illegal activity, unethical behavior, drug abuse, or workplace violence.

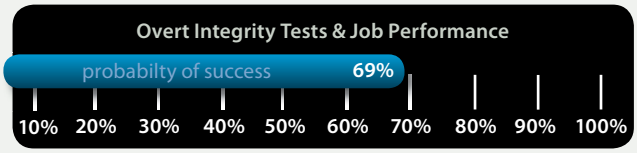


Personality-based integrity tests also do a good job of predicting who will engage in workplace deviance. Compared with job applicants who score poorly, there is a 68 percent chance that job applicants who score well on personality-based integrity tests will participate in less illegal activity, unethical behavior, excessive absences, drug abuse, or workplace violence.

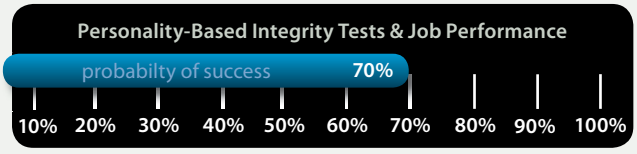


Job Performance

In addition to reducing unethical behavior and workplace deviance, integrity tests can help companies hire better performers. Compared with employees who score poorly, there is a 69 percent chance that employees who score well on overt integrity tests will be better performers.

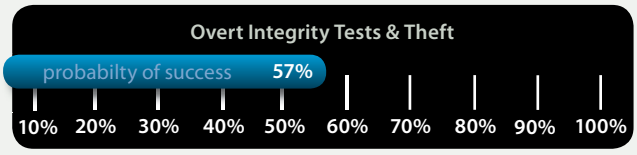


The figures are nearly identical for personality-based integrity tests. Compared with those who score poorly, there is a 70 percent chance that employees who score well on personality-based integrity tests will be better at their jobs.



Theft

Although integrity tests can help companies decrease most kinds of workplace deviance and increase employees' job performance, they have a smaller effect on a specific kind of workplace deviance: theft. Compared with employees who score poorly, there is a 57 percent



chance that employees who score well on overt integrity tests will be less likely to steal. No theft data were available to assess personality-based integrity tests.

Faking and Coaching on Integrity Tests

Although overt and personality-based integrity tests do a very good job of helping companies hire people of higher integrity, it is possible to improve scores on these tests through coaching and faking. In coaching, job applicants are taught the underlying rationale of an integrity test or given specific directions for improving their integrity scores. Faking occurs when applicants simply try to "beat the test" or try to fake a good impression. Unfortunately for the companies that use integrity tests, both strategies work.

On average, coaching can improve scores on overt integrity tests by an astounding 1.5 standard deviations and on personality-based integrity tests by a meaningful .36 standard deviation. This would be the equivalent of increasing your total SAT score by 150 and 36 points, respectively (the SAT has a mean of 500 and a standard deviation of 100). Likewise, on average, faking can improve scores on overt integrity tests by an impressive 1.02 standard deviations and on personality-based integrity tests by a meaningful .59 standard deviation. Again, this would be the equivalent of increasing your SAT score by 102 and 59 points, respectively.

Companies that want to avoid coaching and faking effects must maintain tight security over integrity tests so that applicants have little information regarding them, periodically check the validity of the tests to make sure they're accurately predicting workplace deviance and job performance, or periodically switch tests if they suspect that test security has been compromised.[60]

EXHIBIT 4.6 A Basic Model of Ethical Decision Making

1.	**Identify the problem.** What makes it an ethical problem? Think in terms of rights, obligations, fairness, relationships, and integrity. How would you define the problem if you stood on the other side of the fence?
2.	**Identify the constituents.** Who has been hurt? Who could be hurt? Who could be helped? Are they willing players, or are they victims? Can you negotiate with them?
3.	**Diagnose the situation.** How did it happen in the first place? What could have prevented it? Is it going to get worse or better? Can the damage now be undone?
4.	**Analyze your options.** Imagine the range of possibilities. Limit yourself to the two or three most manageable. What are the likely outcomes of each? What are the likely costs? Look to the company mission statement or code of ethics for guidance.
5.	**Make your choice.** What is your intention in making this decision? How does it compare with the probable results? Can you discuss the problem with the affected parties before you act? Could you disclose without qualm your decision to your boss, the CEO, the board of directors, your family, or society as a whole?
6.	**Act.** Do what you have to do. Don't be afraid to admit errors. Be as bold in confronting a problem as you were in causing it.

We learned in Chapter 3 that leadership is an important factor in creating an organizational culture. So, it's no surprise that in study after study, when researchers ask, "What is the most important influence on your ethical behavior at work?" the answer comes back, "My manager." The first step in establishing an ethical climate is for managers, especially top managers, to act ethically themselves.

A second step in establishing an ethical climate is for top management to be active in and committed to the company ethics program.[67] Top managers who consistently talk about the importance of ethics and back up that talk by participating in their companies' ethics programs send the clear message that ethics matter. Business writer Dayton Fandray says, "You can have ethics offices and officers and training programs and reporting systems, but if the CEO doesn't seem to care, it's all just a sham. It's not surprising to find that the companies that really do care about ethics make a point of including senior management in all of their ethics and compliance programs."[68]

A third step is to put in place a reporting system that encourages managers and employees to report potential ethics violations. **Whistleblowing**, that is, reporting others' ethics violations, is a difficult step for most people to take.[69] Potential

[Whistleblowing] reporting others' ethics violations to management or legal authorities

whistleblowers often fear that they, and not the ethics violators, will be punished.[70] Managers who have been interviewed about whistleblowing have said, "In every organization, someone's been screwed for standing up." "If anything, I figured that by taking a strong stand I might get myself in trouble. People might look at me as a goody two-shoes. Someone might try to force me out." This is exactly what happened to Sandy Baratta, who used to be a vice president at Oracle, which makes database software used by most large companies. Baratta was fired, she alleges, for complaining about Oracle's treatment of women and its unethical business practices. Under California's whistleblower protection laws, a jury awarded her $2.6 million in damages.[71]

Today, many federal and state laws protect the rights of whistleblowers (see **http://www.whistleblowers.org** for more information). In particular, the Sarbanes-Oxley Act of 2002 made it a serious crime to retaliate in any way against corporate whistleblowers in publicly owned companies. Managers who punish whistleblowers can be imprisoned for up to 10 years. Some companies, including defense contractor Northrop Grumman, have made it easier for whistleblowers to report possible violations by establishing anonymous, toll-free corporate ethics hot lines. Nortel, the telecommunications company, even publicizes which of its ethics hot lines don't have caller ID (so they can't identify the caller's phone number). At **Ernst & Young**, a "big 4" accounting firm, phone- and web-based complaints are routed to EthicsPoint, an independent contractor who forwards them to appropriate E&Y managers or legal counsel.[72] The Sarbanes-Oxley Act requires all publicly held companies to establish anonymous hot lines to encourage reporting of unethical and illegal behaviors, so it's not surprising that a recent survey found that 91 percent of companies have an anonymous reporting system whereby employees can report observed misconduct.[73]

Despite such provisions, it is not easy to be a whistleblower. The factor that does the most to discourage whistleblowers from reporting problems is lack of company action on their complaints.[74] Thus, the final step in developing an ethical climate is for management to fairly and consistently punish those who violate the company's code of ethics. When an anonymous caller used hospital chain Columbia/HCA's toll-free ethics phone line to report that a supply clerk was stealing medical equipment and selling it online at eBay, the information was forwarded to company investigators, who bid on and bought the equipment. Being a good eBay seller, the supply clerk quickly shipped the stolen goods directly from her home. When confronted with the stolen goods, she confessed and was immediately fired.[75] Amazingly, though, not all companies fire ethics violators. In fact, 8 percent of surveyed companies admit that they would promote top performers even if they violated ethical standards.[76]

REVIEW 5

Practical Steps to Ethical Decision Making Employers can increase their chances of hiring ethical employees by administering overt integrity tests and personality-based integrity tests to all job applicants. Most large companies now have corporate codes of ethics. To affect ethical decision making, these codes must be known both inside and outside the organization. In addition to offering general rules, ethics codes must also provide specific, practical advice. Ethics training seeks to increase employees' awareness of ethical issues, make ethics a serious and credible factor in organizational decisions, and teach employees a practical model of ethical decision making. The most important factors in creating an ethical business climate are the personal examples set by company managers, involvement of management in the company ethics program, a reporting system that encourages whistleblowers to report potential ethics violations, and fair but consistent punishment of violators.

WHAT IS SOCIAL RESPONSIBILITY?

Social responsibility is a business's obligation to pursue policies, make decisions, and take actions that benefit society.[77] Unfortunately, because there are strong disagreements over to whom and for what in society organizations are responsible, it can be difficult for managers to know what is or will be perceived as socially responsible corporate behavior. In a recent McKinsey & Co. study of 1,144 top global executives, 79 percent predicted that at least some responsibility for dealing with future social and political issues would fall on corporations, but only 3 percent said they themselves do a good job of dealing with these issues.[78] So what should managers and corporations do to be socially responsible?

After reading the next four sections, you should be able to explain

6. what influences ethical decision making.
7. what practical steps managers can take to improve ethical decision making.
8. how organizations can choose to respond to societal demands for social responsibility.
9. whether social responsibility hurts or helps an organization's economic performance.

Some say that corporations need to give more to nonprofit organizations. In fact, corporate giving to charities has increased 22 percent to $13.7 billion in cash and in-kind gifts. Checkbook philanthropy, however, isn't enough these days, says Susan Puflea, senior vice president and director of GolinHarris Change.[79] Companies, she says, also need to be socially responsible as they conduct their businesses. Consider some examples. **MB Food Processing**, in South Fallsburg, New York, has stopped using chlorine-based disinfectants in its poultry processing plants. Instead, it will combine salt and water and an electrical charge to produce electrolyzed water to clean chickens and kill food-borne bacteria.[80] Wal-Mart Stores, long assailed for its labor and global-outsourcing practices, has made a series of high-profile investments to slash energy use overall, in its stores

[Social responsibility] a business's obligation to pursue policies, make decisions, and take actions that benefit society

and its vast trucking fleets, and has promised to purchase more electricity derived from renewable sources.[81]

But Wal-Mart and MB Food Processing weren't socially responsible just out of the goodness of their corporate hearts. Wal-Mart took steps to reduce energy use because doing so also lowers costs. MB Food Processing switched to electrolyzed water because doing so strengthened its established reputation as a humane, environmentally friendly grower of chickens, which allows it to charge more for its products. These two examples illustrate the challenges and different motivations of acting in a socially responsible manner: balancing the needs of different groups in the face of limited resources and/or constraints.

6 TO WHOM ARE ORGANIZATIONS SOCIALLY RESPONSIBLE?

There are two perspectives regarding to whom organizations are socially responsible: the shareholder model and the stakeholder model. According to the late Nobel Prize–winning economist Milton Friedman, the only social responsibility that organizations have is to satisfy their owners, that is, company shareholders. This view—called the **shareholder model**—holds that the only social responsibility that businesses have is to maximize profits. By maximizing profit, the firm maximizes shareholder wealth and satisfaction. More specifically, as profits rise, the company stock owned by shareholders generally increases in value.

Friedman argued that it is socially irresponsible for companies to divert time, money, and attention from maximizing profits to social causes and charitable organizations. The first problem, he believed, is that organizations cannot act effectively as moral agents for all company shareholders. Although shareholders are likely to agree on investment issues concerning a company, it's highly unlikely that they have common views on what social causes a company should or should not support.

For instance, most *Fortune* 500 companies have corporate foundations that support nonprofit organizations. But even corporate leaders can't agree on what causes or nonprofit organizations should be supported. For instance, when Texaco merged with Chevron, the new company leadership decided to end Texaco's 64-year sponsorship of radio broadcasts for New York City's Metropolitan Opera. Similarly, after Exxon and Mobil merged to become ExxonMobil, the company ended Mobil's 34 years of support for PBS's *Masterpiece Theatre*.[82] Rather than act as moral agents, Friedman argued, companies should maximize profits for shareholders. Shareholders can then use their time and increased wealth to contribute to the social causes, charities, or institutions they want, rather than those that companies want.

Under the stakeholder model, management's most important responsibility is the firm's long-term survival.

The second major problem, Friedman said, is that the time, money, and attention diverted to social causes undermine market efficiency.[83] In competitive markets, companies compete for raw materials, talented workers, customers, and investment funds. A company that spends money on social causes will have less money to purchase quality materials or to hire talented workers who can produce a valuable product at a good price. If customers find the company's product less desirable, its sales and profits will fall. If profits fall, the company's stock price will decline, and the company will have difficulty attracting investment funds that could be used to fund long-term growth. In the end, Friedman argues, diverting the firm's money, time, and resources to social causes hurts customers, suppliers, employees, and shareholders. Russell Roberts, an economist at George Mason University, agrees, saying, "Doesn't it make more sense to have companies do what they do best, make good products at fair prices, and then let consumers use the savings for the charity of their choice?"[84]

By contrast, under the **stakeholder model**, management's most important responsibility is the firm's long-term survival (not just maximizing profits), which is achieved by satisfying the interests of multiple corporate stakeholders (not just shareholders).[85] **Stakeholders** are persons or groups with a legitimate interest in a company.[86] Since stakeholders are interested in and affected by the organization's actions, they have a "stake" in what those actions are. Consequently, stakeholder groups may try to influence the firm to act in their own interests. Exhibit 4.7 shows the various stakeholder groups that the organization must satisfy to assure its long-term survival.

Being responsible to multiple stakeholders raises two basic questions. First, how does a company identify organizational stakeholders? Second, how does a company balance the needs of different stakeholders? Distinguishing between primary and secondary stakeholders can help answer these questions.[87]

Some stakeholders are more important to the firm's survival than others. **Primary stakeholders** are groups on which the organization depends for its long-term survival; they include shareholders, employees, customers, suppliers, governments, and local communities. When managers are struggling to balance the needs of different stakeholders, the stakeholder model suggests that the needs of primary stakeholders take precedence over the needs of secondary stakeholders. But among primary stakeholders, are some more important than others? According to the life-cycle theory of organizations, the answer is yes. Organizations' needs change as they go through the life-cycle stages of formation/start-up, growth, maturity, and decline or transition. At each stage, different primary stakeholders will be critical to organizational well-being, and their concerns and issues will take precedence over those of other primary

stakeholders.[88] In practice, though, CEOs typically give somewhat higher priority to shareholders, employees, and customers than to suppliers, governments, and local communities, no matter what stage of the life cycle a company is in.[89] Exhibit 4.8 lists issues that organizations will probably have to address to keep their primary stakeholders satisfied.

Addressing the concerns of primary stakeholders is important because if a stakeholder group becomes dissatisfied and terminates its relationship with the company, the company could be seriously harmed or go out of business. For example, **Interpublic Group**, one of the world's largest advertising agencies, lost Bank of America to rival Omnicom Group. Bank of America's departure not only cost Interpublic $60 to $65 million a year in lost revenue, it also coincided with the loss of even larger clients—General Motors, Nestlé, and Unilever—who took large parts of their advertising business elsewhere.[90] Interpublic's profits and stock value have been significantly below the industry average since losing these key clients.[91]

Secondary stakeholders, such as the media and special interest groups, can influence or be influenced by the company. Unlike the primary stakeholders, however, they do not engage in regular transactions with the company and are not critical to its long-term survival. Meeting the needs of primary stakeholders is therefore usually more important than meeting the needs of secondary stakeholders. Nevertheless, secondary stakeholders are still important because they can affect public perceptions and opinions about socially responsible behavior.

[Secondary stakeholder] any group that can influence or be influenced by a company and can affect public perceptions about the company's socially responsible behavior

For instance, after hundreds of protests by animal-rights activists, including groups such as the People for the Ethical Treatment of Animals (PETA), Smithfield Foods, the nation's largest pork producer, announced that it would phase out "gestation crates" at all of its company-owned sow farms over the next decade. Gestation crates are boxes 2 feet wide by 7 feet long used to confine female pigs during their 16-week gestation period. In this case, a secondary stakeholder, animal-rights

activists, was able to mobilize public opinion and convince Smithfield Foods' primary stakeholders and large customers, such as McDonald's and Wal-Mart, to exert pressure on Smithfield to discontinue the practice. Smithfield is the first major pork producer to move to ban the crates, and others are sure to follow.[92]

So, to whom are organizations socially responsible? Many commentators, especially economists and financial analysts, continue to argue that organizations are responsible only to shareholders. Increasingly, however, top managers have come to believe that they and their companies must be socially responsible to their stakeholders. This view has gained adherents since the Great Depression, when General Electric first identified shareholders, employees, customers, and the general public as its stakeholders. In 1947, Johnson & Johnson listed customers, employees, managers, and shareholders as its stakeholders; and in 1950, Sears Roebuck announced that its most important stakeholders were "customers, employees, community, and stockholders."[93] Today, surveys show that as many as 80 percent of top-level managers believe that it is unethical to focus just on shareholders. Twenty-nine states have changed their laws to allow company boards of directors to consider the needs of employees, creditors, suppliers, customers, and local communities, as well as those of shareholders.[94] Although there is not complete agreement, a majority of opinion makers would argue that companies must be socially responsible to their stakeholders.

To Whom Are Organizations Socially Responsible? Social responsibility is a business's obligation to benefit society. To whom are organizations socially responsible? According to the shareholder model, the only social responsibility that organizations have is to maximize shareholder wealth by maximizing company profits. According to the stakeholder model, companies must satisfy the needs and interests of multiple corporate stakeholders, not just shareholders. However, the needs of primary stakeholders, on which the organization relies for its existence, take precedence over those of secondary stakeholders.

7 FOR WHAT ARE ORGANIZATIONS SOCIALLY RESPONSIBLE?

If organizations are to be socially responsible to stakeholders, what are they to be socially responsible *for*? As Exhibit 4.9 illustrates, companies can best benefit their stakeholders by fulfilling their economic, legal, ethical, and discretionary responsibilities.[95] Economic and legal responsibilities are at the bottom of the pyramid because they play a larger part in a company's social responsibility than do ethical and discretionary responsibilities. However, the relative importance of these various responsibilities depends on society's expectations of corporate social responsibility at a particular point in time.[96] A century ago, society expected businesses to meet their economic and legal responsibilities and little else. Today, when society judges whether businesses are socially responsible, ethical and discretionary responsibilities are considerably more important than they used to be.

Historically, **economic responsibility**, or making a profit by producing a product or service valued by society, has been a business's most basic social responsibility. Organizations that don't meet their financial and economic expectations come

under tremendous pressure. For example, company boards are very, very quick these days to fire CEOs. Typically, all it takes is two or three bad quarters in a row. Stagnant sales and declining profits led to Mary Forte's ouster as CEO of Zales.[97] Kevin Rollins was relieved of his duties as CEO of Dell for a single bad quarter and for allowing archrival Hewlett-Packard to increase its lead over Dell.[98] Thomas Neff, who heads the executive recruiting firm Spencer Stuart, says, "It used to be a couple of years [and not two or three quarters]." William Rollnick, who became acting chairman of Mattel after the company fired its previous CEO, says, "There's zero forgiveness. You screw up and you're dead."[99] On an annual basis, roughly 4 percent of CEOs are large companies are fired each year.[100] Nearly one-third of all CEOs, however, are eventually fired because of their inability to successfully change their companies.[101] In fact, CEOs are three times more likely to be fired today than two decades ago.

Legal responsibility is a company's social responsibility to obey society's laws and regulations as it tries to meet its economic responsibilities. For instance, companies award stock options so that managers and employees are rewarded when the company does well. Stock options give you the right to purchase shares of stock at a set price. Let's say that on June 1, the company awards you the right (or option) to buy 100 shares of stock, which, on that day, sells for $10 a share. If the stock price falls below $10, the options are worthless. But, if the stock price rises above $10, the options have value. Specifically, if the stock price rises to

[Legal responsibility] a company's social responsibility to obey society's laws and regulations

$15 a share, you can exercise your options by paying the company $1,000 (100 shares at $10 a share). But because the stock is selling for $15, you can sell your 100 shares for $1,500 and make $500. But what if you could go back in time to, say, January 1 when the stock was selling for $5? You'd make $1,000 instead of $500. It would be unethical and illegal, however, to "backdate" your options to when the stock sold for a lower price. Doing so would illegally increase the value of your options. But, that's exactly what the president and chief operating officer did at Monster Worldwide (which runs Monster.com). By improperly backdating his options, he earned an additional $24 million.[102] At Monster, however, backdating was condoned by the CEO, who routinely backdated options for members of the management team.[103]

Ethical responsibility is a company's social responsibility not to violate accepted principles of right and wrong when conducting its business. Cyrus Hassankola has been "going out of business" for nearly two decades. Swiss-educated, but from Iran, he entered the Oriental rug business in Zurich. Because there were so many shops, he advertised that his was "going out of business." The store stayed open several more months and "made tons of money." He then opened and closed four more rug stores after running highly profitable "going out of business" sales. After moving to the United States, Hassankola replicated this strategy in five states, until, weary of traveling, he opened a store in Dallas and officially named it "Going Out of Business," with the hope that it would pull in customers on a regular basis. It's not illegal in Texas to name your store "Going Out of Business," but you are required to get a license for going out of business sales. The larger issue, however, is that most people would agree it's the wrong thing to do. David Beasley of Dallas's Better Business Bureau says, "I understand the desire to stay in business. But you can't do it by going out of business."[104] So, Hassankola's store is now the "Cyrus Rug Gallery," which has a "Liquidation Sale" banner out front. Because different stakeholders may disagree about what is or is not ethical, meeting ethical responsibilities is more difficult than meeting economic or legal responsibilities.

Discretionary responsibilities pertain to the social roles that businesses play in society beyond their economic, legal, and ethical responsibilities. For example, dozens of companies support the fight against hunger at The Hunger Site, **http://www.thehungersite.com**. Each time someone clicks on the "donate free food" button (only one click per day per visitor), sponsors of The Hunger Site donate money to pay for food to be sent to Bosnia, Indonesia, Mozambique, or wherever people suffer from hunger. Thanks to the corporate sponsors and the clicks of 59 million annual visitors, nearly 8 million pounds of food are distributed each year.[105] Discretionary responsibilities such as these are voluntary. Companies are not considered unethical if they don't perform them. Today, however, corporate stakeholders expect companies to do much more than in the past to meet their discretionary responsibilities.

For What Are Organizations Socially Responsible? Companies can best benefit their stakeholders by fulfilling their economic, legal, ethical, and discretionary responsibilities. Being profitable, or meeting one's economic responsibility, is a business's most basic social responsibility. Legal responsibility consists of following a society's laws and regulations. Ethical responsibility means not violating accepted principles of right and wrong when doing business. Discretionary responsibilities are social responsibilities beyond basic economic, legal, and ethical responsibilities.

8 RESPONSES TO DEMANDS FOR SOCIAL RESPONSIBILITY

Social responsiveness refers to a company's strategy to respond to stakeholders' economic, legal, ethical, or discretionary expectations concerning social responsibility. A social responsibility problem exists whenever company actions do not meet stakeholder expectations. One model of social responsiveness, shown in Exhibit 4.10, identifies four strategies for responding to social responsibility problems: reactive, defensive, accommodative, and proactive. These strategies differ in the extent to which the company is willing to act to meet or exceed society's expectations.

A company using a **reactive strategy** will do less than society expects. It may deny responsibility for a problem or fight any suggestions that the company should solve a problem. The U.S. Consumer Product Safety Commission recalled 900,000 Simplicity bassinets after two infants strangled between the product's metal bars. Similar concerns led to a recall of 600,000 Simplicity baby cribs. At the time of the recalls, Simplicity was no longer in business. It had gone into bankruptcy and its assets, including the Simplicity brand name, were purchased by SFCA, Inc. SFCA, however, refused to pay for the recall, declaring, "SFCA purchased Simplicity's assets at auction after Simplicity, Inc. went out of business and has no legal liability for any products distributed previously by Simplicity."[106] With SFCA denying responsibility, 17 retailers, including Wal-Mart, Toys 'R' Us, and Amazon, began, at their own expense, to pull Simplicity bassinets and cribs from their stores and websites. Industry expert Rich Christianson commented, "SFCA executives can argue until they are blue in the face that they should be held harmless for the product woes of the past ownership, but while this may or may not serve as an adequate defense in the eventuality of lawsuits, it is clearly not resonating well with retailers, consumers or the CPSC."[107]

By contrast, a company using a **defensive strategy** would admit responsibility for a problem but would do the least required to meet societal expectations. Second Chance Body Armor makes bulletproof vests for police officers. According to company founder Richard Davis, tests indicated that the protective material in its vests deteriorated quickly under high temperatures and humidity, conditions under which they're typically used. As a result, Davis concluded that even vests that were only two years old were potentially unsafe. Nevertheless, he couldn't convince the company's executive committee to recall the vests (an

accommodative strategy). Davis says he told the committee that it had three choices: recall the vests and stop selling them, do nothing and wait "until a customer is injured or killed," or wait until the problem becomes public and "be forced to make excuses as to why we didn't recognize and correct the problem."[108] After two vests were pierced by bullets, killing one police officer and wounding another, Second Chance announced that it would fix or replace 130,000 potentially defective vests. Although the company finally admitted responsibility for the problem, management decided to do only the minimum of what society expects (fix a defective product). Second Chance, therefore, used a defensive strategy.

A company using an **accommodative strategy** will accept responsibility for a problem and take a progressive approach by doing all that could be expected to solve the problem. **Unilever**, one of the world's largest consumer product companies, annually buys 1.5 million tons of palm oil to be used in margarine, ice cream, soap, and shampoo. Greenpeace protestors dressed as orangutans and climbed to the top of the company's headquarters in London to draw attention to Unilever's palm oil suppliers, who they claimed were destroying palm forests in Indonesia and Malaysia. Emulating an award-winning Dove soap commercial, "Evolution," Greenpeace then produced a short video entitled "Dove Onslaught(er)," which attributed the use of palm oil in Unilever's Dove soap to deforestation of palm forests (see both on YouTube.com).[109] Unilever accepted responsibility for the problem, stating, "…following a public challenge from Greenpeace, we formalized our commitment to draw all our palm oil from certified sustainable sources by 2015. We also agreed to support a moratorium on any further deforestation in South-East Asia."[110] Unilever also formed a coalition of 50 companies and nonprofits to influence palm oil growers, introduced resolutions at the Roundtable on Sustainable Palm Oil to encourage palm oil growers to change their foresting practices, began audits of their palm oil suppliers to make sure their practices were consistent with its new recommendations, and began working with Greenpeace and other groups to promote change in the industry.

Finally, a company using a **proactive strategy** will anticipate responsibility for a problem before it occurs, do more than expected to address the problem, and lead the industry in its approach. Honda Motors announced that it will include side-curtain air bags (that drop from the roof and protect passengers' heads) and front-side air bags (that come out of the door to protect against side-impact collisions) as standard equipment on all of its cars. Although more expensive car brands, such as Lexus and Volvo, already included these safety features, Honda was the first to make them standard on all models. On most other cars, these features were optional, meaning that customers had to pay extra for them. Brian O'Neill of the Insurance Institute for Highway Safety said, "This is a very positive development because we have been troubled by more and more manufacturers going the option route when it comes to safety equipment." Charlie Baker, Honda's vice president for U.S. research and development, says, "We are convinced this is the right direction and will save lives."[111]

[Proactive strategy] a social responsiveness strategy in which a company anticipates responsibility for a problem before it occurs and does more than society expects to address the problem

Responses to Demands for Social Responsibility Social responsiveness is a company's response to stakeholders' demands for socially responsible behavior. There are four social responsiveness strategies. When a company uses a reactive strategy, it denies responsibility for a problem. When it uses a defensive strategy, it takes responsibility for a problem but does the minimum required to solve it. When a company uses an accommodative strategy, it accepts responsibility for problems and does all that society expects to solve them. Finally, when a company uses a proactive strategy, it does much more than expected to solve social responsibility problems.

9 SOCIAL RESPONSIBILITY AND ECONOMIC PERFORMANCE

One question that managers often ask is, "Does it pay to be socially responsible?" In previous editions of this textbook, the answer was "no," as early research indicated that there was not an inherent relationship between social responsibility and economic performance.[112] Recent research, however, leads to different conclusions. There is no trade-off between being socially responsible and economic performance.[113] And, there is a small, positive relationship between being socially responsible and economic performance that strengthens with corporate reputation.[114] Let's explore what each of these results means.

First, there is no trade-off between being socially responsible and economic performance.[115] Being socially responsible usually won't make a business less profitable. What this suggests is that the costs of being socially responsible—and those costs can be high, especially early on—can be offset by a better product or corporate reputation, which results in stronger sales or higher profit margins. For example, Unilever replaced its "All" laundry detergent with "All Small and Mighty," a triple concentrate that reduces the amount needed to wash a load of clothes by two-thirds. Changing to All Small and Mighty required Unilever to change its packaging (new bottle molds had to be created), its advertising, and its distribution methods. Helayna Minsk, director of laundry for Unilever U.S., said, "As an industry, we will all be spending a great deal of money in molds, in converting over, as will our retailers in terms of resetting their shelves, resetting their warehouses for new packs…[but] the consumer is better off because she is getting a much more convenient form of packaging, and the retailer can put a lot more bottles on the shelves." In other words, while Unilever incurred significant upfront costs to be more socially responsible with its All Small and Might detergent, in the long run, those costs won't necessarily prevent it from making a profit with this product.

Second, it usually *does* pay to be socially responsible, and that relationship becomes stronger particularly when a company or its products have a strong reputation for social responsibility.[116] For example, **GE**, long one of the most admired and profitable corporations in the world, was one of the first and largest *Fortune* 500 companies to make a strategic commitment to providing environmentally friendly products and service. CEO Jeffrey Immelt wants GE to "develop and drive the technologies of the future that will protect and clean our environment."[117] Is Immelt doing this because of personal beliefs? He says no. "It's no great thrill for me to do this stuff…I never put it in right versus wrong terms." GE calls its strategy "ecoimagination," which it says is "helping to solve the world's biggest environmental challenges while driving profitable growth for GE." Says Immelt, "We invest in the basic strategies that we think are going to fit into [ecoimagination], but make money for our investors at the same time."[118] And, in just 5 years, GE has increased the number of ecoimagination products from 17 to 80. As a result, it now

sells more than $17 billion of such products and services each year, with annual revenue growth increasing by double digits.[119]

Finally, even if there is generally a small positive relationship between social responsibility and economic performance that becomes stronger when a company or its products have a positive reputation for social responsibility, and even if there is no trade-off between being socially responsible and economic performance, there is no guarantee that socially responsible companies will be profitable. Simply put, socially responsible companies experience the same ups and downs in economic performance that traditional businesses do. A good example is Ben & Jerry's, the ice cream people. Ben & Jerry's started in 1978 when founders Ben Cohen and Jerry Greenfield sent away for a $5 course on how to make ice cream. Ben & Jerry's is as famous for its commitment to social responsibility as for its super premium ice cream. The company donates 7.5 percent of its pretax profits to support AIDS patients, homeless people, and the environment.[120] Moreover, customers buy Ben & Jerry's ice cream because it tastes great *and* because they want to support a socially responsible company. As Ben Cohen says, "We see ourselves as somewhat of a social service agency and somewhat of an ice cream company."[121] But—and this is a big "but"—despite its outstanding reputation as a socially responsible company, Ben & Jerry's consistently had financial troubles after going public (selling shares of stock to the public) 15 years ago. In fact, its financial problems became so severe that Ben and Jerry sold the company to British-based Unilever.[122] Being socially responsible may be the right thing to do, and is usually associated with increased profits, but it doesn't guarantee business success.

Social Responsibility and Economic Performance Does it pay to be socially responsible? Studies show that there is generally no trade-off between social responsibility and economic performance. In most circumstances, there is generally a small positive relationship between social responsibility and economic performance that becomes stronger when a company or its products have a positive reputation. Social responsibility, however, does not guarantee profitability, as socially responsible companies experience the same ups and downs as other companies.

MANAGEMENT DECISION

Implementing Sustainability

Your heart is racing as you stand in front of the gathering of customers.[124] Though not usually at a loss for words, you are having trouble answering their questions about the dangers of the materials and processes used by your company, Interface, Inc., a manufacturer of commercial-grade carpet and flooring. What's more, when you hesitate, they doggedly persist. And none of the questions are about things you know, like discounts, lower prices, or inventory!

After you conclude the meeting, you race back to the office and convene a task force to respond to your customers' questions. But as soon as you assign the team its task, its members turn around and ask you to explain the company's environmental vision. "What vision?" you think to yourself. Desperately looking for inspiration, you happen upon a book by Paul Hawken entitled *The Ecology of Commerce: A Declaration of Sustainability*. You open it, hoping to glean some good ideas that you can repackage for your task force (and your customers).

Interface generates billions of dollars in revenue each year, but in the process, it extracts over 1 billion pounds of raw materials from the earth. The company is also a profligate water user, requiring millions

of gallons a year for its manufacturing process—not to mention the petroleum-based materials consumed and the greenhouse gases emitted during the process. Furthermore, your product, carpet, is not recyclable. When people install new carpet, the old carpet is dumped in a landfill.

But Interface is not alone. The entire carpet industry works to the same standards. Competitors like Shaw Walker, J & J Industries, and C&A Floorcoverings use the same amount of materials, have essentially the same manufacturing processes, and generate the same amount of waste, all for products that can't be (or aren't) recycled.

After reading Hawken's book, you realize that Interface will have to change. The question is, how much? How much can Interface change its processes to be environmentally friendly without compromising the company's growth? Sustainability requires that products either be able to easily reenter nature without depositing toxins or be recyclable into new materials. For a manufacturing process to be sustainable, its net effect on the environment must be zero. That might mean using renewable resources, redesigning the process to eliminate all waste streams, or even creating a product that can be infinitely recycled. That's a lot to ask. Can you sustain the company if you adopt environmental sustainability as a vision?

Questions

1. Which level of social responsibility best describes your company's current operations?
2. What environmental vision do you communicate to your task force? In other words, what social responsiveness strategy will you adopt at Interface?
3. Can sustainability be economically viable for Interface? Defend your answer.

MANAGEMENT TEAM DECISION

Sponsorship or Sellout

In the world of charitable organizations, the most grueling activity must certainly be fund-raising.[125] Although soliciting donations for popular causes can be easy, lesser-known nonprofits, which do very important work, may have difficulty consistently raising enough money to function. Sometimes, corporate sponsorship is necessary to obtain adequate funding. The obvious plus to corporate sponsorship is the cash, and perhaps greater visibility and legitimacy in the community (depending, of course, on the reputation of the sponsor). But corporate sponsorship can also have drawbacks. Potential donors may think that the charity no longer needs additional funding or withdraw support because they perceive that the charity has "sold out" to corporate financial inducements.

In considering a possible sponsorship, managers of charitable organizations can find themselves facing an ethical dilemma. Consider the following situation: A health-care foundation that is putting on a benefit concert to raise money to fund research on respiratory diseases signs up a popular regional band. Unable to cover the costs for the band, concert hall, decorations, and publicity, the foundation entertains an offer from operators of a new and controversial waste incineration plant, who are willing to put up $50,000 to become sponsors of the event.

Such situations are all too common in the world of nonprofit fund-raising, and getting these decisions right can often mean the difference between success and failure. To execute this management team decision, you will need to assemble a team of four to five students. Your management team will be working with the following scenario.

Women Against Violence (WAV) is a prominent local charity focused on providing victims of domestic violence with temporary housing, helping them cope with stress, and, in some cases, helping them begin a new life. During the 1990s, your management team was able to lift the fund-raising for WAV to all-time highs. Now, however, tight economic conditions have dried up donations. As WAV's management team is meeting to determine how and when to shut down operations, you receive a call from a local company, Famous Brewery and Bottling Company. Famous not only has its own brewery and specialty beers but also bottles and distributes beer for larger, nationally known beer brands. Famous is a progressive company and almost half its top management team comprised of women. But you also know that alcohol is involved in many domestic abuse situations.

You put the representative from Famous on speakerphone so the entire team can hear her. She proposes that Famous sponsor a spring festival to raise

money for WAV. Famous will give WAV $40,000 to organize the festival (for advertising, tent and game rentals, concession stands, and so on), and WAV will receive all of the proceeds from the festival. In return, Famous wants to set up a booth at the festival and have its name and logo next to WAV's on any promotional materials, such as flyers, banners, and buttons. You thank the representative and turn off the phone. Turning to your team, you say, "So, do we take the money or not?"

You will be making a decision for or against corporate sponsorship for WAV by Famous Brewery and Bottling Company. Before beginning the exercise, review Exhibit 4.6.

Questions

1. Rank the ethical intensity of the decision. Consider assigning a numerical value to each of the six factors listed on page 150, on a scale of, say, 1 to 5. Add the six values together and assess the sum against a possible 30 points.
2. As a team, examine the situation through the lens of each of the principles of ethical decision making. What is your final decision?
3. What role did the ethical intensity of the decision play in your ultimate decision?

PRACTICE BEING A MANAGER

Discerning Unethical Behavior

Applying ethical judgment in an organizational setting can be challenging. This exercise offers you the opportunity to consider how you might approach such a situation as a manager in an investment firm.

Read the scenario and prepare your responses to the individual (homework) questions in advance of discussing this exercise in class.

Scenario

Imagine that you are a newly hired portfolio manager at Excalibur Funds. Although you're new to this job, you have 8 years' experience in the mutual fund business. You left a larger and more established mutual fund company to join Excalibur because of its reputation as a bright, up-and-coming investment company, a place where someone like yourself could participate in building a new and dynamic investment company.

Your new fund, the Pioneer Fund, is a growth-oriented fund investing in small companies. Typically, the majority of the fund's stock investments is in high-technology companies. Pioneer is moving up fast in its peer group, and if the fund continues to perform well, you stand a good chance of being the manager recognized when it breaks into the top tier of performance.

One of the features that attracted you to this job is the opportunity to work with a seasoned group of traders, analysts, and staff professionals. The Pioneer Fund staff has averaged 10 percent turnover over the past 5 years, unusual in an industry where turnover commonly reaches 60 to 80 percent. After a month of working with your new team, however, you have noticed some troubling patterns. First, you felt that some of your staff were delaying or stonewalling you on several occasions when you requested more detailed information on particular trades. It took too long to get the information, and when you did receive it, the information looked a little *too* neat and well organized. Second, the analysts have seemed guarded regarding their interaction with some of the technology companies in which the Pioneer Fund invests. On more than one occasion you've noticed analysts quickly ending phone calls when you entered the office or minimizing computer screens when you walk by their desks. Finally, the group just seems a bit too *nice* when you are around. The investment business is often hectic and stressful. Shouting matches over investment decisions are not uncommon, and grumbling is a second language. But all you get are smiles and charm.

So here you are at your desk on a Saturday evening, finishing off the last of a pot of coffee and planning for Monday morning. One thing is clear—you must begin to scratch below the surface of the Pioneer Fund team. Your gut tells you that something is wrong here, perhaps very wrong. For all you know, you may be sitting on the next big investment scandal. Your head tells you that you have no hard evidence of unethical or illegal behavior and that you'd better tread carefully. If your gut is wrong and you run around making hasty accusations, you may lose what appears to be a very talented investment team.

What steps should you take starting Monday morning?

Preparing for Class Discussion

Complete the following steps individually in preparation for class discussion. Write your responses to the questions in each step.

Step 1: Understand the situation and key considerations. What considerations would be important to you in developing a plan of action in this situation? What resources might you draw upon to determine whether or not particular actions are unethical and/or illegal?

Step 2: Develop a plan of action. What steps would you follow in this scenario? What factors should you consider in planning your timing of these steps?

Step 3: Anticipate response(s). How might the Pioneer Fund employees respond to your plan of action? Develop a few scenarios.

Small Group and Class Discussion

Your professor will assign you to a small discussion group. Your group should discuss the following questions and be prepared to share your thoughts with the class:

1. What are the most difficult aspects of responding to a murky situation—those situations in which you sense the presence of unethical and/or illegal behavior but haven't seen unequivocal proof of wrongdoing?
2. What are the risks of waiting for unequivocal proof before beginning to take action? What are the risks of acting decisively based on your "gut" sense of a situation?
3. What is different about acting ethically/responsibly within an organizational environment/culture like that of the Pioneer Fund versus acting ethically/responsibly as an individual? What are the particular challenges and dynamics associated with ethical and responsible behavior in an organization?

DEVELOP YOUR CAREER POTENTIAL

Examining Nonprofits

These assignments will help develop your present and future capabilities as a manager. Since stakeholders increasingly expect companies to do more to fulfill their discretionary responsibilities, chances are you and your company will be expected to support your community in some significant way. To begin learning about community needs and corporate social responsibility, visit a local charity or nonprofit organization of your choosing, perhaps a hospital, the Red Cross, Goodwill, Planned Parenthood, a soup kitchen, or a homeless shelter. Talk to the people who work or volunteer there. Gather the information you need to answer the following questions.

Questions

1. What is the organization's mission?
2. Whom does the organization serve, and how does it serve them?
3. What percentage of the organization's donations is used for administrative purposes? What percentage is used to directly benefit those served by the organization? What is the ratio of volunteers to paid workers?
4. What job or task does a typical volunteer perform for the organization? How much time does a typical volunteer give to the organization each week? For what types of jobs does the organization need more volunteers?
5. How does the business community support the organization?
6. Why are you interested in the activities of this organization?

William Hundert (Kevin Kline), a professor at Saint Benedict's preparatory school, believes in teaching his students about living a principled life as well as teaching them his beloved classical literature. Hundert's principled ways are challenged, however, by a new student, Sedgewick Bell (Emile Hirsch). Bell's behavior during the 73rd annual Julius Caesar competition causes Hundert to suspect that Bell leads a less than principled life.

Years later, Hundert is the honored guest of his former student Sedgewick Bell (Joel Gretsch) at Bell's estate and competes in a reenactment of the Julius Caesar competition. Bell nearly wins the competition, but when Hundert notices that Bell is wearing an earpiece and is cheating with an assistant's help, he gives him a question he knows he cannot answer.

This scene is an edited portion of the competition reenactment.

On May 4, The city of Greensburg, Kansas was leveled by violent storms and tornadoes. Steve Hewitt, the city administrator, and Mayor Lonnie McCollum rallied the people and vowed to rebuild a new and improved Greensburg—as a "green town." What would You Do?

Ford Motor Company Dearborn, Michigan.[1]

"You turned Boeing around from billion-dollar losses to huge profits and increased market share. But when you became Ford Motor Company's CEO, people asked, "What does an airplane guy know about the car business?" Well, on your first day as CEO, you reviewed the product lineup and discovered something missing, the Ford Taurus, the best-selling car in company history. "Where was it?" you asked. "We killed it. After a while, they didn't sell very well, so we stopped." Incredulous, you replied, "You stopped? How many billions of dollars did it cost to build brand loyalty around the Taurus name? Well, you've got until tomorrow to find a vehicle to put the Taurus name on. Then, you have two years to make a new Taurus which had better be the coolest vehicle that you can possibly make." So, in less than four hours, you made your first billion-dollar decision. It wouldn't be your last. With billions of dollars in losses, you eliminated 46,000 jobs, sold off Aston Martin, Jaguar, and Land Rover, and cut truck and SUV production by 40 percent. Despite these drastic moves, Ford still lost $12.6 billion your second year and $2.7 billion your third.

With losses still mounting, the first major issue you need to address is vehicle customization, that is, maximizing consumer choice by producing different cars with different parts for different world markets. Vehicle customization originated in 1967 when Ford's European operations were created to design and manufacture cars just for Europe. Consequently, when Ford attempted to cut costs by creating a common "world car" to be sold in Europe and the United States, it failed. The resulting cars (yes, "cars"), one designed in Detroit and the other in Germany, were completely different except for two shared parts.

The second major issue is that Ford's management teams have difficulty staying on target and tracking company performance. Even with downsizing, Ford is a complex company with 205,000 employees, multiple product lines, and international operations on four continents. Surprisingly, Ford's managers only stay in their jobs a few years. And, if you're off to your next job and don't have to live with the consequences of your decisions, why care about whether you meet your department's or division's goals?

The final issue is that contentious relationships between Ford's divisions have produced dysfunctional decision making. Different geographic regions and functional divisions, such as engineering, production, and sales, are more interested in doing what they want than what is best for Ford as a whole. Feelings on this issue are so strong that your management team pleaded with you to remove Ford's blue logo from one of your PowerPoint presentations so as not to "alienate" those who worked for Ford's

Volvo, Jaguar, and Lincoln divisions. At the time you agreed, but now realize it was a mistake.

Three years ago, you arranged for $23 billion in loans to get the company through tough times. And with Chrysler and GM in bankruptcy, and industry sales off 35 percent, you've needed every dime. But, you're 65 percent through those funds, so you've got to address these key issues. Ford's survival depends on it. Should Ford continue to make different cars for Europe and the United States? If so, how do you lower expenses? If not, then how do you get the company to produce the "world cars," when it has failed to do so before? What should Ford's strategic objective be here? Beyond making managers stay longer in their jobs, which won't be popular, how will you change Ford's culture so that managers pay attention to company plans and feel accountable for meeting performance targets? Finally, what will you do to address the dysfunctional way in which decisions are made, where different departments and units care more about their issues than the company's issues?

If you were the CEO of Ford, what would you do?

Even inexperienced managers know that planning and decision making are central parts of their jobs. Figure out what the problem is. Generate potential solutions or plans. Pick the best one. Make it work. Experienced managers, however, know how hard it really is to make good plans and decisions. One seasoned manager says: "I think the biggest surprises are the problems. Maybe I had never seen it before. Maybe I was protected by my management when I was in sales. Maybe I had delusions of grandeur, I don't know. I just know how disillusioning and frustrating it is to be hit with problems and conflicts all day and not be able to solve them very cleanly."[2]

This chapter begins by examining the benefits and pitfalls of planning. Next, you will learn how to make a plan that works. Then you will look at the different kinds of plans that are used from the top to the bottom in most companies. In the second part of the chapter, we discuss the steps of rational decision making and consider its limitations. We finish the chapter by discussing how managers can use groups and group decision techniques to improve decisions.

PLANNING

After reading the next three sections, you should be able to

1. discuss the benefits and pitfalls of planning.
2. describe how to make a plan that works.
3. discuss how companies can use plans at all management levels, from top to bottom.

Planning is choosing a goal and developing a method or strategy to achieve that goal. In the face of tougher regulations and an industry-wide reputation for selling junk food, **General Mills** decided that 20 percent of its products must meet more rigorous nutrition standards. Managers had to adapt old products and develop new ones that were higher in whole grains, lower in sugar and salt, and would encourage people to eat their vegetables. Some products, like single-serving vegetables, were successful. Others, like Go-Gurt yogurt in a plastic tube, were flops. But setting clear standards for nutritional value and tying annual executive bonuses to achievement of those standards helped General Mills meet its goal. The company is now well on its way to its next goal: having 40 percent of its products meeting rigorous nutrition standards by 2010.[3]

1 BENEFITS AND PITFALLS OF PLANNING

Are you one of those naturally organized people who always make a daily to-do list, write everything down so you won't forget, and never miss a deadline because you keep track of everything with your handy time management notebook or iPhone or PC? Or are you one of those flexible, creative, go-with-the-flow people who dislike planning and organizing because it restricts your freedom, energy, and performance? Some people are natural planners. They love it and can see only its benefits. Others dislike planning and can see only its disadvantages. It turns out that *both* views have real value.

Planning has advantages and disadvantages. Let's learn about **1.1 the benefits and 1.2 the pitfalls of planning.**

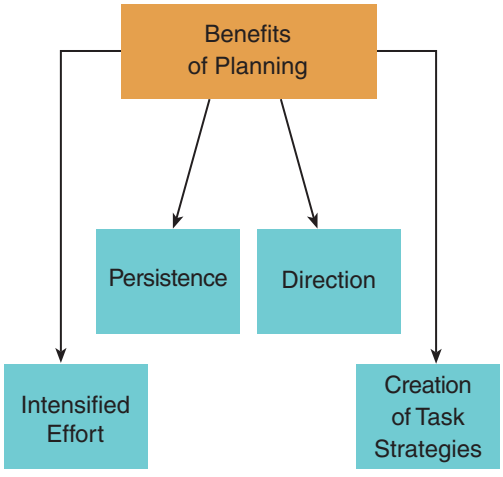
1.1 Benefits of Planning

Planning offers several important benefits: intensified effort, persistence, direction, and creation of task strategies.[4] First, as shown in Exhibit 5.1, managers and employees put forth greater effort when following a plan. Take two workers. Instruct one to "do your best" to increase production, and instruct the other to achieve a 2 percent increase in production each month. Research shows that the one with the specific plan will work harder.[5]

Second, planning leads to persistence, that is, working hard for long periods. In fact, planning encourages persistence even when there may be little chance of short-term success.[6] McDonald's founder Ray Kroc, a keen believer in the power of persistence, had this quotation from President Calvin Coolidge hung in all of his executives' offices: "Nothing in the world can take the place of persistence. Talent will not; nothing is more common than unsuccessful men with talent. Genius will not;

EXHIBIT 5.1

Benefits of Planning



unrewarded genius is almost a proverb. Education will not; the world is full of educated derelicts. Persistence and determination alone are omnipotent."[7]

The third benefit of planning is direction. Plans encourage managers and employees to direct their persistent efforts *toward* activities that help accomplish their goals and *away* from activities that don't.[8] For example, a large insurance company wanted to improve the performance evaluation feedback its managers gave employees. To help the managers improve, company trainers taught them 43 effective performance feedback behaviors, such as, "I will give my subordinate a clear understanding of the results I expect him or her to achieve" and "During the performance appraisal interview, I will be very supportive, stressing good points before discussing needed improvement." During the training, managers were instructed to choose just 12 behaviors (out of the 43) on which they wanted to make the most improvement. When subordinates rated their managers on the 43 behaviors, it became clear that no matter which 12 behaviors different managers chose to concentrate on, they improved only on those 12 behaviors. Thus, plans direct behavior toward activities that lead to goal accomplishment and away from those that don't.

The fourth benefit of planning is that it encourages the development of task strategies. In other words, planning not only encourages people to work hard for extended periods and to engage in behaviors directly related to goal accomplishment, it also encourages them to think of better ways to do their jobs. Finally, perhaps the most compelling benefit of planning is that it has been proved to work for both companies and individuals. On average, companies with plans have larger profits and grow much faster than companies that don't.[9] The same holds true for individual managers and employees: There is no better way to improve the performance of the people who work in a company than to have them set goals and develop strategies for achieving those goals.

1.2 Pitfalls of Planning

Despite the significant benefits associated with planning, planning is not a cure-all. Plans won't fix all organizational problems. In fact, many management authors and consultants believe that planning can harm companies in several ways.[10] As shown in Exhibit 5.2, the first pitfall of planning is that it can impede change and prevent or slow needed adaptation. Sometimes companies become so committed to achieving the goals set forth in their plans, or on following the strategies and tactics spelled out in them, that they fail to see that their plans aren't working or that their goals need to change. When it comes to environmentally sound cars, **General Motors** missed its initial opportunity because its culture was "wedded to big cars and horsepower." While Toyota formed its "green group" in the mid-1990s, which led to the development of the Prius, its popular electrical hybrid, GM didn't begin developing experimental technology for an electric car until 2003. And then, it killed the project after deciding to continue selling highly profitable SUVs (sport utility vehicles). GM restarted its work on hybrid cars in 2006, but its new Chevy Volt, a battery-powered car, which combines overnight recharging from off-peak electricity and a small gas engine (during the day) to recharge the batteries that energize the electric motor that propels the car, won't be ready until 2011.[11]

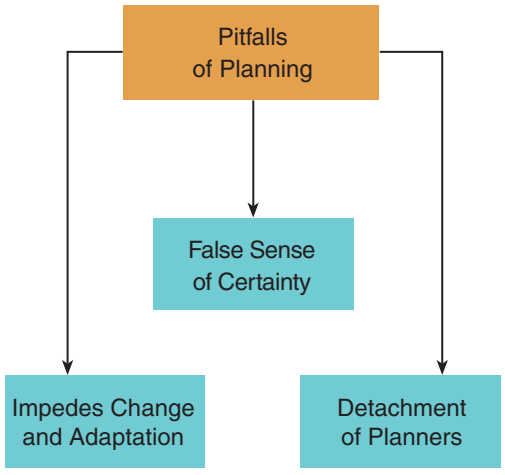


EXHIBIT 5.2

Pitfalls of Planning

The second pitfall is that planning can create a false sense of certainty. Planners sometimes feel that they know exactly what the future holds for their competitors, their suppliers, and their companies. However, all plans are based on assumptions: "The price of gasoline will increase by 4 percent per year";

"Exports will continue to rise." For plans to work, the assumptions on which they are based must hold true. If the assumptions turn out to be false, then the plans based on them are likely to fail.

The third potential pitfall of planning is the detachment of planners. In theory, strategic planners and top-level managers are supposed to focus on the big picture and not concern themselves with the details of implementation (i.e., carrying out the plan). According to management professor Henry Mintzberg, detachment leads planners to plan for things they don't understand.[12] Plans are meant to be guidelines for action, not abstract theories. Consequently, planners need to be familiar with the daily details of their businesses if they are to produce plans that can work.

If you doubt that the details are important to good execution of a plan, imagine that you're about to have coronary bypass surgery to replace four clogged arteries. You can have either an experienced surgeon or a first-year medical intern perform your surgery. The intern is a fully qualified M.D. who clearly understands the theory and the plan behind bypass surgery but has never performed such an operation. As you lie on the operating table, who is the last person you'd like to see as the anesthesia kicks in: the first-year intern who knows the plan but has never done a bypass or the experienced surgeon who has followed the plan hundreds of times? Planning works better when the people developing the plan are not detached from the process of executing the plan.

Benefits and Pitfalls of Planning Planning involves choosing a goal and developing a method to achieve that goal. Planning is one of the best ways to improve organizational and individual performance. It encourages people to work harder (intensified effort), to work hard for extended periods (persistence), to engage in behaviors directly related to goal accomplishment (directed behavior), and to think of better ways to do their jobs (task strategies). Most importantly, companies that plan have larger profits and faster growth than companies that don't plan. However, planning also has three potential pitfalls. Companies that are overly committed to their plans may be slow to adapt to changes in their environment. Planning is based on assumptions about the future, and when those assumptions are wrong, the plans are likely to fail. Finally, planning can fail when planners are detached from the implementation of plans.

REVIEW 1

2 HOW TO MAKE A PLAN THAT WORKS

Planning is a double-edged sword. If done right, planning brings about tremendous increases in individual and organizational performance. If planning is done wrong, however, it can have just the opposite effect and harm individual and organizational performance.

In this section, you will learn how to make a plan that works. As depicted in Exhibit 5.3, planning consists of **2.1 setting goals, 2.2 developing commitment to the goals, 2.3 developing effective action plans, 2.4 tracking progress toward goal achievement,** and **2.5 maintaining flexibility in planning.**

2.1 Setting Goals

The first step in planning is to set goals. To direct behavior and increase effort, goals need to be specific and challenging.[13] For example, deciding to "increase sales this year" won't direct and energize workers as much as deciding to "increase North

EXHIBIT 5.3

How to Make a Plan That Works

American sales by 4 percent in the next 6 months." Likewise, deciding to "drop a few pounds" won't motivate you as much as deciding to "lose 15 pounds." Specific, challenging goals provide a target for which to aim and a standard against which to measure success.

One way of writing effective goals for yourself, your job, or your company is to use the S.M.A.R.T. guidelines. **S.M.A.R.T. goals** are **S**pecific, **M**easurable, **A**ttainable, **R**ealistic, and **T**imely.[14] Let's see how a heating, ventilation, and air-conditioning (HVAC) company might use S.M.A.R.T. goals in its business.

The HVAC business is cyclical. It's extremely busy at the beginning of summer, when homeowners find that their air-conditioning isn't working, and at the beginning of winter, when furnaces and heat pumps need repair. During these times, most HVAC companies have more business than they can handle, while at other times of year their business can be very slow. So a *specific* goal would be to increase sales by 50 percent during the fall and spring, when business is slower. This goal could be *measured* by keeping track of the number of annual maintenance contracts sold to customers. This goal of increasing sales during the off-seasons is *attainable* because maintenance contracts typically include spring tune-ups (air-conditioning systems) and fall tune-ups (furnace or heating systems). Moreover, a 50 percent increase in sales during the slow seasons appears to be *realistic*. Because customers want their furnaces and air conditioners to work the first time it gets cold (or hot) each year, a well-designed pitch may make them very open to buying service contracts that ensure their equipment is in working order. Tune-up work can then be scheduled during the slow seasons, increasing sales at those times. Finally, this goal can be made *timely* by asking the staff to push sales of maintenance contracts before Labor Day, the traditional end of summer, when people start thinking about the cold days ahead, and in March, when winter-weary people start longing for hot days in air-conditioned comfort. The result should be more work during the slow fall and spring seasons.

[Goal commitment] the determination to achieve a goal

"If workers don't care about a goal, that goal won't encourage them to work harder or smarter."

2.2 Developing Commitment to Goals

Just because a company sets a goal doesn't mean that people will try to accomplish it. If workers don't care about a goal, that goal won't encourage them to work harder or smarter. Thus, the second step in planning is to develop commitment to goals.[15]

Goal commitment is the determination to achieve a goal. Commitment to achieve a goal is not automatic. Managers and workers must choose to commit themselves to a goal. Edwin Locke, professor emeritus of management at the University of Maryland and the foremost expert on how, why, and when goals work, tells a story about an

doing the right thing

Stretch Goals: Avoid the "15 Percent Delusion"

Stretch goals are extremely ambitious goals that you don't know how to reach. The purpose of stretch goals is to achieve extraordinary improvements in company performance. Stretch goals are so demanding that they force managers and workers to throw away old, comfortable solutions and adopt radical, never-used solutions. Though stretch goals may encourage large improvements, they may also pressure people to do anything to meet "the numbers." The most common stretch goal CEOs set is "15 percent annual growth," the magical number that doubles corporate earnings every 5 years. But with earnings growth averaging just 8 percent over the last 40 years, the chances of achieving 15 percent growth every year are extremely low. So instead of promising generally unobtainable results, managers should set more realistic stretch goals. When Bob Eckert became CEO of Mattel, he dumped the company's stated goals of 15 percent annual earnings growth and 10 percent revenue growth. Says Eckert, "They were not realistic. We were not going to play that game anymore."[16]

overweight friend who finally lost 75 pounds. Locke says, "I asked him how he did it, knowing how hard it was for most people to lose so much weight." His friend responded, "Actually, it was quite simple. I simply decided that I *really wanted* to do it."[17] Put another way, goal commitment is really wanting to achieve a goal.

So how can managers bring about goal commitment? The most popular approach is to set goals participatively. Rather than assigning goals to workers ("Johnson, you've got till Tuesday of next week to redesign the flux capacitor so it gives us 10 percent more output"), managers and employees choose goals together. The goals are more likely to be realistic and attainable if employees participate in setting them. Another technique for gaining commitment to a goal is to make the goal public. For example, college students who publicly communicated their semester grade goals ("This semester, I'm shooting for a 3.5") to significant others (usually a parent or sibling) were much more committed to achieving their grades. More important, those students earned grades that were nearly a half-grade higher than the grades of students who did not tell others about their grade goals. So, one way to increase commitment to goals is to go public by having individuals or work units tell others about their goals. Still another way to increase goal commitment is to obtain top management's support. Top management can show support for a plan or program by providing funds, speaking publicly about the plan, or participating in the plan itself.

2.3 Developing Effective Action Plans

The third step in planning is to develop effective action plans. An **action plan** lists the specific steps (how), people (who), resources (what), and time period (when) for accomplishing a goal. Unlike most CEOs, Randy Papadellis has a unique goal that requires an extraordinary action plan. As the CEO of Ocean Spray, Papadellis has to

[Action plan] the specific steps, people, and resources needed to accomplish a goal

buy all of the cranberries that his farmers produce (Ocean Spray is a farmer cooperative) and buy the crop at the highest possible price. Then, it's Papadellis's job to figure out how to sell the entire crop of high-cost berries. He says, "Imagine if Pepsi had to maximize the aluminum it used, and at the highest price it could afford!" Under Papadellis's direction, Ocean Spray began looking for alternative uses for cranberries beyond the traditional juice and canned products, uses that would involve new methods, people, and resources. The company invented dried-fruit Craisins by reinfusing juice into husks that used to be thrown away. Craisins have grown into a $100 million product line. Ocean Spray also developed a set of light drinks that had just 40 calories, mock berries that could be infused with other flavors (such as blueberry and strawberry) and used in muffins and cereals, and was the first company to introduce juice boxes. Because of these effective actions, Ocean Spray has been able to increase the price it pays its farmers over 100 percent in the past three years.[18]

2.4 Tracking Progress

The fourth step in planning is to track progress toward goal achievement. There are two accepted methods of tracking progress. The first is to set proximal goals and distal goals. **Proximal goals** are short-term goals or subgoals, whereas **distal goals** are long-term or primary goals.[19] The idea behind setting proximal goals is that achieving them may be more motivating and rewarding than waiting to reach far-off distal goals. In a research study, Massachusetts Institute of Technology students were given a complex proofreading assignment. They were paid 10 cents for each error they found but were penalized $1 a day for turning in their work late. One group of students was given a single deadline—a distal goal—and told to turn in all of their work 3 weeks from the start of the study. A second group of students was given weekly deadlines—proximal goals—and told to turn in one-third of their work each week. A third group of students was allowed to set their own deadlines; they set their own proximal goals. The single-deadline students (those with no proximal goals, just a distal goal) were the worst performers: They turned in their work 12 days late and corrected only 70 errors. The students who were assigned weekly goals (proximal goals) were the best performers: They turned in their work only a half day late and corrected 136 errors. Next best were the students who set their own proximal goals: They turned in their work 6.5 days late and corrected 104 errors.[20] The lesson for managers is clear. If you want people to do a better job of tracking the quality and timeliness of their work, use proximal goals to set multiple deadlines.[21]

The second method of tracking progress is to gather and provide performance feedback. Regular, frequent performance feedback allows workers and managers to track their progress toward goal achievement and make adjustments in effort, direction, and strategies.[22] Exhibit 5.4 shows the impact of feedback on safety behavior at a large bakery company with a worker safety record that was two-and-a-half times worse than the industry average. During the baseline period, workers in the wrapping department, who measure and mix ingredients, roll the bread dough, and put it into baking pans, performed their jobs safely about 70 percent of the time (see 1 in Exhibit 5.4). The baseline safety record for workers in the makeup department, who bag and seal baked bread and assemble, pack, and tape cardboard cartons for shipping, was somewhat better at 78 percent (see 2). The company then gave workers 30 minutes of safety training, set a goal of 90 percent safe behavior, and then provided daily feedback (such as a chart similar to Exhibit 5.4). Performance improved dramatically. During the intervention period, safely performed behaviors rose to an average of 95.8 percent for wrapping workers (see 3) and 99.3 percent for workers in the makeup department (see 4), and never fell below 83 percent. Thus, the combination of training, a challenging goal, and feedback led to a dramatic increase in performance.

EXHIBIT 5.4

Effects of Goal Setting, Training, and Feedback on Safe Behavior in a Bread Factory

The importance of feedback alone can be seen in the reversal stage, when the company quit posting daily feedback on safe behavior. Without daily feedback, the percentage of safely performed behavior returned to baseline levels—70.8 percent for the wrapping department (see 5) and 72.3 percent for the makeup department (see 6). For planning to be effective, workers need both a specific, challenging goal and regular feedback to track their progress. Indeed, additional research indicates that the effectiveness of goal setting can be doubled by the addition of feedback.[23]

2.5 Maintaining Flexibility

Because action plans are sometimes poorly conceived and goals sometimes turn out not to be achievable, the last step in developing an effective plan is to maintain flexibility. One method of maintaining flexibility while planning is to adopt an options-based approach.[24] The goal of **options-based planning** is to keep options open by making small, simultaneous investments in many alternative plans. Then, when one or a few of these plans emerge as likely winners, you invest even more in these plans while discontinuing or reducing investment in the others.

In part, options-based planning is the opposite of traditional planning. Whereas the purpose of an action plan is to commit people and resources to a particular course of action, the purpose of options-based planning is to leave those commitments open by maintaining **slack resources**, that is, a cushion of resources, such as extra time, people, money, or production capacity, that can be used to address and adapt to unanticipated changes, problems, or opportunities.[25] Holding options open gives you choices. And choices, combined with slack resources, give you flexibility.

Total U.S. newspaper circulation has dropped from 59,894,000 ten years ago to 49,115,000 today, and major city newspapers are going out of business or threatened with bankruptcy. Newspaper publishers have got to find a way to maintain sales and ad revenues, but because they can't be certain about what will work to reverse these trends, many are turning to options-based planning by making small, simultaneous investments in a number of alternatives.[26] One example is E.W. Scripps's *Naples Daily News*, which has aggressively tried to counter the national trend in the newspaper industry of decreasing sales as the audience turns to the Internet for its news. To increase readership, the *Naples Daily News* offers content via TV, radio, magazines, cell phones, PlayStations, and iPhones. The newspaper posts a 15-minute video newscast on its website each day and offers services like calling readers at the end of each quarter in a football game to update the score. Publisher John Fish says profits are "a good bit higher than our print margins. It's just going to grow in the future. And if we don't provide the services, someone else will come up under us."[27]

Another method of maintaining flexibility while planning is to take a learning-based approach. Traditional planning assumes that initial action plans are correct and will lead to success. By contrast, **learning-based planning** assumes that action plans need to be continually tested, changed, and improved as companies learn better ways of achieving goals.[28] For example, Joe Ferry's design team at Virgin Atlantic Airways was charged with coming up with a new reclining sleeper seat for use in both the first- and business-class sections. Even though sleeper seats were common in first class, no one was using them in business class. Virgin hoped its plan to move the plush seats into business class would give it an edge against the competition. But the year Virgin started design and development, chief competitor British Airways launched a truly flat bed (not just a reclining seat) in business class, making Virgin's plan all but useless. Compounding Virgin's woes were customers complaining about sliding and discomfort when using the seat in the reclining position. Ferry describes the situation like this: "We were an also-ran, which didn't really sit well with us." So Virgin changed the plan and decided to focus on overhauling its first-class seating well before it needed to be. This time, the airline asked Ferry's

When a competitor came out with a better first-class seating option, Virgin Atlantic quickly changed its design plans and developed a first-class suite in advance of its original deadline.

team to change from designing a seat to designing a suite and allocated $127 million to the project. Different from the first attempt, the seats in Virgin's so-called upper-class suite have been a hit with customers. That's because the new suite seats use two types of foam—one for sitting, one for sleeping—so that passengers are comfortable in both positions (no more sliding). Virgin expected the change in plan to increase market share by 1 percent, but only 2 years after launch, the new seats have allowed the company to exceed that goal.[29]

How to Make a Plan That Works There are five steps to making a plan that works: (1) Set S.M.A.R.T. goals, or goals that are **S**pecific, **M**easurable, **A**ttainable, **R**ealistic, and **T**imely. (2) Develop commitment to the goals from the people who contribute to goal achievement. Managers can increase workers' goal commitment by encouraging worker participation in goal setting, making goals public, and getting top management to show support for workers' goals. (3) Develop action plans for goal accomplishment. (4) Track progress toward goal achievement by setting both proximal and distal goals and by providing workers with regular performance feedback. (5) Maintain flexibility. Keeping options open through options-based planning and seeking continuous improvement through learning-based planning help organizations maintain flexibility as they plan.

3 PLANNING FROM TOP TO BOTTOM

Planning works best when the goals and action plans at the bottom and middle of the organization support the goals and action plans at the top of the organization. In other words, planning works best when everybody pulls in the same direction. Exhibit 5.5 illustrates this planning continuity, beginning at the top with a clear definition of the company purpose and ending at the bottom with the execution of operational plans.

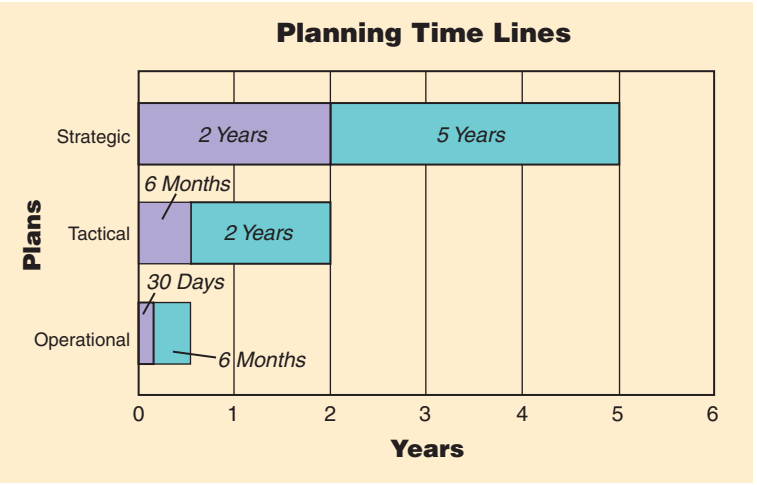
Time Lines for Strategic, Tactical, and Operational Plans



Let's see how **3.1 top managers create the organization's purpose statement and strategic objective, 3.2 middle managers develop tactical plans and use management by objectives to motivate employee efforts toward the overall purpose and strategic objective,** and **3.3 first-level managers use operational, single-use, and standing plans to implement the tactical plans.**

3.1 Starting at the Top

As shown in Exhibit 5.6, top management is responsible for developing long-term **strategic plans** that make clear how the company will serve customers and position itself against competitors in the next 2 to 5 years. (The strategic planning and management process is examined in its entirety in Chapter 6.) Strategic planning begins with the creation of an organizational purpose.

A **purpose statement**, which is often referred to as an organizational mission or vision, is a statement of a company's purpose or reason for existing.[30] Purpose statements should be brief—no more than two sentences. They should also be enduring, inspirational, clear, and consistent with widely shared company beliefs and values. An excellent example of a well-crafted purpose statement is that of Avon, the cosmetics company, shown in Exhibit 5.7. It guides everyone in the organization and provides a focal point for the delivery of beauty products and services to the customer, women around the world. The purpose is the same whether Avon is selling lipstick to women in India, shampoo packets to women in the Amazon, or jewelry to women in the United States. Despite these regional differences in specific strategy, the overall goal—understanding the needs of women globally—does not change. Furthermore, Avon's purpose is clear, inspirational, and consistent with Avon's company values and the principles that guide the company, also shown in Exhibit 5.7. Other examples of

organizational purposes that have been particularly effective include Walt Disney Company's "to make people happy" and Schlage Lock Company's "to make the world moresecure."[31]

The **strategic objective**, which flows from the purpose, is a more specific goal that unifies company-wide efforts, stretches and challenges the organization, and possesses a finish line and a time frame.[32] For example, in 1961, President John F. Kennedy established a strategic objective for **NASA** with this simple statement: "Achieving the goal, before this decade is out, of landing a man on the moon and returning him safely to earth."[33] NASA achieved this strategic objective on July 20, 1969, when astronaut Neil Armstrong walked on the moon. Once the strategic objective has been accomplished, a new one should be chosen. Again, however, the new strategic objective must grow out of the organization's purpose, which does not change significantly over time, for example, NASA's hopes to accomplish its latest strategic goal, or what it calls its "exploration systems mission directorate," between 2015 and 2020. NASA's strategic goal is to "return to the moon where we will build a sustainable long term human presence."[34] NASA further explains its strategic goal by saying, "As the space shuttle approaches retirement and the International Space Station nears completion, NASA is building the next fleet of vehicles to bring astronauts back to the moon, and possibly to Mars and beyond."

3.2 Bending in the Middle

Middle management is responsible for developing and carrying out tactical plans to accomplish the organization's strategic objective. **Tactical plans** specify how a company will use resources, budgets, and people to accomplish specific goals related to its strategic objective for the next 5 years. Whereas strategic plans and objectives are used to focus company efforts over the next 2 to 5 years, tactical plans and objectives are used to direct behavior, efforts, and attention over the next 6 months to 2 years. Several years ago, **Clorox**, a $4 billion global consumer products company, was not meeting sales goals for 30 percent of its products. So it developed a simple, but powerful, tactical plan where the chief financial officer, director of supply chain, and vice presidents of sales, marketing, and operations met monthly to identify products that were below sales and profit goals. Product exceeding targets were graded green. Those within 5 percent were graded yellow. But products more than 5 percent below goal targets were graded red, and the managers responsible for those product lines were required to develop plans to improve sales or to identify whether and how to eliminate product lines whose sales were unlikely to improve. Two years after implementing this tactical plan, over 90 percent of Clorox's products met sales and profit goals, and the average sales per product increased by 25 percent, giving Clorox the highest sales per product in its industry.[35]

Management by objectives is a management technique often used to develop and carry out tactical plans. **Management by objectives (MBO)** is a four-step process in which managers and their employees (1) discuss possible goals; (2) collectively select goals that are challenging, attainable, and consistent with the company's overall goals; (3) jointly develop tactical plans that lead to the accomplishment of tactical goals and objectives; and (4) meet regularly to review progress toward accomplishment of those goals. At **Kindermusik International**, a music education publisher, all 50 employees attend weekly 1-hour meetings to review the company's weekly goals and financial results. Half-day review sessions are held each quarter to review results against quarterly and annual goals and to discuss how to cut costs and increase revenues. Because they regularly review and discuss goal progress, employees were

[Management by objectives (MBO)] a four-step process in which managers and employees discuss and select goals, develop tactical plans, and meet regularly to review progress toward goal accomplishment

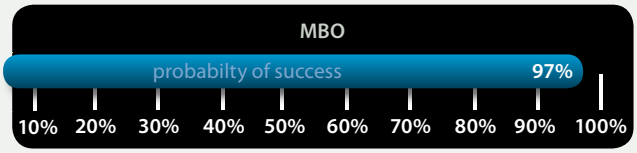
Management by Objectives

For years, both managers and management researchers have wondered how much of an effect planning has on organizational performance, or indeed if it has any effect at all. While proponents argued that planning encourages workers to work hard, persist in their efforts, engage in behaviors directly related to goal accomplishment, and develop better strategies for achieving goals, opponents argued that planning impedes organizational change and adaptation, creates the illusion of managerial control, and artificially separates thinkers and doers.

Now, however, the results from 70 different organizations strongly support the effectiveness of management by objectives (i.e., short-term planning).

Management by Objectives (MBO)

Management by objectives is a process in which managers and subordinates at all levels in a company sit down together to jointly set goals, share information and discuss strategies that could lead to goal achievement, and regularly meet to review progress toward accomplishing those goals. Thus, MBO is based on goals, participation, and feedback. On average, companies that effectively use MBO outproduce those that don't use MBO by an incredible 44.6 percent. And in companies where top management is committed to MBO, that is, where objective setting begins at the top, the average increase in performance is an even more astounding 56.5 percent. By contrast, when top management does not participate in or support MBO, the average increase in productivity is only 6.1 percent. In all, there is a 97 percent chance that companies that use MBO will outperform those that don't! Thus, MBO can make a very big difference to the companies that use it.[36]



When done right, MBO is an extremely effective method of tactical planning. Still, MBO is not without disadvantages.[37] Some MBO programs involve excessive paperwork, requiring managers to file annual statements of plans and objectives, plus quarterly or semiannual written reviews assessing goal progress. Today, however, electronic and web-based management systems and software make it easier for managers and employees to set goals, link them to the organization's strategic direction, and continuously track and evaluate their progress.[38]

Another difficulty is that managers are frequently reluctant to give employees feedback about their performance. A third disadvantage is that managers and employees sometimes have difficulty agreeing on goals. And when employees are forced to accept goals that they don't want, goal commitment and employee effort suffer. Last, because MBO focuses on quantitative, easily measured goals, employees may neglect important but unmeasured parts of their jobs. In other words, if your job performance is judged only by whether you reduce costs by 3 percent or raise revenues by 5 percent, then you are unlikely to give high priority to the unmeasured but still important parts of your job, such as mentoring new employees or sharing knowledge and skills with coworkers.

sensitive to reducing costs, so they proposed replacing the company's 5-day sales convention, which costs about $50,000, with a series of year-round virtual meetings with sales managers, sales representatives, and customers. CEO Michael Dougherty said, "If you'd asked me, I would have said, 'We've always done the convention.' But the folks who are closer to the event and closer to the customers know that there were other and better ways to achieve the same goal."[39]

3.3 Finishing at the Bottom

Lower-level managers are responsible for developing and carrying out **operational plans**, which are the day-to-day plans for producing or delivering the organization's products and services. Operational plans direct the behavior, efforts, and priorities of operative employees for periods ranging from 30 days to 6 months. There are three kinds of operational plans: single-use plans, standing plans, and budgets.

Single-use plans deal with unique, one-time-only events. For example, **Industrial Motion, Inc.**, a small international procurement service, relocated from California to North Carolina in order to reduce its operating expenses. The company had to come up with a plan for everything from managing business data, moving key employees and hiring new ones, and buying furniture.[40] Because the move would happen once, it required a single-use plan.

Unlike single-use plans that are created, carried out, and then never used again, **standing plans** save managers time because once the plans are created, they can be used repeatedly to handle frequently recurring events. If you encounter a problem that you've seen before, someone in your company has probably written a standing plan that explains how to address it. Using this plan rather than reinventing the wheel will save you time. There are three kinds of standing plans: policies, procedures, and rules and regulations.

Policies indicate the general course of action that company managers should take in response to a particular event or situation. A well-written policy will also specify why the policy exists and what outcome the policy is intended to produce. All companies have travel policies with expense guidelines on how much employees can spend on airline tickets (coach, rather business class or first class), hotel rooms, cars or meals. Many companies require employees to book their travel using company-provided travel websites that automatically enforce those guidelines. New travel software, however, can generate automated e-mails to employees that encourage them to purchase their airline tickets early relative to their travel dates. Typically, the earlier the purchase, the lower the cost. At **American Honda**, this early purchase travel policy is reinforced by travel expense tracking software that sends e-mails to employees and their bosses pointing out that a $1,000 ticket purchased by the employee could have been purchased for $800 a week earlier. Charles Franklin, Honda's corporate travel manager, says the policy matters, because with 40,000 annual trips made by American Honda employees, $100 less per trip would save the company $4 million a year.[41]

Procedures are more specific than policies because they indicate the series of steps that should be taken in response to a particular event. A manufacturer's procedure for handling defective products might include the following steps. Step 1: Rejected material is locked in a secure area with "reject" documentation attached. Step 2: Material Review Board (MRB) identifies the defect and how far outside the standard the rejected products are. Step 3: MRB determines the disposition of the defective product as either scrap or as rework. Step 4: Scrap is either discarded or recycled, and rework is sent back through the production line to be fixed. Step 5: If delays in delivery will result, MRB member notifies customer.[42]

Rules and regulations are even more specific than procedures because they specify what must happen or not happen. They describe precisely how a particular action should be performed. For instance, many companies have rules and regulations forbidding managers from writing job reference letters for employees who have worked at their firms because a negative reference may prompt a former employee to sue for defamation of character.[43]

After single-use plans and standing plans, budgets are the third kind of operational plan. **Budgeting** is quantitative planning because it forces managers to decide how to allocate available money to best accomplish company goals. According to Jan King, author of *Business Plans to Game Plans*, "Money sends a clear message about your priorities. Budgets act as a language for communicating your goals to others." Exhibit 5.8 shows the operating budget outlays for the U.S. federal government. Together, social programs (Social Security and income security, or welfare) and health-care programs (Medicare and health) account for nearly 60 percent of the federal budget. Budgeting is a critical management task, one that most managers could do better. For more detailed information about budgeting, see *Essential Managers: Managing Budgets* by Stephen Brookson or *Budgeting Basics & Beyond: A Complete Step-by-Step Guide for Nonfinancial Managers* by Jae K. Shim and Joel G. Siegel. Both books are written for budget beginners.

Planning from Top to Bottom Proper planning requires that the goals at the bottom and middle of the organization support the objectives at the top of the organization. Top management develops strategic plans that indicate how a company will serve customers and position itself against competitors over a period of 2 to 5 years. Middle managers use techniques like management by objectives to develop tactical plans that direct behavior, efforts, and priorities over the next 6 months to 2 years. Finally, lower-level managers develop operational plans that guide daily activities in producing or delivering an organization's products and services. Operational plans typically span periods ranging from 30 days to 6 months. There are three kinds of operational plans: single-use plans, standing plans (policies, procedures, and rules and regulations), and budgets.

WHAT IS RATIONAL DECISION MAKING?

Imagine that your boss asks you for a recommendation on outfitting the salesforce, many of whom travel regularly, with new computers. She asks you to prepare a report that details the problems the sales team has been having with its computers and summarizes both current and future computer needs. You need to come up with at least five plans or options for getting computers to help members of the sales team do their job as efficiently as possible no matter where they are. When your boss delegates this "computer problem," what she really wants from you is a rational decision. **Decision making** is the process of choosing a solution from available alternatives.[44] **Rational decision making** is a systematic process in which managers define problems, evaluate alternatives, and choose optimal solutions that provide maximum benefits to their organizations. Thus, your boss expects you to define and analyze the computer problem and explore alternatives. Furthermore, your solution has to be optimal, because the department is going to live with the computer equipment you recommend for the next 3 years.

After reading the next two sections, you should be able to

4. explain the steps and limits to rational decision making.
5. explain how group decisions and group decision-making techniques can improve decision making.

[Decision making] the process of choosing a solution from available alternatives

[Rational decision making] a systematic process of defining problems, evaluating alternatives, and choosing optimal solutions

[Problem] a gap between a desired state and an existing state

4 STEPS AND LIMITS TO RATIONAL DECISION MAKING

Exhibit 5.9 shows the six steps of the rational decision-making process.

Let's learn more about each of these steps: **4.1 define the problem, 4.2 identify decision criteria, 4.3 weight the criteria, 4.4 generate alternative courses of action, 4.5 evaluate each alternative,** and **4.6 compute the optimal decision. Then we'll consider 4.7 limits to rational decision making.**

4.1 Define the Problem

The first step in decision making is identifying and defining the problem. A **problem** exists when there is a gap between a desired state (what is wanted) and an existing state (the situation you are actually facing). For instance, women want to look good and be comfortable in properly fitted clothes. But since the garment industry's size standards are outdated (collected 60 years ago on a small group of Caucasian women in their 20s) or ignored, fit varies tremendously. A size 8 in one brand will be a size 10 in another. As a result, women who can't find good-fitting clothes leave without purchasing or are forced to buy poorly fitted clothes that are returned to the store or discarded after several wearings. Either way, the result is the same: Clothing manufacturers have a problem because dissatisfied customers won't buy their brands in the future.[45]

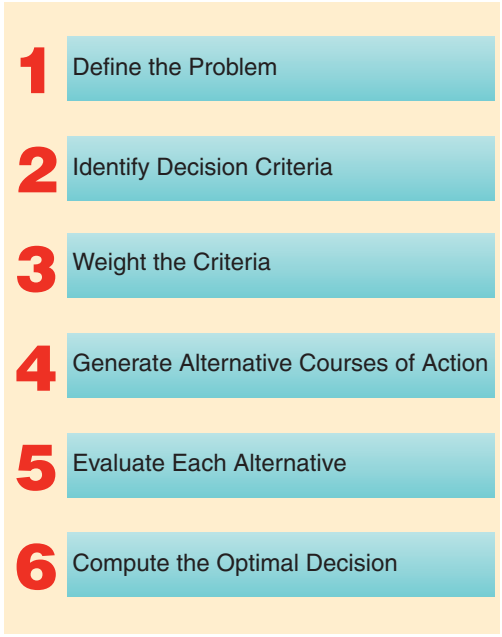

EXHIBIT 5.9

Steps of the Rational Decision-Making Process

The presence of a gap between an existing state and a desired state (such as selling clothes that should fit, but don't) is no guarantee that managers will make decisions to solve problems. Three things must occur for this to happen.[46] First, managers have to be aware of the gap. They have to know there is a problem before they can begin solving it. For example, after noticing that people were spending more money on their pets, a new dog food company created an expensive, high-quality dog food. To emphasize its quality, the dog food was sold in cans and bags with gold labels, red letters, and detailed information about its benefits and nutrients. Yet the product did not sell very well, and the company went out of business in less than a year. Its founders didn't understand why. When they asked a manager at a competing dog food company what their biggest mistake had been, the answer was, "Simple. You didn't have a picture of a dog on the package."[47] This problem would have been easy to solve, if management had only been aware of it.

"We know customers are looking for meaningful value, not just a lower price."

Being aware of a problem isn't enough to begin the decision-making process. Managers also have to be motivated to reduce the gap between a desired and an existing state. In Chapter 1, you learned that **Starbucks** had closed nearly a 1,000 stores and laid off over 25,000 employees to cut expenses by $100 million to restore profits. But, it wasn't until McDonald's rolled out a national advertising campaign for its lower-priced McCafé mochas, lattes, and cappuccinos that Starbucks was finally motivated to cut product prices. CEO Howard Schultz said, "We know customers are looking for meaningful value, not just a lower price. In the coming days we're going to arm our consumers and partners with the facts about Starbucks coffee."[48] Those facts include lowering the price of basic drinks, such as a "grande" iced coffee, by 45 cents to less than $2. With profits down 77 percent and same-store sales down 8 percent, and with McDonald's now selling specialty coffee drinks for $3 or less, Starbucks was motivated to take steps to keep customers who might be tempted by McDonald's lower prices.

Finally, it's not enough to be aware of a problem and be motivated to solve it. Managers must also have the knowledge, skills, abilities, and resources to fix the problem. Product designer Cricket Lee tried to solve the sizing problem in the women's clothing industry by developing Fitlogic, a sizing standard that takes account of body types and is not intimidating for larger women. Said Lee, "My intention is to standardize fit. This is what women in America want."[49] Although relatively unknown, Lee has convinced QVC (a home shopping TV network), Nordstroms, Macy's, and Jones Apparel to license Fitlogic to help women with different body shapes buy better-fitting clothes. With 84 percent of women experiencing fit problems, and poor fit accounting for nearly 40 percent of returned clothes, Lee has clearly identified a widespread problem. Other retailers, such as Banana Republic and Chico's FAS, are taking note by creating their own specialized sizing systems, as Banana Republic does by assigning different names to pants with different fit.[50]

4.2 Identify Decision Criteria

Decision criteria are the standards used to guide judgments and decisions. Typically, the more criteria a potential solution meets, the better that solution will be. Let's return to the employee who was given the responsibility for making a rational decision about the office computer setup. What general factors would be important when purchasing computers for the office? Reliability, price, warranty, on-site service, and compatibility with existing software, printers, and computers would all be important, but you must also consider the technical details. What specific factors would you want the office computers to have? Well, with technology changing so quickly, you'll probably want to buy computers with as much capability and flexibility as you can afford. Today, for the first time, laptops now account for over 50 percent of the market.[51] Business laptops come in four distinct model types. There are budget models that are good for routine office work but are usually saddled with a slower processor; workhorse models that are not lightweight, but have everything included; slim models for traveling but that usually require an external drive to read/write to a DVD/CD; and tablet models that include such items as handwriting recognition software.[52] What will the users really need? Will they need to burn CDs and DVDs, or just read them? How much memory and hard drive space will the users need? Should you pay extra for durability, file encryption, and extra-large batteries? What about Internet and wireless connectivity? Answering questions like these will help you identify the criteria that will guide the purchase of the new equipment.

4.3 Weight the Criteria

After identifying decision criteria, the next step is deciding which criteria are more or less important. Although there are numerous mathematical models for weighting decision criteria, all require the decision maker to provide an initial ranking of the criteria. Some use **absolute comparisons**, in which each criterion is compared with a standard or ranked on its own merits. For example, *Consumer Reports* uses this checklist when it rates and recommends new cars: predicted reliability, previous owners' satisfaction, predicted depreciation (the price you could expect if you sold the car), ability to avoid an accident, fuel economy, crash protection, acceleration, ride, and front seat comfort.[53]

Different individuals will rank these criteria differently, depending on what they value or require in a car. Exhibit 5.10 shows the absolute weights that someone buying a car might use. Because these weights are absolute, each criterion is judged on its own importance, using a five-point scale, with "5" representing "critically important" and "1" representing "completely unimportant." In this instance, predicted reliability, fuel economy, and front seat comfort were rated most important, and acceleration and predicted depreciation were rated least important.

Another method uses **relative comparisons**, in which each criterion is compared directly with every other criterion.[54] Exhibit 5.11 shows six criteria that someone might use when buying a house. Moving down the first column of Exhibit 5.11, we see that the time of the daily commute has been rated less important (−1) than school system quality; more important (+1) than having an inground pool, sun room, or a quiet street; and just as important as the house being brand new (0). Total weights, which are obtained by summing the scores in each column, indicate that the daily commute and school system quality are the most important factors

to this home buyer, while an inground pool, sun room, and a quiet street are the least important. So with relative comparison, criteria are directly compared with each other.

4.4 Generate Alternative Courses of Action

After identifying and weighting the criteria that will guide the decision-making process, the next step is to identify possible courses of action that could solve the problem. In general, at this step, the idea is to generate as many alternatives as possible. Let's assume that you're trying to select a city in Europe to be the location of a major office. After meeting with your staff, you generate a list of possible alternatives: Amsterdam, the Netherlands; Barcelona or Madrid, Spain; Berlin or Frankfurt, Germany; Brussels, Belgium; London, England; Milan, Italy; Paris, France; and Zurich, Switzerland.

4.5 Evaluate Each Alternative

The next step is to systematically evaluate each alternative against each criterion. Because of the amount of information that must be collected, this step can take much longer and be much more expensive than other steps in the decision-making process. When selecting a European city for your office, you could contact economic development offices in each city, systematically interview businesspeople or executives who operate there, retrieve and use published government data on each location, or rely on published studies such as Cushman & Wakefield's *European Cities Monitor*, which conducts an annual survey of more than 500 senior European executives who rate thirty-four European cities on twelve business-related criteria.[55]

No matter how you gather the information, once you have it, the key is to systematically use that information to evaluate each alternative against each criterion. Exhibit 5.12 shows how each of the ten cities on your staff's list fared on each of the twelve criteria (higher scores are better), from qualified staff to

freedom from pollution. Although London has the most qualified staff, the best access to markets and telecommunications, and is the easiest city to travel to and from, it is also one of the most polluted and expensive cities on the list. Paris offers excellent access to markets and clients, but if your staff is multilingual, Amsterdam may be a better choice.

4.6 Compute the Optimal Decision

The final step in the decision-making process is to compute the optimal decision by determining the optimal value of each alternative. This is done by multiplying the rating for each criterion (Step 4.5) by the weight for that criterion (Step 4.3), and then summing those scores for each alternative course of action that you generated (Step 4.4). For example, the 500 executives participating in Cushman & Wakefield's survey of the best European cities for business rated the twelve decision criteria in terms of importance as shown in the first column of Exhibit 5.12. Access to quality staff, markets, telecommunication, and easy travel to and from the city were the four most important factors, while quality of life and freedom from pollution were the least important factors. To calculate the optimal value for Paris, its score in each category is multiplied by the weight for each category (.60 × .79 in the qualified staff category, for example). Then all of these scores are added together to produce the optimal value, as follows:

$$(.60 \times .79) +_ (.59 \times 1.11) +_ (.54 \times .79) + _$$
$$(.53 \times 1.39) +_ (.40 \times .21) +_ (.27 \times .26) + _$$
$$(.27 \times .57) +_ (.26 \times .31) +_ (.25 \times 1.10) + _$$
$$(.24 \times .45) +_ (.21 \times .61) +_ (.18 \times .16) =_ 3.22$$

Since London has a weighted average of 4.27 compared to 3.22 for Paris and 2.29 for Frankfurt, London clearly ranks as the best location for your company's new European office because of its large number of qualified staff; easy access to markets; outstanding ease of travel to, from, and within the city; excellent telecommunications; and top-notch business climate.

4.7 Limits to Rational Decision Making

In general, managers who diligently complete all six steps of the rational decision-making model will make better decisions than those who don't. So, when they can, managers should try to follow the steps in the rational decision-making model, especially for big decisions with long-range consequences.

It's highly doubtful, however, that rational decision making can always help managers choose *optimal* solutions that provide *maximum* benefits to their organizations. The terms *optimal* and *maximum* suggest that rational decision making leads to perfect or near-perfect decisions. Of course, for managers to make perfect decisions, they have to operate in perfect worlds with no real-world constraints. In an optimal world, the manager who asked you to develop a computer strategy for the sales team would be able to clearly define which salespeople needed budget laptops, slim laptops, workhorse laptops, or tablet laptops and simply ensure that all team members received exactly what they needed to do their jobs effectively. You would not have been constrained by price or time as you developed solutions.

Furthermore, without any constraints, the manager could identify and weight an extensive list of decision criteria, generate a complete list of possible solutions, and then test and evaluate each computer against each decision criterion. Finally, the manager would have the necessary experience and knowledge with computers to easily make sense of all these sophisticated tests and information. Of course, it never works like that in the real world. Managers face time and money constraints. They often don't have time to make extensive lists of decision criteria. And they often don't have the resources to test all possible solutions against all possible criteria.

The rational decision-making model describes the way decisions *should* be made. In other words, decision makers wanting to make optimal decisions *should not* have to face time and cost constraints. They *should* have unlimited resources and time to generate and test all alternative solutions against all decision criteria. And they *should* be willing to recommend any decision that produces optimal benefits for the company, even if that decision would harm their own jobs or departments. Of course, very few managers actually make rational decisions the way they *should*. The way in which managers actually make decisions is more accurately described as bounded (or limited) rationality. **Bounded rationality** means that managers try to take a rational approach to decision making but are restricted by real-world constraints, incomplete and imperfect information, and their own limited decision-making capabilities.

In theory, fully rational decision makers **maximize** decisions by choosing the optimal solution. In practice, however, limited resources along with attention, memory, and expertise problems make it nearly impossible for managers to maximize decisions. Consequently, most managers don't maximize—they satisfice. Whereas maximizing is choosing the best alternative, **satisficing** is choosing a "good-enough" alternative. With twenty-four decision criteria, fifty alternative computers to choose from, two computer labs with hundreds of thousands of dollars of equipment, and unlimited time and money, the manager could test all alternatives against all decision criteria and choose the perfect PC. In reality, however, the manager's limited time, money, and expertise mean that only a few alternatives will be assessed against a few decision criteria. In practice, the manager will visit two or three computer or electronic stores, read a couple of recent computer reviews, and get bids from Dell, Lenovo, and Hewlett-Packard as well as some online superstores like CDW or PC Connection. The decision will be complete when the manager finds a good-enough laptop computer that meets a few decision criteria.

PLUS—A Process for Ethical Decision Making

People are often unsure how to include ethics in their decision-making processes. To help them, the Ethics Resource Center recommends using the following PLUS guidelines throughout the various steps of the rational decision-making model:

- P is for policies. Is your decision consistent with your organization's policies, procedures, and guidelines?
- L is for legal. Is your decision acceptable under applicable laws and regulations?
- U is for universal. Is your decision consistent with your organization's values and principles?
- S is for self. Does your decision satisfy your personal sense of right, good, and fair?

The PLUS guidelines can't guarantee ethical decisions, but they can help employees be more attentive to ethical issues as they define problems, evaluate alternatives, and choose solutions.[56]

REVIEW 4

Steps and Limits to Rational Decision Making Rational decision making is a six-step process in which managers define problems, evaluate alternatives, and compute optimal solutions. The first step is identifying and defining the problem. Problems exist where there is a gap between desired and existing states. Managers won't begin the decision-making process unless they are aware of the gap, motivated to reduce it, and possess the necessary resources to fix it. The second step is defining the decision criteria that are used when judging alternatives. In Step 3, an absolute or relative comparison process is used to rate the importance of the decision criteria. Step 4 involves generating as many alternative courses of action (i.e., solutions) as possible. Potential solutions are assessed in Step 5 by systematically gathering information and evaluating each alternative against each criterion. In Step 6, criterion ratings and weights are used to compute the optimal value for each alternative course of action. Rational managers then choose the alternative with the highest optimal value.

The rational decision-making model describes how decisions should be made in an ideal world without limits. However, bounded rationality recognizes that in the real world, managers' limited resources, incomplete and imperfect information, and limited decision-making capabilities restrict their decision-making processes. These limitations often prevent managers from being rational decision makers.

5 USING GROUPS TO IMPROVE DECISION MAKING

According to a study reported in *Fortune* magazine, 91 percent of U.S. companies use teams and groups to solve specific problems (i.e., make decisions).[57] Why so many? Because when done properly, group decision making can lead to much better decisions than those typically made by individuals. In fact, numerous studies show that groups consistently outperform individuals on complex tasks.

Let's explore the **5.1 advantages and pitfalls of group decision making and see how the following group decision-making methods—5.2 structured conflict, 5.3 the nominal group technique, 5.4 the Delphi technique, 5.5 the stepladder technique,** and **5.6 electronic brainstorming—can be used to improve decision making.**

5.1 Advantages and Pitfalls of Group Decision Making

Groups can do a much better job than individuals in two important steps of the decision-making process: defining the problem and generating alternative solutions. There are four reasons for this. First, groups are able to view problems from multiple perspectives because group members usually possess different knowledge, skills, abilities, and experiences. Being able to view problems from different perspectives, in turn, can help groups perform better on complex tasks and make better decisions than individuals.[58]

Second, groups can find and access much more information than individuals alone. At 1-800-GOT-JUNK?, a national chain of over 200 locations that provides efficient, timely junk removal, applicants are not interviewed by one person at a time. Instead, each applicant is interviewed by a group of eight people with eight different areas of expertise. Together they assess the candidate immediately following the interview. CEO Brian Scudamore believes there is wisdom in crowds, and relying on groups to conduct interviews has helped his company maintain a remarkably low employee turnover rate of only 1.4 percent.[59]

[Groupthink] a barrier to good decision making caused by pressure within the group for members to agree with each other

Third, the increased knowledge and information available to groups make it easier for them to generate more alternative solutions. Studies show that generating lots of alternative solutions is critical to improving the quality of decisions. Finally, if groups are involved in the decision-making process, group members will be more committed to making chosen solutions work.

Although groups can do a better job of defining problems and generating alternative solutions, group decision making is subject to some pitfalls that can quickly erase these gains. One possible pitfall is groupthink. **Groupthink** occurs in highly cohesive groups when group members feel intense pressure to agree with each other so that the group can approve a proposed solution.[60] Because groupthink leads to consideration of a limited number of solutions and restricts discussion of

any considered solutions, it usually results in poor decisions. Groupthink is most likely to occur under the following conditions:

- The group is insulated from others with different perspectives.
- The group leader begins by expressing a strong preference for a particular decision.
- The group has no established procedure for systematically defining problems and exploring alternatives.
- Group members have similar backgrounds and experiences.[61]

Groupthink may be one of the reasons that Merck's prescription drug Vioxx stayed on the market for over 5 years despite fatal side effects. Merck, one of the largest drug makers in the world, viewed Vioxx as a miracle pain reliever, and over 100 million prescriptions for the drug were written in the 5 years it was on the market. The *New England Journal of Medicine*, however, had reported that Vioxx users suffered from significant heart problems almost from the beginning, and the drug was eventually withdrawn from the market. Court documents revealed that Merck's internal studies showed an association between Vioxx usage and an elevated incidence of heart attacks. Litigants allege that because the drug generated a substantial profit, managers chose to listen to positive feedback about how well the drug worked as a painkiller rather than act on the information about the drug's risky side effects. After several years in court, Merck agreed to a $4.85 billion settlement with 45,000 eligible claimants.[62]

Google's Marissa Mayer uses six guidelines to keep the 70 meetings she holds each week on track.

A second potential problem with group decision making is that it takes considerable time. Reconciling schedules so that group members can meet takes time. Furthermore, it's a rare group that consistently holds productive task-oriented meetings to effectively work through the decision process. Some of the most common complaints about meetings (and thus decision making) are that the meeting's purpose is unclear, participants are unprepared, critical people are absent or late, conversation doesn't stay focused on the problem, and no one follows up on the decisions that were made. As Google's vice president of search products and user experience, Marissa Mayer holds over 70 meetings a week and is the last executive to hear a pitch before it is made to the cofounders. To keep meetings on track, Mayer has set down six guidelines. Meetings must (1) have a firm agenda and (2) an assigned note-taker. Meetings must occur (3) during established office hours and (4) preferably in short, 10-minute micro-meetings. Those running the meeting should (5) discourage office politics and rely on data, and above all, they should (6) stick to the clock. Mayer's guidelines help meetings stay focused and productive.[63]

A third possible pitfall to group decision making is that sometimes one or two people, perhaps the boss or a strong-willed, vocal group member, can dominate group discussions and limit the group's consideration of different problem definitions and

alternative solutions. And, unlike individual decisions where people feel personally responsible for making a good choice, another potential problem is that group members may not feel accountable for the decisions made and actions taken by the group.

Although these pitfalls can lead to poor decision making, this doesn't mean that managers should avoid using groups to make decisions. When done properly, group decision making can lead to much better decisions. The pitfalls of group decision making are not inevitable. Managers can overcome most of them by using the various techniques described next.

5.2 Structured Conflict

The right kind of conflict can lead to much better group decision making.

Most people view conflict negatively. Yet the right kind of conflict can lead to much better group decision making. **C-type conflict**, or "cognitive conflict," focuses on problem and issue-related differences of opinion.[64] In c-type conflict, group members disagree because their different experiences and expertise lead them to view the problem and its potential solutions differently. C-type conflict is also characterized by a willingness to examine, compare, and reconcile those differences to produce the best possible solution. Alteon Websystems, now a division of Nortel Networks, makes critical use of c-type conflict. Top manager Dominic Orr described Alteon's c-type conflict this way:

> *People arrive with a proposal or a solution—and with the facts to support it. After an idea is presented, we open the floor to objective, and often withering, critiques. And if the idea collapses under scrutiny, we move on to another: no hard feelings. We're judging the idea, not the person. At the same time, we don't really try to regulate emotions. Passionate conflict means that we're getting somewhere, not that the discussion is out of control. But one person does act as referee—by asking basic questions like "Is this good for the customer?" or "Does it keep our time-to-market advantage intact?" By focusing relentlessly on the facts, we're able to see the strengths and weaknesses of an idea clearly and quickly.*[65]

By contrast, **a-type conflict**, meaning "affective conflict," refers to the emotional reactions that can occur when disagreements become personal rather than professional. A-type conflict often results in hostility, anger, resentment, distrust, cynicism, and apathy. Unlike c-type conflict, a-type conflict undermines team effectiveness by preventing teams from engaging in the activities characteristic of c-type conflict that are critical to team effectiveness. Examples of a-type conflict statements are "your idea," "our idea," "my department," "you don't know what you are talking about," or "you don't understand our situation." Rather than focusing on issues and ideas, these statements focus on individuals.[66]

Two methods of introducing structured c-type conflict into the group decision-making process are devil's advocacy and dialectical inquiry. The **devil's advocacy** approach can be used to create c-type conflict by assigning an individual or a subgroup the role of critic. The following five steps establish a devil's advocacy program:

1. Generate a potential solution.
2. Assign a devil's advocate to criticize and question the solution.
3. Present the critique of the potential solution to key decision makers.
4. Gather additional relevant information.
5. Decide whether to use, change, or not use the originally proposed solution.[67]

Dialectical inquiry creates c-type conflict by forcing decision makers to state the assumptions of a proposed solution (a thesis) and then generate a solution that is

[C-Type conflict (Cognitive Conflict)] disagreement that focuses on problem- and issue-related differences of opinion

[A-Type conflict (Affective Conflict)] disagreement that focuses on individuals or personal issues

[Devil's advocacy] a decision-making method in which an individual or a subgroup is assigned the role of a critic

[Dialectical inquiry] a decision-making method in which decision makers state the assumptions of a proposed solution (a thesis) and generate a solution that is the opposite (antithesis) of that solution

the opposite (antithesis) of the proposed solution. The following are the five steps of the dialectical inquiry process:

1. Generate a potential solution.
2. Identify the assumptions underlying the potential solution.
3. Generate a conflicting counterproposal based on the opposite assumptions.
4. Have advocates of each position present their arguments and engage in a debate in front of key decision makers.
5. Decide whether to use, change, or not use the originally proposed solution.[68]

BMW uses dialectical inquiry in its design process, typically creating six internal design teams to compete against each other to design a new car. After a front-runner or leading design emerges from one of the teams, another team is assigned to design a car that is diametrically opposed to the leading design (Step 3 of the dialectical inquiry method).[69]

When properly used, both the devil's advocacy and dialectical inquiry approaches introduce c-type conflict into the decision-making process. Contrary to the common belief that conflict is bad, studies show that these methods lead not only to less a-type conflict but also improved decision quality and greater acceptance of decisions once they have been made.[70] See the "What Really Works" feature for more information on both techniques.

5.3 Nominal Group Technique

Nominal means "in name only." Accordingly, the **nominal group technique** received its name because it begins with a quiet time in which group members independently write down as many problem definitions and alternative solutions as possible. In other words, the nominal group technique begins by having group members act as individuals. After the quiet time, the group leader asks each group member to share one idea at a time with the group. As they are read aloud, ideas are posted on flipcharts or wallboards for all to see. This step continues until all ideas have been shared. In the next step, the group discusses the advantages and disadvantages of the ideas. The nominal group technique closes with a second quiet time in which group members independently rank the ideas presented. Group members then read their rankings aloud, and the idea with the highest average rank is selected.[71]

The nominal group technique improves group decision making by decreasing a-type conflict. But it also restricts c-type conflict. Consequently, the nominal group technique typically produces poorer decisions than do the devil's advocacy and dialectical inquiry approaches. Nonetheless, more than 80 studies have found that nominal groups produce better ideas than those produced by traditional groups.[72]

5.4 Delphi Technique

[Nominal group technique] a decision-making method that begins and ends by having group members quietly write down and evaluate ideas to be shared with the group

[Delphi technique] a decision-making method in which members of a panel of experts respond to questions and to each other until reaching agreement on an issue

In the **Delphi technique**, the members of a panel of experts respond to questions and to each other until reaching agreement on an issue. The first step is to assemble a panel of experts. Unlike other approaches to group decision making, however, it isn't necessary to bring the panel members together in one place. Because the Delphi technique does not require the experts to leave their offices or disrupt their schedules, they are more likely to participate. For example, a colleague and I were asked by a local government agency to use a Delphi technique to assess the "10 most important

Devil's Advocacy, Dialectical Inquiry, and Considering Negative Consequences

Ninety percent of the decisions managers face are well-structured problems that recur frequently under conditions of certainty. For example, for most retailers, a customer's request for a refund on a returned item without a receipt is a well-structured problem. It happens every day (recurs frequently), and it's easy to determine if a customer has a receipt (condition of certainty).

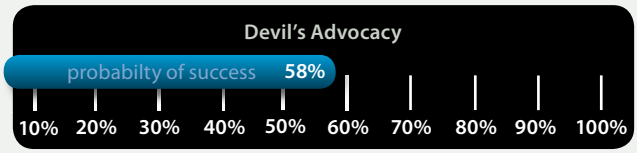
Well-structured problems are solved with programmed decisions, in which a policy, procedure, or rule clearly specifies how to solve the problem. Thus, there's no mystery about what to do when someone shows up without a receipt: Allow the item to be exchanged for one of similar value, but don't give a refund.

In some sense, programmed decisions really aren't decisions because anyone with experience knows what to do. No thought is required. What keeps managers up at night is the other 10 percent of problems. Ill-structured problems that are novel (no one's seen them before) and exist under conditions of uncertainty are solved with nonprogrammed decisions. Nonprogrammed decisions do not involve standard methods of resolution. Every time managers make a nonprogrammed decision, they have to figure out a new way of handling a new problem. That's what makes the decisions so tough.

Both the devil's advocacy and dialectical inquiry approaches to decision making, along with a related approach, considering negative consequences, can be used to improve nonprogrammed decision making. All three work because they force decision makers to identify and criticize the assumptions underlying the nonprogrammed decisions that they hope will solve ill-structured problems.

Devil's Advocacy

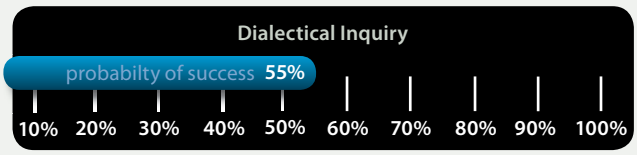
There is a 58 percent chance that decision makers who use the devil's advocacy approach to criticize and question their solutions will produce decisions that are better than decisions based on the advice of experts.



Dialectical Inquiry

There is a 55 percent chance that decision makers who use the dialectical inquiry approach to criticize and question their solutions will produce decisions that are better than decisions based on the advice of experts.

Note that each technique has been compared with decisions obtained by following experts' advice. So, although these probabilities of success, 55 percent and 58 percent, seem small, they very likely understate the effects of both techniques. In other words, the probabilities of better decisions would have been much larger if both techniques had been compared with unstructured decision-making processes.

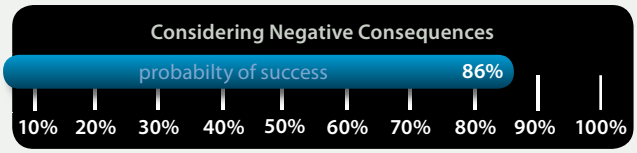


Group Decision Making and Considering Negative Consequences

Considering negative consequences, such as with a devil's advocate or via critical inquiry, means pointing out the potential disadvantages of proposed solutions. There is an 86 percent chance that groups that consider

(*continued*)

negative consequences will produce better decisions than those that don't.[73]



Managers should not use the Delphi technique for common decisions. Because it is a time-consuming, labor-intensive, and expensive process, the Delphi technique is best reserved for important long-term issues and problems. Nonetheless, the judgments and conclusions obtained from it are typically better than those you would get from one expert.

steps for small businesses." The first step is to assemble the group. We assembled a panel of local top-level managers and CEOs.

The second step is to create a questionnaire consisting of a series of open-ended questions for the group. We asked our panel of experts to answer questions like: "What is the most common mistake made by small-business persons?" "Right now, what do you think is the biggest threat to the survival of most small businesses?" "If you had one piece of advice to give to the owner of a small business, what would it be?"

In Step 3, the group members' written responses are analyzed, summarized, and fed back to the group for reactions until the members reach agreement. In our Delphi study, it took about a month to get the panel members' written responses to the first three questions. Then we summarized their responses in a brief report (no more than two pages). We sent the summary to the panel members and asked them to explain why they agreed or disagreed with these conclusions from the first round of questions. Asking group members why they agree or disagree is important because it helps uncover their unstated assumptions and beliefs. Again, this process of summarizing panel feedback and obtaining reactions to that feedback continues until the panel members reach agreement. For our study, it took just one more round for the panel members to reach a consensus. In all, it took approximately 3½ months to complete our Delphi study.

5.5 Stepladder Technique

The stepladder technique improves group decision making by ensuring that each member's contributions are independent and are considered and discussed by the group. As shown in Exhibit 5.13, the **stepladder technique** begins with discussion between two group members who share their thoughts, ideas, and recommendations before jointly making a tentative decision. Other group members are added to the discussion one at a time at each step, like a stepladder. The existing group members take the time to listen to and understand each new member's thoughts, ideas, and recommendations. Then they share the ideas and suggestions they had already considered. The group discusses the new and old ideas together and makes a tentative decision. This process (new member's ideas are heard, group shares previous ideas and suggestions, discussion is held, tentative group decision is made) continues until each group member's ideas have been discussed.

For the stepladder technique to work, group members must have enough time to consider the problem or decision on their own, to present their ideas to the group, and to thoroughly discuss all ideas and alternatives with the group at each step. Rushing through a step destroys the advantages of this technique. Also, groups must make sure that subsequent group members are completely unaware of previous discussions and suggestions. This will ensure that each member who joins the group brings truly independent thoughts and suggestions, thus greatly increasing the chances of making better decisions. All members must be present before a final decision is made.

One study found that groups using the stepladder technique produced significantly better decisions than did traditional groups in which all group members are present for the entire discussion. Moreover, the stepladder groups performed better than the

best individual member of their group 56 percent of the time, whereas traditional groups outperformed the best individual member of their group only 13 percent of the time.[74] Besides better performance, groups using the stepladder technique also generated more ideas and were more satisfied with the decision-making process. This technique also works particularly well with audio conferencing, in which geographically dispersed group members make decisions via a telephone conference call.[75]

5.6 Electronic Brainstorming

Brainstorming, in which group members build on others' ideas, is a technique for generating a large number of alternative solutions. Brainstorming has four rules:

1. The more ideas, the better.
2. All ideas are acceptable, no matter how wild or crazy they might seem.
3. Other group members' ideas should be used to come up with even more ideas.
4. Criticism or evaluation of ideas is not allowed.

Although brainstorming is great fun and can help managers generate a large number of alternative solutions, it does have a number of disadvantages. Fortunately, **electronic brainstorming**, in which group members use computers to communicate and generate alternative solutions, overcomes the disadvantages associated with face-to-face brainstorming.[76]

The first disadvantage that electronic brainstorming overcomes is **production blocking**, which occurs when you have an idea but have to wait to share it because someone else is already presenting an idea to the group. During this short delay, you may forget your idea or decide that it really wasn't worth sharing. Production blocking doesn't happen with electronic brainstorming. All group members are seated at computers, so everyone can type in ideas whenever they occur. There's no waiting your turn to be heard by the group.

The second disadvantage that electronic brainstorming overcomes is **evaluation apprehension**, that is, being afraid of what others will think of your ideas.

EXHIBIT 5.14

What You See on the Computer during Electronic Brainstorming

With electronic brainstorming, all ideas are anonymous. When you type in an idea and hit the Enter key to share it with the group, group members see only the idea. Furthermore, many brainstorming software programs also protect anonymity by displaying ideas in random order. So if you laugh maniacally when you type "Cut top management's pay by 50 percent!" and then hit the Enter key, it won't show up immediately on everyone's screen. This makes it doubly difficult to determine who is responsible for which comments.

In the typical layout for electronic brainstorming, all participants sit in front of computers around a U-shaped table. This configuration allows them to see their computer screens, the other participants, a large main screen, and a meeting leader or facilitator. Exhibit 5.14 shows what the typical electronic brainstorming group member will see on his or her computer screen. Step 1 in electronic brainstorming is to anonymously generate as many ideas as possible. Groups commonly generate 100 ideas in a half-hour period. Step 2 is to edit the generated ideas, categorize them, and eliminate redundancies. Step 3 is to rank the categorized ideas in terms of quality. Step 4, the last step, has three parts: generate a series of action steps, decide the best order for accomplishing these steps, and identify who is responsible for each step. All four steps are accomplished with computers and electronic brainstorming software.[77]

Studies show that electronic brainstorming is much more productive than face-to-face brainstorming. Four-person electronic brainstorming groups produce 25 to 50 percent more ideas than four-person regular brainstorming groups, and 12-person electronic brainstorming groups produce 200 percent more ideas than regular groups of the same size! In fact, because production blocking (having to wait your turn) is not a problem for electronic brainstorming, the number and quality of ideas generally increase with group size.[78]

Even though it works much better than traditional brainstorming, electronic brainstorming has disadvantages, too. An obvious problem is the expense of computers, networks, software, and other equipment. As these costs continue to drop, however, electronic brainstorming will become cheaper.

Another problem is that the anonymity of ideas may bother people who are used to having their ideas accepted by virtue of their position (i.e., the boss). On the other hand, one CEO said, "Because the process is anonymous, the sky's the limit in terms of what you can say, and as a result it is more thought-provoking. As a CEO, you'll probably discover things you might not want to hear but need to be aware of."[79]

A third disadvantage is that outgoing individuals who are more comfortable expressing themselves verbally may find it difficult to express themselves in writing. Finally, the most obvious problem is that participants have to be able to type. Those who can't type, or who type slowly, may be easily frustrated and find themselves at a disadvantage to experienced typists. For example, one meeting facilitator was informed that an especially fast typist was pretending to be more than one person. Says the facilitator, "He'd type 'Oh, I agree' and then 'Ditto, ditto' or 'What a great idea,' all in quick succession, using different variations of uppercase and lowercase letters and punctuation. He tried to make it seem like a lot of people were concurring, but it was just him." Eventually, the person sitting next to him got suspicious and began watching his screen.[80]

Using Groups to Improve Decision Making When groups view problems from multiple perspectives, use more information, have a diversity of knowledge and experience, and become committed to solutions they help choose, they can produce better solutions than individual decision makers. However, group decisions can suffer from these disadvantages: groupthink, slowness, discussions dominated by just a few individuals, and unfelt responsibility for decisions. Group decisions work best when group members encourage c-type conflict. However, group decisions don't work as well when groups become mired in a-type conflict. The devil's advocacy and dialectical inquiry approaches improve group decisions because they bring structured c-type conflict into the decision-making process. By contrast, the nominal group technique and the Delphi technique both improve decision making by reducing a-type conflict through limited interactions between group members. The stepladder technique improves group decision making by adding each group member's independent contributions to the discussion one at a time. Finally, because it overcomes the problems of production blocking and evaluation apprehension, electronic brainstorming is a more effective method of generating alternatives than face-to-face brainstorming.

Who First Thought of Brainstorming?

Alex Osborn, advertising executive and cofounder of the global advertising agency BBDO, is considered the father of brainstorming. His book *Your Creative Power*, published in 1948, introduced to America the idea-generation technique BBDO had been using in-house for years. Osborn advocated having employees storm corporate problems "in commando fashion." Eventually, Osborn's career as a writer overtook his advertising career, and after more than 40 years at the helm, he retired from BBDO.

SELF ASSESSMENT

Self-Management

A key part of planning is setting goals and tracking progress toward their achievement. As a manager, you will be involved in some type of planning in an organization. But the planning process is also used in a personal context, where it is called self-management. Self-management involves setting goals for yourself, developing a method or strategy to achieve them, and then carrying it out. For some people, self-management comes naturally. Everyone seems to know someone who is highly organized, self-motivated, and disciplined. That someone may even be you. If that someone is not you, however, then you will need to develop your self-management skills as a means to becoming a better manager.

A part of planning, and therefore management, is setting goals and tracking progress toward goal achievement.[81] Answer each of the questions using the following scale:

MANAGEMENT DECISION

Web 2.0

You arrive early in the office to prepare for a meeting with your IT team. It has become increasingly clear to you that technology is changing—and fast—and many of the old IT tools your company still uses are becoming obsolete. Add to that your growing salesforce of 20-somethings who find these tools unfamiliar and burdensome. They've been begging you to allow them to use the Web 2.0 tools on their smartphones. So you called this meeting to explore the possibilities with your IT team.

Since you just bought your smartphone two weeks ago, you had to learn about the variety of Web 2.0 tools available and brush up on their costs and benefits. Social networking tools allow people to create a customized public (or private) profile and update it instantly. Internet-based applications like word processing, spreadsheets, and calendars take the software off your computer so you can create, manipulate, and use documents anytime, anywhere. And cloud computing enables information of all sorts to be stored not on individual devices that have to be synched or connected to a network but in a digital "cloud" that can be accessed from your desktop, your laptop, or your smartphone anywhere, anytime.

"This has a lot of potential," you think. No more "Oops, I left that at the office" ruining a sales call, since documents can be accessed anywhere. You can keep up with your sales reps wherever they are—and they can keep in touch with you, too. If they have questions in the middle of a sales call, they can get the information they need to clinch the deal on the spot, since information—or the experts who can supply it—are instantly accessible. Anyone in the company can access the most recent performance statistics, find out how many items are left in inventory, or contact a colleague instantly. And Web 2.0 tools even offer new ways to reach out to potential customers. Your tennis partner, whose company has already begun adopting these tools, told you, "We're a lot less mired in technology. Employees say they can spend less time dealing with the IT system and more time actually thinking about their work."

You know that Web 2.0 has its disadvantages, though. It won't be cheap to adopt a cloud-based system, equip employees with the devices they'll need to access it, and train them how to use it. Also, tech companies are only beginning to integrate social networking, Internet-based software, and cloud computing into a single system, so there are still bugs. Maybe it's worth adopting one or two tools and moving toward Web 2.0 gradually. It also means your IT team will have less control over the flow of information, and you're definitely concerned about security.[82] Still, the advantages are significant, and adopting a system like this could transform your business.

Questions

1. What decision criteria should you consider as you decide how to transition to Web 2.0? How would you weight those criteria? Which would be most important to you?
2. Generate a list of possible courses of action you could take. Evaluate those options based on your decision criteria.
3. How might you use groups to help you make this decision? Think about how you would involve your IT team. But also: How would you involve employees?
4. What would be a maximal decision? In other words, what is the optimal solution? Under what circumstances would you satisfice? What is a "good enough" alternative to the optimal solution?

MANAGEMENT TEAM DECISION

Selling to Wal-Mart

Because of your company's success, the end-of-the year accounting review is usually an upbeat occasion, and this December is no different. Your company manufactures an innovative kickstand that reduces injuries by keeping a child's bike from falling all the way to the ground. After the device was written up in a parents' magazine recently, sales to specialty bike shops—your primary

customers—have started to climb. Despite the increased demand, you can still make kickstands to order.

At a meeting with your management team, you remark that although sales are increasing at a slow but steady rate, the company still has a large amount of excess capacity. A colleague agrees and then enthusiastically announces, "I know how to take care of that. Let's sell to Wal-Mart!" A hush falls over the meeting. Becoming a Wal-Mart supplier would mean honing your current distribution process into a finely tuned, perfect delivery operation. The retailing behemoth gives suppliers a 30-second window to deliver their goods to Wal-Mart distribution centers; you currently ship product via UPS ground. Wal-Mart requires severe price concessions from all its suppliers, a practice that has forced many American manufacturers to outsource production overseas in order to get their production costs low enough to meet Wal-Mart's pricing mandates. Master Lock, Carolina Mills, Levi's, and, a bit closer to home, Huffy Bicycle area few examples. Your company uses local suppliers for metal, paint, plastics, and packaging, and it pays its 25 workers above-market wages. Thankfully, at the moment your company is the only manufacturer of the kickstand, so you have more freedom to set a competitive price on that item. If you begin selling through Wal-Mart, however, imitators will soon follow, and that would definitely affect your already modest margins. Not to mention that Wal-Mart uses historical price data about a company and its competitors to drive prices down across industries. Suppliers are rarely if ever granted a price increase; on the contrary, they are asked for regular price decreases!

In addition, if vendors want their products on Wal-Mart's shelves, they have to implement Wal-Mart's "customized business plans." Each year, the big retailer hands its suppliers detailed "strategic business planning packets." Wal-Mart grades its suppliers with weekly, quarterly, and annual report cards. And when it comes to discussion of price, there is no real negotiation even for household brands. Plus, Wal-Mart often requires its suppliers to underwrite the costs of the retailer's supply chain productivity initiatives, like using radio-frequency identification (RFID) tags on their products for inventory tracking, a system that can cost between $13 million and $23 million to put in place. Trying to meet Wal-Mart's requirements has pushed many small- and medium-sized businesses into bankruptcy. Businesses that stay afloat have generally done so by outsourcing to China (in areas like shoes, housewares, and apparel, 80 to 90 percent of Wal-Mart's inventory comes from China).

But there are also benefits to selling to Wal-Mart. You have instant access to the world's largest global retailing network. Doing things the "Wal-Mart way" inevitably leads to more efficient operations. And the volume! You could sell exponentially more kickstands through Wal-Mart than through the small specialty retailers to whom you currently sell. If doing business with Wal-Mart is so bad, why do Unilever, P&G, and Dial sell 6, 17, and 28 percent of their goods, respectively, to the giant retailer? A former president of Huffy Bicycle once said that Wal-Mart gives you "a chance to compete. If you can't compete, that's your problem." You agree, to a point. Before you can voice any of the pros and cons, another manager expertly sums up the dilemma by saying, "The only thing worse than selling to Wal-Mart is not selling to Wal-Mart."[83]

Before you begin this Management Team Decision, each team member will probably need to do some preliminary research on Wal-Mart's business practices; go to the campus library to find articles on topics like productivity, inventory management, and even Wal-Mart's business practices. A visit to the Wal-Mart stores website (**http://www.walmartstores.com**) can give you a wealth of information on how the company manages its suppliers. You may also wish to visit the PBS show *Frontline*'s web page "Is Wal-Mart Good for America?" (**http://www.pbs.org/wgbh/pages/frontline/shows/walmart/secrets**).

Questions

1. As a team, use this exercise to practice one of the group decision-making techniques discussed in the chapter. Work together to decide which technique to use.
2. Do you apply to become a Wal-Mart supplier, with all that entails? Why or why not?
3. If you become a Wal-Mart supplier, what key areas of your operations will need to change and how?
4. Think about how the decision-making technique you chose affected the outcome of your decision. Do you think your collective decision would have been different if you had used, say, dialectical inquiry instead of the stepladder technique?

PRACTICE BEING A MANAGER

Effective planning and decision making are crucial to the success of organizations. Your success as a manager will be determined in large part by your planning and decision-making capabilities. This exercise highlights some well-tested tools for strengthening your planning and decision-making skills.

Individual Preparation

Step 1: Identify your "best company." Suppose that you are going to develop a plan that will result in your being hired to work for the single BEST COMPANY possible. "Best company" has not been defined for you, so you must determine what this might mean. Identify your "best company," and make your plan. You need to consider such aspects as building the right academic and work profile, marketing yourself to the company, and interviewing effectively. Carefully record both your plan and the steps that you took to develop it. In class you will be asked to share this information with a small discussion group.

Small Group Discussion

Step 2: Discuss your plan. Taking turns, individually share your plan with the members of your discussion group. Members should listen carefully, ask questions, and make notes regarding the similarities and differences of individual plans.

Step 3: Create a brochure. Now suppose that your group has been asked to develop a brochure for distribution in college career centers. The brochure will be titled "Getting a Job with Your Dream Company."

Using what you have learned from sharing your individual plans, work as a group to develop a sketch/outline of this brochure.

Class Discussion

Step 4: As a class, discuss the following questions:

- Did you follow the rational decision-making process in identifying your best company and creating your plan for landing a job with this company? Why or why not?
- What role might bounded rationality have played in your individual and/or team decision-making process?
- Does planning increase the likelihood of success in being hired by a great company? Why or why not?
- If you were an editor assigned the project of developing the brochure "Getting a Job with Your Dream Company," would you be more likely to give the assignment to (1) a qualified individual, or (2) a qualified group? Considering your recent experiences in this exercise, what are the trade-offs of each approach (individual versus group decision making)?

DEVELOP YOUR CAREER POTENTIAL

What Do You Want to Be When You Grow Up?

What do you want to be when you grow up?[84] Still not sure? Ask around. You're not alone. Chances are, your friends and relatives aren't certain either. Sure, they may have jobs and careers, but you're likely to find that, professionally, many of them don't want to be where they are today. Sometimes people's interests change, or they may burn out. And some people are unhappy with their current job or career because they weren't in the right one to begin with.

Getting the job and career you want is not easy. It takes time, effort, and persistence. And even though you will probably follow multiple career paths in your life, your career-planning process will be easier (and more effective) if you take the time to develop a personal career plan.

Begin by answering the following questions. (*Hint*: Treat this seriously. If you do it effectively, this plan could guide your career decisions for the next 5 to 7 years.)

1. Describe your strengths and weaknesses. Don't just rely on your opinions of your abilities. Ask your parents, relatives, friends, and employers what they think, too. Encourage them to be honest and then be prepared to hear some things that you may not want to hear. Remember, though, this information can help you pick the right job or career.
2. Write an advertisement for the job you want to have 5 years from now. Be specific. Describe the company, title, responsibilities, required education and experience, salary, and benefits. Use employment ads in the Sunday job listings as inspiration.
3. Create a detailed plan to obtain this job. In the short term, what classes do you need to take? Should you change your major? Do you need a business major or minor or maybe a minor in a foreign language? What kind of summer work experience will move you closer to getting the job you want 5 years from now? What job do you need to get right out of college to obtain the work experience you need? Create a specific plan for each of the 5 years in your career plan, keeping in mind that the plans for later years are likely to change. The value in planning is that it forces you to think about what you want and the steps you can take now to help achieve those goals.
4. Decide when you will monitor and evaluate the progress you're making with your plan. Career experts suggest that every 6 months is about right. Pick two dates and write them in your schedule. Furthermore, right now, before you forget, set five specific, challenging goals that you need to accomplish in the next 6 months in order to achieve your career plans.

Inside Man

©GREENLIGHT

The 2006 crime thriller ***Inside Man*** features Denzel Washington as a tough NYPD hostage negotiator. He finds himself in a high-stakes cat-and-mouse game with a clever bank robber (Clive Owen), who confuses and outwits the police at every turn. Bank robber Dalton Russell is holding 50 people hostage in the vault of the Manhattan Trust Bank building, and Detective Frazier is determined to get them out alive, but the movie's tagline—"It looked like the perfect bank robbery. But you can't judge a crime by its cover"—tells us this there is more going on than it seems. In this scene, Captain John Darius (Willem Dafoe) updates Detective Frazier on what is happening inside the bank.

What to Watch for and Ask Yourself

1. Does this scene show strategic or tactical planning?
2. What pieces of the planning type does it specifically show? Give examples from the scene.
3. Do you expect this plan to succeed? Why or why not?

Flight 001

© CENGAGE

Brad John and John Sencion, co-founders of Flight 001, traveled often between the United States, Europe, and Japan during their careers in the fashion industry. Before each trip, they found themselves shopping all over town for last-minute essentials. Then, on a 1998 flight from New York to Paris, the weary travelers came up with a solution: a one-stop travel shop for globe-trotters like themselves. Now in business for over 10 years, Flight 001 sells guidebooks, cosmetics, laptop bags, luggage, electronics and gadgets, passport covers, and other personal consumer products. Sencion summed up their mission: "We're trying to bring a little fun and glamor back in to travel." In this video, they discuss the challenges of business planning when the economy doesn't always cooperate and their hopes to expand into every major city in the United States, Europe, and Asia.

What to Watch for and Ask Yourself

1. What plans need to be in place before they can meet their expansion goals?
2. In what ways might the introduction of the Flight 001 brand of products be considered a stretch goal?
3. How did the change in the economy affect Flight 001's plans for the year?

What would You Do?[1]

Cisco Headquarters, Palo Alto, California.[1]

Your board of directors wants to know: How should Cisco grow? Your response was, "Well, the way we've grown in the past is…." "No. That's not the question. Looking backward is easy. How should we grow in the future? Should we build or buy?" And with the next board meeting in only 3 months, you don't have much time to come up with the answer. Cisco started in 1984 as the plumbers of the Internet by making the switches and routers that direct data traffic over corporate networks and then later, the Internet. Its products weren't sexy, but every company with an expanding network needed them. So Cisco became the fastest-growing and most valuable company in the world (on the basis of its stock price and total market capitalization). That is, until the technology crash of 2001, which resulted in a $2.5 billion charge for unsold inventory and a stock price that dropped by 83 percent. However, by laying off 10,000 employees, redesigning routers and switches to have fewer and more interchangeable parts, and reducing its fifty product lines to forty, Cisco cut expenses 17 percent and became profitable again.

Nearly a decade later, things are much different. Cisco's revenues are six times larger than the combined revenues of its top eleven competitors. Cisco has nearly 60,000 employees who work in 450 offices in 96 countries. And, the company pulls in $40 billion a year in revenue, three-quarters of which comes from routers and switches (i.e., "plumbing") with 65 percent gross profit margins. But as you and your board know from experience, there's no guarantee that this success will last, especially in high-tech, where competitors catch up with and replace the leading firms in their industries on a regular basis.

How should Cisco grow? Build or buy? Well, 75 percent of our revenues already come from routers and switches, and it's unlikely that we could become more dominant in this area. So if we were to build, in other words, to come up with new products in new areas, what might those be? Should we focus on products that businesses buy? After all, that's who we sell to now. Or, should we take our expertise in routers and switches and focus on consumer products? Finally, while Cisco is growing 15 percent per year, that's down significantly from the 40 percent growth that we've had since inception, save for 2001. So we need to identify high-growth markets and products that we could design and build.

If we grow by pur-chasing technology firms with already established products or services, should we stick to our knitting by buying firms with products and services closely related to our existing business? Or should we diversify by buying firms that are very different from our basic business, routers and switches? For instance, Cisco has the opportunity to acquire a firm that specializes in technology security (spam, viruses, malware, and other Internet threats), an area in which it has no experience. What's more likely to work and be less risky, buying firms with similar products or services (like Cisco's) or buying firms

with different products or services? Basically, should Cisco move beyond its core business?

Finally, if we do decide to buy firms with already established products or services, how can we make sure those acquisitions work? Study after study shows that most mergers and acquisitions have no better than a 50–50 shot of working. In other words, buy another firm, try to merge its products and services and culture and people into your firm, and there's only a 50 percent chance of success. Those are lousy odds. If we buy existing firms, what could we do to increase the odds that our acquisitions would be successful?

If you were the CEO of Cisco, what would you do?

In Chapter 5, you learned that *strategic plans* are overall plans that clarify how a company intends to serve customers and position itself against competitors over the next 2 to 5 years. While Cisco dominates the market for network routers and switches, what made Cisco successful in the past won't necessarily make it successful in the future. That's why Cisco has to decide on a strategy, build or buy, for future growth.

This chapter begins with an in-depth look at how managers create and use strategies to obtain a sustainable competitive advantage like Cisco's. Then you will learn the three steps of the strategy-making process. Next, you will learn about corporate-level strategies that help managers answer the question, "What business or businesses should we be in?" You will then examine the industry-level competitive strategies that help managers determine how to compete successfully within a particular line of business. The chapter finishes with a review of the firm-level strategies of direct competition and entrepreneurship.

BASICS OF ORGANIZATIONAL STRATEGY

Less than a decade ago, **Apple Computer** was not in the music business. And then it released the iPod, which quickly set the standard for all other digital music devices. Designed around a 1.8-inch-diameter hard drive, the iPod boasted low battery consumption and enough memory to hold literally thousands of songs in an easy-to-use product smaller than a deck of cards, designed with unparalleled style. Because Apple used existing and readily available technology to make the iPod, Sony, Samsung, Dell, Creative, and Microsoft moved quickly to produce their own MP3 players.

As the market has matured over the past several years, competitors have increasingly tried to steal—or at least minimize—Apple's competitive advantage by adding unique features to their MP3 players in hopes of catching up to the iPod. **Sony's** new X Series Walkman includes, like the latest touch-screen navigation, the ability to surf the Internet via Wi-Fi, to view pictures and videos, and to store—and listen to at your convenience—to web-based radio shows.

After reading the next two sections, you should be able to

1. specify the components of sustainable competitive advantage, and explain why it is important.
2. describe the steps involved in the strategy-making process.

SanDisk, best known as a maker of basic flash drive memory, has been competing with the iPod for about 5 years and sells the SanDisk Sansa View, which is similar to the iPod in terms of audio and video capabilities. However, the Sansa View lacks touch-screen controls and the 35,000 apps that you can download onto the iPod Touch or iPhone. By the time you read this, Microsoft's Zune player will have touch-screen control, HD radio (similar to the quality of satellite radio), and HD video out, the latter of which will allow you to download and watch HD TV shows and movies on your Zune, which can then be hooked to an HD-TV (something you can already do with iTunes and select iPods). Apple still holds a commanding 71 percent of the market for digital music players. SanDisk, its nearest competitor, has 11 percent; and Microsoft's Zune has 4 percent.[2]

How can a company like Apple, which dominates a particular industry, maintain its competitive advantage as strong, well-financed competitors enter the market? What steps can Apple and other companies take to better manage their strategy-making process?

1 SUSTAINABLE COMPETITIVE ADVANTAGE

Resources are the assets, capabilities, processes, employee time, information, and knowledge that an organization controls. Firms use their resources to improve organizational effectiveness and efficiency. Resources are critical to organizational strategy because they can help companies create and sustain an advantage over competitors.[3]

Organizations can achieve a **competitive advantage** by using their resources to provide greater value for customers than competitors can. For example, the iPod's competitive advantage came from its simple, attractive design relative to its price. But Apple's most important advantage was being the first company to make it easy to use MP3 players to legally buy and download music from iTunes.com. (Prior to the iTunes store, the only means of acquiring digital music was illegal file swapping.) Apple negotiated agreements with nearly all of the major record labels to distribute their songs from a central online library, and iTunes quickly became the premier platform for music downloading. The easy-to-understand site came with free downloadable software customers could use to organize and manage their digital music libraries.[4]

The goal of most organizational strategies is to create and then sustain a competitive advantage. A competitive advantage becomes a **sustainable competitive advantage** when other companies cannot duplicate the value a firm is providing to customers. Sustainable competitive advantage is *not* the same as a long-lasting competitive advantage, though companies obviously want a competitive advantage to last a long time. Instead, a competitive advantage is *sustained* if competitors have tried unsuccessfully to duplicate the advantage and have, for the moment, stopped trying to duplicate it. It's the corporate equivalent of your competitors saying, "We give up. You win. We can't do what you do, and we're not even going to try to do it anymore." As Exhibit 6.1 shows, four conditions must be met if a firm's resources are to be used to achieve a sustainable competitive advantage. The resources must be valuable, rare, imperfectly imitable, *and* nonsubstitutable.

[Resources] the assets, capabilities, processes, employee time, information, and knowledge that an organization uses to improve its effectiveness and efficiency, create and sustain competitive advantage, and fulfill a need or solve a problem

EXHIBIT 6.1

Four Requirements for Sustainable Competitive Advantage

Valuable resources allow companies to improve their efficiency and effectiveness. Unfortunately, changes in customer demand and preferences, competitors' actions, and technology can make once-valuable resources much less valuable. Throughout the 1980s, Sony controlled the portable music market with its ubiquitous Sony Walkman, which has sold over 230 million units worldwide since its introduction in 1979. For many years, Sony had the technology to produce a higher quality of music than other portable devices on the market. Sony leveraged the capabilities of its engineers and inventors (more resources) to make incremental changes to the Walkman that were not matched by the competition, that is, until the MP3 player came along. With the introduction of Apple's iPod to the market, Sony's Walkman lost nearly all its value. Sony finally changed the Walkman to a portable digital device and created its own online music store (Connect), which did not match the simplicity or availability of songs at the iTunes store.[5] When Connect soon proved unprofitable, Sony shut it down.[6]

For sustained competitive advantage, valuable resources must also be rare resources. Think about it: How can a company sustain a competitive advantage if all of its competitors have similar resources and capabilities? Consequently, **rare resources**, resources that are not controlled or possessed by many competing firms, are necessary to sustain a competitive advantage. When Apple introduced the iPod, no other portable music players on the market used existing hard-drive technology in their design. The iPod gained an immediate advantage over competitors because it was able to satisfy the desire of consumers to carry large numbers of songs in a portable device, something the newer MP3 systems and older individual CD players could not do. The technology that powered the iPod, however, was readily available, so competitors were able to quickly imitate and, for short periods, exceed the iPod's basic storage capacity. As competitors began introducing their iPod lookalikes, Apple responded by replacing the original mechanical control wheel with an easier-to-use solid-state touch wheel and then doubled the hard-drive storage so that it was larger than on competitors' devices.

Once again, Apple used its design talents (resources) to gain an advantage over the competition. One of Apple's truly rare resources is its ability to reconfigure existing technology into a package that is easy to use, elegantly designed, and therefore highly desired by customers. Another example of this capability is the iPod Touch, of which Apple has sold 16 million. The iPod Touch can do nearly everything an iPhone can—run apps, browse the web, and use touch-screen controls—save for making cell phone calls and taking pictures. But, with apps like Skype, iPod Touch owners will even be able to make phone calls as long as they have a Wi-Fi connection to the Internet.[7]

As this example shows, valuable and rare resources can create temporary competitive advantage. For sustained competitive advantage, however, other firms must be unable to imitate or find substitutes for those valuable, rare resources. **Imperfectly imitable resources** are those resources that are impossible or extremely costly or difficult to duplicate. For example, despite numerous attempts by competitors to imitate it, iTunes has retained its competitive lock on the music download business. Because it capitalized on Apple's reputation for developing customer-friendly software, the library of music, movies, and podcasts on iTunes is still two to three times larger than those of other music download sites.

Because the company initially developed a closed system for its iTunes and iPod, it was difficult for consumers to download music from sources other than Apple's iTunes store. But for many customers, who wouldn't even consider another brand, this was not a problem. Kelly Moore, a sales representative for a Texas software company, takes her pink iPod mini everywhere she goes and keeps it synchronized

with her iBook laptop. She says, "Once I find something I like, I don't switch brands."[8] She's not alone. As of this writing, sales at the iTunes store total over 6 billion songs, 200 million TV shows, and 1 billion applications.[9] No other competitor comes close to those numbers.

Valuable, rare, imperfectly imitable resources can produce sustainable competitive advantage only if they are also **nonsubstitutable resources**, meaning that no other resources can replace them and produce similar value or competitive advantage. The industry has tried to produce equivalent substitutes for iTunes, but competitors have had to experiment with different business models in order to get customers to accept them. Napster founders Shawn Fanning and Wayne Rosso have created a subscription-based service called Mashboxx that charges $15 a month for unlimited downloads, and Zune Marketplace has established a similar system with over 3 million songs, and downloadable videos (TV shows and movies), podcasts, and audiobooks.[10] In addition to straight subscription models, some companies experimented with price. Where iTunes now charges 69 cents, 99 cents, or $1.29 per song, period, Amazon's online store charges 99 cents per song, but prices album collections from $4.99, and then $5 to $5.99, $6 to $6.99, $7 to $7.99, and $8 to $8.99. At Amie Street, a newly posted track can be downloaded for free, but as the number of downloads increases, so does the song's price, until it reaches the maximum of 98 cents.[11] In response to competitors' experimentation, Apple went to the variable pricing mentioned above, 69 cents, 99 cents, or $1.29 cents per song, and also removed digital rights management, which restricted the extent to which users could copy their music from one device to another.[12] It will take years to find out whether these new means of purchase will constitute an effective substitute to iTunes.[13]

In summary, Apple has reaped the rewards of a first-mover advantage from its interdependent iPod and iTunes. The company's history of developing customer-friendly software, the innovative capabilities of the iPod, the simple pay-as-you-go sales model of iTunes, and the unmatched list of music and movies available for download provide customers with a service that has been valuable, rare, relatively nonsubstitutable, and, in the past, imperfectly imitable. Past success is, however, no guarantee of future success: Apple needs to continually change and develop its offerings or risk being unseated by a more nimble competitor whose products are more relevant and have higher perceived value to the consumer.

[Nonsubstitutable resource] a resource that produces value or competitive advantage and has no equivalent substitutes or replacements

Sustainable Competitive Advantage Firms can use their resources to create and sustain a competitive advantage, that is, to provide greater value for customers than competitors can. A competitive advantage becomes sustainable when other companies cannot duplicate the benefits it provides and have, for now, stopped trying. To provide a sustainable competitive advantage, the firm's resources must be valuable (capable of improving efficiency and effectiveness), rare (not possessed by many competing firms), imperfectly imitable (extremely costly or difficult to duplicate), and nonsubstitutable (competitors cannot substitute other resources to produce similar value).

2 STRATEGY-MAKING PROCESS

In order to create a sustainable competitive advantage, a company must have a strategy.[14] Exhibit 6.2 displays the three steps of the strategy-making process: **2.1 assess the need for strategic change, 2.2 conduct a situational analysis, and then 2.3 choose strategic alternatives. Let's examine each of these steps in more detail.**

2.1 Assessing the Need for Strategic Change

The external business environment is much more turbulent than it used to be. With customers' needs constantly growing and changing, and with competitors working harder, faster, and smarter to meet those needs, the first step in creating a strategy is determining the need for strategic change. In other words, the company should determine whether it needs to change its strategy to sustain a competitive advantage.[15]

[competitive inertia] a reluctance to change strategies or competitive practices that have been successful in the past

"There's a great deal of uncertainty in strategic business environments."

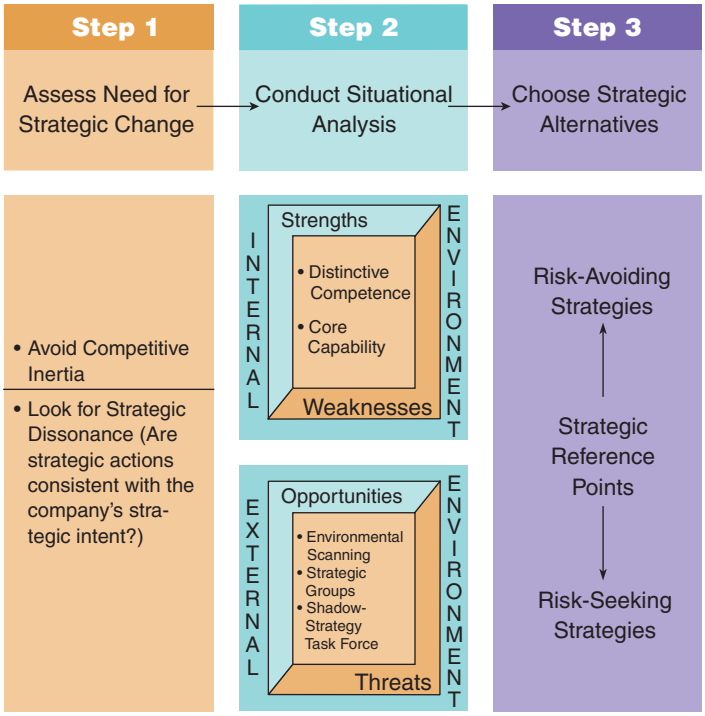
Determining the need for strategic change might seem easy to do, but it's really not. There's a great deal of uncertainty in strategic business environments. Furthermore, top-level managers are often slow to recognize the need for strategic change, especially at successful companies that have created and sustained competitive advantages. Because they are acutely aware of the strategies that made their companies successful, they continue to rely on those strategies, even as the competition changes. In other words, success often leads to **competitive inertia**—a reluctance to change strategies or competitive practices that have been successful in the past.

Sheraton Hotels, which are a unit of **Starwood Hotels and Resorts Worldwide Inc.,** are a prime example of competitive inertia. Sheraton, once one of the largest and best recognized hotel chains in the world, is now viewed by many customers as having convenient locations, but old decor, variable quality, and unexceptional service. Sheraton's Hoyt Harper admitted, "The gap between our good Sheraton hotels and our underperforming hotels. . . was quite alarming." Those problems show up in prices that people are willing to pay. For example, the average Sheraton room goes for $100.72 compared to $112.62 at Marriott. Starwood, which manages Sheraton, neglected Sheraton for years as it put money and effort into its other hotel brands, such as W and Westin, which are trendier and more upscale. Hoyt Harper, who is in charge of the new strategy, said "Sheraton for eight years has been the ugly stepchild…." Realizing that what worked in the past won't work anymore, Harper has developed an aggressive plan to close thirty-three poor-performing Sheraton hotels, and then spend $4 billion to redo the remaining Sheratons' hotel lobbies, workout facilities, and hotel rooms, all the way down to the coffee in the rooms and the sheets on the bed.[16]

Besides being aware of the dangers of competitive inertia, what can managers do to improve the speed and accuracy with which they determine the

EXHIBIT 6.2

Three Steps of the Strategy-Making Process



need for strategic change? One method is to actively look for signs of strategic dissonance. **Strategic dissonance** is a discrepancy between a company's intended strategy and the strategic actions managers take when actually implementing that strategy.[17] For example, when Edgar Bronfman, Jr., bought the struggling Warner Music Group, his intended strategy was to cut costs and stop excessive spending. Ironically, after laying off 1,200 employees to save $250 million and cutting remaining salaries by as much as 50 percent, he approved a $13,000 bill to charter a private jet to fly top company managers to the Grammy awards in Los Angeles and then quietly restored the salary cuts he had made after top executives complained.[18]

Note, however, that strategic dissonance is not the same thing as when a strategy does not produce the results that it's supposed to. For example, while **eBay** is the leading auction site on the Internet, its strategy the last few years has been to compete in online retailing (there were thousands of eBay stores selling new goods of all kinds), which put it in direct competition with Amazon.com. Because eBay's sales have been dropping while Amazon's sales have been increasing, eBay CEO John Donahoe indicated that eBay is abandoning online retailing and returning to selling used and overstock goods via online auctions.[19] So, in this instance, eBay was executing a strategy that didn't work. This would have been strategic dissonance only if eBay had not actually been implementing its strategy of being a full online retailer. Either way, however, the strategy is not working and strategic change is needed.

2.2 Situational Analysis

A situational analysis can also help managers determine the need for strategic change. A **situational analysis**, also called a **SWOT analysis** for *strengths*, *weaknesses*, *opportunities*, and *threats*, is an assessment of the strengths and weaknesses in an organization's internal environment and the opportunities and threats in its external environment.[20] Ideally, as shown in Step 2 of Exhibit 6.1, a SWOT analysis helps a company determine how to increase internal strengths and minimize internal weaknesses while maximizing external opportunities and minimizing external threats.

When Memorial Hospital of Fremont, Ohio, decided that the process it used to order all the necessary medical and administrative supplies was out of control, managers asked all the departments to work together to conduct a SWOT analysis. The process helped the hospital identify its strengths, such as the experience of the materials management group, and its weaknesses, which included allowing anyone in the organization to order anything he or she wanted from any vendor. Departments outlined opportunities to dramatically improve the quality and flow of supplies while controlling costs and determined that one of the biggest threats was expired medical supplies (that could no longer be used). Using the SWOT analysis as a map, the hospital began requiring all vendors to register when they entered the building, wear a visitor's badge while on hospital premises, and process all orders through the central purchasing department. Soon, the hospital staff developed the right mix of products and product inventories required for each area of the hospital and, at the same time, dramatically reduced the number of staff involved in purchasing and stocking supplies. Over the next 2 years, the hospital saved more than $1 million, and administrators won praise from hospital departments for their ability to improve services.[23]

As this example illustrates, a SWOT analysis can be used to evaluate entire companies or individual operations within an organization. All companies' competitive advantages can erode over time if internal strengths eventually become

doing the right thing

Is Ethics an Overlooked Source of Competitive Advantage?

Volvo's reputation for selling safe cars has been a source of competitive advantage for years. You didn't buy a boxy Volvo for its looks; you bought it because your family would be well protected in an accident. If safety can be a source of competitive advantage, could ethics be one, too?

Though competitive advantage usually comes from physical capital (plant, equipment, finances), organizational capital (structure, planning, systems), and human capital (skills, judgment, adaptability of your work force), Johnson & Johnson is still widely admired, two decades afterward, for its response when several people died after someone put cyanide in Tylenol capsules. The company quickly pulled Tylenol from store shelves and introduced tamper-proof packaging. The move cost Johnson & Johnson half a billion dollars, but protected consumers from further harm. The company's market share was back to #1 within a year of the reintroduction.

Should ethics be your first source of competitive advantage? Probably not. It makes more sense to start with low costs, good service, or unique product capabilities. But when you're looking for another way to create or sustain a competitive advantage, consider that a reputation as an ethical corporation may be an additional way to differentiate your company from the competition.[21]

weaknesses. Consequently, an analysis of an organization's internal environment, that is, a company's strengths and weaknesses, often begins with an assessment of its distinctive competencies and core capabilities. A **distinctive competence** is something that a company can make, do, or perform better than its competitors. For example, *Consumer Reports* magazine consistently ranks Honda and Toyota cars either number one or two in quality and reliability.[24] Similarly, *PC Magazine* readers ranked Apple's desktop and laptop computers best in terms of service and reliability.[25]

[Distinctive competence] what a company can make, do, or perform better than its competitors

[Core capabilities] the internal decision-making routines, problem-solving processes, and organizational cultures that determine how efficiently inputs can be turned into outputs

"Distinctive competencies cannot be sustained for long without superior core capabilities."

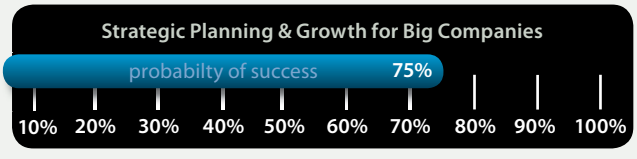
Whereas distinctive competencies are tangible—for example, a product or service is faster, cheaper, or better—the core capabilities that produce distinctive competencies are not. **Core capabilities** are the less visible, internal decision-making routines, problem-solving processes, and organizational cultures that determine how efficiently inputs can be turned into outputs. Distinctive competencies cannot be sustained for long without superior core capabilities. Offering gourmet, environmentally conscious food products at a low cost is the distinctive competence at **Trader Joe's**. One can find ten kinds of hummus and every kind of dried fruit imaginable. Most of the products sold at Trader Joe's have no artificial colors, artificial flavors, or preservatives. The core capability the company uses to execute this strategy is its ability to buy in large quantities and bargain directly with producers. Trader Joe's also offers 80 percent of its products as house brands, compared to 16 percent industry-wide, and does not carry any mass-market brands like Crest or Pepsi. These capabilities allow Trader Joe's to offer similar products at lower prices than competitors like Whole Foods Market. One customer said, "I love Trader Joe's because they let me eat

Strategy Making for Firms, Big and Small

Companies create strategies that produce sustainable competitive advantage by using the strategy-making process (assessing the need for strategic change, conducting a situational analysis, and choosing strategic alternatives). For years, it had been thought that strategy making was something that only large firms could do well. It was believed that small firms did not have the time, knowledge, or staff to do a good job of strategy making. However, two meta-analyses indicate that strategy making can improve the profits, sales growth, and return on investment of both big *and* small firms.

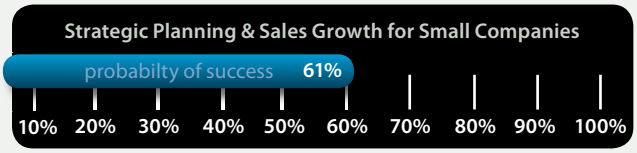
Strategy Making for Big Firms

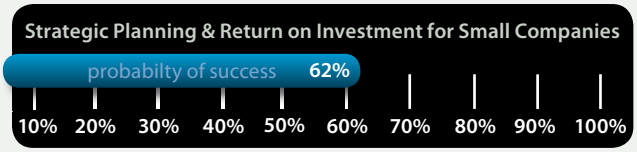
There is a 72 percent chance that big companies that engage in the strategy-making process will be more profitable than big companies that don't. Not only does strategy making improve profits but it also helps companies grow. Specifically, there is a 75 percent chance that big companies that engage in the strategy-making process will have greater sales and earnings growth than big companies that don't. Thus, in practical terms, the strategy-making process can make a significant difference in a big company's profits and growth.



Strategy Making for Small Firms

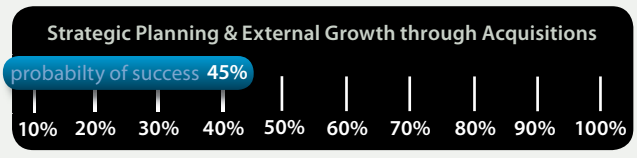
Strategy making can also improve the performance of small firms. There is a 61 percent chance that small firms that engage in the strategy-making process will have more sales growth than small firms that don't. Likewise, there is a 62 percent chance that small firms that engage in the strategy-making process will have a larger return on investment than small companies that don't. Thus, in practical terms, the strategy-making process can make a significant difference in a small company's profits and growth, too.





External Growth Through Acquisitions

One way to grow a company is through external growth, or buying other companies (see Section 3.1 on portfolio strategy). However, researchers have long debated whether buying other companies actually adds value to the acquiring company. A meta-analysis based on 103 studies and a sample of 25,205 companies indicates that, on average, acquiring other companies actually *hurts* the value of the acquiring firm. In other words, there is only a 45 percent chance that growing a company through external acquisitions will work![22]



like a yuppie without taking all my money." Stores also feature fifteen or more new products each week, bringing the curious customer back to find out what's new.[26]

After examining internal strengths and weaknesses, the second part of a situational analysis is to look outside the company and assess the opportunities and threats in the external environment. In Chapter 3, you learned that *environmental scanning* involves searching the environment for important events or issues that might affect the organization, such as pricing trends or new products and technology. In a situational analysis, however, managers use environmental scanning to identify specific opportunities and threats that can either improve or harm the company's ability to sustain its competitive advantage. Identification of strategic groups and formation of shadow-strategy task forces are two ways to do this.

Strategic groups are not groups that actually work together. They are companies—usually competitors—that managers closely follow. More specifically, a **strategic group** is a group of other companies within an industry against which top managers compare, evaluate, and benchmark their company's strategic threats and opportunities.[27] (*Benchmarking* involves identifying outstanding practices, processes, and standards at other companies and adapting them to your own company.) Typically, managers include companies as part of their strategic group if they compete directly with those companies for customers or if those companies use strategies similar to theirs. The U.S. home improvement industry has annual sales in excess of $290 billion.[28] It's likely that the managers at Home Depot, the largest U.S. home improvement and hardware retailer, assess strategic threats and opportunities by comparing their company to a strategic group consisting of the other major home improvement supply companies. Exhibit 6.3 shows the number of stores, the size of the typical new store, and the overall geographic distribution (states, countries) of Home Depot stores compared with Lowe's, 84 Lumber, and Ace Hardware.

core, secondary, and transient firms.[29] **Core firms** are the central companies in a strategic group. Home Depot operates 2,200 stores covering all 50 states, Puerto Rico, the U.S. Virgin Islands, Mexico, and all 10 provinces of Canada. The company has 322,000 employees and annual revenue of over $71.2 billion. By comparison, Lowe's has more than 1,645 stores and 229,000 employees in 50 states and 12 provinces in Canada, stocks more than 40,000 products in each store, and has annual revenues of more than $48.2 billion.[30] Clearly, Lowe's is the closest competitor to Home Depot and is the core firm in Home Depot's strategic group. Even though Ace Hardware has more stores (4,600) than Home Depot and appears to be a bigger multinational player (60 different countries), Ace's franchise structure and small, individualized stores (10,000 to 14,000 square feet, with each store laid out differently with a different mix of products) keeps it from being a core firm in Home Depot's strategic group. Likewise, Home Depot's management probably doesn't include Aubuchon Hardware in its core strategic group, because it has only 130 stores in New England and upstate New York.

	# of Stores	# of States	Countries	Size of Modern Store (Sq. Feet)
Home Depot	2,079	50	3	130,000
Lowe's	1,325	49	2	117,000
Ace Hardware	4,700	50	70	17,000
84 Lumber	500	40	1	33,000

EXHIBIT 6.3

Strategic Groups for Home Depot

When most managers scan their environments for strategic threats and opportunities, they concentrate on the strategic actions of core firms, not unrelated firms like Aubuchon.[31] Where does a firm like Ace Hardware fit in? The company has made significant efforts to position itself as a more helpful version of Home Depot. Ace's Vision 21 strategic plan aims to make franchisees the leaders in Ace's unique convenient-store approach to selling hardware. Ace operates stores in over 60 countries and has moved aggressively over the past decade to improve its supply chain operation. But Ace's franchise structure and small, individualized stores keep it from being a core firm in Home Depot's strategic group.[32]

Secondary firms are firms that use strategies related to but somewhat different from those of core firms. 84 Lumber has 320 stores in 35 states, but even though its stores are open to the public, the company focuses on supplying professional contractors, to which it sells 95 percent of its products. Without the wide variety of products on the shelves or assistance available to the average consumer, people without expertise in building or remodeling probably don't find 84 Lumber stores very accessible. Home Depot would most likely classify 84 Lumber as a secondary firm in its strategic group analysis.[33] Managers need to be aware of the potential threats and opportunities posed by secondary firms, but they usually spend more time assessing the threats and opportunities associated with core firms.

Transient firms are companies whose strategies are changing from one strategic position to another. Ace Hardware is moving directly toward Home Depot's primary market. To compete more effectively with Home Depot and Lowe's, Ace recently increased the capacity of its warehouse operation, which now carries more than 65,000 products and makes them available to all Ace stores. In other words, Ace Hardware is trying to become one of Home Depot's core competitors. Likewise, True Value Hardware has expanded to 4,600 stores in 60 countries. But rather than compete on the basis of assortment, True Value is attempting to compete with Home Depot and Lowe's on price and fast delivery. Because the strategies of transient firms are changing, managers may not know what to think about these firms and may overlook or misjudge the potential threats and opportunities posed by transient firms.

[Core firms] the central companies in a strategic group

[Secondary firms] the firms in a strategic group that follow strategies related to but somewhat different from those of the core firms

[Transient firms] the firms in a strategic group whose strategies are changing from one strategic position to another

Because top managers tend to limit their attention to the core firms in their strategic group, some companies have started using shadow-strategy task forces to more aggressively scan their environments for strategic threats and opportunities. A **shadow-strategy task force** actively seeks out its own company's weaknesses and then, thinking like a competitor, determines how other companies could exploit them for competitive advantage.[34] To make sure that the task force challenges conventional thinking, its members should be independent-minded, come from a variety of company functions and levels, and have the access and authority to question the company's current strategic actions and intent. For example, Ciba-Geigy's Industrial Dye division makes color dyes used in carpet manufacturing. One of the difficulties in this business is ensuring color consistency, that is, making sure that the dark gray carpet manufactured next week will be the same dark gray color as the carpet manufactured today. Ciba-Geigy's shadow-strategy task force determined that if its competitors could find ways to consistently, precisely, and cheaply match color carpet dyes (so that carpet colors looked the same regardless of when and where they were manufactured), Ciba-Geigy would be at a considerable competitive disadvantage. After the shadow-strategy task force challenged top management with its conclusions, the company went about developing distinctive competencies in dye research and manufacturing, which allowed it to make dyes with scientific precision.[35]

In short, a situational analysis has two basic parts. The first is to examine internal strengths and weaknesses by focusing on distinctive competencies and core capabilities. The second is to examine external opportunities and threats by focusing on environmental scanning, strategic groups, and shadow-strategy task forces.

2.3 Choosing Strategic Alternatives

After determining the need for strategic change and conducting a situational analysis, the last step in the strategy-making process is to choose strategic alternatives that will help the company create or maintain a sustainable competitive advantage. According to strategic reference point theory, managers choose between two basic alternative strategies. They can choose a conservative, *risk-avoiding strategy* that aims to protect an existing competitive advantage. Or they can choose an aggressive, *risk-seeking strategy* that aims to extend or create a sustainable competitive advantage. Menards is a hardware store chain with 40,000 employees and 210 locations throughout the Midwest.[36] When hardware giant Home Depot entered the Midwest, Menards faced a basic choice: Avoid risk by continuing with the strategy it had in place before Home Depot's arrival or seek risk by trying to further its competitive advantage against Home Depot, which is six times its size. Some of its competitors decided to fold. Kmart closed all of its Builders Square hardware stores when Home Depot came to Minneapolis. Handy Andy liquidated its 74 stores when Home Depot came to the Midwest. But Menards decided to fight, spending millions to open 35 new stores at the same time that Home Depot was opening 44 of its own.[37]

[Shadow-strategy task force] a committee within a company that analyzes the company's own weaknesses to determine how competitors could exploit them for competitive advantage

[Strategic reference points] the strategic targets managers use to measure whether a firm has developed the core competencies it needs to achieve a sustainable competitive advantage

The choice to seek risk or avoid risk typically depends on whether top management views the company as falling above or below strategic reference points. **Strategic reference points** are the targets that managers use to measure whether their firm has developed the core competencies that it needs to achieve a sustainable competitive advantage. If a hotel chain decides to compete by providing superior

quality and service, then top management will track the success of this strategy through customer surveys or published hotel ratings such as those provided by the prestigious Mobil Travel Guide. If a hotel chain decides to compete on price, it will regularly conduct market surveys to check the prices of other hotels. The competitors' prices are the hotel managers' strategic reference points against which to compare their own pricing strategy. If competitors can consistently underprice them, then the managers need to determine whether their staff and resources have the core competencies to compete on price.

As shown in Exhibit 6.4, when a company is performing above or better than its strategic reference points, top management will typically be satisfied with the company's strategy. Ironically, this satisfaction tends to make top management conservative and risk-averse. Since the company already has a sustainable competitive advantage, the worst thing that could happen would be to lose it, so new issues or changes in the company's external environments are viewed as threats. By contrast, when a company is performing below or worse than its strategic reference points, top management will typically be dissatisfied with the company's strategy. In this instance, managers are much more likely to choose a daring, risk-taking strategy. If the current strategy is producing substandard results, the company has nothing to lose by switching to risky new strategies in the hopes that it can create a sustainable competitive advantage. Managers of companies in this situation view new issues or changes in external environments as opportunities for potential gain.

Strategic reference point theory is not deterministic, however. Managers are not predestined to choose risk-averse or risk-seeking strategies for their companies. Indeed, one of the most important elements of the theory is that managers *can* influence the strategies chosen by their company by *actively changing and adjusting*

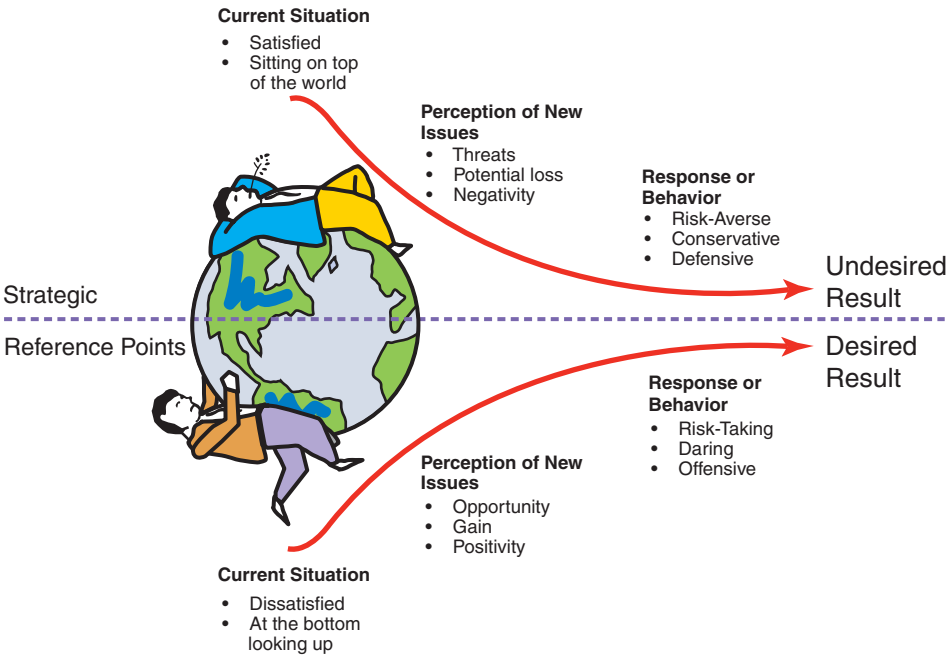

EXHIBIT 6.4

Strategic Reference Points

the strategic reference points they use to judge strategic performance. If a company has become complacent after consistently surpassing its strategic reference points, then top management can change from a risk-averse to a risk-taking orientation by raising the standards of performance (i.e., the strategic reference points). This is just what happened at Menards.

Instead of being satisfied with merely protecting its existing stores (a risk-averse strategy), founder John Menard changed the strategic reference points the company had been using to assess strategic performance. To encourage a daring, offensive-minded strategy that would allow the company to open nearly as many new stores as Home Depot, he determined that Menards would have to beat Home Depot on not one or two, but four strategic reference points: price, products, sales per square foot, and "friendly accessibility." The strategy appears to be succeeding. In terms of price, market research indicates that a 100-item shopping cart of goods is consistently cheaper at Menards. In terms of products, Menards sells 50,000 products per store, the same as Home Depot. In terms of sales per square foot, Menards ($407 per square foot) outsells Home Depot ($300 per square foot).[38] Finally, unlike Home Depot's warehouse-like stores, Menards' stores are built to resemble grocery stores. Shiny tiled floors, wide aisles, and easy-to-reach products all make Menards a "friendlier" place for shoppers. And now with Lowe's, the second-largest hardware store chain in the nation, also entering its markets, Menards has added a fifth strategic reference point: store size. At 225,000 square feet, most new Menards stores are more than double the size of Home Depot's stores and 100,000 square feet larger than Lowe's biggest stores.[39] John Caulfield, who wrote a book about Home Depot and the hardware business, says, "Menards is clearly throwing the gauntlet down at Lowe's. They're saying, 'If you come into Chicago, here is what you're going to face.'"[40]

So even when (perhaps *especially* when) companies have achieved a sustainable competitive advantage, top managers must adjust or change strategic reference points to challenge themselves and their employees to develop new core competencies for the future. In the long run, effective organizations will frequently revise their strategic reference points to better focus managers' attention on the new challenges and opportunities that occur in their ever-changing business environments.

REVIEW 2

Strategy-Making Process The first step in the strategy-making process is determining whether a strategy needs to be changed to sustain a competitive advantage. Because uncertainty and competitive inertia make this difficult to determine, managers can improve the speed and accuracy of this step by looking for differences between top management's intended strategy and the strategy actually implemented by lower-level managers (i.e., looking for strategic dissonance). The second step is to conduct a situational analysis that examines internal strengths and weaknesses (distinctive competencies and core capabilities), as well as external threats and opportunities (environmental scanning, strategic groups, and shadow-strategy task forces). In the third step of the strategy-making process, strategic reference point theory suggests that when companies are performing better than their strategic reference points, top management will typically choose a risk-averse strategy. When performance is below strategic reference points, it is more likely to choose risk-seeking strategies. Importantly, however, managers can influence the choice of strategic alternatives by actively changing and adjusting the strategic reference points they use to judge strategic performance.

CORPORATE-, INDUSTRY-, AND FIRM-LEVEL STRATEGIES

To formulate effective strategies, companies must be able to answer these three basic questions:

- What business are we in?
- How should we compete in this industry?
- Who are our competitors, and how should we respond to them?

These simple but powerful questions are at the heart of corporate-, industry-, and firm-level strategies.

After reading the next three sections, you should be able to

3. explain the different kinds of corporate-level strategies.
4. describe the different kinds of industry-level strategies.
5. explain the components and kinds of firm-level strategies.

3 CORPORATE-LEVEL STRATEGIES

Corporate-level strategy is the overall organizational strategy that addresses the question "What business or businesses are we in or should we be in?" Garry Ridge, CEO of WD-40 Corporation, explains how he changed its corporate-level strategy from a "Johnny one-note" business selling only WD-40 lubricant to an "innovation marketing and distribution company … [focused on] the squeak, smell, and dirt business":

> *In the U.S., WD-40 had reached what I named "fortress status" as a brand. Back then, more people used WD-40 every day than used dental floss. We decided to turn up the volume on that opportunity to grow. And also, to position ourselves not just to be a marketing company (which we were back then) but what we are now, which is an innovation marketing and distribution company. We decided we were going to be in the squeak, smell, and dirt business. I listened to what Warren Buffet had said. He said you have to be in businesses that are going to be [around] in the future. I felt that there would always be squeaks. There will always be smells. And there would always be dirt. That was the strategy as we started looking for brands that we could acquire. We then formed a team called Team Tomorrow, which focused only on revenues of the future. Team Tomorrow has a goal of being able to generate $100 million worth of annual revenue from products developed and launched in the previous three-year period. We are doing $35 million now from zero dollars in 2002.*[41]

Exhibit 6.5 shows the two major approaches to corporate-level strategy that companies use to decide which businesses they should be in: **3.1 portfolio strategy and 3.2 grand strategies.**

Corporate-Level Strategies

3.1 Portfolio Strategy

One of the standard strategies for stock market investors is **diversification**, or owning stocks in a variety of companies in different industries. The purpose of this strategy is to reduce risk in the overall stock portfolio (the entire collection of stocks). The basic idea is simple: If you invest in ten companies in ten different industries, you won't lose your entire investment if one company performs poorly. Furthermore, because they're in different industries, one company's losses are likely to be offset by another company's gains. Portfolio strategy is based on these same ideas. We'll start by taking a look at the theory and ideas behind portfolio strategy and then proceed with a critical review that suggests that some of the key ideas behind portfolio strategy are *not* supported.

Portfolio strategy is a corporate-level strategy that minimizes risk by diversifying investment among various businesses or product lines.[42] Just as a diversification strategy guides an investor who invests in a variety of stocks, portfolio strategy guides the strategic decisions of corporations that compete in a variety of businesses. For example, portfolio strategy could be used to guide the strategy of a company like 3M, which makes 55,000 products for six different business sectors: consumers and offices (Post-its, Scotch tape); display and graphics (for computers, cell phones, PDAs, TVs); electronics and communications (flexible circuits used in printers and electronic displays); health care (medical, surgical, dental, and personal care products); industrial and transportation (tapes, adhesives, supply chain software, products and components for the manufacture, repair, and maintenance of autos, aircraft, boats, and other vehicles); safety, security, and protection services (glass safety, fire protection, respiratory products); and transportation.[43] Similarly, portfolio strategy could be used by Johnson & Johnson, which has 250 divisions making health-care products for the pharmaceutical, medical device and diagnostic, consumer, and health-care-professionals markets.[44]

Just as investors consider the mix of stocks in their stock portfolio when deciding which stocks to buy or sell, managers following portfolio strategy try to acquire companies that fit well with the rest of their corporate portfolio and to sell those that don't. After **Verizon** revised its strategy to focus on its cell phone and FiOS (superfast optical Internet, TV, and phone services for homes and businesses) divisions, it sold local phone businesses that provide phone service in rural areas and small towns across fourteen states to Frontier Communications for $8.6 billion and then reinvested the proceeds in its core businesses. John Killian, Verizon's chief financial officer, said, "These are good properties, but they're much more rural in nature, and they really don't fit with the strategy we have for FiOS and broadband."[45] Portfolio strategy provides the following guidelines to help companies make these difficult decisions.

First, according to portfolio strategy, the more businesses in which a corporation competes, the smaller its overall chances of failing. Think of a corporation as a stool and its businesses as the legs of the stool. The more legs or businesses added to the stool, the less likely it is to tip over. Using this analogy, portfolio strategy reduces 3M's risk of failing because the corporation's survival depends on essentially six different business sectors. Managers employing portfolio strategy can either develop new businesses internally or look for **acquisitions**, that is, other companies to buy. Either way, the goal is to add legs to the stool.

[Diversification] a strategy for reducing risk by buying a variety of items (stocks or, in the case of a corporation, types of businesses) so that the failure of one stock or one business does not doom the entire portfolio

[Portfolio strategy] a corporate-level strategy that minimizes risk by diversifying investment among various businesses or product lines

[Acquisition] the purchase of a company by another company

Second, beyond adding new businesses to the corporate portfolio, portfolio strategy predicts that companies can reduce risk even more through **unrelated diversification**—creating or acquiring companies in completely unrelated businesses (more on the accuracy of this prediction later). According to portfolio strategy, when businesses are unrelated, losses in one business or industry should have minimal effect on the performance of other companies in the corporate portfolio. One of the best examples of unrelated diversification is Samsung of Korea. Samsung has businesses in electronics (computer memory chips, computer and telecommunication equipment, color TV displays, glass bulbs; corporate IT service providers, high-speed optical network service providers); machinery and heavy industries (shipbuilding, construction, airplane engine manufacturing, fiber optics, semiconductors); chemicals (engineering plastics and specialty chemicals); financial services (life and accident insurance, credit cards, installment financing, and financial securities and trusts); and other areas ranging from engineering consulting to hotels and home security products and services.[46] Because most internally grown businesses tend to be related to existing products or services, portfolio strategy suggests that acquiring new businesses is the preferred method of unrelated diversification.

Third, investing the profits and cash flows from mature, slow-growth businesses into newer, faster-growing businesses can reduce long-term risk. The best-known portfolio strategy for guiding investment in a corporation's businesses is the **Boston Consulting Group (BCG)** matrix.[47] The **BCG matrix** is a portfolio strategy that managers use to categorize their corporation's businesses by growth rate and relative market share, helping them decide how to invest corporate funds. The matrix, shown in Exhibit 6.6, separates businesses into four categories based on how fast the market is growing (high-growth or low-growth) and the size of the business's share of that market (small or large). **Stars** are companies that have a large share of a fast-growing market. To take advantage of a star's fast-growing market and its strength in that market (large share), the corporation must invest substantially in it. The investment is usually worthwhile, however, because many stars produce sizable future profits. **Question marks** are companies that have a small share of a fast-growing market. If the corporation invests in these companies, they may eventually become stars, but their relative weakness in the market (small share) makes investing in question marks more risky than investing in stars. **Cash cows** are companies that have a large share of a slow-growing market. Companies in this situation are often highly profitable, hence the name "cash cow." Finally, **dogs** are companies that have a small share of a slow-growing market. As the name suggests, having a small share of a slow-growth market is often not profitable.

Since the idea is to redirect investment from slow-growing to fast-growing companies, the BCG matrix starts by recommending that while the substantial cash flows from cash cows last, they should be reinvested in stars (see 1 in Exhibit 6.6) to help them grow even faster and obtain even more market share. Using this strategy, current profits help produce future profits. Over time, as their market growth slows, some stars may turn into cash cows (see 2). Cash flows should also be directed to some question marks

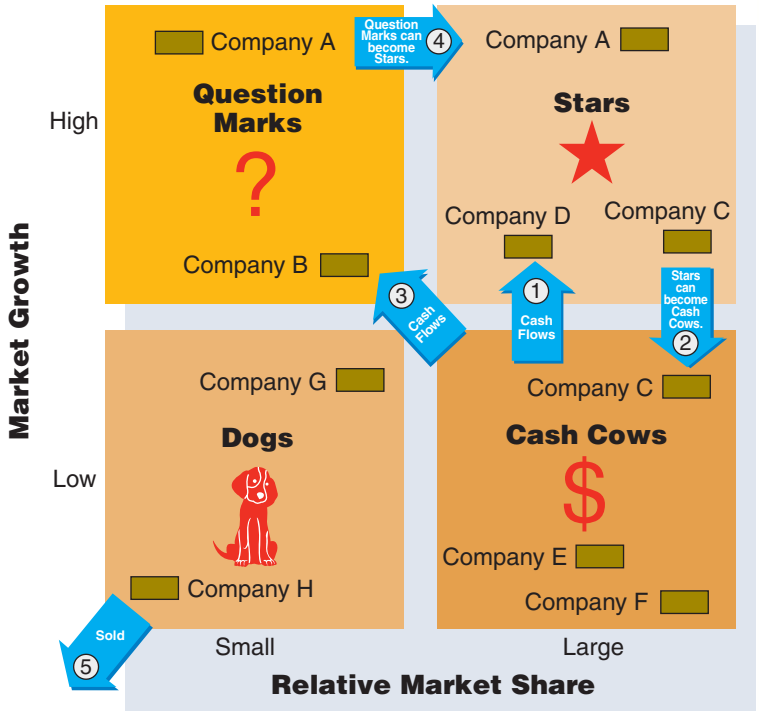
EXHIBIT 6.6

Boston Consulting Group Matrix



mgmt: fact

In 1963, the Boston SafeDeposit and Trust Company assigned employee Bruce Henderson to create a consulting business for the company, which ultimately became the Boston Consulting Group (BCG). In 1966, Henderson's group outlined the now-ubiquitous concept of the experience curve (costs go down as experience increases). In 1968, BCG introduced the growth-share matrix, which is now known simply as the BCG matrix and is depicted in Exhibit 6.6. By 2005, Boston Consulting Group had nearly 3,000 consultants in 61 offices in 37 countries and generated annual revenue of $1.5 billion (the company's first month of billings totaled $500).[48]

(see 3). Though riskier than stars, question marks have great potential because of their fast-growing market. Managers must decide which question marks are most likely to turn into stars (and therefore warrant further investment) and which ones are too risky and should be sold. Over time, managers hope some question marks will become stars as their small markets become large ones (see 4). Finally, because dogs lose money, the corporation should "find them new owners" or "take them to the pound." In other words, dogs should either be sold to other companies or closed down and liquidated for their assets (see 5).

U-Shaped Relationship between Diversification and Risk

Although the BCG matrix and other forms of portfolio strategy are relatively popular among managers, portfolio strategy has some drawbacks. The most significant? Contrary to the predictions of portfolio strategy, the evidence suggests that acquiring unrelated businesses is *not* useful. As shown in Exhibit 6.7, there is a U-shaped relationship between diversification and risk. The left side of the curve shows that single businesses with no diversification are extremely risky (if the single business fails, the entire business fails). So, in part, the portfolio strategy of diversifying is correct—competing in a variety of different businesses can lower risk. However, portfolio strategy is partly wrong, too—the right side of the curve shows that conglomerates composed of completely unrelated businesses are even riskier than single, undiversified businesses.[49]

A second set of problems with portfolio strategy has to do with the dysfunctional consequences that can occur when companies are categorized as stars, cash cows, question marks, or dogs. Contrary to expectations, the BCG matrix often yields incorrect judgments about a company's potential. In other words, managers using the BCG matrix aren't very good at accurately determining which companies should be categorized as stars, cash cows, questions

marks, or dogs. The most common mistake is simply miscategorizing highly profitable companies as dogs.[50] In part, this is because the BCG relies on past performance (previous market share and previous market growth), which is a notoriously poor predictor of future company performance. More worrisome, however, is research which indicates that the BCG matrix actually makes managers worse at judging the future profitability of a business. A study, conducted in six countries over 5 years, gave managers and business students clear information about the current and future profits (i.e., slow or fast growth) of three companies and asked them to select the one that would be most successful in the future. Although not labeled this way, one company was clearly a star, another was a dog, and the last was a cash cow. Just exposing people to the ideas in the BCG matrix led them to incorrectly categorize less profitable businesses as the most successful businesses 64 percent of the time, while actually *using* the BCG matrix led to making the same mistake 87 percent of the time.[51]

Furthermore, using the BCG matrix can also weaken the strongest performer in the corporate portfolio, the cash cow. As funds are redirected from cash cows to stars, corporate managers essentially take away the resources needed to take advantage of the cash cow's new business opportunities. As a result, the cash cow becomes less aggressive in seeking new business or in defending its present business. For example, **Procter & Gamble's** Tide, the laundry detergent that P&G brought to market in 1946, is clearly a cash cow, accounting for billions in worldwide revenues. A few years ago, however, in a bid to bring new products to market the company was diverting up to half a billion dollars from cash cows like Tide to promote potential product blockbusters (i.e., stars) such as Febreze, a spray that eliminates odors; Dryel, which dry-cleans clothes at home; Fit, a spray that kills bacteria on fruits and vegetables; and Impress, a high-tech plastic wrap.[52] P&G ultimately reversed the diversion of funds as then CEO A. G. Lafley refocused the company on its biggest brands (its cash cows) with spectacular results. Tide now has annual revenues of $3.5 billion, making it P&G's largest brand.[53] By contrast, Febreze is estimated to achieve annual sales of approximately $760 million, or roughly 22 percent of Tide's sales.[54] Finally, labeling a top performer as a cash cow can harm employee morale. Cash-cow employees realize that they have inferior status and that instead of working for themselves, they are now working to fund the growth of stars and question marks.

So, what kind of portfolio strategy does the best job of helping managers decide which companies to buy or sell? The U-shaped curve in Exhibit 6.7 indicates that, contrary to the predictions of portfolio strategy, the best approach is probably **related diversification**, in which the different business units share similar products, manufacturing, marketing, technology, or cultures. The key to related diversification is to acquire or create new companies with core capabilities that complement the core capabilities of businesses already in the corporate portfolio. Hormel Foods is an example of related diversification in the food business. The company both manufactures and markets a variety of foods, from deli meats to salsa to the infamous SPAM.

We began this section with the example of 3M and its 55,000 products sold in over seven different business sectors. While seemingly different, most of 3M's product divisions are based in some fashion on its distinctive competencies in adhesives and tape (e.g., wet or dry sandpaper, Post-it notes, Scotchgard fabric protector, transdermal skin patches, and reflective material used in traffic signs). Furthermore, all of 3M's divisions share its strong corporate culture that promotes and encourages risk taking and innovation. In sum, in contrast to a single, undiversified business or unrelated diversification, related diversification reduces risk because the different businesses can work as a team, relying on each other for needed experience, expertise, and support. Exhibit 6.8 details the problems associated with portfolio

[Related diversification] creating or acquiring companies that share similar products, manufacturing, marketing, technology, or cultures

EXHIBIT 6.8 Portfolio Strategy: Problems and Recommendations

Problems with Portfolio Strategy	Recommendations for Making Portfolio Strategy Work
Unrelated diversification does not reduce risk.	Don't be so quick to sell dogs or question marks. Instead, management should commit to the markets in which it competes by strengthening core capabilities.
Present performance is used to predict future performance.	Put your "eggs in similar (not different) baskets" by acquiring companies in related businesses.
Assessments of a business's growth potential are often inaccurate.	Acquire companies with complementary core capabilities.
Cash cows fail to aggressively pursue opportunities and defend themselves from threats.	Encourage collaboration and cooperation between related firms and businesses within the company.
Being labeled a "cash cow" can hurt employee morale.	"Date before you marry." Work with a business before deciding to acquire it.
Companies often overpay to acquire stars.	When in doubt, don't acquire new businesses. Mergers and acquisitions are inherently risky and difficult to make work. Only acquire firms that can help create or extend a sustainable competitive advantage.
Acquiring firms often treat acquired stars as "conquered foes." Key stars' managers, who once controlled their own destiny, often leave because they are now treated as relatively unimportant middle managers.

strategy and recommends ways that managers can increase their chances of success through related diversification.

3.2 Grand Strategies

A **grand strategy** is a broad strategic plan used to help an organization achieve its strategic goals.[55] Grand strategies guide the strategic alternatives that managers of individual businesses or subunits may use in deciding what businesses they should be in. There are three kinds of grand strategies: growth, stability, and retrenchment/recovery.

The purpose of a **growth strategy** is to increase profits, revenues, market share, or the number of places (stores, offices, locations) in which the company does business. Companies can grow in several ways. They can grow externally by merging with or acquiring other companies in the same or different businesses. Some of the largest mergers and acquisitions of recent years include Roche acquiring Genentech (pharmaceuticals), Pfizer acquiring Wyeth (pharmaceuticals), Mars acquiring Wrigley (gum and candy), and InBev acquiring Anheuser-Busch (beer and alcoholic beverages).

Another way to grow is internally, directly expanding the company's existing business or creating and growing new businesses. Nestlé, the global food company with well-known brands like Nesquik chocolate milk, KitKat chocolate bars, and Gerber baby food, typically aims for and achieves internal growth rates of 7 percent to 8 percent by growing sales of existing products or developing new products. For instance, because of rising sales of its products, Nestlé didn't have

[Grand strategy] a broad corporate-level strategic plan used to achieve strategic goals and guide the strategic alternatives that managers of individual businesses or subunits may use

[Growth strategy] a strategy that focuses on increasing profi ts, revenues, market share, or the number of places in which the company does business

to cut prices during an economic recession. CEO Paul Bulcke said, "People go for value. It is not always a question of price. Nestlé has also grown internally by adding new products such as NaturNes, a new line of baby food that uses steaming to preserve food's nutritional value, and Nespresso, a new line of expensive chocolates.[56]

The purpose of a **stability strategy** is to continue doing what the company has been doing, just doing it better. Companies following a stability strategy try to improve the way in which they sell the same products or services to the same customers. Since its inception in 1938, **REI** has never strayed from its focus on the outdoors. Its Mountain Safety Research division designs and makes mountaineering equipment, clothing, and camping products. REI Adventures offers adventure travel packages (e.g., kayaking, climbing, and backpacking) with hand-picked local guides on all seven continents. Finally, in addition to its website, REI has 80 stores in 27 states selling high-quality outdoor gear, clothing, and footwear.[57] And today, with 3.5 million members whose membership entitles them to discounts and expert advice, REI is one of the largest retail co-ops in the world. Companies often choose a stability strategy when their external environment doesn't change much or after they have struggled with periods of explosive growth.

The purpose of a **retrenchment strategy** is to turn around very poor company performance by shrinking the size or scope of the business or, if a company is in multiple businesses, by closing or shutting down different lines of the business. The first step of a typical retrenchment strategy might include making significant cost reductions; laying off employees; closing poorly performing stores, offices, or manufacturing plants; or closing or selling entire lines of products or services.[58] After **Sears** saw its earnings drop from $800 million to a loss of $50 million over the course of 18 months, it reduced administrative expenses by $168 million by cutting jobs at headquarters and distribution centers and by consolidating its Kenmore, Craftsman, and Diehard brands into one division. It also reduced inventory, particularly in appliances, by substantially cutting prices, decreasing the value of on-hand inventory from $10.3 billion to $9.5 billion. So, despite sales dropping by 7 percent, Sears' retrenchment strategy returned it to profitability a year later.[59]

After cutting costs and reducing a business's size or scope, the second step in a retrenchment strategy is recovery. **Recovery** consists of the strategic actions that a company takes to return to a growth strategy. This two-step process of cutting and recovery is analogous to pruning roses. Prior to each growing season, roses should be cut back to two-thirds their normal size. Pruning doesn't damage the roses; it makes them stronger and more likely to produce beautiful, fragrant flowers. The retrenchment-and-recovery process is similar. Cost reductions, layoffs, and plant closings are sometimes necessary to restore companies to good health. After billions in losses and 10 years of unsuccessfully trying to make its merger with **Chrysler** work, Daimler AG, which makes Mercedes cars and trucks, sold its 80 percent stake in Chrysler to Cerebus Capital Management for $6 billion. Even then, Daimler's remaining 20 percent stake in Chrysler resulted in an additional $2.8 billion in losses. To restore profitability, Daimler cut labor costs by $2.8 billion in Germany by delaying pay raises of 2.1 percent and postponing payment of a $392 million profit-sharing payout to employees. In North America, it cut costs by $900 million by eliminating its Sterling truck brand, which resulted in the closing of two assembly plants and layoffs of 2,300 plant employees and 1,200 administrative jobs.[60] Like pruning, those cuts are intended to allow companies to eventually return to a successful growth strategy (i.e., recovery). When company performance drops significantly, a strategy of retrenchment and recovery may help the company return to a successful growth strategy.

"People go for value. It is not always a question of price."

REVIEW 3

Corporate-Level Strategies Corporate-level strategies such as portfolio strategy and grand strategies help managers determine what businesses they should be in. Portfolio strategy focuses on lowering business risk by being in multiple, unrelated businesses and by investing the cash flows from slow-growth businesses into faster-growing businesses. One portfolio strategy, the BCG matrix, suggests that cash flows from cash cows should be reinvested in stars and in carefully chosen question marks. Dogs should be sold or liquidated. Portfolio strategy has several problems, however. Acquiring unrelated businesses actually increases risk rather than lowering it. The BCG matrix is often wrong when predicting companies' futures (as dogs or cash cows, for example). And redirecting cash flows can seriously weaken cash cows. The most successful way to use the portfolio approach to corporate strategy is to reduce risk through related diversification.

The three kinds of grand strategies are growth, stability, and retrenchment/recovery. Companies can grow externally by merging with or acquiring other companies, or they can grow internally through direct expansion or creating new businesses. Companies choose a stability strategy—selling the same products or services to the same customers—when their external environment changes very little or after they have dealt with periods of explosive growth. Retrenchment strategy, shrinking the size or scope of a business, is used to turn around poor performance. If retrenchment works, it is often followed by a recovery strategy that focuses on growing the business again.

4 INDUSTRY-LEVEL STRATEGIES

Industry-level strategy addresses the question "How should we compete in this industry?"

Let's find out more about industry-level strategies, shown in Exhibit 6.9, by discussing **4.1 the five industry forces that determine overall levels of competition in an industry as well as 4.2 the positioning strategies** and **4.3 adaptive strategies that companies can use to achieve sustained competitive advantage and above-average profits.**

4.1 Five Industry Forces

[Industry-level strategy] a corporate strategy that addresses the question "How should we compete in this industry?"

According to Harvard professor Michael Porter, five industry forces determine an industry's overall attractiveness and potential for long-term profitability. These include the character of the rivalry, the threat of new entrants, the threat of substitute products or services, the bargaining power of suppliers, and the bargaining power of buyers. The stronger these forces, the less attractive the industry becomes to corporate investors because it is more difficult for companies to be profitable. Porter's

industry forces are illustrated in Exhibit 6.10. Let's examine how these forces are bringing changes to several kinds of industries.

Character of the rivalry is a measure of the intensity of competitive behavior among companies in an industry. Is the competition among firms aggressive and cutthroat, or do competitors focus more on serving customers than on attacking each other? Both industry attractiveness and profitability decrease when rivalry is cutthroat. For example, selling cars is a highly competitive business. Pick up a local newspaper on Friday, Saturday, or Sunday morning, and you'll find dozens of pages of car advertising ("Anniversary Sale-A-Bration," "Ford March Savings!" and "$99 Down, You Choose!"). In fact, competition in new car sales is so intense that if it weren't for used-car sales, repair work, and replacement parts, many auto dealers would actually lose money.

The **threat of new entrants** is a measure of the degree to which barriers to entry make it easy or difficult for new companies to get started in an industry. If new companies can easily enter the industry, then competition will increase and prices and profits will fall. On the other hand, if there are sufficient barriers to entry, such as large capital requirements to buy expensive equipment or plant facilities or the need for specialized knowledge, then competition will be weaker and prices and profits will generally be higher. For instance, high costs and intense competition make it very difficult to enter the video-game business. The barriers to entry for this business are extremely high given that today's average video game takes 12 to 36 months to create, $10 to $20 million to develop, and teams of highly paid creative workers to develop realistic graphics, captivating story lines, and innovative game capabilities, who must also be disciplined enough to meet budgets and very strict deadlines and still produce efficient, reliable, bug-free code.[61] These barriers to entry are also in place for online video games, like **Activision Blizzard's** *World of Warcraft*, which are growing even faster than traditional video games. Regarding online gaming, industry analyst Arvind Bhatia says, "This is a very hard and expensive market to enter, let alone be successful."[62]

The **threat of substitute products or services** is a measure of the ease with which customers can find substitutes for an industry's products or services. If customers can easily find substitute products or services, the competition will be greater and profits will be lower. If there are few or no substitutes, competition will be weaker and profits will be higher. Generic medicines are some of the best-known examples of substitute products. Under U.S. patent law, a company that develops a drug has exclusive rights to produce and market that drug for 20 years. Prices and profits are generally high during this period if the drug sells well. After 20 years, however, the patent will expire, and any pharmaceutical company can manufacture and sell the same drug. When this happens, drug prices drop substantially, and the company that developed the drug typically sees its revenues drop sharply. Over the next few years, Astro Zeneca will lose patent protection for Crestor (which lowers cholesterol) and Symbicort (for asthma). Other companies and drugs with expiring patents include Eli Lilly and Zyprexa (for schizophrenia); Forest Laboratories and Lexapro (for depression), and Pfizer and Lipitor (for cholesterol), Aricept (for Alzheimer's), and Xalatan for glaucoma.[63]

[Character of the rivalry] a measure of the intensity of competitive behavior between companies in an industry

[Threat of new entrants] a measure of the degree to which barriers to entry make it easy or difficult for new companies to get started in an industry

[Threat of substitute products or services] a measure of the ease with which customers can find substitutes for an industry's products or services

Bargaining power of suppliers is a measure of the influence that suppliers of parts, materials, and services to firms in an industry have on the prices of these inputs. When companies can buy parts, materials, and services from numerous suppliers, the companies will be able to bargain with the suppliers to keep prices low. On the other hand, if there are few suppliers, or if a company is dependent on a supplier with specialized skills and knowledge, then the suppliers will have the bargaining power to dictate price levels. Today, there are so many suppliers of inexpensive, standardized parts, computer chips, and video screens that dozens of new companies are beginning to manufacture flat-screen TVs. One of those companies is Xoceco (ZO-say-co), a Chinese company that has made inexpensive, low-quality TVs for two decades. But with dozens of companies able to supply the high-tech parts it needs, Xoceco was able to enter the flat-screen TV market without having to spend millions of dollars on research and development. Instead, it is simply buying the parts and software it needs directly from suppliers, assembling the TVs in its Chinese factories, and then undercutting the prices of now-struggling market leaders like Sony.[64]

Bargaining power of buyers is a measure of the influence that customers have on the firm's prices. If a company sells a popular product or service to multiple buyers, then the company has more power to set prices. By contrast, if a company is dependent on just a few high-volume buyers, those buyers will typically have enough bargaining power to dictate prices. For example, with more than 7,928 stores and 176 million weekly shoppers, Wal-Mart is the largest single buyer in the history of retailing. The company buys 30 percent of all toothpaste, shampoo, and paper towels made by retail suppliers; 15 to 20 percent of all CDs, videos, and DVDs; 15 percent of all magazines; 14 percent of all groceries; and 20 percent of all toys. And, of course, Wal-Mart uses its purchasing power as a buyer to push down prices. Gary Meyers, a vice president of global procurement at Wal-Mart, admits that "as things get more competitive [in the retail industry], the pressure that comes along with that, yeah, we try to take advantage of it."[65] Pamela Kohn, Wal-Mart's general merchandise manager for perishables, agreed, saying, "When our grocery suppliers bring price increases, we don't just accept them."[66]

4.2 Positioning Strategies

After analyzing industry forces, the next step in industry-level strategy is to protect your company from the negative effects of industry-wide competition and to create a sustainable competitive advantage. According to Michael Porter, there are three positioning strategies: cost leadership, differentiation, and focus.

Cost leadership means producing a product or service of acceptable quality at consistently lower production costs than competitors so that the firm can offer the product or service at the lowest price in the industry. Cost leadership protects companies from industry forces by deterring new entrants, who will have to match low costs and prices. Cost leadership also forces down the prices of substitute products and services, attracts bargain-seeking buyers, and increases bargaining power with suppliers, who have to keep their prices low if they want to do business with the cost leader. Although it sells the occasional $100,000 5-carat diamond ring or $11,000 Lalique crystal vase, millions of $1,500 plasma televisions, and too many cases of $120 Dom Perignon champagne to count, Costco, the second largest warehouse chain (behind Sam's), has a simple strategy: ultra-low costs. At Costco, nothing, not even the $100,000 diamond ring, is marked up more than 15 percent over the wholesale price. By contrast, low-priced Wal-Mart uses an average 33 percent markup. Is Costco ever tempted to mark up prices more than 15 percent to increase profits? Cofounder and CEO Jim Sinegal, who uses two folding tables as a desk to

keep costs down, says, "There are all sorts of opportunities where you can try to sneak in a little more margin here and a little more profitability there, but that's not what we're about."[67]

Differentiation means making your product or service sufficiently different from competitors' offerings so that customers are willing to pay a premium price for the extra value or performance that it provides. Differentiation protects companies from industry forces by reducing the threat of substitute products. It also protects companies by making it easier to retain customers and more difficult for new entrants trying to attract new customers. For example, why would anyone pay $2,000 for a clothes washer when they could purchase a regular washer for $350? The answer, according to John Alexander, **Whirlpool's** vice president and general manager for brand marketing and merchandising, is product differentiation. Says Alexander, "if we deliver a big enough benefit or the right benefit for the consumer, the consumer will trade up"[68] This is why GE's Harmony II washer, which has been preprogrammed to detect and get rid of 80 different stains, sells for about $2,000. Or why LG sells a $1,500 Steam Washer that, unlike traditional washers, uses, naturally, water and steam to clean clothes and has a steam-only cycle to get rid of wrinkles. Or why Whirlpool charges $800 to $900 for its Cabrio washer, which automatically determines the correct settings, such as water, temperature, speed, or cycle, that should be used to clean your clothes. And, through special engineering, the Cabrio also results in less wear and tear on your clothes, so they last longer.

Smaller, more-focused auction sites serve select groups of online buyers and sellers, such as artists and handicrafters. Silkfair and Etsy are two sites that focus on these special target markets.

With a **focus strategy**, a company uses either cost leadership or differentiation to produce a specialized product or service for a limited, specially targeted group of customers in a particular geographic region or market segment. Focus strategies typically work in market niches that competitors have overlooked or have difficulty serving. While eBay dominates the online auction business, smaller, more-focused auction sites serve select groups of online buyers and sellers. Artists who sell jewelry and handmade goods are attracted to Silkfair because it has larger pictures (which is important when you sell small items like jewelry) and lets sellers use video, customer forums, and blogs to promote their products and interact with customers. Cathleen McLain, who sells her jewelry on Silkfair, said, "I don't need a million people to see my things, just the right people who have hopefully good taste to buy my things."[69] Likewise, **Etsy** sells only handmade goods and has this focused mission: "to enable people to make a living making things, and to reconnect makers with buyers." Since inception, 100,000 different sellers have used Etsy to sell their handmade products.[70]

[Differentiation] the positioning strategy of providing a product or service that is sufficiently different from competitors' offerings that customers are willing to pay a premium price for it

[Focus strategy] the positioning strategy of using cost leadership or differentiation to produce a specialized product or service for a limited, specially targeted group of customers in a particular geographic region or market segment

4.3 Adaptive Strategies

Adaptive strategies are another set of industry-level strategies. Whereas the aim of positioning strategies is to minimize the effects of industry competition and build a sustainable competitive advantage, the purpose of adaptive strategies is to choose

an industry-level strategy that is best suited to changes in the organization's external environment. There are four kinds of adaptive strategies: defenders, prospectors, analyzers, and reactors.[71]

Defenders seek moderate, steady growth by offering a limited range of products and services to a well-defined set of customers. In other words, defenders aggressively "defend" their current strategic position by doing the best job they can to hold on to customers in a particular market segment. KitKat's chocolate-covered, two-fingered, chocolate-covered wafers are so popular in the United Kingdom (UK) that one is eaten every 47 seconds. For years, Nestlé SA used a defender strategy to sell KitKats, producing only slight changes to the original, like limited-edition flavors such as peppermint or orange for a few months each year. Wanting to jump-start KitKat's slow, but steady sales growth, Nestlé abandoned its defender strategy and introduced a huge variety of new flavors like strawberries and cream, passion fruit and mango, red berry, Christmas pudding, and tiramisu. While sales increased at first, traditional customers soon complained. Londoner Colin Snead said, "It wasn't what I wanted from a KitKat . . . after the strawberry one, I stuck with the normal KitKat."[72] Within 2 years, Nestlé killed the new flavors, keeping only tiramisu and caramel, and adding KitKat Senses, a 165-calorie version of the original flavor. Sales, which had dropped, are now up thanks to increased advertising and a return to giving customers what they want, the basic KitKat bar and just a few variants.[73]

In Japan, Kit Kat is pronounced "kitto katso" which roughly translates to "I hope you win." To spur growth, Nestlé rolled out packages combining the candy with other good-luck charms during school exam time. As a result, Kit Kat sales soared 28 percent.

Prospectors seek fast growth by searching for new market opportunities, encouraging risk taking, and being the first to bring innovative new products to market. Prospectors are analogous to gold miners who "prospect" for gold nuggets (i.e., new products) in hopes that the nuggets will lead them to a rich deposit of gold (i.e., fast growth). 3M has long been known for its innovative products, particularly in the areas of adhesives. Since 1904, it has invented sandpaper; masking, cellophane, electrical, and scotch tapes; the first commercially available audio and video tapes; and its most famous invention, Post-it notes. Lately, 3M has invented a film that increases the brightness of LCD displays on laptop computers; developed a digital system for construction companies to detect underground telecommunication, gas, water, sewer, or electrical lines without digging; and created a pheromone spray that, by preventing harmful insects from mating, will protect apple, walnut, tomato, cranberry, and grape crops. For more on 3M's innovative products, see the 3M innovation archive (**http://www.3m.com/cms/CA/en/1-30/cklcFFS/view.html**).

Analyzers are a blend of the defender and prospector strategies. They seek moderate, steady growth *and* limited opportunities for fast growth. Analyzers are rarely first to market with new products or services. Instead, they try to simultaneously minimize risk and maximize profits by following or imitating the proven successes of prospectors. **Tempur-Pedic** is the fastest-growing bed company in part because it replaced bed springs with visco foam. Traditional bed makers Sealy and Simmons sat back, analyzed, and came up with their own answers to visco foam. Simmons came out with its own visco bed, while Sealy moved to natural latex, which has many of the

same qualities but which Sealy claims to be better. Analyzing the market after Tempur-Pedic's release of visco helped Sealy and Simmons determine their strategies.[74]

Finally, unlike defenders, prospectors, or analyzers, **reactors** do not follow a consistent strategy. Rather than anticipating and preparing for external opportunities and threats, reactors tend to "react" to changes in their external environment after they occur. Not surprisingly, reactors tend to be poorer performers than defenders, prospectors, or analyzers. A reactor approach is inherently unstable, and firms that fall into this mode of operation must change their approach or face almost certain failure. **Hard Rock Café International** has 125 restaurants and 10 hotels around the world. When it spent $400 million in Myrtle Beach, South Carolina, to create the Hard Rock Café Park, a rock and roll–based theme park with monster rides (like the Led Zeppelin roller coaster which blared the band's "Whole Lotta Love"), there was every expectation that success would follow. But, bankruptcy occurred after just one season because the park's managers did not anticipate or prepare for the basic challenges they would face in this resort town. Economist Don Schunk said, "There was just sort of this assumption that all they had to do was throw the Hard Rock name around and people would figure it out on their own."[75] In a town famous for its beautiful and *free* beach, admission was $50 per customer. Moreover, park managers didn't coordinate their limited promotions with nearby hotels or local tourism officials. Paul Ruben, who edits *Park World*, the trade industry magazine for the amusement park industry said, "You want to draw families, theme the park as storybook land or fairytale land. I don't think the Hard Rock name is necessarily the best route for an amusement park."[76]

Industry-Level Strategies Industry-level strategies focus on how companies choose to compete in their industry. Five industry forces determine an industry's overall attractiveness to corporate investors and its potential for long-term profitability. Together, a high level of new entrants, substitute products or services, bargaining power of suppliers, bargaining power of buyers, and rivalry among competitors combine to increase competition and decrease profits. Three positioning strategies can help companies protect themselves from the negative effects of industry-wide competition. Under a cost leadership strategy, firms try to keep production costs low so that they can sell products at prices lower than competitors can. Differentiation is a strategy aimed at making a product or service sufficiently different from competitors' products that it can command a premium price. Using a focus strategy, firms seek to produce a specialized product or service for a limited, specially targeted group of customers. The four adaptive strategies help companies adapt to changes in the external environment. Defenders want to "defend" their current strategic positions. Prospectors look for new market opportunities by bringing innovative new products to market. Analyzers minimize risk by following the proven successes of prospectors. Reactors do not follow a consistent strategy, but instead react to changes in their external environment after they occur.

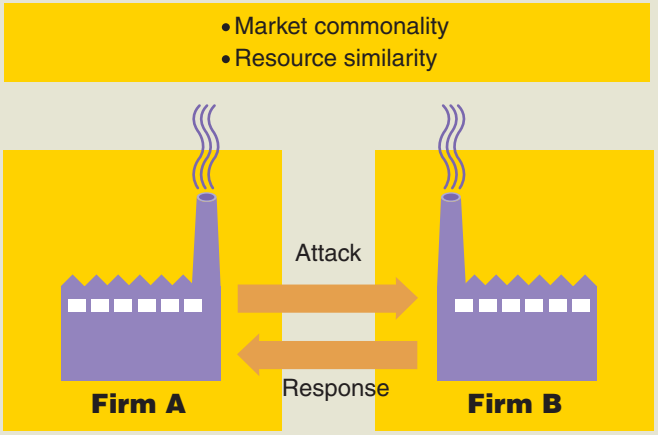
Attack and respond, respond and attack. **Firm-level strategy** addresses the question "How should we compete against a particular firm?"

Let's find out more about the firm-level strategies (direct competition between companies) shown in Exhibit 6.11 by reading about **5.1 the basics of direct competition, 5.2 the strategic moves involved in direct competition between companies,** and **5.3 entrepreneurship and intrapreneurship.**

5.1 Direct Competition

EXHIBIT 6.11

Firm-Level Strategies (Direct Competition)



Entering a market is the most forceful attack.
Exiting a market is a clear defensive signal of retreat.
Entrepreneurship is the strategy of entering established markets or developing new markets.

Although Porter's five industry forces indicate the overall level of competition in an industry, most companies do not compete directly with all the firms in their industry. For example, McDonald's and Red Lobster are both in the restaurant business, but no one would characterize them as competitors. McDonald's offers low-cost, convenient fast food in a seat-yourself restaurant, while Red Lobster offers mid-priced, sit-down seafood dinners complete with servers and a bar.

Instead of competing with an industry, most firms compete directly with just a few companies within it. **Direct competition** is the rivalry between two companies offering similar products and services that acknowledge each other as rivals and take offensive and defensive positions as they act and react to each other's strategic actions.[77] Two factors determine the extent to which firms will be in direct competition with each other: market commonality and resource similarity. **Market commonality** is the degree to which two companies have overlapping products, services, or customers in multiple markets. The more markets in which there is product, service, or customer overlap, the more intense the direct competition between the two companies. **Resource similarity** is the extent to which a competitor has similar amounts and kinds of resources, that is, similar assets, capabilities, processes, information, and knowledge used to create and sustain an advantage over competitors. From a competitive standpoint, resource similarity means that your direct competitors can probably match the strategic actions that your company takes.

Exhibit 6.12 shows how market commonality and resource similarity interact to determine when and where companies are in direct competition.[78] The overlapping area in each quadrant (between the triangle and the rectangle, or between the differently colored rectangles) depicts market commonality. The larger the overlap, the greater the market commonality. Shapes depict resource similarity, with rectangles representing one set of competitive resources and triangles representing another. Quadrant I shows two companies in direct competition because they have similar resources at their disposal and a high degree of market commonality. These companies try to sell similar products and services to similar customers. McDonald's and Burger King would clearly fit here as direct competitors.

In Quadrant II, the overlapping parts of the triangle and rectangle show two companies going after similar customers with some similar products or services,

[Firm-level strategy] a corporate strategy that addresses the question "How should we compete against a particular firm?"

[Direct competition] the rivalry between two companies that offer similar products and services, acknowledge each other as rivals, and act and react to each other's strategic actions

[Resource similarity] the extent to which a competitor has similar amounts and kinds of resources

but doing so with different competitive resources. McDonald's and Wendy's restaurants would fit here. Wendy's is after the same lunchtime and dinner crowds that McDonald's is. Nevertheless, with its more expensive hamburgers, fries, shakes, and salads, Wendy's is less of a direct competitor to McDonald's than Burger King is. For example, Wendy's Garden Sensation salads (using fancy lettuce varieties, grape tomatoes, and mandarin oranges) bring in customers who would have eaten at more expensive casual dining restaurants like Applebee's.[79] A representative from Wendy's says, "We believe you win customers by consistently offering a better product at a strong, everyday value."[80]

In Quadrant III, the very small overlap shows two companies with different competitive resources and little market commonality. McDonald's and Luby's cafeterias fit here. Although both are in the fast-food business, there's almost no overlap in terms of products and customers. Luby's sells baked chicken, turkey, roasts, meat loaf, and vegetables, none of which are available at McDonald's. Furthermore, Luby's customers aren't likely to eat at McDonald's. In fact, Luby's is not really competing with other fast-food restaurants, but with eating at home. Company surveys show that close to half of its customers would have eaten at home, not at another restaurant, if they hadn't come to Luby's.[81]

Finally, in Quadrant IV, the small overlap between the two rectangles shows that McDonald's and Subway compete with similar resources but with little market commonality. In terms of resources, sales at McDonald's are much larger, but Subway has grown substantially in the last decade and now has 31,172 stores worldwide, compared to 32,000 worldwide at McDonald's (just 13,000 in the United States).[82] Though Subway and McDonald's compete, they aren't direct competitors in terms of market commonality in the way that McDonald's and Burger King are because Subway, unlike McDonald's, sells itself as a provider of healthy fast food. Thus, the overlap is much smaller in Quadrant IV than in Quadrant I. With its advertising featuring "Jared," who lost 245 pounds eating at Subway, the detailed nutritional information available in its stores, and its close relationship with the American Heart Association, Subway's goal "is to emphasize that the Subway brand represents all that is good about health and well-being."[83] And while fast-food customers tend to eat at both restaurants, Subway's customers are twice as loyal as McDonald's customers, most likely because of Subway's healthier food.[84]

5.2 Strategic Moves of Direct Competition

While corporate-level strategies help managers decide what business to be in and industry-level strategies help them determine how to compete within an industry, firm-level strategies help managers determine when, where, and what strategic actions should be taken against a direct competitor. Firms in direct competition can make two basic strategic moves: attacks and responses. These moves occur all the time in virtually every industry, but they are most noticeable in industries where multiple large competitors are pursuing customers in the same market space.

An **attack** is a competitive move designed to reduce a rival's market share or profits. Hoping to increase its market share at Burger King's expense, McDonald's began a brutal price war by putting eight items on a new $1 value menu, including two sandwiches, the Big N' Tasty quarter-pounder and the McChicken sandwich, that usually sold for $1.99.[85] Sales of those sandwiches doubled within weeks.[86] The attack worked very well at first, as Robert Doughty, a Burger King spokesperson, complained: "They've created a senseless price war. That has put a lot of competitive pressure on us and others, too."[87] A **response** is a countermove, prompted by a rival's attack, that is designed to defend or improve a company's market share or profit. There are two kinds of responses.[88] The first is to match or mirror your competitor's move. This is what Burger King did to McDonald's by selling 11 menu items at 99 cents each, including its popular double cheeseburgers. The second kind of response, however, is to respond along a different dimension from your competitor's move or attack. For example, instead of cutting prices, Burger King could have introduced a new menu item to attract customers away from McDonald's.

Market commonality and resource similarity determine the likelihood of an attack or response, that is, whether a company is likely to attack a direct competitor or to strike back with a strong response when attacked. When market commonality is strong and companies have overlapping products, services, or customers in multiple markets, there is less motivation to attack and more motivation to respond to an attack. The reason for this is straightforward: When firms are direct competitors in a large number of markets, they have a great deal at stake. So when McDonald's launched an aggressive price war with its value menu, Burger King had no choice but to respond by cutting its own prices.

Whereas market commonality affects the likelihood of an attack or a response to an attack, resource similarity largely affects response capability, that is, how quickly and forcefully a company can respond to an attack. When resource similarity is strong, the responding firm will generally be able to match the strategic moves of the attacking firm. Consequently, a firm is less likely to attack firms with similar levels of resources because it is unlikely to gain any sustained advantage when the responding firms strike back. On the other hand, if one firm is substantially stronger than another (i.e., there is low resource similarity), then a competitive attack is more likely to produce sustained competitive advantage.

With over 32,000 stores to Burger King's 11,565 stores and much greater financial resources, McDonald's hoped its price war would inflict serious financial damage on Burger King while suffering minimal financial damage itself. This strategy worked to some extent. Although Burger King already sold 11 menu items for 99 cents, it wasn't willing or able to cut the price of its bestselling Whopper sandwiches to 99 cents (from $1.99). Basically admitting that it couldn't afford to match McDonald's price cuts on more expensive sandwiches, a Burger King spokesperson insisted, "McDonald's can't sell those sandwiches at $1 without losing money. It isn't sustainable." Thanks to its much larger financial resources, McDonald's had the funds to outlast Burger King in the price war. As often happens, though, the price war ended up hurting both companies' profits.[89] McDonald's ended the price war when it became clear that lower prices didn't draw more customers to its restaurants.

In general, the more moves (i.e., attacks) a company initiates against direct competitors, and the greater a company's tendency to respond when attacked, the better its performance. More specifically, attackers and early responders (companies that are quick to launch a retaliatory attack) tend to gain market share and profits at the expense of late responders. This is not to suggest that a full-attack strategy always works best. In fact, attacks can provoke harsh retaliatory responses. When it first came on the market, Sony's PlayStation 3 (PS3) cost $599, but it came with an 80-GB hard

"The greater a company's tendency to respond when attacked, the better its performance."

drive and a then rare Blu-ray disc player. Sales lagged. However, Nintendo's Wii game console cost $249 and Microsoft's Xbox 360 game console cost $400. So Sony cut the price of the 80-GB PS3 to $499 and introduced a 40-GB PS3 for $399.[90] Microsoft responded over the next 4 years with a combination of price cuts from which Sony has yet to recover, cutting the Xbox 360 with a 20-GB hard drive from $349 to $299, cutting the price of an Xbox 360 with a 60-GB hard drive from $349 to $299, and cutting a 120-GB Xbox 360 from $399 to $299.[91] Sony's PS3 sales have continued to slow, running at about 20 percent of Wii sales and 40 percent of Xbox 360 sales.[92] Consequently, when deciding when, where, and what strategic actions to take against a direct competitor, managers should always consider the possibility of retaliation.

5.3 Entrepreneurship and Intrapreneurship: Entering New Markets

As the McDonald's–Burger King, and PS3–Xbox 360 examples illustrate, attacks and responses can include smaller, more tactical moves like price cuts, specially advertised sales or promotions, or improvements in service. On a larger scale, they can also involve resource-intensive strategic moves such as expanding service and production facilities, introducing new products or services within the firm's existing business, or entering a completely new line of business for the first time.

Of these, *market entries* and *market exits* are probably the most important kinds of attacks and responses. Entering a market is perhaps the most forceful attack or response because it sends the clear signal that the company is committed to gaining or defending market share and profits at a direct competitor's expense. By contrast, exiting a market is an equally clear defensive signal that your company is retreating.[93]

Since **entrepreneurship** is the process of entering new or established markets with new goods or services, entrepreneurship is also a firm-level strategy. In fact, the basic strategic act of entrepreneurship is new entry, or creating a new business from a brand-new startup firm. For example, Scott Griffith created a new rental car company called Zipcar to compete with such established companies as Enterprise, Hertz,

and Avis. Zipcar is able to compete by offering more and doing it cheaply. After paying $50 for a membership and a $25 application fee, you reserve a Zipcar (for an hour, day, or longer) online or via a toll-free phone number. Zipcar members simply go to a Zipcar location and use their access card to unlock their reserved car—but the wireless access system allows entry only during the time period that the car is reserved. That way, no one else can use the car during that time. When finished, the renter simply returns the car to its original location. Gas and insurance are included in the price (about $73 a day, or $9.25 an hour). When the gas gauge show the tank is just ¼ full, you fill the tank by using the Zipcar gas card stored in the driver's visor. You'll be prompted to enter the car's mileage and the ID number from your Zipcar card.[94] And all of this is done without filling out forms, dealing with people at a rental counter, and having the paperwork and car inspected by security personnel before leaving the rental car lot.[95]

Established firms can be entrepreneurial, too, by entering new or established markets with new goods or services. When existing companies are entrepreneurial, it's called **intrapreneurship**.[96] Chances are that you've purchased private-label goods, such as Wal-Mart's Sam's Choice Cola, instead of brands like Coke or Pepsi. Private-label goods can be as much as 20 percent of a retailer's business. Electronics retailer **Best Buy** is being intrapraneurial by developing its own private-label line of electronics goods. At first, it simply sold the same electronics products, such as Blu-ray DVD players, that you could get at Wal-Mart and Radio Shack (because they were made by the same Chinese suppliers). Now, however, using the terabytes of customer satisfaction data gathered in its stores and a team of engineers, it is designing private-label electronics goods that are different from the products already in its stores. For instance, after its store data indicated that a large share of DVD players were purchased for children, it designed a spill-resistant model with rubber edges. Best Buy now sells hundreds of products under its own brands, including Insignia and Dynex TVs, Rocketfish video cables, and Geek Squad flash drives.[97]

[Intrapreneurship] entrepreneurship within an existing organization

[Entrepreneurial orientation] the set of processes, practices, and decision-making activities that lead to new entry, characterized by five dimensions: risk taking, autonomy, innovativeness, proactiveness, and competitive aggressiveness

Whereas the *goal* of an intrapreneurial strategy is new entry, the *process* of carrying out an intrapreneurial strategy depends on the ability of the company's founders or existing managers to foster an entrepreneurial orientation (remember, intrapreneurship is entrepreneurship in an existing organization). An **entrepreneurial orientation** is the set of processes, practices, and decision-making activities that lead to new entry. Five key dimensions characterize an entrepreneurial orientation:[98]

- *Risk taking.* Entrepreneurial firms are willing to take some risks by making large resource commitments that may result in costly failure. Another way to conceptualize risk taking is to think of it as a managerial preference for bold rather than cautious acts.
- *Autonomy.* If a firm wants to successfully develop new products or services to enter new markets, it must foster creativity among employees. To be creative, employees need the freedom and control to develop a new idea into a new product or service opportunity without interference from others. In other words, they need autonomy.
- *Innovativeness.* Entrepreneurial firms also foster innovativeness by supporting new ideas, experimentation, and creative processes that might produce new products, services, or technological processes.

- *Proactiveness.* Entrepreneurial firms have the ability to anticipate future problems, needs, or changes by developing new products or services that may not be related to their current business, by introducing new products or services before the competition does, and by dropping products or services that are declining (and likely to be replaced by new products or services).[99]
- *Competitive aggressiveness.* Because new entrants are more likely to fail than existing firms are, they must be aggressive if they want to succeed. A new firm often must be willing to use unconventional methods to directly challenge competitors for their customers and market share.

Without these five key characteristics, an entrepreneurial orientation is unlikely to be created, and an intrapreneurial strategy is unlikely to succeed.

Firm-Level Strategies Firm-level strategies are concerned with direct competition between firms. Market commonality and resource similarity determine whether firms are in direct competition and thus likely to attack each other or respond to each other's attacks. In general, the more markets in which there is product, service, or customer overlap, and the greater the resource similarity between two firms, the more intense the direct competition between them. When firms are direct competitors in a large number of markets, attacks are less likely because responding firms are highly motivated to quickly and forcefully defend their profits and market share. By contrast, resource similarity affects response capability, meaning how quickly and forcefully a company responds to an attack. When resource similarity is strong, attacks are much less likely to produce a sustained advantage because the responding firm is capable of striking back with equal force.

Market entries and exits are the most important kinds of attacks and responses. Entering a new market is a clear offensive signal, while exiting a market is a clear signal that a company is retreating. Market entry is perhaps the most forceful attack or response because it sends the clear signal that the company is committed to gaining or defending market share and profits at a direct competitor's expense. In general, attackers and early responders gain market share and profits at the expense of late responders. Attacks must be carefully planned and carried out, however, because they can provoke harsh retaliatory responses.

Finally, the basic strategic act of entrepreneurship is new entry. To carry out an entrepreneurial strategy, a company must create an entrepreneurial orientation by encouraging risk taking, autonomy, innovativeness, proactiveness, and competitive aggressiveness.

SELF ASSESSMENT

Strategy Questionnaire

Generally speaking, a strategy is a plan of action that is designed to help you achieve a goal. Strategies are not limited to grand plans that help you accomplish grand goals. You probably use strategies every day in simple ways. For example, think of a route you regularly drive. Do you know how fast (or slow) you need to go to catch all the lights on green? Or where to swerve to avoid a pothole? Or even when to take a side street to shave a few minutes off your commute? Speeding up for one block in order to catch the green lights at the next five intersections is a strategy. Strategy, then, involves thinking about how you are going to accomplish what you set out (i.e., have planned) to do.

This assessment will provide some baseline information on attitudes you might have that will relate to your management skills.[100] Answer each of the questions either true or false. Try not to spend too much time on any one item, and be sure to answer all the questions.

1. I get satisfaction from competing with others.
2. It's usually not important to me to be the best.
3. Competition destroys friendships.
4. Games with no clear-cut winners are boring.
5. I am a competitive individual.
6. I will do almost anything to avoid an argument.
7. I try to avoid competing with others.
8. I would like to be on a debating team.
9. I often remain quiet rather than risk hurting another person.
10. I find competitive situations unpleasant.
11. I try to avoid arguments.
12. In general, I will go along with the group rather than create conflict.
13. I don't like competing against other people.
14. I don't like games that are winner-take-all.
15. I dread competing against other people.
16. I enjoy competing against an opponent.
17. When I play a game, I like to keep score.
18. I often try to outperform others.
19. I like competition.
20. I don't enjoy challenging others even when I think they are wrong.

To determine your score, count the number of responses marked "True" and enter it here ____. You can find the interpretation for your score at: **academic.cengage.com/management/Williams**.

How Does Your Garden (Company) Grow?

The Scotts Company is older than dirt. Well, almost. O.M. Scott founded the company in 1868 as a premium seed company for U.S. farmers, who, to his mind, needed and should have clean, weed-free fields.[101] The company began selling grass seed in 1907 and launched a dedicated research division in 1947. Throughout the 20th century and still today, Scotts has been associated with the Turf Builder line of consumer grass seed, professional turf seed (think golf courses and football fields), and numerous fertilizer products.

In 1995, the $100 million plant-food company Miracle-Gro, started by your grandfather, merged with Scotts to form Scotts Miracle-Gro. Since the merger was finalized, you've seen Scotts Miracle-Gro buy companies that make everything from fertilizer to insecticides. When conglomerate ITT, which primarily makes electronics and fluid controls and equipment, bought Burpee, the seed company, ITT asked Scotts to manage it. In addition, Scotts introduced a line of fertilizer spreaders under its own name, solidified relationships with big-box retail stores like Lowe's and Home Depot, and began selling products in the United Kingdom countries, known for their love of and knack for gardening.

Over the years, Scotts Miracle-Gro has bought dozens of companies, and as a result, Scotts Miracle-Gro is huge. Now with $2.5 billion in annual sales, Scotts dominates lawn care like Budweiser dominates beer. (Your grandfather would never have imagined this.) So now that you're on top, how do you keep growing? Or *should* you keep growing? The lawn and garden market is a $35 billion annual market, so there could be plenty of upside, but drawing from your weed-killing technology, you know it's possible to grow a plant to death.

Questions

1. What strategic alternative—risk seeking or risk avoiding—do you think Scotts Miracle-Gro should pursue? Answer in terms of strategic reference point theory.
2. Using portfolio theory, map out a diversification plan that would help Scotts grow without straying too far from its distinctive competencies in turf, seed, and fertilizer.
3. Do you continue following a growth strategy, or do you shift to a stability strategy? Explain.

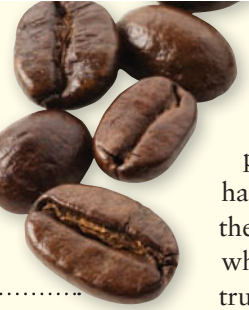
Playing the Game

When you first started in the business of inventing video-game systems, it was fresh and exhilarating.[102] Nintendo had revolutionized the home video-game industry by making arcade-quality graphics available on home game consoles. By the mid-1990s, the company's Super Nintendo Entertainment System was a market leader, selling 49 million units, and your Sega Genesis system was no slacker, selling 30 million units globally. Today, however, video games and consoles have little in common with Nintendo's groundbreaking Mario Brothers and Donkey Kong games, let alone Atari's Pong.

The video-game industry is a $17 billion industry and consoles sell hundreds of millions of units. Sony's first PlayStation sold 102.5 million units worldwide, and its PlayStation 2, which was so powerful the Japanese government feared it could be used to make advanced weaponry, has sold 111.3 million units since its launch. Microsoft's first-generation Xbox sold roughly 25 million units and used chip technology that made it more powerful than Sony's market leader. Then Microsoft upped the ante with the Xbox 360, whose new-generation microchip transmits data 3.5 times faster than the original Xbox. Then Sony trumped Microsoft by making its PlayStation 3 even more powerful; it contains a chip able to perform 218 billion calculations per second—speed on par with a supercomputer!

All this one-upmanship comes at a heavy price that pushes smaller players out of the market. For example, Sony spent $1.8 billion just to develop the microchip that powers its PlayStation 3 console, which



retails for approximately $500. Even at that price, though, Sony is selling the PlayStation hardware at a loss and counting on making up the money on the sale of related video games, which it expects will take 3 years! The same is true of Microsoft, whose Xbox console retails for nearly $300 but hadn't earned Microsoft a single penny after 6 years on the market.

You wonder if all these big investments make sense. After all, despite the general increase in the number of consoles sold, the same folks tend to buy the consoles year after year. Game playing in Japan is declining about 10 percent a year, and in the United States game consoles have been in the same percentage of households (36 percent, to be exact) for years. That means competitors are all vying for the same customers, those 18- to 34-year-old men who get a rush from the screamingly fast action of complex games. That is, until Nintendo came out with Wii, a simple console designed to play simple games and priced at a relatively reasonable $250. Wii was designed to attract new customers to video gaming, like women and older consumers. As for handheld video games, Nintendo's DS is simpler than the Sony equivalent PSP3 and has sold more units. The cost to develop a game for DS is one-tenth the cost to develop games for other platforms, which means Nintendo recoups its investments more quickly.

In the end, the industry is still exhilarating—not so much from the excitement of creating something new, but in a swimming-with-sharks kind of way. Sega hasn't been a serious force in the industry for over 20 years. If you're going to get back into the game, so to speak, how should you do it?

Assemble a team of four to five students to play the management team at Sega trying to reestablish itself in the gamer market.

Questions

1. Using Porter's five industry forces, map the videogame industry.
2. What are the risks and opportunities of the strategies followed by Sony and Xbox? By Nintendo?
3. Do you try to reestablish Sega by participating in the attack-and-respond dynamic of escalating technology, or do you try to follow Nintendo's go-simple path out of the video arms race? Explain.

PRACTICE BEING A MANAGER

Most Likely to Succeed

Organizational strategy is aimed at achieving sustainable competitive advantage over rivals in a particular market. This exercise will offer you the opportunity to consider how companies in the restaurant industry might develop a strategy and attempt to gain sustainable competitive advantage.

For purposes of this exercise, your professor will organize your class into small teams. Each team will be competing for the title of "Most Likely to Succeed." One team will be designated as judges for this competition.

Step 1 (15 minutes): Develop a concept for a new restaurant business. You may choose to develop your concept as a local, regional, or national company—but in all cases, you must plan to open a restaurant in your local area. Your concept should include the following: (a) name for your restaurant/chain; (b) description of your menu, layout, and any other distinguishing features; and (c) likely direct competitors of your new concept. Prepare an informal presentation of not more than 2 minutes.

Step 2 (20 minutes): Present the concepts. Each team will make an informal 2-minute presentation of the restaurant concepts.

Step 3 (5 minutes): Judge the presentations. Judges will confer and reach a decision regarding the top concepts on the basis of "Most Likely to Succeed." Judges should apply the sustainable competitive advantage concept/factors in making their selections. While the judges are conferring, each team should discuss and evaluate the concepts presented by the competing teams. Teams should apply the tools and concepts in this chapter in evaluating these concepts.

Step 4: Discuss as a class.

- What are the challenges of achieving sustainable competitive advantage in the restaurant business? Consider cases of failure and success in your local market—what factors seemed to play a role in determining success or failure?
- What *strategic groups*, or clusters of direct competitors (for example, fast-food burgers),

were identified in the team presentations? Which strategic groups might be tougher to enter in your local area? Which might be easier to enter?

- Do major restaurant chains have a built-in sustainable competitive advantage over local competition in your area? If you think so, what is the source of this advantage, and is it more pronounced in some strategic groups than in others (e.g., greater in tacos than in fine dining)? If not, what strategies have the "locals" used to successfully compete with larger restaurant chains?

DEVELOP YOUR CAREER POTENTIAL

An Individual SWOT Analysis

In order to maintain and sustain a competitive advantage, companies continue to analyze their overall strategy in light of their current situation.[103] In doing so, they often use a SWOT analysis, which focuses on the strengths and weaknesses in the firm's internal environment and the opportunities and threats present in the firm's external environment. One way to gain experience in conducting a SWOT analysis is to perform one on yourself—in other words, conduct a personal SWOT analysis.

Assume you have just completed your college education and are ready to apply for a job as a manager of a small- to medium-sized facility. Perform a personal SWOT analysis to determine if your current situation matches your overall strategy. Identifying your strengths will probably be the easiest step in the analysis. They will most likely be the skills, abilities, experience, and knowledge that help differentiate you from your competitors. Take care to be realistic and honest in analyzing your strengths and weaknesses.

One way to identify both strengths and weaknesses is to look at previous job evaluation comments and talk to former and present employers and coworkers. Their comments will typically focus on objective strengths and weaknesses that you have exhibited on the job. You may also gather information about your strengths and weaknesses by analyzing your personal interests and learning more about your personality type. Most college placement offices have software to help students identify their interests and personality types and then match that information to certain career paths. This type of assessment can help ensure that you do not choose a career path that is incongruent with your personality and interests.

Probably the hardest portion of the personal SWOT analysis will be the identification of your weaknesses. As humans, we are often reluctant to focus on our deficiencies; nonetheless, being aware of potential weaknesses can help us reduce them or improve upon them. Since you are preparing for a career in management, you should research what skills, abilities, knowledge, and experience are needed to be a successful manager. Comparing your personal strengths against those needed as a manager can help you identify potential weaknesses. Once you identify weaknesses, develop a plan to overcome them. Remember that most annual evaluations will include both strengths and weaknesses, so don't forget to include them in your analysis.

You can identify opportunities now by looking at employment possibilities for entry-level managers. In this part of the analysis, it helps to match your personal strengths with opportunities. For example, if you have experience in manufacturing, you may initially choose to apply only to manufacturing-type businesses.

The last step of the analysis involves identifying potential threats. Threats are barriers that can prevent you from obtaining your goals. Threats may include events such as an economic recession that reduces the number of job openings for entry-level managers. By knowing what the barriers are and by assembling proactive plans to help deal with them, you can reduce the possibility of your strategy becoming ineffective.

Focusing on a personal SWOT analysis can be a practical way to prepare for an actual company analysis, and it also allows you to learn more about yourself and your long-term plans.

Questions

1. In light of the SWOT analysis, what plans might you propose for yourself that will help you maximize your strengths, exploit your opportunities, and minimize your weaknesses and threats? Write three S.M.A.R.T. goals (remember Chapter 5) that will help you implement your plans.
2. How might this assignment prepare you for both your academic and your professional career?

Field of Dreams

© GREENLIGHT

In the classic 1989 film ***Field of Dreams***, Ray Kinsella (Kevin Costner) hears a voice while working in his Iowa cornfield that says, "If you build it, he will come." Ray concludes that "he" is legendary "Shoeless Joe" Jackson (Ray Liotta), a 1919 Chicago White Sox player suspended for rigging the 1919 World Series. With the support of his wife Annie (Amy Madigan), Ray jeopardizes his farm by plowing under a cornfield and creating a modern baseball diamond in its place. Shoeless Joe soon arrives, followed by the rest of the suspended players. This charming fantasy film, based on W. P. Kinsellas's novel *Shoeless Joe*, shows the rewards of pursuing a dream. In this clip, Ray's brother-in-law Mark (Timothy Busfield) insists that they will have to start farming on the field again if they're going to make enough money to avoid foreclosure on their property, but Ray's daughter Karin (Gaby Hoffman) suggests another idea.

What to Watch For and Ask Yourself

1. If you were Ray, what would you do in this situation? Would you be more likely to take Mark's advice or Karin's?
2. If Ray decides to do what his daughter Karin suggests with the field, could you call that an example of entrepreneurship? Intrapreneurship?
3. What are the risks Ray faces if he acts on Karin's suggestion?

Numi Organic Tea

© CENGAGE

Ahmed Rahim, the cofounder and CEO of Numi Organic Tea, doesn't hire new employees lightly. He still interviews nearly every serious prospect—and most are interviewed at least three times before getting a job offer. Employees must have more than just a willingness to work hard; Numi is looking for people with passion. Rahim explained the philosophy this way: "People are everything for a company. You can have a great product and great mission, but without the right people, you don't have the right formula." Fifty people currently work for this progressive, Oakland-based company. Given the pace of growth, Numi can't afford to lose the time and energy resulting from hasty hiring decisions and the inevitable turnover. As you'll see in this video, the company would rather make sure each person it hires has the desired skills and experience, fits well with the culture, and can serve as a Numi ambassador everywhere he or she goes.

What to Watch For and Ask Yourself

1. What are some of the company's resources that are discussed in this video?
2. How important is the hiring process at Numi to the company's success? Can hiring the right people create a competitive advantage for Numi?
3. Do you think you could get hired at Numi? How well do you think you would fit into its work environment?

Develop Your Career Potential

Reel to Real

What would You Do?

Novartis AG Headquarters, Basel, Switzerland.[1]

In Hollywood, a "blockbuster" movie often represents the difference between a profitable and unprofitable year for a movie studio. The same holds true in the pharmaceutical industry. The more "blockbuster" drugs a pharmaceutical company has, the more money it makes. Like Hollywood studios, pharmaceutical companies have to keep coming up with "blockbusters" in order to sustain profitability and market share. Patents last 20 years during which time only the patent holder may sell a patented drug during this time. Patents expiring on many "old" blockbuster drugs are expiring, and pharmaceutical companies could lose $140 billion in sales over the next 5 years to generic drug manufacturers who aggressively sell low-cost versions of those same drugs as soon as they're no longer patent protected. How bad is the threat? Merck estimates that its sales revenues of Zocar, a cholesterol reducing drug, dropped 82 percent the first year off of its patent. So, unless they come up with new blockbuster drugs to replace lost sales, pharmaceutical companies will have to shrink dramatically or go out of business. The problem, however, is that drug companies are struggling to develop new drugs. Eli Lilly's former CEO Sidney Taurel said, "I think the industry is doomed if we don't change."

The question, of course, is how? One area that needs to change is how pharmaceutical companies develop their drugs and their drug pipeline. Because of the need for blockbuster drugs with blockbuster revenues, most pharmaceutical firms have focused on finding drug treatments for large-market diseases like cancer, heart disease, or depression. Under this approach, company researchers would identify as many different chemical (i.e., molecular) treatment and treatment combinations as possible, and then rapidly test as many as possible hoping, often through sheer numbers, to discover treatments with potential, followed by additional tests, and then animal and potentially human trials. Swinging for the fences, however, has led to many more strikeouts. For example, Richard Pasternak, Merck's vice president of Cardiovascular Clinical Research, says, "There haven't been any new therapies that are proven to reduce death and disability for atherosclerosis since the introduction of [cholesterol-lowering] statins in the 1980s. Indeed, over the last 5 years, pharmaceutical companies spent $65.2 billion on research and development, but brought 57 percent fewer new drugs to market compared to the previous 5-year period.

Novartis is not immune to the threats to the pharmaceutical industry. Like its competitors, it is struggling to bring new drugs to market. For example, Galvus, its promising diabetes drug, which the company hoped would provide blockbuster sales, failed in late-stage testing. Profits were down 45 percent, by nearly a billion dollars in

the last quarter. As a result, the company is cutting 2,500 jobs, closing research centers in Vienna and Japan, cutting management layers, and restructuring into four divisions. Those are only short-term moves, however. If Novartis is to be successful in the long run, it must find a way to fundamentally change the way it researches new drug treatments. But, if it doesn't follow the blockbuster model, what should it do instead? Innovation comes from great ideas, so how can Novartis do a better job of managing the sources of innovation within the company? Next, you're not happy with the research leadership within the company, particularly in the key labs near headquarters in Basel. You know a change needs to be made, but you're not sure if you should promote a talented person from within or go for an outsider? And, you're not sure if the new leader should have stronger research skills or stronger business skills? Finally, for two decades, pharmaceutical companies have relied on multifunctional teams, comprised of researchers, doctors, market analysts, and managers, to assess drug potential and bring new drugs to market. With change and innovation desperately needed, should you continue to use these multifunctional teams?

If you were in charge at Novartis AG, what would you do?

We begin this chapter by reviewing the issues associated with organizational innovation, the problem facing Novartis. Organizational innovation is the successful implementation of creative ideas in an organization.[2] Creativity, which is a form of organizational innovation, is the production of novel and useful ideas.[3] In the first part of this chapter, you will learn why innovation matters and how to manage innovation to create and sustain a competitive advantage. In the second part, you will learn about organizational change, which is a difference in the form, quality, or condition of an organization over time.[4] You will also learn about the risk of not changing and the ways in which companies can manage change.

ORGANIZATIONAL INNOVATION

Sometimes the solution to a problem causes another problem. **Jernhusen AB**, a Swedish property-administration firm, is building a new thirteen-story office and retail building near Stockholm's Central Station. How should the company heat it? Problem number two: How should it get rid of excess heat in the train station, generated by the 250,000 people who pass through it every day? As Karl Sundholm, representative of Jernhusen, puts it, "All people produce heat, and that heat is in fact fairly difficult to get rid of. Instead of opening windows and letting all that heat go to waste we want to harness it through the ventilation system."[5] The innovative solution to both problems? Convert the heat in the station to hot water and pump it through the heating system of the new building using pipes that connect the building to the station. Sundholm estimates the system will cost about 300,000 kronor (32,000 euros; US$47,000) to install, and it is likely to reduce energy consumption by 15 percent. Per Berggren, Jernhusen's managing director, notes, "It's more like thinking out of the box, being environmentally smart."[6]

Organizational innovation is the successful implementation of creative ideas, like using the heat generated by train terminal passengers to heat the train terminal.[7]

[Organizational innovation] the successful implementation of creative ideas in organizations

[Creativity] the production of novel and useful ideas

[Organizational change] a difference in the form, quality, or condition of an organization over time

After reading the next two sections on organizational innovation, you should be able to

1. explain why innovation matters to companies.
2. discuss the different methods that managers can use to effectively manage innovation in their organizations.

1 WHY INNOVATION MATTERS

When was the last time you used a record player to listen to music, tuned up your car, baked cookies from scratch, or manually changed the channel on your TV? Because of product innovations and advances in technology, it's hard to remember, isn't it? In fact, since compact discs began replacing vinyl record albums more than a decade ago, many of you may *never* have played a record album. And your little brothers and sisters may never have played music from a CD! Lots of people used to tune up their own cars because doing a tune-up was easy, quick, and cheap. Change the points, spark plugs, and distributor cap, and your car was good for another 6 months or 12,000 miles. Today, with advanced technology and computerized components, tuning up a car is far too complex for most people. Hardly anybody makes cookies from scratch anymore, either. Millions of kids think that baking cookies means adding water to a powdered mix or getting premade cookie dough out of the refrigerator. As for manually changing the channels on your TV, you may have done that recently, but only because you couldn't find the remote.

We can only guess what changes technological innovations will bring in the next 20 years. Will we carry computers in our pockets? Today's iPhones, Blackberries, and Android phones are a step in that direction. Will solar power and wind power get cheap and efficient enough so that your home has a stand-alone power source off the main electrical grid? And will HD TVs, now the standard, be replaced by lifelike HD holographic pictures (think of R2D2 projecting Princess Leia in *Star Wars*) that project lifelike 3D images?[8] Who knows? The only thing we do know about the next 20 years is that innovation will continue to change our lives. For a fuller appreciation of how technological innovation has changed our lives, see Exhibit 7.1.

Let's begin our discussion of innovation by learning about **1.1 technology cycles** and **1.2 innovation streams.**

1.1 Technology Cycles

In Chapter 3, you learned that technology consists of the knowledge, tools, and techniques used to transform inputs (raw materials and information) into outputs (products and services). A **technology cycle** begins with the birth of a new technology and ends when that technology reaches its limits and dies as it is replaced by a newer, substantially better technology.[9] For example, technology cycles occurred when air-conditioning supplanted fans, when Henry Ford's Model T replaced horse-drawn carriages, when planes replaced trains as a means of cross-country travel, when vaccines that prevented diseases replaced medicines designed to treat them, and when battery-powered wristwatches replaced mechanically powered, stem-wound wristwatches.

From Gutenberg's invention of the printing press in the 1400s to the rapid advance of the Internet, studies of hundreds of technological innovations have shown that nearly all technology cycles follow the typical **S-curve pattern of innovation** shown in Exhibit 7.2.[10] Early in a technology cycle, there is still much to learn, so progress is slow, as depicted by point A on the S-curve. The flat slope indicates that increased effort (in terms of money or research and development) brings only small improvements in technological performance.

Intel's technology cycles have followed this pattern. Intel spends billions to develop new computer chips and to build new production facilities to produce them. Intel has found that the technology cycle for its integrated circuits is about 3 years. In each 3-year cycle, Intel introduces a new chip, improves the chip by making it a little bit faster each year, and then replaces that chip at the end of the cycle with a brand-new, different chip that is substantially faster than the old chip. At first, though, the billions

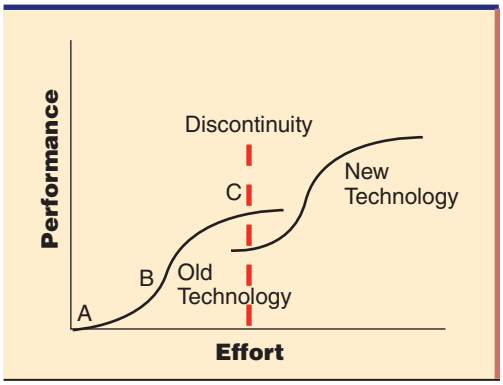
Intel spends typically produce only small improvements in performance. For instance, Intel's first 60-megahertz (MHz) Pentium processors ran at a speed of 51 based on the iComp Index, as shown in Exhibit 7.3. (The iComp Index is a benchmark test for measuring relative computer speed. For example, a computer with an iComp score of 200 is twice as fast as a computer with an iComp score of 100.) Six months later, Intel's new 75-MHz Pentium was only slightly faster, with an iComp speed of 67.

Fortunately, as the new technology matures, researchers figure out how to get better performance from it. This is represented by point B of the S-curve in Exhibit 7.2.

The steeper slope indicates that small amounts of effort will result in significant increases in performance. Again, Intel's technology cycles have followed this pattern. After 6 months to a year with a new chip design, Intel's engineering and production people typically figure out how to make the new chips much faster than they were initially. Despite slow progress at point A in the first 6 months, Intel soon rolled out 100-MHz, 120-MHz, 133-MHz, 150-MHz, and 166-MHz Pentium chips that, based on the iComp Index, were 76 percent, 96 percent, 117 percent, 124 percent, and 149 percent faster than the original 60-MHz speed (see Exhibit 7.3).

At point C in Exhibit 7.2, the flat slope again indicates that further efforts to develop this particular technology will result in only small increases in performance. More importantly, however, point C indicates that the performance limits of that particular technology are being reached. In other words, additional significant improvements in performance are highly unlikely. Exhibit 7.3 shows that with iComp speeds of 127 and 142, Intel's 166-MHz and 200-MHz Pentiums were 2.49 and 2.78 times as fast as its original 60-MHz Pentiums. Yet, despite these impressive gains in performance, Intel was unable to make its Pentium chips run any faster because the basic Pentium design had reached its limits.

EXHIBIT 7.2
S-Curves and Technological Innovation



Source: R. N. Foster, *Innovation: The Attacker's Advantage* (New York: Summit, 1986).

After a technology has reached its limits at the top of the S-curve, significant improvements in performance usually come from radical new designs or new performance-enhancing materials. In Exhibit 7.2, that new technology is represented by the second S-curve. The changeover or discontinuity between the old and new technologies is represented by the dotted line. At first, the old and new technologies will likely coexist. Eventually, however, the new technology will replace the old technology. When that happens, the old technology cycle will be complete, and a new one will have started.

The changeover between Intel's Pentium processors, the old technology, and its Pentium II processors, the new technology (despite their similar names, these chips used significantly different technologies), took approximately 1 year. Exhibit 7.3 shows this changeover or discontinuity between the two technologies. With an iComp speed of 267, the first Pentium II (233 MHz) was 88 percent faster than the last and fastest 200-MHz Pentium processor. And because their design and performance were significantly different from (and faster than) Pentium II chips, Intel's Pentium III chips represented the beginning of yet another S-curve technology cycle in integrated circuits. A 450-MHz Pentium III chip was 21 percent faster than a 450-MHz Pentium II chip. Over time, improving existing technology (tweaking the performance of the current technology cycle), combined with replacing old technology with new technology cycles (the Pentium 4 replacing the Pentium III replacing the Pentium II replacing the Pentium), has increased the speed of Pentium computer processors by a factor of 58 in just 17 years and all computer processors by a factor of 300!

Because US Rail's cars are self-propelled by two built-in diesel engines and can pull up to two other passenger cars, they don't require expensive electrical rail systems or locomotive engines.

Though the evolution of Intel's Pentium chips has been used to illustrate S-curves and technology cycles, it's important to note that technology cycles and technological innovation don't necessarily involve faster computer chips or cleaner-burning automobile engines. Remember, *technology* is simply the knowledge, tools, and techniques used to transform inputs into outputs. So a technology cycle occurs whenever there are major advances or changes in the *knowledge*, *tools*, and *techniques* of a field or discipline, whatever they may be.

For example, one of the most important technology cycles in the history of civilization occurred in 1859, when 1,300 miles of central sewer line were constructed throughout London to carry human waste to the sea more than 11 miles away. This extensive sewer system replaced the widespread practice of dumping raw sewage directly into streets, where people walked through it and where it drained into public wells that supplied drinking water. Though the relationship between raw sewage and cholera wasn't known at the time, preventing waste runoff from contaminating water supplies stopped the spread of that disease, which had killed millions of people for centuries in cities throughout the world.[11] Safe water supplies immediately translated into better health and longer life expectancies. Indeed, the water you drink today is safe thanks to this technological breakthrough.

Likewise, today, while most cities could benefit from commuter rail transportation systems, the cost is prohibitive relative to the benefits except in the most highly populated cities, like Boston, New York, or Washington, D.C. Even aboveground light rail systems, which are supposed to be less expensive, cost $5 million a mile

because of the cost of laying electrical rail to power the system. This is why the self-powered rail cars made by **US Rail Car** are so innovative. Unlike typical passenger trains that are pulled by a locomotive, US Rail's single-deck (94 passengers) and double-deck (188 passengers) cars are self-propelled by two built-in diesel engines and can pull up to two other passenger cars. As a result, passenger loads are 18 percent higher, fuel costs are half of normal passenger car systems, and pollution is reduced by 72 percent. And, because they are engineered to use existing rail lines, no new rail has to be laid. Furthermore, they're 75 percent less expensive than light rail because the self-propelled cars avoid the cost of electrifying each mile of track to run the system. The only cost is new stations and parking lots. Finally, initial capital outlays are small because cities don't have to buy an entire fleet of locomotives and passenger cars to start a new rail system. If initial ridership is light, simply buy one or two self-propelled cars and have them pull one or two passenger cars. As ridership slowly grows, add more self-propelled cars.[12]

So, when you think about technology cycles, don't automatically think "high technology." Instead, broaden your perspective by considering advances or changes in any kind of knowledge, tools, and techniques.

1.2 Innovation Streams

In Chapter 6, you learned that organizations can create *competitive advantage* for themselves if they have a *distinctive competence* that allows them to make, do, or perform something better than their competitors. A competitive advantage becomes sustainable if other companies cannot duplicate the benefits obtained from that distinctive competence. Technological innovation, however, can enable competitors to duplicate the benefits obtained from a company's distinctive advantage. It can also quickly turn a company's competitive advantage into a competitive disadvantage.

For more than 110 years, Eastman Kodak was the dominant producer of photographic film worldwide. Retailers often dedicated an entire aisle to the yellow and red boxes containing Kodak film in a variety of speeds and exposures for all types of cameras. The Kodak brand was associated with quality, availability, and value, and consumers purchased rolls of film by the billions. That is, until Kodak invented the digital camera (patent number 4,131,919). But Kodak itself was unprepared for the rapid acceptance of its new technology, and its managers watched film quickly become obsolete for the majority of camera users. Technological innovation turned Kodak's competitive advantage into a competitive disadvantage. This technology shift has had a significant impact on Kodak, which reduced its film operation to a quarter of its former size by laying off over 27,000 employees. In a further nod to its declining film sales, Kodak stopped production of its Kodachrome film line, which included film for stills and slides, as well as movies.[13] To adjust to the new marketplace, Kodak has been bolstering investments in its digital camera division; in the chemicals, paper, and kiosks used for picture printing; and in consumer inkjet printers (to print photographs) and fast digital inkjet printers for commercial uses.[14]

As the Kodak example shows, companies that want to sustain a competitive advantage must understand and protect themselves from the strategic threats of innovation. Over the long run, the best way for a company to do that is to create a stream of its own innovative ideas and products year after year. Consequently, we define **innovation streams** as patterns of innovation over time that can create sustainable competitive advantage.[15] Exhibit 7.4 shows a typical innovation consisting of a series of technology cycles. Recall that a technology cycle begins with a new technology and ends when that technology is replaced by a newer, substantially better technology. The innovation stream in Exhibit 7.4 shows three such technology cycles.

[Innovation streams] patterns of innovation over time that can create sustainable competitive advantage

An innovation stream begins with a **technological discontinuity**, in which a scientific advance or a unique combination of existing technologies creates a significant breakthrough in performance or function. For example, minimally invasive techniques are revolutionizing brain surgery. When Douglas Baptist had a golf ball-sized tumor, his surgeon cut a tiny opening through his eyebrow, removed the tumor, and sewed up the opening, leaving practically no trace of the operation. Previously, his skull would have been sawed open. Dr. John Mangiardi, who did the procedure, says, "We used to have to shave off half the head. We don't do that anymore."[16] Today, surgeons use endoscopes (tiny cameras with lights attached to mini surgical tools) and MRI and CT scans (which create 3-D maps of the brain) to remove brain tumors with precision and little physical trauma. Further advances in technology are now being used to remove brain tumors via an endoscope inserted through the patient's nose. Dr. Carl Snyderman, of the University of Pittsburgh Medical Center, says, "We go into the center of a tumor and take it out in small little pieces and take these little pieces out through the nose one at a time."[17] As a result of these advances, the cost and length of hospital stays associated with these surgeries have been cut in half.

Technological discontinuities are followed by a **discontinuous change**, which is characterized by technological substitution and design competition. **Technological substitution** occurs when customers purchase new technologies to replace older technologies. In the first half of the 1800s, letters, messages, and news traveled by boat, train, or horseback. The famous Pony Express, for example, could deliver mail from St. Joseph, Missouri, to Sacramento, California, in 10 days because it used a large number of fresh riders and fresh horses.[18] Between 1840 and 1860, however, many businesses began using the telegraph, which could transmit messages and news cross-country (or even around the world) in minutes rather than days, weeks, or months.[19] Indeed, telegraph companies were so successful that the Pony Express went out of business almost immediately after the completion of the transcontinental telegraph, which linked telegraph systems from coast to coast.

Discontinuous change is also characterized by **design competition**, in which the old technology and several different new technologies compete to establish a new technological standard or dominant design. Because of large investments in old technology, and because the new and old technologies are often incompatible with each other, companies and consumers are reluctant to switch to a different technology during a design competition. Indeed, the telegraph was so widely used as a means of communication in the late 1800s that at first almost no one understood why telephones would be a better way to communicate. It's hard to envision today, with everyone constantly checking cell phones for e-mail, texts, and voice mail, but as Edwin Schlossberg explains in his book *Interactive Excellence*: "People could not imagine why they would want or need to talk immediately to someone who was across town or, even more absurdly, in another town. Although people could write letters to one another, and some could send telegraph messages, the idea of sending one's voice to another place

[Technological discontinuity] the phase of an innovation stream in which a scientific advance or unique combination of existing technologies creates a significant breakthrough in performance or function

[Discontinuous change] the phase of a technology cycle characterized by technological substitution and design competition

[Technological substitution] the purchase of new technologies to replace older ones

[Design competition] competition between old and new technologies to establish a new technological standard or dominant design

and then instantly hearing another voice in return was simply not a model that existed in people's experience. They also did not think it was worth the money to accelerate sending or hearing a message."[20] In addition, during design competition, the older technology usually improves significantly in response to the competitive threat from the new technologies; this response also slows the changeover from older to newer technologies. "Early adopters" of **Toshiba's** HD DVD player continued to use the technology for their collections, but most people will eventually use Blu-ray because, as the industry standard, it will dominate the market for high-definition DVD viewing.[21]

Discontinuous change is followed by the emergence of a **dominant design**, which becomes the new accepted market standard for technology.[22] Dominant designs emerge in several ways. One is critical mass, meaning that a particular technology can become the dominant design simply because most people use it. This happened in the design competition between Toshiba's HD DVD technology and Sony's Blu-ray technology for dominance in establishing a new standard format for high-definition home video. Toshiba lost the design competition because Warner Bros., which had been using both technologies, decided to go exclusively with Blu-ray. At the time of Warner's announcement, Blu-ray held 64 percent of the market, compared to 36 percent for HD DVD.[23] Retailers soon joined Warner Bros. in announcing their intentions to sell only Blu-ray equipment and videos.

The best technology doesn't always become the dominant design because a number of other factors come into play. For instance, a design can become dominant if it solves a practical problem. The QWERTY keyboard (named for the top left line of letters) became the dominant design for typewriters because it slowed typists who, by typing too fast, caused mechanical typewriter keys to jam. Though computers can easily be switched to the DVORAK keyboard layout, which doubles typing speed and cuts typing errors by half, QWERTY lives on as the standard keyboard. In this instance, the QWERTY keyboard solved a problem that, with computers, is no longer relevant. Yet it remains the dominant design not because it is the best technology, but because most people learned to type that way and continue to use it.

Dominant designs can also emerge through independent standards bodies. The **International Telecommunication Union (ITU)** (**http://www.itu.ch**) is an independent organization that establishes standards for the communications industry. The ITU was founded in Paris in 1865 because European countries all had different telegraph systems that could not communicate with each other. Messages crossing borders had to be transcribed from one country's system before they could be coded and delivered on another. After 3 months of negotiations, 20 countries signed the International Telegraph Convention, which standardized equipment and instructions, enabling telegraph messages to flow seamlessly from country to country. Today, as in 1865, various standards are proposed, discussed, negotiated, and changed until agreement is reached on a final set of standards that communication industries (Internet, telephony, satellites, radio) will follow worldwide. For example, because most cell phones have different charger interfaces (i.e., plugs) and electrical requirements, you've probably had to buy new chargers—one for home, one for work, and one for your car—each time you got a new cell phone. That's now a thing of the past, as the ITU has adopted a micro-USB standard (look at the connector that plugs into your digital camera) that can be used with any phone. This new standard will not only make it easy to borrow someone else's charger when you leave yours at home, it will also prevent consumers from throwing away 51,000 tons of obsolete chargers each year (that worked with their old phones but not their new ones). The new chargers are also much more energy efficient.[24]

No matter how it happens, the emergence of a dominant design is a key event in an innovation stream. First, the emergence of a dominant design indicates that there are winners and losers. Technological innovation is both competence enhancing and competence destroying. Companies that bet on the now-dominant design usually

[Dominant design] a new technological design or process that becomes the accepted market standard

prosper. By contrast, when companies bet on the wrong design or the old technology, they may experience **technological lockout**, which occurs when a new dominant design (i.e., a significantly better technology) prevents a company from competitively selling its products or makes it difficult to do so.[25]

For example, Toshiba has stopped producing HD DVD players because a critical mass of consumers and technology adopted Blu-ray technology, which became the dominant design. Toshiba will continue to make spare parts for existing machines and may apply the technology to downloading videos online. But it will shift its business strategy to other sectors, such as flash drives, which are beginning to replace hard drives in computers.[26] In fact, more companies are likely to go out of business in a time of discontinuous change and changing standards than in an economic recession or slowdown.

Second, the emergence of a dominant design signals a shift from design experimentation and competition to **incremental change**, a phase in which companies innovate by lowering the cost and improving the functioning and performance of the dominant design. For example, manufacturing efficiencies enable Intel to cut the cost of its chips by one-half to two-thirds during a technology cycle, while doubling or tripling their speed. This focus on improving the dominant design continues until the next technological discontinuity occurs.

Why Innovation Matters Technology cycles typically follow an S-curve pattern of innovation. Early in the cycle, technological progress is slow and improvements in technological performance are small. As a technology matures, however, performance improves quickly. Finally, as the limits of a technology are reached, only small improvements occur. At this point, significant improvements in performance must come from new technologies.

The best way to protect a competitive advantage is to create a stream of innovative ideas and products. Innovation streams begin with technological discontinuities that create significant breakthroughs in performance or function. Technological discontinuities are followed by discontinuous change, in which customers purchase new technologies (technological substitution) and companies compete to establish the new dominant design (design competition). Dominant designs emerge because of critical mass, because they solve a practical problem, or because of the negotiations of independent standards bodies. Because technological innovation is both competence enhancing and competence destroying, companies that bet on the wrong design often struggle (technological lockout), while companies that bet on the eventual dominant design usually prosper. Emergence of a dominant design leads to a focus on incremental change, lowering costs, and making small, but steady improvements in the dominant design. This focus continues until the next technological discontinuity occurs.

2 MANAGING INNOVATION

[Technological lockout] the inability of a company to competitively sell its products because it relied on old technology or a nondominant design

[Incremental change] the phase of a technology cycle in which companies innovate by lowering costs and improving the functioning and performance of the dominant technological design

One consequence of technology cycles and innovation streams is that managers must be equally good at managing innovation in two very different circumstances. First, during discontinuous change, companies must find a way to anticipate and survive the technological changes that can suddenly transform industry leaders into losers and industry unknowns into powerhouses. Companies that can't manage innovation following technological discontinuities risk quick organizational decline and dissolution. Second, after a new dominant design emerges following discontinuous change, companies must manage the very different process of incremental improvement and innovation. Companies that can't manage incremental innovation slowly deteriorate as they fall farther behind industry leaders.

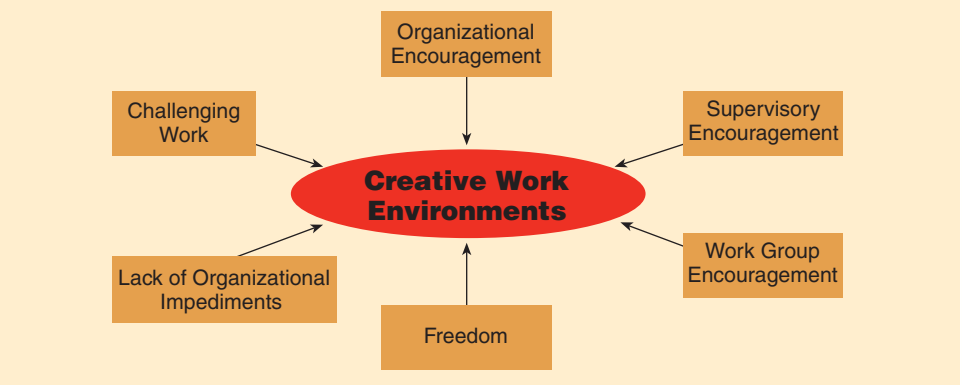
Unfortunately, what works well when managing innovation during discontinuous change doesn't work well when managing innovation during periods of incremental change (and vice versa). Consequently, to successfully manage innovation streams, companies need to be good at three things: **2.1 managing sources of innovation, 2.2 managing innovation during discontinuous change,** and **2.3 managing innovation during incremental change.**

2.1 Managing Sources of Innovation

Innovation comes from great ideas. So a starting point for managing innovation is to manage the sources of innovation, that is, where new ideas come from. One place that new ideas originate is with brilliant inventors. Do you know who invented the telephone, the light bulb, a way to collect and store electricity, air-conditioning, radio, television, automobiles, the jet engine, computers, and the Internet? These innovations were created by Alexander Graham Bell, Thomas Edison, Pieter van Musschenbroek, Willis Carrier, Guglielmo Marconi, John Baird and Philo T. Farnsworth, Gottlieb Daimler and Wilhelm Maybach, Sir Frank Whittle, Charles Babbage, and Vint Cerf and Robert Kahn, respectively. These innovators and their innovations forever changed the course of modern life. But only a few companies have the likes of an Edison, Marconi, or Graham Bell working for them. Given that great thinkers and inventors are in short supply, what might companies do to ensure a steady flow of good ideas?

Well, when we say that innovation begins with great ideas, we're really saying that innovation begins with creativity. As we defined it at the beginning of this chapter, creativity is the production of novel and useful ideas.[27] Although companies can't command employees to be creative ("You *will* be more creative!"), they can jump-start innovation by building **creative work environments** in which workers perceive that creative thoughts and ideas are welcomed and valued. As Exhibit 7.5 shows, creative work environments have six components that encourage creativity: challenging work, organizational encouragement, supervisory encouragement, work group encouragement, freedom, and a lack of organizational impediments.[28]

EXHIBIT 7.5 Components of Creative Work Environments



Sources: T. M. Amabile, R. Conti, H. Coon, J. Lazenby, & M. Herron, "Assessing the Work Environment for Creativity," *Academy of Management Journal* 39 (1996): 1154–1184.

Work is *challenging* when it requires effort, demands attention and focus, and is perceived as important to others in the organization. According to researcher Mihaly Csikszentmihalyi (pronounced ME-high-ee CHICK-sent-me-high-ee), challenging work promotes creativity because it creates a rewarding psychological experience known as "flow." **Flow** is a psychological state of effortlessness, in which you become completely absorbed in what you're doing and time seems to fly. When flow occurs, who you are and what you're doing become one. Csikszentmihalyi first encountered flow when studying artists: "What struck me by looking at artists at work was their tremendous focus on the work, this enormous involvement, this forgetting of time and body. It wasn't justified by

[Creative work environments] workplace cultures in which workers perceive that new ideas are welcomed, valued, and encouraged

[Flow] a psychological state of effortlessness, in which you become completely absorbed in what you're doing and time seems to pass quickly

expectation of rewards, like, 'Aha, I'm going to sell this painting.'"[29] Csikszentmihalyi has found that chess players, rock climbers, dancers, surgeons, and athletes regularly experience flow, too. A key part of creating flow experiences, and thus creative work environments, is to achieve a balance between skills and task challenge. Workers become bored when they can do more than is required of them and anxious when their skills aren't sufficient to accomplish a task. When skills and task challenge are balanced, however, flow and creativity can occur.

A creative work environment requires three kinds of encouragement: organizational, supervisory, and work group encouragement. *Organizational encouragement* of creativity occurs when management encourages risk taking and new ideas, supports and fairly evaluates new ideas, rewards and recognizes creativity, and encourages the sharing of new ideas throughout different parts of the company *Supervisory encouragement* of creativity occurs when supervisors provide clear goals, encourage open interaction with subordinates, and actively support development teams' work and ideas. *Work group encouragement* occurs when group members have diverse experience, education, and backgrounds and the group fosters mutual openness to ideas; positive, constructive challenge to ideas; and shared commitment to ideas. For further discussion of these factors, see Chapter 10 on managing teams.

An example of organizational and supervisory encouragement can be found at **Adobe**, which builds software for business and publishing. Every quarter, Adobe hosts the Idea Champion Showcase, an American Idol-style "ideathon" in which six presenters get 10 minutes each to pitch a new business idea involving product concept, packaging, and technology. Top executives are not invited to the showcase because their cautiousness caused them to "hurl rocks" at new ideas before they have a chance to develop. Rick Bess, an idea mentor at Adobe who developed the showcase, said, "If you had an idea that needed [management approval for] a new sales channel, a new business model, or new packaging, well, good luck. It was hard for ideas to get through the hierarchy."[30] So Bess developed the showcase after an internal study showed that too many roadblocks were being thrown in front of new ideas.

Freedom means having autonomy over one's day-to-day work and a sense of ownership and control over one's ideas. Numerous studies have indicated that creative ideas thrive under conditions of freedom. Royal Philips Electronics (Philips) embraced this freedom in its drive to both simplify its products and make everything sensible. All groups within the company have been given complete freedom to rethink every product with the goal of making it simpler for the end user to install and use. Says Andrea Ragnetti, chief marketing officer for Philips, "In the past, companies just developed the technology and hoped someone would buy it . . . now we are starting from the point of discovering what exactly consumers want a product to do." To ensure that new ideas are on the right track, Philips executives formed the Philips Simplicity Advisory Board and drafted only people from outside the organization. The panel includes Sara Berman, head of her own highly successful clothing label; Peggy Fritzsche, a radiology professor at Loma Linda University and the former president of the Radiological Society of North America; Gary Chang, an architect in China; and John Maeda, a professor of design at MIT. The eclectic panel works with any of Philips's work groups to help them think through the practicality of every product.[31]

To foster creativity, companies may also have to *remove impediments* to creativity from their work environments. Internal conflict and power struggles, rigid management structures, and a conservative bias toward the status quo can all discourage creativity. They create the perception that others in the organization will decide which ideas are acceptable and deserve support. **Best Buy** developed a unique, somewhat risky program called ROWE (results-only work environment). All of the 4,000 employees at the company's headquarters in Minneapolis work on their own schedule. There are no office hours, no set meetings, and no need to come into the

office at all—provided you get your work done. Employees are strictly evaluated on output measures that are determined by the management of the company. Since its inception, productivity has risen 35 percent, turnover has dropped dramatically, and employee satisfaction has skyrocketed. As pointed out by *BusinessWeek*, "the most innovative new product may be the structure of the workplace itself."[32]

Give Credit, Don't Take It

You came up with a great idea and ran it by your boss, who loved it. Next thing you know, the office is buzzing about this "great new idea." But instead of giving you the credit, your boss shamelessly sold the idea as his own. Not only is stealing others' ideas wrong, but nothing kills a creative work environment faster than not giving people credit for their ideas. If you're the boss, no matter who comes up with "the" idea, give that person credit. Spread the recognition and acknowledgment around so that their coworkers and your boss's boss know about your employees' great ideas. Do the right thing. Give credit where it's due. You'll be rewarded with more great ideas.[33]

2.2 Experiential Approach: Managing Innovation during Discontinuous Change

A study of 72 product-development projects (i.e., innovation) in 36 computer companies across the United States, Europe, and Asia sheds light on how to manage innovation. Companies that succeeded in periods of discontinuous change (characterized by technological substitution and design competition, as described earlier) typically followed an experiential approach to innovation.[34] The **experiential approach to innovation** assumes that innovation is occurring within a highly uncertain environment and that the key to fast product innovation is to use intuition, flexible options, and hands-on experience to reduce uncertainty and accelerate learning and understanding. As Exhibit 7.6 shows, the experiential approach to innovation has five aspects: design iterations, testing, milestones, multifunctional teams, and powerful leaders.[35]

An iteration is a repetition. So a **design iteration** is a cycle of repetition in which a company tests a prototype of a new product or service, improves on the design, and then builds and tests the improved product or service prototype. A **product prototype** is a full-scale working model that is being tested for design, function, and reliability. **Testing** is a systematic comparison of different product designs or design iterations. Companies that want to create a new dominant design following a technological discontinuity quickly build, test, improve, and retest a series of different product prototypes. **Rickster Powell** has jumped from an airplane 20,000 times in order to test parachute designs for sporting and military uses.[36] Powell explains how it works: "When . . . the chief parachute designer . . . comes up with a new design and we're going to test it for the first time [and are] not sure whether it will fly or not, I put on a skydiving rig which is composed of emergency backup parachute as well as

a main parachute, and then the parachute to be tested will go on the front. So that's in case there's a real problem with it, [such as] it doesn't fly, [or] it's unstable, then I can get rid of that parachute and still be in a normal skydiving situation with a main parachute and a reserve parachute."[37] He and a partner strap cameras to their bodies to film the chute's deployment, which enables the manufacturers to look for problems. Not all of the parachute design iterations end up working as planned. In fact, only nine out of fifty designs he's tested have actually been produced.

By trying a number of very different designs or making successive improvements and changes in the same design, frequent design iterations reduce uncertainty and improve understanding. Simply put, the more prototypes you build, the more likely you are to learn what works and what doesn't. Also, when designers and engineers build a number of prototypes, they are less likely to fall in love with a particular prototype. Instead, they'll be more concerned with improving the product or technology as much as they can. Testing speeds up and improves the innovation process, too. When two very different design prototypes are tested against each other, or the new design iteration is tested against the previous iteration, product design strengths and weaknesses quickly become apparent. Likewise, testing uncovers errors early in the design process when they are easiest to correct. Finally, testing accelerates learning and understanding by forcing engineers and product designers to examine hard data about product performance. When there's hard evidence that prototypes are testing well, the confidence of the design team grows. Also, personal conflict between design team members is less likely when testing focuses on hard measurements and facts rather than personal hunches and preferences.

Milestones are formal project review points used to assess progress and performance. For example, a company that has put itself on a 12-month schedule to complete a project might schedule milestones at the 3-month, 6-month, and 9-month points on the schedule. By making people regularly assess what they're doing, how well they're performing, and whether they need to take corrective action, milestones provide structure to the general chaos that follows technological discontinuities.

[Milestones] formal project review points used to assess progress and performance

Milestones also shorten the innovation process by creating a sense of urgency that keeps everyone on task. When Florida Power & Light was building its first nuclear power facility, the company's construction manager passed out 2,000 desk calendars to company employees, construction contractors, vendors, and suppliers to ensure that everyone involved in the project was aware of the construction timeline. Contractors that regularly missed deadlines were replaced.[38] Finally, milestones are beneficial for innovation because meeting regular milestones builds momentum by giving people a sense of accomplishment.

A 90,000-Member Idea Machine

In an effort to tap unaffiliated scientific talent and expertise, companies are turning to the likes of InnoCentive. Funded and launched by Eli Lilly in 2001, InnoCentive now boasts an army of 90,000 scientists willing to tackle problems posted to its website by companies (called "Seekers") like Procter & Gamble, DuPont, and Boeing. Seekers pay Solvers anywhere from $10,000 to $100,000 per solution. The purpose of the site is to spur innovation in chemistry, biology, biochemistry, and materials science. Keep your eyes on the trend of using financial awards to spur innovative thinking.[39]

Multifunctional teams are work teams composed of people from different departments. Multifunctional teams accelerate learning and understanding by mixing and integrating technical, marketing, and manufacturing activities. By involving all key departments in development from the start, multifunctional teams speed innovation through early identification of new ideas or problems that would typically not have been generated or addressed until much later.

At Ford, researchers, who dream up and test ideas, and product engineers, who find ways to get them to work, usually work in separate buildings. But to design the hybrid Escape, they worked side by side in cubicles for over 3 years. Team member Tom Gee says, "Before, it might have been a half mile apart, but even one building away is a barrier compared with what we have now. It makes a huge difference."[40] Working side by side was critical to figuring out how to prevent the battery from being damaged by overcharging in cold weather. Ford's researchers and engineers solved the problem by designing sensors and software that monitor the energy sent to the battery (when the gas engine is being used) 50,000 times per second, making sure that the energy is sufficient to recharge the battery but not enough to damage it.

Powerful leaders provide the vision, discipline, and motivation to keep the innovation process focused, on time, and on target. Powerful leaders are able to get resources when they are needed, are typically more experienced, have high status in the company, and are held directly responsible for the products' success or failure.

[Multifunctional teams] work teams composed of people from different departments

On average, powerful leaders can get innovation-related projects done 9 months faster than leaders with little power or influence.

One such powerful leader was Phil Martens, the former head of Ford's product development. With a year to go before introduction and Ford's hybrid Escape months behind schedule, he told the team, "We are going to deliver on time. . . . Anything you need you'll get."[41] Martens said, "You could have heard a pin drop." But he followed this declaration by strongly supporting the team. Except for daily inquiries from above, he promised no interruptions or interference from anyone—even top management. When the team members needed something, they got it without waiting. When language differences created problems with the Japanese company that made the hybrid's batteries, "a Ford battery expert fluent in Japanese was dispatched to Japan within 24 hours."[42] Martens said, "I allowed them to be entrepreneurial, and they doubled their productivity." Mary Ann Wright, the launch manager charged with making sure the project stayed on schedule, said, "The same people who had been coming into my office saying, 'I don't know how we're going to get there,' were saying within weeks and months, 'My God, we can get there.'"[43]

2.3 Compression Approach: Managing Innovation during Incremental Change

Whereas the experiential approach is used to manage innovation in highly uncertain environments during periods of discontinuous change, the compression approach is used to manage innovation in more certain environments during periods of incremental change, as shown in Exhibit 7.6. Whereas the goals of the experiential approach are significant improvements in performance and the establishment of a *new* dominant design, the goals of the compression approach are lower costs and incremental improvements in the performance and function of the *existing* dominant design.

The general strategies in each approach are different, too. With the experiential approach, the general strategy is to build something new, different, and substantially better. Because there's so much uncertainty—no one knows which technology will become the market leader—companies adopt a winner-take-all approach by trying to create the market-leading, dominant design. With the compression approach, the general strategy is to compress the time and steps needed to bring about small, consistent improvements in performance and functionality. Because a dominant technology design already exists, the general strategy is to continue improving the existing technology as rapidly as possible.

In short, a **compression approach to innovation** assumes that innovation is a predictable process, that incremental innovation can be planned using a series of steps, and that compressing the time it takes to complete those steps can speed up innovation. As Exhibit 7.6 shows, the compression approach to innovation has five aspects: planning, supplier involvement, shortening the time of individual steps, overlapping steps, and multifunctional teams.[44]

In Chapter 5, *planning* was defined as choosing a goal and a method or strategy to achieve that goal. When *planning for incremental innovation*, the goal is to squeeze or compress development time as much as possible, and the general strategy is to create a series of planned steps to accomplish that goal. Planning for incremental innovation helps avoid unnecessary steps and enables developers to sequence steps in the right order to avoid wasted time and delays between steps. Planning also reduces misunderstandings and improves coordination.

Most planning for incremental innovation is based on the idea of generational change. **Generational change** occurs when incremental improvements are made to a dominant technological design such that the improved version of the technology is

[Compression approach to innovation] an approach to innovation that assumes that incremental innovation can be planned using a series of steps and that compressing those steps can speed innovation

[Generational change] change based on incremental improvements to a dominant technological design such that the improved technology is fully backward compatible with the older technology

fully backward compatible with the older version.[45] Software is backward compatible if a new version of the software will work with files created by older versions. One of the expected and important features of gaming machines like PlayStation 3, Xbox 360, and the Nintendo Wii is their ability to play games purchased for earlier machines. In fact, the latest Game Boy can play games released more than 20 years ago. Backward compatibility is an important component of ensuring the success of new technology. When developing its PlayStation 3 (PS3), Sony decided to reduce the game machine's backward compatibility with its predecessor, the PlayStation 2 (PS2), because of production costs. Making the PS3 units fully compatible would have required including a high-end technology chip for PS2 games and one for PS3 games, which would have significantly added to the costs of the new unit. Designers opted instead to load software into the PS3 chip that would allow the new system to play older games. But not all PS2 games worked with the software, and often when PS2 games were played on the PS3 machines, the screens would freeze or the system would lock up. Adding to that frustration, dedicated PS3 games were not rolled out as quickly as expected. As you can imagine, Sony paid the price in reduced sales and angry consumers.[46]

Because the compression approach assumes that innovation can follow a series of preplanned steps, one of the ways to shorten development time is *supplier involvement*. Delegating some of the preplanned steps in the innovation process to outside suppliers reduces the amount of work that internal development teams must do. Plus, suppliers provide an alternative source of ideas and expertise that can lead to better designs. **Rowmark** produces thin plastic sheets that can be engraved or shaped by a thermoforming process. In an effort to improve the performance of its product, lower raw material costs, and avoid supply disruptions, it recruits the companies who supply its resin and additives to participate in the product design and manufacturing processes. Eric Hausserman, Rowmark's vice president for manufacturing and technology, points out, "We see our suppliers as partners in every sense of the term."[47] In general, the earlier suppliers are involved, the quicker they catch and prevent future problems, such as unrealistic designs or mismatched product specifications.

Another way to shorten development time is simply to *shorten the time of individual steps* in the innovation process. A common way to do that is through computer-aided design (CAD). CAD speeds up the design process by allowing designers and engineers to make and test design changes using computer models rather than physically testing expensive prototypes. CAD also speeds innovation by making it easy to see how design changes affect engineering, purchasing, and production. Karenann Terrell, director of e-business strategy at Chrysler, explains how the company's CAD system, FASTCAR, works:

> *FastCar takes a virtual CAD/CAM design and teams it with all the other information that we already have on hand about the part or vehicle. So, no longer do we change a part and then ask: "How much do those new components cost? What are the quality implications?" As we make changes, all that information is integrated into the new designs. Think of the side of a sedan where the hood and fender come together . . . when we brought them together in a digital mock-up, there was a bigger gap than we wanted. Using FastCar technology, we were able to work out the effects of a proposed design change before it was made. In this case, we notified the engineers of the fender and hood, as well as the supplier of a plastic attachment in the wheel well. That vendor said: "If you make that change, I need to cut a new tool, which will cost you lots of money. Why don't I just move my fastening point? Then you don't have a gap." So we didn't have to make a design change. In the old world, it would have been four or five weeks before we knew about the supplier's tool change.*[48]

In a sequential design process, each step must be completed before the next step begins. But sometimes multiple development steps can be performed at the same time. *Overlapping steps* shorten the development process by reducing delays or waiting time between steps. For example, Warner Bros. is using overlapping steps to reduce the time it will take to make the entire series of seven *Harry Potter* films—one for each of the seven books in J. K. Rowling's series chronicling the seven years the title character is at Hogwarts School of Witchcraft and Wizardry. Unfortunately, it was taking Warner Bros. more than 2 years to write, shoot, and produce each movie. All the actors were aging and would soon resemble adults more than high school students. So Warner Bros. decided to use new directors and new production teams for each of the movies in the *Harry Potter* series. That way, the company could begin shooting the next film while the previous one was in postproduction and the one prior to that was in the theaters. For example, while *Harry Potter and the Half Blood Prince* was released in July 2009, the seventh book, *Harry Potter and the Deathly Hallows*, was already in production so that it could be released in two parts, the first in 2010 and the second in 2011.[49] Without this effort, young Harry Potter might have been in his early 30s by the time of the seventh and final movie.[50]

Managing Innovation To successfully manage innovation streams, companies must manage the sources of innovation and learn to manage innovation during both discontinuous and incremental change. Since innovation begins with creativity, companies can manage the sources of innovation by supporting a creative work environment in which creative thoughts and ideas are encouraged. Creative work environments provide challenging work; offer organizational, supervisory, and work group encouragement; allow significant freedom; and remove organizational impediments to creativity.

Companies that succeed in periods of discontinuous change typically follow an experiential approach to innovation. The experiential approach assumes that intuition, flexible options, and hands-on experience can reduce uncertainty and accelerate learning and understanding. This approach involves frequent design iterations, frequent testing, regular milestones, creation of multifunctional teams, and use of powerful leaders to guide the innovation process. A compression approach to innovation works best during periods of incremental change. This approach assumes that innovation can be planned using a series of steps and that compressing the time it takes to complete those steps can speed up innovation. The five aspects of the compression approach are planning (generational change), supplier involvement, shortening the time of individual steps (computer-aided design), overlapping steps, and multifunctional teams.

REVIEW 2

ORGANIZATIONAL CHANGE

Four years ago, **EMI**, the fourth-largest music publisher in the world, invited some of its teenage customers to its London headquarter to talk to its managers about their music preferences and habits. At the end of the discussion, the EMI managers thanked them by telling them to please take whatever CDs they wanted from a nearby table. But, even though they were free, not one CD was taken. That, said someone from EMI, "Was the moment we realized the game was completely up."[51] While CD sales still account for over 85 percent of music sales in the United States, those sales are dropping sharply, from 449.2 million CDs in

2007 to 360.6 million CDs in 2008, the last years for which full data were available.[52] Similar declines occurred in Britain, Japan, France, Spain, Italy, Australia, and Canada. The increase in sales from digital music downloads, however, was not enough to overcome the drop in CD sales. Why? Because a consumer purchasing a CD buys an album, typically ten songs per CD, while a consumer purchasing downloaded music typically buys one song at a time. The decline in CD sales will be incredibly difficult for the music companies to overcome. With CD sales down, retailers like Wal-Mart are now dedicating 30 percent less floor space to CD sales. Publishers like EMI, which are losing hundreds of millions of dollars each year, no longer have the marketing budgets and resources to publicize bands and their music. Finally, advances in recording and publishing technology have made it easy for major artists like Madonna, the Eagles, or Radiohead to sell or release their music directly to consumers without the music companies.[53]

It's no surprise the music companies are struggling. CD sales have been declining ever since Naptser made it possible to download digital music without paying for it, and even more since iTunes made it possible to download one song at a time for just 99 cents. Yet the music companies have been unable to change their business quickly enough to stop the bleeding. Indeed, businesses operate in a constantly changing environment. Recognizing and adapting to internal and external changes can mean the difference between continued success and going out of business. Companies that fail to change run the risk of organizational decline. Music companies' inability to change may eventually lead to their demise.

After reading the next two sections on organizational change, you should be able to

3. discuss why not changing can lead to organizational decline.
4. discuss the different methods that managers can use to better manage change as it occurs.

3 ORGANIZATIONAL DECLINE: THE RISK OF NOT CHANGING

Businesses operate in a constantly changing environment. Recognizing and adapting to internal and external changes can mean the difference between continued success and going out of business. Companies that fail to change run the risk of organizational decline.[54] **Organizational decline** occurs when companies don't anticipate, recognize, neutralize, or adapt to the internal or external pressures that threaten their survival. In other words, decline occurs when organizations don't recognize the need for change. **General Motors'** loss of market share in the automobile industry (from 52 percent to 22 percent) is an example of organizational decline.[55] There are five stages of organizational decline: blinded, inaction, faulty action, crisis, and dissolution.

In the *blinded stage*, decline begins because key managers fail to recognize the internal or external changes that will harm their organizations. This blindness may be due to a simple lack of awareness about changes or an inability to understand their significance. It may also come from the overconfidence that can develop when a company has been successful. Blinded by its status as the world's largest car maker,

[Organizational decline] a large decrease in organizational performance that occurs when companies don't anticipate, recognize, neutralize, or adapt to the internal or external pressures that threaten their survival

General Motors was confident that with its enormous marketing and research and development budget, it could afford to offer many options for its customers. Its strategy of offering consumers seventy different car models across eight separate brands was based on the strategy chosen by its legendary chairman, Alfred P. Sloan, to offer a "car for every purse and purpose."[56] Gerald Meyers, the former CEO of American Motors Corporation (which was purchased by Chrysler), said, "Nobody else could cover the whole range of the marketplace like GM, not Ford, not Chrysler."[57] But the reasons for GM's success eventually became the reasons for its failure. According to Meyers, strategies and approaches that had once made GM innovative and progressive "became a millstone on the whole company." GM's management failed to see the trend toward smaller, reliable, more fuel-efficient vehicles built by its Japanese-based rivals, Honda, Toyota, and Nissan, which, together, eventually built more than a dozen auto assembly facilities in the United States as their market share grew and GM's declined.

In the *inaction stage*, as organizational performance problems become more visible, management may recognize the need to change but still take no action. The managers may be waiting to see if the problems will correct themselves. Or, they may find it difficult to change the practices and policies that previously led to success. Possibly, too, they wrongly assume that they can easily correct the problems, so they don't feel the situation is urgent. Indeed, just 10 months before declaring bankruptcy, then CEO Rick Wagoner said, "What exposes us to failure now is not our product lineup, or our business plan, or our long-term strategy," suggesting that the slowdown in the economy was the sole reason for GM's problems.[58] But even before then, GM's engineers and managers, if they had taken action, would have been well ahead of their competitors. For example, GM's engineers were designing minivans a decade before Chrysler brought the first minivan to market. Likewise, GM began work on hybrid car technology in the early 1990s, well ahead of Toyota, which has now sold over 600,000 Prius hybrid cars. However, GM never followed through. Former GM CEO Robert Stempel said, "I'm furious. GM had the [hybrid] technology. The lead was there. I know it."[59]

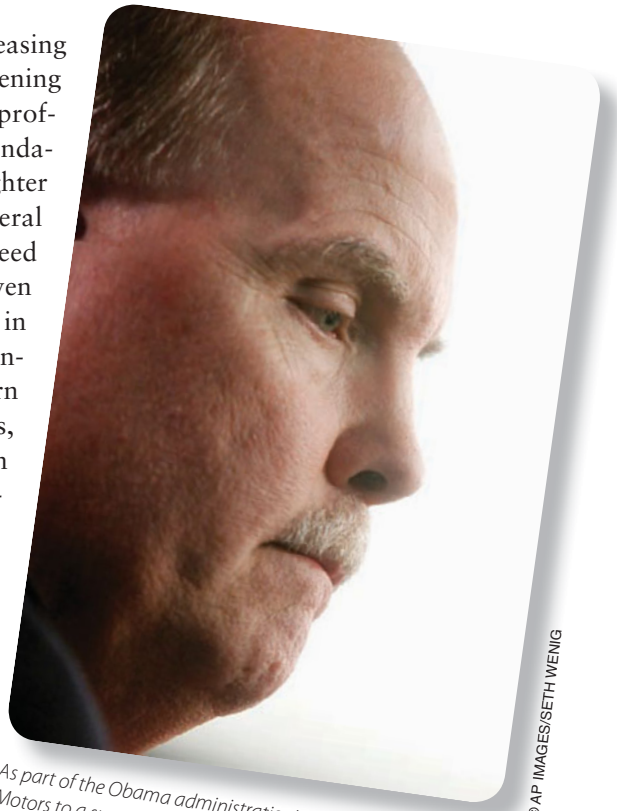
In the *faulty action stage*, faced with rising costs and decreasing profits and market share, management will announce belt-tightening plans designed to cut costs, increase efficiency, and restore profits. In other words, rather than recognizing the need for fundamental changes, managers assume that if they just run a tighter ship, company performance will return to previous levels. General Motors fit this pattern, too. Rather than reexamine the basic need for change, GM's management focused on cost cutting. But even that didn't take hold immediately. After losing $8.65 billion in 2005, 4 years before declaring bankruptcy, GM continued to invest billions in its small car brands, like Saturn, hoping to turn sales around. Only when GM reported a $15.5 billion loss, 2 years later, did it make the commitment to cut $10 billion in expenses by killing its Oldsmobile brand, closing unneeded assembly plants, and laying off workers.[60] Still, killing off other brands was, according to then CEO Wagoner, "not a thoughtful discussion."[61] Furthermore, he declared, speculations about bankruptcy "don't help anything and are completely inaccurate." Unfortunately for GM, cost-cutting moves were too little, too late, particularly with the company burning cash at the rate of a billion dollars a month.



As part of the Obama administration's plan to shrink General Motors to a sustainable size and give a majority ownership stake to the federal government, former CEO Rick Wagoner was replaced with Fritz Henderson, pictured.

In the *crisis stage*, bankruptcy or dissolution (breaking up the company and selling its parts) is likely to occur unless the company completely reorganizes the way it does business. At this point, however, companies typically lack the resources to fully change how they run their businesses. Cutbacks and layoffs will have reduced the level of talent among employees. Furthermore, talented managers who were savvy enough to see the crisis coming will have found jobs with other companies, often with competitors. Because of rising costs and lower sales, cash is tight. And lenders and suppliers are unlikely to extend further loans or credit to ease the cash crunch. The cash crunch, together with an inability to raise capital, prompted General Motors to approach Congress for a bailout. GM then burned through $20 billion in government-provided funds *before* filing for bankruptcy, at which point it received another $30 billion in government funding.[62]

In the *dissolution stage*, after failing to make the changes needed to sustain the organization, the company is dissolved through bankruptcy proceedings or by selling assets in order to pay suppliers, banks, and creditors. GM's bankruptcy on June 1, 2009, was the second largest in history. At the time of the filing, GM had 235,000 employees (91,000 in the United States) to which it was paying $476 million a month in salaries and benefits. At this point in organizational decline, a new CEO may be brought in to oversee the closing of stores, offices, and manufacturing facilities, the final layoff of managers and employees, and the sale of assets. Indeed, CEO Rick Wagoner was replaced by Fritz Henderson, who, unlike Wagoner, acknowledged that bankruptcy was possible. Henderson began an aggressive cost-cutting plan to lay off nearly 30,000 factory workers and 10,000 white-collar employees and close 17 factories and parts centers.[63]

It is important to note that decline is reversible at each of the first four stages, and that not all companies in decline reach final dissolution. For example, GM is trying to aggressively cut costs, stabilize its shrinking market share, and use innovative production techniques in an effort to reverse a decline that has lasted nearly a decade and resulted in all-time-low stock prices.

REVIEW 3

Organizational Decline: The Risk of *Not* Changing The five-stage process of organizational decline begins when organizations don't recognize the need for change. In the blinded stage, managers fail to recognize the changes that threaten their organization's survival. In the inaction stage, management recognizes the need to change but doesn't act, hoping that the problems will correct themselves. In the faulty action stage, management focuses on cost cutting and efficiency rather than facing up to the fundamental changes needed to ensure survival. In the crisis stage, failure is likely unless fundamental reorganization occurs. Finally, in the dissolution stage, the company is dissolved through bankruptcy proceedings; by selling assets to pay creditors; or through the closing of stores, offices, and facilities. If companies recognize the need to change early enough, however, dissolution may be avoided.

4 MANAGING CHANGE

According to social psychologist Kurt Lewin, change is a function of the forces that promote change and the opposing forces that slow or resist change.[64] **Change forces** lead to differences in the form, quality, or condition of an organization over time. By contrast, **resistance forces** support the status quo, that is, the existing conditions in an organization. Change is difficult under any circumstances. In a study of heart bypass patients, doctors told participants straightforwardly to change their eating and health habits or they would die. Unbelievably, a full 90 percent of participants did *not* change their habits at all![65] This fierce resistance to change also applies to organizations.

Resistance to change is caused by self-interest, misunderstanding and distrust, and a general intolerance for change.[66] People resist change out of *self-interest* because they fear that change will cost or deprive them of something they value. For example, resistance might stem from a fear that the changes will result in a loss of pay, power, responsibility, or even perhaps one's job. People also resist change because of *misunderstanding and distrust*; they don't understand the change or the reasons for it, or they distrust the people—typically management—behind the change. Resistance isn't always visible at first. In fact, some of the strongest resisters may initially support the changes in public, nodding and smiling their agreement, but then ignore the changes in private and do their jobs as they always have. Management consultant Michael Hammer calls this deadly form of resistance the "Kiss of Yes."[67]

Resistance may also come from a generally low tolerance for change. Some people are simply less capable of handling change than others. People with a *low tolerance for change* feel threatened by the uncertainty associated with change and worry that they won't be able to learn the new skills and behaviors needed to successfully negotiate change in their companies.

Because resistance to change is inevitable, successful change efforts require careful management. In this section, you will learn about **4.1 managing resistance to change, 4.2 what not to do when leading organizational change,** and **4.3 different change tools and techniques.**

[Change forces] forces that produce differences in the form, quality, or condition of an organization over time

[Resistance forces] forces that support the existing state of conditions in organizations

[Resistance to change] opposition to change resulting from self-interest, misunderstanding and distrust, or a general intolerance for change

[Unfreezing] getting the people affected by change to believe that change is needed

[Change intervention] the process used to get workers and managers to change their behavior and work practices

4.1 Managing Resistance to Change

According to Kurt Lewin, managing organizational change is a basic process of unfreezing, change intervention, and refreezing. **Unfreezing** is getting the people affected by change to believe that change is needed. During the **change intervention**

itself, workers and managers change their behavior and work practices. **Refreezing** is supporting and reinforcing the new changes so that they stick.

Resistance to change is an example of frozen behavior. Given the choice between changing and not changing, most people would rather not change. Because resistance to change is natural and inevitable, managers need to unfreeze resistance to change to create successful change programs. The following methods can be used to manage resistance to change: education and communication, participation, negotiation, top-management support, and coercion.[68]

When resistance to change is based on insufficient, incorrect, or misleading information, managers should *educate* employees about the need for change and *communicate* change-related information to them. Managers must also supply the information and funding or other support employees need to make changes. For example, resistance to change can be particularly strong when one company buys another company. This is because one company in the merger usually has a higher status due to its size, or higher profitability, or the fact that it is the acquiring company. These status differences are important to managers and employees, particularly if they're in the lower-status company, who worry about retaining their jobs or influence after the merger. And that fear or concern can greatly increase resistance to change.[69] To avoid such a scenario, New York–Presbyterian Healthcare System reduced resistance to change by designating mentors to coach individuals, groups, and departments in newly acquired companies about its procedures and practices. New York–Presbyterian's Diane Iorfida said at the time, "Keeping employees informed every step of the way is so important. It's also important to tell the truth, whatever you do. If you don't know, say you don't know."[70]

Another way to reduce resistance to change is to have those affected by the change *participate in planning and implementing the change process*. Employees who participate have a better understanding of the change and the need for it. Furthermore, employee concerns about change can be addressed as they occur if employees participate in the planning and implementation process. The **San Diego Zoo** and Wild Animal Park took innovative steps in order to reposition itself as a leader in conservation. A core element of the planning was input from the zoo's staff, as the strategy team invited employees from all departments to provide insights on what they felt the zoo did well and what it could do better. Through this process, the zoo enacted a plan that would highlight its internal resources and capabilities through an expansion of its consulting business, the use of facilities to display sustainable technology and products, and hosting events that would highlight the knowledge of zoo scientists.[71]

Employees are also less likely to resist change if they are allowed *to discuss and agree on who will do what* after change occurs. When Best Buy, the electronics superstore chain, started **http://www.blueshirtnation.com**—its retail associates all wear short-sleeved blue shirts—it was simply trying to get employees to share good advertising ideas. But Steve Bendt, who helped start the website, said: "We found out real fast that employees didn't want to play that game. Instead, they gave us new rules and told us what they wanted on the site and at the company. We shut up pretty quickly and realized we needed to just listen."[72] What happed on the website is that the employees who were into photography communicated and shared ideas, as did those who were into computers, home networking, video games, or high-definition TVs and entertainment systems. And, because they, not management, controlled the conversations, they began discussing how to solve store problems. For example, after an employee put together a floor display case for a digital camera that was much too large, he posted a picture to see if other stores had the same problem. When others agreed it was an issue, display designers at headquarters realized their mistake and sent out the right-sized display. Similar discussions in which employees complained that not having Best Buy e-mail accounts made it difficult for them to communicate with each other or follow up with customers led the company to give all full-time employees company e-mail accounts.

All Disney animators went through a 6-month "CG Boot Camp," where they learned how to draw animated characters with computers.

Resistance to change also decreases when change efforts receive *significant managerial support*. Managers must do more than talk about the importance of change, though. They must provide the training, resources, and autonomy needed to make change happen. For example, with a distinguished 70-year history of hand-drawing Hollywood's most successful animated films (*Snow White, Bambi, The Little Mermaid, Beauty and the Beast*), animators at Walt Disney Company naturally resisted the move to computer-generated (CG) animation. David Stainton, chief of animation, says his animators "fundamentally worry that, 20 years from now, nobody will know how to draw. They're afraid they won't be able to express their skill to the same level."[73] Animator Glen Keane worried that "I would have to go backwards from what I do by hand."[74] So Stainton told his animators, "Your talent really lies in . . . your ability to bring characters to life," and that can be done through drawing or computers.[75] Disney supported the difficult change by putting all of its animators through a 6-month "CG Boot Camp," where they learned how to draw animated characters with computers.

Finally, resistance to change can be managed through **coercion**, or the use of formal power and authority to force others to change. Because of the intense negative reactions it can create (e.g., fear, stress, resentment, sabotage of company products), coercion should be used only when a crisis exists or when all other attempts to reduce resistance to change have failed. Exhibit 7.7 summarizes some additional suggestions for what managers can do when employees resist change.

4.2 What *Not* to Do When Leading Change

So far, you've learned about the basic change process (unfreezing, change, refreezing) and managing resistance to change. Harvard Business School professor John Kotter argues that knowing what *not* to do is just as important as knowing what to do when it comes to achieving successful organizational change.[76]

8. Not anchoring changes in the corporation's culture.

Source: J. P. Kotter, "Leading Change: Why Transformation Efforts Fail," *Harvard Business Review* 73, no. 2 (March–April 1995): 59.

Exhibit 7.8 shows the most common errors that managers make when they lead change. The first two errors occur during the unfreezing phase, when managers try to get the people affected by change to believe that change is really needed. The first and potentially most serious error is *not establishing a great enough sense of urgency*. Indeed, Kotter estimates that more than half of all change efforts fail because the people affected are not convinced that change is necessary. People will feel a greater sense of urgency if a leader in the company makes a public, candid assessment of the company's problems and weaknesses. **Celestica, Inc.**, located in Toronto, Canada, is an electronics manufacturing services company that produces complex printed circuit assemblies, such as PC motherboards and networking cards, flat-screen TVs, and Xbox video game systems for Microsoft. When Craig Muhlhauser took over as president and CEO, Celestica, Inc. was losing money and market share. Muhlhauser went to work right away. He informed employees that the company couldn't survive if it didn't change. Within his first 30 days as CEO, he reduced staff by 35 percent, moved new people into important positions, and had everyone in the company's attention.[77]

The second mistake that occurs in the unfreezing process is *not creating a powerful enough coalition*. Change often starts with one or two people. But change has to be supported by a critical and growing group of people to build enough momentum to change an entire department, division, or company. Besides top management, Kotter recommends that key employees, managers, board members, customers, and even union leaders be members of a *core change coalition* that guides and supports organizational change. "In a turnaround, there are three kinds of employees," said Celestica's CEO Craig Muhlhauser—those on your side, those on the fence, and those who will never buy in. The latter have to be let go and those on the fence should be persuaded to contribute or leave. Says Muhlhauser, "We have to make change, change is difficult and as we make change, it is important to realize that there are people who are going to resist that change. In talking to those people, the objective is to move everybody into the column of supporters. But that is probably unachievable."[78] It's also important to strengthen this core change coalition's resolve by periodically bringing its members together for off-site retreats.

The next four errors that managers make occur during the change phase, when a change intervention is used to try to get workers and managers to change their behavior and work practices. *Lacking a vision* for change is a significant error at this point. As you learned in Chapter 5, a *vision* (defined as a *purpose statement* in Chapter 5) is a statement of a company's purpose or reason for existing. A vision for change makes clear where a company or department is headed and why the

change is occurring. Change efforts that lack vision tend to be confused, chaotic, and contradictory. By contrast, change efforts guided by visions are clear and easy to understand and can be effectively explained in 5 minutes or less. **Procter & Gamble's** beauty and grooming division accounts for one-third of P&G's global sales. But with beauty sales down 4 percent and grooming sales down 7 percent, division chief Ed Shirley has introduced a clear vision for changing the division. Said Shirley, "Our principal beauty focus has been winning with women, yet we're not broadly serving male consumers' needs outside of Gillette and fine fragrances."[79] The change, he said, "will require a cultural shift" as well as a change in the organizational structure based on gender, rather than products, "to better serve 'Him and Her.'"[80]

Undercommunicating the vision by a factor of 10 is another mistake in the change phase. According to Kotter, companies mistakenly hold just one meeting to announce the vision. Or, if the new vision receives heavy emphasis in executive speeches or company newsletters, senior management then undercuts the vision by behaving in ways contrary to it. Successful communication of the vision requires that top managers link everything the company does to the new vision and that they "walk the talk" by behaving in ways consistent with the vision. Furthermore, even companies that begin change with a clear vision sometimes make the mistake of *not removing obstacles to the new vision*. They leave formidable barriers to change in place by failing to redesign jobs, pay plans, and technology to support the new way of doing things. One of Celestica's key obstacles was efficiently and effectively managing its supply chain; it worked with 4,000 suppliers around the world. The complexity of this supply chain network and the costs of uncoordinated transportation and shipping reduced the speed with which it could meet customer orders and made it difficult to keep costs low. CEO Craig Muhlhauser and his management team removed this obstacle by implementing Liveshare, an information system that gave it and its suppliers real-time data on sales, production, inventory, and shipping for all of its products. For example, if Best Buy wanted to buy more units of a hot-selling video game, it used to have to contact Celestica via phone, e-mail, or fax to see how quickly the order could be delivered. But now with Liveshare, it can see live, up-to-date numbers indicating how many of those video games are rolling off Celestica's production lines or are now on trucks in route to Best Buy trucking depots.[81]

Another error in the change phase is *not systematically planning for and creating short-term wins*. Most people don't have the discipline and patience to wait 2 years to see if the new change effort works. Change is threatening and uncomfortable, so people need to see an immediate payoff if they are to continue to support it. Kotter recommends that managers create short-term wins by actively picking people and projects that are likely to work extremely well early in the change process. Celestica's Craig Muhlhauser understood the important of short-term wins. Said Muhlhauser, "My approach was to look at the first 30 days, then at the first 3 months, then at the first 12 months and then I took a look at the 3 years. In a turnaround, you have to take hold very quickly. You have to show relatively quick hits [i.e., short-term wins] to show your turnaround strategy is working—and then you deal with a multitude of issues in a very focused way that will allow you to continue to show improvement."[82]

The last two errors that managers make occur during the refreezing phase, when attempts are made to support and reinforce changes so that they stick. *Declaring victory too soon* is a tempting mistake in the refreezing phase. Managers typically declare victory right after the first large-scale success in the change process. Declaring success too early has the same effect as draining the gasoline out of a car: It stops change efforts dead in their tracks. With success declared, supporters of the change process stop pushing to make change happen. After all, why push when success

has been achieved? Rather than declaring victory, managers should use the momentum from short-term wins to push for even bigger or faster changes. This maintains urgency and prevents change supporters from slacking off before the changes are frozen into the company's culture.

The last mistake that managers make is *not anchoring changes in the corporation's culture*. An o*rganization's culture* is the set of key values, beliefs, and attitudes shared by organizational members that determines the accepted way of doing things in a company. As you learned in Chapter 3, changing cultures is extremely difficult and slow. According to Kotter, two things help anchor changes in a corporation's culture. The first is directly showing people that the changes have actually improved performance. At Celestica, this was demonstrated by the quick increase in quarterly profits, which led to a 60 percent increase in its stock price.[83] The second is to make sure that the people who get promoted fit the new culture. If they don't, it's a clear sign that the changes were only temporary. To anchor this change, Muhlhauser created a culture of meritocracy that rewarded managers and employees for their contributions. The rewards have come in the form of promotions, pay increases, and huge bonuses. Customer satisfaction has improved. With the increasing demand for consumer products, such as smart phones, employees are excited about the prospects for Celestica. "We've got some new programs in the pipeline so we're optimistic about our ability to compete in and win in that market," said CEO Craig Muhlhauser.[84]

4.3 Change Tools and Techniques

Imagine that your boss came to you and said, "All right, genius, you wanted it. You're in charge of turning around the division." Where would you begin? How would you encourage change-resistant managers to change? What would you do to include others in the change process? How would you get the change process off to a quick start? Finally, what approach would you use to promote long-term effectiveness and performance? Results-driven change, the General Electric workout, transition management teams, and organizational development are different change tools and techniques that can be used to address these issues.

One of the reasons that organizational change efforts fail is that they are activity-oriented rather than results-oriented. In other words, they focus primarily on changing company procedures, management philosophy, or employee behavior. Typically, there is much buildup and preparation as consultants are brought in, presentations are made, books are read, and employees and managers are trained. There's a tremendous emphasis on doing things the new way. But, with all the focus on "doing," almost no attention is paid to *results*, to seeing if all this activity has actually made a difference.

By contrast, **results-driven change** supplants the emphasis on activity with a laser-like focus on quickly measuring and improving results.[85] Top managers at Hyundai knew that if they were to compete successfully against the likes of Honda and Toyota, they would have to substantially improve the quality of their cars. So top managers guided the company's results-driven change process by first increasing the number of quality teams from 100 to 865. Then, all employees were required to attend seminars on quality improvement and use the results of industry quality studies, like those published annually by J. D. Power and Associates, as their benchmark. Hyundai then measured the effects of the focus on quality. Before the change, a new Hyundai averaged 23.4 initial quality problems; after the results-driven change efforts, that number dropped to 9.6.[86] Today, Hyundai ranks fourth, according to J. D. Power and Associates, in initial car quality behind luxury brands Lexus, Porsche, and Cadillac.[87]

[Results-driven change] change created quickly by focusing on the measurement and improvement of results

As a result of the superb quality of its cars, Hyundai's global sales actually rose 5 percent during the global recession when nearly every other auto manufacturer, including Toyota and Honda, saw their sales drop 25 percent to 35 percent.[88] Another advantage of results-driven change is that managers introduce changes in procedures, philosophy, or behavior only if they are likely to improve measured performance. In other words, managers and workers actually test to see if changes make a difference. Consistent with this approach, Hyundai invested $30 million in a test center where cars could be subjected to a sequence of extremely harsh conditions for as long as they could withstand them, allowing engineers to pinpoint defects and fix the problems.[89]

A third advantage of results-driven change is that quick, visible improvements motivate employees to continue to make additional changes to improve measured performance. A few years into Hyundai's change process, Chrysler and Mitsubishi Motors announced that they would use Hyundai-designed four-cylinder engines in their small and midsized cars, reinforcing that all the changes Hyundai had made to the way it measured and improved car quality had been worth the effort.[90] As at Hyundai, the quick successes associated with results-driven change can be particularly effective at reducing resistance to change. Exhibit 7.9 describes the basic steps of results-driven change.

[General Electric workout] a three-day meeting in which managers and employees from different levels and parts of an organization quickly generate and act on solutions to specific business problems

The **General Electric workout** is a special kind of results-driven change. The "workout" involves a 3-day meeting that brings together managers and employees from different levels and parts of an organization to quickly generate and act on solutions to specific business problems.[91] On the first morning, the boss discusses the agenda and targets specific business problems that the group will solve. Then, the boss leaves and an outside facilitator breaks the group (typically 30 to 40 people) into five or six teams and helps them spend the next day and a half discussing and debating solutions.

On day three, in what GE calls a "town meeting," the teams present specific solutions to their boss, who has been gone since day one. As each team's spokesperson makes specific suggestions, the boss has only three options: agree on the spot, say no, or ask for more information so that a decision can be made by a specific, agreed-on date. GE boss Armand Lauzon sweated his way through a town meeting. To encourage him to say yes, his workers set up the meeting room to put pressure on Lauzon. He says, "I was wringing wet within half an hour. They had 108 proposals, I had about a minute to say

EXHIBIT 7.9 Results-Driven Change Programs

- Management should create measurable, short-term goals to improve performance.
- Management should use action steps only if they are likely to improve measured performance.
- Management should stress the importance of immediate improvements.
- Consultants and staffers should help managers and employees achieve quick improvements in performance.
- Managers and employees should test action steps to see if they actually yield improvements. Action steps that don't should be discarded.
- It takes few resources to get results-driven change started.

yes or no to each one, and I couldn't make eye contact with my boss without turning around, which would show everyone in the room that I was chicken."[92] In the end, Lauzon agreed to all but eight suggestions. Furthermore, once those decisions were made, no one at GE was allowed to overrule them.

While the GE workout clearly speeds up change, it may also fragment change if different managers approve conflicting suggestions in separate town meetings across a company. By contrast, a transition management team provides a way to coordinate change throughout an organization. A **transition management team (TMT)** is a team of eight to twelve people whose full-time job is to manage and coordinate a company's change process.[93] One member of the TMT is assigned to anticipate and manage the emotions and behaviors related to resistance to change. Despite their importance, many companies overlook the impact that negative emotions and resistant behaviors can have on the change process. TMT members report to the CEO every day, decide which change projects are approved and funded, select and evaluate the people in charge of different change projects, and make sure that different change projects complement one another.

For example, when FleetBoston Financial merged with Bank of America (BoA), a TMT was used to quickly implement Six Sigma quality programs (see Chapter 18 for an explanation) throughout the entire merged organization. Six Sigma programs, which eliminate mistakes and improve quality, had already saved BoA $2 billion by cutting the time required to open a new branch from 500 to 350 days, reducing the number of ATM and deposit errors by 88 percent, and cutting the response time on individual retirement accounts from 3 days to 10 minutes. Since BoA had been using Six Sigma for 4 years and FleetBoston for just 2, the goal of the TMT was to ensure that the Six Sigma programs for FleetBoston's half of the merged company would catch up as quickly as possible. The team accomplished this by assigning a Six Sigma expert from BoA to each of FleetBoston's key lines of business. Jim Buchanan, who is in charge of the team, said, "We expect that within two years Fleet will be caught up."[94]

[Transition management team (TMT)] a team of 8 to 12 people whose full-time job is to manage and coordinate a company's change process

It is also important to say what a TMT is *not*. A TMT is not an extra layer of management further separating upper management from lower managers and employees. A TMT is not a steering committee that creates plans for others to carry out. Instead, the members of the TMT are fully involved with making change happen on a daily basis. Furthermore, it's not the TMT's job to determine how and why the company will change. That responsibility belongs to the CEO and upper management. Finally, a TMT is not permanent. Once the company has successfully changed, the TMT is disbanded. Indeed, Bank of America won't need a TMT anymore once everyone in the merged companies has been trained in Six Sigma practices. Exhibit 7.10 lists the primary responsibilities of TMTs.

EXHIBIT 7.10 Primary Responsibilities of Transition Management Teams

1. Establish a context for change and provide guidance.
2. Stimulate conversation.
3. Provide appropriate resources.
4. Coordinate and align projects.
5. Ensure congruence of messages, activities, policies, and behaviors.
6. Provide opportunities for joint creation.
7. Anticipate, identify, and address people problems.
8. Prepare the critical mass.

Organizational development is a philosophy and collection of planned change interventions designed to improve an organization's long-term health and performance. Organizational development takes a long-range approach to change; assumes that top-management support is necessary for change to succeed; creates change by educating workers and managers to change ideas, beliefs, and behaviors so that problems can be solved in new ways; and emphasizes employee participation in diagnosing, solving, and evaluating problems.[95] As shown in Exhibit 7.11,

[Organizational development] a philosophy and collection of planned change interventions designed to improve an organization's long-term health and performance

EXHIBIT 7.11 General Steps for Organizational Development Interventions

1. **Entry**	A problem is discovered and the need for change becomes apparent. A search begins for someone to deal with the problem and facilitate change.
2. **Startup**	A change agent enters the picture and works to clarify the problem and gain commitment to a change effort.
3. **Assessment & feedback**	The change agent gathers information about the problem and provides feedback about it to decision makers and those affected by it.
4. **Action planning**	The change agent works with decision makers to develop an action plan.
5. **Intervention**	The action plan, or organizational development intervention, is carried out.
6. **Evaluation**	The change agent helps decision makers assess the effectiveness of the intervention.
7. **Adoption**	Organizational members accept ownership and responsibility for the change, which is then carried out through the entire organization.
8. **Separation**	The change agent leaves the organization after first ensuring that the change intervention will continue to work.

organizational development interventions begin with the recognition of a problem. Then, the company designates a **change agent** to be formally in charge of guiding the change effort. This person can be someone from the company or a professional consultant. The change agent clarifies the problem, gathers information, works with decision makers to create and implement an action plan, helps to evaluate the plan's effectiveness, implements the plan throughout the company, and then leaves (if from outside the company) after making sure the change intervention will continue to work.

Change agent Hajime Oba is one of the key reasons that Toyota cars are tops in quality and reliability. Oba's job is to work closely with Toyota suppliers, showing them how to increase quality and decrease costs. For example, Michigan Summit Polymers installed a $280,000 paint system with robots and a paint oven to bake paint onto the dashboard vents that went into Toyota cars, but Oba showed that a $12 hair dryer did the job better and faster (3 minutes versus 90 minutes for the robots and paint oven). Because of Oba's demonstration, Summit replaced the robots with simple but effective $150 spray guns and the paint oven with intense light bulbs. Overall, Oba has helped Summit cut its defects from 3,000 parts per million to less than 60 parts per million.[96] Oba's efforts as a change agent have significantly improved the quality of parts at Toyota's other suppliers as well. That, in turn, has helped Toyota reach the top of the quality rankings issued by J. D. Power and Associates and *Consumer Reports* magazine.[97]

Organizational development interventions are aimed at changing large systems, small groups, or people.[98] More specifically, the purpose of *large system interventions* is to change the character and performance of an organization, business unit, or department. *Small group intervention* focuses on assessing how a group functions and helping it work more effectively to accomplish its goals. *Person-focused intervention* is intended to increase interpersonal effectiveness by helping people become aware of their attitudes and behaviors and acquire new skills and knowledge. Exhibit 7.12 describes the most frequently used organizational development interventions for large systems, small groups, and people. For additional information about changing systems, groups, and people, see the "What Really Works" feature.

EXHIBIT 7.12 Different Kinds of Organizational Development Interventions

LARGE SYSTEM INTERVENTIONS	
Sociotechnical systems	An intervention designed to improve how well employees use and adjust to the work technology used in an organization.
Survey feedback	An intervention that uses surveys to collect information from the members, reports the results of that survey to the members, and then uses those results to develop action plans for improvement.
SMALL GROUP INTERVENTIONS	
Team building	An intervention designed to increase the cohesion and cooperation of work group members.
Unit goal setting	An intervention designed to help a work group establish short- and long-term goals.
PERSON-FOCUSED INTERVENTIONS	
Counseling/coaching	An intervention designed so that a formal helper or coach listens to managers or employees and advises them on how to deal with work or interpersonal problems.
Training	An intervention designed to provide individuals with the knowledge, skills, or attitudes they need to become more effective at their jobs.

Managing Change The basic change process involves unfreezing, change, and refreezing. Resistance to change, which stems from self-interest, misunderstanding and distrust, and a general intolerance for change, can be managed through education and communication, participation, negotiation, top-management support, and coercion. Knowing what not to do is as important as knowing what to do to achieve successful change. Managers should avoid these errors when leading change: not establishing urgency, not creating a guiding coalition, lacking a vision, undercommunicating the vision, not removing obstacles to the vision, not creating short-term wins, declaring victory too soon, and not anchoring changes in the corporation's culture.

Finally, managers can use a number of change techniques. Results-driven change and the GE workout reduce resistance to change by getting change efforts off to a fast start. Transition management teams, which manage a company's change process, coordinate change efforts throughout an organization. Organizational development is a collection of planned change interventions (large system, small group, person-focused), guided by a change agent, that are designed to improve an organization's long-term health and performance.

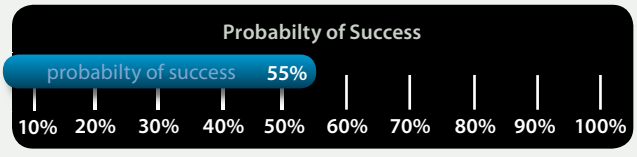
Change the Work Setting or Change the People? Do Both!

Let's assume that you believe that your company needs to change. Congratulations! Just recognizing the need for change puts you ahead of 80 percent of the companies in your industry. But now that you've recognized the need for change, how do you make change happen? Should you focus on changing the work setting or the behavior of the people who work in that setting? It's a classic chicken-or-egg type of question. Which would you do?

A recent meta-analysis based on 52 studies and a combined total of 29,611 study participants indicated that it's probably best to do both!

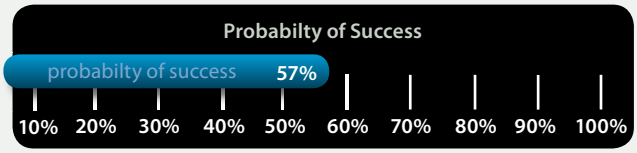
Changing the Work Setting

An organizational work setting has four parts: organizing arrangements (control and reward systems, organizational structure), social factors (people, culture, patterns of interaction), technology (how inputs are transformed into outputs), and the physical setting (the actual physical space in which people work). Overall, there is a 55 percent chance that organizational change efforts will successfully bring changes to a company's work setting. Although the odds are 55–45 in your favor, this is a much lower probability of success than you've seen with the management techniques discussed in other chapters. This simply reflects how strong resistance to change is in most companies.



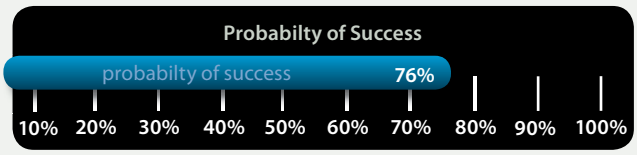
Changing the People

Changing people means changing individual work behavior. The idea is powerful. Change the decisions people make. Change the activities they perform. Change the information they share with others. And change the initiatives they take on their own. Change these individual behaviors and collectively you change the entire company. Overall, there is a 57 percent chance that organizational change efforts will successfully change people's individual work behavior. If you're wondering why the odds aren't higher, consider how difficult it is to change personal behavior. It's incredibly difficult to quit smoking, change your diet, or maintain a daily exercise program. Not surprisingly, changing personal behavior at work is also difficult. Viewed in this context, a 57 percent chance of success is a notable achievement.



Changing Individual Behavior and Organizational Performance

The point of changing individual behavior is to improve organizational performance (increase profits, market share, and productivity, and lower costs). Overall, there is a 76 percent chance that changes in individual behavior will produce changes in organizational outcomes. So, if you want to improve your company's profits, market share, or productivity, focus on changing the way that your people behave at work.[99]



SELF ASSESSMENT

Mind Benders

Innovation is a key to corporate success. Companies that innovate and embrace the changes in their business environment tend to outperform those that stand still. Even so, innovative companies don't simply rely on the creativity of their own work force. They often contract with outside providers to generate new ideas for everything from operations to new products. In other words, innovative companies fill gaps in their own creativity by looking outside the organization.

As a manager, you will benefit from understanding how you are creative (not *if* you are creative). And just as important as your own creativity is your attitude toward creative endeavors.

This assessment will provide some baseline information you can use as you develop your managerial skills.[100] Indicate the extent to which each of the following statements is true of either your actual behavior or your intentions at work. MANAGEMENT DECISION

Change Costs More Than Pennies

As you wipe your feet, you can't help but notice how messy the carpet is. "Well, that's what it's for," you think. "This is a factory, not a bookstore." But seeing all those metal chips in the rug makes you think about the plant floor. You turn back around and survey the shop. Everywhere you look, parts are stacked in metal bins on wooden palettes, next to the palettes, on tables by machines, encroaching into the aisles—which are marked off with vibrant yellow striping to remind workers to keep them clear. It looks like there is much more work than the roughly $500,000 worth of parts that are actually in process.

Slowly, you begin to wend your way through the machines. Your plant uses five basic types of machines to make hundreds of thousands of different parts for everything from motorcycles to hospital beds to nail guns to industrial water purifiers. You make the mechanism that fills Downy bottles at Procter & Gamble and the tumblers that spit the movie tickets out from under the counter at theaters across the country. Machines are organized by type, so as a job moves through the plant, it will hit any number of machines in a particular order. A job with multiple operations might get moved around the plant from area to area up to seven times. Even though things are always moving, many areas of the plant seem crowded, as jobs line up waiting for their turn on the next machine. Red tickets in pans scattered around the shop and in a designated area are a reminder that there's still quite a bit of scrap (or bad) work being run. Twenty-five percent of jobs going through the shop have to be fixed or rerun because the parts are the wrong size, if only by 0.001 inch. When you make it to the scheduling area, colored Post-it notes show how many jobs are rush, how many are late, and how many haven't even been started. The on-time delivery rate is only 70 percent. For a precision machine shop that can cut metal to measurements in the ten-thousandths of an inch, the overall operations aren't so precise.

Everywhere you look, you see disorder. Maybe those consultants were right: To be competitive, really to survive, you need to approach your operations in a more systematic fashion. A large percentage of companies with your capabilities have gone out of business, but even though there is less competition, there are fewer customers. The types of parts you manufacture are either being designed out of products or are being outsourced to China and Mexico. Without significant change, you're not going to be able to survive the decade, let alone double your size in 2 years (which is your secret stretch goal).

Last week, a local manufacturing consultancy sent a few members to your shop to present a preliminary proposal on how they could help you run a more efficient operation. The company would assign a team to help your workers learn new, leaner processes of doing work; promises of increased productivity, profitability, and morale were made, with references galore. The consultants even invited you and your management team to take a plant tour of one (or more) of their most recent clients. Ultimately, the consultants would provide materials, workshops, and follow-up support to your shop employees every day all day for several days over a period of 6 months—for approximately $200,000. Right out of the gate, they would send two consultants to your shop for five consecutive weeks. But at $250 per hour per consultant, that's a quick $100,000 to spend on teaching communication skills and showing workers how to identify waste issues that prevent them from doing their jobs effectively and efficiently.

With only $8 million in revenue in a business where labor and the costs of goods sold are high, your profits are slim. Spending money on the outsiders could very well mean finishing the year in the red instead of the black. Maybe you could hire someone to do the job full-time for half that amount. For $100,000, you could hire someone to do the same job full-time for a year. That might be better than having some consultants come, give their workshops, and leave the rest up to you after they head home. And will telling your employees that "things are going to change around here" be the best way to get things in order? Maybe it would be better if change initiatives started from the bottom. The majority of your sixty-five workers have been with you for over 20 years (turnover is not one of your problems), but with tenure comes intractability. In general, your employees are set in their ways. Still, they want the company to succeed, so maybe that concern will be a strong enough motivator.

Questions

1. Consider the above situation. What are the benefits to hiring outsiders to manage your change efforts?
2. Do you pay the $200,000 for the consultancy, do you hire a dedicated change agent, or do you try to marshal internal teams to spearhead a change effort?

MANAGEMENT TEAM DECISION

Recharging a Company in Decline

You and your management team face a tough road ahead, and your main task is to figure out just what kind of car can get you down that road. What's the problem? You're in charge of a major American automaker that has just gone bankrupt. It's easy for you to blame the general economic downturn the United States—indeed, the entire world—is in, but you know it's not that simple.

You take a moment to think about how you got into this. After all, your company was once on the leading edge of innovation in the auto industry. You invented the electric starter, getting rid of those hand cranks for good. You even have a history of green innovation, since you gave the industry the catalytic converter, which substantially reduced tailpipe emissions. But a number of things seem to have gone wrong along the way. Low gas prices meant that consumer interest in alternative technologies was low. So you kept producing V-8 engines and put your efforts to develop new fuel cells on the back burner, even as Asian automakers invested heavily in hybrid technologies.

Once gas prices rose and regulatory pressure on emissions became more intense, you found yourself in a real bind because consumers no longer wanted your SUVs and you had no viable product to compete with the alternatives offered by your Asian competitors. In an effort to keep up, you marketed an electric car you had been developing. But, with only a 40-mile range between charges and a sticker price of $40,000 compared to the hybrids available at close to half the price, it's no wonder your efforts were not considered viable. Indeed, your alternative wasn't even ready for market.

But living in the past will not help your team pull the company out of bankruptcy. You face pretty big odds. The auto industry is shrinking, and signs are that the new company can't look the same as the old and expect to survive, let alone thrive. Consumers want smaller, cheaper cars, and there is less overall demand in a recession. Still, innovation may be the way out of this dilemma, not just for you, but for the entire American economy, since innovation is the key to creating new jobs and wealth. Indications suggest that the battery-powered car is the wave of the future. Indeed, California 2014 ZEV standards will only be met by battery-powered cars. You can develop that battery technology you have in your pocket, especially with $2 billion in government grants and $25 billion in low-interest loans available for advanced battery technology and manufacturing green cars. But you are not alone. Whoever controls the battery industry may well control the car industry of the future. The Chinese are on the verge of a battery-powered car, and companies like BMW and Renault-Nissan are pushing to reduce the cost of batteries. You'll also need strategy as well as technological innovation. Until you improve the technology, you've got to market a car with a long recharging time and a limited range.[101]

As you weigh your options, you think that the car battery may not be the only thing with a long recharging time. Still, the decision whether or not to plug in may make or break your company.

Questions

1. Where in the innovation stream is the auto industry? Which approach to managing innovation will you take at your company?
2. How can you establish a creative work environment at your company? Think about the various components of a creative work environment discussed in the text and ways you could implement them.

PRACTICE BEING A MANAGER

Supporting Creativity

Successfully managing innovation is challenging. Companies must find ways to support creativity and invention, while at the same time screening their investments in support of innovation. This exercise will give you an opportunity to experience a bit of the organizational dynamic regarding innovation and investment.

Step 1: Assign roles. Your professor will assign you to a pair or small group and give your team a role as either "Inventors" or "Investors." Regardless of role, assume that you work for a large clothing and accessories company that targets college students. Your company makes some traditional clothing and gear (such as backpacks and folios) but also prides itself on developing new and innovative products. And recently there has been some interest in considering new services that the company might offer to the college market, things like event or trip planning.

Step 2: Work with your partner(s) on the following tasks depending on your assigned role.

Inventors: Brainstorm and work to develop a new product or service concept. Be prepared to explain your concept to those inside the company who screen ideas and recommend investments.

Investors: Discuss and agree upon some criteria that your company should use to screen new-product and service concepts and to identify which ones to recommend to senior management. Be prepared to listen to one or more concept presentations, ask questions, and then use your criteria to evaluate the concept(s).

Step 3: Pair up. As instructed by your professor, Inventor and Investor groups should pair up. Inventors will now present their new concept, and investors will ask questions and then use their criteria to rate the concept.

Step 4: Change roles. As time allows, your professor will rotate Inventor and Investor pairings through a few rounds of concept presentation and investor evaluation.

Step 5: Debrief. Return to your original Inventor or Investor pair/group, and discuss your experiences in this role play. What are some of the challenges of playing this role? What was it like to interact with the "other side" of the presentation/evaluation process?

Step 6: Discuss challenges. As a class, discuss the challenges likely faced by companies as they try to successfully manage innovation. Some items for discussion might include:

1. What is the impact of an "evaluation/rating" on the creative process?
2. Do you think that "inventor units" (such as product development and R&D) and "investor units" (finance) often clash over new-product investment decisions? Why or why not?
3. What role might organizational culture (and subculture) play in the innovation and investment processes?
4. How might managers support healthy innovation and wise investment?

DEVELOP YOUR CAREER POTENTIAL

Spark Your Own Creativity

Creativity is a vital part of every organization—and not just the whiz-bang, multimillion-dollar type of creativity.[102] Even banal tasks can benefit from a new approach: An office assistant may think creatively about how to manage the company's filing system or figure out a simple way to keep track of who is in and out of the office. A Chicago company called Inventables has developed innovation kits—boxes containing disparate items to spark creativity—which it sells to clients like Procter & Gamble and Motorola four times a year. The idea is that designers and engineers will be inspired by tinkering with the contents of the kits.

You don't need Inventables to become inspired, however. Nor do you have to wait for your company to develop a creative work environment before you can become creative. You can spark your own creativity and think "outside the box" on your own. Eureka! Ranch, a Cincinnati-based innovation consultancy company, uses toys to help adults remember how to be imaginative, and its long client list of *Fortune* 500 companies is a testament to founder Doug Hall's methods. Another company, Mindware, specializes in educational activities and toys that can help adults regain access to their imaginations. Just looking through its catalog of erector sets, science sets, puzzle books, strategy games, and tangrams may be enough to get your juices flowing.

Activities

1. Visit **http://www.eurekaranch.com** and search for the audio clip of what the company does and how it does it. Listen to the clip. What do you think of the three dimensions of creativity?
2. At the Eureka Ranch website, find the page on Brain Brew. What is Brain Brew Radio? Is it available in your area? If it is, consider listening to it once a month to hear the creative ideas that people across the country are working on.
3. Visit **http://www.mindwareonline.com** and peruse some of the products the company sells. Which products do you find most appealing? If it's in your budget, order one of the items as a tool to help you develop and refine your creative side.

In the classic 1989 film ***Field of Dreams***, Ray Kinsella (Kevin Costner), while working in his Iowa cornfield, hears a voice that says, "If you build it, he will come." Ray concludes that "he" is legendary "Shoeless Joe" Jackson (Ray Liotta), a 1919 Chicago White Sox player suspended for rigging the 1919 World Series. With the support of his wife Annie (Amy Madigan), Ray jeopardizes his farm by plowing under a cornfield and creating a modern baseball diamond in its place. Shoeless Joe soon arrives, followed by the rest of the suspended players. This charming fantasy film, based on W. P. Kinsellas' novel ***Shoeless Joe,*** shows the rewards of pursuing a dream. In this clip, Ray's brother-in-law Mark (Timothy Busfield) insists that they will have to start farming on the field again if they're going to make enough money to avoid foreclosure on their property, but Ray's daughter Karin (Gaby Hoffman) suggests another idea.

What to Watch for and Ask Yourself

1. When someone suggests an idea to you that you don't completely understand, how open are you to considering it?
2. Which character is the most resistant to the idea of changing the farm into a ball field? Why?
3. Which characters demonstrate the most creativity and vision?

Roger Scholfield, general manager of Scholfield Honda in Wichita, Kansas, says, "The world and the marketplace are constantly changing, so if you're not a person comfortable with change, then this business is not for you." As gas prices soar and concerns about the environment grow, many people are looking for innovative solutions to energy problems. Lee Lindquist, alternative fuels specialist at Scholfield Honda, learned Honda had been selling a natural gas vehicle in New York and California since 1998, where it was marketed as a way for municipalities and fleet customers to address air quality issues. Lindquist convinced Scholfield that they should sell the Civic GX at their dealership in Wichita, too. In this video, Scholfield and Lindquist discuss the challenges of selling natural gas vehicles in Kansas, who the early adopters have been, and why they believe the cars are good for both customers and the environment.

What to Watch for and Ask Yourself

1. What might explain dealers' failure to promote the Civic GX, beyond fueling issues?
2. How might Scholfield Honda expand on the changes put into motion by Lindquist?
3. How could the Honda Corporation capitalize on innovation at the dealership level?

Caterpillar Headquarters, Peoria, Illinois.[1]

One of General Motors' and Chrysler's key mistakes, which eventually led to their bankruptcies, was not recognizing in the 1970s that the automobile industry had gone global. With 50+ percent market share in the United States, GM was so dominant that it ignored Toyota, Nissan (then called Datsun), and Honda when they entered the U.S. market. Caterpillar has not and will not make that mistake as long as you are in charge. Your global view is simple, but powerful: Since the United States has only 5 percent of the world's population, 95 percent of your customers are located abroad. For example, combine India's and China's huge populations with 8 to 10 percent annual growth in their economies and huge infrastructure investments by their governments, and it's clear that Caterpillar's future opportunities will be strongest in Asia. But there are also huge opportunities in the Middle East and in developing economies, particularly in Latin America. So the question is not whether Caterpillar will be global, but how?

Indeed, while global opportunities abound, they won't come easily. Aggressive competitors like Komatsu have already sold or leased 23,000 heavy-duty construction, earth-moving, and mining equipment machines in China. Komatsu dominates the market for the gigantic dump trucks used at Chinese mines, selling two of every three that are bought in China. Ironically, many of the products that Komatsu sells globally are made at its U.S.-based plant in Peoria, Illinois, just a few miles from Caterpillar's world headquarters. But that is just one of Komatsu's many production facilities throughout the world. Kunio Noji, Komatsu's CEO, believes that being American-based is a disadvantage for Caterpillar. Said Noji, "Caterpillar is suffering because of being centered in the U. S." Why? Because Caterpillar gets 40 percent of its sales in the U.S. market and doesn't think or act like a global company. Caterpillar will also have to match the combined reliability and innovation in Komatsu's products. For instance, each Komatsu truck or excavator is outfitted with a satellite antenna that transmits a continuous stream of data to headquarters that tells Komatsu where the machines are, what they are doing, how well they are running, and when they will need maintenance. (Another benefit is that Komatsu can shut the machines down if companies are late with their payments.)

So how should Caterpillar go global? Should you manufacture in the United States and export? It took years to build relationships with suppliers and distributors in the United States. Will you be able to replicate that abroad? Or should you look for a partner and consider a joint venture? Or should you build or buy manufacturing plants overseas so that your factories are closer to your customers?

Another key question is whether the company should be run the

same way abroad as it is in Peoria? If we have factories or distributors overseas, should we run them the same way? Will the sales and marketing approaches that have worked in North America also work in China and India?

Finally, when companies go abroad, they search for locations with the best business climates. With so much growth potential in China, India, the Middle East, and Latin America, that won't be difficult for Caterpillar. Instead, the challenge will be finding the right mix of products and services to position the company against the boom-and-bust cycle inherent in the industry. When the heavy machinery industry booms, no one can keep up with demand and everyone builds new factories and hires tens of thousands of new employees. But when the industry goes bust, factories are closed and tens of thousands of employees are laid off. How can Caterpillar position itself to better handle this challenging aspect of its global business?

If you were the CEO of Caterpillar, what would you do?

Caterpillar's struggle with international expansion is an example of the key issue in global business: How can you be sure that the way you run your business in one country is the right way to run that business in another? This chapter discusses how organizations answer that question. We start by examining global business in two ways: first by exploring its impact on U.S. businesses and then by reviewing the basic rules and agreements that govern global trade. Next, we examine how and when companies go global by examining the trade-off between consistency and adaptation and by discussing how to organize a global company. Finally, we look at how companies decide where to expand globally. Here, we consider how to find the best business climate, how to adapt to cultural differences, and how to better prepare employees for international assignments.

WHAT IS GLOBAL BUSINESS?

Business is the buying and selling of goods or services. Buying this textbook was a business transaction. So was selling your first car. So was getting paid for babysitting or for mowing lawns. **Global business** is the buying and selling of goods and services by people from different countries. The Timex watch on my wrist as I write this chapter was purchased at a Wal-Mart in Texas. But since it was made in the Philippines, I participated in global business when I wrote Wal-Mart a check. Wal-Mart, for its part, had already paid Timex, which had paid the company that employs the Filipino managers and workers who made my watch. Of course, there is more to global business than buying imported products at Wal-Mart.

After reading the next section, you should be able to

1. discuss the impact of global business and the trade rules and agreements that govern it.

1 GLOBAL BUSINESS, TRADE RULES, AND TRADE AGREEMENTS

[Global business] the buying and selling of goods and services by people from different countries

If you want a simple demonstration of the impact of global business, look at the tag on your shirt, the inside of your shoes, and the inside of your cell phone (take out your battery). Chances are, all of these items were made

in different places around the world. As I write this, my shirt, shoes, and cell phone were made in Thailand, China, and Korea. Where were yours made?

Let's learn more about **1.1 the impact of global business, 1.2 how tariff and nontariff trade barriers have historically restricted global business, 1.3 how today global and regional trade agreements are reducing those trade barriers worldwide**, and **1.4 how consumers are responding to those changes in trade rules and agreements**.

1.1 The Impact of Global Business

Thomas Friedman, author and columnist for the *New York Times*, observed global business in action when he visited Infosys, a consulting and information technology company, in India:

> *I guess the eureka moment came on a visit to the campus of Infosys Technologies, one of the crown jewels of the Indian outsourcing and software industry. Nandan Nilekani, the Infosys CEO, was showing me his global videoconference room, pointing with pride to a wall-size flat-screen TV, which he said was the biggest in Asia. Infosys, he explained, could hold a virtual meeting of the key players from its entire global supply chain for any project at any time on that supersize screen. So its American designers could be on the screen speaking with their Indian software writers and their Asian manufacturers all at once. That's what globalization is all about today, Nilekani said. Above the screen there were eight clocks that pretty well summed up the Infosys workday: 24/7/365. The clocks were labeled United States West, United States East, G.M.T., India, Singapore, Hong Kong, Japan, Australia.*[2]

Infosys does global business by selling products and services worldwide with managers and employees from different continents working together as seamlessly as if they were next door to each other. But Infosys isn't unique. There are thousands of other multinational companies just like it.

Multinational corporations are corporations that own businesses in two or more countries. In 1970, more than half of the world's 7,000 multinational corporations were headquartered in just two countries: the United States and the United Kingdom. Today, there are 79,000 multinational corporations, more than 11 times as many as in 1970, and only 2,418, or 3.1 percent, are based in the United States.[3] Today, 56,448 multinationals, or 71.5 percent, are based in other developed countries (e.g., Germany, Italy, Canada, and Japan), while 20,586, or 26.1 percent, are based in developing countries (e.g., Colombia, South Africa, and other developing countries). So, today, multinational companies can be found by the thousands all over the world!

Another way to appreciate the impact of global business is by considering direct foreign investment. **Direct foreign investment** occurs when a company builds a new business or buys an existing business in a foreign country. **Lufthansa**, the German-based airline, made direct foreign investments when it paid $300 million for U.S.-based JetBlue Airways and $91 million for a 45 percent stake in Brussels Airlines and increased its 30 percent ownership of British Midland Airways to 80 percent.[4] Of course, companies from many other countries also own businesses in the United States. As Exhibit 8.1 shows, companies from the United Kingdom, Japan, Canada, the Netherlands, Germany, France, Switzerland, and Luxembourg have the largest direct foreign investment in the United States. Overall, foreign companies invest more than $2.1 trillion a year to do business in the United States.

[Direct foreign investment] a method of investment in which a company builds a new business or buys an existing business in a foreign country

EXHIBIT 8.1

Direct Foreign Investment in the United States

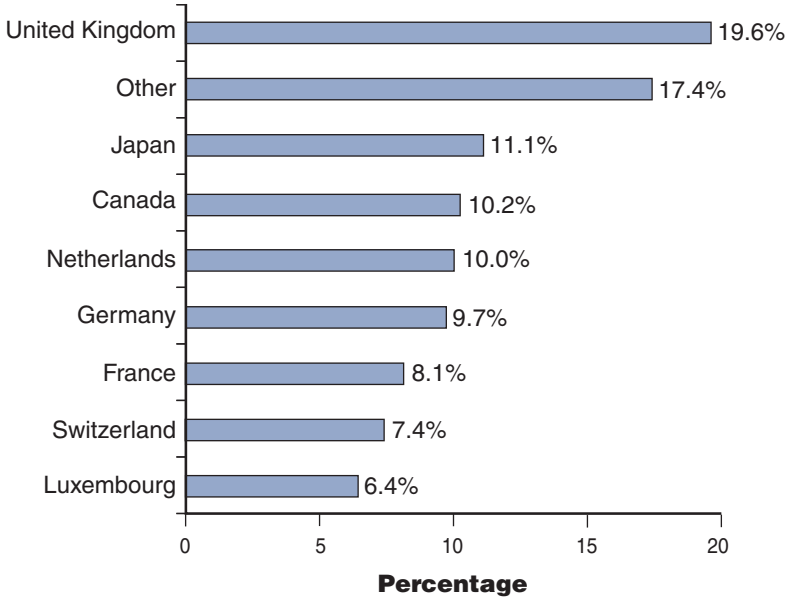

EXHIBIT 8.2 U.S. Direct Foreign Investment Abroad

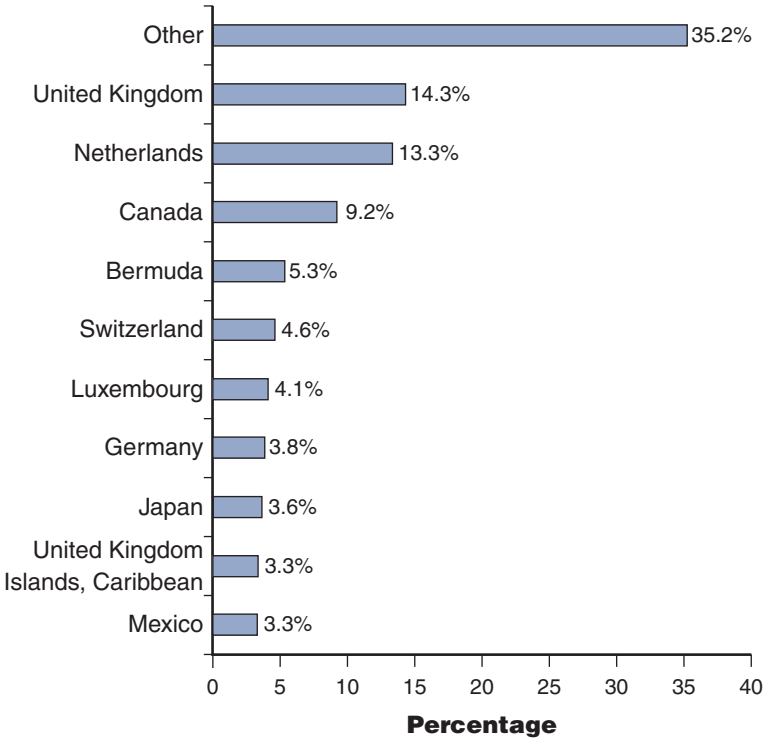

But direct foreign investment in the United States is only half the picture. U.S. companies also have made large direct foreign investments in countries throughout the world. For example, **Hershey Co.**, a Pennsylvania-based candy company, purchased Barry Callebaut AG's Van Houten consumer chocolate business in Asia, allowing Hershey, which gets most of its growth from North America, to expand internationally.[5] As Exhibit 8.2 shows, U.S. companies have made their largest direct foreign investments in the United Kingdom, the Netherlands, and Canada. Overall, U.S. companies invest more than $2.8 trillion a year to do business in other countries.

So, whether foreign companies invest in the United States or U.S. companies invest abroad, direct foreign investment is an increasingly important and common method of conducting global business.

1.2 Trade Barriers

Although today's consumers usually don't care where the products they buy come from (more on this in Section 1.4), national governments have traditionally preferred that consumers buy domestically made products in hopes that such purchases would increase the number of domestic businesses and workers. Indeed, governments have done much more than hope that you will buy from domestic companies. Historically, governments have actively used **trade barriers** to make it much more expensive or difficult (or sometimes impossible) for consumers to buy or consume imported goods. For example, the European Union places a 34 percent tax on frozen strawberries imported from China.[6] And the U.S. government imposes a tariff of 54 cents a gallon on imported ethanol, which is blended with gasoline for use in automobiles.[7] By establishing these restrictions and taxes, the governments of the European Union and the United States are engaging in **protectionism**, which is the use of trade barriers to protect local companies and their workers from foreign competition.

Governments have used two general kinds of trade barriers: tariff and nontariff barriers. A **tariff** is a direct tax on imported goods. Like the U.S. government's 54-cents-per-gallon tax on imported ethanol, tariffs increase the cost of imported goods relative to that of domestic goods. For example, the U.S. import tax on trucks is 25 percent. This means that U.S. buyers must pay $25,000 for a $20,000 imported

truck, with the $5,000 tariff going to the U.S. government. As a result, fewer than 10,000 pickup trucks are imported by the United States each year.[8] **Nontariff barriers** are nontax methods of increasing the cost or reducing the volume of imported goods. There are five types of nontariff barriers: quotas, voluntary export restraints, government import standards, government subsidies, and customs valuation/classification. Because there are so many different kinds of nontariff barriers, they can be an even more potent method of shielding domestic industries from foreign competition.

Quotas are specific limits on the number or volume of imported products. For example, raw sugarcane imports into the United States are limited to approximately 1.1 million metric tons per year because of strict import quotas.[9] Since this is well below the demand for sugar in the United States, domestic U.S. sugar prices are twice as high as sugar prices in the rest of the world.[10] Like quotas, **voluntary export restraints** limit the amount of a product that can be imported annually. The difference is that the exporting country rather than the importing country imposes restraints. Usually, however, the "voluntary" offer to limit exports occurs because the importing country has implicitly threatened to impose quotas. For example, to protect South African textile manufacturers from cheap and plentiful Chinese textile products, the South African government convinced China to "voluntarily" restrict the textiles it exports to South Africa each year.[11] According to the World Trade Organization (see the discussion in Section 1.3), however, voluntary export restraints are illegal and should not be used to restrict imports.[12]

In theory, **government import standards** are established to protect the health and safety of citizens. In reality, such standards are often used to restrict or ban imported goods. For example, Japan banned the importation of nearly all U.S. apples, which are one-third the cost of Japanese apples. Ostensibly, the ban was to prevent transmission of fire blight bacteria to Japanese apple orchards, but research conducted *jointly* by U.S. and Japanese scientists "does not support Japan's assertion that mature, symptomless apples can transmit" the fire blight bacteria.[13] The Japanese government was actually using this government import standard to protect the economic health of its apple farmers rather than the biological health of its apple orchards. Only after the World Trade Organization ruled that there was no scientific basis for the ban did Japan allow U.S. apples to be imported without restrictions.[14]

Many nations also use **subsidies**, such as long-term, low-interest loans, cash grants, and tax deferments, to develop and protect companies in special industries. Not surprisingly, businesses complain about unfair trade practices when foreign companies receive government subsidies. Boeing, the U.S. jet manufacturer, protested when Airbus received $4.5 billion in "launch aid" from nine European countries to

[Voluntary export restraints] voluntarily imposed limits on the number or volume of products exported to a particular country

[Subsidies] government loans, grants, and tax deferments given to domestic companies to protect them from foreign competition

build its new A380 superjumbo jet. In a formal complaint to the World Trade Organization, the U.S. Trade Representative argued that "Airbus governments thus enable Airbus to launch aircraft at an otherwise unsustainable scale and pace, if it could have launched them at all. Thus they expand the range of the Airbus product family against which U.S. producers must compete, and lower the price at which Airbus is able to offer those products. . . . The subsidization of Airbus jeopardizes the durability of any recent improvement in Boeing's competitive situation."[15]

The last type of nontariff barrier is **customs classification**. As products are imported into a country, they are examined by customs agents, who must decide into which of nearly 9,000 categories they should classify a product (see the Official Harmonized Tariff Schedule of the United States at **http://www.usitc.gov/tata/hts/index.htm** for more information). Classification is important because the category assigned by customs agents can greatly affect the size of the tariff and whether the item is subject to import quotas. For example, the U.S. Customs Service has several customs classifications for imported shoes. Tariffs on imported leather or "nonrubber" shoes are about 10 percent, whereas tariffs on imported rubber shoes, such as athletic footwear or waterproof shoes, range from 20 to 84 percent. (See **http://www.usitc.gov** for full information on tariffs.) The difference is large enough that some importers try to make their rubber shoes look like leather in hopes of receiving the nonrubber customs classification and lower tariff.

1.3 Trade Agreements

Thanks to the trade barriers described above, buying imported goods has often been much more expensive and difficult than buying domestic goods. During the 1990s, however, the regulations governing global trade were transformed. The most significant change was that 124 countries agreed to adopt the Uruguay Round of the **General Agreement on Tariffs and Trade (GATT)**. GATT, which existed from 1947 to 1995, was an agreement to regulate trade among (eventually) 120+ countries, the purpose of which was "substantial reduction of tariffs and other trade barriers and the elimination of preferences."[16] GATT members engaged in eight rounds of trade negotiations, with the Uruguay Round signed in 1994 and going into effect in 1995. Although GATT itself was replaced by the **World Trade Organization (WTO)** in 1995, the changes that it made continue to encourage international trade.

The WTO, headquartered in Geneva, Switzerland, administers trade agreements, provides a forum for trade negotiations, handles trade disputes, monitors national trade policies, and offers technical assistance and training for developing countries for its 150 member countries.Through tremendous decreases in tariff and nontariff barriers, the Uruguay round of GATT made it much easier and cheaper for consumers in all countries to buy foreign products. First, tariffs were cut 40 percent on average worldwide by 2005. Second, tariffs were eliminated in ten specific industries: beer, alcohol, construction equipment, farm machinery, furniture, medical equipment, paper, pharmaceuticals, steel, and toys. Third, stricter limits were put on government subsidies. For example, the Uruguay round of GATT put limits on how much national governments can subsidize company research in electronic and high-technology industries (see the discussion of subsidies in Section 1.2). Fourth, the Uruguay round of GATT established protections for intellectual property, such as trademarks, patents, and copyrights. Protection of intellectual property has become an increasingly important issue in global trade because of widespread product piracy. For example, 90 percent of the computer software and 95 percent of the video games in China are illegal pirated copies.[17] Likewise, Chinese bootleggers regularly sell illegal online or DVD copies of movies, such as *Wall-E* or *IronMan*, months before

the movie studios release official copies to stores in the United States.[18] Product piracy like this costs movie companies, distributors, and theaters, as well as video/DVD distributors $18 billion in lost revenue each year.[19]

Finally, trade disputes between countries now are fully settled by arbitration panels from the WTO. In the past, countries could use their veto power to cancel a panel's decision. For instance, the French government routinely vetoed rulings that its large cash grants to French farmers constituted unfair subsidies. Now, however, countries that are members of the WTO (every country that agreed to GATT is a member) no longer have veto power. Thus, WTO rulings are complete and final. For more information about GATT and the WTO, go to the WTO's website at **http://www.wto.org**. Exhibit 8.3 provides a brief overview of the WTO and its functions.

The second major development that has reduced trade barriers has been the creation of **regional trading zones**, or zones in which tariff and nontariff barriers are reduced or eliminated for countries within the trading zone. The largest and most important trading zones are in Europe (the Maastricht Treaty), North America (the North American Free Trade Agreement, or NAFTA), Central America (Central America Free Trade Agreement, or CAFTA-DR), South America (Union of South American Nations, or USAN), and Asia (the Association of Southeast Asian Nations, or ASEAN, and Asia-Pacific Economic Cooperation, or APEC). The map in Exhibit 8.4 shows the extent to which free trade agreements govern global trade.

In 1992, Belgium, Denmark, France, Germany, Greece, Ireland, Italy, Luxembourg, the Netherlands, Portugal, Spain, and the United Kingdom implemented the **Maastricht Treaty of Europe**. The purpose of this treaty was to transform their twelve different economies and twelve currencies into one common economic market, called the European Union (EU), with one common currency. Austria, Finland, and Sweden joined the EU in 1995, followed by Cyprus, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Slovakia, and Slovenia in 2004, and Bulgaria and Romania in 2007, bringing the total membership to twenty-seven countries.[20] Croatia, Macedonia, and Turkey have applied and are being considered for membership.[21] On 1 January 2002, a single common currency, the euro, went into circulation in twelve of the EU's members

Prior to the treaty, trucks carrying products were stopped and inspected by customs agents at each border. Furthermore, since the required paperwork, tariffs, and government product specifications could be radically different in each country, companies often had to file twelve different sets of paperwork, pay twelve different tariffs, produce twelve different versions of their basic product to meet various government specifications, and exchange money in twelve different currencies. Likewise, open business travel from state to state, which we take for granted in the United States, was complicated by inspections at each border crossing. If you lived in Germany but worked in Luxembourg, your car was stopped and your passport was inspected twice every day as you traveled to and from work. Also, every business transaction required a currency exchange, for example, from German deutsche marks to Italian lira, or from French francs to Dutch guilders. Imagine all of this happening to millions of trucks, cars, and businesspeople, and you can begin to appreciate the difficulty and cost of conducting business across Europe before the Maastricht Treaty. For more information about the Maastricht Treaty, the EU, and Europe's new common currency, the euro, see **http://europa.eu/abc/12lessons/index_en.htm**.

NAFTA, the **North American Free Trade Agreement** between the United States, Canada, and Mexico, went into effect on 1 January 1994. More than any other regional trade agreement, NAFTA has liberalized trade between countries so that businesses can plan for one market (North America) rather than for three separate markets (the United States, Canada, and Mexico). One of NAFTA's most important achievements was to eliminate most product tariffs *and* prevent the three countries from increasing existing tariffs or introducing new ones. Before NAFTA, Wal-Mart used expensive intermediaries to distribute goods to its stores, and Mexican officials often pressured managers for bribes. Because of burdensome paperwork, deliveries sometimes took months to clear customs. Before NAFTA, Wal-Mart sold a Sony flat-screen TV imported from Japan with a 23 percent tariff for $1,600 in Mexico. This all changed with NAFTA. Sony built a new factory in Mexico, enabling it to ship the TVs duty-free anywhere in the United States, Canada, or Mexico. With minimal shipping costs and the 23 percent tariff eliminated, Wal-Mart was then able to sell the same flat-screen TVs for $600 in Mexico, about what they sold for in the United States at that time.[22] Overall, Mexican and Canadian exports to the United States are up 247 percent since NAFTA went into effect. U.S. exports to Mexico and Canada are up 171 percent, too, growing twice as fast as U.S. exports to any other part of the world.[23] In fact, Mexico and Canada now account for one-third of all U.S. exports.[24] For more information about NAFTA, see the Office of NAFTA & Inter-American Affairs at **http://www.ustr.gov/Trade_Agreements/Regional/NAFTA/Section_Index.html**.

CAFTA-DR, the new **Central America Free Trade Agreement** between the United States, the Dominican Republic, and the Central American countries of Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua, and the Dominican Republic went into effect in August 2005. With a combined population of 347.6 million (compared to 302.3 million in the United States), the CAFTA-DR countries together are the tenth-largest U.S. export market in the world and the third-largest U.S. export market in Latin America, after Mexico and Brazil. U.S. companies export more than $26.3 billion in goods each year to the CAFTA-DR countries.[25] Furthermore, U.S. exports to CAFTA-DR countries, which are increasing at 16 percent per year, are by far the fastest-growing export market for U.S. companies.[26] For more information about CAFTA-DR, see **http://www.fas.usda.gov/itp/CAFTA/cafta.asp**.

On 23 May 2008, twelve South American countries signed the **Union of South American Nations (UNASUR)** Constitutive Treaty, which united the former Mercosur (Argentina, Brazil, Paraguay, Uruguay, and Venezuela) and Andean Community (Bolivia, Colombia, Ecuador, and Peru) alliances along with Guyana, Suriname, and Chile. UNASUR aims to create a unified South America by permitting free movement between nations, creating a common infrastructure that includes an interoceanic highway, and establishing the region as a single market by eliminating tariffs by 2019. UNASUR is one of the largest trading zones in the world, encompassing 361 million people in South America with a combined gross domestic product of nearly $1 trillion.[27] For more about UNASUR see **http://www.comunidadandina.org/ingles/sudamerican.htm**.

ASEAN, the **Association of Southeast Asian Nations**, and **APEC**, the **Asia-Pacific Economic Cooperation**, are the two largest and most important regional trading groups in Asia. ASEAN is a trade agreement between Brunei Darussalam, Cambodia, Indonesia, Lao PDR, Malaysia, Myanmar, the Philippines, Singapore, Thailand, and Vietnam, which form a market of more than 575 million people. U.S. trade with ASEAN countries exceeds $161 billion a year.[28] In fact, the United States is ASEAN's second-largest trading partner (Japan is its largest), and ASEAN'S member nations constitute the fifth-largest trading partner of the United States ASEAN. An ASEAN free trade area will begin in 2015 for the six original countries (Brunei Darussalam, Indonesia, Malaysia, the Philippines, Singapore, and Thailand) and in 2018 for the newer member

APEC is a broader agreement that includes Australia, Canada, Chile, the People's Republic of China, Hong Kong, Japan, Mexico, New Zealand, Papua New Guinea, Peru, Russia, South Korea, Taiwan, the United States, and all the members of ASEAN except Cambodia, Lao PDR, and Myanmar. APEC's twenty-one member countries contain 2.6 billion people, account for 47 percent of all global trade, and have a combined gross domestic product of over $19 trillion. APEC countries began reducing trade barriers in 2000, though all the reductions will not be completely phased in until 2020.[30] For more information about APEC, see **http://www.apec.org.**

1.4 Consumers, Trade Barriers, and Trade Agreements

In Tokyo, a 12-ounce Coke costs 98 cents.[31] A cup of regular coffee costs $10.19 in Moscow, $6.77 in Paris, and $6.62 in Athens.[32] In the United States, each of these items costs about a dollar. A McDonald's Big Mac sandwich costs an average of $3.54 in the United States, $3.30 in the United Kingdom, and $5.60 in Switzerland.[33] Although not all products are more expensive in other countries (in some, they are cheaper; for example, a Big Mac costs $1.83 in China and $2.30 in Mexico), international studies find that American consumers get much more for their money than most other consumers in the world. For example, the average worker earns nearly $60,820 a year in Switzerland, $77,370 in Norway, $37,790 in Japan, and $46,040 in America.[34] Yet, after adjusting these incomes for how much they can buy, the Swiss income is equivalent to just $44,410, the Norwegian income to $53,650, and the Japanese income to $34,750![35] This is the same as saying that $1 of income can buy you only 73 cents worth of goods in Switzerland, 69 cents in Norway, and 92 cents' worth in Japan. In other words, Americans can buy much more with their incomes than those in other countries can.

"Free trade agreements increase choices, competition, and purchasing power and thus decrease what people pay for food, clothing, necessities, and luxuries."

One reason that Americans get more for their money is that the U.S. marketplace is the most competitive in the world and has been one of the easiest for foreign companies to enter.[36] Although some U.S. industries, such as textiles, have been heavily protected from foreign competition by trade barriers, for the most part, American consumers (and businesses) have had plentiful choices among American-made and foreign-made products. More important, the high level of competition between foreign and domestic companies that creates these choices helps keep prices low in the United States. Furthermore, it is precisely the lack of choice and the low level of competition that keep prices higher in countries that have not been as open to foreign companies and products. For example, Japanese trade barriers are estimated to cost Japanese consumers more than $100 billion a year. In fact, Japanese trade barriers amount to a 51 percent tax on food for the average Japanese family.[37]

So why do trade barriers and free trade agreements matter to consumers? They're important because free trade agreements increase choices, competition, and purchasing power and thus decrease what people pay for food, clothing, necessities, and luxuries. Accordingly, today's consumers rarely care where their products and services come

from. Mark Sneed, president of Phillips Foods, which imports blue crab from its Asian processing factories at one-third the cost of crab caught and processed in the United States, says, "I've never once had a customer ask me if we served domestic or imported crabs, just like they never ask if we have foreign shrimp."[38] Peter Germano, a New York jeweler who sells diamonds, says people don't care where the diamonds are from; they "just want to know which is cheaper."[39] Luis de Anda, who visits one of Wal-Mart's Sam's Wholesale Clubs in Mexico once a month to purchase diapers and toilet paper in bulk for his family and friends, says, "Why should I care where they're from? With the money I save, I take my family to the movies."[40] Finally, polls show that 70 percent of consumers don't look at country-of-origin when shopping. That increases to 85 percent among those 12–24 years in age.[41] College student James Rich said, "We tend to go after what is the best product or, rather, whatever product is most relevant to us."[42]

And why do trade barriers and free trade agreements matter to managers? The reason, as you're about to read, is that while free trade agreements create new business opportunities, they also intensify competition, and addressing that competition is a manager's job.

Global Business, Trade Rules, and Trade Agreements Today, there are more than 79,000 multinational corporations worldwide; just 3.1 percent are based in the United States. Global business affects the United States in two ways: through direct foreign investment in the United States by foreign companies, and through U.S. companies' investment in business in other countries. United States direct foreign investment throughout the world typically amounts to about $2.8 trillion per year, whereas direct foreign investment by foreign companies in the United States amounts to $2.1 trillion per year. Historically, tariffs and nontariff trade barriers, such as quotas, voluntary export restraints, government import standards, government subsidies, and customs classifications, have made buying foreign goods much harder or more expensive than buying domestically produced products. In recent years, however, worldwide trade agreements such as GATT, along with regional trading agreements like the Maastricht Treaty of Europe, NAFTA, CAFTA-DR, USAN, ASEAN, and APEC, have substantially reduced tariff and nontariff barriers to international trade. Companies have responded by investing in growing markets in Asia, Eastern Europe, and Latin America. Consumers have responded by purchasing products based on value, rather than geography.

REVIEW 1

HOW TO GO GLOBAL?

Once a company has decided that it *will* go global, it must decide *how* to go global. For example, if you decide to sell in Singapore, should you try to find a local business partner who speaks the language, knows the laws, and understands the customs and norms of Singapore's culture? Or should you simply export your products from your home country? What do you do if you are also entering Eastern Europe, perhaps starting in Hungary? Should you use the same approach in Hungary that you used in Singapore?

Although there is no magical formula for answering these questions, after reading the next two sections, you should be able to

2. explain why companies choose to standardize or adapt their business procedures.
3. explain the different ways that companies can organize to do business globally.

2 CONSISTENCY OR ADAPTATION?

In this section, we return to a key issue: How can you be sure that the way you run your business in one country is the right way to run that business in another? In other words, how can you strike the right balance between global consistency and local adaptation?

Global consistency means that when a multinational company has offices, manufacturing plants, and distribution facilities in different countries, it will use the same rules, guidelines, policies, and procedures to run those offices, plants, and facilities. Managers at company headquarters value global consistency because it simplifies decisions. In contrast, a company with a **local adaptation** policy modifies its standard operating procedures to adapt to differences in foreign customers, governments, and regulatory agencies. Local adaptation is typically more important to local managers who are charged with making the international business successful in their countries.

If companies lean too much toward global consistency, they run the risk of using management procedures poorly suited to particular countries' markets, cultures, and employees (i.e., a lack of local adaptation). Unlike the United States, which has widely shared tastes in fashion from state to state, in Europe **Tommy Hilfiger** found highly fragmented consumer tastes, which differed significantly across countries. Consequently, while Hilfiger sells most of its products via the same large department and discount stores throughout the United States, in Europe it has taken the opposite strategy by signing sales agreements with 4,500 small, boutique stores in fifteen countries. CEO Fred Gehring says, "The fragmentation of dealing with all these little mom-and-pop stores is so alien to American businesses," yet "these stores are the backbone of every major brand" that sells in Europe.[43] Another reason to work with these 4,500 stores is that unlike in the United States, where it's easier to expand by acquiring land and building new stores, there are few store locations available. Consequently, it makes more sense to work with existing retailers, no matter how small.

If companies focus too much on local adaptation, however, they run the risk of losing the cost efficiencies and productivity that result from using standardized rules and procedures throughout the world. For example, to keep these 4,500 small retailers happy and wanting to sell more Hilfiger products, the company opened 21 regional showrooms, each featuring at least 25 clothing lines, many of which are adapted to particular markets. By contrast, most American companies centralize regional showrooms in just a few locations, whether they're doing business in the United States or abroad. While this lead to much higher costs for Hilfiger—operating costs are 15 percent of sales in Europe and just 5 percent of sales in the United States—those higher costs produce larger sales. And with profit margins 50 percent to 100 percent higher in Europe, those higher costs still produce much higher profits.[44]

REVIEW 2

Consistency or Adaptation? Global business requires a balance between global consistency and local adaptation. Global consistency means using the same rules, guidelines, policies, and procedures in each location. Managers at company headquarters like global consistency because it simplifies decisions. Local adaptation means adapting standard procedures to individual markets. Local managers prefer a policy of local adaptation because it gives them more control. Not all businesses need the same combinations of global consistency and local adaptation. Some thrive by emphasizing global consistency and ignoring local adaptation. Others succeed by ignoring global consistency and emphasizing local adaptation.

3 FORMS FOR GLOBAL BUSINESS

Besides determining whether to adapt organizational policies and procedures, a company must also determine how to organize itself for successful entry into foreign markets.

Historically, companies have generally followed the *phase model of globalization*, in which a company makes the transition from a domestic company to a global company in the following sequential phases: **3.1 exporting, 3.2 cooperative contracts, 3.3 strategic alliances, and 3.4 wholly owned affiliates**. At each step, the company grows much larger, uses those resources to enter more global markets, is less dependent on home country sales, and is more committed in its orientation to global business. Some companies, however, do not follow the phase model of globalization.[45] Some skip phases on their way to becoming more global and less domestic. Others don't follow the phase model at all. These are known as **3.5 global new ventures**. This section reviews these forms of global business.[46]

3.1 Exporting

When companies produce products in their home countries and sell those products to customers in foreign countries, they are **exporting**. Located about 90 minutes from Shanghai, the city of Honghe is one of China's largest sweater producers. Half of its 100,000 citizens work in over 100 factories that generate $650 million a year by producing and exporting 200 million sweaters annually.[47]

Exporting as a form of global business offers many advantages. It makes the company less dependent on sales in its home market and provides a greater degree of control over research, design, and production decisions. Do you know who this year's winner of *American Idol* was? *Idol* has been America's number-one television show for nearly a decade, so chances are you or someone you know does. But did you know that there are 38 other versions of *American Idol* (which is modeled after *Pop Idol* in Britain) around the world? And did you know that **Fremantle Media**, which owns and exports those different versions of *American Idol*, produces global versions of *The Apprentice* (16 countries), *Family Feud* (47 countries), *The Price Is Right,* and *America's Got Talent* (22 countries)?[48] What makes this work in so many different countries is Fremantle Media's tight control of production. CEO Tony Cohen says, "It's not just about the licensing of formats but the brilliance with which you execute it. You've got to do it well. These things have been through evolution and are pretty well perfect. You can't tamper with it, we're very possessive about that." In all of these different countries says Cohen, "We do all the merchandising, all the telephony, there's an Idol camp—a summer camp where you can learn all aspects of performing . . . there have been Idol cars in Belgium and Holland, Idol-branded perfume in multiple territories. People really like it."[49]

Though advantageous in a number of ways, exporting also has its disadvantages. The primary disadvantage is that many exported goods are subject to tariff and nontariff barriers that can substantially increase their final cost to consumers. A second disadvantage is that transportation costs can significantly increase the price of an exported product. For example, when the price of crude oil was approaching $150 a barrel, manufacturers who made everything from batteries to sofas to industrial parts started bringing manufacturing production from overseas back to North America. Jeff Rubin, chief economist at **CIBC World Markets** in Toronto, said, "In a world of triple-digit oil prices, distance cost money."[50] Claude Hayes, president of the retail heating division at the DESA LLC, said at the time, "my cost of getting a shipping container here from China just keeps going up—and I don't see any end in sight." Yet a third disadvantage: Companies that export depend on foreign importers

[Exporting] selling domestically produced products to customers in foreign countries

for product distribution. If, for example, the foreign importer makes a mistake on the paperwork that accompanies a shipment of imported goods, those goods can be returned to the foreign manufacturer at the manufacturer's expense.

3.2 Cooperative Contracts

When an organization wants to expand its business globally without making a large financial commitment to do so, it may sign a **cooperative contract** with a foreign business owner who pays the company a fee for the right to conduct that business in his or her country. There are two kinds of cooperative contracts: licensing and franchising.

[Cooperative contract] an agreement in which a foreign business owner pays a company a fee for the right to conduct that business in his or her country

[Licensing] an agreement in which a domestic company, the licensor, receives royalty payments for allowing another company, the licensee, to produce the licensor's product, sell its service, or use its brand name in a specified foreign market

Under a **licensing** agreement, a domestic company, the *licensor*, receives royalty payments for allowing another company, the *licensee*, to produce its product, sell its service, or use its brand name in a particular foreign market. In India, the **Murjani Group** licenses Tommy Hilfiger products. In the last 3 years, Murjani has built ten new Hilfiger retail stores in India that produce between $20 and $25 million in annual revenues. However, the Murjani Group's licensing arrangement with Hilfiger is not exclusive. The Murjani Group intends to follow the same strategy by establishing forty Calvin Klein stores in India over the next 5 years. Why would Tommy Hilfiger and Calvin Klein partner with the Murjani Group rather than go it alone (i.e., wholly owned subsidiaries)? Laurence Franklin, CEO of Tumi, which sells luggage, women's purses, business and laptop cases, and other kinds of personal and

Fair and Safe Working Conditions in Foreign Factories

Requiring workers to work 15-hour days or to work 7 days a week with no overtime pay, beating them for arriving late, requiring them to apply toxic materials with their bare hands, charging them excessive fees for food and lodging—these are just a few of the workplace violations found in the overseas factories that make shoes, clothes, bicycles, and other goods for large U.S. and multinational companies. The Fair Labor Association, which inspects overseas factories for Adidas-Salomon, Levi Strauss, Liz Claiborne, Nike, Reebok, Polo Ralph Lauren, and others, recommends the following workplace standards for foreign factories.

- Make sure there is no forced labor or child labor; no physical, sexual, psychological, or verbal abuse or harassment; and no discrimination.
- Provide a safe and healthy working environment to prevent accidents.
- Respect the right of employees to freedom of association and collective bargaining. Compensate employees fairly by paying the legally required minimum wage or the prevailing industry wage, whichever is higher.
- Provide legally required benefits. Employees should not be required to work more than 48 hours per week and 12 hours of overtime (for which they should receive additional pay), and they should have at least 1 day off per week.

Do the right thing. Investigate and monitor the working conditions of overseas factories where the goods sold by your company are made. Insist that improvements be made. Find another supplier if they aren't.[52]

business accessories, says, "that expansion into India was more challenging because there's not a lot of high-end, international retail development there."[51] Working with Murjani provides faster entry into India and better solutions.

One of the most important advantages of licensing is that it allows companies to earn additional profits without investing more money. As foreign sales increase, the royalties paid to the licensor by the foreign licensee increase. Moreover, the licensee, not the licensor, invests in production equipment and facilities to produce the licensed product. Licensing also helps companies avoid tariff and nontariff barriers. Since the licensee manufactures the product within the foreign country, tariff and nontariff barriers don't apply. For example, Britvic Corona is licensed to bottle and distribute Pepsi-Cola within the United Kingdom. Because it bottles the soft drink in Britain, tariff and nontariff barriers do not apply.

The biggest disadvantage associated with licensing is that the licensor gives up control over the quality of the product or service sold by the foreign licensee. Unless the licensing agreement contains specific restrictions, the licensee controls the entire business from production to marketing to final sales. Many licensors include inspection clauses in their license contracts, but closely monitoring product or service quality from thousands of miles away can be difficult. An additional disadvantage is that licensees can eventually become competitors, especially when a licensing agreement includes access to important technology or proprietary business knowledge.

A **franchise** is a collection of networked firms in which the manufacturer or marketer of a product or service, the *franchisor*, licenses the entire business to another person or organization, the *franchisee*. For the price of an initial franchise fee plus royalties, franchisors provide franchisees with training, assistance with marketing and advertising, and an exclusive right to conduct business in a particular location. Most franchise fees run between $5,000 and $35,000. Franchisees pay McDonald's, one of the largest franchisors in the world, an initial franchise fee of $45,000. Another $950,900 to $1,797,700 is needed beyond that to pay for food inventory, kitchen equipment, construction, landscaping, and other expenses (the cost varies per country). While they typically borrow part of this cost from a bank, McDonald's requires franchisees to put down 40 percent in cash for the initial investment.[53] Since typical royalties range from 2.0 to 12.5 percent of gross sales, franchisors are well rewarded for the help they provide to franchisees. More than 400 U.S. companies franchise their businesses to foreign franchise partners.

Overall, franchising is a fast way to enter foreign markets. Over the last 20 years, U.S. franchisors have more than doubled their global franchises, for a total of more than 100,000 global franchise units. Because it gives the franchisor additional cash flows from franchisee fees and royalties, franchising can be a good strategy when a company's domestic sales have slowed. Yum! Brands, which owns and runs Pizza Hut, Taco Bell, KFC (formerly Kentucky Fried Chicken), A&W Restaurants, and Long John Silver's, is accepting very few new franchises in the United States because the U.S. market is saturated with fast-food outlets. McDonald's opens fewer than 50 new restaurants a year in the United States.[54] Outside the United States, however, these restaurants are experiencing much stronger growth. In the last decade, McDonald's nearly doubled the number of its overseas restaurants and continues to add approximately 500 to 600 new international restaurants per year.[55] Among Pizza Hut, Taco Bell, KFC, A&W Restaurants, and Long John Silvers, Yum! Brands also opens 500 to 600 new international franchise restaurants a year.[56]

Despite franchising's many advantages, franchisors face a loss of control when they sell businesses to franchisees who are thousands of miles away. Franchising specialist Cheryl Scott says, "One franchisor I know was wondering why the royalties coming from India were so small when he knew the shop was always packed. It was because the franchisee wasn't putting all of the sales through the cash register."[57]

[Franchise] a collection of networked firms in which the manufacturer or marketer of a product or service, the franchisor, licenses the entire business to another person or organization, the franchisee

Although there are exceptions, franchising success may be somewhat culture-bound. Because most global franchisors begin by franchising their businesses in similar countries or regions (Canada is by far the first choice for American companies taking their first step into global franchising), and because 65 percent of franchisors make absolutely no change in their business for overseas franchisees, that success may not generalize to cultures with different lifestyles, values, preferences, and technological infrastructures. When Jim Bryant began opening Subway sandwich shops in China 10 years ago, Americans living there were elated (one kissed the floor), but Chinese customers didn't know how to order (he had to make signs explaining how) or how to eat a sandwich (they peeled it like a banana because they didn't want to physically touch their food). Likewise, because the tuna in the tuna salad didn't have a visible head or a tail, they didn't believe it was actually fish.[58] Management consultant Dennis Custage says, "The number one mistake companies make is trying to run everything the way it was in their home country, with a bunch of expatriates."[59] Furthermore, unlike McDonald's, which added a new spicy chicken burger, and KFC, which replaced coleslaw with shredded carrots, fungus, or bamboo shoots, Subway didn't change its menu for Chinese tastes. Luo Bing Ling, who runs a Subway store in Beijing, says, "Subway should have at least one item tailored to Chinese tastes to show they are respecting the local culture."[60]

3.3 Strategic Alliances

Companies forming **strategic alliances** combine key resources, costs, risks, technology, and people. The most common strategic alliance is a **joint venture**, which occurs when two existing companies collaborate to form a third company. The two founding companies remain intact and unchanged, except that together they now own the newly created joint venture. One of the oldest and most successful global joint ventures is Fuji Xerox, a joint venture between Fuji Film of Japan and U.S.-based Xerox Corporation, which makes copiers and automated office systems. More than 45 years after its creation, Fuji Xerox employs 42,000 employees and has close to $12 billion in revenues. Fuji Xerox is largely responsible for copier sales in Asia, whereas Xerox is responsible for North American sales. Rank Xerox, a Xerox subsidiary, is responsible for sales in Europe.[61]

One of the advantages of global joint ventures is that, like licensing and franchising, they help companies avoid tariff and nontariff barriers to entry. Another advantage is that companies participating in a joint venture bear only part of the costs and the risks of that business. Many companies find this attractive because of the expense of entering foreign markets or developing new products. For example, U.S.-based **Weight Watchers International** formed an international joint venture in China with Groupe Danone, which sells healthy foods worldwide. David Kirchhoff, president and chief executive officer of Weight Watchers International, said, "We are excited to partner with Groupe Danone for the expansion of our weight management approach into the Chinese marketplace. This new joint venture will facilitate and drive Weight Watchers entry into one of the world's key markets, leveraging the unique strengths of each company. Group Danone is the ideal partner for Weight Watchers with its experience in China, its knowledge of Chinese consumers and its mission to bring healthy food to the world's population."[62]

[Strategic alliance] an agreement in which companies combine key resources, costs, risk, technology, and people

[Joint venture] a strategic alliance in which two existing companies collaborate to form a third, independent company

Global joint ventures can be especially advantageous to smaller local partners who link up with larger, more experienced foreign firms that can bring advanced management, resources, and business skills to the joint venture. For example, **Arrow Energy, Ltd.** is an oil and natural gas exploration and production company based in Calgary, Canada. Arrow is partnering with **Royal Dutch Shell PLC** in a global joint venture to mine and export natural gas from coal seams in Australia.[63] Global joint ventures are

not without problems, though. Because companies share costs and risks with their joint venture partners, they must also share profits. At one time, sharing of profits created some tension at Fuji Film, Xerox, and their joint venture, Fuji Xerox. In fact, until Xerox's recent turnaround, the company struggled for so long that business experts joked that Fuji Xerox, which has been highly profitable, should purchase Xerox.

Managing global joint ventures can also be difficult because they represent a merging of four cultures: the country and the organizational cultures of the first partner, and the country and the organizational cultures of the second partner. Often, to be fair to all involved, each partner in the global joint venture will have equal ownership and power. But this can result in power struggles and a lack of leadership. Because of these problems, companies forming global joint ventures should carefully develop detailed contracts that specify the obligations of each party. Toshiba, which participated in its first global joint ventures in the early 1900s by making light bulb filaments with General Electric, treats joint ventures like a marriage of the two companies and views the contract as a prenuptial agreement. The joint venture contract specifies how much each company will invest, what its rights and responsibilities are, and what it is entitled to if the joint venture does not work out. These steps are important because the rate of failure for global joint ventures is estimated to be as high as 70 percent.[64]

When companies involved in global joint ventures don't carefully specify the obligations of each party, difficulties can occur. Shanghai Automotive, an auto manufacturer owned by the Chinese government that has global joint ventures with General Motors and Volkswagen, builds hundreds of thousands of Buicks, Chevys, Santanas, and Passats each year for Chinese consumers. Now, however, Shanghai Automotive has announced that it will build its own cars for the Chinese market to compete directly with its partners. Michael Dunne, president of Automotive Resources Asia, says, "The Chinese formed joint ventures for one purpose: to learn how to do it themselves one day. That day is here."[65]

[Wholly owned affiliates] foreign offices, facilities, and manufacturing plants that are 100 percent owned by the parent company

3.4 Wholly Owned Affiliates (Build or Buy)

Approximately one-third of multinational companies enter foreign markets through wholly owned affiliates. Unlike licensing arrangements, franchises, or joint ventures, **wholly owned affiliates** are 100 percent owned by the parent company. For example, Honda Motors of America in Marysville, Ohio, is 100 percent owned by Honda Motors of Japan. Likewise, Ford Motor of Germany in Cologne is 100 percent owned by the Ford Motor Company in Detroit, Michigan.[66]

The primary advantage of wholly owned businesses is that the parent company receives all of the profits and has complete control over the foreign facilities. The biggest disadvantage is the expense of building new operations or buying existing businesses. Although the payoff can be enormous if wholly owned affiliates succeed, the losses can be immense if they fail because the parent company assumes all of the risk. **Value City**, which is a wholly owned subsidiary of Retail Ventures Inc., has 113 stores in the Midwest and the Southeast. Value City, which sells discount merchandise, has struggled against Wal-Mart and Target in recent years and is losing over $50 million a year. As a result of those losses, Retail Ventures is selling Value City so it can focus on DSW, which is a discount shoe retailer with 250 stores in 36 states.[67]

3.5 Global New Ventures

Companies used to evolve slowly from small operations selling in their home markets to large businesses selling to foreign markets. Furthermore, as companies went global, they usually followed the phase model of globalization. Recently, however, three trends have combined to allow companies to skip the phase model when going global. First, quick, reliable air travel can transport people to nearly any point in the world within one day. Second, low-cost communication technologies such as international e-mail, teleconferencing, phone conferencing, and the Internet make it easier to communicate with global customers, suppliers, managers, and employees. Third, there is now a critical mass of businesspeople with extensive personal experience in all aspects of global business.[68] This combination of developments has made it possible to start companies that are global from inception. With sales, employees, and financing in different countries, **global new ventures** are companies that are founded with an active global strategy.[69]

Although there are several different kinds of global new ventures, all share two common factors. First, the company founders successfully develop and communicate the company's global vision from inception. Winphoria Networks, which specializes in wireless networks, was global the day it started. Company investor Promod Haque explains: "Sales and marketing and the CEO were in Boston," but "the center of gravity was outside the United States. By having our employees based in Madrid and Bangalore, we were bidding contracts in Europe and Asia" during a time when sales were slow in the United States.[70] Winphoria's global launch was so successful that Motorola bought it only a few years after the start-up.

Second, rather than going global one country at a time, new global ventures bring a product or service to market in several foreign markets at the same time. While headquartered in Lexington, Massachusetts, VistaPrint receives 15,000 orders a day from customers in 120 different countries who design their business cards, brochures, and invitations online using seventeen different VistaPrint websites, each representing a different language or location. Printing happens at two automated production facilities, one in the Netherlands and the other in Canada. Once printed, the products are cut and sized by robots and then packaged and delivered just 3 days

[Global new ventures] new companies that are founded with an active global strategy and have sales, employees, and financing in different countries

after ordering. Regarding VistaPrint's commitment to worldwide customers, founder Robert Keane says, "The United States is blessed and cursed with a huge domestic market. It's often hard for start-ups to find their way out of their home nation. But you have to—it's not that type of world anymore."[71]

Forms for Global Business The phase model of globalization says that as companies move from a domestic to a global orientation, they use these organizational forms in sequence: exporting, cooperative contracts (licensing and franchising), strategic alliances, and wholly owned affiliates. Yet not all companies follow the phase model. For example, global new ventures are global from their inception.

WHERE TO GO GLOBAL?

Deciding where to go global is just as important as deciding how your company will go global.

After reading the next three sections, you should be able to

4. explain how to find a favorable business climate.
5. discuss the importance of identifying and adapting to cultural differences.
6. explain how to successfully prepare workers for international assignments.

4 FINDING THE BEST BUSINESS CLIMATE

When deciding where to go global, companies try to find countries or regions with promising business climates.

An attractive global business climate **4.1 positions the company for easy access to growing markets, 4.2 is an effective but cost-efficient place to build an office or manufacturing facility,** and **4.3 minimizes the political risk to the company**.

4.1 Growing Markets

The most important factor in an attractive business climate is access to a growing market. For example, no product is known and purchased by as many people throughout the world as **Coca-Cola**. Yet even Coke, which is available in over 200 countries, still has tremendous potential for further global growth. Coca-Cola gets 76 percent of its sales outside of North America. And emerging markets, where it has seen its fastest growth, now account for half of Coke's sales worldwide.[72]

Two factors help companies determine the growth potential of foreign markets: purchasing power and foreign competitors. **Purchasing power** is measured by comparing the relative cost of a standard set of goods and services in different countries. Earlier in the chapter we noted that a Coke costs 98 cents in Tokyo. Because a 12-ounce Coke costs only about 50 cents in the United States, the average American would have more purchasing power than the average Japanese. Purchasing power is strong in countries like Mexico, India, and China, which have low average levels of

income. This is because basic living expenses such as food, shelter, and transportation are very inexpensive in those countries, so consumers still have money to spend after paying for necessities. For example, Mexican newlyweds Lucia Jiminez, a clothing store clerk, and Benjamin Macias, an office worker for an eyeglass store, earn just $650 a month. But that modest income easily qualifies them for a 30-year mortgage because the cost of their brand-new two-bedroom house 30 minutes outside Mexico City is just $25,200.[73] Because basic living expenses are so low in China, Mexico, and India and incomes are rising, purchasing power is strong and millions of Chinese, Mexican, and Indian consumers increasingly have extra money to spend on what they want in addition to what they need.[74]

Consequently, countries with high and growing levels of purchasing power are good choices for companies looking for attractive global markets. As Exhibit 8.5 shows, Coke has found that the per capita consumption of Coca-Cola, or the number of Cokes a person drinks per year, rises directly with purchasing power.

For example, in China, Brazil, and Spain, where the average person earns, respectively, $7,600, $8,600, and $27,000 annually, the number of Coca-Cola soft drinks increases, respectively, from 18 to 156 to 305. The more purchasing power people have, the more likely they are to purchase soft drinks.

The second part of assessing the growth potential of global markets involves analyzing the degree of global competition, which is determined by the number and quality of companies that already compete in a foreign market. Intel has been in China for 20 years not only because of the size of the potential market (China has 1.3 billion people and 95 percent of Chinese homes still don't have a computer) but also because there was almost no competition. But now that China is the third-largest computer

chip market in the world, Intel faces competition from AMD, Intel's primary U.S. competitor, which entered China 4 years ago, and Shanghai Semiconductor Manufacturing International, a 5-year-old Chinese company that manufactures low-end chips. Intel's 20-year head start, however, has given it a dominating 75 percent share of the Chinese market.[75]

4.2 Choosing an Office/Manufacturing Location

Companies do not have to establish an office or manufacturing location in each country they enter. They can license, franchise, or export to foreign markets, or they can serve a larger region from one country. But there are many reasons why a company might choose to establish a location in a foreign country. Some foreign offices are established through global mergers and acquisitions, like the acquisition of IBM's Think Pad brand, headquartered in Raleigh, North Carolina, by Beijing-based computer maker **Lenovo**. In fact, while Lenovo maintains offices in both places, top executives hold their monthly meetings at a different location each time—a strategy Bill Amelio, CEO of Lenovo, calls "worldsourcing." Other companies seek a tax haven (although this is more difficult for American companies due to legal concerns), want to reflect their customer base, or strive to create a global brand. Although a company must be legally incorporated in one place, some companies have anywhere from nine to twenty-three global hubs and don't regard any one as more central than another.[76]

Thus, the criteria for choosing an office/manufacturing location are different from the criteria for entering a foreign market. Rather than focusing on costs alone, companies should consider both qualitative and quantitative factors. Two key qualitative factors are work force quality and company strategy. Work force quality is important because it is often difficult to find workers with the specific skills, abilities, and experience that a company needs to run its business. Work force quality is one reason that many companies doing business in Europe locate their customer call centers in the Netherlands. As shown in Exhibit 8.6, workers in the Netherlands are the most linguistically gifted in Europe, with 73 percent speaking two languages, 44 percent speaking three languages, and 12 percent speaking more than three. Of course, with employees who speak several languages, call centers located in the Netherlands can handle calls from more countries and generally employ 30 to 50 percent fewer employees than those located in other parts of Europe. Another advantage of locating a call center in the Netherlands is that 60 percent of call center workers have university or advanced degrees in technology or management.[77]

A company's strategy is also important when choosing a location. For example, a company pursuing a low-cost strategy may need plentiful raw materials, low-cost transportation, and low-cost labor. A company pursuing a differentiation strategy (typically a higher-priced, better product or service) may need access to high-quality materials and a highly skilled and educated work force.

Quantitative factors such as the kind of facility being built, tariff and nontariff barriers, exchange rates, and transportation and labor costs should also be considered when choosing an office/manufacturing

location. A real estate specialist in company location decisions explains how things change with different types of facility: "If it's an assembly plant, a company might be inclined to look for incentives that would subsidize its hiring. With a distribution facility, an adequate transportation network will likely be critical. A corporate headquarters will need a good communications network, a multilingual labor force, and easy access by air. On the other hand, a research and development operation will require proximity to a high-tech infrastructure and access to good universities."[78] Companies rely on studies such as Cushman & Wakefield's annually published "European Cities Monitor" to compare business climates throughout Europe.[79] Similar studies are available for other parts of the world. Exhibit 8.7 offers a quick overview of the best cities for business based on a variety of criteria. This information is a good starting point if your company is trying to decide where to put an international office or manufacturing plant.

4.3 Minimizing Political Risk

When managers think about political risk in global business, they envision burning factories and riots in the streets. Although political events such as these receive dramatic and extended coverage from the media, the political risks that most companies face usually are not covered as breaking stories on Fox News and CNN. Nonetheless, the negative consequences of ordinary political risk can be just as devastating to companies that fail to identify and minimize that risk.[81]

doing the right thing

Foreign Corrupt Business Practices Act

The Foreign Corrupt Business Practices Act (FCPA) prohibits company managers, employees, or agents from offering money or anything else of value to bribe officials of foreign governments or political parties to use their influence to help that firm acquire new business or keep existing business in that country. Individuals violating the FCPA can be fined up to $100,000 and imprisoned for up to 10 years. Companies that violate the FCPA can be fined up to $2 million, suspended from government contracts, denied export licensing privileges, and investigated by the Securities and Exchange Commission. U.S. businesspeople often worry that the FCPA puts them at a disadvantage because other countries have permitted bribes to be deducted as business expenses. Recently, however, 33 major trading partners of the United States agreed to enact laws similar to the FCPA.[80]

When conducting global business, companies should attempt to identify two types of political risk: political uncertainty and policy uncertainty.[82] **Political uncertainty** is associated with the risk of major changes in political regimes that can result from war, revolution, death of political leaders, social unrest, or other influential events. **Policy uncertainty** refers to the risk associated with changes in laws and government policies that directly affect the way foreign companies conduct business.

Policy uncertainty is the most common—and perhaps most frustrating—form of political risk in global business, especially when changes in laws and government policies directly undercut sizable investments made by foreign companies. Royal Dutch Shell joined with Russia-based Gazprom, a state-owned company controlled by the Kremlin, to develop Sakhalin-2, one of the world's largest liquefied natural gas fields. Shell and its partners took the lead role with 55 percent ownership and fronted a correspondingly larger amount of the estimated $20 billion in development costs. However, after years of development and billions in investment, the Russian government banned foreign companies from owning more than 49 percent of any energy development project. In the end, to avoid losing its investment, Royal Dutch Shell relinquished majority ownership to Gazprom in return for a $7.45 billion payment, well short of the $12 billion Shell had already invested. Furthermore, the deal significantly reduced Shell's access to develop and sell gas reserves in the Sakhalin-2 gas field and in the Zapolyarnoye gas field, which Shell had contracted to develop a year before.[83]

Several strategies can be used to minimize or adapt to the political risk inherent in global business. An *avoidance strategy* is used when the political risks associated with a foreign country or region are viewed as too great. If firms are already invested in high-risk areas, they may divest or sell their businesses. If they have not yet invested, they will likely postpone their investment until the risk shrinks. Exhibit 8.8 shows the long-term political stability for various countries in the Middle East (higher scores indicate less political risk). The following factors, which were used to compile these ratings, indicate greater political risk: government instability, poor socioeconomic conditions, internal or external conflict, military involvement in politics, religious and ethnic tensions, high foreign debt as a percentage of

gross domestic product, exchange rate instability, and high inflation.[84] An avoidance strategy would likely be used for the riskiest countries shown in Exhibit 8.8, such as Iran, Saudi Arabia, and Lebanon, but might not be needed for the less risky countries, such as Israel, Kuwait, or Oman. Risk conditions and factors change, so be sure to make risk decisions with the latest available information from resources such as the PRS Group, **http://www.prsgroup.com**, which supplies information about political risk to 80 percent of the *Fortune* 500 companies.

Control is an active strategy to prevent or reduce political risks. Firms using a control strategy lobby foreign governments or international trade agencies to change laws, regulations, or trade barriers that hurt their business in that country. **Emerson Electric Co.** had virtually no business for its InSinkErator garbage disposals in Europe during the 1990s. The company lobbied European governments to convince them of the environmentally friendly impact of a waste disposer compared to other methods of getting rid of food waste, such as composting, which involves garbage trucks and landfills that emit poisonous methane gases. By contrast, garbage disposals are the cheapest method to dispose food waste because they enable water-treatment plants to turn methane (that comes through the sewer system) into power and decrease the carbon footprint by reducing the amount of waste transported by trucks. Partially as a result of its lobbying, Emerson now sells over 100,000 disposals each year in Europe.[85]

Another method for dealing with political risk is *cooperation*, which involves using joint ventures and collaborative contracts, such as franchising and licensing. Although cooperation does not eliminate the political risk of doing business in a country, it can limit the risk associated with foreign ownership of a business. For example, a German company forming a joint venture with a Chinese company to do business in China may structure the joint venture contract so that the Chinese company owns 51 percent or more of the joint venture. Doing so qualifies the joint venture as a Chinese company and exempts it from Chinese laws that apply to foreign-owned businesses. However, as we saw with Shell and Gazprom, the state-controlled Russian oil company, cooperation cannot always protect against *policy risk* if a foreign government changes its laws and policies to directly affect the way foreign companies conduct business.

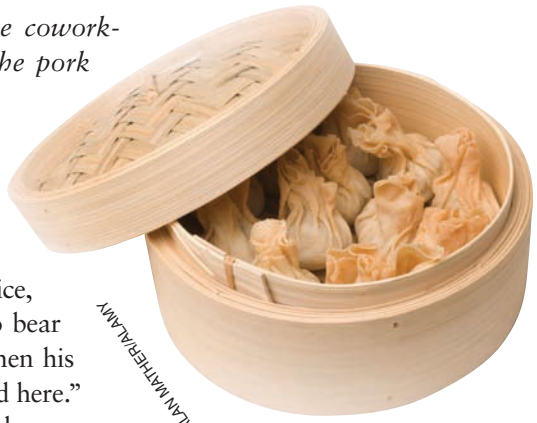
REVIEW 4

Finding the Best Business Climate The first step in deciding where to take your company global is finding an attractive business climate. Look for a growing market where consumers have strong purchasing power and foreign competitors are weak. When locating an office or manufacturing facility, consider both qualitative and quantitative factors. In assessing political risk, be sure to examine political uncertainty and policy uncertainty. If the location you choose has considerable political risk, you can avoid it, try to control the risk, or use a cooperation strategy.

5 BECOMING AWARE OF CULTURAL DIFFERENCES

Some of the more interesting and amusing aspects of global business are the unexpected confrontations that people have with cultural differences, "the way they do things over there." *Wall Street Journal* columnist Geoffrey Fowler relates the following story from Hong Kong, where he works:

> *I was riding the elevator a few weeks ago with a Chinese colleague here in the Journal's Asian headquarters. I smiled and said, "Hi." She responded, "You've gained weight."*
>
> *I might have been appalled, but at least three other Chinese coworkers also have told me I'm fat. I probably should cut back on the pork dumplings.*[86]



© ALAN MATHER/ALAMY

Uttered in the United States, such comments would be considered rude. Fowler indicates that in China, where people openly talk about people's weight, body shapes, and salaries, such comments are probably just friendliness. Likewise, the Chinese colleagues of American Jennifer Gallo, who works in Beijing, have commented on her clothing ("very nice, could be European"), her muscle tone ("flabby"), and her likeliness to bear children ("certain to have many boys").[87] So what does Fowler say when his friendly Chinese colleagues tell him he's fat? "There's so much good food here."

National culture is the set of shared values and beliefs that affects the perceptions, decisions, and behavior of the people from a particular country. The first step in dealing with culture is to recognize that there are meaningful differences. Professor Geert Hofstede spent 20 years studying cultural differences in fifty-three different countries. His research shows that there are five consistent cultural dimensions across countries: power distance, individualism, masculinity, uncertainty avoidance, and short-term versus long-term orientation.[88]

Power distance is the extent to which people in a country accept that power is distributed unequally in society and organizations. In countries where power distance is weak, such as Denmark and Sweden, employees don't like their organization or their boss to have power over them or tell them what to do. They want to have a say in decisions that affect them. As Exhibit 8.9 shows, Russia and China, with scores of 95 and 80, respectively, are much stronger in power distance than Germany (35), the Netherlands (38), and the United States (40).

Individualism is the degree to which societies believe that individuals should be self-sufficient. In individualistic societies, employees put loyalty to themselves first and loyalty to their company and work group second. In Exhibit 8.9, the United States (91), the Netherlands (80), France (71), and Germany (67) are the strongest in individualism, while Indonesia (14), West Africa (20), and China (20) are the weakest.

Masculinity and *femininity* capture the difference between highly assertive and highly nurturing cultures. Masculine cultures emphasize assertiveness, competition, material success, and achievement, whereas feminine cultures emphasize the importance of relationships, modesty, caring for the weak, and quality of life. In Exhibit 8.9, Japan (95), Germany (66), and the United States (62) have the most masculine orientations, while the Netherlands (14) has the most feminine orientation.

The cultural difference of *uncertainty avoidance* is the degree to which people in a country are uncomfortable with unstructured, ambiguous, unpredictable situations. In countries with strong uncertainty avoidance, like Greece and Portugal, people tend to be aggressive and emotional and seek security rather than uncertainty. In Exhibit 8.9, Japan (92), France (86), West Africa (90), and Russia (90) are strongest in uncertainty avoidance, while Hong Kong (29) is the weakest.

[National culture] the set of shared values and beliefs that affects the perceptions, decisions, and behavior of the people from a particular country

Short-term/long-term orientation addresses whether cultures are oriented to the present and seek immediate gratification or to the future and defer gratification. Not surprisingly, countries with short-term orientations are consumer-driven, whereas countries with long-term orientations are savings-driven. In Exhibit 8.9, China (118) and Hong Kong (96) have very strong long-term orientations, while Russia (10), West Africa (16), Indonesia (25), the United States (29), and Germany (31) have very strong short-term orientations. To generate a graphical comparison of two different country's cultures, go to **http://www.geert-hofstede.com/hofstede_dimensions.php**. Select a "home culture"; then select a "host culture." A graph comparing the countries on each of Hofstede's five cultural differences will automatically be generated.

Cultural differences affect perceptions, understanding, and behavior. Recognizing cultural differences is critical to succeeding in global business. Nevertheless, as Hofstede pointed out, descriptions of cultural differences are based on averages—the average level of uncertainty avoidance in Portugal, the average level of power distance in Argentina, and so forth. Accordingly, says Hofstede, "If you are going to spend time with a Japanese colleague, you shouldn't assume that overall cultural statements about Japanese society automatically apply to this person."[89] Similarly, cultural beliefs may differ significantly from one part of a country to another.[90]

After becoming aware of cultural differences, the second step is deciding how to adapt your company to those differences. Unfortunately, studies investigating the effects of cultural differences on management practice point more to difficulties than to easy solutions. One problem is that different cultures will probably perceive management policies and practices differently. For example, blue-collar workers in France and Argentina, all of whom performed the same factory jobs for the same multinational company, perceived its company-wide safety policy differently.[91] French workers perceived that safety wasn't very important to the company, but Argentine workers thought that it was. The fact that something as simple as a safety policy can be perceived differently across cultures shows just how difficult it can be to standardize management practices across different countries and cultures.

Another difficulty is that cultural values are changing, albeit slowly, in many parts of the world. The fall of communism in Eastern Europe and the former Soviet Union and the broad economic reforms in China have produced sweeping changes on two continents in the last decade. Thanks to increased global trade resulting from GATT and other regional free trade agreements, major economic transformations are also under way in India, Mexico, Central America, and South America. Consequently, when trying to adapt management practices to cultural differences, companies must ensure that they are not basing their adaptations on outdated and incorrect assumptions about a country's culture.

Becoming Aware of Cultural Differences National culture is the set of shared values and beliefs that affects the perceptions, decisions, and behavior of the people from a particular country. The first step in dealing with culture is to recognize meaningful differences such as power distance, individualism, masculinity, uncertainty avoidance, and short-term/long-term orientation. Cultural differences should be carefully interpreted because they are based on averages, not individuals. Adapting managerial practices to cultural differences is difficult because policies and practices can be perceived differently in different cultures. Another difficulty is that cultural values may be changing in many parts of the world. Consequently, when companies try to adapt management practices to cultural differences, they need to be sure that they are not using outdated assumptions about a country's culture.

Bilingualism—A Growing Trend

Over 50 million people in the United States speak more than one language. This number is double what it was just 20 years ago, and it continues to grow. In Europe even more value is placed on the ability to speak multiple languages; more Europeans are multilingual, speaking three or more languages, than are just bilingual. Being able to communicate in multiple languages is an important asset in any business and can help give a company the edge it needs to succeed in a competitive market.

6 PREPARING FOR AN INTERNATIONAL ASSIGNMENT

Around a conference table in a large U.S. office tower, three American executives sat with their new boss, Akiro Kusumoto, the newly appointed head of a Japanese firm's American subsidiary, and two of his Japanese lieutenants. The meeting was called to discuss ideas for reducing operating costs. Kusumoto

began by outlining his company's aspirations for its long-term U.S. presence. He then turned to the budgetary matter. One Japanese manager politely offered one suggestion, and an American then proposed another. After gingerly discussing the alternatives for quite some time, the exasperated American blurted out: "Look, that idea is just not going to have much impact. Look at the numbers!" In the face of such bluntness, uncommon and unacceptable in Japan, Kusumoto fell silent. He leaned back, drew air between his teeth, and felt a deep longing to return home. He realized his life in this country would be filled with many such jarring encounters and lamented his posting to a land of such rudeness.[92]

Akiro Kusumoto is a Japanese **expatriate**, someone who lives and works outside his or her native country. The cultural shock that he was experiencing is common. The difficulty of adjusting to language, cultural, and social differences is the primary reason for expatriate failure in overseas assignments. For example, although there have recently been disagreements among researchers about these numbers, it is probably safe to say that 5 to 20 percent of American expatriates sent abroad by their companies will return to the United States before they have successfully completed their assignments.[93] Of those who do complete their international assignments, about one-third are judged by their companies to be no better than marginally effective.[94]

Since the average cost of sending an employee on a 3-year international assignment is $1 million, failure in those assignments can be extraordinarily expensive.[95]

The chances for a successful international assignment can be increased through **6.1 language and cross-cultural training** and **6.2 consideration of spouse, family, and dual-career issues**.

6.1 Language and Cross-Cultural Training

Predeparture language and cross-cultural training can reduce the uncertainty that expatriates feel, the misunderstandings that take place between expatriates and natives, and the inappropriate behaviors that expatriates unknowingly commit when they travel to a foreign country. Indeed, simple things like using a phone, locating a public toilet, asking for directions, finding out how much things cost, exchanging greetings, or understanding what people want can become tremendously complex when expatriates don't know a foreign language or a country's customs and cultures. In his book *Blunders in International Business*, David Ricks tells the story of an American manager working in the South Pacific who, by hiring too many local workers from one native group, unknowingly upset the balance of power in the island's traditional status system. The islanders met on their own and quickly worked out a solution to the problem. After concluding their meeting at 3 am, they calmly went to the manager's home to discuss their solution with him (time was not important in their culture). But since the American didn't speak their language and didn't understand why they had shown up en masse outside his home at 3 am, he called in the Marines, who were stationed nearby, to disperse what he thought was a riot.

Expatriates who receive predeparture language and cross-cultural training make faster adjustments to foreign cultures and perform better on their international assignments.[96] Unfortunately, only a third of the managers who go on international assignments are offered any kind of predeparture training, and only half of those actually participate in the training![97] Suzanne Bernard, director of international mobility at Bombadier Aerospace in Canada, says, "We always offer cross-cultural training, but it's very seldom used by executives leaving in a rush at the last minute."[98] This is somewhat surprising given the failure rates for expatriates and the high cost of those failures. Furthermore, with the exception of some language courses, predeparture training is not particularly expensive or difficult to provide. Three methods can be used to prepare workers for international assignments: documentary training, cultural simulations, and field experiences.

[Expatriate] someone who lives and works outside his or her native country

Documentary training focuses on identifying specific critical differences between cultures. For example, when sixty workers at Axcelis Technologies in Beverly, Massachusetts, were preparing to do business in India, they learned that while Americans make eye contact and shake hands firmly when greeting others, Indians, as a sign of respect, do just the opposite, avoiding eye contact and shaking hands limply.[99]

After learning specific critical differences through documentary training, trainees can then participate in *cultural simulations*, in which they practice adapting to cultural differences. After the workers at Axcelis Technologies learned about key differences between their culture and India's, they practiced adapting to those differences by role playing: Some Axcelis workers would take the roles of Indian workers, while other Axcelis workers would play themselves and try to behave in a way consistent with Indian culture. As they role-played, Indian music played loudly in the background, and they were coached on what to do or not do by Bidhan Chandra, an international consultant. Chandra says, "When people understand these differences, they're less likely to make mistakes with each other."[100] Axcelis human resources director Randy Longo says, "At first, I was skeptical and wondered what I'd get out of the class. But it was enlightening for me. Not everyone operates like we do in America."[101]

Finally, *field simulation* training, a technique made popular by the U.S. Peace Corps, places trainees in an ethnic neighborhood for 3 to 4 hours to talk to residents about cultural differences. For example, a U.S. electronics manufacturer prepared workers for assignments in South Korea by having trainees explore a nearby South Korean neighborhood and talk to shopkeepers and people onthe street about South Korean politics, family orientation, and day-to-day living practices.

6.2 Spouse, Family, and Dual-Career Issues

When Ford Motor Company manager John Larsen moved his wife, Laurel, and their children, ages 2, 4, and 6, to Chongqing, China, his children became a "crowd stopping spectacle" as local people, who had never seen Westerners much less their children, stopped to gawk. Laurel Larsen says, "It's not very fun and my kids hate it. . . . When we go home [to the 19th-floor Hilton hotel suite in which they live] and close the door, we feel like we are back in America."[102]

Not all international assignments are as difficult for expatriates and their families, but the evidence clearly shows that how well an expatriate's spouse and family adjust to the foreign culture is the most important factor in determining the success or failure of an international assignment.[103] Barry Kozloff of Selection Research International says, "The cost of sending a family on a foreign assignment is around $1 million and their failure to adjust is an enormous loss."[104] Unfortunately, despite its importance, there has been little systematic research on what does and does not help expatriates' families successfully adapt. A number of companies, however, have found that adaptability screening and intercultural training for families can lead to more successful overseas adjustment.

Adaptability screening is used to assess how well managers and their families are likely to adjust to foreign cultures. For example, Prudential Relocation Management's international division has developed an "Overseas Assignment Inventory" to assess a spouse and family's open-mindedness, respect for others' beliefs, sense of humor, and marital communication. Likewise, Pennsylvania-based AMP, a worldwide producer of electrical connectors, conducts extensive psychological screening on expatriates and their spouses when making international assignments. But adaptability screening does not just involve a company assessing an employee; it can also involve an employee screening international assignments for desirability. Since more employees are becoming aware of the costs of international assignments (spouses having to give up or change jobs, children having to change schools, everyone having to learn a new language), some companies are willing to pay for a preassignment trip so the employee and his or her spouse

Cross-Cultural Training

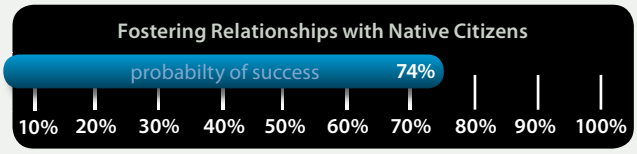
Most expatriates will tell you that cross-cultural training helped them adjust to foreign cultures. Such anecdotal data, however, are not as convincing as systematic studies. Twenty-one studies, with a combined total of 1,611 participants, have examined whether cross-cultural training affects the self-development, relationships, perceptions, adjustment, and job performance of expatriates. Overall, they show that cross-cultural training works extremely well in most instances.

Self-Development

When you first arrive in another country, you must learn how to make decisions that you took for granted in your home country: how to get to work, how to get to the grocery, how to pay your bills, and so on. If you've generally been confident about yourself and your abilities, an overseas assignment can challenge that sense of self. Cross-cultural training helps expatriates deal with these and other challenges. Expatriates who receive cross-cultural training are 79 percent more likely to report healthy psychological well-being and self-development than those who don't receive training.

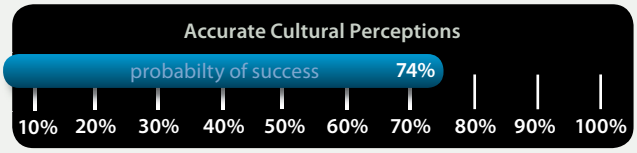
Fostering Relationships

One of the most important aspects of an overseas assignment is establishing and maintaining relationships with host nationals. If you're in Brazil, you need to make friends with Brazilians. Many expatriates, however, make the mistake of making friends only with other expatriates from their home country. In effect, they become social isolates in a foreign country. They work and live there, but as much as they can, they speak their native language, eat their native foods, and socialize with other expatriates from their home country. Cross-cultural training makes a big difference in whether expatriates establish relationships with host nationals. Expatriates who receive cross-cultural training are 74 percent more likely to establish such relationships.



Accurate Perceptions of Culture

Another characteristic of successful expatriates is that they understand the cultural norms and practices of the host country. For example, many Americans do not understand the famous pictures of Japanese troops turning their backs to American military commanders on V-J Day, when Japan surrendered to the United States at the end of World War II. Americans viewed this as a lack of respect, when, in fact, in Japan turning one's back in this way is a sign of respect. Cross-cultural training makes a big difference in the accuracy of perceptions concerning host country norms and practices. Expatriates who receive cross-cultural training are 74 percent more likely to have accurate perceptions.



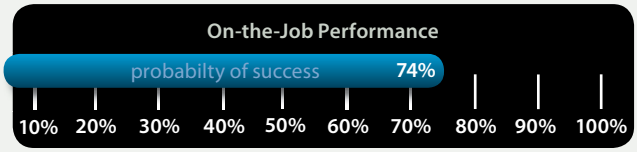
Rapid Adjustment

New employees are most likely to quit in the first 6 months because this initial period requires the most adjustment: learning new names, new faces, new procedures, and

new information. It's tough. Of course, expatriates have a much harder time adjusting to their new jobs because they are also learning new languages, new foods, new customs, and often new lifestyles. Expatriates who receive cross-cultural training are 74 percent more likely to make a rapid adjustment to a foreign country.

Job Performance

It's good that cross-cultural training improves self-development, fosters relationships, improves the accuracy of perceptions, and helps expatriates make rapid adjustments to foreign cultures. From an organizational standpoint, however, the ultimate test of cross-cultural training is whether it improves expatriates' job performance. The evidence shows that cross-cultural training makes a significant difference in expatriates' job performance, although the difference is not quite as large as for the other factors. Nonetheless, it is estimated that cross-cultural training for 100 managers could bring about $390,000 worth of benefits to a company, or nearly $4,000 per manager. This is an outstanding return on investment, especially when you consider the high rate of failure for expatriates. Expatriates who have received cross-cultural training are 71 percent more likely to have better on-the-job performance than those who did not receive cross-cultural training.[106]



can investigate the country *before* accepting the international assignment.[105]

Only 40 percent of expatriates' families receive language and cross-cultural training, yet such training is just as important for the families of expatriates as for the expatriates themselves.[107] In fact, it may be more important because, unlike expatriates, whose professional jobs often shield them from the full force of a country's culture, spouses and children are fully immersed in foreign neighborhoods and schools. Households must be run, shopping must be done, and bills must be paid. Unfortunately, expatriate spouse Laurel Larsen, despite 2 hours of Chinese lessons a week, hasn't learned enough of the language to communicate with the family's babysitter. She has to phone her husband, who became fluent in Chinese in his teens, to translate. Expatriates' children must deal with different cultural beliefs and practices, too. While the Larsens' three daughters love the private, international school that they attend, they still have had difficulty adapting to, from their perspective, the incredible differences in inner China. Six-year-old Emma taped this poem to her parents' nightstand: "Amarica is my place! I love Amarica. It was fun. It was so fun. I miss it."[108] In addition to helping families prepare for the cultural differences they will encounter, language and cross-cultural training can help reduce uncertainty about how to act and decrease misunderstandings between expatriates and their families and locals.

Preparing for an International Assignment Many expatriates return prematurely from international assignments because of poor performance. However, premature return is much less likely to happen if employees receive language and cross-cultural training, such as documentary training, cultural simulations, or field experiences, before going on assignment. Adjustment of expatriates' spouses and families, which is the most important determinant of success in international assignments, can be improved through adaptability screening and intercultural training.

Attitudes about global business are as varied as managers are numerous. It seems that the business press can always find someone who is for globalization and someone who is against it. But regardless of your opinion on the subject, managers will increasingly confront issues related to the globalization of the business environment. It is probable that, as a manager, you will need to develop global sensibilities (if you don't already have them). Understanding your own cultural perspective is the first step in doing so.

This assessment has three parts: Step 1, complete the questionnaire shown below; Step 2, determine your score; Step 3, develop a plan to increase your global managerial potential.[109]

MANAGEMENT DECISION

Going Global South of the Border

You are the CEO of a small but growing manufacturing company in Texas. Despite the global economic downturn, you have managed to keep the company's head above water, and your board is pressuring you to take advantage of opportunities outside the United States so the company is well positioned in the global marketplace when recovery takes place. Everyone seems to be turning to China, with its low labor costs and pool of highly skilled workers. Some people call you crazy, but you are looking just a few miles south of the border at Mexico.

They call you crazy because the political uncertainty in Mexico is quite high. Corruption is rampant in Mexican bureaucracy. And drug-related violence makes the thought of sending your workers to Juarez, just south of the border, enough to turn your stomach. You've read reports of workers being accosted at banks on payday, executives being kidnapped, bodies dangling from highway overpasses, and the 2000-plus murders in Juarez over the past year and a half doesn't leave you confident that Mexico is a good place to build your business.

China certainly has a growing market in manufacturing, but so does Mexico. And, despite the corruption and violence, it is growing even further, offering great opportunity in a less competitive environment. Some schools in Mexico are partnering with industry to establish programs in aerospace engineering, microelectronics, bioengineering, radio frequency design, and renewable energies that will produce a larger pool of quality skilled labor. Purchasing power is also quite low in Mexico, as it is in China, making the cost of this skilled labor low.

While the reasons not to establish business in Mexico are daunting, going global in China is not all roses, either. It costs a lot in money and tied-up inventory to ship products back to the United States. What would be expensive and take two weeks could be done cheaply and in a matter of days from a Mexican *maquiladora*, or factory focused on producing products for export. You would also face the potential for loss of intellectual property and a high rate of piracy in China, and of course quality control problems in China are notorious. If your factory is just south of the border, you have the opportunity for direct control and oversight—if only you can minimize the risk of violence and convince your team that it is still worth going.

Questions

1. What strategy would you take toward Mexico: an avoidance strategy, a control strategy, or a cooperation strategy? Explain your choice using the criteria outlined in the text.
2. What steps would you take to reduce the impact of violence on your business in Mexico?

MANAGEMENT TEAM DECISION

A Different Way to Go Global

Exporting, cooperative contracts, licensing, franchising, joint ventures, wholly owned affiliates, global new ventures . . . As a management team wanting to take your business to the next level, you have a smorgasboard of options available to you. But, in addition to these traditional options, there is another angle you can take, one that is becoming increasingly popular among startup companies like yours: social entrepreneurship. Social entrepreneurs use business skills to solve social problems. You and the members of your team, just out of your MBA programs, are excited about the business and want to grow it and make money. But you are also passionate about making a difference when it comes to problems like homelessness in the United States or AIDS in Africa.

As your team discusses how and where to go global, you think about the problems you'd like to address and you look to role models to help you brainstorm and plan. You read about how Pfizer—a pharmaceutical giant, not a startup—started a program to offer free medicines to recently unemployed Americans. Other companies are doing the same in Africa. Peet's Coffee & Tea has been working recently to develop the economic well-being of coffee farmers in Kenya, Rwanda, Tanzania, and Uganda by teaching them to grow better quality coffee that Peet's can market to its customers in coffee-loving developed economies.

As much as your team wants to help others in need, you also recognize that doing good can't come at the expense of the bottom line. In fact, Peet's Coffee's effort is currently run by a nonprofit and hasn't started making Peet's any money yet. You know that the success of such ventures is untested, but your team is also aware that any effort at going global involves some type of risk. Thinking it through, you ask yourselves what's in it for companies who undertake social entrepreneurship—and what might be in it for you? Pfizer adopted this program to create customer loyalty, exchanging a brick (something it has) for a jade (something even more valuable and harder to come by). Customers who drink Peet's care about where their coffee comes from and about its quality, so Peet's establishes relationships with African farmers partly in response to customer demand and to build its brand.[110]

With all of this in mind, it's your team's task to figure out how you can balance your interest in doing business on a global scale with your interest in making a difference in the world.

Questions

1. What are the advantages of social entrepreneurship as a way to approach doing business in developing economies outside the United States? What are the disadvantages?
2. How might you combine social entrepreneurship with traditional options for going global?
3. Can establishing a multinational corporation or a joint venture serve the principles of social entrepreneurship? Would some options lend themselves better to social entrepreneurship than others? What might such a business venture look like?

PRACTICE BEING A MANAGER

Hometown Culture

One of the major dilemmas in global management concerns the degree to which a multinational firm should adapt its business practices to particular locations and cultures versus the degree to which it should maintain consistency across all its operations. In general, firms prefer consistency because it streamlines operations and may result in global economies of scale. At the same time, multinational firms cannot gloss over differences without running the risk of losing a particular market to more responsive (local) competition. In this exercise, you will interpret your "hometown" culture for a large multinational company.

Suppose that a large multinational equipment company (based outside your country of origin) is planning to open a major production facility and retail dealership in your hometown. This company has hired you as a consultant to help it successfully establish operations in your hometown.

Step 1: Describe your hometown. Write a brief sketch (1–2 pages, using bullet points will suffice) in which you describe the important cultural features of

your hometown, including such aspects as language, dress, courtesy/customs, and attitudes toward "foreignness" and newcomers. Try as much as possible to capture aspects of the location and culture of your hometown that would be important for newcomers to recognize and respect.

Step 2: Form a team. Your professor will assign you to small discussion groups of three to five students.

Step 3: Share your description. Take turns in your discussion groups introducing yourselves, identifying your hometown, and sharing the highlights of your brief sketch of your hometown. Listen for similarities and differences across your hometowns.

Step 4: Make recommendations. As a group, agree on some recommendations to the multinational company. Assume that the company is planning to enter all of your hometowns simultaneously. To what degree might the company use a consistent (same) approach in entering your hometowns? Is one or more of your hometowns likely to require a foreign multinational to make more particular adaptations?

Step 5: Share findings with class. Each group should share its list of hometowns and its recommendations with the class.

Step 6: Consider challenges. As a class discuss the challenges of entering global markets, particularly in regard to achieving the appropriate mix of consistency and adaptation.

DEVELOP YOUR CAREER POTENTIAL

Building Cultural Bridges Inside American Business

All savvy managers seem to be familiar with the Japanese custom of exchanging business cards, the French custom of the 2-hour lunch, and the South American custom of getting to know potential business partners on a personal level before discussing business.[111] But how many managers are aware of the cultural differences that exist within the United States? For example, how many Manhattanites know that in some parts of the country, businesses close down on the first day of hunting season?

Political rhetoric often refers to "two Americas" and the differences between the heartland and the coasts, but many other oppositional geographic pairings also represent different sets of cultural norms. Some other obvious examples are North–South, East–West, and the more general urban–rural. How many businesspeople know how to be effective in all these American cultures? Much has been made of the political and cultural implications of these divides, but not enough attention has been paid to what it means for business.

Cultural differences were addressed in Chapter 3 and will be again in Chapter 15. In the context of this chapter, however, it is important to note that many of the issues related to global management are applicable in any geographic context. Deciding whether to locate a firm in Alabama versus Oregon requires the same due diligence as deciding between Madrid and Madagascar. Managers need to assess the best business climate, identify and adapt to cultural differences, and prepare workers who will be transferred to the new location.

Activities

1. Think of yourself as a member of a particular geographic cultural group. (In the United States, we are conditioned to think of cultural groups based on ethnicity and race, but for this exercise, think in terms of location.) What are the characteristics of this group?
2. Once you have an outline of your geographic culture, try to identify the group most opposite to your own. For example, if you consider yourself a New Yorker, you may think of a Mississippian or a Californian.
3. Research regional and local periodicals to learn about the norms in the other culture. You might also talk with a friend who attends college in a different region or state to get a more personal understanding of norms in other parts of the country. List some of the norms in the other location, and compare them with the norms in your area of the country.

Lost in Translation

©GREENLIGHT

The 2003 film ***Lost in Translation,*** based on Sofia Coppola's Academy Award–winning screenplay, stars Scarlett Johansson as a recent college graduate and newlywed named Charlotte. She visits Tokyo with her husband, a photographer on assignment in the city, who leaves her alone to navigate her way through a country whose culture and language she doesn't understand. When she meets Bob Harris (Bill Murray), an actor who is there to shoot a whiskey commercial and pocket a quick $2 million for it, they forge an unlikely friendship. This clip is an edited composite taken from different scenes in the movie. It shows us what Japan looks like through Charlotte's eyes as she explores it on her own and tries to make sense of what she sees.

What to Watch For and Ask Yourself

1. Imagine you have just arrived in Japan, and you are experiencing what Charlotte is for the first time. Do you understand everything you see?
2. If you were managing a company that had operations in foreign countries, how important do you think it would be to experience new places and learn about different cultures the way Charlotte does?
3. How might it change the way you did business in those countries if you had actually been to them?
4. Does Charlotte seem to be culturally sensitive or insensitive?

Evo

© CENGAGE

Evo is a Seattle-based online retailer of all ski-, snowboard-, wake-, and skate-related items, but the company has loyal customers who live in places as far away as Bahrain and Bali. Their website, **http://www.evogear.com**, is quickly establishing them as a global brand. Founder Bryce Phillips recently added evoTRIP to the website, a program that offers extreme ski, snowboarding, and surf expeditions to places like South America and Switzerland. In this video, Phillips explains the difficulties facing his company, such as licensing and distribution agreements with manufacturers. The majority of Evo's international transactions are relatively seamless, but day-to-day operations can still be affected by global events. He is confident, however, that his company will be able to expand its global reach as licensing practices change to reflect the boundary-free world of e-commerce, and as Evo becomes more established as a global brand.

What to Watch For and Ask Yourself

1. What are some of the obstacles Evo has encountered in global e-commerce?
2. What cultural differences should Evo and evoTRIP participants pay attention to when traveling abroad?
3. Do you think the management at Evo benefits more from practicing global consistency or local adaptation?

Chapter 9

Designing Adaptive Organizations

This chapter shows you the traditional organizational structure approach to organizational design (the vertical and horizontal configuration of departments, authority, and jobs within a company), as well as how contemporary organizations are redesigning their processes to better transform inputs into outputs.

Chapter 10

Managing Teams

Chapter 10 reviews the advantages and disadvantages of teams and explores when companies should use them. You'll also read about the different types of work teams and the characteristics common to all teams and learn practical steps to managing teams—team goals and priorities, and organizing, training, and compensating teams.

Reel to Real

What would You Do?

Yahoo Headquarters, Sunnyvale, California.[1]

When Yahoo! co-founder Jerry Yang invited you to his house, you said, "I'm not taking the CEO job, so I hope you have good wine." When Yang started talking about Yahoo!, it was a bit confusing, so you asked him to draw an organizational chart so you could follow along. As he drew, you thought, "That's really the organization?" So you asked who makes key decisions about, for example, Yahoo!'s search function and engine. Yang started drawing arrows, lines criscrossed all over, and you thought, "This is just like a Dilbert cartoon." You couldn't figure out who was in charge of what. "I got it," you told him, "What Yahoo! needs is a manager."

But, you weren't the first to figure that out. Several years earlier, Yahoo! senior executive Brad Garlinghouse wrote what came to be known as the "Peanut Butter Manifesto," in which he said, "I've heard our strategy described as spreading peanut butter across the myriad opportunities that continue to evolve in the online world. The result: a thin layer of investment spread across everything we do and thus we focus on nothing in particular. I hate peanut butter. We all should." Garlinghouse went on to say that Yahoo! lacked "a focused, cohesive vision," "clarity of ownership and accountability," and "decisiveness." He attributed many of those problems to the company's structure, saying, "We are separated into silos that far too frequently don't talk to each other. And when we do talk, it isn't to collaborate on a clearly focused strategy, but rather to argue and fight about ownership, strategies and tactics. We now operate in an organizational structure—admittedly created with the best of intentions—that has become overly bureaucratic. For far too many employees, there is another person with dramatically similar and overlapping responsibilities. This slows us down and burdens the company with unnecessary costs." In the end, Garlinghouse concluded, "The current business unit structure must go away," and that "the smoothly spread peanut butter needs to turn into a deliberately sculpted strategy—that is narrowly focused."

This is not the first time that Yahoo! has had problems finding the right organizational structure. At one time, Yahoo didn't even have a direct sales unit! Speedy growth, organizational complexity, and the fast-paced change of online business have made it difficult to properly structure the company. Indeed, Yahoo! just went through a reorganization less than a year ago in which heads of international markets were given more autonomy so their units could do a better job of appealing to customer preferences in different parts of the world. But complaints started immediately, as few in the company really understood who was responsible for what. Clay

Study Tips

Try the exercise with a variety of company types and then see if the companies you used have organizational information on their websites. Practicing building organizational structures will help you better understand the different elements covered in the chapter.

Think about your favorite company and imagine how you think it could be organized. Draw an organizational structure that you think makes sense for the business and the industry it's in.

Moran, senior vice president and market research analyst for an investment firm, summed up skeptics' views by saying, "We have seen no noticeable impact from recent restructurings."

With profits down 78 percent and a recent layoff of 5 percent of the company workforce, you wonder where you should start? Clearly , with so many different business units and widespread confusion under the current matrix structure, a new structure is inevitable. But, as you look at Yahoo!'s web site, you wonder if a functional, customer, product, or geographic structure would work best, and why? Next, what steps can you take to instill ownership, accountability and decisiveness throughout, but still give the techies enough freedom to innovate and create? In other words, what tradeoffs and balance do you need to make in terms of centralization and decentralization? Finally, the lack of a cohesive vision appears to be at the center of Yahoo!'s organizational structure issues. Is Yahoo!, like Google, a search and web advertising company? Is it a media company which draws 600 million visitors a year to its rich sources of news, financial information, and online communities? Or, is it a technology conglomerate that builds and delivers web applications and services? Which should be Yahoo!'s cohesive vision, and what's the right way to structure the company to support that vision?

If you were the new CEO at Yahoo!, what would you do?

No one builds a house without first looking at the design. Put a window there. Take out a wall here. Soon you've got the design you want. Only then do you start building. These days, the design of a company is just as important as the design of a house. Even successful companies, such as Yahoo, must constantly examine their organizational design.

This chapter begins by reviewing the traditional organizational structure approach to organizational design. **Organizational structure** is the vertical and horizontal configuration of departments, authority, and jobs within a company. Organizational structure is concerned with questions such as "Who reports to whom?" and "Who does what?" and "Where is the work done?" For example, **Sony Corporation of America** is headed by Chairman and CEO Howard Stringer, who is based in New York City. But Sony has a number of divisions to handle

[Organizational structure] the vertical and horizontal configuration of departments, authority, and jobs within a company

different sectors of the company's business, each headed by its own president or CEO. PlayStations are developed and managed in Foster City, California, by Sony Computer Entertainment. Sony camcorders, home theater equipment, LCD screens, VAIO computers, Blu-ray disc players, and the Walkman are handled in San Diego by Sony Electronics. The Spider-Man films and *Seinfeld* were brought to you by Sony Pictures, a division of Sony Entertainment in Culver City, California, while the music of Justin Timberlake and Avril Lavigne comes courtesy of Sony/BMG in New York City.[2] Companies like Sony use organizational structure to set up departments and relationships among employees in order to make business happen. You can see Sony's organizational structure in Exhibit 9.1. In the first half of the chapter, you will learn about the traditional vertical and horizontal approaches to organizational structure, including departmentalization, organizational authority, and job design.

In the second half of the chapter, you will learn how contemporary organizations are becoming more adaptive by redesigning their internal and external processes. An **organizational process** is the collection of activities that transform inputs into outputs that customers value.[3] Organizational process asks "How do things get done?" For example, **Microsoft** uses basic internal and external processes to write computer software, shown in Exhibit 9.2. The process starts when Microsoft gets feedback from customers through Internet newsgroups, e-mail, phone calls, or letters. This information helps Microsoft understand customers' needs and problems and identify important software issues and needed changes and functions. Microsoft then rewrites the software, testing it internally at the company and then externally through its beta testing process, in which customers who volunteer or are selected by Microsoft give the company extensive feedback, which is then used to make improvements. The beta testing process may take as long as a year and involve thousands of knowledgeable people. After final corrections are made to the software, the company distributes and sells it to customers. They start the process again by giving Microsoft more feedback. Indeed, Microsoft's advertising campaign for the kickoff of Windows 7, which was developed through extensive beta testing, was "I'm a PC, and Windows 7 was my idea."

This process view of Microsoft, which focuses on how things get done, is very different from the hierarchical view of Sony, which focuses on accountability, responsibility, and positions within the chain of command. In the second half of the chapter, you will learn how companies use reengineering, empowerment, and behavioral informality to redesign their internal organizational processes. The chapter ends with a discussion about the ways in which companies are redesigning their external processes, that is, how they are changing to improve their interactions with those outside the company. In that discussion, you will explore the basics of modular and virtual organizations.

DESIGNING ORGANIZATIONAL STRUCTURES

With offices and operations in 58 countries, products in over 200, and more than 150,000 employees worldwide, **Sara Lee Corporation** owns some of the best-known brands in the world (Sara Lee, Hillshire Farm, Ball Park, and Jimmy Dean). To improve company performance, Sara Lee changed its organizational structure to focus on three key customer/geographic markets: North American Retail (packaged meats such as Hillshire Farm, Ballpark or Jimmy Dean brands, and Senseo coffee), North American Fresh Bakery (bakery goods to retail and institutional customers), North American Foodservice (meat, bakery, and beverages to foodservice distributors, restaurants, and hospitals in North America), International Beverage (coffee and tea products in Europe, Australia, and Brazil), International Bakery (bakery and dough products to retail and foodservice customers in Europe and Australia), and International Household and Body Care (body care, air care, shoe care, and insecticide products sold in Europe, Africa, Australia, and Asia). Companies or divisions that didn't fit with the new structure, like the European meats division and the branded apparel businesses (including Champion and Playtex), were sold. As a result, Sara Lee is now focused on its core businesses—retail, bakery, food service, and beverages in North American and international markets.[4]

Why would a large company like Sara Lee with 41,000 employees and $12 billion in annual revenues completely restructure its organizational design? What does it expect to gain from this change?

After reading the next three sections, you'll have a better understanding of the importance of organizational structure because you should be able to

1. describe the departmentalization approach to organizational structure.
2. explain organizational authority.
3. discuss the different methods for job design.

1 DEPARTMENTALIZATION

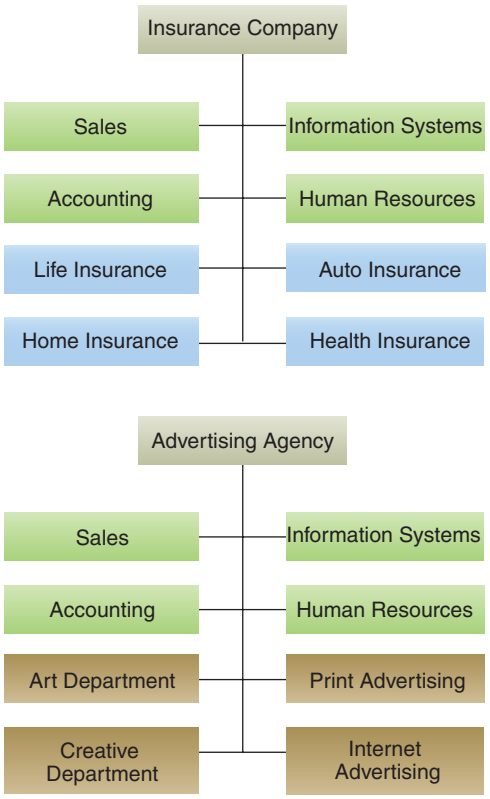
Traditionally, organizational structures have been based on some form of departmentalization. **Departmentalization** is a method of subdividing work and workers into separate organizational units that take responsibility for completing particular tasks.[5] Bayer, a Germany-based company, has separate departments or divisions for health care, crop science, material science, and services.[6]

[Departmentalization] subdividing work and workers into separate organizational units responsible for completing particular tasks

Traditionally, organizational structures have been created by departmentalizing work according to five methods: **1.1 functional, 1.2 product, 1.3 customer, 1.4 geographic,** and **1.5 matrix.**

1.1 Functional Departmentalization

EXHIBIT 9.3 Functional Departmentalization



The most common organizational structure is functional departmentalization. Companies tend to use this structure when they are small or just starting out. **Functional departmentalization** organizes work and workers into separate units responsible for particular business functions or areas of expertise. A common functional structure might have individuals organized into accounting, sales, marketing, production, and human resources departments.

Not all functionally departmentalized companies have the same functions. The insurance company and the advertising agency shown in Exhibit 9.3 both have sales, accounting, human resources, and information systems departments, as indicated by the green boxes. The blue and khaki boxes indicate the functions that are different. As would be expected, the insurance company has separate departments for life, auto, home, and health insurance. The advertising agency has departments for artwork, creative work, print advertising, and Internet advertising. So the functional departments in a company that uses functional structure depend in part on the business or industry a company is in.

Functional departmentalization has some advantages. First, it allows work to be done by highly qualified specialists. While the accountants in the accounting department take responsibility for producing accurate revenue and expense figures, the engineers in research and development can focus their efforts on designing a product that is reliable and simple to manufacture. Second, it lowers costs by reducing duplication. When the engineers in research and development come up with that fantastic new product, they don't have to worry about creating an aggressive advertising campaign to sell it. That task belongs to the advertising experts and sales representatives in marketing. Third, with everyone in the same department having similar work experience or training, communication and coordination are less problematic for departmental managers.

At the same time, functional departmentalization has a number of disadvantages. To start, cross-department coordination can be difficult. Managers and employees are often more interested in doing what's right for their function than in doing what's right for the entire organization. A good example is the traditional conflict between marketing and manufacturing. Marketing typically pushes for spending more money to make more products with more accessories and capabilities to meet customer needs. By contrast, manufacturing pushes for fewer products with simpler designs so that manufacturing facilities can ship finished products on time and keep costs within expense budgets. As companies grow, functional departmentalization may also lead to slower decision making and produce managers and workers with narrow experience and expertise.

1.2 Product Departmentalization

Product departmentalization organizes work and workers into separate units responsible for producing particular products or services. Exhibit 9.4 shows the product departmentalization structure used by United Technologies Corporation (UTC), which is organized along seven different product lines: Carrier (heating, ventilating, and air-conditioning), Hamilton Sundstrand (aircraft electrical power generation and distribution systems), Otis (design, manufacture, installation, maintenance, and servicing of elevators and escalators), Pratt & Whitney (commercial and military jet aircraft engines), Sikorsky (military and commercial helicopters), UTC Fire & Security (fire safety and security products and services), and UTC Power (fuel cells and power systems).[7]

One of the advantages of product departmentalization is that, like functional departmentalization, it allows managers and workers to specialize in one area of expertise. Unlike the narrow expertise and experiences in functional departmentalization, however, managers and workers develop a broader set of experiences and expertise related to an entire product line. Likewise, product departmentalization makes it easier for top managers to assess work-unit performance. Because of the clear separation of their seven different product divisions, United Technologies' top managers can easily compare the performance of its Otis elevators and its Pratt & Whitney aircraft engines divisions. The divisions had similar revenues—almost $12.9 billion for Otis and $13 billion for Pratt & Whitney—but Otis had a profit of $2.5 billion (a 19.4 percent profit margin) compared with just $2.1 billion (a 16.2 percent profit margin) for Pratt & Whitney.[8] Finally, decision making should be faster because managers and workers are responsible for the entire product line rather than for separate functional departments; in other words, there are fewer conflicts compared to functional departmentalization.

The primary disadvantage of product departmentalization is duplication. You can see in Exhibit 9.4 that UTC's Otis elevators and Pratt & Whitney divisions both have customer service, engineering, human resources, legal, manufacturing, and procurement (similar to sourcing and logistics) departments. Duplication like this often results in higher costs. If United Technologies were instead organized by function, one lawyer could handle matters related to both elevators and aircraft engines rather than working on only one or the other.

A second disadvantage is the challenge of coordinating across the different product departments. United Technologies would probably have difficulty standardizing its policies and procedures in product departments as different as the Carrier (heating, ventilating, and air-conditioning) and Sikorsky (military and commercial helicopters) divisions.

1.3 Customer Departmentalization

[Customer departmentalization] organizing work and workers into separate units responsible for particular kinds of customers

Customer departmentalization organizes work and workers into separate units responsible for particular kinds of customers. For example, as Exhibit 9.5 shows, **Swisscom AG**, Switzerland's leading telecommunications provider, is organized into

EXHIBIT 9.5 Customer Departmentalization: Swisscom AG

departments by type of customer: residential customers (fixed line and voice, mobile and voice, broadband Internet, and digital TV); small- and medium-sized businesses (fixed line and voice, mobile line and voice, Internet and data services, and maintenance and operation of IT infrastructure); larger corporations (fixed-line voice and data; mobile-line voice and data; Internet and data services; and maintenance and operation of IT infrastructure); and network and IT customers (corporate communications, business development, finance and controlling, risk and quality management, human resources, IT outsourcing).[9]

The primary advantage of customer departmentalization is that it focuses the organization on customer needs rather than on products or business functions. Furthermore, creating separate departments to serve specific kinds of customers allows companies to specialize and adapt their products and services to customer needs and problems. The primary disadvantage of customer departmentalization is that, like product departmentalization, it leads to duplication of resources. It can be difficult to achieve coordination across different customer departments, as is also the case with product departmentalization. Finally, the emphasis on meeting customers' needs may lead workers to make decisions that please customers but hurt the business.

1.4 Geographic Departmentalization

Geographic departmentalization organizes work and workers into separate units responsible for doing business in particular geographic areas. Exhibit 9.6 shows the geographic departmentalization used by Coca-Cola Enterprises (CCE), the largest bottler and distributor of Coca-Cola products in the world. (The Coca-Cola Company develops and advertises soft drinks. CCE, which is a separate company with its own stock, buys the soft-drink concentrate from the Coca-Cola Company, combines it with other ingredients, and then distributes the final product in cans, bottles, or fountain containers.) As shown in Exhibit 9.6, CCE has two regional groups: North America and Europe. As the table in the exhibit shows, each of these regions would be a sizable company by itself. The European Group alone serves people in Belgium, Great Britain, France, Luxembourg, Monaco, and the Netherlands; sells half a billion cases of soft drinks a year; employs 10,500 people; and runs 46 bottling facilities.

[Geographic departmentalization] organizing work and workers into separate units responsible for doing business in particular geographic areas

The primary advantage of geographic departmentalization is that it helps companies respond to the demands of different markets. This can be especially important when the company sells in different countries. CCE's geographic divisions sell products suited to taste preferences in different countries. For example, CCE bottles and distributes the following products in Europe but not in the United States: Aquarius, Bonaqua, Burn, Coca-Cola Light (which is somewhat different from Diet Coke), Cresta flavors, Five Alive, Kia-Ora, Kinley, Lilt, Malvern, and Oasis.[10] Another advantage is that geographic departmentalization can reduce costs by locating unique organizational resources closer to customers. For instance, it is cheaper in the long run for CCE to build bottling plants in Belgium than to bottle Coke in England and then transport it across the English Channel to Belgium.

The primary disadvantage of geographic departmentalization is that it can lead to duplication of resources. For example, while it may be necessary to adapt products and marketing to different geographic locations, it's doubtful that CCE needs significantly different inventory tracking systems from location to location. Also, even more than with the other forms of departmentalization, it can be difficult to coordinate departments that are literally thousands of miles from each other and whose managers have very limited contact with each other.

1.5 Matrix Departmentalization

Matrix departmentalization is a hybrid structure in which two or more forms of departmentalization are used together. The most common matrix combines the product and functional forms of departmentalization, but other forms may also be used. Exhibit 9.7 shows the matrix structure used by **Procter & Gamble**, which has 138,000 employees working in 80 different countries.[11] Across the top of Exhibit 9.7, you can see that the company uses a product unit structure where it groups its billion-dollar brands into three global business units, each of which has two segments: beauty care (beauty and grooming), household care (baby care and family care), and health and well-being (health care, and snack, coffee, and pet care). Global business units are responsible for product initiatives or upgrades, which are typically launched simultaneously with a worldwide marketing campaign. The left side of the figure, however, shows that the company is also using a functional structure based on three functions: market development, which makes sure that a product is adapted to and sells well within a particular region in the world (market development regions include North America, Asia/India/Australia, Northeast Asia, Greater China, Central-Eastern Europe/Middle East Africa, Western Europe, and Latin America); global business services, which enable the company to operate efficiently, work effectively with business partners,

[Matrix departmentalization] a hybrid organizational structure in which two or more forms of departmentalization, most often product and functional, are used together

and increase employee productivity; and corporate functions, which provide global business units with the functional business assistance (i.e., finance, accounting, human resources, information technology, etc.) they need.[12]

The boxes in the figure represent the matrix structure, created by the combination of the product and functional structures. For example, the Pantene Team (Pantene is a set of haircare products within the beauty segment of the beauty care global business unit) would work with market development to adapt and sell Pantene products worldwide, use global business services to work with suppliers and keep costs down, and then rely on corporate functions for assistance hiring employees and billing customers and paying suppliers. Similar matrix combinations are shown for P&G's Old Spice, Pampers, Tide, Actonel, and Pringles teams within each of the six segments found under its three global business units.

Several things distinguish matrix departmentalization from the other traditional forms of departmentalization.[13] First, most employees report to two bosses, one from each core part of the matrix. For example, in Exhibit 9.7 a manager on the Pampers team responsible for marketing would report to a boss in the baby care and family care segment of the household care global business unit as well as to a manager in the market development function. Second, by virtue of their hybrid design, matrix structures lead to much more cross-functional interaction than other forms of departmentalization. In fact, while matrix workers are typically members of only one functional department (based on their work experience and expertise), they are also commonly members of several ongoing project, product, or customer groups. Third, because of the high level of cross-functional interaction, matrix departmentalization requires significant coordination between managers in the different parts of the matrix. In particular, managers have the complex job of tracking and managing the multiple demands (project, product, customer, or functional) on employees' time.

The primary advantage of matrix departmentalization is that it allows companies to efficiently manage large, complex tasks like researching, developing, and marketing pharmaceuticals or carrying out complex global businesses. Efficiency comes from avoiding duplication. For example, rather than having an entire marketing function for each project, the company simply assigns and reassigns workers from the marketing department (or market development at P&G) as they are needed at various stages of product completion. More specifically, an employee from a department may simultaneously be part of five different ongoing projects but may be actively completing work on only a few projects at a time. Another advantage is the pool of resources available to carry out large, complex tasks. Because of the ability to quickly pull in expert help from all the functional areas of the company, matrix project managers have a much more diverse set of expertise and experience at their disposal than do managers in the other forms of departmentalization.

The primary disadvantage of matrix departmentalization is the high level of coordination required to manage the complexity involved in running large, ongoing projects at various levels of completion. Matrix structures are notorious for confusion and conflict between project bosses in different parts of the matrix. At P&G, such confusion or conflict might occur between managers in the Snack, Coffee, and Pet Care business segment and the Global Business Services function when trying to decide how best to manufacture and distribute Pringles products around the world. Disagreements or misunderstandings about schedules, budgets, available resources, and the availability of employees with particular functional expertise are common.

Another disadvantage is that matrix structures require much more management skill than the other forms of departmentalization.

Because of these problems, many matrix structures evolve from a **simple matrix**, in which managers in different parts of the matrix negotiate conflicts and resources directly, to a **complex matrix**, in which specialized matrix managers and departments are added to the organizational structure. In a complex matrix, managers from different parts of the matrix might report to the same matrix manager, who helps them sort out conflicts and problems.

Sometimes, however, even these steps aren't enough to alleviate the problems that can occur in matrix structures. Europe-based Unilever is the maker and marketer of such well-known products as Dove soap, Vaseline Intensive Care lotions, Hellman's mayonnaise, I Can't Believe It's Not Butter, Lipton teas, Wishbone salad dressings, Skippy peanut butter, and Lawry's seasonings. Unilever was run using a complex matrix structure. The company even had dual headquarters in Rotterdam, the Netherlands, and London, England. The confusion and conflict associated with having two sets of management located in two headquarters were so great that Unilever has now switched to just one CEO and one headquarters. In addition, the company has moved to a simpler organizational structure based on geography, with three regional chiefs (in Europe, the Americas, and Asia/Africa) plus two global divisions (foods and soaps).[14] Patrick Cescau, the new CEO, says, "We have recognized the need for greater clarity of leadership and we are moving to a simpler leadership structure that will provide a sharper operational focus."[15] In short, because everyone now reports to just one boss, "we have clarified who calls the shots," says Cescau.

[Simple matrix] a form of matrix departmentalization in which managers in different parts of the matrix negotiate conflicts and resources

[Complex matrix] a form of matrix departmentalization in which managers in different parts of the matrix report to matrix managers, who help them sort out conflicts and problems

Departmentalization The five traditional departmental structures are functional, product, customer, geographic, and matrix. Functional departmentalization is based on the different business functions or expertise used to run a business. Product departmentalization is organized according to the different products or services a company sells. Customer departmentalization focuses its divisions on the different kinds of customers a company has. Geographic departmentalization is based on the different geographic areas or markets in which the company does business. Matrix departmentalization is a hybrid form that combines two or more forms of departmentalization, the most common being the product and functional forms. There is no single best departmental structure. Each structure has advantages and disadvantages.

2 ORGANIZATIONAL AUTHORITY

The second part of traditional organizational structures is authority. **Authority** is the right to give commands, take action, and make decisions to achieve organizational objectives.[16] Traditionally, organizational authority has been characterized by the following dimensions: **2.1 chain of command, 2.2 line versus staff authority, 2.3 delegation of authority,** and **2.4 degree of centralization**.

2.1 Chain of Command

Turn back a few pages to Sony's organizational chart in Exhibit 9.1. If you place your finger on any position in the chart, say, VAIO Business Group (under Electronic Business), you can trace a line upward to the company's CEO, Howard Stringer. This

[Authority] the right to give commands, take action, and make decisions to achieve organizational objectives

line, which vertically connects every job in the company to higher levels of management, represents the chain of command. The **chain of command** is the vertical line of authority that clarifies who reports to whom throughout the organization. People higher in the chain of command have the right, *if they so choose*, to give commands, take action, and make decisions concerning activities occurring anywhere below them in the chain. In the following discussion about delegation and decentralization, you will learn that managers don't always choose to exercise their authority directly.[17]

One of the key assumptions underlying the chain of command is **unity of command**, which means that workers should report to just one boss.[18] In practical terms, this means that only one person can be in charge at a time. Matrix organizations, in which employees have two bosses (or two headquarters, as in the Unilever example you just read about), automatically violate this principle. This is one of the primary reasons that matrix organizations are difficult to manage. Unity of command serves an important purpose: to prevent the confusion that might arise when an employee receives conflicting commands from two different bosses. When Bill Gates became chair of Microsoft (after being CEO) and Steve Ballmer became CEO, there was confusion about the chain of command at Microsoft. In one meeting, Gates approved a budget increase for a project. Ballmer then denied the increase, shouting at Gates, "You put me in charge of the company. Let me run it."[19] With their different styles and approaches, and with managers and employees used to deferring to Gates over the 20 years that he was CEO, it's not surprising that the chain of command was unclear and that Gates and Ballmer had trouble adjusting to their new roles.

2.2 Line versus Staff Authority

A second dimension of authority is the distinction between line and staff authority. **Line authority** is the right to command immediate subordinates in the chain of command. For example, Sony CEO Howard Stringer has line authority over the head of Sony Entertainment Business Group, which includes Sony Pictures. Stringer can issue orders to that division president and expect them to be carried out. In turn, the head of Sony Entertainment Business Group can issue orders to his subordinates and expect them to be carried out. **Staff authority** is the right to *advise* but not command others who are not subordinates in the chain of command. For example, a manager in human resources at Sony might advise the manager in charge of Sony's TV Business Group on a hiring decision but cannot order him or her to hire a certain applicant.

The terms *line* and *staff* are also used to describe different functions within the organization. A **line function** is an activity that contributes directly to creating or selling the company's products. So, for example, activities that take place within the manufacturing and marketing departments would be considered line functions. A **staff function**, such as accounting, human resources, or legal services, does not contribute directly to creating or selling the company's products, but instead supports line activities. For example, marketing managers might consult with the legal staff to make sure the wording of a particular advertisement is legal.

2.3 Delegation of Authority

Managers can exercise their authority directly by completing the tasks themselves, or they can choose to pass on some of their authority to subordinates. **Delegation of authority** is the assignment of direct authority and responsibility to a subordinate to complete tasks for which the manager is normally responsible.

[Staff authority] the right to advise, but not command, others who are not subordinates in the chain of command

[Staff function] an activity that does not contribute directly to creating or selling the company's products, but instead supports line activities

[Delegation of authority] the assignment of direct authority and responsibility to a subordinate to complete tasks for which the manager is normally responsible

When a manager delegates work, three transfers occur, as illustrated in Exhibit 9.8. First, the manager transfers full responsibility for the assignment to the subordinate. Many managers find giving up full responsibility somewhat difficult. As mentioned above, when Microsoft's Bill Gates became chair and chief software architect after being CEO, he found it difficult to relinquish authority to his long-time partner, new CEO Steve Ballmer. Consultant David Nadler says, "There is a savior complex that says, "I'm the only one one" who can lead this company effectively.[20]

As the Gates–Ballmer example illustrates, one reason it is difficult for some managers to delegate is that they often fear that the task won't be done as well as if they did it themselves. However, one CEO says, "If you can delegate a task to somebody who can do it 75 percent to 80 percent as well as you can today, you delegate it immediately." Why? The reason is that many tasks don't need to be done perfectly; they just need to be *done*. And delegating tasks that someone else can do frees managers to assume other important responsibilities. Delegating authority can generate a related problem: micromanaging. Sometimes managers delegate only to later interfere with how the employee is performing the task. "Why are you doing it that way? That's not the way I do it." But delegating full responsibility means that the employee—not the manager—is now completely responsible for task completion. Good managers need to trust their subordinates to do the job.

EXHIBIT 9.8 Delegation: Responsibility, Authority, and Accountability

The second transfer that occurs with delegation is that the manager gives the subordinate full authority over the budget, resources, and personnel needed to do the job. To do the job effectively, subordinates must have the same tools and information at their disposal that managers had when they were responsible for the same task. In other words, for delegation to work, delegated authority must be commensurate with delegated responsibility. Historically, pharmaceutical research at GlaxoSmithKline followed a process common to nearly all drug companies: A panel of research and development chiefs far removed from the laboratory determined which drugs to develop and then decided how much money to invest in each. Research scientists in the labs had limited or no say in the drugs selected for research, and each scientist worked on only a single aspect of a drug, passing the resultant compounds onto the next researcher in line, who would do the next step. This assembly-line process led to fewer drugs in the pipeline and scientists who weren't particularly enthusiastic about their work. In order to improve the flow of new drugs as well as to retain the best talent, Glaxo began to delegate to its frontline researchers the ability to set research priorities and allocate the resources required to see a drug through development. Glaxo scientists are now organized into "pods" that focus on specific disease categories. Employees control their own budgets, decide which projects to pursue, and receive funding based on the number of useful compounds their labs have created. Delegating at Glaxo has worked. Not only has the number of drugs entering human trials tripled since the company began using pods, Glaxo is now expanding into treatment areas where it previously had no presence.[21]

"If you can delegate a task to somebody who can do it 75 percent to 80 percent as well as you can today, you delegate it immediately."

The third transfer that occurs with delegation is the transfer of accountability. The subordinate now has the authority and responsibility to do the job and in return is accountable for getting the job done. In other words, managers delegate their managerial authority and responsibility to subordinates in exchange for results. *Forbes* magazine columnist John Rutledge calls delegation "MBB," Managing by Belly Button. He says, "The belly button is the person whose belly you point your finger at when you want to know how the work is proceeding, i.e., the person who will actually be accountable for each step. . . . The belly button is not a scapegoat—a person to blame later when things go wrong. He or she is the person who makes sure that things go right."[22] Exhibit 9.9 gives some tips on how to be an effective delegator.

"The belly button is not a scapegoat—a person to blame later when things go wrong. He or she is the person who makes sure that things go right."

EXHIBIT 9.9 How to Be a More Effective Delegator

1. Trust your staff to do a good job. Recognize that others have the talent and ability to complete projects.
2. Avoid seeking perfection. Establish a standard of quality and provide a time frame for reaching it.
3. Give effective job instructions. Make sure employees have enough information to complete the job successfully.
4. Know your true interests. Delegation is difficult for some people who actually prefer doing the work themselves rather than managing it.
5. Follow up on progress. Build in checkpoints to help identify potential problems.
6. Praise the efforts of your staff.
7. Don't wait to the last minute to delegate. Avoid crisis management by routinely delegating work.
8. Ask questions, expect answers, and assist employees to help them complete the work assignments as expected.
9. Provide the resources you would expect if you were doing an assignment yourself.
10. Delegate to the lowest possible level to make the best possible use of organizational resources, energy, and knowledge.

2.4 Degree of Centralization

If you've ever called a company's toll-free number with a complaint or a special request and been told by the customer-service representative, "I'll have to ask my manager" or "I'm not authorized to do that," you know that centralization of authority exists in that company. **Centralization of authority** is the location of most authority at the upper levels of the organization. In a centralized organization, managers make most decisions, even the relatively small ones. That's why the customer-service representative you called couldn't make a decision without first asking the manager.

If you are lucky, however, you may have talked to a customer-service representative at another company who said, "I can take care of that for you right now." In other words, the person was able to handle your problem without any input from or consultation with company management. **Decentralization** is the location of a significant amount of authority in the lower levels of the organization. An organization is decentralized if it has a high degree of delegation at all levels. In a decentralized organization, workers closest to problems are authorized to make the decisions necessary to solve the problems on their own.

Decentralization has a number of advantages. It develops employee capabilities throughout the company and leads to faster decision making and more satisfied customers and employees. Furthermore, a study of 1,000 large companies found that companies with a high degree of decentralization outperformed those with a low degree of decentralization in terms of return on assets (6.9 percent versus 4.7 percent), return on investment (14.6 percent versus 9.0 percent), return on equity (22.8 percent versus 16.6 percent), and return on sales (10.3 percent versus 6.3 percent). Surprisingly, the same study found that few large companies actually are decentralized. Specifically, only 31 percent of employees in these 1,000 companies were responsible for recommending improvements to management. Overall, just 10 percent of employees received the training and information needed to support a truly decentralized approach to management.[23]

With results like these, the key question is no longer *whether* companies should decentralize, but *where* they should decentralize. One rule of thumb is to stay centralized where standardization is important and to decentralize where standardization is unimportant. **Standardization** is solving problems by consistently applying the same rules, procedures, and processes. As its name suggests, **Air Products & Chemicals** serves global customers by selling a unique set of gases (from argon to hydrogen to nitrogen to specialty gases), gas equipment and services, and related chemical products. As it grew over the last decade through acquisitions, its information technology (IT) department inherited fourteen different databases, five different corporate networks, and, of course, different kinds of servers, personal computers, and handheld devices. Not surprisingly, with so many different platforms to support, IT costs were rising 5 percent to 10 percent per year. So senior IT managers devised

[Centralization of authority] the location of most authority at the upper levels of the organization

[Decentralization] the location of a significant amount of authority in the lower levels of the organization

[Standardization] solving problems by consistently applying the same rules, procedures, and processes

a "standardization index" to track and reduce the number of IT platforms the company was supporting. IT Manager Ron Crane said, "From day one, the business understood that standardizing would save them 3 percent to 7 percent annually."[24] After 5 years of planning and tracking via the standardization index, the company now has only two kinds of databases, one company network, one family of servers, and just four PC options. As a result, instead of rising, IT costs have been reduced by $3 million to $5 million a year.

Organizational Authority Organizational authority is determined by the chain of command, line versus staff authority, delegation, and the degree of centralization in a company. The chain of command vertically connects every job in the company to higher levels of management and makes clear who reports to whom. Managers have line authority to command employees below them in the chain of command but have only staff, or advisory, authority over employees not below them in the chain of command. Managers delegate authority by transferring to subordinates the authority and responsibility needed to do a task; in exchange, subordinates become accountable for task completion. In centralized companies, most authority to make decisions lies with managers in the upper levels of the company. In decentralized companies, much of the authority is delegated to the workers closest to problems, workers who can then make the decisions necessary for solving the problems themselves. Centralization works best for tasks that require standardized decision making. When standardization isn't important, decentralization can lead to faster decisions, greater employee and customer satisfaction, and significantly better financial performance.

3 JOB DESIGN

Imagine that McDonald's decided to pay $75,000 a year to its drive-through window cashiers. That's $75,000 for saying, "Welcome to McDonald's. May I have your order please?" Would you take the job? Sure you would. Work a couple of years. Make a hundred and fifty grand. Why not? Let's assume, however, that to get this salary, you have to be a full-time McDonald's drive-through window cashier for the next 10 years. Would you still take the job? Just imagine, 40 to 60 times an hour, you'd repeat the same basic process:

1. "Welcome to McDonald's. May I have your order please?"
2. Listen to the order. Repeat it for accuracy. State the total cost. "Please drive to the second window."
3. Take the money. Make change.
4. Give customers drinks, straws, and napkins.
5. Give customers food.
6. "Thank you for coming to McDonald's."

Could you stand to do the same simple tasks an average of 50 times per hour, 400 times per day, 2,000 times per week, 8,000 times per month? Few can. Fast-food workers rarely stay on the job more than 6 months. Indeed, McDonald's and other fast-food restaurants have well over 100 percent employee turnover each year.[25]

In this next section, you will learn about **job design**—the number, kind, and variety of tasks that individual workers perform in doing their jobs. You will learn **3.1 why companies continue to use specialized jobs like the McDonald's drive-through job** and **3.2 how job rotation, job enlargement, job enrichment,** and **3.3 the job characteristics model are being used to overcome the problems associated with job specialization.**

3.1 Job Specialization

Job specialization occurs when a job is composed of a small part of a larger task or process. Specialized jobs are characterized by simple, easy-to-learn steps, low variety, and high repetition, like the McDonald's drive-through window job just described. One of the clear disadvantages of specialized jobs is that, being so easy to learn, they quickly become boring. This, in turn, can lead to low job satisfaction and high absenteeism and employee turnover, all of which are very costly to organizations.

Why, then, do companies continue to create and use specialized jobs? The primary reason is that specialized jobs are very economical. As we learned from Frederick W. Taylor and Frank and Lillian Gilbreth in Chapter 2, once a job has been specialized, it takes little time to learn and master. Consequently, when experienced workers quit or are absent, the company can replace them with new employees and lose little productivity. For example, next time you're at McDonald's, notice the pictures of the food on the cash registers. These pictures make it easy for McDonald's trainees to quickly learn to take orders. Likewise, to simplify and speed operations, the drink dispensers behind the counter are set to automatically fill drink cups. Put a medium cup below the dispenser. Punch the medium drink button. The soft-drink machine then fills the cup to within a half-inch of the top, while that same worker goes to get your fries. At McDonald's, every task has been simplified in this way. Because the work is designed to be simple, wages can remain low since it isn't necessary to pay high salaries to attract highly experienced, educated, or trained workers.

3.2 Job Rotation, Enlargement, and Enrichment

Because of the efficiency of specialized jobs, companies are often reluctant to eliminate them. Consequently, job redesign efforts have focused on modifying jobs to keep the benefits of specialized jobs while reducing their obvious costs and disadvantages. Three methods—job rotation, job enlargement, and job enrichment—have been used to try to improve specialized jobs.[26]

In factory work or even some office jobs, many workers perform the same task all day long. If you attach side mirrors in an auto factory, you probably complete this task 45 to 60 times an hour. If you work as the cashier at a grocery store, you check out a different customer every 2 to 3 minutes. And if you work as an office receptionist, you may answer and direct phone calls up to 200 times an hour. **Job rotation** attempts to overcome the disadvantages of job specialization by periodically moving workers from one specialized job to another to give them more variety and the opportunity to use different skills. For example, an office receptionist who does nothing but answer phones could be systematically rotated to a different job, such as typing, filing, or data entry, every day or two. Likewise, the "mirror attacher" in the automobile plant might attach mirrors in the first half of the day's work shift and then install bumpers during the second half. Because employees simply switch from one specialized job to another, job rotation allows companies to retain the

[Job specialization] a job composed of a small part of a larger task or process

[Job rotation] periodically moving workers from one specialized job to another to give them more variety and the opportunity to use different skills

economic benefits of specialized work. At the same time, the greater variety of tasks makes the work less boring and more satisfying for workers.

Another way to counter the disadvantages of specialization is to enlarge the job. **Job enlargement** increases the number of different tasks that a worker performs within one particular job. Instead of being assigned just one task, workers with enlarged jobs are given several tasks to perform. For example, an enlarged "mirror attacher" job might include attaching the mirror, checking to see that the mirror's power adjustment controls work, and then cleaning the mirror's surface. Though job enlargement increases variety, many workers report feeling more stress when their jobs are enlarged. Consequently, many workers view enlarged jobs as simply more work, especially if they are not given additional time to complete the additional tasks.

Job enrichment attempts to overcome the deficiencies in specialized work by increasing the number of tasks *and* by giving workers the authority and control to make meaningful decisions about their work.[27] At AES, an independent power company that sells electricity to public utilities and steam (for power) to industrial organizations, workers have been given an extraordinary level of authority and control. For example, with his hands still blackened after unloading coal from a barge, employee Jeff Hatch calls a broker to determine which Treasury bills the company should buy to maximize the short-term return on its available cash. Hatch asks his broker, "What kind of rate can you give me for $10 million at 30 days?" When the broker tells him, "6.09 percent," he responds, "But I just got a 6.13 percent quote from Chase."[28] Indeed, ordinary plant technicians at AES are given budgets worth several million dollars and are trusted to purchase everything from mops to gas turbines. In most companies, such tasks would be entrusted only to managers, but former CEO Dennis Bakke says, "The more you increase individual responsibility, the better the chances for incremental improvements in operations." Paul Burdick, an engineer entrusted with the ability to purchase billions of dollars of coal, agrees, adding, "You're given a lot of leeway and a lot of rope. You can use it to climb or you can hang yourself."[29]

"The more you increase individual responsibility, the better the chances for incremental improvements in operations."

3.3 Job Characteristics Model

In contrast to job rotation, job enlargement, and job enrichment, which focus on providing variety in job tasks, the **job characteristics model (JCM)** is an approach to job redesign that seeks to formulate jobs in ways that motivate workers and lead to positive work outcomes.[30]

As shown in Exhibit 9.10, the primary goal of the model is to create jobs that result in positive personal and work outcomes, such as internal work motivation, satisfaction with one's job, and work effectiveness. Of these, the central concern of the JCM is internal motivation. **Internal motivation** is motivation that comes from the job itself rather than from outside rewards such as a raise or praise from the boss. If workers feel that performing the job well is itself rewarding, then the job has internal motivation. Statements such as "I get a nice sense of accomplishment" or "I feel good about myself and what I'm producing" are examples of internal motivation.

Moving to the left in Exhibit 9.10, you can see that the JCM specifies three critical psychological states that must occur for work to be internally motivating. First, workers must *experience the work as meaningful*; that is, they must view their job as being important. Second, they must *experience responsibility for work outcomes*—they must feel personally responsible for the work being done well. Third, workers must have *knowledge of results*; that is, they must know how well they are performing their jobs. All three critical psychological states must occur for work to be internally motivating.

Let's return to our grocery store cashier. Cashiers usually have knowledge of results. When you're slow, your checkout line grows long. If you make a mistake,

[Internal motivation] motivation that comes from the job itself rather than from outside rewards

customers point it out: "No, I think that's on sale for $2.99, not $3.99." Likewise, cashiers experience responsibility for work outcomes. At the end of the day, the register is totaled and the money is counted. Ideally, the money matches the total sales in the register. If the money in the till is less than what's recorded in the register, most stores make the cashier pay the difference. Consequently, most cashiers are very careful to avoid being caught short at the end of the day. Nonetheless, despite knowing the results and experiencing responsibility for work outcomes, most grocery store cashiers (at least where I shop) aren't internally motivated because they don't experience the work as meaningful. With scanners, it takes little skill to learn or do the job. Anyone can do it. In addition, cashiers have few decisions to make, and the job is highly repetitive.

What kinds of jobs produce the three critical psychological states? Moving another step to the left in Exhibit 9.10, you can see that these psychological states arise from jobs that are strong on five core job characteristics: skill variety, task identity, task significance, autonomy, and feedback. **Skill variety** is the number of different activities performed in a job. **Task identity** is the degree to which a job, from beginning to end, requires completion of a whole and identifiable piece of work. **Task significance** is the degree to which a job is perceived to have a substantial impact on others inside or outside the organization. **Autonomy** is the degree to which a job gives workers the discretion, freedom, and independence to decide how and when to accomplish the work. Finally, **feedback** is the amount of information the job provides to workers about their work performance.

To illustrate how the core job characteristics work together, let's use them to more thoroughly assess why the McDonald's drive-through window job is not particularly satisfying or motivating. To start, skill variety is low. Except for the size of an order or special requests ("no onions"), the process is the same for each customer. At best, task identity is moderate. Although you take the order, handle the money, and deliver the food, others are responsible for a larger part of the process—preparing the food. Task identity will be even lower if the McDonald's has two drive-through windows because each drive-through window worker will have an even more specialized task. The first is limited to taking the order and making change, while the second just delivers the food.

Task significance, the impact you have on others, is probably low. Autonomy is also very low: McDonald's has strict rules about dress, cleanliness, and procedures. But the job does provide immediate feedback such as positive and negative customer comments, car horns honking, the amount of time it takes to process orders, and the number of cars in the drive-through. With the exception of feedback, the low levels of the core job characteristics show why the drive-through window job is not internally motivating for many workers.

[Skill variety] the number of different activities performed in a job

[Task identity] the degree to which a job, from beginning to end, requires the completion of a whole and identifiable piece of work

[Task significance] the degree to which a job is perceived to have a substantial impact on others inside or outside the organization

[Autonomy] the degree to which a job gives workers the discretion, freedom, and independence to decide how and when to accomplish the job

[Feedback] the amount of information the job provides to workers about their work performance

What can managers do when jobs aren't internally motivating? The far left column of Exhibit 9.10 lists five job redesign techniques that managers can use to strengthen a job's core characteristics. *Combining tasks* increases skill variety and task identity by joining separate, specialized tasks into larger work modules. For example, some trucking firms are now requiring truck drivers to load their rigs as well as drive them. The hope is that involving drivers in loading will ensure that trucks are properly loaded, thus reducing damage claims.

© TIM BOYLE/GETTY IMAGES

This two-window drive-through in Monroe, Washington, is typical of McDonald's (and other fast-food restaurants) around the country. But even though this way of organizing the work is extremely efficient, it can be less than stimulating for employees.

Work can be formed into *natural work units* by arranging tasks according to logical or meaningful groups. Although many trucking companies randomly assign drivers to trucks, some have begun assigning drivers to particular geographic locations (e.g., the Northeast or Southwest) or to truckloads that require special driving skill (e.g., oversized loads or hazardous chemicals). Forming natural work units increases task identity and task significance.

Establishing client relationships increases skill variety, autonomy, and feedback by giving employees direct contact with clients and customers. In some companies, truck drivers are expected to establish business relationships with their regular customers. When something goes wrong with a shipment, customers are told to call drivers directly.

Vertical loading means pushing some managerial authority down to workers. For truck drivers, this means that they have the same authority as managers to resolve customer problems. In some companies, if a late shipment causes problems for a customer, the driver has the authority to fully refund the cost of that shipment without first obtaining management's approval.

The last job redesign technique offered by the model, *opening feedback channels*, means finding additional ways to give employees direct, frequent feedback about their job performance. For example, with advances in electronics, many truck drivers get instantaneous data as to whether they're on schedule and driving their rigs in a fuel-efficient manner. Likewise, the increased contact with customers also means that many drivers now receive monthly data on customer satisfaction. For additional information on the JCM, see this chapter's "What Really Works" feature.

Job Design Companies use specialized jobs because they are economical and easy to learn and don't require highly paid workers. But specialized jobs aren't motivating or particularly satisfying for employees. Companies have used job rotation, job enlargement, job enrichment, and the job characteristics model to make specialized jobs more interesting and motivating. With job rotation, workers move from one specialized job to another. Job enlargement simply increases the number of different tasks within a particular job. Job enrichment increases the number of tasks in a job and gives workers authority and control over their work. The goal of the job characteristics model is to make jobs intrinsically motivating. For this to happen, jobs must be strong on five core job characteristics (skill variety, task identity, task significance, autonomy, and feedback), and workers must experience three critical psychological states (knowledge of results, responsibility for work outcomes, and meaningful work). If jobs aren't internally motivating, they can be redesigned by combining tasks, forming natural work units, establishing client relationships, vertical loading, and opening feedback channels.

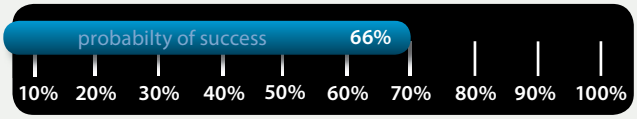
The Job Characteristics Model: Making Jobs More Interesting and Motivating

Think of the worst job you ever had. Was it factory work where you repeated the same task every few minutes? Was it an office job requiring a lot of meaningless paperwork? Or was it a job so specialized that it took no effort or thinking whatsoever to do?

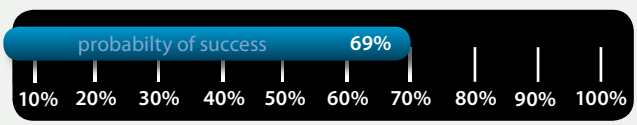
The job characteristics model reviewed in this chapter suggests that workers will be more motivated or satisfied with their work if their jobs have greater task identity, task significance, skill variety, autonomy, and feedback. Eighty-four studies, with a combined total of 22,472 participants, found that, on average, these core job characteristics make jobs more satisfying for most workers. In addition, jobs rich with the five core job characteristics are especially satisfying for workers who possess an individual characteristic called *growth need strength*. Read on to see how well the JCM really increases job satisfaction and reduces workplace absenteeism.

Job Satisfaction

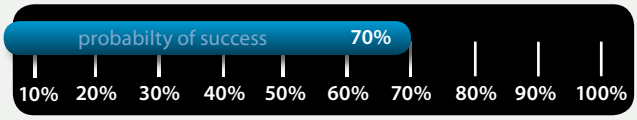
There is a 66 percent chance that workers will be more satisfied with their work when their jobs have task identity, the chance to complete an entire job from beginning to end, than when they don't.



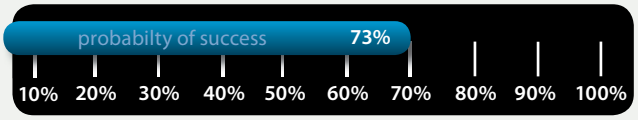
On average, there is a 69 percent chance that workers will be more satisfied with their work when their jobs have task significance—a substantial impact on others—than when they don't.



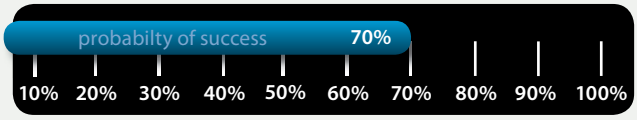
On average, there is a 70 percent chance that workers will be more satisfied with their work when their jobs have skill variety—a variety of activities, skills, and talents—than when they don't.



On average, there is a 73 percent chance that workers will be more satisfied with their work when their jobs have autonomy—the discretion to decide how and when to accomplish the work—than when they don't.



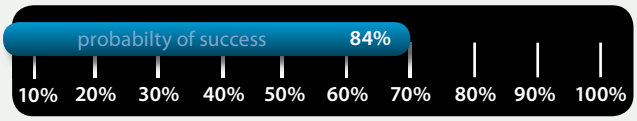
On average, there is a 70 percent chance that workers will be more satisfied with their work when their jobs provide feedback—information about their work performance—than when they don't.



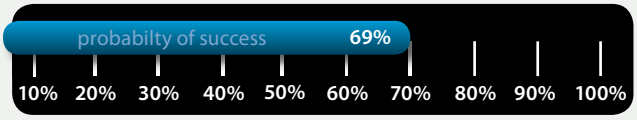
These statistics indicate that, on average, the JCM has at worst a 66 percent chance of improving workers' job satisfaction. In all, this is impressive evidence that the model works. In general, you can expect these results when redesigning jobs based on the model.

We can be more accurate about the effects of the JCM, however, if we split workers into two groups: those with high growth need strength and those with low growth need strength. *Growth need strength* is the need or desire to achieve personal growth and development through one's job. Workers high in growth need strength respond well to jobs designed according to the JCM because they enjoy work that challenges them and allows

them to learn new skills and knowledge. In fact, there is an 84 percent chance that workers with high growth need strength will be more satisfied with their work when their jobs are redesigned according to the JCM.



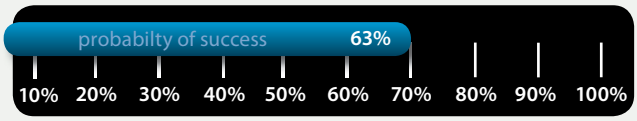
By comparison, because they aren't as interested in being challenged or learning new things at work, there is only a 69 percent chance that workers low in growth need strength will be satisfied with jobs that have been redesigned according to the principles of the JCM. This is still a favorable percentage, but it is weaker than the 84 percent chance of job satisfaction that occurs for workers high in growth need strength.



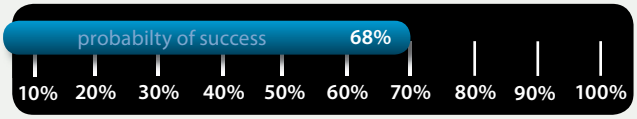
Workplace Absenteeism

Although not shown in the job characteristics model displayed in Exhibit 9.10, workplace absenteeism is an important personal or work outcome affected by a job's core characteristics. In general, the "richer" your job is with task identity, task significance, skill variety, autonomy, and feedback, the more likely you are to show up for work every day.

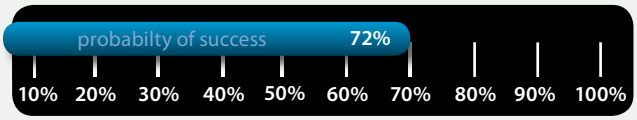
Workers are 63 percent more likely to attend work when their jobs have task identity than when they don't.



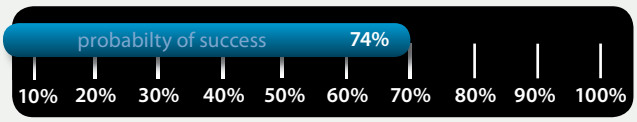
Workers are 68 percent more likely to attend work when their jobs have task significance than when they don't.



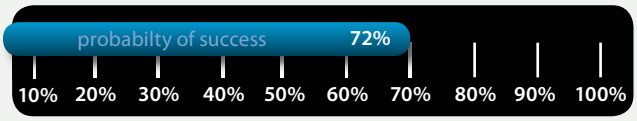
Workers are 72 percent more likely to attend work when their jobs have skill variety than when they don't.



Workers are 74 percent more likely to attend work when their jobs have autonomy than when they don't.



Workers are 72 percent more likely to attend work when their jobs provide feedback than when they don't.[31]



DESIGNING ORGANIZATIONAL PROCESSES

More than 40 years ago, Tom Burns and G. M. Stalker described how two kinds of organizational designs, mechanistic and organic, are appropriate for different kinds of organizational environments.[32] **Mechanistic organizations** are characterized by specialized jobs and responsibilities; precisely defined, unchanging roles; and a rigid chain of command based on centralized authority and vertical communication. This type of organization works best in stable, unchanging business environments. By contrast,

After reading the next two sections, you should be able to

5. describe the methods that companies are using to redesign external organizational processes (i.e., interorganizational processes).

organic organizations are characterized by broadly defined jobs and responsibility; loosely defined, frequently changing roles; and decentralized authority and horizontal communication based on task knowledge. This type of organization works best in dynamic, changing business environments.

The organizational design techniques described in the first half of this chapter—departmentalization, authority, and job design—are better suited for mechanistic organizations and the stable business environments that were more prevalent before 1980. By contrast, the organizational design techniques discussed next, in the second part of the chapter, are more appropriate for organic organizations and the increasingly dynamic environments in which today's businesses compete. The key difference between these approaches is that mechanistic organizational designs focus on organizational structure, whereas organic organizational designs are concerned with organizational process, or the collection of activities that transform inputs into outputs valued by customers.

4 INTRAORGANIZATIONAL PROCESSES

An **intraorganizational process** is the collection of activities that take place within an organization to transform inputs into outputs that customers value. The steps involved in an automobile insurance claim are a good example of an intraorganizational process:

1. Document the loss (the accident).
2. Assign an appraiser to determine the dollar amount of damage.
3. Make an appointment to inspect the vehicle.
4. Inspect the vehicle.
5. Write an appraisal and get the repair shop to agree to the damage estimate.
6. Pay for the repair work.
7. Return the repaired car to the customer.

Let's take a look at how companies are using **4.1 reengineering, 4.2 empowerment,** and **4.3 behavioral informality to redesign intraorganizational processes like these.**

4.1 Reengineering

In their best-selling book *Reengineering the Corporation*, Michael Hammer and James Champy define **reengineering** as "the *fundamental* rethinking and *radical* redesign of business *processes* to achieve *dramatic* improvements in critical, contemporary measures of performance, such as cost, quality, service and speed."[33] Hammer and Champy further explained the four key words shown in italics in this definition. The first key word is *fundamental*. When reengineering organizational designs, managers must ask themselves, "Why do we do what we do?" and "Why do we do it the way we do?" The usual answer is "Because that's the way we've always done it." The second key word is *radical*. Reengineering is about significant change, about starting over by throwing out the old ways of getting work done. The third key word is *processes*. Hammer and Champy noted that "most business people are not process oriented; they are focused on tasks, on jobs, on people, on structures, but not on processes." The fourth key word is *dramatic*. Reengineering is about achieving quantum improvements in company performance.

An example from IBM Credit's operation illustrates how work can be reengineered.[34] IBM Credit lends businesses money to buy IBM computers. Previously, the

[Organic organization] an organization characterized by broadly defined jobs and responsibility; loosely defined, frequently changing roles; and decentralized authority and horizontal communication based on task knowledge

[Intraorganizational process] the collection of activities that take place within an organization to transform inputs into outputs that customers value

loan process began when an IBM salesperson called the home office to obtain credit approval for a customer's purchase. The first department involved in the process took the credit information over the phone from the salesperson and recorded it on the credit form. The credit form was sent to the credit checking department, then to the pricing department (where the interest rate was determined), and on through a total of five departments. In all, it took the five departments 6 days to approve or deny the customer's loan. Of course, this delay cost IBM business. Some customers got their loans elsewhere. Others, frustrated by the wait, simply canceled their orders.

Finally, two IBM managers decided to walk a loan straight through each of the departments involved in the process. At each step, they asked the workers to stop what they were doing and immediately process their loan application. They were shocked by what they found. From start to finish, the entire process took just 90 minutes! The 6-day turnaround time was almost entirely due to delays in handing off the work from one department to another. The solution: IBM redesigned the process so that one person, not five people in five separate departments, now handles the entire loan approval process without any handoffs. The results were indeed dramatic. Reengineering the credit process reduced approval time from 6 days to 4 hours and allowed IBM Credit to increase the number of loans it handled by a factor of 100! Likewise, reengineering helped Schneider National, a trucking company, reduce the time it took to bid for trucking jobs from 2 weeks to 2 days.[35]

Reengineering changes an organization's orientation from vertical to horizontal. Instead of taking orders from upper management, lower- and middle-level managers and workers take orders from a customer who is at the beginning and end of each process. Instead of running independent functional departments, managers and workers in different departments take ownership of cross-functional processes. Instead of simplifying work so that it becomes increasingly specialized, reengineering complicates work by giving workers increased autonomy and responsibility for complete processes.

In essence, reengineering changes work by changing **task interdependence**, the extent to which collective action is required to complete an entire piece of work. As shown in Exhibit 9.11, there are three kinds of task interdependence.[36] In **pooled interdependence**, each job or department independently contributes to the whole. In **sequential interdependence**, work must be performed in succession, as one group's or job's outputs become the inputs for the next group or job. Finally, in **reciprocal interdependence**, different jobs or groups work together in a back-and-forth manner to complete the process. By reducing the handoffs between different jobs or groups, reengineering decreases sequential interdependence. Likewise, reengineering decreases pooled interdependence by redesigning work so that formerly independent jobs or departments now work together to complete processes. Finally, reengineering increases reciprocal interdependence by making groups or individuals responsible for larger, more complete processes in which several steps may be accomplished at the same time.

As an organizational design tool, reengineering promises big rewards, but it has also come under severe criticism. The most serious complaint is that because it allows a few workers to do the work formerly done by many, reengineering is simply a corporate code word for cost cutting and worker layoffs.[37] For this reason, detractors claim that reengineering hurts morale and performance. Even though ordering times were reduced from 3 weeks to 3 days, Levi Strauss ended an $850 million reengineering project because of the fear and turmoil it created in the company's work force. One low point occurred when Levi management, encouraged by its reengineering consultants, told 4,000 workers that they would have to "reapply for their jobs" as the company shifted from its traditional

vertical structure to a process-based form of organizing. Thomas Kasten, Levi Strauss's vice president for reengineering and customer service, says, "We felt the pressure building up [over reengineering efforts], and we were worried about the business."[38] Today, even reengineering gurus Hammer and Champy admit that roughly 70 percent of all reengineering projects fail because of the effects on people in the workplace. Says Hammer, "I wasn't smart enough about that [the people issues]. I was reflecting my engineering background and was insufficiently appreciative of the human dimension. I've [now] learned that's critical."[39]

4.2 Empowerment

Another way of redesigning intraorganizational processes is through empowerment. **Empowering workers** means permanently passing decision-making authority and responsibility from managers to workers. For workers to be fully empowered, companies must give them the information and resources they need to make and carry out good decisions and then reward them for taking individual initiative.[40] Unfortunately, this doesn't happen often enough. As Michael Schrage, author and MIT researcher, wrote:

> *A warehouse employee can see on the intranet that a shipment is late but has no authority to accelerate its delivery. A project manager knows—and can mathematically demonstrate—that a seemingly minor spec change will bust both her budget and her schedule. The spec must be changed anyway. An airline reservations agent tells the Executive Platinum Premier frequent flier that first class appears wide open for an upgrade. However, the airline's yield management software won't permit any upgrades until just four hours before the flight, frequent fliers (and reservations) be damned. In all these cases, the employee has access to valuable information. Each one possesses the "knowledge" to do the job better. But the knowledge and information are irrelevant and useless. Knowledge isn't power; the ability to act on knowledge is power.*[41]

When workers are given the proper information and resources and are allowed to make good decisions, they experience strong feelings of empowerment. **Empowerment** is a feeling of intrinsic motivation, in which workers perceive their work to have meaning and perceive themselves to be competent, having an impact, and capable of self-determination.[42] Work has meaning when it is consistent with personal standards and beliefs. Workers feel competent when they believe they can perform an activity with skill. The belief that they are having an impact comes from a feeling that they can affect work outcomes. A feeling of self-determination arises from workers' belief that they have the autonomy to choose how best to do their work.

Empowerment can lead to changes in organizational processes because meaning, competence, impact, and self-determination produce empowered employees who take active rather than passive roles in their work. Wegmans Food Market Inc., a perennial top company on the *Fortune* ranking of the best businesses to work for, is a classic example of employee empowerment. Wegmans has sixty-nine stores in New York, Pennsylvania, New Jersey, and Virginia. Employees are encouraged to do just about anything to keep customers loyal to the organization and to do so on the spot, without consulting a higher-up. One day it could mean sending a chef to a customer's home to clear up a botched food order. Another day it could mean cooking a family's Thanksgiving turkey in the store because the one bought was too big

4.3 Behavioral Informality

How would you describe the atmosphere in the office where you last worked? Was it a formal, by-the-book, follow-the-rules, address-each-other-by-last-names atmosphere? Or was it more informal, with an emphasis on results rather than rules, casual business dress rather than suits, and first names rather than last names and titles? Or was it somewhere in between?

Behavioral informality (or formality) is a third influence on intraorganizational processes. **Behavioral informality** refers to workplace atmospheres characterized by spontaneity, casualness, and interpersonal familiarity. By contrast, **behavioral formality** refers to workplace atmospheres characterized by routine and regimen, specific rules about how to behave, and impersonal detachment. As Exhibit 9.12 shows, behavioral formality and informality are characterized by four factors: language usage, conversational turn taking and topic selection, emotional and proxemic gestures, and physical and contextual cues. Let's examine each in more detail.[44]

[Behavioral formality] a workplace atmosphere characterized by routine and regimen, specific rules about how to behave, and impersonal detachment

Compared with formal work atmospheres, the language in informal workplaces is often slurred ("Whatcha doin'?"), elliptical ("Coffee?" versus "Would you like some

coffee?"), and filled with slang terms and vivid descriptions. People use first names and perhaps nicknames to address each other, rather than Mr., Ms., Dr., or formal titles. When it comes to conversations in informal workplaces, people jump right in when they have something to say (known as unregulated turn taking); conversations shift from topic to topic, many of which are unrelated to business; and joking and laughter are common. From joy to disappointment, people show much more emotion in informal workplaces. Relaxed behavior, such as putting your feet on your desk or congregating in hallways for impromptu discussions, is more common, too. In terms of physical and contextual cues, informal workplaces de-emphasize differences in hierarchical status or rank to encourage more frequent interaction between organizational members. Consequently, to make their organizations feel less formal, many companies have eliminated such management perks as executive dining rooms, reserved parking spaces, and large corner offices separated from most workers by virtue of their location on a higher floor of the company building (the higher the floor, the greater one's status). Chipotle Mexican Grill de-emphasizes differences in hierarchical rank through an innovative employee title system that speaks volumes about the company's informal culture. The "Manager of Duct Tape and Plungers" is in charge of customer service. The "Director of Hoopla, Hype, and Ballyhoo" is the company's spokesperson, and the leader of the creative services department is the "Head of Special Weapons and Tactics." Even though the title system has never received an official corporate blessing, the offbeat titles are still sanctioned: They are used on business cards and in formal business correspondence, reinforcing how seriously Chipotle takes behavioral informality.[45]

Casual dress policies and open office systems are two of the most popular methods for increasing behavioral informality. In fact, a survey conducted by the Society for Human Resource Management indicates that casual dress policies (no suits, ties, jackets, dresses, or formal clothing required) are extremely popular.[46] Today, 84 percent of companies have some form of casual dress code, up from 63 percent 9 years ago and 24 percent 14 years ago.[47] Similarly, 42 percent of all companies permit casual dress at least one day a week, compared with 17 percent 5 years ago. Moreover, 33 percent of companies permit casual dress every day of the week, up from 20 percent 7 years ago.

Although sales of formal business wear, such as men's suits, increased in 2004 and 2005, sales were down 13.8 percent last year. Still, companies such as retailer Target have instituted formal dress codes that ban business casual based on the idea that a more professional workplace will lead to better results.[48] However, according to John Challenger, chief executive of Challenger, Gray & Christmas, a Chicago-based outplacement company, "no study shows that productivity goes up with better dress."[49] Indeed, casual dress appears to improve employee attitudes. Colin Stanbridge, the chief executive of London's Chamber of Commerce, says, "People tend to work at their best when they feel most comfortable. And today I think the vast majority of people feel at their most comfortable when wearing casual dress."[50] In fact, 85 percent of human resources directors believe that casual dress can improve office morale, and 79 percent say that employees are very satisfied with casual dress codes.[51] Moreover, nearly two-thirds of the human resources directors believe that casual dress policies are an important tool for attracting qualified employees in tight labor markets. Michael Losey, president of the Society for Human Resource Management, concludes that "for the majority of corporations and industries, allowing casual dress can have clear advantages at virtually no cost."[52]

While casual dress increases behavioral informality by having managers and workers at all levels dress in a more relaxed manner, open office systems increase behavioral informality by significantly increasing the level of communication and interaction among employees. By definition, **open office systems** try to increase interaction by removing physical barriers that separate workers. One characteristic of open office systems is that they have much more shared space than private space. **Shared spaces** are areas used by and open to all employees. Cubicles with low-to-the-ground partitions (used by 75 percent of office workers), offices with no doors or with glass walls, collections of comfortable furniture that encourage people to congregate, and common areas with tables and chairs that encourage people to meet, work, or eat together are examples of shared space.[53] In contrast, **private spaces**, such as private offices with doors, are used by and open to just one employee.

The advantage of an open office with extensive shared space is that it dramatically increases the amount of unplanned, spontaneous, and chance communication among employees.[54] People are much more likely to plan meetings and work together when numerous collaboration spaces with conference tables, white boards, and computers are readily available. With no office walls, inviting common areas, and different departments mixed together in large open spaces, spontaneous communication occurs more often.

After Radio Shack moved from two traditional, 19-story office towers into a new headquarters with open offices, cubicles, and immense amounts of shared space, the volume of corporate e-mail dropped by 37 percent because people were much more likely to run into and actually talk to each other. Senior Vice President Laura Moore says, "For somebody to stick his or her head over your workplace [cubicle] is accepted protocol. That has made executives much more approachable."[55] Also, open office systems increase chance encounters by making it much more likely that people from different departments or areas will run into each other. When Sigma-Aladrich, a bio technology firm, built a new office with a three-story, open staircase at the center of the building, the main goal, according to Keld Sorensen, director of research and development, was increasing "interaction."[56] In fact, the open staircase, which is complemented by benches and expansive landings on each story (so people would sit and talk) has led to 156 percent more chance encounters than at the old building, which had elevators and an enclosed stairwell. Indeed, soon after the move to the new office, two scientists from opposite sides of the building ran into each other on the stairs, stopped to talk, and ended up generating a significant new reagent for scientific testing.

Not everyone is enthusiastic about open offices, however. For example, Ingrid Tischer, who sits in a cubicle next to the kitchen in her office, says she can't help being distracted by others' conversations and frequently joins in. Because of the location of her cubicle, "I know things about my colleagues' lives, and they know things about mine."[57] In fact, cubicle dwellers are interrupted by "noise, visual distractions, and chatty visitors" up to 21 times a day. And, since it takes about 3 minutes each time to refocus on what they were doing, cubicle workers can lose an hour a day to these interruptions. Attorney Phillip Fisher says, [58] "I honestly don't know how people can concentrate in a cubicle." For this reason, Sun Microsystems and Microsoft give their employees private offices. William Agnello, Sun's vice president of real estate and the workplace, says, "We have researched the heck out of this. Our studies show that, for our engineers, there are just too many distractions and interruptions."[59] Microsoft's John Pinette agrees: "Private offices allow our employees to concentrate on their work and to avoid unnecessary distractions—[which is] obviously critical when you're doing something that requires as much focus as developing software does."[60]

Don't Scavenge That Office If Somebody Is Still in It

It's like roadkill in the animal kingdom. As soon as the word gets out that someone is leaving the company, coworkers start scheming to scavenge the office leftovers—chairs, computer monitors, filing cabinets, even staplers. "This issue is practically everywhere," says Mary Wong, president of a human resources consulting company. "Professionals—anyone you and I would normally consider to be very adult—turn into children" over the prospect of picking an empty office clean of its "goodies." Sometimes—and this is where it gets disrespectful—office scavengers move in even before the employee, who's often been laid off, has left. Ethics consultant Steve Lawler tells the story of a laid-off manager who, just hours after hearing the bad news, was already getting requests for the expensive Herman Miller Aeron chair in which he was still sitting. Office scavenging is a strange and predictable aspect of office life. It happens everywhere. But if you're going to scavenge, and you probably will, do the right thing by maintaining the dignity of departing coworkers: Wait until the office is empty before you strike.[61]

Open offices encourage communication and interaction throughout an organization, but they have their drawbacks as well. In fact, sales of taller cube walls, like those shown here, are increasing, while sales of traditional four-foot walls are decreasing.

Indeed, because there is so much shared space and so little private space, companies with open systems have to take steps to give employees privacy when they need to concentrate on individual work. One step is simply to use taller cubicles. Indeed, Herman Miller, a manufacturer of office furniture and systems, has seen sales of its 62-inch-high cubicle panels increase by 18 percent while sales of its 46-inch-high panels have dropped by 19 percent. Another approach is to install white-noise machines to prevent voices and other noises from disrupting others.[62] **Dynasound**, which makes sound-masking machines that use white noise to make conversations difficult to hear, has seen sales increase by 141 percent.[63] Yet another approach is to make conference rooms available. In contrast to traditional offices, where such rooms are used for meetings, many employees in open systems reserve conference rooms when they need private time to work. Another possibility is to turn a cubicle into a more private space. When Mark Saunders, of GlaxoSmithKline Consumer Healthcare, moved from a private office to a cubicle at the end of a busy hallway, he "felt sensory overload." To make it easier for him to concentrate, the company's office design team created a nylon screen that can be placed around his cubicle to block out visual distractions.[64] If your office doesn't provide such screens, you can always fork out $15.00 for the Cube-a-Door, a free-standing cardboard partition stamped with the words "Work in Progress. Do Not Disturb," that will serve as a "door" to your cubicle when you need to screen out interruptions.[65]

Intraorganizational Processes Today, companies are using reengineering, empowerment, and behavioral informality to change their intraorganizational processes. Through fundamental rethinking and radical redesign of business processes, reengineering changes an organization's orientation from vertical to horizontal. Reengineering changes work processes by decreasing sequential and pooled interdependence and by increasing reciprocal interdependence. Reengineering promises dramatic increases in productivity and customer satisfaction, but it has been criticized as simply an excuse to cut costs and lay off workers.

Empowering workers means taking decision-making authority and responsibility from managers and giving it to workers. Empowered workers develop feelings of competence and self-determination and believe that their work has meaning and impact. Workplaces characterized by behavioral informality are spontaneous and casual. The formality or informality of a workplace depends on four factors: language usage, conversational turn taking and topic selection, emotional and proxemic gestures, and physical and contextual cues. Casual dress policies and open office systems are two of the most popular methods for increasing behavioral informality.

5 INTERORGANIZATIONAL PROCESSES

An **interorganizational process** is a collection of activities that occur *among companies* to transform inputs into outputs that customers value. In other words, many companies work together to create a product or service that keeps customers happy. For example, when you purchase a Liz Claiborne outfit, you're not just buying from Liz Claiborne; you're also buying from a network of 250 suppliers in 35 countries from Saipan, to Mexico, to Cambodia, to China that make those clothes for Liz Claiborne. After Liz Claiborne's New York-based designers come up with a concept, it is shipped to a sourcing team in Hong Kong, which changes the design as needed to keep costs low and then finds companies that can produce the right fabrics and the entire line of clothing. Those companies then manufacture the first product prototypes and send them back to the New York designers for final inspection and possibly last-minute changes.[66]

In this section, you'll explore interorganizational processes by learning about **5.1 modular organizations** and **5.2 virtual organizations**.[67]

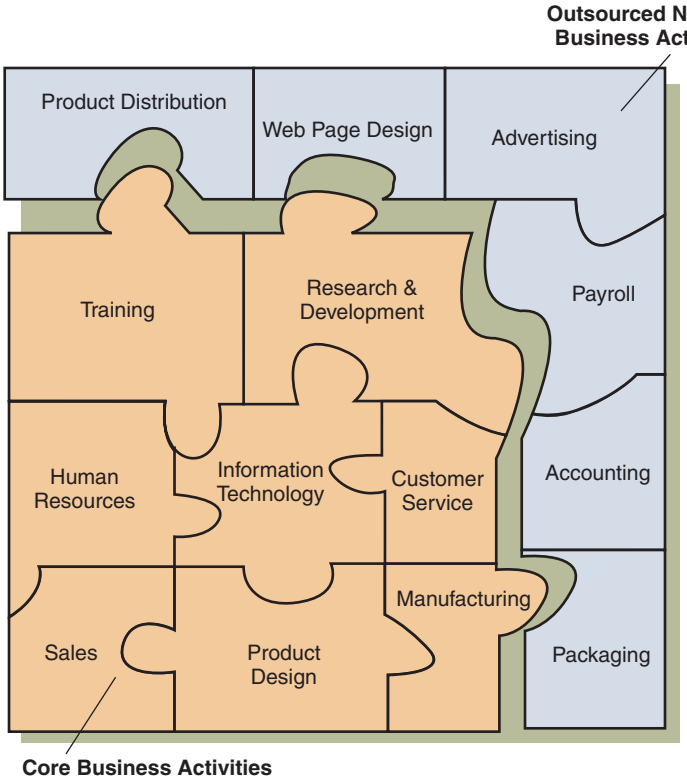
5.1 Modular Organizations

Stephen Roach, chief economist for investment bank Morgan Stanley, says that companies increasingly want to take "functions that aren't central to their core competency," and outsource them.[68] Except for the core business activities that they can perform better, faster, and cheaper than others, **modular organizations** outsource all remaining business activities to outside companies, suppliers, specialists, or consultants. The term *modular* is used because the business activities purchased from outside companies can be added and dropped as needed, much like adding pieces to a three-dimensional puzzle. Exhibit 9.13 depicts a modular organization in which the company has chosen to keep training, human resources, sales, product design, manufacturing, customer service, research and development, and information technology as core business activities but has outsourced the noncore activities of product distribution, web page design, advertising, payroll, accounting, and packaging.

[Interorganizational process] a collection of activities that take place among companies to transform inputs into outputs that customers value

[Modular organization] an organization that outsources noncore business activities to outside companies, suppliers, specialists, or consultants

EXHIBIT 9.13 Modular Organization



Modular organizations have several advantages. First, because modular organizations pay for outsourced labor, expertise, or manufacturing capabilities only when needed, they can cost significantly less to run than traditional organizations. For example, when Apple came up with its iPod digital music player, it outsourced the audio chip design and manufacture to SigmaTel in Austin, Texas, and final assembly to Asutek Computers in Taiwan. Doing so not only reduced costs and sped up production (beating Sony's Network Walkman to market) but also allowed Apple to do what it does best—design innovative products with easy-to-use software.[69] Furthermore, after other companies imitated Apple by producing their own digital music players, Apple was able to take advantage of its lower costs by aggressively cutting prices.[70] To obtain these advantages, however, modular organizations need reliable partners—vendors and suppliers with whom they can work closely and can trust.

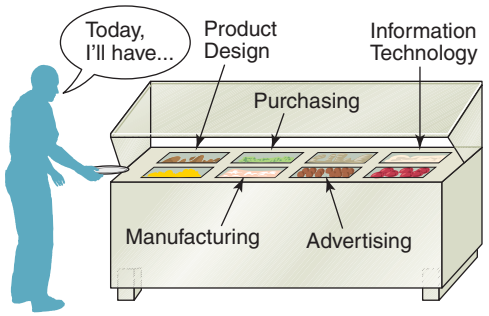
Modular organizations have disadvantages, too. The primary disadvantage is the loss of control that occurs when key business activities are outsourced to other companies. Also, companies may reduce their competitive advantage in two ways if they mistakenly outsource a core business activity. First, as a result of competitive and technological change, the noncore business activities a company has outsourced may suddenly become the basis for competitive advantage. Second, related to that point, suppliers to whom work is outsourced can sometimes become competitors.

Crowdsourcing

Companies are tapping into an army of people willing to work for literally pennies. At Amazon's Mechanical Turk, companies or individuals (called "requesters") post repetitive tasks that can be completed only by human intelligence, such as identifying the best of a set of photos, writing product descriptions, and color-coding clothing sold by online retailers. Most of these jobs take only a few minutes and pay just a few cents. But requesters can also post tasks that are more involved. One manager originally paid a consultant $2,000 for a flow chart of his company's repair process. When the company needed additional work, however, it enlisted a "Turker." The second flow chart cost $5. Keep your eye on the trend of crowdsourcing.[71]

5.2 Virtual Organizations

EXHIBIT 9.14 Virtual Organization



In contrast to modular organizations in which the interorganizational process revolves around a central company, a **virtual organization** is part of a network in which many companies share skills, costs, capabilities, markets, and customers with each other. Exhibit 9.14 shows a virtual organization in which, for "today," the parts of a virtual company consist of product design, purchasing, manufacturing, advertising, and information technology. Unlike modular organizations, in which the outside organizations are tightly linked to one central company, virtual organizations work with some companies in the network alliance, but not with all. So, whereas a puzzle with various pieces is a fitting metaphor for a modular organization, a potluck dinner is an appropriate metaphor for a virtual organization. All participants bring their finest food dish but eat only what they want.

Another difference is that the working relationships between modular organizations and outside companies tend to be more stable and longer lasting than the shorter, often temporary relationships found among the virtual companies in a network alliance. The composition of a virtual organization is always changing. The combination of network partners that a virtual corporation has at any one time depends on the expertise needed to solve a particular problem or provide a specific product or service. This is why the businessperson in the network organization shown in Exhibit 9.14 is saying, "Today, I'll have. . . ." Tomorrow, the business could want something completely different. In this sense, the term *virtual organization* means the organization that exists "at the moment."

For example, twenty-one carton manufacturers have formed a network of virtual organizations called the **Independent Carton Group (ICG)**.[72] The original network, which brought five independent carton companies together, was designed so that each of the five companies could help each other in case a catastrophe occurred at one of their production facilities. For instance, if an ICG company ever experienced a catastrophe at a production facility, the other four members of the ICG would be there to temporarily provide alternative production arrangements so the affected company wouldn't lose its customers. However, as the group grew, they realized they could trade off manufacturing capacities with each other to better serve customers' needs, so they combined their efforts to provide carton packaging in 16 different industries, from automotive to biotech to food to electronics. ICG customers benefit from competitive pricing, uninterrupted supplies, and group purchasing power.

Virtual organizations have a number of advantages. They let companies share costs. Inspired by the ICG model, fifteen regional ink manufacturers, blenders, and distributors formed the Print Suppliers Group to grow their businesses and combine orders for paint supplies to take advantage of volume purchasing discounts. John Toigo, president of Grand Rapids Printing Ink, says, "Combining our purchasing allows us a much better price point,"[73] Marlon Tusche, vice president of sales and marketing for Pertech Printing Inks, agrees: "By working together, our purchasing power is much stronger, plus we can share our knowledge, which makes us stronger technically."[74]

And, because members of virtual organizations can quickly combine their efforts to meet customers' needs, they are fast and flexible. Although member companies of ICG are highly specialized, as a collective, ICG is able to bid for larger and complex orders and then assign the work to a smaller group of member companies that have the expertise required to meet customer specifications. "We are able to deliver what the customer wants in a timely manner at a good price," said Andrew Willie, executive director of the ICG group.[75] Finally, because each member of the network

[Virtual organization] an organization that is part of a network in which many companies share skills, costs, capabilities, markets, and customers to collectively solve customer problems or provide specific products or services

alliance is the best at what it does, virtual organizations should in theory provide better products and services in all respects.

As with modular organizations, a disadvantage of virtual organizations is that once work has been outsourced, it can be difficult to control the quality of work done by network partners. The greatest disadvantage, however, is that tremendous managerial skills are required to make a network of independent organizations work well together, especially since their relationships tend to be short and based on a single task or project.

Virtual organizations are using two methods to solve this problem. The first is to use a *broker*. In traditional, hierarchical organizations, managers plan, organize, and control. But with the horizontal, interorganizational processes that characterize virtual organizations, the job of a broker is to create and assemble the knowledge, skills, and resources from different companies for outside parties, such as customers.[76] The second way to make networks of virtual organizations more manageable is to use a *virtual organization agreement* that, somewhat like a contract, specifies the schedules, responsibilities, costs, payouts, and liabilities for participating organizations.[77] For more information on how a virtual organizations works, see **http://www.independentcartongroup.com**.

REVIEW 5

Interorganizational Processes Organizations are using modular and virtual organizations to change interorganizational processes. Because modular organizations outsource all noncore activities to other businesses, they are less expensive to run than traditional companies. However, modular organizations require extremely close relationships with suppliers, may result in a loss of control, and could create new competitors if the wrong business activities are outsourced. Virtual organizations participate in a network in which they share skills, costs, capabilities, markets, and customers. As customer problems, products, or services change, the combination of virtual organizations that work together changes. Virtual organizations can reduce costs, respond quickly, and, if they can successfully coordinate their efforts, produce outstanding products and service.

SELF ASSESSMENT

Flexibility and Structure

Every organization needs some degree of flexibility and standardization. In other words, companies need to have enough flexibility in their organizations to respond to changes in their business environment, but firms also must have certain structures in place to ensure smooth operations. For example, if someone gets hurt on company property, clear procedures about what to do in the case of an accident help managers respond quickly and confidently. But being overly committed to following rules can hamstring an organization and keep it from growing. As a manager, you will probably encounter both types of situations, and to respond appropriately you will need to have an idea of how comfortable you are in a formal environment versus a more loosely structured workplace. Every organization needs some degree of flexibility to adapt to new situations and some degree of standardization to make routine tasks and decisions as efficient and effective as possible.[78] In this assessment, indicate the extent to which you agree or disagree with the following statements. Use this scale for your responses:

1. Strongly disagree
2. Disagree
3. Slightly disagree
4. Neutral
5. Slightly agree
6. Agree
7. Strongly agree

MANAGEMENT DECISION

Garbage Jobs

Glancing at the newspaper machine in the lobby, you are happy to see the headline proclaiming the end of the garbage collectors' strike in a nearby city.[79] That kind of strike tends to have a ripple effect on neighboring areas, and as the manager of a private waste collection company in the region, you breathe a sigh of relief.

Nonetheless, as you walk to your office, you can't help thinking about the job of your garbage collectors. It's repetitive, hot (or cold, depending on the season), anonymous, and relatively thankless. Your employees work in pairs, so each truck has one driver and one "thrower"—not much variety for either worker. There's not much on-the-job interaction either, as the driver is in the cab and the thrower rides on the back of the truck. And with the company looking into purchasing newer trucks that automatically lift and dump the garbage cans, you may even go to one person per truck.

In addition, to minimize the time it takes to collect the trash, you assign each team to the same neighborhood week after week. That ensures maximum efficiency: Drivers subconsciously time traffic lights, pace themselves for starts and stops, and know the route without needing to consult a map. Even when collectors know the route, the work can be grueling. Each route has to be finished each day; no one will tolerate garbage left on the curb after the assigned pickup day. So even if a traffic accident or construction brings traffic to a standstill, the garbage has to be collected each day according to schedule.

The more you think about it, the more the job sounds dull—and somewhat stressful. As you fire up your computer and begin to look at your favorite industry blog, you wonder if you can make the job more interesting for your employees. Scanning the screen, you link to an article about a region in Britain that is putting defibrillators in garbage trucks to complement the ambulance service in rural areas. Well, that's not quite what you had in mind for making garbage collecting interesting for your employees, but still, it's something.

Questions

1. Can you use the job characteristics model (JCM) to redesign the job of the trash collector to be internally motivating? How?

2. Assume that the trash collection job is not internally motivating. Identify areas where you can strengthen the job's core characteristics and give specific examples.

3. Is it possible to redesign the very specialized job of a garbage collector to make it more satisfying? Is a redesign feasible? In other words, do you redesign the job or keep it as is? Explain your reasoning.

Letting Go at Lego

By definition, toys should be fun. Unfortunately for you, competing in today's toy industry is anything but.[80] Cutthroat competition and children's changing interests have pushed toymakers to consolidate, cut costs, and grow through licensing agreements with media giants like Disney and Nickelodeon, something many toymakers consider to be selling out.

No one needs to explain the crushing pressure to you—you're the new CEO of Lego, the first outsider in the company's history to run the family-owned business—because you were hired to save the company from sure decline. Last year, Lego had over $1 billion in sales. Its proprietary manufacturing operation pumps out 15 billion components a year—that's 1.7 million bricks, Lego people, and other elements per hour. By the numbers, Lego is the world's leading tire maker, producing 306 million tiny rubber tires a year for its sets. Lego's iconic bricks are so versatile that with a pack of only six bricks, a child can create 915,103,765 unique configurations. It's no wonder that Lego beat out Barbie and the teddy bear to be named Toy of the Century by *Fortune* magazine and by the British Toy Retailers Association.

Despite the volume of product being produced, the perennial accolades, and a reputation for nurturing creativity in children, Lego is losing money at an alarming rate. On last year's $1 billion in sales, the company lost a whopping $240 million. It also carries about $750 million in debt. That means you begin your stint as CEO squarely behind the eight ball. First on your list of things to do: change the company mission from "nurturing the child" to "I'm here to make money for the company."

Part of what's weighing Lego down is the fact that the company does it all. Lego uses its own designers to develop new products; other companies use a combination of in-house talent and innovation labs to come up with new-product ideas. Lego manufactures its bricks (and other products) on extruding machines it developed itself at company-owned factories in Denmark and Switzerland, where labor costs are stratospheric; 70 percent of the world's toys are manufactured in China by contract manufacturers hired just to produce the toys and with labor that costs pennies on the kroner. Lego distributes all of its own products; other companies use third-party logistics companies like DHL and UPS to manage distribution. Lego even books $5.2 million in travel a year through an in-house travel agency that uses proprietary software; most companies use dedicated travel services, like American Express Travel.

To bring Lego back into the black, you've got to cut costs, and the fastest way to cut costs is outsourcing. The biggest savings would come from outsourcing your production, but that also carries the biggest risks. Controlling your manufacturing would be difficult. You'd have to share your machinery technology—what if a contractor started using your technology and specifications to make black-market Legos, something not at all inconceivable if you outsourced to China? And there's the fact that Legos are part of the fabric of Billund, the Danish town of 6,500 where the bricks were invented and where Lego's headquarters employs most of the company's 8,000 workers. Most of the people in Billund work for Lego. Still, savings from outsourcing manufacturing alone would bring the company to nearly break-even levels.

Controlling distribution helps you manage inventories and track sales trends, but should Lego really operate its own distribution network? So many companies specialize in this area that it's hard to equal their capabilities. Even something that is as seemingly easy to outsource as travel is not so easy. In-house travel agents know the ins and outs of Lego's travel policy; an outside provider is not always able to recognize a breach in the policy. Lego managers book

10,000 air tickets a year, and the head of the travel department says her team saves the company $325,000 in administrative costs alone over working with an outside company.

One thing is certain: You're not going to be able to make a decision on what to outsource (if anything) without consulting your management team. Form a team of four or five students to act as the management team for Lego. You may want to refer to Exhibit 9.13 as you work through the following questions.

Questions

1. What risks, if any, does outsourcing pose to Lego's corporate identity?
2. What do you think Lego's core and noncore business activities should be?
3. Do you outsource production, which will by itself achieve your cost-cutting goal, or do you outsource a smattering of other functions and keep Lego a "toymaker" rather than a "toy marketer"?

PRACTICE BEING A MANAGER

Work Dynamics

Effective organization is vital to the accomplishment of company objectives. Two critical aspects of effective organization are departmentalization and the design of jobs. In this role-play exercise you will have the opportunity to experience some of the work dynamics surrounding the grouping of workers and the design of jobs.

Step 1: Form work groups. Your professor will form groups and give you a role assignment.

Step 2: Review your role. Read your role assignment carefully, and prepare to begin working per your role assignment.

Step 3 (10–20 minutes): Begin acting. When your professor directs you to begin, you should start working as assigned by your role.

Step 4: Compile your results. Total your results by work group, and compare across the teams.

Step 5: Debrief as a class. Discuss the results as a class. What factors seemed to play a role in the efficiency and effectiveness of the work groups? What role did organization and job design play? If this were an actual organizational work group, what might you do to improve performance and worker satisfaction?

DEVELOP YOUR CAREER POTENTIAL

"Work" in Someone Else's Shoes

Why is learning to see things from someone else's perspective one of the most difficult things to do in today's workplace? Sometimes, the inability to see things as others see them has to do with the people involved. Inexperience, ignorance, and selfishness can all play a role. In most organizations, however, the inability to see things from someone else's perspective results from the jobs themselves, not the people who do them. Because jobs limit who we talk to, what we talk about, what we think about, and what we care about at work, it should not be a surprise that people who perform different jobs have very different views about each other and the workplace.

For example, at Southwest Airlines the pilots who fly the planes and the ground crews who unload, load, and refuel them had little appreciation for each other. The ground crews felt that the pilots treated them like second-class citizens. The pilots couldn't understand why the ground crews weren't doing more to get their planes out of the gates and in the air as fast as possible. To improve understanding and help them see things from each other's perspective, Southwest created a program called Cutting Edge, in which the captains and ground crews learned a lot about each other's jobs. For example, the pilots brought the ground crews into their cockpits and showed them the detailed processes they were required to follow to get planes ready for departure. The pilots, on the other hand, gained appreciation and understanding by actually working as members of Southwest's ground crews. After several days of demanding ground crew work, Southwest pilot Captain Mark Boyter said:

I remember one time when I was working the ramp [as a member of a ground crew] in Los Angeles. I was dead tired. I had flown that morning and had a couple of legs in, so I got out of my uniform and jumped into my ramp clothes. That afternoon was very hot. It was in the 80s—I can't imagine how they do it on a 120-degree day in Phoenix. I was tired and hungry and hadn't had a break. Then I saw this pilot sitting up there in the cockpit eating his frozen yogurt. I said to myself, "Man, I'd like to be up there now." Then I caught myself. I'm up there every day. Now, I know that pilot has been up since 3:00 in the morning. I know that he's been flying an airplane since 6:00 AM. I know it's 3:00 in the afternoon and he hasn't had a chance to get off and have a meal yet today. I know all that, and yet, the yogurt still looks really good to me. Then I thought, "How can a ramp agent [on the ground crew] in Los Angeles who works his butt off for two or three years, working double shifts two or three times a week, understand this? It hit me that there's a big gap in understanding here."[81]

The misunderstandings between Southwest's pilots and ground crews are not unique. All organizations experience them. Nurses and doctors, teachers and students, and managers and employees all have difficulty seeing things from each other's perspective. As Southwest's Cutting Edge program shows, however, you can minimize differences and build understanding by "working" in someone else's shoes.

Questions

1. Describe the job-related differences or tensions where you work. Who is involved? What jobs do they do? Explain why the job-related differences or tensions exist.
2. Since the best way to see things from someone else's perspective is to "work" in his or her shoes, see if you can spend a day, a morning, or even 2 hours performing one of these jobs. If that's not possible, spend some time carefully observing the jobs and then interview several people who perform them. Describe your boss's reaction to this request. Was he or she supportive? Why or why not?
3. Answer the following questions after you have worked the job or conducted your interviews. What most surprised you about this job? What was easiest? What was hardest? Explain. Now that you've had the chance to see things as others see them, what do you think would happen, good or bad, from letting other people in your organization work in someone else's shoes? Explain.

The original Mechanical Turk

Did you read the Crowdsourcing box on page 346? If so, you might be interested to know that the original Mechanical Turk was an 18th-century chess-playing automaton that purportedly could beat anyone at chess. The Turk was a mannequin, but the machine concealed a human chess master who would actuate the Turk with mechanical controls. The Turk beat many statesman and luminaries, including Napoleon Bonaparte and Benjamin Franklin. Read more in Tom Standage's book *The Mechanical Turk*.

Rendition

"What if someone you love . . . just disappeared?" This is the question posed by the 2007 dramatic thriller ***Rendition.*** Anwar El-Ibrahimi (Omar Metwally) boards a flight in South Africa but never arrives home to his family in the States. His pregnant wife Isabella (Reese Witherspoon) doesn't know that he has been named as a suspected terrorist and sent to a secret detention facility in North Africa, where he is tortured and interrogated. Eventually, CIA analyst Douglas Freeman (Jake Gyllenhaal), who has overseen the interrogation, becomes convinced of El-Ibrahimi's innocence, but he is ordered to continue with the detention. In this scene, Senator Hawkins (Alan Arkin) is talking to congressional aide Alan Smith (Peter Sarsgaard) about the situation and explaining why they think there may be a connection between the terrorists and El-Ibrahimi.

What to Watch for and Ask Yourself

1. How would you describe the workplace atmosphere in this scene? Would you say it demonstrates behavioral informality or formality?
2. Do you think the scene shows line authority or staff authority between these two men?
3. What kind of feedback is Alan Smith getting from Senator Hawkins? Is it primarily positive or negative?

MANAGEMENT WORKPLACE

Evo

When Bryce Phillips started selling ski and snow-board equipment on eBay, he managed everything—customer care, supply chain, technology, buying, and finance—all from his own apartment. Eight years later, Phillips runs a hugely successful e-commerce site, employs more than sixty people, manages its Seattle flagship store, and operates a 40,000-square-foot distribution center. His company, called Evo, has grown at least 70 percent every year and recently hit $10 million in sales. To effectively lead this rapidly expanding venture, Phillips continually looks for ways to delegate responsibilities to the capable managers around him. In this video you'll learn about some of the challenges Evo has faced as the company has grown and hear why Phillips believes employee empowerment is so important.

What to Watch for and Ask Yourself

1. Given Evo's current structure and pace of growth, what organizational challenges might arise in the future?
2. Is Evo a centralized or decentralized company? Explain.
3. Imagine it is 20 years from now and Evo is organized into divisions. What are they?

GE Aircraft Engines, Durham, N.C.[1]

In 1917, when the United States entered World War I, the U.S. government was looking for a company that could develop the first airplane engine "booster" or turbo supercharger. Under wartime secrecy, GE began testing and developing various engine designs. Months later, at Pike's Peak, 14,000 ft. above sea level, GE demonstrated a 350 horsepower, turbo supercharged Liberty aircraft engine for the U.S. government. GE landed the federal contract and went full time into the aircraft engine business. Today, GE Aircraft Engines, with revenues of nearly $11 billion, develops and manufactures jet engines for military and commercial aircraft. Indeed, nearly half of the aircraft flown by the U.S. military, as well as half of the aircraft flown by commercial airlines, are powered by GE jet engines. GE's jet engines are so reliable that its CF6-80C2 jet engine was selected to power Air Force One, the Boeing 747 used to fly the President of the United States.

Today, you and your management team are responsible for planning a new factory to build the GE 90, one of GE's most popular commercial jet engines. The location has already been decided, an empty GE manufacturing plant in Durham, North Carolina. However, all other decisions are up to you and your managers. Fortunately, you have designed and started a new plant from the ground up before, what the management consultants call a greenfield site. You think to yourself, "This is a great opportunity. But, we're going to have to be very careful, because whatever we establish from the start what will get perpetuated in the end. Fortunately, though, starting a culture is so much easier than changing a culture." The question, of course, is what to create?

Well, one way to answer that is to hit the road and visit well-run factories at other companies. You're bound to come up with good ideas that way. One of your managers has interesting suggestion, too. He thinks that everyone who is hired to work in the plant should have an FAA mechanic's license. In other words, the people who are building GE's jet engines should be capable of repairing any kind of jet engine. He said, "That would mean we'd start with a better caliber of employee and we wouldn't have to spend time in fundamental training." And you say, thinking out loud, "We might just want to consider using teams to run everything." as you look around the room, you can sense mixed reactions. One of your managers says, "Boy, I just don't know. At the GE plant where I used to work, we switched to teams and the employee turnover rate, which was near zero jumped to

double digits." Another manager says, "Levi's, the jean manufacturer tried teams, too, and had a horrible results."

You respond, "I understand your reluctance. Teams can be tricky. But, they hold a lot of promise, too. If we do teams properly, productivity, quality, and employee satisfaction should rise, while costs decrease." "Well, we don't have to decide today. As we travel and visit other factories, let's see if we can't answer these questions. First, when does it make sense to use teams and when does it make sense to not? Second, if we determine that teams would be appropriate for our factory, what kind of teams should we use and why? Third, how should people who work on teams be paid? We've got to find a way to encourage individual initiative, while at the same time encouraging people to work together on teams. OK, that's set. Get your airline tickets and we'll be back here in two weeks to make our decision.

If you were the manager at GE Aircraft engines new Durham, North Carolina plant, what would you do?

Ninety-one percent of organizations are significantly improving their effectiveness by using work teams.[2] Procter & Gamble and Cummins Engine began using teams in 1962 and 1973, respectively. Boeing, Caterpillar, Champion International, Ford Motor Company, 3M, and General Electric established work teams in the mid to late 1980s. Today, most companies use teams to tackle a variety of issues.[3] "Teams are ubiquitous. Whether we are talking about software development, Olympic hockey, disease outbreak response, or urban warfare, teams represent the critical unit that 'gets things done' in today's world."[4]

We begin this chapter by reviewing the advantages and disadvantages of teams and exploring when companies should use teams instead of more traditional approaches. Next, we discuss the different types of work teams and the characteristics that all teams share. The chapter ends by focusing on the practical steps to managing teams: team goals and priorities, and organizing, training, and compensating teams.

WHY WORK TEAMS?

Work teams consist of a small number of people with complementary skills who hold themselves mutually accountable for pursuing a common purpose, achieving performance goals, and improving interdependent work processes.[5] By this definition, computer programmers working on separate projects in the same department of a company would not be considered a team. To be a team, the programmers would have to be interdependent and share responsibility and accountability for the quality and amount of computer code they produced.[6] Teams are becoming more important in many industries because they help organizations respond to specific problems and challenges. Though work teams are not the answer for every situation or organization, if the right teams are used properly and in the right settings, teams can dramatically improve company performance over more traditional management approaches and instill a sense of vitality in the workplace that is otherwise difficult to achieve.

After reading the next two sections, you should be able to

1. explain the good and bad of using teams.
2. recognize and understand the different kinds of teams.

[Work team] a small number of people with complementary skills who hold themselves mutually accountable for pursuing a common purpose, achieving performance goals, and improving interdependent work processes

1 THE GOOD AND BAD OF USING TEAMS

Let's begin our discussion of teams by learning about **1.1 the advantages of teams, 1.2 the disadvantages of teams,** and **1.3 when to use and not use teams.**

1.1 The Advantages of Teams

Companies are making greater use of teams because teams have been shown to improve customer satisfaction, product and service quality, speed and efficiency in product development, employee job satisfaction, and decision making.[7] For example, one survey indicated that 80 percent of companies with more than 100 employees use teams, and 90 percent of all U.S. employees work part of their day in a team.[8] Teams help businesses increase *customer satisfaction* in several ways. One way is to create work teams that are trained to meet the needs of specific customers. Hewitt Associates, a consulting firm, manages benefits administration for hundreds of multinational client firms. To ensure customer satisfaction, Hewitt reengineered its customer service center and created specific teams to handle benefits-related questions posed by employees of specific client organizations.[9] Similarly, Three Counties, a fund and portfolio management company, uses a team structure in which specific teams are responsible for specific groups of customers, thereby ensuring high quality service necessary for customer satisfaction.[10]

Businesses also create problem-solving teams and employee involvement teams to study ways to improve overall customer satisfaction and make recommendations for improvements. Teams like these typically meet on a weekly or monthly basis. Every day at the Longaberger Company, 2,500 skilled weavers make over 40,000 high-quality baskets that sell for $30 to $260. When productivity began to drop, management turned to an employee involvement group to solve the problem. After studying 40 basket makers for three weeks, the team found that the weavers often had the wrong materials. The team came up with a solution that makes sure each weaver has the proper kinds of wood veneers used to make the different baskets. Before the new system, workers ran out of the proper materials 53 times per day. Now, that happens only 9 times per day. And because the new system has also reduced scrap (leftover, unusable materials) by 75 percent, the company is saving $3 million per year.[11]

Teams also help firms improve *product and service quality* in several ways.[12] In contrast to traditional organizational structures where management is responsible for organizational outcomes and performance, teams take direct responsibility for the quality of the products and service they produce. At Whole Foods, a supermarket chain that sells groceries and health foods, the ten teams that manage each store are responsible for store quality and performance; they are also directly accountable because the size of their team bonus depends on the store's performance. Productive teams get an extra $1.50 to $2.00 per hour in every other paycheck. As a result, Whole Foods teams don't merely want friends on their teams—they want talented, productive workers.[13] Making teams directly responsible for service and product quality pays off. At Whole Foods, comparable store sales (meaning a particular store's sales this year compared with its sales last year) are increasing between 7.7 and 10 percent per year on average!

As you learned in Chapter 7, companies that are slow to innovate or integrate new features and technologies into their products are at a competitive disadvantage. Therefore, a third reason that teams are increasingly popular is that they can increase *speed and efficiency when designing and manufacturing products*.[14] **Louis Vuitton**, the French-based world-renown fashion house, designs and makes some of the most expensive, best-selling purses, shoulder bags, tote bags, and luggage in the world. With many bags costing $1,000 or more, it might surprise you to learn that it took 30 craftspeople eight days to produce just one Louis Vuitton bag! This was because each worker completed just one task, such as cutting leather, gluing and sewing, or stitching the lining, and bottlenecks would form as the slower workers forced faster workers to wait for the next purse to come to them for work. Louis Vuitton fixed the

problem by switching to teams of six to twelve workers who learned to complete four different production steps. Teams were then positioned in U-shaped workstations with sewing machines and assembly tables so that team members could pass bags back and forth without waiting. The result? It takes just one day and six to twelve workers to produce a Louis Vuitton bag. Furthermore, since team members complete multiple tasks, teams can now work on different kinds of bags, which allows the company to quickly switch production to its best-selling items. Finally, with quality up significantly, returns of defective bags have dropped by two-thirds.[15]

Another reason for using teams is that teamwork often leads to increased *job satisfaction*.[16] One reason that teamwork can be more satisfying than traditional work is that it gives workers a chance to improve their skills. This is often accomplished through **cross-training**, in which team members are taught how to do all or most of the jobs performed by the other team members. The advantage for the organization is that cross-training allows a team to function normally when one member is absent, quits, or is transferred. The advantage for workers is that cross-training broadens their skills and increases their capabilities while also making their work more varied and interesting.

A second reason that teamwork is satisfying is that work teams often receive proprietary business information that is available only to managers at most companies. For example, Whole Foods has an "open books, open door, open people" philosophy. Team members are given full access to their store's financial information and everyone's salaries, including those of the store manager and the CEO.[17] Each day, next to the time clock, Whole Foods employees can see the previous day's sales for each team as well as the sales on the same day from the previous year. Each week, team members can examine the same information, broken down by team, for all of the Whole Foods stores in their region. And each month, store managers review information on profitability, including sales, product costs, wages, and operating profits, with each team in the store. Since team members decide how much to spend, what to order, what things should cost, and how many team members should work each day, this information is critical to making teams work at Whole Foods.[18] Whole Foods creates an empowering work environment to honor one of its core values: "supporting team member excellence and happiness."[19]

Team members also gain job satisfaction from unique leadership responsibilities that are not typically available in traditional organizations Orchestras are led by a conductor who is clearly in charge. Can you imagine an orchestra without a conductor? The award-winning, New York City–based Orpheus Chamber Orchestra does not have a conductor. Instead, it has a concert master who is responsible for a performance. What is most interesting is that the concert master's role is rotated among different members of the orchestra. While a typical concertmaster is a violinist, the position even rotates around the various instruments of the orchestra. Flutist Susan Palma-Nidel says that assuming the concertmaster's role "has allowed me to discover strengths that I didn't know I had. Not only have I helped lead the group, but I've also been interviewed by the media—something I never thought I'd do. If I hadn't been forced to do those things, I'm not sure that I ever would have."[20] Furthermore, rotating leadership among team members can lead to more participation and cooperation in team decision making and improved team performance.[21]

Finally, teams share many of the advantages of group decision making discussed in Chapter 5. For instance, because team members possess different knowledge, skills, abilities, and experiences, a team is able to view problems from multiple perspectives. This diversity of viewpoints increases the odds that team decisions will solve the underlying causes of problems and not just address the symptoms. The increased knowledge and information available to teams also make it easier for them to generate more alternative solutions, a critical part of improving the quality of decisions. Because team

members are involved in decision-making processes, they are also likely to be more committed to making those decisions work. In short, teams can do a much better job than individuals in two important steps of the decision-making process: defining the problem and generating alternative solutions. Exhibit 10.1 summarizes the advantages and disadvantages of teams. (The disadvantages are discussed in the next section.)

1.2 The Disadvantages of Teams

Although teams can significantly improve customer satisfaction, product and service quality, speed and efficiency in product development, employee job satisfaction, and decision making, using teams does not guarantee these positive outcomes. In fact, if you've ever participated in team projects in your classes, you're probably already aware of some of the problems inherent in work teams. Despite all of their promise, teams and teamwork are also prone to these significant disadvantages: initially high turnover, social loafing, and the problems associated with group decision making.

doing the right thing

Don't be a team slacker—Do your share

Given the amount of teamwork required in business classes, most of you have encountered slackers in student groups. Perhaps you've even "slacked" yourself from time to time. From an ethical perspective, though, slacking is clearly wrong. In reality, it's no different from cheating on an exam. When you slack, you're relying on others to do your work. You benefit without putting forth effort. And "your" team's project, paper, or presentation hasn't benefited from your contributions. In fact, it's very likely that your slacking may have significantly hurt "your" team's performance. Furthermore, in the real world, the consequences of team slacking, such as lost sales, poorer decisions, lower-quality service or products, or lower productivity, are much larger. So, do the right thing. Whether it's in class or in business, don't be a slacker. Don't cheat your teammates. Pull your share of the "rope."

The first disadvantage of work teams is *initially high turnover*. Teams aren't for everyone, and some workers balk at the responsibility, effort, and learning required in team settings. When General Electric's Salisbury plant switched to teams, the turnover rate jumped from near zero to 14 percent. Plant manager Roger Gasaway says of teams and teamwork, "It's not all wonderful stuff."[22] Other people may quit because they object to the way team members closely scrutinize each other's job performance, particularly when teams are small. Randy Savage, who works for Eaton Corporation, a manufacturer of car and truck parts, said, "They say there are no bosses here, but if you screw up, you find one pretty fast." Beverly Reynolds, who quit Eaton's team-based system after nine months, says her coworkers "weren't standing watching me, but from afar, they were watching me." And even though her teammates were willing to help her improve her job performance, she concludes, "As it turns out, it just wasn't for me at all."[23]

Social loafing is another disadvantage of work teams. **Social loafing** occurs when workers withhold their efforts and fail to perform their share of the work.[24] A 19th-century French engineer named Maximilian Ringlemann first documented social loafing when he found that one person pulling on a rope alone exerted an average of 139 pounds of force on the rope. In groups of three, the average force dropped to 117 pounds per person. In groups of eight, the average dropped to just 68 pounds per person. Ringlemann concluded that the larger the team, the smaller the individual effort. In fact, social loafing is more likely to occur in larger groups where identifying and monitoring the efforts of individual team members can be difficult.[25] In other words, social loafers count on being able to blend into the background where their lack of effort isn't easily spotted. From team-based class projects, most students already know about social loafers or "slackers," who contribute poor, little, or no work whatsoever. Not surprisingly, a study of 250 student teams found that the most talented students are typically the least satisfied with teamwork because of having to carry slackers and do a disproportionate share of their team's work.[26] Perceptions of fairness are negatively related to the extent of social loafing within teams.[27]

How prevalent is social loafing on teams? One study found that when team activities were not mandatory, only 25 percent of manufacturing workers volunteered to join problem-solving teams; 70 percent were quiet, passive supporters (that is, they didn't put forth effort); and 5 percent were actively opposed to these activities.[28] Another study found that on management teams, 56 percent of the managers, or more than half, withheld their effort in one way or another. Exhibit 10.2 lists the factors that encourage people to withhold effort in teams.

[Social loafing] behavior in which team members withhold their efforts and fail to perform their share of the work

EXHIBIT 10.2 Factors That Encourage People to Withhold Effort in Teams

1. **The presence of someone with expertise.** Team members will withhold effort when another team member is highly qualified to make a decision or comment on an issue.
2. **The presentation of a compelling argument.** Team members will withhold effort if the arguments for a course of action are very persuasive or similar to their own thinking.
3. **The lack of confidence in one's ability to contribute.** Team members will withhold effort if they are unsure about their ability to contribute to discussions, activities, or decisions. This is especially so for high-profile decisions.
4. **An unimportant or meaningless decision.** Team members will withhold effort by mentally withdrawing or adopting a "who cares" attitude if decisions don't affect them or their units, or if they don't see a connection between their efforts and their team's successes or failures.
5. **A dysfunctional decision-making climate.** Team members will withhold effort if other team members are frustrated or indifferent or if a team is floundering or disorganized.

Finally, teams share many of the *disadvantages of group decision making* discussed in Chapter 5, such as groupthink. In *groupthink*, members of highly cohesive groups feel intense pressure not to disagree with each other so that the group can approve a proposed solution. Because groupthink restricts discussion and leads to consideration of a limited number of alternative solutions, it usually results in poor decisions. Also, team decision making takes considerable time, and team meetings can often be unproductive and inefficient. Another possible pitfall is *minority domination*, where just one or two people dominate team discussions, restricting consideration of different problem definitions and alternative solutions. Finally, team members may not feel accountable for the decisions and actions taken by the team.

1.3 When to Use Teams

As the two previous subsections made clear, teams have significant advantages *and* disadvantages. Therefore, the question is not whether to use teams, but *when* and *where* to use teams for maximum benefit and minimum cost. As Doug Johnson, associate director at the Center for Collaborative Organizations at the University of North Texas, puts it, "Teams are a means to an end, not an end in themselves. You have to ask yourself questions first. Does the work require interdependence? Will the team philosophy fit company strategy? Will management make a long-term commitment to this process?"[29] Exhibit 10.3 provides some additional guidelines on when to use or not use teams.[30]

First, teams should be used when there is a clear, engaging reason or purpose for using them. Too many companies use teams because they're popular or because the companies assume that teams can fix all problems. Teams are much more likely to succeed if they know why they exist and what they are supposed to accomplish, and more likely to fail if they don't. Johan Bruyneel has won the **Tour de France** nine times, not as a rider, but as a team director. Bruyneel guided Lance Armstrong and his teams to seven straight Tour wins. After Armstrong retired (but later returned), Bruyneel coached rider Alberto Contador to two wins. While Bruyneel has clearly worked with talented riders, no other team director has even come close. What accounts for his teams' successes? Clear purposes and goals. Bruyneel understands that it takes a year to win the 3-week Tour de France. So he plans out the entire year before the race, mixing in the right combination of training, racing, and rest. Then, for each of the nine members of his riding teams, he develops daily, week, monthly, and annual goals to prepare them to fulfill their team roles.[31] Jon Katzenbach, coauthor of

The Wisdom of Teams, supports Bruyneel's approach, saying, "If groups want to achieve team performance, the most important factor is not the leader of the team; it is the clarity around the performance purpose for that group. The more clear and compelling that is, the more naturally those people will function as a team."[32]

Second, teams should be used when the job can't be done unless people work together. This typically means that teams are needed when tasks are complex, require multiple perspectives, or require repeated interaction with others to complete. For example, contrary to stories of legendary programmers who write software programs by themselves, **Microsoft** uses teams to write computer code because of the enormous complexity of today's software. Most software simply has too many options and features for one person (or even one team) to complete it all. Likewise, Microsoft uses teams because writing good software requires repeated interaction with others. Microsoft ensures this interaction by having its teams "check in" their computer code every few days. The different pieces of code written by the different teams are then compiled to create an updated working build or prototype of the software. The next day, all the teams and team members begin testing and debugging the new build. Over and over again, the computer code is compiled, sent back to the teams to be tested and improved, and then compiled and tested again.[33] The mistake that Microsoft made when developing Vista, its widely criticized operating system, was that the different development teams didn't share their plans with each other, that is, Microsoft didn't have enough repeated interaction between teams. So while each team's code might test cleanly on its own, conflicts and failure would occur when the different team codes were combined. Microsoft's Julie Larson-Green said, "That's where the conflicts started."[34] So when developing and testing Windows 7, Vista's replacement, Microsoft development teams shared their plans with each other, and spent time listening and collaborating with engineers at computer manufacturers like H-P and Dell. John Cook, H-P's vice president of desktop marketing, said that Microsoft, "had some brutally honest discussions with what our engineers and customers thought of Vista. . . . They listened and were much more humble."[35] In the end, the collaboration among teams and with computer manufacturers paid off in Windows 7 being faster, more reliable, and flexible. Ian LeGrow, a Microsoft group program manager, said, "Instead of it being a plan owned by one team, our plan was a part of all the teams."[36]

If tasks are simple and don't require multiple perspectives or repeated interaction with others, however, teams should not be used.[37] For instance, production levels dropped by 23 percent when Levi Strauss introduced teams in its factories. Levi Strauss' mistake was assuming that teams were appropriate for garment work, where workers perform single, specialized tasks, like sewing zippers or belt loops. Because this kind of work does not require interaction with others, Levi Strauss unwittingly pitted the faster workers against the slower workers on each team. Arguments, infighting, insults, and threats were common between faster workers and the slower workers who held back team performance. One seamstress even had to physi cally restrain an angry coworker who was about to throw a chair at a faster worker who constantly nagged her about her slow pace.[38]

Third, teams should be used when rewards can be provided for teamwork and team performance. Rewards that depend on team performance rather than individual performance are the key to rewarding team behaviors and efforts. You'll read more about team rewards later in the chapter, but for now it's enough to know that if the type of reward (individual versus team) is not matched to the type of performance (individual versus team), teams won't work. This was the case with Levi Strauss, where a team structure was superimposed on individual jobs that didn't require interaction between workers. After the switch to teams, faster workers placed tremendous pressure on slower workers to increase their production speed. And since pay was determined by team performance, top individual performers saw their pay drop by several dollars an hour, while slower workers saw their pay increase by several dollars an hour—all while overall productivity dropped in the plant.[39] Systems that reward individual performance but hope for high team-level performance are sure to fail.[40]

The Good and Bad of Using Teams In many industries, teams are growing in importance because they help organizations respond to specific problems and challenges. Teams have been shown to increase customer satisfaction (specific customer teams), product and service quality (direct responsibility), speed and efficiency in product development (overlapping development phases), and employee job satisfaction (cross-training, unique opportunities, and leadership responsibilities). Although teams can produce significant improvements in these areas, using teams does not guarantee these positive outcomes. Teams and teamwork have the disadvantages of initially high turnover and social loafing (especially in large groups). Teams also share many of the advantages (multiple perspectives, generation of more alternatives, and more commitment) and disadvantages (groupthink, time-consuming, poorly run meetings, domination by a few team members, and weak accountability) of group decision making. Finally, teams should be used for a clear purpose, when the work requires that people work together, when rewards can be provided for both teamwork and team performance, when ample resources can be provided, and when teams can be given clear authority over their work.

REVIEW 1

2 KINDS OF TEAMS

Companies use different kinds of teams for different purposes. Google uses teams to innovate and develop new products as well as tweak and improve its search algorithms and functions.[41] At Children's Hospital Boston, the use of teams and team-based rewards helped shorten the billing cycle by reducing the average number of days a bill spent in the accounts receivable department from 100 to just 65 days.[42] At Federal Express, teams were able to cut service errors by 13 percent.[43]

Let's continue our discussion of teams by learning about the different kinds of teams that companies like Google and Maytag use to make themselves more competitive. We look first at **2.1 how teams differ in terms of autonomy, which is the key dimension that makes one team different from another**, and then at **2.2 some special kinds of teams**.

2.1 Autonomy, the Key Dimension

Teams can be classified in a number of ways, such as permanent or temporary, or functional or cross-functional. However, studies indicate that the amount of autonomy possessed by a team is the key difference among teams.[44] *Autonomy* is the degree to which workers have the discretion, freedom, and independence to decide how and when to accomplish their jobs. Exhibit 10.4 shows how five kinds of teams differ in terms of autonomy. Moving left to right across the autonomy continuum

Perlof (Washington, DC: American Psychological Association), 85–136.

at the top of the exhibit, traditional work groups and employee involvement groups have the least autonomy, semi-autonomous work groups have more autonomy, and, finally, self-managing teams and self-designing teams have the most autonomy. Moving from bottom to top along the left side of the exhibit, note that the number of responsibilities given to each kind of team increases directly with its autonomy. Let's review each of these kinds of teams and their autonomy and responsibilities in more detail.

The smallest amount of autonomy is found in **traditional work groups**, where two or more people work together to achieve a shared goal. In these groups, workers are responsible for doing the work or "executing the task," but they do not have direct responsibility or control over their work. Workers report to managers, who are responsible for their performance and have the authority to hire and fire them, make job assignments, and control resources. For instance, suppose that an experienced worker blatantly refuses to do his share of the work, saying, "I've done my time. Let the younger employees do the work." In a team with high autonomy, the responsibility of getting this employee to put forth his fair share of effort would belong to his teammates. But, in a traditional work group, that responsibility belongs to the boss or supervisor. The supervisor in this situation calmly confronted the employee and told him, "We need your talent, [and] your knowledge of these machines. But if you won't work, you'll have to go elsewhere." Within days, the employee's behavior improved.[45]

Employee involvement teams, which have somewhat more autonomy, meet on company time on a weekly or monthly basis to provide advice or make suggestions to management concerning specific issues such as plant safety, customer relations, or product quality.[46] Though they offer advice and suggestions, they do not have the authority to make decisions. Membership on these teams is often voluntary, but members may be selected because of their expertise. The idea behind employee involvement teams is that the people closest to the problem or situation are best able to recommend solutions. When a large hospital found that it could no longer afford its expensive employee retirement plan, it turned to six employee involvement groups representing 3,000 workers for a solution. The groups analyzed the problem and then worked with retirement consultants (chosen by the groups) to generate new retirement options that were affordable, protected the retirement benefits that employees had already earned and, in the end, were even better for employees.[47]

Semi-autonomous work groups not only provide advice and suggestions to management but also have the authority to make decisions and solve problems related to the major tasks required to produce a product or service. Semi-autonomous groups regularly receive information about budgets, work quality and performance, and competitors' products. Furthermore, members of semi-autonomous work groups are typically cross-trained in a number of different skills and tasks. In short, semi-autonomous work groups give employees the authority to make decisions that are typically made by supervisors and managers.

That authority is not complete, however. Managers still play a role, though much reduced compared with traditional work groups, in supporting the work of semi-autonomous work groups. The role a manager plays on a team usually evolves over time. "It may start with helping to transition problem-solving responsibilities to the team, filling miscellaneous requests for the team, and doing ad hoc tasks," says Steven Hitchcock, president of Axis Performance Advisors in Portland, Oregon. Later, the team may develop into a mini-enterprise and the former manager becomes externally focused—sort of an account manager for the customer. Managers have to adjust

what they do based on the sophistication of the team.[48] A lot of what managers of semi-autonomous work groups do is ask good questions, provide resources, and facilitate performance of group goals.

Self-managing teams differ from semi-autonomous work groups in that team members manage and control *all* of the major tasks *directly related* to production of a product or service without first getting approval from management. This includes managing and controlling the acquisition of materials, making a product or providing a service, and ensuring timely delivery. At a Crown Cork aluminum can factory in Texas, "The teams make and implement decisions regarding production, product quality, training, attendance, safety, maintenance, and certain types of discipline. The teams can stop production lines without management approval, stop delivery of cans that do not meet quality standards, decide which workers should receive training, decide whether to grant leave requests, and investigate and correct safety problems."[49] The use of self-directed teams significantly increased productivity at a number of companies, increasing quality 12 percent at AT&T, reducing errors 13 percent at FedEx, and helping 3M increase production by 300 percent at one of its manufacturing plants.[50] Seventy-two percent of *Fortune* 1,000 companies have at least one self-managing team, up from 28 percent in 1987.[51] **Self-designing teams** have all the characteristics of self-managing teams, but they can also control and change the design of the teams themselves, the tasks they do and how and when they do them, and the membership of the teams. **ICU Medical** in San Clemente, California, makes devices such as the Click Lock, which prevents medical workers from getting stuck with needles and IV systems from accidentally becoming disconnected. At the company, which is organized around self-designing teams, any worker can—on his or her own—form any team to address any problem. The teams set meetings, assign tasks, and determine deadlines. For example, Dom Romstead, who planned production schedules in manufacturing facilities, watched a forklift slowly move parts back and forth between a warehouse and a molding machine. Frustrated with the inefficiency of the process, he talked with coworkers and started a team to examine the entire manufacturing process related to the company's best-selling product. After six months of study, the team, which included two of his superiors, the director of manufacturing and the head of logistics, reduced the number of manufacturing steps from 36 to 27, saving the company $500,000 a year. Ben Rosen, a management professor at the University of North Carolina, said of ICU Medical, "It's rare that a company says, 'Go form your own team and go address this issue."[52]

2.2 Special Kinds of Teams

Companies are also increasingly using several other kinds of teams that can't easily be categorized in terms of autonomy: cross-functional teams, virtual teams, and project teams. Depending on how these teams are designed, they can be either low- or high-autonomy teams.

Cross-functional teams are intentionally composed of employees from different functional areas of the organization.[53] Because their members have different functional backgrounds, education, and experience, cross-functional teams usually attack problems from multiple perspectives and generate more ideas and alternative solutions, all of which are especially important when trying to innovate or do creative problem solving.[54] Cross-functional teams can be used almost anywhere in an organization and are often used in conjunction with matrix and product organizational

structures (see Chapter 9). They can also be used either with part-time or temporary team assignments or with full-time, long-term teams. General Electric used a cross-functional team to design a set of stainless steel, high-end kitchen appliances, called the Café Series, which look like they belong in a restaurant kitchen but are for serious cooks who love entertaining at home. Marketing staffers came up with the concept. Industrial and technical designers made the refrigerators, stoves, dishwashers, and ovens resemble restaurant kitchen appliances. And, together, the designers and marketing staff studied consumers who tried the prototype appliances in GE's test kitchens.[55]

Virtual teams are groups of geographically and/or organizationally dispersed coworkers who use a combination of telecommunications and information technologies to accomplish an organizational task.[56] Christopher Rice, CEO of BlessingWhite, a global consulting firm indicates that virtual teams are common. Said Rice, "In three-quarters of large organizations, team members are dispersed across different locations and time zones . . . but relatively few organizations address the frustrations and difficulties that arise with managing such teams."[57]

Members of virtual teams rarely meet face-to-face; instead, they use e-mail, videoconferencing, and group communication software. For example, MySQL, an open source database software developer, has 320 workers in 25 countries, located from Tennessee to the Ukraine. They communicate with each other using a company chat room (or Skype when live voice conversations are necessary) and are accountable for completing tasks using a program called Worklog.[58] Virtual teams can be employee involvement teams, self-managing teams, or nearly any kind of team discussed in this chapter.

[Virtual team] a team composed of geographically and/or organizationally dispersed coworkers who use telecommunication and information technologies to accomplish an organizational task

The principal advantage of virtual teams is their flexibility. Employees can work with each other, regardless of physical location, time zone, or organizational affiliation.[59] Because the team members don't meet in a physical location, virtual teams

also find it much easier to include other key stakeholders such as suppliers and customers. Plus, virtual teams have certain efficiency advantages over traditional team structures. Because the teammates do not meet face-to-face, a virtual team typically requires a smaller time commitment than a traditional team does. Moreover, employees can fulfill the responsibilities of their virtual team membership from the comfort of their own offices without the travel time or downtime typically required for face-to-face meetings.[60]

A drawback of virtual teams is that the team members must learn to express themselves in new contexts.[61] The give-and-take that naturally occurs in face-to-face meetings is more difficult to achieve through video conferencing or other methods of virtual teaming. Billie Williamson, a partner at **Ernst & Young**, one of the "big 4" accounting firms that has been managing virtual teams for a decade, says, "Listen carefully to every team member on phone calls. You don't have the benefit of face-to-face interactions (although videoconferencing can help). I focus on how the person is speaking. Is the person excited? Bored? Is the choice of words overly careful? Is there a quality in the speaker's voice that would make a private conversation advisable? It's important to listen to everything, particularly any silences. Silence can mean consent, or it can mean the person you're not hearing from disagrees with the team's strategy or is disengaged. You need to hear from everyone to make sure the team is moving forward together. If I sense that a team member is lacking engagement—not responding, not participating, or missing deadlines—I call as soon as possible after the meeting to find out what's going on. And I always send an e-mail after each meeting to document and confirm discussions, conclusions, and next steps."[62]Consistent with this example, several studies have shown that physical proximity enhances information processing.[63] Therefore, some companies bring virtual team members together on a regular basis to try to minimize these problems. Again, Ernst & Young's Billie Williamson says, "'Virtual' should not mean you never meet. With international teams, I visit each country's team once a year. With Ernst & Young's Americas Inclusiveness team (which she manages), . . . we all get together annually. In the current economy, it might not be possible to meet as often as you would like. But you need to step up the frequency of communication. Check in more often, and make sure people understand what's going on."[64] Exhibit 10.5 provides a number of tips for successfully managing virtual teams.

Project teams are created to complete specific, one-time projects or tasks within a limited time.[65] Project teams are often used to develop new products, significantly improve existing products, roll out new information systems, or build new factories or offices. The project team is typically led by a project manager who has the overall responsibility for planning, staffing, and managing the team, which usually includes employees from different functional areas. Effective project teams demand both individual and collective responsibility.[66] One advantage of project teams is that drawing employees from different functional areas can reduce or eliminate communication barriers. In turn, as long as team members feel free to express their ideas, thoughts, and concerns, free-flowing communication encourages cooperation among separate departments and typically speeds up the design process.[67] **GE Healthcare** engineer Davy Hwang was given an incredibly challenging project: "Take a 15-lb. electrocardiograph machine that cost $5.4 million and took three and a half years to develop. Squeeze the same technology into a portable device that weighs less than three pounds and can be held with one hand. Oh, and develop it in 18 months for just 60 percent of its wholesale cost." When I told him, said Hwang's boss, Omar Ishrak, "He thought I was crazy."[68] To save money and time, Hwang's quickly assembled project team simply modified parts from other products, for example, a printer

EXHIBIT 10.5 Tips for Managing Successful Virtual Teams

- Select people who are self-starters and strong communicators.
- Keep the team focused by establishing clear, specific goals and by explaining the consequences and importance of meeting these goals.
- Provide frequent feedback so that team members can measure their progress.
- Keep team interactions upbeat and action-oriented by expressing appreciation for good work and completed tasks.
- "Personalize" the virtual team by periodically bringing team members together and by encouraging team members to share information with each other about their personal lives. This is especially important when the virtual team first forms.
- Improve communication through increased telephone calls, e-mails, and Internet messaging and videoconference sessions.
- Periodically ask team members how well the team is working and what can be done to improve performance.
- Empower virtual teams so they have the discretion, freedom, and independence to decide how and when to accomplish their jobs.

designed for heavy-duty usage in bus terminals. After 22 months of development, just a few past the deadline, Hwang's project team completed the new MAC 400, GE's first portable ECG machine which cost just $1,500 compared to its $10,000 predecessor. "When you stretch a team like that, it forces them to be far more creative," says Omar Ishrak.[69] Another advantage of project teams is their flexibility. When projects are finished, project team members either move on to the next project or return to their functional units. For example, publication of this book required designers, editors, page compositors, and Web designers, among others. When the task was finished, these people applied their skills to other textbook projects. Because of this flexibility, project teams are often used with the matrix organizational designs discussed in Chapter 9.

Kinds of Teams Companies use different kinds of teams to make themselves more competitive. Autonomy is the key dimension that makes teams different. Traditional work groups (which execute tasks) and employee involvement groups (which make suggestions) have the lowest levels of autonomy. Semi-autonomous work groups (which control major direct tasks) have more autonomy, while self-managing teams (which control all direct tasks) and self-designing teams (which control membership and how tasks are done) have the highest levels of autonomy. Cross-functional, virtual, and project teams are common but are not easily categorized in terms of autonomy. Cross-functional teams combine employees from different functional areas to help teams attack problems from multiple perspectives and generate more ideas and solutions. Virtual teams use telecommunications and information technologies to bring coworkers together, regardless of physical location or time zone. Virtual teams reduce travel and work time, but communication may suffer since team members don't work face-to-face. Finally, project teams are used for specific, one-time projects or tasks that must be completed within a limited time. Project teams reduce communication barriers and promote flexibility; teams and team members are reassigned to their department or new projects as old projects are completed.

MANAGING WORK TEAMS

"Why did I ever let you talk me into teams? They're nothing but trouble."[70] Lots of managers have this reaction after making the move to teams. Many don't realize that this reaction is normal, both for them and for workers. In fact, such a reaction is characteristic of the *storming* stage of team development (discussed in Section 3.5). Managers who are familiar with these stages and with the other important characteristics of teams will be better prepared to manage the predictable changes that occur when companies make the switch to team-based structures.

After reading the next two sections, you should be able to

3. understand the general characteristics of work teams.
4. explain how to enhance work team effectiveness.

3 WORK TEAM CHARACTERISTICS

Understanding the characteristics of work teams is essential for making teams an effective part of an organization. Therefore, in this section you'll learn about **3.1 team norms, 3.2 team cohesiveness, 3.3 team size, 3.4 team conflict,** and **3.5 the stages of team development**.

3.1 Team Norms

Over time, teams develop **norms**, which are informally agreed-on standards that regulate team behavior.[71] Norms are valuable because they let team members know what is expected of them. At Nucor Steel, work groups expect their members to get to work on time. To reinforce this norm, anyone who is late to work will not receive the team bonus for that day (assuming the team is productive). A worker who is more than 30 minutes late will not receive the team bonus for the entire week. Losing a bonus matters at Nucor because work group bonuses can easily double the size of a worker's take-home pay.[72]

Studies indicate that norms are one of the most powerful influences on work behavior because they regulate the everyday actions that allow teams to function effectively. Team norms are often associated with positive outcomes such as stronger organizational commitment, more trust in management, and stronger job and organizational satisfaction.[73] Effective work teams develop norms about the quality and timeliness of job performance, absenteeism, safety, and honest expression of ideas and opinions. To encourage the development of team norms, trainer Tom Ruddy created a deck of 35 playing cards describing problems that Xerox's customer service teams usually encounter. Ruddy has teams discuss each card/problem. When they agree

[Norms] informally agreed-on standards that regulate team behavior

what to do, they write their solution on the card along with the word *norm*. Everyone then gets a copy of the deck with the team's norms on them. When a team norm is broken, such as one teammate cutting off another's point, the card with the violated norm is played—in this case "everyone's opinion will be heard." It's a little corny at first, but, says Ruddy, "After a while, team members internalize the proper behavior. That's when the team really starts to click."[74]

Norms can also influence team behavior in negative ways. For example, most people would agree that damaging organizational property; saying or doing something to hurt someone at work; intentionally doing one's work badly, incorrectly, or slowly; griping about coworkers; deliberately bending or breaking rules; or doing something to harm the company or boss are negative behaviors. A study of workers from 34 teams in 20 different organizations found that teams with negative norms strongly influenced their team members to engage in these negative behaviors. In fact, the longer individuals were members of a team with negative norms and the more frequently they interacted with their teammates, the more likely they were to perform negative behaviors. Since team norms typically develop early in the life of a team, these results indicate how important it is for teams to establish positive norms from the outset.[75]

3.2 Team Cohesiveness

Cohesiveness is another important characteristic of work teams. **Cohesiveness** is the extent to which team members are attracted to a team and motivated to remain in it.[76] Burlington Northern Santa Fe Railway's intermodal team, which was charged with finding efficient ways to combine transportation through trucks and trains, was a particularly cohesive team. Dave Burns, a member of that team, says, "In my mind, the key word to this team was 'shared.' We shared everything. There was a complete openness among us. And the biggest thing that we shared was an objective and a strategy that we had put together jointly. That was our benchmark every day. Were we doing things in support of *our* plan?"[77] The same was true of the team that came up with MasterCard's endearing "Priceless" ad campaigns. Each ad in the series features a list of ordinary transactions and the dollar amounts associated with those purchases. The final item in the series, however, is always pitched as "priceless." Joyce Thomas, one of the three-member team that conceived of and created those ads, says, "We were very comfortable working together, so we debated everything freely."[78]

The level of cohesiveness in a group is important for several reasons. To start, cohesive groups have a better chance of retaining their members. As a result, cohesive groups typically experience lower turnover.[80] In addition, team cohesiveness promotes cooperative behavior, generosity, and a willingness on the part of team members to assist each other.[81] When team cohesiveness is high, team members are more motivated to contribute to the team because they want to gain the approval of other team members. For these reasons and others, studies have clearly established that cohesive teams consistently perform better.[82] Furthermore, cohesive teams quickly achieve high levels of performance. By contrast, teams low in cohesion take much longer to reach the same levels of performance.[83]

What can be done to promote team cohesiveness? First, make sure that all team members are present at team meetings and activities. Team cohesiveness suffers when members are allowed to withdraw from the team and miss team meetings and events.[84] Second, create additional opportunities for teammates to work together by rearranging

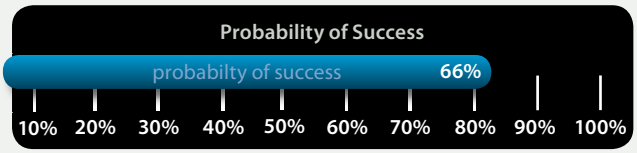
[Cohesiveness] the extent to which team members are attracted to a team and motivated to remain in it

Cohesion and Team Performance

Have you ever worked in a really cohesive group where everyone liked and enjoyed each other and was glad to be part of the group? It's great. By contrast, have you ever worked in a group where everyone really disliked each other and was unhappy to be part of the group? It's terrible. Anyone who has had either of these experiences can appreciate how important group cohesion is and the effect it can have on team performance. Indeed, 46 studies based on 1,279 groups confirm that cohesion does matter.

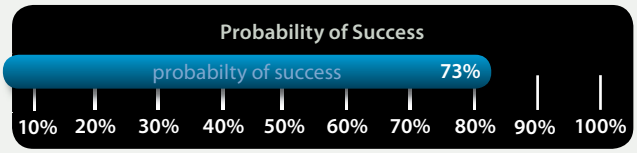
Team Performance

On average, there is a 66 percent chance that cohesive teams will outperform less cohesive teams.



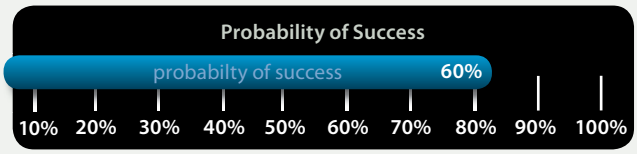
Team Performance with Interdependent Tasks

Teams work best for interdependent tasks that require people to work together to get the job done. When teams perform interdependent tasks, there is a 73 percent chance that cohesive teams will outperform less cohesive teams.



Team Performance with Independent Tasks

Teams generally are not suited for independent tasks that people can accomplish by themselves. When teams perform independent tasks, there is only a 60 percent chance that cohesive teams will outperform less cohesive teams.



Some caution is warranted in interpreting these results. For example, there is always the possibility that a team could become so cohesive that its team goals become more important than organizational goals. Also, teams sometimes unite around negative goals and norms that are harmful rather than helpful to organizations. Nonetheless, there is also room for even more optimism about cohesive teams. Teams that are cohesive *and* committed to the goals they are asked to achieve should have an even higher probability of success than the numbers shown here.[79]

work schedules and creating common workspaces. When task interdependence is high and team members have lots of chances to work together, team cohesiveness tends to increase.[85] Third, engaging in nonwork activities as a team can help build cohesion. At a company where teams put in extraordinarily long hours coding computer software, the software teams maintained cohesion by doing "fun stuff" together. Team leader Tammy Urban says, "We went on team outings at least once a week. We'd play darts, shoot pool. Teams work best when you get to know each other outside of work—what people's interests are, who they are. Personal connections go a long way when you're developing complex applications in our kind of time frames."[86] Finally, companies build team cohesiveness by making employees feel that they are part of a organization.

3.3 Team Size

The relationship between team size and performance appears to be curvilinear. Very small or very large teams may not perform as well as moderately sized teams. For most teams, the right size is somewhere between six and nine members.[87] This size is conducive to high team cohesion, which has a positive effect on team performance, as discussed above. A team of this size is small enough for the team members to get to know each other and for each member to have an opportunity to contribute in a meaningful way to the success of the team. At the same time, the team is also large enough to take advantage of team members' diverse skills, knowledge, and perspectives. It is also easier to instill a sense of responsibility and mutual accountability in teams of this size.[88]

By contrast, when teams get too large, team members find it difficult to get to know one another, and the team may splinter into smaller subgroups. When this occurs, subgroups sometimes argue and disagree, weakening overall team cohesion. As teams grow, there is also a greater chance of *minority domination*, where just a few team members dominate team discussions. Even if minority domination doesn't occur, larger groups may not have time for all team members to share their input. And when team members feel that their contributions are unimportant or not needed, the result is less involvement, effort, and accountability to the team.[89] Large teams also face logistical problems such as finding an appropriate time or place to meet. Finally, the incidence of social loafing, discussed earlier in the chapter, is much higher in large teams.

Just as team performance can suffer when a team is too large, it can also be negatively affected when a team is too small. Teams with just a few people may lack the diversity of skills and knowledge found in larger teams. Also, teams that are too small are unlikely to gain the advantages of team decision making (multiple perspectives, generating more ideas and alternative solutions, and stronger commitment) found in larger teams.

What signs indicate that a team's size needs to be changed? If decisions are taking too long, if the team has difficulty making decisions or taking action, if a few members dominate the team, or if the commitment or efforts of team members are weak, chances are the team is too big. In contrast, if a team is having difficulty coming up with ideas or generating solutions, or if the team does not have the expertise to address a specific problem, chances are the team is too small.

3.4 Team Conflict

Conflict and disagreement are inevitable in most teams. But this shouldn't surprise anyone. From time to time, people who work together are going to disagree about what and how things get done. What causes conflict in teams? Although almost anything can lead to conflict—casual remarks that unintentionally offend a team member or fighting over scarce resources—the primary cause of team conflict is disagreement over team goals and priorities.[90] Other common causes of team conflict include disagreements over task-related issues, interpersonal incompatibilities, and simple fatigue.

Though most people view conflict negatively, the key to dealing with team conflict is not avoiding it, but rather making sure that the team experiences the right kind of conflict. In Chapter 5, you learned about *c-type conflict*, or *cognitive conflict*, which focuses on problem-related differences of opinion, and *a-type conflict*, or *affective conflict*, which refers to the emotional reactions that can occur when disagreements become personal rather than professional.[91] Cognitive conflict is strongly associated

with improvements in team performance, whereas affective conflict is strongly associated with decreases in team performance.[92] Why does this happen? With cognitive conflict, team members disagree because their different experiences and expertise lead them to different views of the problem and solutions. Indeed, managers who participated on teams that emphasized cognitive conflict described their teammates as "smart," "team players," and "best in the business." They described their teams as "open," "fun," and "productive." One manager summed up the positive attitude that team members had about cognitive conflict by saying, "We scream a lot, then laugh, and then resolve the issue."[93] Thus, cognitive conflict is also characterized by a willingness to examine, compare, and reconcile differences to produce the best possible solution.

By contrast, affective conflict often results in hostility, anger, resentment, distrust, cynicism, and apathy. Managers who participated on teams that emphasized affective conflict described their teammates as "manipulative," "secretive," "burned out," and "political."[94] Not surprisingly, affective conflict can make people uncomfortable and cause them to withdraw and decrease their commitment to a team.[95] Affective conflict also lowers the satisfaction of team members, may lead to personal hostility between coworkers, and can decrease team cohesiveness.[96] So, unlike cognitive conflict, affective conflict undermines team performance by preventing teams from engaging in the kinds of activities that are critical to team effectiveness.

So, what can managers do to manage team conflict? First, they need to realize that emphasizing cognitive conflict alone won't be enough. Studies show that cognitive and affective conflicts often occur together in a given team activity! Sincere attempts to reach agreement on a difficult issue can quickly deteriorate from cognitive to affective conflict if the discussion turns personal and tempers and emotions flare. While cognitive conflict is clearly the better approach to take, efforts to engage in cognitive conflict should be managed well and checked before they deteriorate and the team becomes unproductive.

Can teams disagree and still get along? Fortunately, they can. In an attempt to study this issue, researchers examined team conflict in twelve high-tech companies. In four of the companies, work teams used cognitive conflict to address work problems but did so in a way that minimized the occurrence of affective conflict.

There are several ways teams can have a good fight; the steps are shown in Exhibit 10.6 shows the steps.[97] First, work with more, rather than less, information. If data are plentiful, objective, and up-to-date, teams will focus on issues, not personalities. Second, develop multiple alternatives to enrich debate. Focusing on multiple solutions diffuses conflict by getting the team to keep searching for a better solution. Positions and opinions are naturally more flexible with five alternatives than with just two. Third, establish common goals. Remember, most team conflict arises from disagreements over team goals and priorities. Therefore, common goals encourage collaboration and minimize conflict over a team's purpose. Steve Jobs, CEO of Apple, explains it this way: "It's okay to spend a lot of time arguing about which route to take to San Francisco when everyone wants to end up there, but a lot of time gets wasted in such arguments if one person wants to go to San Francisco and another secretly wants to go to San Diego."[98] Fourth, inject humor into the workplace. Humor relieves tension, builds cohesion, and just makes being in teams fun. Fifth, maintain a balance of power by involving as many people as possible in the decision process. And, sixth, resolve issues without forcing a consensus. Consensus means that everyone must agree before decisions are finalized. Effectively, requiring consensus gives everyone on the team veto power. Nothing gets done until everyone agrees, which, of course, is nearly impossible. As a result, insisting on consensus usually promotes affective rather than cognitive conflict. If team members can't agree after constructively discussing their options, it's better to have the team leader make

the final choice. Most team members can accept the team leader's choice if they've been thoroughly involved in the decision process.

3.5 Stages of Team Development

As teams develop and grow, they pass through four stages of development. As shown in Exhibit 10.7, those stages are forming, storming, norming, and performing.[99] Although not every team passes through each of these stages, teams that do tend to be better performers.[100] This holds true even for teams composed of seasoned executives. After a period of time, however, if a team is not managed well, its performance may start to deteriorate as the team begins a process of decline and progresses through the stages of de-norming, de-storming, and de-forming.[101]

Forming is the initial stage of team development. This is the getting-acquainted stage in which team members first meet each other, form initial impressions, and try to get a sense of what it will be like to be part of the team. Some of the first team norms will be established during this stage as team members begin to find out what behaviors will and won't be accepted by the team. During this stage, team leaders should allow time for team members to get to know each other, set early ground rules, and begin to set up a preliminary team structure.

Conflicts and disagreements often characterize the second stage of team development, **storming**. As team members begin working together, different personalities and work styles may clash. Team members become more assertive at this stage and more willing to state opinions. This is also the stage when team members jockey for position and try to establish a favorable role for themselves on the team. In addition, team members are likely to disagree about what the group should do and how it should do it. Team performance is still relatively low, given that team cohesion is weak and team members are still reluctant to support each other. Since teams that get stuck in the storming stage are almost always ineffective, it is important for team leaders to focus the team on team goals and on improving team performance. Team members need to be particularly patient and tolerant with each other in this stage.

During **norming**, the third stage of team development, team members begin to settle into their roles as team members. Positive team norms will have developed by this stage, and teammates should know what to expect from each other. Petty differences should have been resolved, friendships will have developed, and group cohesion will be relatively strong. At this point, team members will have accepted team goals, be operating as a unit, and, as indicated by the increase in performance, be working together effectively. This stage can be very short and is often characterized by someone on the team saying, "I think things are finally coming together." Note, however, that teams may also cycle back and forth between storming and norming several times before finally settling into norming.

© ISTOCKPHOTO.COM/STUDIOVISION

In the last stage of team development, **performing**, performance improves because the team has finally matured into an effective, fully functioning team. At this point, members should be fully committed to the team and think of themselves as members of a team and not just employees. Team members often become intensely loyal to

one another at this stage and feel mutual accountability for team successes and failures. Trivial disagreements, which can take time and energy away from the work of the team, should be rare. At this stage, teams get a lot of work done, and it is fun to be a team member.

The team should not become complacent, however. Without effective management, its performance may begin to decline as the team passes through the stages of de-norming, de-storming, and de-forming.[102] Indeed, John Puckett, manufacturing vice president for circuit-board manufacturer XEL Communications, says, "The books all say you start in this state of chaos and march through these various stages, and you end up in this state of ultimate self-direction, where everything is going just great. They never tell you it can go back in the other direction, sometimes just as quickly."[103]

In **de-norming**, which is a reversal of the norming stage, team performance begins to decline as the size, scope, goal, or members of the team change. With new members joining the group, older members may become defensive as established ways of doing things are questioned and challenged. Expression of ideas and opinions becomes less open. New members change team norms by actively rejecting or passively neglecting previously established team roles and behaviors.

In **de-storming**, which is a reversal of the storming phase, the team's comfort level decreases. Team cohesion weakens as more group members resist conforming to team norms and quit participating in team activities. Angry emotions flare as the group explodes in conflict and moves into the final stage of de-forming.

In **de-forming**, which is a reversal of the forming stage, team members position themselves to gain control of pieces of the team. Team members begin to avoid each other and isolate themselves from team leaders. Team performance rapidly declines as the members quit caring about even minimal requirements of team performance.

If teams are actively managed, decline is not inevitable. However, managers need to recognize that the forces at work in the de-norming, de-storming, and de-forming stages represent a powerful, disruptive, and real threat to teams that have finally made it to the performing stage. Getting to the performing stage is half the battle. Staying there is the second half.

[Norming] the third stage of team development, in which team members begin to settle into their roles, group cohesion grows, and positive team norms develop

[Performing] the fourth and final stage of team development, in which performance improves because the team has matured into an effective, fully functioning team

[De-norming] a reversal of the norming stage, in which team performance begins to decline as the size, scope, goal, or members of the team change

[De-storming] a reversal of the storming phase, in which the team's comfort level decreases, team cohesion weakens, and angry emotions and conflict may flare

[De-forming] a reversal of the forming stage, in which team members position themselves to control pieces of the team, avoid each other, and isolate themselves from team leaders

Work Team Characteristics The most important characteristics of work teams are team norms, cohesiveness, size, conflict, and development. Norms let team members know what is expected of them and can influence team behavior in positive and negative ways. Positive team norms are associated with organizational commitment, trust, and job satisfaction. Team cohesiveness helps teams retain members, promotes cooperative behavior, increases motivation, and facilitates team performance. Attending team meetings and activities, creating opportunities to work together, and engaging in nonwork activities can increase cohesiveness. Team size has a curvilinear relationship with team performance: Teams that are very small or very large do not perform as well as moderate-sized teams of six to nine members. Teams of this size are cohesive and small enough for team members to get to know each other and contribute in a meaningful way but are large enough to take advantage of team members' diverse skills, knowledge, and perspectives. Conflict and disagreement are inevitable in most teams. The key to dealing with team conflict is to maximize cognitive conflict, which focuses on issue-related differences, and minimize affective conflict, the emotional reactions that occur when disagreements become personal rather than professional. As teams develop and grow, they pass through four stages of development: forming, storming, norming, and performing. After a period of time, however, if a team is not managed well, its performance may decline as the team regresses through the stages of de-norming, de-storming, and de-forming.

4 ENHANCING WORK TEAM EFFECTIVENESS

Making teams work is a challenging and difficult process. Nonetheless, companies can increase the likelihood that teams will succeed by carefully managing **4.1 the setting of team goals and priorities** and **4.2 how work team members are selected, 4.3 trained,** and **4.4 compensated.**[104]

4.1 Setting Team Goals and Priorities

In Chapter 5, you learned that having specific, measurable, attainable, realistic, and timely (S.M.A.R.T.) goals is one of the most effective means for improving individual job performance. Fortunately, team goals also improve team performance. In fact, team goals lead to much higher team performance 93 percent of the time.[105] For example, Nucor Corporation sets specific, challenging *hourly* goals for each of its production teams, which consist of first-line supervisors and production and maintenance workers. The average in the steel industry is 10 tons of steel per hour. Nucor production teams have an hourly goal of 8 tons per hour, but get a 5 percent bonus for every ton over 8 tons that they produce. With no limit on the bonuses they can receive, Nucor's production teams produce an average of 35 to 40 tons of steel per hour![106]

Why is setting *specific* team goals so critical to team success? One reason is that increasing a team's performance is inherently more complex than just increasing one individual's job performance. For instance, consider that any team is likely to involve at least four different kinds of goals: each member's goal for the team, each

Two Sheets and a Blanket

Arguably, the organization with some of the highest performing teams in the United States (maybe the world) is the U.S. Marine Corps. One of the many exercises the Marines use to get new arrivals at its Parris Island boot camp to perform as a team is called "two sheets and a blanket." An entire platoon (about 50 recruits) gets three minutes to make all the beds in the barracks—with hospital corners tight enough to bounce a quarter. If the entire platoon doesn't finish, the drill instructor orders the platoon to strip the beds and start over. So it goes—all day if necessary—until the recruits realize that they can finish in time and to specification only if they work together with the faster guys helping the slower guys.

member's goal for himself or herself on the team, the team's goal for each member, and the team's goal for itself.[107] In other words, without a specific goal for the team itself (the last of the four goals listed), team members may head off in all directions at once pursuing these other goals. Consequently, setting a specific goal *for the team* clarifies team priorities by providing a clear focus and purpose.

Challenging team goals affect how hard team members work. In particular, they greatly reduce the incidence of social loafing. When faced with difficult goals, team members necessarily expect everyone to contribute. Consequently, they are much more likely to notice and complain if a teammate isn't doing his or her share. In fact, when teammates know each other well, when team goals are specific, when team communication is good, and when teams are rewarded for team performance (discussed below), there is only a 1 in 16 chance that teammates will be social loafers.[108]

What can companies and teams do to ensure that team goals lead to superior team performance? One increasingly popular approach is to give teams stretch goals. *Stretch goals* are extremely ambitious goals that workers don't know how to reach.[109] For example, **Subaru's** manufacturing plant in Lafayette, Indiana has the stretch goal of producing zero landfill waste. That's right—an automobile assembly plant with the goal of producing no waste—zero, zip, nada. Denise Coogan, the plant's environmental compliance manager, said, "We didn't redefine 'zero.' Zero means zero. Nothing from our manufacturing process goes to the landfill."[110] The purpose of stretch goals is to achieve extraordinary improvements in performance by forcing managers and workers to throw away old, comfortable solutions and adopt radical, never-used-before solutions.[111] For example, the stretch goal of zero landfill waste encouraged employees in the steel stamping section of the plant to, ironically, ask for larger rolls of steel. Subaru's Denise Coogan said, "Our stamping associates were looking to meet their targets, and discovered that every roll of steel that we blanked out had 3 feet 9 inches left, when we needed 4 feet to stamp out a hood. So our associates worked with our supplier and specified a more exact amount, and we found that by changing this little thing, we saved 102 pounds of steel for every car that we build."[112] "It saves raw materials that we haven't had to buy, and that we don't have to ship those extra few feet of scrap, and have to recycle it—it's not much on the face of it, but it adds up," she says.[113]

Four things must occur for stretch goals to effectively motivate teams.[114] First, teams must have a high degree of autonomy or control over how they achieve their goals. At CSX's railroad division, top management challenged the new management team at its Cumberland, Maryland, office to increase productivity by 16 percent. The goal was specific and challenging: Ship the same amount of coal each month, but do it with 4,200 railcars instead of 5,000 railcars. The local team, consisting of five new managers, quickly figured out that the trains were spending too much time sitting idly in the rail yards. Finance director Peter Mills says, "We'd look out our office windows at the tracks and wonder, 'Why aren't the cars moving?'" The problem? Headquarters wouldn't let the trains run until they had 160 full railcars to pull, but amassing that many cars could take nearly a week. Since the local management team had the autonomy to pay for the extra crews to run the trains more frequently, it started running trains with as few as 78 cars. Now, coal cars never wait more than a day to be transported to customers, and rail productivity has skyrocketed.[115]

Second, teams must be empowered with control resources, such as budgets, workspaces, computers, or whatever else they need to do their jobs. Steve Kerr, Goldman Sachs' chief learning officer, says, "We have a moral obligation to try to give people the tools to meet tough goals. I think it's totally wrong if you don't give employees the tools to succeed, then punish them when they fail."[116]

Third, teams need structural accommodation. **Structural accommodation** means giving teams the ability to change organizational structures, policies, and practices if doing so helps them meet their stretch goals. Pfizer CEO Jeffrey Kindler has established five stretch goals for his top management team, one of which is to reduce costs by $2 billion while—and here's where the goal really stretches—maintaining rich funding for research and development, business development, and cultivating emerging markets. Structural accommodation is one of the key mechanisms the team will use to facilitate the accomplishment of these stretch goals. The team intends to cut down on bureaucracy; reduce management layers; and eliminate unnecessary committees, policies, and procedures. Kindler acknowledges that this change won't happen overnight and notes that it will take time, discipline, and persistence.[117]

Finally, teams need bureaucratic immunity. **Bureaucratic immunity** means that teams no longer have to go through the frustratingly slow process of multilevel reviews and sign-offs to get management approval before making changes. Once granted bureaucratic immunity, teams are immune from the influence of various organizational groups and are accountable only to top management. Therefore, teams can act quickly and even experiment with little fear of failure.

4.2 Selecting People for Teamwork

University of Southern California management professor Edward Lawler says, "People are very naive about how easy it is to create a team. Teams are the Ferraris of work design. They're high performance but high maintenance and expensive."[118] It's almost impossible to have an effective work team without carefully selecting people who are suited for teamwork or for working on a particular team. A focus on teamwork (individualism-collectivism), team level, and team diversity can help companies choose the right team members.[119]

Are you more comfortable working alone or with others? If you strongly prefer to work alone, you may not be well suited for teamwork. Indeed, studies show that job satisfaction is higher in teams when team members prefer working with others.[120] An indirect way to measure someone's *preference for teamwork* is to assess the person's degree of individualism or collectivism. **Individualism-collectivism** is the degree to which a person believes that people should be self-sufficient and that loyalty to one's self is more important than loyalty to one's team or company.[121] *Individualists*, who put their own welfare and interests first, generally prefer independent tasks in which they work alone. In contrast, *collectivists*, who put group or team interests ahead of self-interests, generally prefer interdependent tasks in which they work with others. Collectivists would also rather cooperate than compete and are fearful of disappointing team members or of being ostracized from teams. Given these differences, it makes sense to select team members who are collectivists rather than individualists. Indeed, many companies use individualism-collectivism as an initial screening device for team members. While many people think of golf as the ultimate individual game, team play, where individual players work together, can be found at the highest level of the professional game in the **Ryder Cup**, where, for eight decades, European and American players have squared off every other year in team-based competition. Olin Browne, a professional golfer who served as assistant captain for the American team said, "Working together for the common good is not normally a function for us out on the PGA Tour. We play as individuals."[122] So, instead of selecting players based on their golf records alone (i.e., individualism), Browne and U.S. coach Paul Azinger selected players based on their ability to fit into the overall U.S. team of 12 players and into smaller "pods" of 4 players (i.e., collectivism). The advantage of this collectivist approach to an individual game like golf, said Browne, is that "the

[Bureaucratic immunity] the ability to make changes without first getting approval from managers or other parts of an organization

[Individualism-collectivism] the degree to which a person believes that people should be self-sufficient and that loyalty to one's self is more important than loyalty to team or company

pods [of 4 people each] allowed the players, without any formal training, to feed off each other and help each other and to manage all the different things that come up in a pressure-cooker situation like the Ryder Cup. In the larger 12-man group, some guys with quieter personalities might have [otherwise] been lost in the shuffle. Some of the rookies might have been [otherwise] too intimidated to speak out."[123] If team diversity is desired, however, individualists may also be appropriate, as discussed below. To determine your preference for teamwork, take the Team Player Inventory shown in Exhibit 10.8.

Team level is the average level of ability, experience, personality, or any other factor on a team. For example, a high level of team experience means that a team has particularly experienced team members. This does not mean that every member of the team has considerable experience, but that enough team members do to significantly raise the average level of experience on the team. Team level is used to guide selection of teammates when teams need a particular set of skills or capabilities to do their jobs well. For example, at GE's Aerospace Engines manufacturing plant in Durham, North Carolina, only applicants who have an FAA-certified mechanic's license are considered for hire. Following that, all applicants are tested in 11 different areas, only one of which involved those technical skills. Keith McKee, who works at the plant, says, "You have to be above the bar in all 11 of the areas: helping skills, team skills, communication skills, diversity, flexibility, coaching ability, work ethic, and so forth. Even if just one thing out of the 11 knocks you down, you don't come to work here."[124]

Whereas team level represents the average level or capability on a team, **team diversity** represents the variances or differences in ability, experience, personality, or any other factor on a team.[125] From a practical perspective, why is team diversity important? Professor John Hollenbeck explains, "Imagine if you put all the extroverts together. Everyone is talking, but nobody is listening. [By contrast,] with a team of [nothing but] introverts, you can hear the clock ticking on the wall."[126] Not only do strong teams have talented members (that is, a high team level), but those talented members are also different in terms of ability, experience, or personality. Some interesting research of 700 Nobel Prize winners has implications for team diversity because it indicates that significant, game-changing ideas rarely occur before 30,

because of the amount of time it takes to get educated and master the knowledge in a particular discipline, or after the age of 50 when research productivity traditionally drops sharply. As a result, **Sun Microsystems**, which employs research teams to design high-end servers and software, makes sure that its research teams contain a mix of younger and older researchers in hopes of increasing research productivity. The idea, says Greg Papadopoulus, Sun's chief technology officer, is that the energy and optimism of younger researchers mixes well with the experience and knowledge of more experienced researchers, and vice versa.[127] As in this example, team diversity is often used to guide the selection of team members when teams must complete a wide range of different tasks or when tasks are particularly complex.

Once the right team has been put together in terms of individualism-collectivism, team level, and team diversity, it's important to keep the team together as long as practically possible. Interesting research by the National Transportation Safety Board shows that 73 percent of the serious mistakes made by jet cockpit crews are made the very first day that a crew flies together as a team and that 44 percent of serious mistakes occur on their very first flight together that day (pilot teams fly two to three flights per day). Moreover, research has shown that fatigued pilot crews who have worked together before make significantly fewer errors than rested crews who have never worked together.[128] Their experience working together helps them overcome their fatigue and outperform new teams that have not worked together before. So, once you've created effective teams, keep them together as long as possible.

4.3 Team Training

After selecting the right people for teamwork, you need to train them. To be successful, teams need significant training, particularly in interpersonal skills, decision-making and problem-solving skills, conflict resolution skills, and technical training.

Organizations that create work teams *often underestimate the amount of training* required to make teams effective. This mistake occurs frequently in successful organizations where managers assume that if employees can work effectively on their own, they can work effectively in teams. In reality, companies that successfully use teams provide thousands of hours of training to make sure that teams work. Stacy Myers, a consultant who helps companies implement teams, says, "When we help companies move to teams, we also require that employees take basic quality and business knowledge classes as well. Teams must know how their work affects the company, and how their success will be measured."[129]

Most commonly, members of work teams receive training in interpersonal skills. **Interpersonal skills** such as listening, communicating, questioning, and providing feedback enable people to have effective working relationships with others.

Because of teams' autonomy and responsibility, many companies also give team members training in *decision-making and problem-solving skills* to help them do a better job of cutting costs and improving quality and customer service. Many organizations also teach teams *conflict resolution skills*. "Teams at **Delta Faucet** have specific protocols for addressing conflict. For example, if an employee's behavior is creating a problem within a team, the team is expected to work it out without involving the team leader. Two team members will meet with the problem team member and work toward a resolution. If this is unsuccessful, the whole team meets and confronts the issue. If necessary, the team leader can be brought in to make a decision, but . . . it is a rare occurrence for a team to reach that stage."[130]

Firms must also provide team members with the *technical training* they need to do their jobs, particularly if they are being cross-trained to perform all of the different jobs on the team. Before teams were created at Milwaukee Mutual Insurance, separate employees performed the tasks of rating, underwriting, and processing insurance policies. After extensive cross-training, however, each team member can now do all three jobs.[131] Cross-training is less appropriate for teams of highly skilled workers. For instance, it is unlikely that a group of engineers, computer programmers, and systems analysts would be cross-trained for each other's jobs.

Team leaders need training, too, as they often feel unprepared for their new duties. New team leaders face myriad problems ranging from confusion about their new roles as team leaders (compared with their old jobs as managers or employees) to not knowing where to go for help when their teams have problems. Exhibit 10.9 lists the top ten problems team leaders face. The solution is extensive training. Overall, does team training work? One recent study found that across a wide variety

of setting, tasks, team types, and 2,650 teams in different organizations, team training was positively related to team performance outcomes.[132]

4.4 Team Compensation and Recognition

Compensating teams correctly is very difficult. For instance, one survey found that only 37 percent of companies were satisfied with their team compensation plans and even fewer, just 10 percent, reported being "very positive."[133] One of the problems, according to Susan Mohrman of the Center for Effective Organizations at the University of Southern California, is that "there is a very strong set of beliefs in most organizations that people should be paid for how well they do. So when people first get put into team-based organizations, they really balk at being paid for how well the team does. It sounds illogical to them. It sounds like their individuality and their sense of self-worth are being threatened."[134] Consequently, companies need to carefully choose a team compensation plan and then fully explain how teams will be rewarded. One basic requirement for team compensation to work is that the level of rewards (individual versus team) must match the level of performance (individual versus team).

Employees can be compensated for team participation and accomplishments in three ways: skill-based pay, gainsharing, and nonfinancial rewards. **Skill-based pay** programs pay employees for learning additional skills or knowledge.[135] These programs encourage employees to acquire the additional skills they will need to perform multiple jobs within a team and to share knowledge with others within their work groups.[136] For example, at XEL Communications, the circuit-board manufacturer, the number of skills each employee has mastered determines his or her individual pay. An employee who takes a class and on-the-job training in advanced soldering will earn 30 cents more per hour. Passing a written test or satisfactorily performing a skill or job for a supervisor or trainer certifies mastery of new skills and results in increased pay. Eastman Chemical uses a similar approach with its teams, but team members also have to demonstrate that they use their new skills at least 10 percent of the time. Otherwise, they lose their pay increase.[137]

In **gainsharing** programs, companies share the financial value of performance gains, such as productivity increases, cost savings, or quality improvements, with their workers.[138] Walk into any **Nucor Corporation** plant and nearly every production worker can tell you within a tenth of a percent what his team's weekly bonus will be at that point. Team size ranges from 12 to 20 and each team includes production workers, maintenance workers and supervisors. "People expect a complicated [incentive] plan, but our plan is really simple: quality tons out the door and pay weekly," says Dan Krug, manager of HR and organizational development at Nucor in Charlotte, North Carolina. With bonuses included, the typical Nucor steel mill worker makes $72,000 a year.[139] *Nonfinancial rewards* are another way to reward teams for their performance. These rewards, which can range from vacation trips to T-shirts, plaques, and coffee mugs, are especially effective when coupled with management recognition, such as awards, certificates, and praise.[140] Nonfinancial awards tend to be most effective when teams or team-based interventions, such as total quality management (see Chapter 18), are first introduced.[141]

Which team compensation plan should your company use? In general, skill-based pay is most effective for self-managing and self-directing teams performing complex tasks. In these situations, the more each team member knows and can do, the better the whole team performs. By contrast, gainsharing works best in relatively stable environments where employees can focus on improving the productivity, cost savings, or quality of their current work system.

EXHIBIT 10.10

Managers' Preferences for Team-Based Pay

Finally, given the level of dissatisfaction with most team compensation systems, what compensation plans would today's managers like to use with the teams in their companies? As shown in Exhibit 10.10, 40.5 percent of managers would directly link merit-pay increases to team performance but allow adjustments within teams for differences in individual performance. By contrast, 13.7 percent would also link merit-based increases directly to team performance but give each team member an equal share of the team's merit-based reward. 19.1 percent would use gainsharing plans based on quality, delivery, productivity, or cost reduction and then provide equal payouts to all teams and team members. Another 14.5 percent would also use gainsharing, but they would vary the team gainsharing award depending on how much money the team saved the company. Payouts would still be equally distributed within teams. Finally, 12.2 percent of managers would opt for plant-wide profit-sharing plans tied to overall company or division performance.[142] In this case, there would be no payout distinctions between or within teams.

Enhancing Work Team Effectiveness Companies can make teams more effective by setting team goals and managing how team members are selected, trained, and compensated. Team goals provide a clear focus and purpose, reduce the incidence of social loafing, and lead to higher team performance 93 percent of the time. Extremely difficult stretch goals can be used to motivate teams as long as teams have autonomy, control over resources, structural accommodation, and bureaucratic immunity. Not everyone is suited for teamwork. When selecting team members, companies should select people who have a preference for teamwork (individualism-collectivism) and should consider team level (average ability on a team) and team diversity (different abilities on a team). Organizations that successfully use teams provide thousands of hours of training to make sure that teams work. The most common types of team training are for interpersonal skills, decision-making and problem-solving skills, conflict resolution, technical training to help team members learn multiple jobs (that is, cross-training), and training for team leaders. Employees can be compensated for team participation and accomplishments in three ways: skill-based pay, gainsharing, and nonfinancial rewards.

From sports to school to work to civic involvement, working in teams is increasingly part of our experience. Even though teams are frequently used to get work done, people still have widely varying opinions of their value. Think of your own situation. MANAGEMENT DECISION

Do You Assemble a Team of Stars or Ordinary Players?

What criteria will you use to assemble a work team?[144] Is a team composed of all-stars better than one composed of ordinary players? Recall that the United States baseball team that included Roger Clemens, Derek Jeter, Alex Rodriguez, and Johnny Damon lost to Mexico, South Korea, and Canada and failed to reach the semifinals of the World Baseball Classic. The 2004 U.S. Olympic basketball team consisting of NBA star players finished third and lost to Lithuania. How could a *Fortune* 500 company that was run by a brilliant former McKinsey consultant and that only hired graduates of America's elite business schools dissolve into fraud and bankruptcy? It happened at Enron. "Some of the worst teams I've ever seen have been those where everybody was a potential CEO," says David Nadler, chief of the Mercer Delta consulting firm, who has worked with executive teams for more than 30 years.

The most important lesson about team performance is that the basic theory of the dream team is wrong, says Geoffrey Colvin, senior editor at *Fortune*. Consider the 1980 U.S. hockey team that beat the Soviets at the Lake Placid Olympics; it was built entirely on anti-dream-team principles. Coach Herb Brooks based his picks on personal chemistry: "I'm not looking for the best players, I'm looking for the right players," he said at the time. CEO John McConnell of Worthington Industries, the Ohio-based steel processor, says, "Give us people who are dedicated to making the team work, as opposed to a bunch of talented people with big egos, and we'll win every time." That's the philosophy that powers teams such as the New England Patriots, which is only the second team in NFL history to win three Super Bowls in four years.

Questions

1. Briefly discuss the advantages and disadvantages of assembling a team composed of (a) star players, and (b) ordinary players.
2. If you were to include star players on your team, what should you do to make sure the team is not dysfunctional and is able to perform as well as expected? Explain.

MANAGEMENT TEAM DECISION

Avoiding Groupthink at NASA

Life is never boring at NASA, but you and your team are really in the hot seat today. You're in charge of an exciting project: a mission to deliver some of the last large pieces of the International Space Station to the crew constructing it. You're supposed to launch tomorrow and you're in the middle of countdown, but the engineering team found a potentially dangerous hydrogen gas leak. Although you're not an engineering whiz, you fully recognize that hydrogen gas is very volatile and could cause major damage to the space shuttle, if not an all-out explosion. This discovery comes at a very inconvenient time. There's not much room to delay launch, because NASA has so many other missions planned and you risk backing up the schedule or delaying this mission for a whole month because conditions in space will be problematic for this mission for the next couple of weeks. You've got a big problem, a short window in which to solve it, and a lot at stake if you don't solve it properly.[145]

Speaking of potential explosions, your mind jumps back to 2003 and the tragic explosion of the space shuttle *Columbia*. In that case, the explosion was caused by a piece of foam debris which hit *Columbia's* wing and damaged it during launch, allowing gases into the wing on reentry which caused the entire craft to explode. Not only were seven astronauts and a craft from its fleet lost, the incident was also an organizational disaster for NASA because it probably could have been prevented. The team knew that foam debris was a potential problem because it caused some damage to the space shuttle *Atlantis* in 2000. Moreover, engineers watching the launch of *Columbia* knew it had been struck by foam debris in this case, too. Although they requested photos from satellites and powerful ground telescopes to help assess the damage, these were never acquired.

What happened? The culture at NASA can be challenging to navigate. The goal of these missions is science and exploration, but they are extremely expensive and exist at political whim, so they also have to be sold. Problems and delays do not build confidence in NASA among the public or in Congress, and there is a lot of pressure for success. As a consequence, key people at NASA rationalize problems, shut out information that could raise a problem—like those satellite photographs of *Columbia's* wing that were never taken—especially if they come from independent sources outside of NASA, and are overly confident that shuttle missions are now routine operations and need not be scrutinized to the degree they once were. And, although people know they should speak up when there's a problem—indeed, some do—the system doesn't exactly encourage it. It's intimidating to raise a potential technical problem that you can't yet fully support with data in a team meeting only hours before launch.[146]

In other words, NASA culture easily breeds groupthink on its teams. And, as the *Columbia* explosion showed, the results of groupthink can be catastrophic—more catastrophic for NASA, perhaps, than failing to meet political pressures. Thankfully, the hydrogen leak has been flagged as a problem. But now it falls on your team to combat the tendency toward groupthink and come up with a plan that can ensure a safe mission *and* a timely one—and come up with that plan quickly.

For this Management Team Decision, assemble five to six students to act as the management team at NASA.

Questions

1. What kinds of information do you need to make a good decision? How will you get that information?
2. What resources does your team need in order to achieve your goal of a safe and timely mission and do it quickly? Think about the things a team needs to achieve a stretch goal and how they would apply to this situation.

   How would you apply strategies to manage team conflict?

PRACTICE BEING A MANAGER

Campus Improvement

Teamwork is vital to the success of organizations. And this makes creating high-performance teams an important management challenge. In this exercise, you will work with fellow students to brainstorm the creation of a high-performing team. Pay particular attention to the assumptions that you and your peers bring to this process regarding what works, and what doesn't work, in relation to creating a high-performance team. At the conclusion of the exercise, you will have an opportunity to discuss the theory and common assumptions regarding effective team building.

Step 1: Get into groups. Your professor will organize small groups.

Step 2: Review the situation. Assume that your group has been hand-picked by the president of your college or university to work for one semester as a "campus improvement" team. At the end of the year you will submit your recommendations to the president and the board of your institution. These leaders have assured you that they will make every effort to implement your recommendations.

Step 3: Develop a plan. Brainstorm and develop a plan for working as a team to achieve the objective of delivering a set of quality recommendations to the president and the board. You should consider the following in developing your plan:

- Working well together as a team
- Establishing criteria for "quality recommendations" (such as representing the various important constituencies and interests on campus)
- Outlining steps, areas and types of work, and assignments for each member that are most likely to take full advantage of the capabilities and resources in your team

Step 4: Discuss your plans as a class. Is this the sort of project that is well suited to using a work team? Why or why not? How might work team characteristics such as norms, cohesiveness, and team size play a role in this team effort? What conflicts might be likely down the road, and at what stage of the process are these conflicts most likely to occur?

Failure to Launch

© GREENLIGHT

In the 2006 romantic comedy *Failure to Launch*, Matthew McConaughey plays Tripp, a thirty-five year old confirmed bachelor who lives a great life in a nice house—his parents'. Whenever a woman starts getting too serious about him, Tripp brings them home to see his childhood bedroom. It's his surefire way of getting rid of clingy girlfriends without ever having to break up with them. His mother Sue (Kathy Bates) and father Al (Terry Bradshaw) are desperate to get Tripp out of the house, so they hire Paula (Sarah Jessica Parker), who specializes in detaching grown children from their families. In this scene, Paula's quirky roommate Kit (Zooey Deschanel) enlists Tripp's friend Ace (Justin Bartha) in getting rid of a bird that has been making too much noise outside her window.

What to Watch for and Ask Yourself

1. Do you think Kit and Ace make a good team? How well do they work together to first shoot the bird and then save it?
2. Is there a clear leader? Who is making most of the decisions in this scene?
3. Is there any evidence of team conflict?

MANAGEMENT WORKPLACE

Greensburg, Kansas

© CENGAGE

It's hard to assign credit to only one person for Greensburg's decision to rebuild the small Kansas town as a model green community after a tornado destroyed most of its buildings. Lonnie McCollum, the mayor at the time, expressed interest in exploring the possibilities of running Greensburg's municipal buildings on solar and wind power well before the EF5 tornado hit in May 2004. After the storm, he saw an opportunity to reinvent the dying town and put it back on the map. But McCollum was not the sole decision maker. He had an ally in Steve Hewitt, Greensburg's city administrator, who took McCollum's vision and expanded it. As this video shows, the real work was convincing Greensburg's residents and city council members to implement the proposed plan.

What to Watch for and Ask Yourself

4. What were the criticisms that Greensburg resident Janice Haney had about the community leaders and the decisions they made on the town's behalf?
5. Who was part of the "work team" that made decisions for the town?
6. If you lived in Greensburg, how would you feel about the way decisions were made?

What would You Do?

Burgerville Headquarters, Vancouver, Washington.[1]

"Hey boss, where's the drive-through cook? Customers' cars are backed up to the street and are waiting seven minutes for their orders, way over our goal of 3 minutes!" Well, the drive-through cook never showed up, and with employee turnover running 128 percent per year, a cook isn't coming until you hire a new one.

The problem with that much turnover is you can't consistently produce a quality product. Making hamburgers and fries may seem simple, but a Burgerville customer spends about $2 more on average than a McDonald's customer, which is reflected in the complexity of your menu. For example, because you source all ingredients locally, hamburgers are not frozen, but made fresh from grass-fed beef. That means more steps than just throwing a frozen hamburger patty onto a hot grill. Each summer, fresh Oregon blackberries and raspberries are hand processed by your employees to make smoothies and milk shakes. Your vice president of marketing and menu development explains the extra work involved, "Each year we train our staff to quickly clean, hull, and chop these berries to ensure freshness," and each restaurant goes through an average of eight flats a day of fresh berries! Likewise, each summer, employees hand cut 250,000 pounds of fresh onions from Walla Walla, Washington, to make Burgerville's famous (and huge!) onion rings. Again, your vice president of marketing and menu development explains, "To ensure consistent quality, each year we have a training session at one of our supplier partners to teach trainers the best ways to slice the onions, coat them in batter, [and] season and fry them." Finally, salads are made with wild Coho salmon, hazelnuts, shell-smoked blue cheese, baby brunia arugula, and organic cranberries and apples, and cheeseburgers are made with locally produced Tillamook cheddar cheese.

Burgerville turned to local sourcing and fresh ingredients in the 1990s because it couldn't compete with McDonald's, Burger King, or Wendy's. Guest counts had dropped significantly, so it looked for a way to differentiate itself from the burger giants. Higher costs usually prevent fast-food restaurants from using fresh, locally grown ingredients, but with an aggressive supply chain effort, you found ways to work successfully with local suppliers and keep costs down. But now, your high turnover rates are threatening the company's strategy. Indeed, a quit rate of 128 percent means the company has to recruit, hire, and train 1,920 workers a year just to maintain its workforce of 1,500 employees across 39 restaurants. The restaurant industry estimates that it costs $3,000 to replace each hourly worker, so employee turnover is

costing Burgerville $5.76 million a year in replacement costs alone, not to mention the lost revenue from decreases in quality (which hurt sales and customer retention) and lost productivity (it takes 30-90 days for most of your employees to learn their jobs). The question, of course, is what to do about it.

Most of your jobs pay minimum wage. So, should you increase pay like Starbucks has, or are there other things on which you should focus to recruit more qualified applicants? After all, the company mission is to "Serve with Love." Again, what's the best way to make that happen? One thing you have to quit doing is simply hiring the next warm body that walks through the door. But, how do you select or screen people for preparing food, handling the cash register, and taking orders? Are interviews enough? Finally, what might you do to make working at Burgerville more satisfying? That is, once they've taken the job, how do you get them to stay more than a few months? You're realistic about this, as nobody stays in these jobs forever. But, if you can get people to stay 3 months, they'll often stay a year or two.

If you were in charge at Burgerville, what would you do?

Human resource management (HRM), or the process of finding, developing, and keeping the right people to form a qualified work force, is one of the most difficult and important of all management tasks. This chapter is organized around the four parts of the human resource management process shown in Exhibit 11.1: determining human resource needs and attracting, developing, and keeping a qualified work force.

This chapter will walk you through the steps of the HRM process. The chapter begins by reviewing how human resource planning determines human resource needs, such as the kind and number of employees a company requires to meet its strategic plans and objectives. Next, we explore how companies use recruiting and selection techniques to attract and hire qualified employees to fulfill those needs. The third part of the chapter discusses how training and performance appraisal can develop the knowledge, skills, and abilities of the work force. The chapter concludes with a review of compensation and employee separation; that is, how companies can keep their best workers through effective compensation practices and how they can manage the separation process when employees leave the organization.

DETERMINING HUMAN RESOURCE NEEDS

Should we hire more workers? What should we pay our current employees to slow employee turnover? What kinds of training do our new employees need to be prepared to do a good job, and what's the best way to deliver that training? In other words, what are our human resource needs, and what's the best way to address them? The human resource management process, shown in Exhibit 11.1, can provide answers to these questions.

After reading the next two sections, you should be able to

1. describe the basic steps involved in human resource planning.
2. explain how different employment laws affect human resource practice.

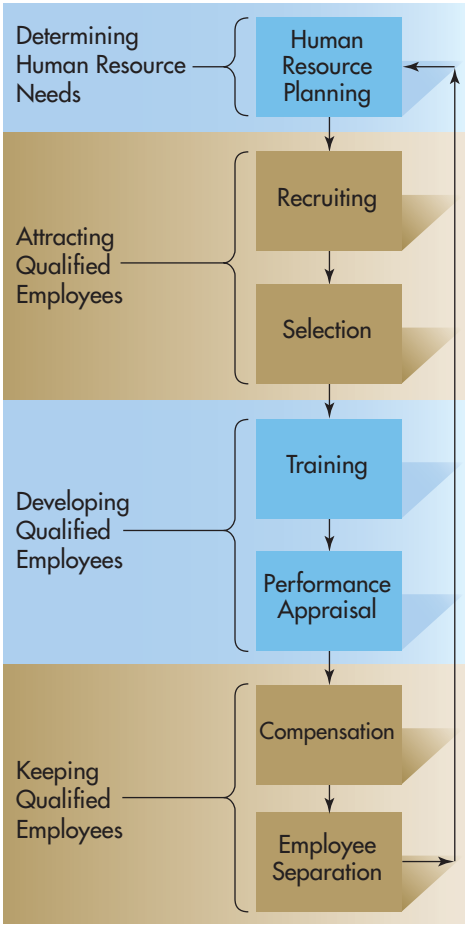
[Human resource management (HRM)] the process of finding, developing, and keeping the right people to form a qualified work force

We can see how the HRM process works by examining what hospitals are doing to address the shortage of qualified nurses around the world. How acute is this shortage? Hospitals in London, England, find it so difficult to attract British nurses that they have sent managers all the way to Jamaica to recruit English-speaking nurses. But Jamaica

© ISTOCKPHOTO.COM/PIXHOOK

has lost so many nurses to English hospitals that it now prevents the British government (which runs the health system in Britain) from hiring its nurses. And why do British hospitals have such a hard time finding nurses? Because Canadian nurses take higher-paying jobs in the United States, which forces Canadian hospitals to hire British nurses and British hospitals to hire nurses from Ghana (since they can no longer hire Jamaican nurses). The nursing shortage is so severe worldwide that even U.S. hospitals now recruit directly in many countries. In South Africa and the Philippines, nurses are encouraged to come to the United States by ads that say, "Nurses! Think of it as your seat in America. Gain invaluable experience, learn the latest medical techniques, and live a fuller life in a relaxed environment."[2] Like all workers, nurses who work in poor conditions for poor pay are willing to move to other countries for better-paying jobs in good companies. For the hospitals around the world that struggle to hire nurses, the HRM process shown in Exhibit 11.1 comes full circle, as attracting, developing, and then keeping qualified nurses affect their human resource needs.

EXHIBIT 11.1 The Human Resource Management Process



1 HUMAN RESOURCE PLANNING

Human resource planning (HRP) is the process of using an organization's goals and strategy to forecast its human resource needs in terms of attracting, developing, and keeping a qualified work force.[3] Why is HRP important? Companies that don't use HRP or that do it poorly may end up with either a surplus of employees that has to be corrected with layoffs or a shortage of employees that leads to increased overtime costs and an inability to meet demand for the company's product or service.

Let's explore human resource planning by examining how to **1.1 forecast the demand and supply of human resources** and **1.2 use human resource information systems to improve those forecasts.**

1.1 Forecasting Demand and Supply

Work force forecasting is the process of predicting the number and kind of workers with specific skills and abilities that an organization will need in the future.[4] There are two kinds of work force forecasts: internal and external forecasts. And there are three kinds of forecasting methods: direct managerial input, best guess, and statistical/historical ratios.

Internal forecasts are projections about factors within the organization that affect the supply and demand for human resources. These factors include the financial performance of the organization; its productivity; its mission; changes in technology or the way the work is performed; and terminations, promotions, transfers, retirements, resignations, and deaths of current employees. For example, according to Mark Young, senior research associate for the Conference Board, Corning Glass focuses on trends over a period of 3 to 4 years, rather than a precise head count and short-term plans. It then segments jobs based on how critical the jobs are to accomplishing its mission and makes different levels of work force investment in

each segment.[5] Exhibit 11.2 provides a more complete list of factors that influence internal forecasts.

External forecasts are projections about factors outside the organization that affect the supply of and demand for human resources. These factors include the labor supply for specific types of workers, the economy (unemployment rate), labor unions, demographics of the labor force (proportion of labor force in, for example, various age groups), geographic movement of the labor force, strength of competitors, and growth in particular businesses and markets. For example, when the economy went into recession, **Dorner Manufacturing Corporation**, which makes conveyor machines, saw its business slow dramatically and asked all its employees, including owners and top executives, to take a 1-week layoff per quarter. Karen Wolf, Dorner's human resource manager said, "because it was an 'equal' hit for all employees, everyone bought into the plan."[6] She explained, "Since we have approximately 170 employees, we will save a significant amount of salary costs."[7] After the short layoffs, the company will catch employees up on their health and life insurance and other benefits. Exhibit 11.2 provides a more complete list of factors that influence external forecasts.

Three kinds of forecasting methods—direct managerial input, best guess, and statistical/historical ratios—are often used to predict the number and kind of workers with specific skills and abilities that an organization will need in the future.[8] The most common forecasting method, *direct managerial input*, is based on straightforward projections of cash flows, expenses, or financial measures such as return on capital. Though financial indicators are relatively quick to calculate and can help managers determine how many workers might be needed, they don't help managers decide which critical skills new employees should possess.

The *best-guess* forecasting method is based on managers' assessment of current head count plus a best guess of how internal factors and external factors will affect that head count. A recent survey reported that managers typically overestimate future staffing levels needed to achieve business goals. The survey also found that organizations are more accurate when it comes to forecasting employment increases than when forecasting employment decreases.[9]

Finally, the *statistical/historical ratios* forecasting method uses statistical methods such as multiple regression in combination with historical data to predict the number and kind of workers a company should hire. For example, a manager might run a regression analysis using data from the last two years. In this analysis, the number of employees that need to be hired is the dependent (predicted) variable, and the number of items manufactured, number of clients, average increase in sales, and similar factors are the independent (predictor) variables. The regression analysis produces a simple equation that indicates how many more employees should be added for each increase in independent variables such as items manufactured or increased sales. This approach takes advantage of existing data and can be much more accurate than best-guess predictions, but only if a company's internal and external environments have not changed significantly.

Corning Glass uses a variety of statistical tools to help predict its work force needs, a process it calls human capital planning. Corning uses human capital planning to improve its ability to identify human resource requirements of corporate strategy and reshape HR services to better support the business. "We've already realized considerable value from the human capital planning process," says Kurt Fischer, vice president of human resources at Corning.[10]

1.2 Human Resource Information Systems

Human resource information systems (HRISs) are computerized systems for gathering, analyzing, storing, and disseminating information related to attracting, developing, and keeping a qualified work force.[11] Exhibit 11.3 shows some of the data that are commonly used in HRISs, data such as personal and educational information, company employment history, performance appraisal information, work history, and promotions.

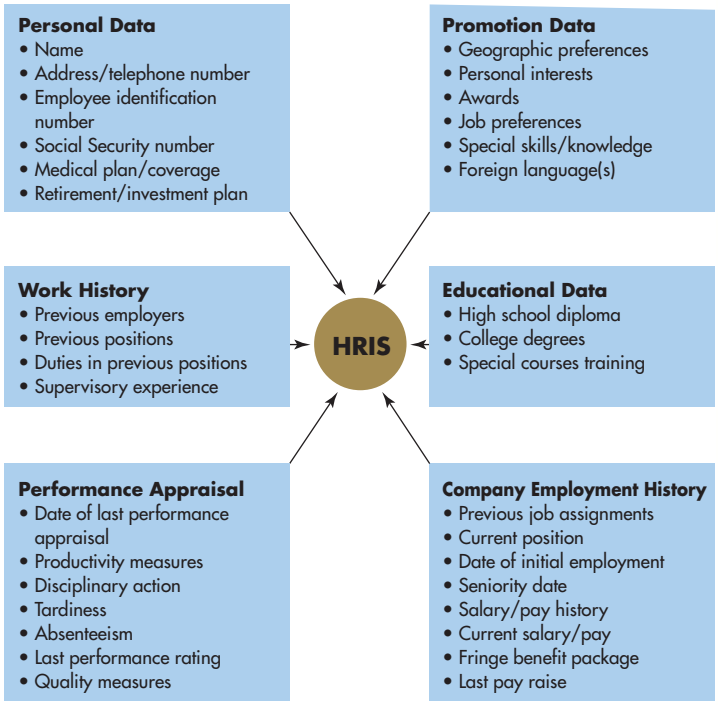
Human resource information systems can be used for transaction processing, employee self-service, and decision support. For HRISs, *transaction processing* usually involves employee payroll checks, taxes, and benefit deductions. For example, when ER One, a Michigan-based company that provides physicians and other clinicians for hospital emergency rooms, was small, it used paper files and different computer spreadsheets and databases to keep track of compensation and benefits for its employees. But now that the company has 180 employees in seven different locations, it uses an HRIS to keep track of its employees. This system quickly provides accurate, up-to-date information about employee compensation and benefits and can be easily accessed from any of the seven locations, says Pat Brainard, the company's director of human resources.[12] HRISs can also reduce administrative costs by preparing certain routine reports, such as the EEOC (Equal Employment Opportunity Commission) or OSHA (Occupational Safety and Health Administration) reports that are required of many companies.

[Human resource information system (HRIS)] a computerized system for gathering, analyzing, storing, and disseminating information related to the HRM process

Though typically used to give managers and HR staffers access to human resource data, today's secure web-based HRISs also give employees immediate, 24-hour *self-service* access to personal data such as benefits and retirement packages. By entering a username and a password, employees can access and change their medical insurance plan, adjust the mix of investments in their 401(k) retirement plan, or check on the status of medical or child-care reimbursements. Hewitt Associates is a global HR consulting and benefits outsourcing firm that provides its customers with secure access to HR data and applications using web-services technology, 24/7. Customers (i.e., employees of client organizations) can access and change their current health-care enrollment, check on their retirement benefits, and reallocate their 401(k) investments.[13]

In addition to gathering and storing information, HRISs also help managers by serving as decision support systems for critical HR decisions.[14] In Chapter 17, you will learn that *decision support systems (DSSs)* help managers understand problems and potential solutions by acquiring and analyzing information with sophisticated models and tools. For

EXHIBIT 11.3 Common Data Categories in Human Resource Information Systems



instance, **Opportunity International**, a nonprofit organization that makes business loans to small companies in 28 countries, uses a decision support system to ask job applicants a series of screening questions, and the results are automatically sent to the hiring manager. Jim Lemke, director of organizational development for Opportunity International, said, "We've been able to hire faster. We have a tool to do the work a human was doing on the front end."[15]

As suggested above, an HRIS can even be used to do preemployment testing or background screening. And while it's common for companies like Opportunity International to use HRISs to do key word résumé screening, companies have just begun to use interactive voice response (IVR) systems, similar to those used by your credit card company's 800 support number when you call to review your bill (i.e., "please state your 16-digit card number followed by the # sign"), to "interview" applicants by phone. Applicants are asked a series of prerecorded questions and the IVR records their verbal responses, which can be played back or searched for specific responses. For example, to reduce employee theft, retail companies will ask applicants about prior incidents of workplace theft, bribery, gambling, or drug or alcohol use. Darrel Knight, whose company, **MTI**, makes IVR systems, says, surprisingly, many people answer "yes" to such questions. Says Knight, "You can also tell a lot about the person by the delay between when the question is asked and when he starts his response, and that's not something you get from a website. You get more human feedback."[16]

An HRIS can also be used effectively to screen *internal applicants* on particular qualifications, to match the qualifications of external applicants against those of internal applicants, to compare salaries within and between departments, and to review and change employees' salaries instantaneously without lengthy paperwork. In short, today's HRISs can help managers make any number of critical human resource decisions.

REVIEW 1

Human Resource Planning Human resource planning (HRP) uses organizational goals and strategies to determine what needs to be done to attract, develop, and keep a qualified work force. Work force forecasts are used to predict the number and kind of workers with specific skills and abilities that an organization needs. Work force forecasts consider both internal and external factors that affect the supply of and demand for workers and can be formulated using three kinds of forecasting methods: direct managerial input, best guess, and statistical/historical ratios. Computerized human resource information systems improve HRP by gathering, analyzing, storing, and disseminating information (personal, educational, work history, performance, and promotions) related to human resource management activities. Human resource information systems can be used for transaction processing (payroll checks and routine reports), employee self-service (24-hour web access allowing instant changes to benefit and retirement packages), and decision support for human resource decisions (analyzing résumés, background screening, and preemployment testing).

2 EMPLOYMENT LEGISLATION

Since their inception, Hooters restaurants have hired only female servers. Moreover, consistent with the company's marketing theme, the servers wear short nylon shorts and cutoff T-shirts that show their midriffs. The Equal Employment Opportunity Commission (EEOC) began an investigation of

Hooters when a Chicago man filed a sex-based discrimination charge. The man alleged that he had applied for a server's job at a Hooters restaurant and was rejected because of his sex. The dispute between Hooters and the EEOC quickly gained national attention. One sarcastic letter to the EEOC printed in *Fortune* magazine read as follows:

> *Dear EEOC:*
>
> *Hi! I just wanted to thank you for investigating those Hooters restaurants, where the waitresses wear those shorty shorts and midriffy T-shirts. I think it's a great idea that you have decided to make Hooters hire men as—how do you say it?—waitpersons. Gee, I never knew so many men wanted to be waitpersons at Hooters. No reason to let them sue on their own either. You're right, the government needs to take the lead on this one.*[17]

This letter characterized public sentiment at the time. Given its backlog of 100,000 job discrimination cases, many wondered if the EEOC didn't have better things to do with its scarce resources.

Three years after the initial complaint, the EEOC ruled that Hooters had violated antidiscrimination laws and offered to settle the case if the company would agree to pay $22 million to the EEOC for distribution to male victims of the "Hooters Girl" hiring policy, establish a scholarship fund to enhance opportunities or education for men, and provide sensitivity training to teach Hooters' employees how to be more sensitive to men's needs. Hooters responded with a $1 million publicity campaign criticizing the EEOC's investigation. Billboards featuring "Vince," a man dressed in a Hooters Girl uniform and blond wig, sprang up all over the country. Hooters customers were given postcards to send complaints to the EEOC. Of course, Hooters paid the postage. As a result of the publicity campaign, restaurant sales increased by 10 percent. Soon thereafter, the EEOC announced that it would not pursue discriminatory hiring charges against Hooters.[18] Nonetheless, the company ended up paying $3.75 million to settle a class-action suit brought by seven men who claimed that their inability to get a job at Hooters violated federal law.[19] Under the settlement, Hooters maintained its women-only policy for server jobs but had to create additional support jobs, such as hosts and bartenders, that would also be open to men. The story doesn't end there, however, as a male applicant who wants to be a Hooters waitperson has sued Hooters, seeking to overturn the prior settlement, which would allow him to be only a host or bartender.[20]

As the Hooters example illustrates, the human resource planning process occurs in a very complicated legal environment. Let's explore employment legislation by reviewing **2.1 the major federal employment laws that affect human resource practice, 2.2 how the concept of adverse impact is related to employment discrimination**, and **2.3 the laws regarding sexual harassment in the workplace**.

2.1 Federal Employment Laws

Exhibit 11.4 lists the major federal employment laws and their websites, where you can find more detailed information. Except for the Family and Medical Leave Act and the Uniformed Services Employment and Reemployment Rights Act, which are administrated by the Department of Labor (**http://www.dol.gov**), all of these laws are administered by the EEOC (**http://www.eeoc.gov**). The general effect of this body of law, which is still evolving through court decisions, is that employers may not discriminate in employment decisions on the basis of sex, age, religion, color, national origin, race, or disability. The intent is to make these factors irrelevant in employment decisions. Stated another way, employment decisions should be based

on factors that are "job related," "reasonably necessary," or a "business necessity" for successful job performance. The only time that sex, age, religion, and the like can be used to make employment decisions is when they are considered a bona fide occupational qualification.[21] Title VII of the 1964 Civil Rights Act says that it is not unlawful to hire and employ someone on the basis of sex, religion, or national origin when there is a **bona fide occupational qualification (BFOQ)** that is "reasonably necessary to the normal operation of that particular business." A Baptist church hiring a new minister can reasonably specify that being a Baptist rather than a Catholic or Presbyterian is a BFOQ for the position. However, it's unlikely that the church could specify race or national origin as a BFOQ. In general, the courts and the EEOC take a hard look when a business claims that sex, age, religion, color, national origin, race, or disability is a BFOQ. For instance, the EEOC disagreed with Hooters' claim that it was "in the business of providing vicarious sexual recreation" and that "female sexuality is a bona fide occupational qualification."[22]

[Bona fide occupational qualification (BFOQ)] an exception in employment law that permits sex, age, religion, and the like to be used when making employment decisions, but only if they are "reasonably necessary to the normal operation of that particular business." BFOQs are strictly monitored by the Equal Employment Opportunity Commission.

It is important to understand, however, that these laws apply to the entire HRM process and not just to selection decisions (e.g., hiring or promotion). These laws also cover all training and development activities, performance appraisals, terminations,

and compensation decisions. Employers who use sex, age, race, or religion to make employment-related decisions when those factors are unrelated to an applicant's or employee's ability to perform a job may face charges of discrimination from employee lawsuits or the EEOC. For example, Morgan Stanley, an investment bank, agreed to pay $54 million in damages after the EEOC filed a sex discrimination suit on behalf of 300 of the firm's female employees. The women were paid less and promoted less often than comparable male employees with whom they worked.[23] Boeing, the jet plane manufacturer, paid $72.5 million to settle a similar lawsuit brought by a group of its female employees.[24]

In addition to the laws presented in Exhibit 11.4, there are two other important sets of federal laws: labor laws and laws and regulations governing safety standards. Labor laws regulate the interaction between management and labor unions that represent groups of employees. These laws guarantee employees the right to form and join unions of their own choosing. For more information about labor laws, see the National Labor Relations Board at **http://www.nlrb.gov**. The Occupational Safety and Health Act (OSHA) requires that employers provide employees with a workplace that is "free from recognized hazards that are causing or are likely to cause death or serious physical harm." This law is administered by the Occupational Safety and Health Administration (which, like the act, is referred to as OSHA). OSHA sets safety and health standards for employers and conducts inspections to determine whether those standards are being met. Employers who do not meet OSHA standards may be fined.[25] For example, OSHA fined British Petroleum $23.8 million after a refinery explosion in Texas City, Texas, killed 15 workers and injured 180 employees.[26] OSHA announced the fine for "egregious, willful violations" of safety standards that led to the fatal explosion.[27] The U.S. Chemical Safety and Hazard Investigation Board, a government agency that investigates major workplace accidents, accused BP of knowing about "widespread safety problems" prior to the accident, which it said was the result of "drastic cost-cutting at the Texas refinery, where maintenance and infrastructure deteriorated over time, setting the stage for the disaster."[28] For more information about OSHA, see **http://www.osha.gov**.

2.2 Adverse Impact and Employment Discrimination

The EEOC has investigatory, enforcement, and informational responsibilities. Therefore, it investigates charges of discrimination, enforces the employment discrimination laws in federal court, and publishes guidelines that organizations can use to ensure they are in compliance with the law. One of the most important guidelines jointly issued by the EEOC, the Department of Labor, the U.S. Justice Department, and the federal Office of Personnel Management is the *Uniform Guidelines on Employee Selection Procedures*, which can be read in their entirety at **http://www.ipacweb.org/files/ug.pdf**. These guidelines define two important criteria, disparate treatment and adverse impact, that are used in determining whether companies have engaged in discriminatory hiring and promotion practices.

Disparate treatment, which is *intentional* discrimination, occurs when people, despite being qualified, are *intentionally* not given the same hiring, promotion, or membership opportunities as other employees because of their race, color, age, sex, ethnic group, national origin, or religious beliefs.[29] For example, in 2007 **FedEx** paid $54.9 million to settle a class action disparate treatment lawsuit in which it was accused of purposefully discriminating against African Americans and Latino employees in its pay and promotion practices.[30] Likewise, **Abercrombie & Fitch** paid $50 million to settle a lawsuit that alleged systematic discrimination against Hispanic, African American, Asian American and female applicants and employees

EEOC commissioner Stuart Ishimaru, left, leaves the podium after addressing reporters at a news conference announcing that Abercrombie & Fitch agreed to pay $40 million to black, Hispanic, and Asian employees and job applicants to settle the class-action federal discrimination lawsuit that accused the clothing retailer of promoting whites at the expense of minorities.

in its employment practices.[31] Legally, a key element of discrimination lawsuits is establishing motive, meaning that the employer intended to discriminate. If no motive can be established, then a claim of disparate treatment may actually be a case of adverse impact. **Adverse impact**, which is *unintentional* discrimination, occurs when members of a particular race, sex, or ethnic group are *unintentionally* harmed or disadvantaged because they are hired, promoted, or trained (or any other employment decision) at substantially lower rates than others. The courts and federal agencies use the **four-fifths (or 80 percent) rule** to determine if adverse impact has occurred. Adverse impact occurs if the decision rate for a protected group of people is less than four-fifths (or 80 percent) of the decision rate for a nonprotected group (usually white males). So, if 100 white applicants and 100 black applicants apply for entry-level jobs, and 60 white applicants are hired (60/100 = 60%), but only 20 black applicants are hired (20/100 = 20%), adverse impact has occurred (0.20/0.60 = 0.33). The criterion for the four-fifths rule in this situation is 0.48 (0.60 × 0.80 = 0.48). Since 0.33 is less than 0.48, the four-fifths rule has been violated.

Violation of the four-fifths rule is not an automatic indication of discrimination, however. If an employer can demonstrate that a selection procedure or test is valid, meaning that the test accurately predicts job performance or that the test is job related because it assesses applicants on specific tasks actually used in the job, then the organization may continue to use the test. If validity cannot be established, however, then a violation of the four-fifths rule may likely result in a lawsuit brought by employees, job applicants, or the EEOC itself.

[Adverse impact] unintentional discrimination that occurs when members of a particular race, sex, or ethnic group are unintentionally harmed or disadvantaged because they are hired, promoted, or trained (or any other employment decision) at substantially lower rates than others

[Four-fifths (or 80 percent) rule] a rule of thumb used by the courts and the EEOC to determine whether there is evidence of adverse impact. A violation of this rule occurs when the selection rate for a protected group is less than 80 percent or four-fifths of the selection rate for a nonprotected group.

[Sexual harassment] a form of discrimination in which unwelcome sexual advances, requests for sexual favors, or other verbal or physical conduct of a sexual nature occurs while performing one's job

[Quid pro quo sexual harassment] a form of sexual harassment in which employment outcomes, such as hiring, promotion, or simply keeping one's job, depend on whether an individual submits to sexual harassment

2.3 Sexual Harassment

According to the EEOC, **sexual harassment** is a form of discrimination in which unwelcome sexual advances, requests for sexual favors, or other verbal or physical conduct of a sexual nature occurs. From a legal perspective, there are two kinds of sexual harassment, quid pro quo and hostile work environment.[32]

Quid pro quo sexual harassment occurs when employment outcomes, such as hiring, promotion, or simply keeping one's job, depend on whether an individual submits to being sexually harassed. For example, in a quid pro quo sexual harassment lawsuit

against Costco, a female employee alleged that her boss groped her and bumped into her from behind to simulate sex. "He would tell her: 'You work with me and I'll work with you,' motioning to his private area."[33] The supervisor also allegedly told her that he would fire her if she reported his activities to upper management. In quid pro quo cases requests for sexual acts are linked to economic outcomes such as keeping a job. A **hostile work environment** occurs when unwelcome and demeaning sexually related behavior creates an intimidating, hostile, and offensive work environment. In contrast to quid pro quo cases, a hostile work environment may not result in economic injury. However, it can lead to psychological injury from a stressful work environment. An Illinois-based trucking company, **Custom Companies**, was fined in excess of $1.1 million by a federal judge for creating a sexually hostile work environment. The EEOC had charged that three female sales representatives were subjected to unwelcome groping, lewd sexual language, sexual propositions, and pornography. The judge overseeing the case concluded, "Defendants' actions were reprehensible," and wrote that "There was evidence of repeated touching . . . sexually explicit comments and jokes, sexual advances, and a sexually charged atmosphere. . . . The harassment came from employees in positions of power."[34]

What common mistakes do managers make when it comes to sexual harassment laws?[35] First, many assume that the victim and harasser must be of opposite sexes. According to the courts, they do not. Sexual harassment can also occur between people of the same sex. Second, managers often assume that sexual harassment can occur only between coworkers or between supervisors and subordinates. Not so. Agents of employers, such as consultants, and even nonemployees can be sexual harassers. The key is not employee status but whether the harassment takes place while company business is being conducted. Third, it is often assumed that only people who have themselves been harassed can file complaints or lawsuits. In fact, especially in hostile work environments, anyone affected by offensive conduct can file a complaint or lawsuit.

Finally, what should companies do to make sure that sexual harassment laws are followed and not violated?[36] First, respond immediately when sexual harassment is reported. A quick response encourages victims of sexual harassment to report problems to management rather than to lawyers or the EEOC. Furthermore, a quick and fair investigation may serve as a deterrent to future harassment. A lawyer for the EEOC says, "Worse than having no sexual harassment policy is a policy that is not followed. It's merely window dressing. You wind up with destroyed morale when people who come forward are ignored, ridiculed, retaliated against, or nothing happens to the harasser."[37] Next, take the time to write a clear, understandable sexual harassment policy that is strongly worded, gives specific examples of what constitutes sexual harassment, spells outs sanctions and punishments, and is widely publicized within the company. This lets potential harassers and victims know what will not be tolerated and how the firm will deal with harassment should it occur.

Next, establish clear reporting procedures that indicate how, where, and to whom incidents of sexual harassment can be reported. The best procedures ensure that a complaint will receive a quick response, that impartial parties will handle the complaint, and that the privacy of the accused and accuser will be protected. At DuPont, Avon, and Texas Industries, employees can call a confidential hotline 24 hours a day, 365 days a year.[38]

Finally, managers should also be aware that most states and many cities or local governments have their own employment-related laws and enforcement agencies. So compliance with federal law is often not enough. In fact, organizations can be in full compliance with federal law and at the same time be in violation of state or local sexual harassment laws.

REVIEW 2

Employment Legislation Human resource management is subject to the following major federal employment laws: Equal Pay Act, Civil Rights Acts of 1964 and 1991, Age Discrimination in Employment Act, Pregnancy Discrimination Act, Americans with Disabilities Act, Family and Medical Leave Act, and Uniformed Services Employment and Reemployment Rights Act. Human resource management is also subject to review by these federal agencies: Equal Employment Opportunity Commission, Department of Labor, Occupational Safety and Health Administration, and National Labor Relations Board. In general, these laws state that sex, age, religion, color, national origin, race, disability, and pregnancy may not be considered in employment decisions unless these factors reasonably qualify as BFOQs. Two important criteria, disparate treatment (intentional discrimination) and adverse impact (unintentional discrimination), are used to decide whether companies have wrongly discriminated against someone. Motive is a key part of determining disparate treatment; the courts and federal enforcement agencies use the four-fifths rule to determine if adverse impact has occurred. The two kinds of sexual harassment are quid pro quo and hostile work environment. Managers often wrongly assume that the victim and harasser must be of the opposite sex, that sexual harassment can occur only between coworkers or between supervisors and their employees, and that only people who have themselves been harassed can file complaints or lawsuits. To ensure compliance with sexual harassment laws, companies should respond immediately when harassment is reported; write a clear, understandable sexual harassment policy; establish clear reporting procedures; and be aware of and follow city and state laws concerning sexual harassment.

FINDING QUALIFIED WORKERS

Despite a worldwide recession, and despite the highest average wages in Australia, Australia's mining companies are finding it nearly impossible to find the workers they need. David Knox, CEO of **Santos, Ltd.**, an oil and gas exploration and production company, said, "One of the real challenges in Australia is continuing to get a really high-quality, high-skilled labor force."[39] With some estimating that the industry needs as many as 70,000 to 100,000 more skilled workers, Australian mining companies have had to go as far as London, Berlin, Amsterdam, and India to find and recruit applicants. Similar shortages occur in dairy farming—Ed Schoen, who runs a 180-cow farm and is on the board of the **Dairy Farmers of America**, said, "We need a stable supply of labor. The dairy industry's survival depends on it . . . worrying about workers is another level of stress we don't need."[40] As these examples illustrate, finding qualified workers can be an increasingly difficult task. But finding qualified applicants is just the first step. Deciding which applicants to hire is the second. Gail Hyland-Savage, CEO of real estate and marketing firm Michaelson, Connor & Boul, says, "Staffing is absolutely critical to the success of every company. To be competitive in today's economy, companies need the best people to create ideas and execute them for the organization. Without a competent and talented workforce, organizations will stagnate and eventually perish. The right employees are the most important resources of companies today."[41]

After reading the next two sections, you should be able to

3. explain how companies use recruiting to find qualified job applicants and
4. describe the selection techniques and procedures that companies use when deciding which applicants should receive job offers.

3 RECRUITING

Recruiting is the process of developing a pool of qualified job applicants. Let's examine **3.1 what job analysis is and how it is used in recruiting, 3.2 how companies use internal recruiting**, and **3.3 external recruiting to find qualified job applicants.**

3.1 Job Analysis and Recruiting

Job analysis is a "purposeful, systematic process for collecting information on the important work-related aspects of a job."[42] A job analysis typically collects four kinds of information:

- Work activities such as what workers do and how, when, and why they do it
- The tools and equipment used to do the job.
- The context in which the job is performed, such as the actual working conditions or schedule.
- The personnel requirements for performing the job, meaning the knowledge, skills, and abilities needed to do a job well.[43]

Job analysis information can be collected by having job incumbents and/or supervisors complete questionnaires about their jobs, by direct observation, by interviews, or by filming employees as they perform their jobs.

Job descriptions and job specifications are two of the most important results of a job analysis. A **job description** is a written description of the basic tasks, duties, and responsibilities required of an employee holding a particular job. **Job specifications**, which are often included as a separate section of a job description, are a summary of the qualifications needed to successfully perform the job. Exhibit 11.5 shows a job description and the job specifications for a helicopter pilot for the city of Little Rock, Arkansas.

Because a job analysis specifies what a job entails as well as the knowledge, skills, and abilities that are needed to do the job well, companies must complete a job analysis *before* beginning to recruit job applicants. Exhibit 11.6 shows that job analysis, job descriptions, and job specifications are the foundation on which all critical human resource activities are built. They are used during recruiting and selection to match applicant qualifications with the requirements of the job. Therefore, it is critically important that job descriptions be accurate. Unfortunately they aren't always so. Denver-based Apartment Investment & Management Co. (**Aimco**) discovered that its high turnover rate was due in part to poorly written job descriptions that focused only on education and experience requirements. When Aimco revised the job descriptions to include what employees actually do, such as collecting rent from delinquent tenants or that working "evenings and weekends [are] par for the course," the 90-day turnover rate dropped from 22 percent to just 3 percent.[44]

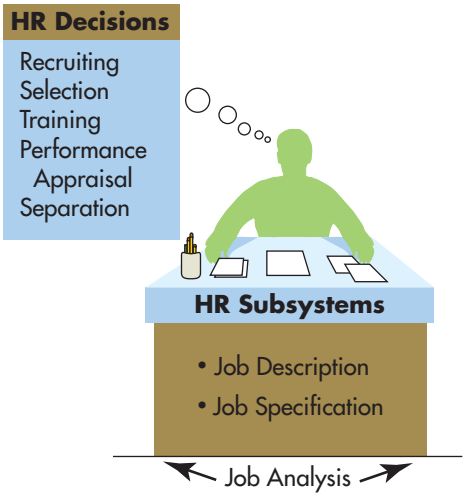
EXHIBIT 11.6

Importance of Job Analysis to Human Resource Management



Job descriptions are also used throughout the staffing process to ensure that selection devices and the decisions based on these devices are job related. For example, the questions asked in an interview should be based on the most important work activities identified by a job analysis. Likewise, during performance appraisals, employees should be evaluated in areas that a job analysis has identified as the most important in a job.

Job analyses, job descriptions, and job specifications also help companies meet the legal requirement that their human resource decisions be job related. To be judged *job related*, recruitment, selection, training, performance appraisals, and employee separations must be valid and be directly related to the important aspects of the job as identified by a careful job analysis. In fact, in *Griggs v. Duke Power Co.* and *Albemarle Paper Co. v. Moody*, the U.S. Supreme Court stated that companies should use job analyses to help establish the job relatedness of their human resource procedures.[45] The EEOC's *Uniform Guidelines on Employee Selection Procedures* also recommend that companies base their human resource procedures on job analysis.

3.2 Internal Recruiting

Internal recruiting is the process of developing a pool of qualified job applicants from people who already work in the company. Internal recruiting, sometimes called "promotion from within," improves employee commitment, morale, and motivation. Recruiting current employees also reduces recruitment startup time and costs, and because employees are already familiar with the company's culture and procedures,

[Internal recruiting] the process of developing a pool of qualified job applicants from people who already work in the company

they are more likely to succeed in new jobs. Internal recruitment "provides a higher level of employee satisfaction, so certainly it can be a retention driver," says Maureen Henson, SPHR, vice president of human resources at Henry Ford Bi-County Hospital in Warren, Michigan. Internal applicants represent a "known commodity," relieving some of the risk of making a bad hiring decision.[46] Job posting and career paths are two methods of internal recruiting.

Job posting is a procedure for advertising job openings within the company to existing employees. A job description and requirements are typically posted on a bulletin board, in a company newsletter, or in an internal computerized job bank that is accessible only to employees. Shawna Swanson, an employment litigation partner with Fenwick & West in San Francisco, recommends making the internal and external processes the same, rather than having two separate paths, such as posting internally first for a period of time and then advertising externally.[47] Job posting helps organizations discover hidden talent, allows employees to take responsibility for career planning, and makes it easier for companies to retain talented workers who are dissatisfied in their current jobs and would otherwise leave the company.[48] Tim Reynolds, corporate director of talent and organization development at **Whirlpool**, the appliance manufacturer, said, "If employees aren't given the opportunity to move within their own company, then they'll get out in the marketplace to get new experiences. As long as they're developing where they are, there's no need to go someplace else."[49] Indeed, a study of 70 large global companies found that organizations which formalize internal recruiting and job posting have a lower average rate of turnover, 11 percent, compared to companies that don't, which average 15 percent turnover.[50] A *career path* is a planned sequence of jobs through which employees may advance within an organization. For example, a person who starts as a sales representative may move up to sales manager and then to district or regional sales manager. Career paths help employees focus on long-term goals and development while also helping companies increase employee retention. Echostar Communications developed a "career path" program designed to persuade call-center workers to stick around longer and cut the costs of hiring and training new workers. Employees who participate in training and meet required skill levels are eligible for rapid promotions and pay increases. EchoStar executives say the program is working—the average call-center agent now stays for 19 months, up from 9 months two years ago. Jessica Nicolo, an early participant in EchoStar's program, was promoted four times in two years and her pay is now 27 percent higher than when she started. Nicolo, a mother of two, says she doesn't expect to leave EchoStar for a long time because now she doesn't feel trapped in another dead-end job.[51]

3.3 External Recruiting

External recruiting is the process of developing a pool of qualified job applicants from outside the company. External recruitment methods include advertising (newspapers, magazines, direct mail, radio, or television), employee referrals (asking current employees to recommend possible job applicants), walk-ins (people who apply on their own), outside organizations (universities, technical/trade schools, professional societies), employment services (state or private employment agencies, temporary help agencies, and professional search firms), special events (career conferences or job fairs), and Internet job sites. Which external recruiting method should you use? Studies show that employee referrals, walk-ins, newspaper advertisements, and state employment agencies tend to be used most frequently for office/clerical and production/service employees. By contrast, newspaper advertisements and college/university recruiting are used most frequently for professional/technical employees. When recruiting managers, organizations tend to rely most heavily on newspaper advertisements, employee referrals, and search firms.[52]

[External recruiting] the process of developing a pool of qualified job applicants from outside the company

In the last decade, the biggest change in external recruiting has been the increased use of the Internet. Some companies now recruit applicants through Internet job sites such as Monster.com, HotJobs.com, Hire.com, and CareerBuilder.com. Companies can post job openings for 30 days on one of these sites for about half the cost of running an advertisement just once in a Sunday newspaper. Plus, Internet job listings generate nine times as many résumés as one ad in the Sunday newspaper.[53] And because these sites attract so many applicants and offer so many services, companies save by finding qualified applicants without having to use more expensive recruitment and search firms, which typically charge one-third or more of a new hire's salary.[54]

Some companies have even begun using search-engine ads, where, for example, a recruiting advertisement will be found on websites next to key words like "accountant" or "nurse." These ads can be restricted by zip codes so that a company looking for an accountant in Indianapolis doesn't have ads shown to potential applicants in Los Angeles. Because they only pay when the recruiting ads are clicked on, search-engine ads can be even cheaper than job websites. And for some companies, they also attract more applicants. Baylor Health Care System, a large medical system in Dallas, found that search-engine ads generated 5,250 applicants at a cost of $4 per applicant. Job websites generated 3,125 applicants at a cost of $30 each. And newspaper and magazine ads generated just 215 applicants at a cost of $750 per applicant. Eileen Bouthillet, Baylor's director of human resources communications, said, "Before we were throwing darts at a dart board trying to see what might stick. Now we have a very targeted strategy and a point of comparison so we can make wise decisions on where we spend our money."[55]

Despite their many benefits, however, job websites have a significant drawback: Companies may receive hundreds, if not thousands, of applications from *unqualified* applicants. The sheer volume increases the importance of proper screening and selection. For example, when IMLogic, which makes instant messaging software, advertised job openings on Monster.com and CareerBuilder.com, the company was flooded with 200 résumés the first hour the jobs were posted and nearly 750 résumés within 2 days. CEO Francis deSouza says, "We weren't ready for that."[56] Many organizations avoid this problem by advertising job openings directly on their websites, assuming that the most qualified applicants will learn something about the company before applying. For example, Subway accepts applications for part-time work at its 27,868 restaurants in 86 countries

© JESSICA RINALDI/REUTERS/LANDOV

Although popular, the Internet is not the only means of external recruiting. Here, a NASCAR fan inquires about a job with the U. S. Border Patrol at a recruiting booth the agency set up outside a NASCAR race at the Texas Motor Speedway in Fort Worth, Texas, in 2009.

at its website (**http://www.subway.com/applications/InStoreJobs/index.aspx**). In fact, 60 percent of the people hired via the Internet have applied at a company website.

Today, between 82 percent and 92 percent of companies use the Internet to fill job openings. In fact, Internet recruiting is now second to newspaper advertising in terms of the number of applicants it generates.[57] And with the addition of the ".jobs" Internet top-level domain (for example, **www.ibm.jobs for jobs at IBM**), more and more companies will use their websites to attract, recruit, and screen job applicants[58] That's because job seekers tend to visit company websites *before* looking for a job through more general sites. In fact, 95 percent of *Fortune* 500 companies have career portals on their corporate websites.[59] A recent survey conducted by SHRM indicates that companies that leverage the .jobs domain have more effective recruiting practices across a range of areas and the .jobs domain provides job seekers with a simple, fast, and consistent destination when job hunting.[60]

Recruiting Recruiting is the process of finding qualified job applicants. The first step in recruiting is to conduct a job analysis to collect information about the important work-related aspects of the job. The job analysis is then used to write a job description of basic tasks, duties, and responsibilities and to write job specifications indicating the knowledge, skills, and abilities needed to perform the job. Job analyses, descriptions, and specifications help companies meet the legal requirement that their human resource decisions be job related. Internal recruiting, or finding qualified job applicants from inside the company, can be done through job posting and career paths. External recruiting, or finding qualified job applicants from outside the company, is done through advertising, employee referrals, walk-ins, outside organizations, employment services, special events, and Internet job sites. The Internet is a particularly promising method of external recruiting because of its low cost, wide reach, and ability to communicate and receive unlimited information.

REVIEW 3

4 SELECTION

Once the recruitment process has produced a pool of qualified applicants, the selection process is used to determine which applicants have the best chance of performing well on the job. When the East Providence, Rhode Island, Police Department has job openings, it follows a "rule of three," meaning that no matter how many candidates it has for an opening, it looks at only the top three applicants as determined by a standardized written test. Those top three applicants for every position must then pass a physical fitness test and a background check. Every applicant who makes it that far is then put on a list of official candidates for police jobs for 2 years. Only the best candidates on that list participate in group interviews with the city manager, police chief, deputy chief, a police captain, and the department's personnel director and affirmative action officer, each of whom privately ranks the candidates after each interview. Applicants with the highest rankings from the group interviews are offered positions in the Police Academy. The remaining applicants from the group interviews may be considered two more times before being rejected.[61]

As this example illustrates, **selection** is the process of gathering information about job applicants to decide who should be offered a job. To make sure that selection decisions are accurate and legally defendable, the EEOC's *Uniform Guidelines on Employee Selection Procedures* recommend that all selection procedures be validated. **Validation** is the process of determining how well a selection test or procedure predicts future job performance. The better or more accurate the prediction of future job performance, the more valid a test is said to be. See the "What Really Works" feature later in this chapter for more on the validity of common selection tests and procedures.

[Selection] the process of gathering information about job applicants to decide who should be offered a job

[Validation] the process of determining how well a selection test or procedure predicts future job performance. The better or more accurate the prediction of future job performance, the more valid a test is said to be.

Let's examine common selection procedures such as **4.1 application forms** and **résumés, 4.2 references and background checks, 4.3 selection tests**, and **4.4 interviews**.

4.1 Application Forms and Résumés

The first selection devices that most job applicants encounter when they seek a job are application forms and résumés. Both contain similar information about an applicant, such as name, address, job and educational history, and so forth. Though an organization's application form often asks for information already provided by the applicant's résumé, most organizations prefer to collect this information in their own format for entry into a human resource information system.

Employment laws apply to application forms just as they do to all selection devices. Application forms may ask applicants for only valid, job-related information. Nonetheless, application forms commonly ask applicants for non-job-related information such as marital status, maiden name, age, or date of high school graduation. Indeed, one study found that 73 percent of organizations had application forms that violated at least one federal or state law.[62] Exhibit 11.7 lists the kinds of information that companies may *not* request in application forms, during job interviews, or in any other part of the selection process. Courts will assume that you consider all of the information you request of applicants even if you don't. Be sure to ask only those questions that directly relate to the candidate's ability and motivation to perform the job.

Companies should also be aware that employment laws in other countries may differ from U.S. laws. For instance, employers in France may ask applicants for non-job-related personal information such as their age or the number of children. And most French employers expect applicants to include a picture with their résumé.[64] Consequently, companies should closely examine their application forms, interview questions, and other selection procedures for compliance with the law wherever they do business.

Résumés also pose problems for companies, but in a different way. Accu-Screen Inc. has kept records for 14 years on résumé falsification data and reports that

Don't Embellish Your Résumé.

Your résumé is supposed to help you get the interview that can get you a job. So where do you draw the line between making yourself look attractive to a potential employer and lying? Despite the strong temptation to improve your odds of getting a job, embellishing your résumé is wrong. Moreover, the information on your résumé is legally binding. If you misrepresent information or lie on your résumé—and many people do—you're breaking the law and can be fired. But where should you draw the line? In general, if what you put on your résumé feels wrong, don't do it. More specifically, don't embellish job titles, responsibilities, employment dates, college degrees, certifications, general qualifications, or previous experience in any way. Do the right thing: Tell the truth on your résumé.[63]

EXHIBIT 11.7 Topics That Employers Should Avoid in Application Forms, Interviews, or Other Parts of the Selection Process

1. *Children.* Don't ask applicants if they have children, plan to have them, or have or need child care. Questions about children can unintentionally single out women.
2. *Age.* Because of the Age Discrimination in Employment Act, employers cannot ask job applicants their age during the hiring process. Since most people graduate high school at the age of 18, even asking for high school graduation dates could violate the law.
3. *Disabilities.* Don't ask if applicants have physical or mental disabilities. According to the Americans with Disabilities Act, disabilities (and reasonable accommodations for them) cannot be discussed until a job offer has been made.
4. *Physical characteristics.* Don't ask for information about height, weight, or other physical characteristics. Questions about weight could be construed as leading to discrimination toward overweight people, who studies show are less likely to be hired in general.
5. *Name.* Yes, you can ask an applicant's name, but you cannot ask a female applicant for her maiden name because it indicates marital status. Asking for a maiden name could also lead to charges that the organization was trying to establish a candidate's ethnic background.
6. *Citizenship.* Asking applicants about citizenship could lead to claims of discrimination on the basis of national origin. However, according to the Immigration Reform and Control Act, companies may ask applicants if they have a legal right to work in the United States.
7. *Lawsuits.* Applicants may not be asked if they have ever filed a lawsuit against an employer. Federal and state laws prevent this to protect whistleblowers from retaliation by future employers.
8. *Arrest records.* Applicants cannot be asked about their arrest records. Arrests don't have legal standing. However, applicants can be asked whether they have been convicted of a crime.
9. *Smoking.* Applicants cannot be asked if they smoke. Smokers might be able to claim that they weren't hired because of fears of higher absenteeism and medical costs. However, they can be asked if they are aware of company policies that restrict smoking at work.
10. *AIDS/HIV.* Applicants can't be asked about AIDS, HIV, or any other medical condition. Questions of this nature would violate the Americans with Disabilities Act, as well as federal and state civil rights laws.

approximately 43 percent of résumés and job applications contain false information. According to a study conducted by J.J. Keller & Associates, Inc., the nation's leading provider of risk and regulatory management solutions, 55 percent of human resource professionals have discovered lies on résumés or applications when conducting pre-employment background or reference checks.[65] Therefore, managers should verify the information collected via résumés and application forms by comparing it with additional information collected during interviews and other stages of the selection process, such as references and background checks, which are discussed next.

4.2 References and Background Checks

Nearly all companies ask an applicant to provide **employment references**, such as previous employers or coworkers, that they can contact to learn more about the candidate. **Background checks** are used to verify the truthfulness and accuracy of information that applicants provide about themselves and to uncover negative,

[Employment references] sources such as previous employers or coworkers who can provide job-related information about job candidates

[Background checks] procedures used to verify the truthfulness and accuracy of information that applicants provide about themselves and to uncover negative, job-related background information not provided by applicants

job-related background information not provided by applicants. Background checks are conducted by contacting "educational institutions, prior employers, court records, police and governmental agencies, and other informational sources, either by telephone, mail, remote computer access, or through in-person investigations."[66]

Unfortunately, previous employers are increasingly reluctant to provide references or background check information for fear of being sued by previous employees for defamation.[67] If former employers provide potential employers with unsubstantiated information that damages applicants' chances of being hired, applicants can (and do) sue for defamation. As a result, 54 percent of employers will not provide information about previous employees.[68] Many provide only dates of employment, positions held, and date of separation.

When previous employers decline to provide meaningful references or background information, they put other employers at risk of *negligent hiring* lawsuits, in which an employer is held liable for the actions of an employee who would not have been hired if the employer had conducted a thorough reference search and background check.[69] In Florida, the Tallahassee Furniture Company hired a worker to make home furniture deliveries but did not conduct a background check or even ask him to complete an application form. After being hired, he attacked a woman in her home with a knife. When she sued the company, it discovered that he had a history of drug use, violent assault, and mental illness. The courts awarded the woman $2.5 million in damages.[70]

With previous employers generally unwilling to give full, candid references and with negligent hiring lawsuits awaiting companies that don't get such references and background information, what can companies do? They can conduct criminal record checks, especially if the job for which the person is applying involves money, drugs, control over valuable goods, or access to the elderly, people with disabilities, or people's homes.[71] According to the Society for Human Resource Management, 96 percent of companies conduct background checks and 80 percent of companies go further and conduct criminal record checks.[72] Another option is to use public networking sites like **www.linkedin.com** to identify and contact the colleagues, customers, and suppliers who are "linked" or connected to job applicants. **LinkedIn's** CEO Dan Nye says that the company called 23 of his LinkedIn connections without his knowledge before offering him a face-to-face interview. With the growing use and popularity of social networking websites, Nye says such practices are "fair game." One downside to this approach is that it could unintentionally alert an applicant's current employer that they're seeking another job. As a result, says Chuck Wardell, managing director at Korn/Ferry International, an executive recruitment firm, "You have to be careful referencing people who have jobs because you might blow them out of their jobs."[73]

Next, dig deeper for more information. Ask references to provide references. Voca Corporation, based in Columbus, Ohio, has 2,500 employees in six states who care for people with mental retardation and developmental disabilities. Hilary Franklin, director of human resources, says she not only checks references but also asks the references to provide references and then asks those references for still others. She says, "As you get two or three times removed, you get more detailed, honest information."[74]

Then ask applicants to sign a waiver that permits you to check references, run a background check, or contact anyone else with knowledge of their work performance or history. Likewise, ask applicants if there is anything they would like the company to know or if they expect you to hear anything unusual when contacting references.[75] This in itself is often enough to get applicants to share information they typically withhold. When you've finished checking, keep the findings confidential to minimize the chances of a defamation charge. Always document all reference and

background checks, noting who was called and what information was obtained. Document everything, not just information you received. To reduce the likelihood that negligent hiring lawsuits will succeed, it's particularly important to document even which companies and people refused to share reference check and background information.

Finally, consider hiring private investigators to conduct background checks, which can often uncover information missed by traditional background checks. For example, while traditional background checks should be able to verify applicants' academic credentials, a private investigator hired by the *Wall Street Journal* found that 7 out of 358 senior executives at publicly traded firms had falsified claims regarding the college degrees they had earned. For example, one executive claimed to hold an electrical engineering degree from the Massachusetts Institute of Technology, but the university said he completed just two semesters.[76] While these numbers are small, remember that traditional background checks didn't uncover the false academic credentials discovered by a private investigator.

4.3 Selection Tests

We're all aware that some people do well in jobs while other people do poorly, but how do you determine into which category an applicant falls? Selection tests give organizational decision makers a chance to know who will likely do well in a job and who won't. The basic idea behind selection testing is to have applicants take a test that measures something directly or indirectly related to doing well on the job. The selection tests discussed here are specific ability tests, cognitive ability tests, biographical data, personality tests, work sample tests, and assessment centers.

Specific ability tests measure the extent to which an applicant possesses the particular kind of ability needed to do a job well. Specific ability tests are also called **aptitude tests** because they measure aptitude for doing a particular task well. For example, if you took the SAT to get into college, then you've taken the aptly named Scholastic Aptitude Test, which is one of the best predictors of how well students will do in college (i.e., scholastic performance). Specific ability tests also exist for mechanical, clerical, sales, and physical work. For example, clerical workers have to be good at accurately reading and scanning numbers as they type or enter data. Exhibit 11.8 shows items similar to the Minnesota Clerical Test, in which applicants have only a short time to determine if the two columns of numbers and letters are identical. Applicants who are good at this are likely to do well as clerical or data entry workers.

Cognitive ability tests measure the extent to which applicants have abilities in perceptual speed, verbal comprehension, numerical aptitude, general reasoning, and spatial aptitude. In other words, these tests indicate how quickly and how well people understand words, numbers, logic, and spatial dimensions. Whereas specific ability tests predict job performance in only particular types of jobs, cognitive ability tests accurately predict job performance in almost all kinds of jobs.[77] Why is this so? The reason is that people with strong cognitive or mental abilities are usually good at learning new things, processing complex information, solving problems, and making decisions, and these abilities are important in almost all jobs.[78] In fact, cognitive ability tests are almost always the best predictors of job performance. Consequently, if you were allowed to use just one selection test, a cognitive ability test would be the one to use.[79] (In practice, though, companies use a battery of different tests because doing so leads to much more accurate selection decisions.)

Biographical data, or **biodata**, are extensive surveys that ask applicants questions about their personal backgrounds and life experiences. The basic idea behind biodata is that past behavior (personal background and life experience) is the best predictor of future behavior. For example, during World War II, the U.S. Air Force had to quickly test tens of thousands of men without flying experience to determine who was likely to be a good pilot. Since flight training took several months and was very expensive, selecting the right people for training was important. After examining extensive biodata, it found that one of the best predictors of success in flight school was whether students had ever built model airplanes that actually flew. This one biodata item was almost as good a predictor as the entire set of selection tests that the Air Force was using at the time.[80]

Most biodata questionnaires have over 100 items that gather information about habits and attitudes, health, interpersonal relations, money, what it was like growing up in your family (parents, siblings, childhood years, teen years), personal habits, current home (spouse, children), hobbies, education and training, values, preferences, and work.[81] In general, biodata are very good predictors of future job performance, especially in entry-level jobs.

You may have noticed that some of the information requested in biodata surveys also appears in Exhibit 11.7 as topics employers should avoid in applications, interviews, or other parts of the selection process. This information can be requested in biodata questionnaires provided the company can demonstrate that the information is job related (i.e., valid) and does not result in adverse impact against protected groups of job applicants. Biodata surveys should be validated and tested for adverse impact before they are used to make selection decisions.[83]

[Biographical data (biodata)] extensive surveys that ask applicants questions about their personal backgrounds and life experiences

[Personality tests] tests that measure the extent to which applicants possess different kinds of job-related personality dimensions

Personality is the relatively stable set of behaviors, attitudes, and emotions displayed over time that makes people different from each other. **Personality tests** measure the extent to which applicants possess different kinds of job-related personality dimensions. In Chapter 12, you will learn that there are five major personality dimensions (the Big Five)—extraversion, emotional stability, agreeableness, conscientiousness,

doing the right thing

Don't Use Psychics, Lie Detectors, or Handwriting Analysis to Make HR Decisions.

The Coronado Bay Resort in San Diego hired a psychic to work with its 18-member management team as a way of "moving the managers to the next step." Seventy-five percent of the organizations in France and Switzerland use handwriting analysis for hiring and promotion decisions. In the past, employers in the United States regularly used polygraphs (lie detectors) for preemployment screening. What do these methods have in common? Companies use them, but they don't work. For example, there is no scientific evidence that handwriting analysis works, yet managers continue to use it. Lie detectors are no more accurate than a coin flip in screening out unethical employees. Fortunately, the Employee Polygraph Protection Act now prevents organizations from using polygraphs for hiring and promotion decisions. As for psychics at work—well, enough said. So, when you're hiring and promoting people, do the right thing. Stay away from fads. Use the reliable, valid, scientifically proven selection and assessment procedures discussed here to hire the right workers and promote the right people into management.[82]

and openness to experience—related to work behavior.[84] Of these, only conscientiousness, the degree to which someone is organized, hardworking, responsible, persevering, thorough, and achievement oriented, predicts job performance across a wide variety of jobs.[85] Conscientiousness works especially well in combination with cognitive ability tests, allowing companies to select applicants who are organized, hardworking, responsible, and smart!

Work sample tests, also called *performance tests*, require applicants to perform tasks that are actually done on the job. So, unlike specific ability, cognitive ability, biographical data, and personality tests, which are indirect predictors of job performance, work sample tests directly measure job applicants' capability to do the job. For example, a computer-based work sample test has applicants assume the role of a real estate agent who must decide how to interact with virtual clients in a game-like scenario. As in real life, the clients can be frustrating, confusing, demanding, or indecisive. In one situation, the wife loves the virtual house but the husband hates it. The applicants, just like actual real estate agents, must demonstrate what they would do in these realistic situations.[86] This work sample simulation gives real estate companies direct evidence of whether applicants can do the job if they are hired. Work sample tests are generally very good at predicting future job performance; however, they can be expensive to administer and can be used for only one kind of job. For example, an auto dealership could not use a work sample test for mechanics as a selection test for sales representatives.

Assessment centers use a series of job-specific simulations that are graded by multiple trained observers to determine applicants' ability to perform managerial work. Unlike the previously described selection tests that are commonly used for specific jobs or entry-level jobs, assessment centers are most often used to select applicants who have high potential to be good managers. Assessment centers often last 2 to 5 days and require participants to complete a number of tests and exercises that simulate managerial work.

Some of the more common assessment center exercises are in-basket exercises, role-plays, small-group presentations, and leaderless group discussions. An *in-basket exercise* is a paper-and-pencil test in which an applicant is given a manager's in-basket containing memos, phone messages, organizational policies, and other communications normally received by and available to managers. Applicants have a limited time to read through the in-basket, prioritize the items, and decide how to deal with each item. Experienced managers then score the applicants' decisions and recommendations. Exhibit 11.9 shows an item that could be used in an assessment center for evaluating applicants for a job as a store manager.

In a *leaderless group discussion*, another common assessment center exercise, a group of six applicants is given approximately 2 hours to solve a problem, but no one is put in charge (hence the name "leaderless" group discussion). Trained observers watch and score each participant on the extent to which he or she facilitates discussion, listens, leads, persuades, and works well with others.

Are tests perfect predictors of job performance? No, they aren't. Some people who do well on selection tests will do poorly in their jobs. Likewise, some people who do poorly on selection tests (and therefore weren't hired) would have been very good performers. Nonetheless, valid tests will minimize these selection errors (hiring people who should not have been hired and not hiring people who should have been hired) while maximizing correct selection decisions (hiring people who should have been hired and not hiring people who should not have been hired). In short, tests increase the chances that you'll hire the right person for the job, that is, someone who turns out to be a good performer. So, although tests aren't perfect, almost nothing predicts future job performance as well as the selection tests discussed here. For more on how well selection tests increase the odds of hiring the right person for the job, see the "What Really Works" feature.

Dear Store Manager,

Last week, my children and I were shopping in your store. After doing our grocery shopping, we stopped in the electronics department and asked the clerk, whose name is Donald Block, to help us find a copy of the latest version of the Madden NFL video game. Mr. Block was rude, unhelpful, and told us to find it for ourselves as he was busy.

I've been a loyal customer for over six years and expect you to immediately do something about Mr.Block's behavior. If you don't, I'll start doing my shopping somewhere else.

Sincerely,
Margaret Quinlan

4.4 Interviews

Sharon Ball, director of recruiting and administration for Epitec Group, has interviewed all kinds of mistake-prone job candidates: one with food on his sweater, another with breath that "smelled like bile," one who reeked of marijuana, and one who stopped the interview to talk on his cell phone for 5 minutes. Only the applicant with bad breath was hired. She says, "Nice guy. We had to pump him full of Tic Tacs."[88] In **interviews**, company representatives ask job applicants job-related questions to determine whether they are qualified for the job. Interviews are probably the most frequently used and relied on selection device. There are several basic kinds of interviews: unstructured, structured, and semistructured.

In **unstructured interviews**, interviewers are free to ask applicants anything they want, and studies show that they do. Because interviewers often disagree about which questions should be asked during interviews, different interviewers tend to ask applicants very different questions.[89] Furthermore, individual interviewers even seem to have a tough time asking the same questions from one interview to the next. This high level of inconsistency lowers the validity of unstructured interviews as a selection device because comparing applicant responses can be difficult. As a result, while unstructured interviews do predict job performance with some success, they are about half as accurate as structured interviews at predicting which job applicants should be hired.[90]

By contrast, with **structured interviews**, standardized interview questions are prepared ahead of time so that all applicants are asked the same job-related questions.[91] Four kinds of questions are typically asked in structured interviews:

- Situational questions ask applicants how they would respond in a hypothetical situation ("What would you do if …?"). These questions are more appropriate for hiring new graduates, who are unlikely to have encountered real-work situations because of their limited work experience.
- Behavioral questions ask applicants what they did in previous jobs that were similar to the job for which they are applying ("In your previous jobs, tell me about …"). These questions are more appropriate for hiring experienced individuals.
- Background questions ask applicants about their work experience, education, and other qualifications ("Tell me about the training you received at …").
- Job-knowledge questions ask applicants to demonstrate their job knowledge (e.g., nurses might be asked, "Give me an example of a time when one of your patients had a severe reaction to a medication. How did you handle it?").[92]

[Unstructured interviews] interviews in which interviewers are free to ask the applicants anything they want

[Structured interviews] interviews in which all applicants are asked the same set of standardized questions, usually including situational, behavioral, background, and job-knowledge questions

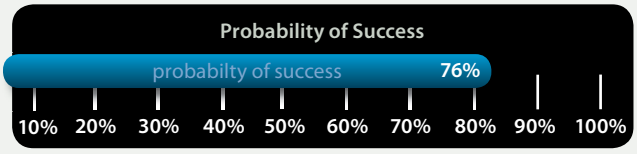
The primary advantage of structured interviews is that comparing applicants is much easier because they are all asked the same questions. Structuring interviews also ensures that interviewers ask only for important, job-related information. Not

Using Selection Tests to Hire Good Workers

Hiring new employees is always something of a gamble. When you say, "We'd like to offer you the job," you never know how it's going to turn out. Nonetheless, the selection tests discussed in this chapter can go a long way toward taking the gambling aspect out of the hiring process. Indeed, more than 1,000 studies based on over 100,000 study participants strongly indicate that selection tests can give employers a much better than average (50–50) chance of hiring the right workers. If you had odds like these working for you in Las Vegas, you'd make so much money the casinos wouldn't let you in the door.

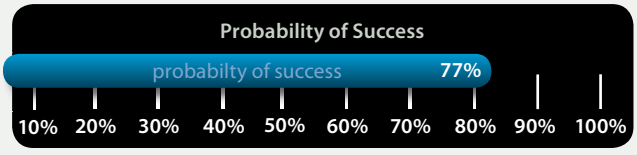
Cognitive Ability Tests

There is a 76 percent chance that applicants who do well on cognitive ability tests will be much better performers in their jobs than applicants who do not do well on such tests.



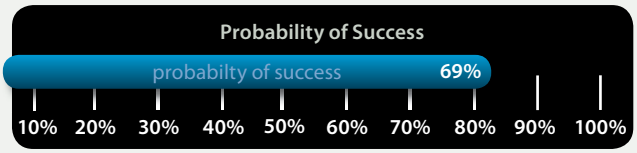
Work Sample Tests

There is a 77 percent chance that applicants who do well on work sample tests will be much better performers in their jobs than applicants who do not do well on such tests.



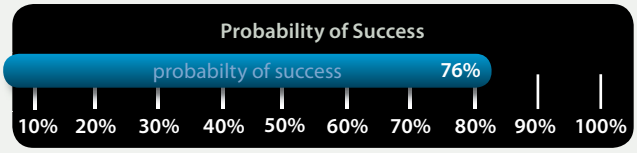
Assessment Centers

There is a 69 percent chance that applicants who do well on assessment center exercises will be much better managers than applicants who do not do well on such exercises.



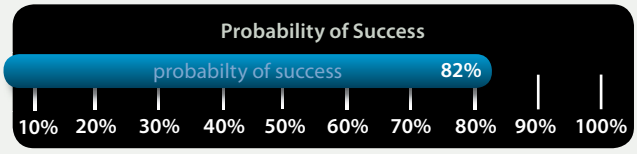
Structured Interviews

There is a 76 percent chance that applicants who do well in structured interviews will be much better performers in their jobs than applicants who do not do well in such interviews.



Cognitive Ability—Work Sample Tests

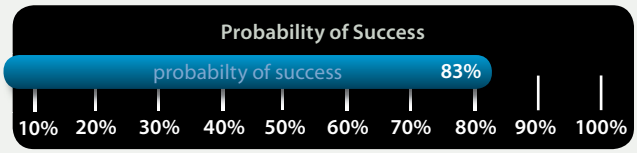
When deciding whom to hire, most companies use a number of tests to make even more accurate selection decisions. There is an 82 percent chance that applicants who do well on a combination of cognitive ability tests and work sample tests will be much better performers in their jobs than applicants who do not do well on both tests.



Cognitive Ability—Integrity Tests

There is an 83 percent chance that applicants who do well on a combination of cognitive ability tests and integrity tests (see Chapter 4 for a discussion of integrity tests) will be much better performers in their jobs than applicants who do not do well on both tests.

(*continued*)



Cognitive Ability—Structured Interviews

only are the accuracy, usefulness, and validity of the interview improved but the chances that interviewers will ask questions about topics that violate employment laws are reduced (go back to Exhibit 11.7 for a list of these topics).

Semistructured interviews are in between structured and unstructured interviews. A major part of the semistructured interview (perhaps as much as 80 percent) is based on structured questions, but some time is set aside for unstructured interviewing to allow the interviewer to probe into ambiguous or missing information uncovered during the structured portion of the interview.

How well do interviews predict future job performance? Contrary to what you've probably heard, recent evidence indicates that even unstructured interviews do a fairly good job.[93] When conducted properly, however, structured interviews can lead to much more accurate hiring decisions than unstructured interviews. In some cases, the validity of structured interviews can rival that of cognitive ability tests. But even more important, because interviews are especially good at assessing applicants' interpersonal skills, they work particularly well with cognitive ability tests. Combining the two—using structured interviews together with cognitive ability tests to identify smart people who work well in conjunction with others—leads to even better selection decisions than using either alone.[94] Exhibit 11.10 provides a set of guidelines for conducting effective structured employment interviews.

REVIEW 4

Selection Selection is the process of gathering information about job applicants to decide who should be offered a job. Accurate selection procedures are valid, are legally defendable, and improve organizational performance. Application forms and résumés are the most common selection devices. Because many application forms request illegal, non-job-related information, and as many as one-third of job applicants falsify information on résumés, these procedures are often of little value in making hiring decisions. References and background checks can also be problematic, given that previous employers are reluctant to provide such information for fear of being sued for defamation. Unfortunately, without this information, other employers are at risk of negligent hiring lawsuits. Selection tests generally do the best job of predicting applicants' future job performance. In general, cognitive ability tests, work sample tests, biographical data, and assessment centers are the most valid tests, followed by personality tests and specific ability tests, which are still good predictors. Selection tests aren't perfect predictors of job performance, but almost nothing predicts future job performance as well as selection tests. The three kinds of job interviews are unstructured, structured, and semistructured interviews. Of these, structured interviews work best because they ensure that all applicants are consistently asked the same situational, behavioral, background, or job-knowledge questions, in the same order.

EXHIBIT 11.10 Guidelines for Conducting Effective Structured Interviews

Interview Stage	What to Do
	• Identify and define the knowledge, skills, abilities, and other (KSAO) characteristics needed for successful job performance. • For each essential KSAO, develop key behavioral questions that will elicit examples of past accomplishments, activities, and performance. • For each KSAO, develop a list of things to look for in the applicant's responses to key questions.
	• Create a relaxed, nonstressful interview atmosphere. • Review the applicant's application form, résumé, and other information. • Allocate enough time to complete the interview without interruption. • Put the applicant at ease; don't jump right into heavy questioning. • Tell the applicant what to expect. Explain the interview process. • Obtain job-related information from the applicant by asking those questions prepared for each KSAO. • Describe the job and the organization to the applicant. Applicants need adequate information to make a selection decision about the organization.
	• Immediately after the interview, review your notes and make sure they are complete. • Evaluate the applicant on each essential KSAO. • Determine each applicant's probability of success and make a hiring decision.

DEVELOPING QUALIFIED WORKERS

According to a recent survey by Mercer Human Resource Consulting, 49 percent of companies are increasing their training budgets. For instance, Hewlett-Packard recently increased its training budget to a whopping $300 million.[95] What is driving the infusion of dollars into training and development budgets of companies? Companies like HP recognize that it is more cost-efficient and competitive to develop talent from within rather than compete for talent on the open market.[96] In addition, according to the American Society for Training and Development, a typical investment in training increases productivity by an average of 17 percent, reduces employee turnover, and makes companies more profitable.[97]

Giving employees the knowledge and skills they need to improve their performance is just the first step in developing employees, however. The second step—and not enough companies do this—is giving employees formal feedback about their actual job performance. A CEO of a large telecommunications company hired an outside consultant to assess and coach (provide feedback to) the company's top 50 managers.

To the CEO's surprise, 75 percent of those managers indicated that the feedback they received from the consultant regarding their strengths and weaknesses was the only substantial feedback they had received about their performance in the last 5 years. On a more positive note, as a result of that feedback, two-thirds of the managers then took positive steps to improve their skills, knowledge, and job performance and expressed a clear desire for more feedback, especially from their boss, the CEO.[98] So, in today's competitive business environment, even top managers understand the importance of formal performance feedback to their growth and development.

After reading the next two sections, you should be able to

5. describe how to determine training needs and select the appropriate training methods and
6. discuss how to use performance appraisal to give meaningful performance feedback.

5 TRAINING

Training means providing opportunities for employees to develop the job-specific skills, experience, and knowledge they need to do their jobs or improve their performance. American companies spend more than $60 billion a year on training. To make sure those training dollars are well spent, companies need to **5.1 determine specific training needs, 5.2 select appropriate training methods**, and **5.3 evaluate training**.

5.1 Determining Training Needs

Needs assessment is the process of identifying and prioritizing the learning needs of employees. Needs assessments can be conducted by identifying performance deficiencies, listening to customer complaints, surveying employees and managers, or formally testing employees' skills and knowledge. The Work Keys method created by American College Testing (maker of the ACT test used for college admissions) in Iowa City, Iowa, is a needs assessment tool used for 7,000 different jobs by more than 1,400 companies nationwide.[99] Work Keys is a series of tests that can be used to determine employees' knowledge and skill levels in communication (listening, reading for information, and writing), problem solving (applied mathematics, applied technology, locating information, and observation), and interpersonal skills (teamwork). As shown in Step 1 of Exhibit 11.11, a needs assessment using Work Keys begins with a job analysis (what ACT calls "job profiling") to determine the knowledge and skill levels required to perform a job successfully. Step 1 shows that a worker needs a skill level of 4 in reading for information, a 5 in applied mathematics, a 3 in applied technology, and a 4 in teamwork (skill levels range from 1 to 6) to do well in a manufacturing job. Following the job analysis, employees are tested to see how well their skills match those required for the job, as shown in Step 2 of Exhibit 11.11. Then, as shown in Step 3 of the exhibit, employees' skill levels are compared with the requirements for the job. The greater the difference between an employee's skill levels and those required, the greater the need for training. Based on the Work Keys needs assessment, this employee needs some training in reading for information, applied mathematics, and teamwork.

Note that training should never be conducted without first performing a needs assessment. Sometimes, training isn't needed at all or isn't needed for all employees. Since the needs assessment shown in Exhibit 11.11 indicates that the employee's applied technology skills match those required for the job, it would be a waste of time and money to send this employee for training in that area.

Unfortunately, however, many organizations simply require all employees to attend training whether they need to or not. As a result, employees who are not interested or don't need the training may react negatively during or after training. Likewise, employees who should be sent for training but aren't may also react negatively. Consequently, a needs assessment is an important tool for deciding who should or should not attend training. In fact, employment law restricts employers from discriminating on the basis of age, sex, race, color, religion, national origin, or disability when selecting training participants. Just like hiring decisions, the selection of training participants should be based on job-related information.

5.2 Training Methods

Assume that you're a training director for a major oil company and that you're in charge of making sure all employees know how to respond effectively in case of an oil spill.[100] Exhibit 11.12 lists a number of training methods you could use: films and videos, lectures, planned readings, case studies, coaching and mentoring, group discussions, on-the-job training, role-playing, simulations and games, vestibule training, and computer-based learning. Which method would be best?

To choose the best method, you should consider a number of factors, such as the number of people to be trained, the cost of training, and the objectives of the training. For instance, if the training objective is to impart information or knowledge to trainees, then you should use films and videos, lectures, and planned readings. In our example, trainees might read a manual or attend a lecture about how to protect a shoreline to keep it from being affected by the spill.

If developing analytical and problem-solving skills is the objective, then use case studies, coaching and mentoring, and group discussions. In our example, trainees might view a video documenting how a team handled exposure to hazardous substances, talk with first responders, and discuss what they would do in a similar situation.

EXHIBIT 11.12 Training Objectives and Methods

Training Objective	Training Method
Impart Information and Knowledge	• **Films and videos.** Films and videos share information, illustrate problems and solutions, and effectively hold trainees' attention. • **Lectures.** Trainees listen to instructors' oral presentations. • **Planned readings.** Trainees read about concepts or ideas before attending training.
Develop Analytical and Problem-Solving Skills	• **Case studies.** Cases are analyzed and discussed in small groups. The cases present a specific problem or decision, and trainees develop methods for solving the problem or making the decision. • **Coaching and mentoring.** Coaching and mentoring of trainees by managers involves informal advice, suggestions, and guidance. This method is helpful for reinforcing other kinds of training and for trainees who benefit from support and personal encouragement. • **Group discussions.** Small groups of trainees actively discuss specific topics. The instructor may perform the role of discussion leader.
Practice, Learn, or Change Job Behaviors	• **On-the-job training (OJT).** New employees are assigned to experienced employees. The trainee learns by watching the experienced employee perform the job and eventually by working alongside the experienced employee. Gradually, the trainee is left on his or her own to perform the job. • **Role-playing.** Trainees assume job-related roles and practice new behaviors by acting out what they would do in job-related situations. • **Simulations and games.** Experiential exercises place trainees in realistic job-related situations and give them the opportunity to experience a job-related condition in a relatively low-cost setting. The trainee benefits from "hands-on experience" before actually performing the job where mistakes may be more costly. • **Vestibule training.** Procedures and equipment similar to those used in the actual job are set up in a special area called a vestibule. The trainee is then taught how to perform the job at his or her own pace without disrupting the actual flow of work, making costly mistakes, or exposing the trainee and others to dangerous conditions.
Impart Information and Knowledge; Develop Analytical and Problem-Solving Skills; and Practice, Learn, or Change Job Behaviors	• **Computer-based learning.** Interactive videos, software, CD-ROMs, personal computers, teleconferencing, and the Internet may be combined to present multimedia-based training.

If practicing, learning, or changing job behaviors is the objective, then use on-the-job training, role-playing, simulations and games, and vestibule training. In our example, trainees might participate in a mock shoreline cleanup to learn what to do in the event oil comes to shore. This simulation could take place on an actual shoreline or on a video-game-like virtual shoreline.

If training is supposed to meet more than one of these objectives, then your best choice may be to combine one of the previous methods with computer-based training. CDW (Computer Discount Warehouse) now uses avatar-based training. An avatar is a computerized depiction of a person. If you've ever played a video game, you've encountered an avatar. When CDW account manager Danielle Paden took a sales course, the avatar first described a situation: an unhappy customer whose computer won't connect to her high-speed Internet hookup. Then, a picture of the customer appeared on the screen accompanied by audio of the customer speaking. Finally, with help from the avatar when she needed it (just click on the avatar),

Paden decided what to do and then received feedback from the avatar and another response from the customer. Paden describes the training as "the closest thing you can get to [actual] client interactions," because "the avatar went through almost every situation you will run across."[101]

These days, many companies are adopting Internet training, or "e-learning." E-learning can offer several advantages. Because employees don't need to leave their jobs, travel costs are greatly reduced. Also, because employees can take training modules when it is convenient (i.e., they don't have to fall behind at their jobs to attend week-long training courses), workplace productivity should increase and employee stress should decrease. For example, **Golden Harvest Seeds**, a producer of agricultural seeds such as hybrid corn, soybeans, grain sorghum and alfalfa, now has 120 training courses on its website for 250 employees and 2,000 independent crop-seed dealers. The company found that employees typically watched the sales videos and training programs on Saturdays and Monday mornings. And more people took the online courses, sales increased, and costs fell to less than $100 per person per course. Says head of sales development David Dam, "We're getting more done with less money."[102] Finally, if the company's technology infrastructure can support it, e-learning can be much faster than traditional training methods.

There are, however, several disadvantages to e-learning. First, despite its increasing popularity, it's not always the appropriate training method. E-learning can be a good way to impart information, but it isn't always as effective for changing job behaviors or developing problem-solving and analytical skills. Second, e-learning requires a significant investment in computers and high-speed Internet and network connections for all employees. Finally, though e-learning can be faster, many employees find it so boring and unengaging that they may choose to do their jobs rather than complete e-learning courses when sitting alone at their desks. E-learning may become more interesting, however, as more companies incorporate gamelike features such as avatars and competition into their e-learning courses. At Silicon Image, employees learn how to make silicon computer chips in a virtual world that simulates the company's corporate campus. Employees interact with their coworkers using three-dimensional characters that they create and control, similar to the popular online world *Second Life*. Workers "walk" through this virtual world just like they would through Silicon Images' real buildings. Each time they enter a department, there are videos, information slides, and tasks to be done. Office Director Andrew Turnbull says that the virtual training adds a "wow factor" to the training. He says, "We wanted to provide the content in a compelling way for adults to learn."[103]

5.3 Evaluating Training

After selecting a training method and conducting the training, the last step is to evaluate the training. Training can be evaluated in four ways: on *reactions* (how satisfied trainees were with the program), on *learning* (how much employees improved their knowledge or skills), on *behavior* (how much employees actually changed their on-the-job behavior because of training), or on *results* (how much training improved job performance, such as increased sales or quality, or decreased costs).[104] In general, training provides meaningful benefits for most companies if it is done well. For example, a study by the American Society for Training and Development shows that a training budget as small as $680 per employee can increase a company's total return on investment by 6 percent.[105]

REVIEW 5

Training Training is used to give employees the job-specific skills, experience, and knowledge they need to do their jobs or improve their job performance. To make sure training dollars are well spent, companies need to determine specific training needs, select appropriate training methods, and then evaluate the training. Needs assessments can be conducted by identifying performance deficiencies, listening to customer complaints, surveying employees and managers, or formally testing employees' skills and knowledge. Selection of an appropriate training method depends on a number of factors, including the number of people to be trained, the cost of training, and the objectives of the training. If the objective is to impart information or knowledge, then films and videos, lectures, and planned readings should be used. If developing analytical and problem-solving skills is the objective, then case studies, coaching and mentoring, and group discussions should be used. If practicing, learning, or changing job behaviors is the objective, then on-the-job training, role-playing, simulations and games, and vestibule training should be used. If training is supposed to meet more than one of these objectives, then it may be best to combine one of the previous methods with computer-based training. Training can be evaluated on reactions, learning, behavior, or results.

6 PERFORMANCE APPRAISAL

Performance appraisal is the process of assessing how well employees are doing their jobs. Most employees and managers intensely dislike the performance appraisal process. One manager says, "I hate annual performance reviews. I hated them when I used to get them, and I hate them now that I give them. If I had to choose between performance reviews and paper cuts, I'd take paper cuts every time. I'd even take razor burns and the sound of fingernails on a blackboard."[106] Unfortunately, attitudes like this are all too common. In fact, 70 percent of employees are dissatisfied with the performance appraisal process in their companies. Likewise, according to the Society for Human Resource Management, 90 percent of human resource managers are dissatisfied with the performance appraisal systems used by their companies.[107]

Performance appraisals are used for four broad purposes: making administrative decisions (e.g., pay increase, promotion, retention), providing feedback for employee development (e.g., performance feedback, developing career plans), evaluating human resource programs (e.g., validating selection systems), and for documentation purposes (e.g., documenting performance ratings and decisions based on those ratings).[108]

Let's explore how companies can avoid some of these problems with performance appraisals by **6.1 accurately measuring job performance** and **6.2 effectively sharing performance feedback with employees**.

6.1 Accurately Measuring Job Performance

[Performance appraisal] the process of assessing how well employees are doing their jobs

Workers often have strong doubts about the accuracy of their performance appraisals—and they may be right. For example, it's widely known that assessors are prone to errors when rating worker performance. Three of the most common rating errors are central tendency, halo, and leniency. *Central tendency error* occurs when assessors rate all workers as average or in the middle of the scale. *Halo error* occurs when assessors rate all workers as performing at the same level (good, bad, or average) in all parts of their jobs. *Leniency error* occurs when assessors rate all workers as performing particularly well. One of the reasons managers make these errors is

that they often don't spend enough time gathering or reviewing performance data. Winston Connor, the former vice president of human resources at Huntsman Chemical, says, "Most of the time, it's just a ritual that managers go through. They pull out last year's review, update it and do it quickly."[109] What can be done to minimize rating errors and improve the accuracy with which job performance is measured? In general, two approaches have been used: improving performance appraisal measures themselves and training performance raters to be more accurate.

One of the ways companies try to improve performance appraisal measures is to use as many objective performance measures as possible. **Objective performance measures** are measures of performance that are easily and directly counted or quantified. Common objective performance measures include output, scrap, waste, sales, customer complaints, and rejection rates.

But when objective performance measures aren't available (and frequently they aren't), subjective performance measures have to be used instead. **Subjective performance measures** require that someone judge or assess a worker's performance. The most common kind of subjective performance measure is the graphic rating scale (GRS) shown in Exhibit 11.13. Graphic rating scales are most widely used because they are easy to construct, but they are very susceptible to rating errors.

© IMAGE SOURCE PINK/JUPITER IMAGES

A popular alternative to graphic rating scales is the **behavior observation scale (BOS)**. BOS requires raters to rate the frequency with which workers perform specific behaviors representative of the job dimensions that are critical to successful job performance. Exhibit 11.13 shows a BOS for two important job dimensions for a retail salesperson: customer service and money handling. Notice that each dimension lists several specific behaviors characteristic of a worker who excels in that dimension of job performance. (Normally, the scale would list 7 to 12 items per dimension, not 3, as in the exhibit.) Notice also that the behaviors are good behaviors, meaning they indicate good performance, and the rater is asked to judge how frequently an employee engaged in those good behaviors. The logic behind the BOS is that better performers engage in good behaviors more often.

Not only do BOSs work well for rating critical dimensions of performance, but studies also show that managers strongly prefer BOSs for giving performance feedback; accurately differentiating between poor, average, and good workers; identifying training needs; and accurately measuring performance. And in response to the statement, "If I were defending a company, this rating format would be an asset to my case," attorneys strongly preferred BOSs over other kinds of subjective performance appraisal scales.[110]

The second approach to improving the measurement of workers' job performance is **rater training**. The most effective is frame-of-reference training, in which a group of trainees learn how to do performance appraisals by watching a videotape of an employee at work. Next, they evaluate the performance of the person in the videotape. A trainer (an expert in the subject matter) then shares his or her evaluations, and trainees' evaluations are compared with the expert's. The expert then explains the rationales behind his or her evaluations. This process is repeated until

the difference in evaluations given by trainees and evaluations by the expert are minimized. The underlying logic behind the frame-of-reference training is that by adopting the frame of reference used by an expert, trainees will be able to accurately observe, judge, and use the scale to evaluate performance of others.[111]

6.2 Sharing Performance Feedback

After gathering accurate performance data, the next step is to share performance feedback with employees. Unfortunately, even when performance appraisal ratings are accurate, the appraisal process often breaks down at the feedback stage. Employees become defensive and dislike hearing any negative assessments of their work, no matter how small. Managers become defensive, too, and dislike giving appraisal feedback as much as employees dislike receiving it. One manager says, "I myself don't go as far as those who say performance reviews are inherently destructive and ought to be abolished, but I agree that the typical annual-review process does nothing but harm. It creates divisions. It undermines morale. It makes people angry, jealous, and cynical. It unleashes a whole lot of negative energy, and the organization gets nothing in return."[112]

What can be done to overcome the inherent difficulties in performance appraisal feedback sessions? Since performance appraisal ratings have traditionally been the judgments of just one person, the boss, one possibility is to use **360-degree feedback**. In this approach, feedback comes from four sources: the boss, subordinates, peers and coworkers, and the employees themselves. The data, which are obtained anonymously (except for the boss's), are compiled into a feedback report comparing the employee's self-ratings with those of the boss, subordinates, and peers and coworkers. Usually, a consultant or human resource specialist discusses the results with the employee. The advantage of 360-degree programs is that negative feedback ("You don't listen") is often more credible when it comes from several people. For example, one boss who received 360-degree feedback thought he was a great writer, so he regularly criticized and corrected his subordinates' reports. Though the subordinates had never discussed this among themselves, they all complained about it in the 360-degree feedback and asked that he stop rewriting their reports. After receiving the feedback, he apologized and stopped.[113]

[360-degree feedback] a performance appraisal process in which feedback is obtained from the boss, subordinates, peers and coworkers, and the employees themselves

A word of caution, though: About half of the companies using 360-degree feedback for performance appraisal now use the feedback only for developmental purposes. They found that sometimes when raises and promotions were on the line, peers and subordinates would give high ratings in order to get high ratings from others. Ed Smiley, a manager who works for a manufacturer, says they stopped using 360-degree feedback at his company because of too much "mutual back-scratching." Said Smiley, "What you don't get is true feedback."[114] Conversely, in some situations employees distorted ratings to harm competitors or help people they liked. A senior manager at a New York City marketing company agrees, saying that 360-degree feedback "also allows people to vent their frustrations and anger on bosses and colleagues in an insensitive way."[115] On the other hand, studies clearly show that ratees prefer to receive feedback from multiple raters, so 360-degree feedback is likely to continue to grow in popularity.[116]

Herbert Meyer, who has been studying performance appraisal feedback for more than 30 years, recommends a list of topics to discuss in performance appraisal feedback sessions (see Exhibit 11.14).[117] Furthermore, managers can do three different things to make performance reviews more comfortable and productive. First, they should separate developmental feedback, which is designed to improve future performance, from administrative feedback, which is used as a reward for past performance, such as for raises. When managers give developmental feedback, they're acting as coaches, but when they give administrative feedback, they're acting as judges. These roles, coaches and judges, are clearly incompatible. As coaches, managers are encouraging, pointing out opportunities for growth and improvement, and employees are typically open and receptive to feedback. But as judges, managers are evaluative, and employees are typically defensive and closed to feedback.

Second, Meyer suggests that performance appraisal feedback sessions be based on self-appraisals, in which employees carefully assess their own strengths, weaknesses, successes, and failures in writing. Because employees play an active role in the review of their performance, managers can be coaches rather than judges. Also, because the focus is on future goals and development, both employees and managers are likely to be more satisfied with the process and more committed to future plans and changes. And, because the focus is on development and not administrative assessment, studies show that self-appraisals lead to more candid self-assessments than traditional supervisory reviews.[118]

Finally, what people do with the performance feedback they receive really matters. A study of 1,361 senior managers found that managers who reviewed their 360-degree feedback with an executive coach (hired by the company) were more likely to set specific goals for improvement, ask their bosses for ways to improve, and subsequently improve their performance.[119]

A 5-year study of 252 managers found that their performance improved dramatically if they met with their subordinates to discuss their 360-degree feedback ("You don't listen") and how they were going to address it ("I'll restate what

EXHIBIT 11.14 What to Discuss in a Performance Appraisal Feedback Session

others have said before stating my opinion"). Performance was dramatically lower for managers who never discussed their 360-degree feedback with subordinates and for managers who did not routinely do so (some managers did not review their 360-degree feedback with subordinates each year of the study). Why is discussing 360-degree feedback with subordinates so effective? These discussions help managers better understand their weaknesses, force them to develop a plan to improve, and demonstrate to the subordinates the managers' public commitment to improving.[120] In short, it helps to have people discuss their performance feedback with others, but it particularly helps to have them discuss their feedback with the people who provided it. This is why HCL Technologies, an outsourcer of technology services, not only has employees rate their bosses, it then posts managers' ratings on the company intranet for everyone to see and to hold top managers accountable.[121]

It is clear that organizations, and specifically managers, must take the task of providing feedback seriously. Recent studies have reported that employees' satisfaction with feedback they receive influences not only their job satisfaction but also their future performance.[122] An employee's satisfaction with feedback is influenced by his or her perceptions of how well the manager knows the employee's job, the extent to which evaluations were based on job-related factors, whether the feedback process included goal setting, and whether the manager provided insights on how to improve future performance.[123]

REVIEW 6

Performance Appraisal Most employees and managers intensely dislike the performance appraisal process. Some of the problems associated with appraisals can be avoided, however, by accurately measuring job performance and effectively sharing performance feedback with employees. Organizations should develop good performance appraisal scales and preferably use behavior observation scales (BOSs). They should train raters to accurately evaluate performance, perhaps by providing frame-of-reference training. They should impress upon managers the value of providing feedback in a clear, consistent, and fair manner and of setting goals and monitoring progress toward those goals.

One way to overcome the inherent difficulties in performance appraisal feedback is to provide 360-degree feedback, in which feedback is obtained from four sources: the boss, subordinates, peers and coworkers, and the employees themselves. Feedback tends to be more credible if it is heard from several sources. Finally, especially for managers, it's helpful to have people discuss the feedback they received with executive coaches or the people who provided it.

KEEPING QUALIFIED WORKERS

At **Penske Automotive Group**, which has 300 car dealerships worldwide, 8 percent of CEO Roger Penske's bonus is tied to keeping employee turnover below 31 percent. Pep Boys, a car parts retail chain, does the same, making 10 percent of its middle managers' pay contingent on low employee turnover. Likewise, ExlService Holdings, an Indian-based offshore outsourcing company, links 30 percent of its lower-level managers' pay to employee turnover. Why link managers' pay to employee turnover? According to Tony Pordon, senior vice president at

Penske Automotive, "We believe that employee turnover is a symptom of bigger problems at the dealership level."[124] Mark Royal, a consultant for the Hay Group, which specializes in employee compensation, further explains that linking managers' pay to turnover, "is a recognition, on the one hand, of people as a driver of business success. It also reflects a recognition that turnover is costly."[125]

After reading the next two sections, you should be able to

7. describe basic compensation strategies and explain how they affect human resource practice;
8. discuss the four kinds of employee separations: termination, downsizing, retirements, and turnover.

7 COMPENSATION

Compensation includes both the financial and the nonfinancial rewards that organizations give employees in exchange for their work. Let's learn more about compensation by examining the **7.1 compensation decisions that managers must make** and **7.2 the role that employment benefits play in compensating today's employees.**

7.1 Compensation Decisions

As Exhibit 11.15 shows, there are four basic kinds of compensation decisions: pay level, pay variability, pay structure, and employment benefits. We'll discuss employment benefits in the next subsection.[126]

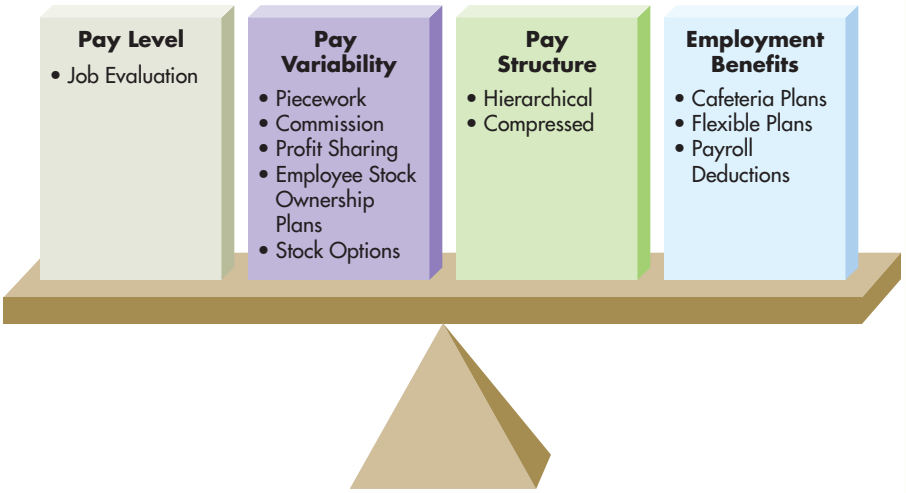
Pay-level decisions are decisions about whether to pay workers at a level that is below, above, or at current market wages. Companies use job evaluation to set their pay structures. **Job evaluation** determines the worth of each job by determining the market value of the knowledge, skills, and requirements needed to perform it. After conducting a job evaluation, most companies try to pay the going rate, meaning the current market wage. There are always companies, however, whose financial situation causes them to pay considerably less than current market wages. While a director of a child-care center in Vermont may make up to $25 an hour, teachers make only $9–11 an hour.[127] According to the American Federation of Teachers, the average annual wage for early child-care workers is $18,820, and hourly wages have increased only 39 cents in the last 25 years.[128]

[Compensation] the financial and nonfinancial rewards that organizations give employees in exchange for their work

[Job evaluation] a process that determines the worth of each job in a company by evaluating the market value of the knowledge, skills, and requirements needed to perform it

Some companies choose to pay above-average wages to attract and keep employees. *Above-market wages* can attract a larger, more qualified pool of job applicants, increase the rate of job acceptance, decrease the time it takes to fill positions, and increase the time that employees stay.[129] For example, the severe nursing shortage discussed at the beginning of the chapter has begun to ease because, as Vanderbilt University nursing professor Peter Buerhaus explains, "Hospitals recognized that all their previous attempts weren't working so they had to raise wages."[130] Three years ago, 13 percent

EXHIBIT 11.15 Kinds of Compensation Decisions



of the nursing positions at the Ochsner Clinic in New Orleans were open. After raising salaries substantially and giving nurses more flexible schedules (e.g., $50,000+ per year to work three 12-hour days per week), only 2.4 percent of its nursing positions were open, compared with a national average of 8.4 percent.

Pay-variability decisions concern the extent to which employees' pay varies with individual and organizational performance. Linking pay to performance is intended to increase employee motivation, effort, and job performance. Piecework, sales commissions, profit sharing, employee stock ownership plans, and stock options are common pay-variability options. For instance, under **piecework** pay plans, employees are paid a set rate for each item produced up to some standard (e.g., 35 cents per item produced for output up to 100 units per day). Once productivity exceeds the standard, employees are paid a set amount for each unit of output over the standard (e.g., 45 cents for each unit above 100 units). Under a sales **commission** plan, salespeople are paid a percentage of the purchase price of items they sell. The more they sell, the more they earn.

Because pay plans such as piecework and commissions are based on individual performance, they can reduce the incentive that people have to work together. Therefore, companies also use group incentives (discussed in Chapter 10) and organizational incentives, such as profit sharing, employee stock ownership plans, and stock options, to encourage teamwork and cooperation.

With **profit sharing**, employees receive a portion of the organization's profits over and above their regular compensation. The more profitable the company, the more profit is shared. Employees of Delta Airlines share profits on 5.5 percent of eligible earnings. In a good year, Delta pays $158 million in profit sharing to its employees.[131]

Employee stock ownership plans (ESOPs) compensate employees by awarding them shares of the company stock in addition to their regular compensation. Joe Hernandez, a 41-year-old migrant worker at McKay Nursery in Waterloo, Wisconsin, makes $20,000 a year working from April to November. But Joe also gets an additional 20 to 25 percent in company stock. So far, he's accumulated more than $80,000 through the company ESOP.[132]

Stock options give employees the right to purchase shares of stock at a set price. Options work like this. Let's say you are awarded the right (or option) to buy 100 shares of stock from the company for $5 a share. If the company's stock price rises to $15 a share, you can exercise your options and make $1,000. When you exercise

your options, you pay the company $500 (100 shares at $5 a share), but, because the stock is selling for $15 in the stock market, you can sell your 100 shares for $1,500 and make $1,000. Of course, as the company's profits and share values increase, stock options become even more valuable to employees. Stock options have no value, however, if the company's stock falls below the option "grant price," the price at which the options have been issued to you. For instance, the options you have on 100 shares of stock with a grant price of $5 aren't going to do you a lot of good if the company's stock is worth $2.50. Why exercise your stock options and pay $5 a share for stock that sells for $2.50 a share in the stock market? (Stock options are said to be "underwater" when the grant price is lower than the market price.) Proponents of stock options argue that this gives employees and managers a strong incentive to work hard to make the company successful. If they do, the company's profits and stock price increase, and their stock options increase in value. If they don't, profits stagnate or turn into losses, and their stock options decrease in value or become worthless. To learn more about ESOPs and stock options, see the National Center for Employee Ownership (**http://www.nceo.org**).

The incentive has to be more than just a piece of paper, however. At Van Meter Industrial, based in Cedar Rapids, Iowa, some employees didn't know what stock was, let alone care about their ESOP program. One even said, "Why don't you just give me a couple hundred bucks for beer and cigarettes [instead]?"[133] So the company created an employee committee to educate their coworkers about how the ESOP program works, meeting with workers in small groups where it's safe to ask questions, and emphasizing, for example, that the company contributes the equivalent of 9.5 weeks of their pay into each employee ESOP each year. Also, employees reaching their 6-month anniversary are given a jacket with the words "I am in" written on it to emphasize that they're now part of the ESOP. As a result of these efforts, Van Meter Industrial's workers now take a strong interest in what they can do to save the company money on a daily basis because, as the company becomes more profitable, the value of their ESOP shares rises. Although Van Meter's stock value was barely keeping up with inflation before this program, it increased 78 percent after the program was implemented.[134]

Pay-structure decisions are concerned with internal pay distributions, meaning the extent to which people in the company receive very different levels of pay.[135] *Hierarchical pay structures* involve big differences from one pay level to another. The highest pay levels are for people near the top of the pay distribution. The basic idea behind hierarchical pay structures is that large differences in pay between jobs or organizational levels should motivate people to work harder to obtain those higher-paying jobs. Many publicly owned companies have hierarchical pay structures by virtue of the huge amounts they pay their top managers and CEOs. For example, the average CEO now makes 364 times as much as the average worker, down from 525 times the pay of average workers just 8 years ago. But with CEO pay packages averaging $18.8 million per year and average workers earning just $36,140, the difference is still incredible and can have a significant effect on employee morale.[136]

By contrast, *compressed pay structures* typically have fewer pay levels and smaller differences in pay between levels. Pay is less dispersed and more similar across jobs in the company. The basic idea behind compressed pay structures is that similar pay levels should lead to higher levels of cooperation, feelings of fairness and a common purpose, and better group and team performance.

So should companies choose hierarchical or compressed pay structures? The evidence isn't straightforward, but studies seem to indicate that there are significant problems with the hierarchical approach. The most damaging finding is that there appears to be little link between organizational performance and the pay of top managers.[137] Furthermore, studies of professional athletes indicate that hierarchical pay structures (e.g., paying superstars 40 to 50 times as much as the lowest-paid athlete on the team)

hurt the performance of teams and individual players.[138] Likewise, managers are twice as likely to quit their jobs when their companies have very strong hierarchical pay structures (i.e., when they're paid dramatically less than the people above them).[139] For now, it seems that hierarchical pay structures work best for independent work, where it's easy to determine the contributions of individual performers and little coordination with others is needed to get the job done. In other words, hierarchical pay structures work best when clear links can be drawn between individual performance and individual rewards. By contrast, compressed pay structures, in which everyone receives similar pay, seem to work best for interdependent work, which requires employees to work together. Some companies are pursuing a middle ground: combining hierarchical and compressed pay structures by giving ordinary workers the chance to earn more through ESOPs, stock options, and profit sharing.

7.2 Employment Benefits

Employment benefits include virtually any kind of compensation other than direct wages paid to employees.[140] Three employee benefits are mandated by law: Social Security, workers' compensation insurance, and unemployment insurance. To attract and retain a good work force, however, most organizations offer a wide variety of benefits, including retirement plans and pensions, paid holidays, paid vacations, sick leave, health insurance, life insurance, dental care, eye care, day-care facilities, paid personal days, legal assistance, physical fitness facilities, educational assistance, and discounts on company products and services. While the cost of employee benefits varies by company and by industry, according to the Bureau of Labor Statistics, on average, benefits cost organizations about 29.3 percent of their payroll.[141] Managers should understand that although benefits are unlikely to improve employee motivation and performance, they do affect job satisfaction, employee decisions about staying or leaving the company, and the company's attractiveness to job applicants.[142] One way that organizations make their benefit plans more attractive is by offering **cafeteria benefit plans** or **flexible benefit plans**, which allow employees to choose which benefits they receive, up to a certain dollar value.[143] Many cafeteria or flexible benefit plans start with a core of benefits, such as health insurance and life insurance, that are available to all employees. Then employees are allowed to select the other benefits that best fit their needs, up to a predetermined dollar amount. Some organizations allow employees to choose from several packages of benefits. The packages are of equivalent value but offer a different mix of benefits. For example, older employees may prefer more benefit dollars spent on retirement plans, while younger employees may prefer additional vacation days.

Pretax payroll deductions, which enable employees to pay for expenses such as medical care, day care, and commuting out of pretax dollars, are one of the more popular benefits options because they provide significant tax savings for employees and organizations. Nevertheless, only 18 percent of eligible employees participate in their company's pretax payroll deduction plan. The problem, as employee Kate Morrison explained, has been that "by the time you filled out the paperwork and mailed it off and they processed it, it could take up to 45 days to get your money back [from your pretax account]."[144] Some companies have solved these problems by giving employees a debit card attached to their pretax spending accounts that they can use to pay expenses directly, thereby avoiding the paperwork and the wait for reimbursement. So-called prepaid debit cards can double or triple the rate of participation in pretax payroll deductions.[145] The drawback to flexible benefit plans has been the high cost of administering them. With advances in information processing technology and HRISs, however, the cost has begun to drop in recent years.

[Cafeteria benefit plans (flexible benefit plans)] plans that allow employees to choose which benefits they receive, up to a certain dollar value

Compensation Compensation includes both the financial and the nonfinancial rewards that organizations give employees in exchange for their work. There are four basic kinds of compensation decisions: pay level, pay variability, pay structure, and employment benefits. Pay-level decisions determine whether workers will receive wages below, above, or at current market levels. Pay-variability decisions concern the extent to which pay varies with individual and organizational performance. Piecework, sales commissions, profit sharing, employee stock ownership plans, and stock options are common pay-variability options. Pay-structure decisions concern the extent to which people in the company receive very different levels of pay. Hierarchical pay structures work best for independent work, while compressed pay structures work best for interdependent work.

Employee benefits include virtually any kind of compensation other than direct wages paid to employees. Flexible or cafeteria benefit plans offer employees a wide variety of benefits, improve job satisfaction, increase the chances that employees will stay with companies, and make organizations more attractive to job applicants. The cost of administering flexible benefit plans has begun to drop in recent years.

8 EMPLOYEE SEPARATIONS

Employee separation is a broad term covering the loss of an employee for any reason. *Involuntary separation* occurs when employers terminate or lay off employees. *Voluntary separation* occurs when employees quit or retire. Because employee separations affect recruiting, selection, training, and compensation, organizations should forecast the number of employees they expect to lose through terminations, layoffs, turnover, or retirements when doing human resource planning.

Let's explore employee separation by examining **8.1 terminations, 8.2 downsizing, 8.3 retirements**, and **8.4 turnover**.

8.1 Terminating Employees

The words "You're fired!" may have never been directed at you, but lots of people hear them, as more than 400,000 people a year get fired from their jobs. Getting fired is a terrible thing, but many managers make it even worse by bungling the firing process, needlessly provoking the person who was fired and unintentionally inviting lawsuits. Manager Craig Silverman had to fire the head of a company that his organization had just acquired. He was specifically instructed to invite her to a meeting, which would require her to travel halfway across the country and then fire her immediately on arrival. He said, "I literally had to tell the car service to wait. I don't think it ever entered [her] mind that [she] would be terminated."[146] A computer systems engineer was fired on "Take Your Daughter to Work Day," with his eight-year-old daughter sitting next to him in the human resource manager's office. He and his daughter were both escorted from the building.[147] Four hundred employees at the Fort Worth headquarters of RadioShack got the following e-mail message: "The work force reduction notification is currently in progress. Unfortunately your position is one that has been eliminated."[148] How would you feel if you had been fired in one of these ways? Though firing is never pleasant (and managers hate firings nearly as much as employees do), managers can do several things to minimize the problems inherent in firing employees.

[Employee separation] the voluntary or involuntary loss of an employee

First, in most situations, firing should not be the first option. Instead, employees should be given a chance to change their behavior. When problems arise, employees should have ample warning and must be specifically informed as to the nature and seriousness of the trouble they're in. After being notified, they should be given sufficient time to change. If the problems continue, the employees should again be counseled about their job performance, what could be done to improve it, and the possible consequences if things don't change (such as a written reprimand, suspension without pay, or firing). Sometimes this is enough to solve the problem. If the problem isn't corrected after several rounds of warnings and discussions, however, the employee may be terminated.[149]

Second, employees should be fired only for a good reason. Employers used to hire and fire employees under the legal principle of employment at will, which allowed them to fire employees for a good reason, a bad reason, or no reason at all. (Employees could also quit for a good reason, a bad reason, or no reason whenever they desired.) As employees began contesting their firings in court, however, the principle of wrongful discharge emerged. **Wrongful discharge** is a legal doctrine that requires employers to have a job-related reason to terminate employees. In other words, like other major human resource decisions, termination decisions should be made on the basis of job-related factors such as violating company rules or consistently poor performance. And with former employees winning 68 percent of wrongful discharge cases and the average wrongful termination award at $532,000 and climbing, managers should record the job-related reasons for the termination, document specific instances of rule violations or continued poor performance, and keep notes and documents from the counseling sessions held with employees.[150]

Finally, to reduce the chances of a wrongful discharge suit, employees should always be fired in private. State the reason for discharge, but don't go into detail or engage in a lengthy discussion with the employee. Make every attempt to be as kind and respectful as possible when informing someone that he or she is being fired. It is permissible and sometimes a good idea to have a witness present. This person should be from human resources or part of the employee's chain of command, such as the supervisor's boss. Company security may be nearby but should not be in the room unless the employee has made direct threats toward others. Finally, managers should be careful not to publicly criticize the employee who has just been fired, as this can also lead to a wrongful discharge lawsuit. In general, unless someone has a "business reason to know" why an employee was fired, the reasons and details related to the firing should remain confidential.[151]

8.2 Downsizing

Downsizing is the planned elimination of jobs in a company. Whether it's because of cost cutting, declining market share, previous overaggressive hiring and growth, or outsourcing, companies typically eliminate 1 million to 1.9 million jobs a year.[152] Two-thirds of companies that downsize will downsize a second time within a year. For example, after laying off 1,520 employees in December and almost 1,000 employees 10 months earlier, Yahoo, which saw its profits drop by 78 percent, announced plans to cut 5 percent of its remaining workforce.[153] General Motors announced it would cut 4,000 white-collar jobs with an overall goal of eliminating 10,000 of its 73,000 salaried positions worldwide. When complete, GM will employ 23,500 white-collar workers, half the number it had a decade ago.[154]

Does downsizing work? In theory, downsizing is supposed to lead to higher productivity and profits, better stock performance, and increased organizational flexibility. However, numerous studies demonstrate that it doesn't. For instance, a 15-year study of downsizing found that downsizing 10 percent of a company's work force produced

[Wrongful discharge] a legal doctrine that requires employers to have a job-related reason to terminate employees

[Downsizing] the planned elimination of jobs in a company

only a 1.5 percent decrease in costs; that firms that downsized increased their stock price by only 4.7 percent over 3 years, compared with 34.3 percent for firms that didn't; and that profitability and productivity were generally not improved by downsizing.[155] Downsizing can also result in the loss of skilled workers who would be expensive to replace when the company grows again.[156] These results make it clear that the best strategy is to conduct effective human resource planning and avoid downsizing altogether. Indeed, downsizing should always be a last resort.

If companies do find themselves in financial or strategic situations where downsizing is required for survival, however, they should train managers in how to break the news to downsized employees, have senior managers explain in detail why downsizing is necessary, and time the announcement so that employees hear it from the company and not from other sources, such as TV or newspaper reports.[157] Finally, companies should do everything they can to help downsized employees find other jobs. One of the best ways to do this is to use **outplacement services** that provide employment counseling for employees faced with downsizing. Outplacement services often include advice and training in preparing résumés, getting ready for job interviews, and even identifying job opportunities in other companies. Fifty-five percent of companies provide outplacement services for laid-off employees, 76 percent provide extended health coverage, and 45 percent offer extended access to employee assistance programs.[158] Exhibit 11.16 provides additional guidelines for conducting layoffs.

Companies also need to pay attention to the survivors, the employees remaining after layoffs have occurred. University of Pennsylvania management professor Peter Cappelli says that survivors "may feel like they could just as easily be the next person laid off."[159] Lori Stewart Coletti, director of client services at Elaine Construction, a Newton, Massachusetts-based firm, said, "The general feeling is, 'Could I be next?' That's the level of uncertainty that you really have to combat."[160] The key to working

EXHIBIT 11.16 Guidelines for Conducting Layoffs

1. Provide clear reasons and explanations for the layoffs.
2. To avoid laying off employees with critical or irreplaceable skills, knowledge, and expertise, get input from human resources, the legal department, and several levels of management.
3. Train managers in how to tell employees that they are being laid off (stay calm; make the meeting short; explain why, but don't be personal; and provide information about immediate concerns, such as benefits, job search, and collecting personal goods).
4. Give employees the bad news early in the day, and try to avoid laying off employees just before holidays.
5. Provide outplacement services and counseling to help laid-off employees find new jobs.
6. Communicate with survivors to explain how the company and their jobs will change.

with layoff survivors, according to Barry Nickerson, president of Dallas-based Marlow Industries, which downsized from 800 to 200 employees, is "Communicate. Communicate. Communicate." Nickerson says, "Every time we had a change we had a meeting to explain exactly what we were doing. We were very open with our employees about where we were financially. We would explain exactly the current status and where we were."[161]

8.3 Retirement

Early retirement incentive programs (ERIPs) offer financial benefits to employees to encourage them to retire early. Companies use ERIPs to reduce the number of employees in the organization, to lower costs by eliminating positions after employees retire, to lower costs by replacing high-paid retirees with lower-paid, less-experienced employees, or to create openings and job opportunities for people inside the company. For example, the state of Wyoming offered its employees a lump-sum bonus, additional insurance benefits, and increased monthly retirement payments to encourage early retirement. Its ERIP must have been fairly attractive, because 56 percent of the state employees eligible for early retirement accepted. Thirty percent of the 437 positions vacated by the early retirees remained empty, saving the state $23.2 million over the first 46 months of the program and a projected $65 million over 8 years. After accounting for the costs of the increased early retirement benefits, the predicted savings came to more than $148,000 per retiree.[162]

Although ERIPs can save companies money, they can pose a big problem for managers if they fail to accurately predict which employees—the good performers or the poor performers—and how many will retire early. Consultant Ron Nicol says, "The thing that doesn't work is just asking for volunteers. You get the wrong volunteers. Some of your best people will feel they can get a job anywhere. Or you have people who are close to retirement and are a real asset to the company."[163] When Progress Energy, in Raleigh, North Carolina, identified 450 jobs it wanted to eliminate with an ERIP, it carefully shared the list of jobs with employees, indicated that layoffs would follow if not enough people took early retirement, and then held 80 meetings with employees to answer questions. Despite this care, an extra 1,000 employees, for a total of 1,450, took the ERIP offer and applied for early retirement![164]

Because of the problems associated with ERIPs, many companies are now offering **phased retirement**, in which employees transition to retirement by working reduced hours over a period of time before completely retiring. The advantage for employees is that they have more free time but continue to earn salaries and benefits without changing companies or careers. The advantage for companies is that it allows them to reduce salaries and hiring and training costs and retain experienced, valuable workers.[165]

[Employee turnover] loss of employees who voluntarily choose to leave the company

[Functional turnover] loss of poor-performing employees who voluntarily choose to leave a company

8.4 Employee Turnover

Employee turnover is the loss of employees who voluntarily choose to leave the company. In general, most companies try to keep the rate of employee turnover low to reduce recruiting, hiring, training, and replacement costs. Not all kinds of employee turnover are bad for organizations, however. In fact, some turnover can actually be good. **Functional turnover** is the loss of poor-performing employees who choose to leave the organization.[166] Functional turnover gives the organization a chance to replace poor performers with better workers. In fact, one study found that simply replacing poor-performing leavers with average workers would increase the

revenues produced by retail salespeople in an upscale department store by $112,000 per person per year.[167] By contrast, **dysfunctional turnover**, the loss of high performers who choose to leave, is a costly loss to the organization.

Employee turnover should be carefully analyzed to determine whether good or poor performers are choosing to leave the organization. If the company is losing too many high performers, managers should determine the reasons and find ways to reduce the loss of valuable employees. The company may have to raise salary levels, offer enhanced benefits, or improve working conditions to retain skilled workers. One of the best ways to influence functional and dysfunctional turnover is to link pay directly to performance. A study of four salesforces found that when pay was strongly linked to performance via sales commissions and bonuses, poor performers were much more likely to leave (that is, functional turnover). By contrast, poor performers were much more likely to stay when paid large, guaranteed monthly salaries and small sales commissions and bonuses.[168]

[Dysfunctional turnover] loss of high-performing employees who voluntarily choose to leave a company

Employee Separations Employee separation is the loss of an employee; separation can occur voluntarily or involuntarily. Before firing or terminating employees, managers should give employees a chance to improve. If firing becomes necessary, it should be done because of job-related factors, such as violating company rules or consistently performing poorly. Downsizing is supposed to lead to higher productivity and profits, better stock performance, and increased organizational flexibility, but studies show that it doesn't. The best strategy is to downsize only as a last resort. Companies that do downsize should offer outplacement services to help employees find other jobs. Companies use early retirement incentive programs to reduce the number of employees in the organization, lower costs, and create openings and job opportunities for people inside the company. The biggest problem with ERIPs is accurately predicting who and how many will accept early retirement. Companies generally try to keep the rate of employee turnover low to reduce costs. Functional turnover can be good for organizations, however, because it offers the chance to replace poor performers with better workers. Managers should analyze employee turnover to determine who is resigning and take steps to reduce the loss of good performers.

MANAGEMENT DECISION

Managing HR in a Recession

Managing your staff has its little ups and downs. Signing on a new employee is exciting. Terminating one is not so fun. And annual performance reviews tend to wrack your nerves a bit. But the task facing you now is truly daunting. The economic recession seems to have touched everyone, and your company is no exception. You face a major budget deficit. It is possible for you to make cuts in administrative costs, programs, and perks to address the problem. Still, staffing cuts seem unavoidable, and it's your job to wield the axe.

You've read studies that suggest layoffs do not really lead to better productivity or profits, so you're skeptical about whether this is a good way to save your bottom line. You know that layoffs ought to be a last resort. After all, they cost more than the severance packages would suggest. Layoffs might damage your reputation for attracting the best talent: Who wants to go to work for a company when they can't be confident their job will be secure in a year? On the other hand, no one's job is terribly secure in this climate. You also might be losing your best potential for leadership. Things will eventually improve, and you don't want to

find yourself with a gap in talent you'll have to rush to fill when they do. The rehiring costs might be more than retaining the employees you have. And there's also the cost in morale among the employees you keep on board. After crunching the numbers and thinking hard about the variables, though, you still conclude that some action is necessary to cut your staffing costs.

You've got options, though. You've been inspired by the creative ways other companies have handled this problem. One company offered its employees an opportunity to take 6 months off to work on a public service project while retaining partial pay. That cut staffing costs, kept employees busy who would otherwise be idle due to slow business, *and* kept them on the payroll. You've read about many companies instituting tiered, or graduated, pay cuts or cutting hours to part-time. Some states even have a program to kick in unemployment wages to replace part of the lost pay.[170]

Whatever you do, you know you have to be left with a group of committed employees who will see the company through the recession and recovery. And you know you'll be better off if even the layoffs are managed well.

Questions

1. What factors will you consider as you decide how to make the cuts (whether to downsize or to keep employees on board while cutting costs)?
2. What can you do to help employees manage the transition to less work or no work?
3. What concrete steps could you take to maintain morale in your company?

MANAGEMENT TEAM DECISION

Hire or Hold Out?

When your systems engineer left to have a baby, you had no idea how hard it would be to replace her.[171] You'd heard the labor market for engineers was tight, but you thought it wouldn't be too tough to find a new hire for a company as well known as Raytheon. That was 6 months ago.

Today, your team is sitting down again with another crop of 200 résumés to compare against the job specifications: Ph.D. in science or computer engineering; experience in manufacturing; knowledge of the manufacturing software you use and of Pro/Engineer Wildfire, a computer-aided design (CAD) software package; able to get top-secret government security clearance; willingness to relocate to Waltham, Massachusetts, where Raytheon is headquartered; and more technical competency requirements. Really, when you look over the list, you don't think the requirements are that stringent, particularly when you consider that Raytheon designs and manufactures aircraft, missile systems, and intelligence and information systems for the U.S. Department of Defense.

And your pool of applicants is nowhere near that of some other companies. Microsoft receives 60,000 résumés a month, but it has only 2,000 openings for software development jobs. Of the 100,000 résumés it received from graduating students last year, it screened only 15,000, interviewed 3,500, and hired 1,000. Come to think of it, though, your chances of getting hired at Microsoft are better than your chances of filling your systems engineer opening.

As you sit down with your team and begin to sift through the 200 résumés, you see right away that 100 don't have a Ph.D. Of the remaining 100 candidates, 40 wouldn't be able to get security clearance, 23 are overqualified, and 18 don't have manufacturing experience, and 10 only have experience on 2001, an earlier version of the CAD software. So out of your 200 applicants, only 9 are left, and you haven't even broached the question about relocating.

You've gone through seven similar piles of résumés in the past 6 months. The whole point of specifying the exact qualifications you want in an applicant was to save time getting the person up and running at the company. Maybe you'd have been better off loosening up the requirements and developing appropriate training programs. What if none of the applicants left standing after this round wants to relocate? Then you'll be starting with another pile next month—or sooner.

Form a team of four to five students to play the role of the hiring team at Raytheon and work through the following questions to come to a decision.

Questions

1. What are the risks to keeping the job requirements tightly structured?
2. What are the risks of loosening up the job specifications?

3. How would loosening up the job specifications affect your training needs?
4. Do you hire an applicant who meets a good number of the job requirements and is generally compatible with the corporate culture; or do you wait for the perfect candidate, even if that means another 6 months of interviewing?

PRACTICE BEING A MANAGER

Legal Recruiting

Managing human resources in today's complex business and legal environment is not easy. Not only must companies hire the creative and hard-working employees who will fuel growth and competitive advantage but they must be careful to do so legally and ethically. Unfair discrimination in any HR process will result in poor placement, turnover, and legal woes. This exercise will give you some practice in navigating the challenges of legal and effective recruitment and selection of employees.

Step 1: Get into groups. Your professor will assign you to groups of four or five students. One student will be given the role of HR attorney for the applicants, two students the role of nursing shift (day/night) managers at Montclair Hospital, and the remaining student(s) will be assigned the role of senior hospital administrator at Montclair Hospital.

Scenario: Montclair Hospital needs to hire new nurses. In fact, the hospital is in a bit of a crisis. Three nurses were recently fired for using drugs while on duty. In the ensuing publicity, a journalist uncovered that two of these nurses were convicted felons. As if these problems were not enough, nurse turnover is up 20 percent this year over last, and productivity of the remaining staff is substandard. Absences are also up lately, particularly those related to child-care or elder-care issues.

Both the day and the night nursing shift managers need to hire some quality nurses—and fast. Hospital administrators have made it abundantly clear that they do not want a repeat of the headline "Felons and Drug Users among Montclair Nursing Staff." Your compensation and benefits are competitive, and, with the exception of the recent news coverage, your hospital enjoys a strong reputation. The nursing labor market is tight (there are fewer nurses than openings), and most new hires are recent nursing school graduates.

Nursing shift managers need to work together to develop a plan to achieve the following:

1. Hire top-flight nurses to fill vacancies left by recent firings and resignations.
2. Stem the turnover of quality nurses already employed by Montclair.
3. Reduce absenteeism, especially unplanned "emergency" absences that wreak havoc with planning the work of an upcoming shift.

Step 2a: Outline a plan. The day and the night nursing shift managers should work together to sketch out a plan for making progress on the three concerns of Montclair Hospital administration (hiring, turnover, absenteeism). Some elements of this plan might include

- Deciding where and how to recruit top nursing candidates
- Screening applicants to reduce risks of turnover, criminal/behavioral problems, and disruptive absenteeism
- Dealing with the turnover, absenteeism, and productivity problems of existing nursing staff

Step 2b: Review the plan. Students in the roles of hospital administrator and HR attorney should listen to the nursing managers as they sketch out their plans. Do not offer comments unless one of the managers asks you for your input. Take careful notes regarding what you hear, with particular attention to concerns and questions. Those in the HR attorney role should consider what you hear from the perspective of both potential applicants (and litigants) and Montclair Hospital (defense of HR practices).

Are the nursing managers developing a plan likely to successfully address the three concerns related to hiring, turnover, and absenteeism? Why or why not? Do you hear anything that might raise a legal concern (such as inappropriate interview questions, possible discrimination)?

Step 3: Debrief as a class. Students should open with comments from each perspective: (1) HR attorneys, (2) hospital administrators, and (3) nursing shift managers. What are some of the specific concerns or questions that arose in your mind as you played your particular role? What are some of the tensions that face the managers and administrators in this situation? How might the HR system of a hospital be improved? Why might nurses represent a particularly challenging set of HR concerns?

360-Degree Feedback

Whereas most performance appraisal ratings have traditionally come from just one person, the boss, 360-degree feedback is obtained from four sources: the boss, subordinates, peers and coworkers, and the employees themselves. In this assignment, you will be gathering 360-degree feedback from people whom you work with or from a team or group that you're a member of for a class.

Here are some guidelines for obtaining your 360-degree feedback:

- *Carefully select respondents*. One of the keys to good 360-degree feedback is getting feedback from the right people. In general, the people you ask for feedback should interact with you on a regular basis and should have the chance to regularly observe your behavior. Also, be sure to get a representative sample of opinions from a similar number of coworkers and subordinates (assuming you have some).
- *Get a large enough number of responses*. In addition to your boss, you should have a minimum of three peers and three subordinates giving you feedback. Five or six respondents in each of those categories is even better.
- *Ensure confidentiality*. Respondents are much more likely to be honest if they know that their comments are confidential and anonymous. So, when you ask respondents for feedback, have them return their comments to someone other than yourself. This person, your "feedback facilitator," will remove the names and any other information that would identify who made particular comments.
- *Explain how the 360-degree feedback will be used*. In this case, explain that the feedback is for a class assignment, that the results will be used for your own personal growth and development, and that the feedback they give you will not affect your grade or formal assessment at work.
- *Ask respondents to make their feedback as specific as possible*. For instance, "bad attitude" isn't very good feedback. "Won't listen to others' suggestions" is much better because it would let you know how to improve your behavior. Have your respondents use the feedback form below to provide your feedback.

Here's what you need to turn in for this assignment:

1. The names and relationships (boss, peers, subordinates, classmates, teammates) of those whom you've asked for feedback.
2. The name of the person you've asked to be your feedback facilitator.
3. Copies of all written feedback that was returned to you.
4. A one-page summary of the written feedback.
5. A one-page description of your specific goals and action plans for responding to the feedback you received.

360-Degree Feedback Form

As part of a class assignment, I, _____, am collecting feedback from you about my performance. What you say or write will not affect my grade. The purpose of this assignment is for me to receive honest feedback from the people I work with in order to identify the things I'm doing well and the things that I need to improve. So please be honest and direct in your evaluation.

When you have completed this feedback form, please return it to _____. He or she has been selected as my feedback facilitator and is responsible for ensuring that your confidentiality and anonymity are maintained. After all feedback forms have been returned to _____, he or she will make sure that your particular responses cannot be identified. Only then will the feedback be shared with me.

Please provide the following feedback.

Continue doing . . .

Describe three things that _____ is doing that are a positive part of his or her performance and that you want him or her to continue doing.

1.

2.

3.

Start doing . . .

Describe three things that _____ needs to start doing that would significantly improve his or her performance.

1.

2.

3.

Please make your feedback as specific and behavioral as possible. For instance, "needs to adjust attitude" isn't very good feedback. "Needs to begin listening to others' suggestions" is much better because the person now knows exactly how to change his or her behavior. So please be specific. Also, please write more than one sentence per comment. This will help the feedback recipient better understand your comments.

MANAGEMENT WORKPLACE

The Maine Media Workshops

The Maine Media Workshops began in 1973 as a kind of summer camp for both amateurs and professionals who wanted to hone their filmmaking, photography, and writing skills. Over the years, students have had the opportunity to work with and learn from some of Hollywood's heavy hitters, such as the Oscar-winning cinematographer Vilmos Zsigmond and the Emmy-winning director Alan Myerson. In this video, the MMW staff members talks about one of the biggest challenges they face now that the program hosts hundreds of courses throughout the year: hiring part-time instructors to teach them. The director of education, Elizabeth Greenburg, explains, "Just because somebody is good at making images doesn't make him or her a good teacher. What makes a good teacher is someone who is generous enough and open enough to share her life, her experience, her career and her knowledge 24/7 with students."

What would You Do?

City Hall, New Haven, Connecticut.[1]

You never thought promoting good people could be so difficult, but you couldn't have been more wrong. Based on the City charter which mandates that only the most qualified job candidates are promoted, your goal as City Manager was to create a fair set of tests to select the best candidates for promotion to lieutenant and captain positions in the Fire Department.

So you carefully selected an experienced testing firm, SIOP, and paid it $100,000 to develop these tests. Following good human resources management practice, SIOP used job analyses to determine the tasks, knowledge, skills, and abilities needed to succeed in lieutenant and captain's jobs. SIOP consultants interviewed experienced lieutenants and captains, observed them in their jobs, rode with them on fire and emergency calls, and then asked your current chiefs, captains, and lieutenants to respond to specific questionnaires about their jobs. And, at every step, SIOP was careful to oversample minority firefighters so that the exams, developed from these job analyses, wouldn't favor white candidates. Based on the results, SIOP then wrote multiple-choice exam items for the most important parts of lieutenant and captain jobs; developed a detailed list showing which information in its training manuals, procedures, and materials was used to write those exam items; and then double-checked that list with New Haven's fire chief and assistant fire chief.

Each test had 100 multiple-choice tests (written at tenth-grade reading levels) based on the material cited in those lists, which the city, in turn, gave to the candidates to help study during a three-month review period. While the multiple-choice tests focused on job-specific knowledge, SIOP created oral exams to test job skills and abilities, writing hypothetical questions and scenarios based on real-life situations that tested candidates' incident-command skills, leadership and command presence, and firefighting strategies. Each candidate was given three hypothetical questions that were answered in front of and scored by three assessors.

Under the City charter's "rule of three," each vacancy is filled by choosing the top three scorers on the list. So for the first vacancy, you can offer the position to any of the top three. Let's say you offer it to the second highest scorer who takes the job. The next vacancy must be offered to either the highest, the third highest, or the fourth highest scoring candidates, and so on. Of the 77 people who took the Lieutenant test, 34 passed, 25 of whom were white, 6 were black, and 3 were Hispanic. But, with the "rule of three" and just 8 vacant lieutenant jobs, only the 10 top candidates could be offered jobs. All were white. Of the 41 people who took the captain test, 22 passed, 16 of whom were white, 3 were black, and 3 were Hispanic. This time, with 7 vacant captain

Study Tips

In the margin next to each paragraph or section in the chapter, write the question that the section answers. For example, "What is the difference between surface- and deep-level diversity?" could go on page 460.

Once you have questions throughout the chapter, you can quiz yourself by using a blank piece of paper to cover the content. To check yourself, reveal each paragraph after you have answered the corresponding question.

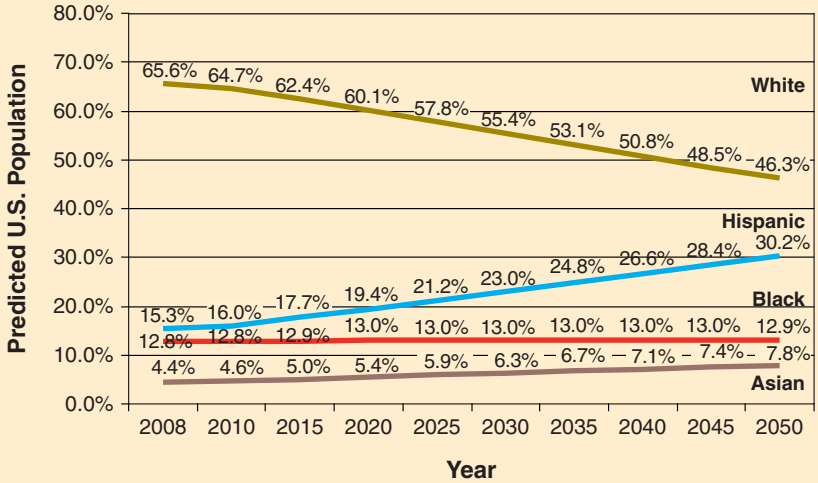
jobs, the "rule of three" permits only the 9 top candidates to receive job offers—7 were white and 2 were Hispanic.

This is precisely what you had hoped to avoid. So, what do you do now? Should you let the test results stand and promote the white and Hispanic candidates to the vacant positions (as suggested by the candidates who felt that their high test scores gave them the right to promotion)? Or should you throw out the test results and start over with another test (as suggested by the president of the International Association of Black Professional Fire Fighters)? Or should you reweight the components of the current test, which now gives 60 percent weight to the multiple-choice items and 40 percent weight to the oral exams (as suggested by another test consultant)? What's the best option and why? Next, as you review the steps that SIOP took, you wonder what additional steps it should have taken to properly prepare the tests and ensure that they were scored fairly and accurately. Also, what evidence should it provide so you can know whether the tests are accurate? Finally, if this goes to court, and you know it will, what will happen? Will the court support the use of the tests or not?

If you were the City Manager of New Haven, what would you do?

Workplace diversity as we know it today is changing. Exhibit 12.1 shows predictions from the U.S. Bureau of the Census of how the U.S. population will change over the next 40 years. The percentage of white, non-Hispanic Americans in the general population is expected to decline from 64.7 percent in 2010 to 46.3 percent by the year 2050. By contrast, the percentage of black Americans will increase (from 12.9 percent to 13.0 percent), as will the percentage of Asian Americans (from 4.7 percent to 7.8 percent). Meanwhile, the proportion of Native Americans will hold steady (between 1.0 and 1.2 percent). The fastest-growing group by far, though, is Hispanics, who are expected to increase from 16 percent of the total population in 2005 to 30.3 percent by 2050.

EXHIBIT 12.1 Percentage of the Projected Population by Race and Hispanic Origin for the United States: 2008 to 2050 (Percentage of total resident population as of July 1)



Source: "Percent of the Projected Population by Race and Hispanic Origin for the United States: 2008 to 2050," U.S. Census Bureau, 14 August 2008, available at http://www.census.gov/population/www/projections/tablesandcharts/table_4.xls [accessed 4 November 2009].

Other significant changes have already occurred. For example, today women hold 46.5 percent of the jobs in the United States, up from 38.2 percent in 1970.[2] Furthermore, white males, who composed 63.9 percent of the work force in 1950, hold just 38.2 percent of today's jobs.[3]

These rather dramatic changes have taken place in a relatively short time. And, as these trends clearly show, the work force of the near future will be increasingly Hispanic, Asian American, African American, and female. It will also be older, as the average Baby Boomer approaches the age of 70 around 2020. Since many Boomers are likely to postpone retirement

and work well into their 70s to offset predicted reductions in Social Security and Medicare benefits, the work force may become even older than expected. For instance, between 1984 and 2014, 16- to 24-year-olds (21.1 percent to 13.7 percent), 25- to 34-year-olds (28.8 percent to 22.7 percent), and 35- to 44-year-olds (22 percent to 20.6 percent) will have become a smaller part of the U.S. labor force. By contrast, those 45 years and older (28.1 percent to 43.1 percent), 55 years and older (13.1 percent to 21.2 percent), and 65 years and older (2.6 percent to 5.4 percent) will all have become larger parts of the U.S. labor force.[4]

This chapter begins with a review of work force diversity; we'll talk about what diversity is and why it matters. Next, you will learn about two basic dimensions of diversity: surface-level diversity (how age, sex, race/ethnicity, and mental and physical disabilities affect people at work) and deep-level diversity (how core personality differences influence behavior and attitudes). In the last section, you will learn how diversity can be managed. Here, you'll read about diversity paradigms, principles, and practices that help managers strengthen the diversity *and* the competitiveness of their organizations.

DIVERSITY AND WHY IT MATTERS

After reading the next section, you should be able to

1. describe diversity and explain why it matters.

Diversity means variety. Therefore, **diversity** exists in organizations when there is a variety of demographic, cultural, and personal differences among the people who work there and the customers who do business there. For example, step into Longo Toyota in El Monte, California, one of Toyota's top-selling dealerships, and you'll find diversity in the form of salespeople who speak Spanish, Korean, Arabic, Vietnamese, Hebrew, and Mandarin Chinese. In fact, the 60 salespeople at Longo Toyota speak 30 different languages.[5] Surprisingly, this level of diversity was achieved without a formal diversity plan in place.[6]

By contrast, some companies lack diversity in their work force, their customers, or both. **Denny's** restaurants paid $54.4 million to settle a class-action lawsuit alleging discriminatory treatment of black customers at its restaurants.[7] **Verizon Communications** paid $48.9 million to settle a lawsuit in which it was accused of discriminating against employees who were pregnant or on maternity leave.[8] And ICM, also known as International Creative Management, a talent agency that represents actors, speakers, and writers, paid $4.5 million to 150 TV show writers, all over the age of 40, who claimed they were discriminated against by ICM's agents.[9] In recent years, Tyson Foods, Coca-Cola, Los Alamos National Laboratory, Federal Express, Abercrombie & Fitch, and many other companies have settled class-action discrimination lawsuits.[10]

Today, however, Denny's, Edison International, Verizon, and Coca-Cola have made great improvements in their level of diversity. For example, minorities own nearly 40 percent of Denny's franchises and comprise 59 percent of its workers, 41 percent of its managers, and 44 percent of its board of directors. *Hispanic Business*, *Black Enterprise*, *Asian Enterprise*, *Family Digest*, and *Fortune* magazine have recognized Denny's for its progress on diversity.[11] Verizon, which was sued for discriminating against employees who were pregnant or on maternity leave, has been named, for nine straight years, to *Working Mother* magazine's list of best

[Diversity] a variety of demographic, cultural, and personal differences among an organization's employees and customers

100 companies for working mothers and been recognized by the National Association for Female Executives and the Women's Business Enterprise National Council as a top workplace for female managers and executives.[12]

1 DIVERSITY: DIFFERENCES THAT MATTER

You'll begin your exploration of diversity by learning **1.1 that diversity is not affirmative action and 1.2 how to build a business case for diversity**.

1.1 Diversity Is Not Affirmative Action

A common misconception is that workplace diversity and affirmative action are the same, yet these concepts differ in several critical ways, including their purpose, how they are practiced, and the reactions they produce. To start, **affirmative action** refers to purposeful steps taken by an organization to create employment opportunities for minorities and women.[13] By contrast, diversity exists in organizations when there is a variety of demographic, cultural, and personal differences among the people who work there and the customers who do business there. So one key difference is that affirmative action is more narrowly focused on demographics such as sex and race, while diversity has a broader focus that includes demographic, cultural, and personal differences.

A second difference is that affirmative action is a policy for actively creating diversity, but diversity can exist even if organizations don't take purposeful steps to create it. For example, Longo Toyota achieved a high level of diversity without having a formal affirmative action program. Likewise, a local restaurant located near a university in a major city is likely to have a more diverse group of employees than one located in a small town. So, organizations can achieve diversity without affirmative action. Conversely, affirmative action does not guarantee diversity. An organization can create employment opportunities for women and minorities yet not have a diverse work force.

A third important difference is that affirmative action is required by law for private employers with 50 or more employees, while diversity is not. Affirmative action originated with Executive Order 11246 (**https://www.dol.gov/esa/ofccp/regs/compliance/aa.htm**) but is also related to the1964 Civil Rights Act, which bans discrimination in voting, public places, federal government programs, federally supported public education, and employment. Title VII of the Civil Rights Act (**http://www.eeoc.gov/policy/vii.html**) requires that workers have equal employment opportunities when being hired or promoted. More specifically, Title VII prohibits companies from discriminating on the basis of race, color, religion, sex, or national origin. Furthermore, Title VII created the Equal Employment Opportunity Commission, or EEOC (**http://www.eeoc.gov**), to administer these laws. By contrast, there is no federal law or agency to oversee diversity. Organizations that pursue diversity goals and programs do so voluntarily. "Until recently, the commitment many companies had to diversity was fundamentally based on moral, ethical and compliance reasons," says Rudy Mendez, vice president for diversity and inclusion at McDonald's. "But now that we can add business impact, diversity executives are being given a much bigger role."[14]

[Affirmative action] purposeful steps taken by an organization to create employment opportunities for minorities and women

Fourth, affirmative action programs and diversity programs also have different purposes. The purpose of affirmative action programs is to compensate for past discrimination, which was widespread when legislation was introduced in the 1960s; to prevent ongoing discrimination; and to provide equal opportunities to all, regardless of race, color, religion, sex, or national origin. Organizations that fail to uphold these laws may be required to

- hire, promote, or give back pay to those not hired or promoted;
- reinstate those who were wrongly terminated;
- pay attorneys' fees and court costs for those who bring charges against them; or
- take other actions that make individuals whole by returning them to the condition or place they would have been had it not been for discrimination.[15]

Consequently, affirmative action is basically a punitive approach.[16] By contrast, as shown in Exhibit 12.2, the general purpose of diversity programs is to create a positive work environment where no one is advantaged or disadvantaged, where "we" is everyone, where everyone can do his or her best work, where differences are respected and not ignored, and where everyone feels comfortable.[17] So, unlike affirmative action, which punishes companies for not achieving specific sex and race ratios in their work forces, diversity programs seek to benefit both organizations and their employees by encouraging organizations to value all kinds of differences.

Despite the overall success of affirmative action in making workplaces much fairer than they used to be, many people argue that some affirmative action programs unconstitutionally offer preferential treatment to females and minorities at the expense of other employees, a view accepted by some courts.[18] The **American Civil Rights Institute** successfully campaigned to ban race- and sex-based affirmative action in college admissions, government hiring, and government contracting programs in California (1996), Washington (1998), and Michigan (2006). Led by Ward Connerly, the Institute backed similar efforts in Arizona, Colorado, Missouri, Nebraska, and Oklahoma in 2008. Opponents like Connerly believe that affirmative action policies establish only surface-level diversity and, ironically, promote preferential treatment. [19]

Furthermore, research shows that people who have gotten a job or promotion as a result of affirmative action are frequently viewed as unqualified, even when clear evidence of their qualifications exists.[20] One woman said, "I won a major prize [in my field], and some of the guys in my lab said it was because I was a woman. I'm certain they didn't choose me because I was a woman. But it gave some disgruntled guys who didn't get the prize a convenient excuse."[21] So, while affirmative action programs have created opportunities for minorities and women, those same minorities and women are frequently presumed to be unqualified when others believe they obtained their jobs as a result of affirmative action.

In summary, affirmative action and diversity are not the same thing. Not only are they fundamentally different but they also differ in purpose, practice, and the reactions they produce.

1.2 Diversity Makes Good Business Sense

Those who support the idea of diversity in organizations often ignore its business aspects altogether, claiming instead that diversity is simply the right thing to do. Yet diversity actually makes good business sense

EXHIBIT 12.2 General Purpose of Diversity Programs

To create a positive work environment where
• No one is advantaged or disadvantaged.
• "We" is everyone.
• Everyone can do his or her best work.
• Differences are respected and not ignored.
• Everyone feels comfortable.

in several ways: cost savings, attracting and retaining talent, and driving business growth.[22]

Diversity helps companies with *cost savings* by reducing turnover, decreasing absenteeism, and avoiding expensive lawsuits.[23] Because of lost productivity and the cost of recruiting and selecting new workers, companies lose substantial amounts of money when employees quit their jobs. In fact, turnover costs typically amount to more than 90 percent of employees' salaries. By this estimate, if an executive who makes $200,000 leaves, the organization will have to spend approximately $180,000 to find a replacement; even the lowest-paid hourly workers can cost the company as much as $10,000 when they quit. Since turnover rates for African Americans average 40 percent higher than for whites, and since women quit their jobs at twice the rate men do, companies that manage diverse work forces well can cut costs by reducing the turnover rates of these employees.[24] And, with women absent from work 60 percent more often than men, primarily because of family responsibilities, diversity programs that address the needs of female workers can also reduce the substantial costs of absenteeism.

Diversity programs also save companies money by helping them avoid discrimination lawsuits, which have increased by a factor of 20 since 1970 and quadrupled just since 1995. In one survey conducted by the Society of Human Resource Management, 78 percent of respondents reported that diversity efforts helped them avoid lawsuits and litigation costs.[25] Indeed, because companies lose two-thirds of all discrimination cases that go to trial, the best strategy from a business perspective is not to be sued for discrimination at all. When companies lose, the average individual settlement amounts to more than $600,000.[26] And settlement costs can be substantially higher in class-action lawsuits, in which individuals join together to sue a company as a group. For example, Coca-Cola paid $192.5 million to settle a class-action suit brought by 2,200 African American workers who were discriminated against in pay, promotions, and performance reviews. A similar lawsuit brought by 1,300 African American workers cost Texaco $176 million.[27] Boeing paid $72.5 million to settle a sex discrimination lawsuit with female employees who were paid less and not promoted because they were women.[28] And Dial Corporation, the soap manufacturer, paid $10 million to settle a sex discrimination lawsuit filed by 90 female employees at its manufacturing plants.[29] In fact, the average class-action lawsuit costs companies $58.9 million for racial discrimination and $24.9 million for sex discrimination.[30] Moreover, just announcing that a publically owned company has been hit with an age discrimination lawsuit lowers the total value of its stock by an average of $40 million.[31]

Just announcing that a publically owned company has been hit with an age discrimination lawsuit lowers the total value of its stock by an average of $40 million.

Diversity also makes business sense by helping companies *attract and retain talented workers*.[32] Indeed, diversity-friendly companies tend to attract better *and* more diverse job applicants. Very simply, diversity begets more diversity. Companies that make *Fortune* magazine's list of the 50 best companies for minorities or are recognized by *Working Women* and *DiversityInc.* magazine have already attracted a diverse and talented pool of job applicants. But, after being recognized for their efforts, they subsequently experience big increases in both the quality and the diversity of people who apply for jobs. Research shows that companies with acclaimed diversity programs not only attract more talented workers but also have higher performance in the stock market.[33]

The third way that diversity makes business sense is by *driving business growth*. In the United States today, there are 40.5 million African Americans, 47.7 million Hispanic Americans, and 14.2 million Asian Americans with, respectively,

$1.1 trillion, $1.2 trillion, and $459 billion in purchasing power.[34] Given the size of those markets, it shouldn't be surprising that a survey conducted by the Society for Human Resource Management found that tapping into "diverse customers and markets" was the number-one reason managers gave for implementing diversity programs.[35] Diversity, therefore, can help companies grow by improving their understanding of the marketplace. When companies have diverse work forces, they are better able to understand the needs of their increasingly diverse customer bases. At Frito Lay, the Latino Employee Network proved invaluable during the development of Doritos' guacamole-flavored tortilla chips. Members of the network, called Adelante, provided feedback on the taste and packaging to help ensure that the product would be regarded as authentic in the Latino community. The Adelante members' insights helped make the guacamole-flavored Doritos one of the most successful new-product launches in the company's history, generating more than $100 million in sales in its first year alone.[36]

Diversity also helps companies grow through higher-quality problem solving. Though diverse groups initially have more difficulty working together than homogeneous groups, diverse groups eventually establish a rapport and do a better job of identifying problems and generating alternative solutions, the two most important steps in problem solving.[37] Ernest Drew, former CEO of Hoechst Celanese, a chemical company, recalls a company conference in which the top 125 managers, mostly white males, were joined by 50 lower-level employees, mostly minorities and women. Problem-solving teams were formed to discuss how the company's corporate culture affected business and how it could be changed. Half the teams were composed of white males, while the other half were of mixed sex and race. Drew says, "It was so obvious that the diverse teams had the broader solutions. They had ideas I hadn't even thought of. For the first time, we realized that diversity is a strength as it relates to problem solving. Before, we just thought of diversity as the total number of minorities and women in the company, like affirmative action. Now we knew we needed diversity at every level of the company where decisions are made."[38]

In short, "diversity is no longer about counting heads; it's about making heads count," says Amy George, vice president of diversity and inclusion at Pepsico.[39] Harvard Business School professor David Thomas, agrees, "Where 10 or 20 years ago, companies were asking, 'Will we be diverse?' Today they must ask, 'How should we use diversity as a resource to be more effective as a business?'"[40]

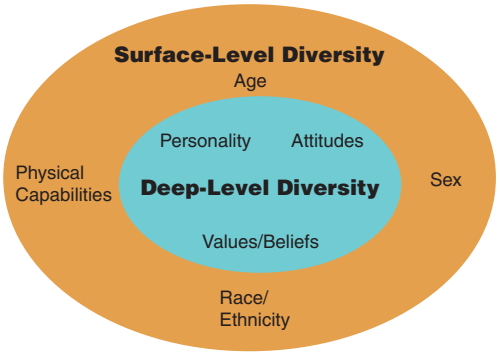
Diversity: Differences That Matter Diversity exists in organizations when there are a variety of demographic, cultural, and personal differences among the people who work there and the customers who do business there. A common misconception is that workplace diversity and affirmative action are the same. But affirmative action is more narrowly focused on demographics, is required by law, and is used to punish companies that discriminate on the basis of race, color, religion, sex, or national origin. By contrast, diversity is broader in focus (going beyond demographics), voluntary, more positive in that it encourages companies to value all kinds of differences, and substantially less controversial than affirmative action. Thus, affirmative action and diversity differ in purpose, practice, and the reactions they produce. Diversity also makes good business sense in terms of cost savings (reducing turnover, decreasing absenteeism, and avoiding lawsuits), attracting and retaining talent, and driving business growth (improving marketplace understanding and promoting higher-quality problem solving).

REVIEW 1

DIVERSITY AND INDIVIDUAL DIFFERENCES

A survey that asked managers, "What is meant by diversity to decision-makers in your organization?" found that they most frequently mentioned race, culture, sex, national origin, age, religion, and regional origin.[41] When managers describe workers this way, they are focusing on surface-level diversity. **Surface-level diversity**, as illustrated in Exhibit 12.3, consists of differences that are immediately observable, typically unchangeable, and easy to measure.[42] In other words, independent observers can usually agree on dimensions of surface-level diversity, such as another person's age, sex, race/ethnicity, or physical capabilities.

EXHIBIT 12.3 Surface- and Deep-Level Diversity



Most people start by using surface-level diversity to categorize or stereotype other people. But those initial categorizations typically give way to deeper impressions formed from knowledge of others' behavior and psychological characteristics such as personality and attitudes.[43] When you think of others this way, you are focusing on deep-level diversity. **Deep-level diversity** consists of differences that are communicated through verbal and nonverbal behaviors and are learned only through extended interaction with others.[44] Examples of deep-level diversity include personality differences, attitudes, beliefs, and values. In other words, as people in diverse workplaces get to know each other, the initial focus on surface-level differences such as age, race/ethnicity, sex, and physical capabilities is replaced by deeper, more complex knowledge of coworkers.

If managed properly, the shift from surface- to deep-level diversity can accomplish two things.[45] First, coming to know and understand each other better can result in reduced prejudice and conflict. Second, it can lead to stronger social integration. **Social integration** is the degree to which group members are psychologically attracted to working with each other to accomplish a common objective, or, as one manager put it, "working together to get the job done."

After reading the next two sections, you should be able to

2. understand the special challenges that the dimensions of surface-level diversity pose for managers.
3. explain how the dimensions of deep-level diversity affect individual behavior and interactions in the workplace.

[Surface-level diversity] differences such as age, sex, race/ethnicity, and physical disabilities that are observable, typically unchangeable, and easy to measure

[Deep-level diversity] differences such as personality and attitudes that are communicated through verbal and nonverbal behaviors and are learned only through extended interaction with others

[Social integration] the degree to which group members are psychologically attracted to working with each other to accomplish a common objective

2 SURFACE-LEVEL DIVERSITY

Because age, sex, race/ethnicity, and disabilities are usually immediately observable, many managers and workers use these dimensions of surface-level diversity to form initial impressions and categorizations of coworkers, bosses, customers, or job applicants. Whether intentionally or not, sometimes those initial categorizations and impressions lead to decisions or behaviors that discriminate. Consequently, these dimensions of surface-level diversity pose special challenges for managers who are trying to create positive work environments where everyone feels comfortable and no one is advantaged or disadvantaged.

Let's learn more about those challenges and the ways that **2.1 age, 2.2 sex, 2.3 race/ethnicity, and 2.4 mental or physical disabilities can affect decisions and behaviors in organizations.**

2.1 Age

Age discrimination is treating people differently (e.g., in hiring and firing, promotion, and compensation decisions) because of their age. The victims of age discrimination are almost always older workers, and the discrimination is based on the assumption that "You can't teach an old dog new tricks." It's commonly believed that older workers can't learn how to use computers and technology, won't adapt to change, are sick more often, and, in general, are much more expensive to employ than younger workers. One manager explains his preference for younger workers over older workers this way: "The way I look at it, for $40,000 or $50,000, I can get a smart, raw kid right out of undergrad who's going to work seven days a week for me for the next two years. I'll train him the way I want him, he'll grow with me, and I'll pay him long-term options so I own him, for lack of a better word. He'll do exactly what I want—and if he doesn't, I'll fire him. . . . The alternative is to pay twice as much for some 40-year-old who does half the amount of work, has been trained improperly, and doesn't listen to what I say."[46] Unfortunately, attitudes like this are all too common.[47] According to the Society for Human Resource Management, 53 percent of 428 surveyed managers believed that older workers "didn't keep up with technology," and 28 percent said that older workers were "less flexible."[48] For example, when 57-year-old Sam Horgan, a former chief financial officer, was interviewing for a job, he was asked by a 30-something job interviewer, "Would you have trouble working with young bright people?"[49] It is also commonly assumed that older workers cost more, and some companies fear that older workers will require higher salaries and more health-care benefits.[50]

Not surprisingly, 80 percent of human resource managers surveyed by *Personnel Management* magazine said that age discrimination was a major problem in their organizations and, moreover, that older employees were not receiving the same training and promotional opportunities as younger workers.[51] Likewise, two-thirds of 10,000 people surveyed by AARP (American Association of Retired Persons) felt that they had been wrongly discharged from a job because of their age. In fact, a study by the Society for Human Resource Management found that 20 percent of all companies had been sued for age discrimination in the preceding 5 years.[52] Normally, somewhere between 17,000 and 20,000 age discrimination cases are filed with the EEOC each year (**http://www.eeoc.gov/stats/adea.html**). And these numbers may increase given a U.S. Supreme Court ruling that employees may sue for age discrimination even if the discrimination was not intentional (see Chapter 11's discussion of disparate treatment and adverse impact).[53] In fact, the recent round of layoffs and organizational restructuring caused by the economic recession led to a 29 percent increase in the number of allegations of age-based discrimination filed with the EEOC.[54] And, it takes older employees who are laid off much longer to find a job. A U.S. Labor Department study found that 3 years after an economic downturn, 65 percent to 69 percent of younger workers, ages 20 to 54, had found new jobs after being laid off. By contrast, just 56 percent of 55- to 64-year-olds had regained jobs, and only 24 percent of those 65 or older had found jobs.[55]

So, what's reality and what's myth? Do older employees actually cost more? In some ways, they do. The older people are and the longer they stay with a company, the more the company pays for salaries, pension plans, and vacation time. But older workers cost companies less, too, because they show better judgment, care more about the quality of their work, and are less likely to quit, show up late, or be absent, the cost of which can be substantial.[56] A survey by Chicago outplacement firm Challenger, Gray & Christmas found that only 3 percent of employees age 50 and over changed jobs in any given year, compared with 10 percent of the entire work force and 12 percent of workers ages 25 to 34. The study also found that while older workers make up about 14 percent of the work force, they suffer only 10 percent of

[Age discrimination] treating people differently (e.g., in hiring and firing, promotion, and compensation decisions) because of their age

all workplace injuries and use fewer health-care benefits than younger workers with school-age children.[57] As for the widespread belief that job performance declines with age, the scientific evidence clearly refutes this stereotype. Performance does not decline with age, regardless of the type of job.[58]

What can companies do to reduce age discrimination?[59] To start, managers need to recognize that age discrimination is much more pervasive than they probably think. Whereas "old" used to mean mid-50s, in today's workplace, "old" is closer to 40. When 773 CEOs were asked, "At what age does a worker's productivity peak?" the average age they gave was 43. Thus, age discrimination may be affecting more workers because perceptions about age have changed. In addition, with the aging of the Baby Boomers, age discrimination is more likely to occur simply because there are millions more older workers than there used to be. And, because studies show that interviewers rate younger job candidates as more qualified (even when they aren't), companies need to train managers and recruiters to make hiring and promotion decisions on the basis of qualifications, not age.

When 773 CEOs were asked, "At what age does a worker's productivity peak?" the average age they gave was 43. Thus, age discrimination may be affecting more workers because perceptions about age have changed.

Companies also need to monitor the extent to which older workers receive training. The Bureau of Labor Statistics found that the number of training courses and number of hours spent in training drops dramatically after employees reach the age of 44.[60] Finally, companies need to ensure that younger and older workers interact with each other. One study found that younger workers generally hold positive views of older workers and that the more time they spent working with older coworkers, the more positive their attitudes became.[61]

[Sex discrimination] treating people differently because of their sex

[Glass ceiling] the invisible barrier that prevents women and minorities from advancing to the top jobs in organizations

2.2 Sex

Sex discrimination occurs when people are treated differently because of their sex. Sex discrimination and racial/ethnic discrimination (discussed in the next section) are often associated with the so-called **glass ceiling**, the invisible barrier that prevents women and minorities from advancing to the top jobs in organizations.

To what extent do women face sex discrimination in the workplace? Almost every year, the EEOC receives between 21,000 and 29,000 charges of sex-based discrimination (**http://www.eeoc.gov/stats/sex.html**). In some ways, there is much less sex discrimination than there used to be. For example, whereas women held only 17 percent of managerial jobs in 1972, today they now outnumber men with 50.6 percent of managerial jobs, a percentage that now surpasses their representation in the workforce (46.3 percent).[62] Likewise, women own 40 percent of all U.S. businesses.[63] Whereas women owned 700,000 businesses in 1977 and 4.1 million businesses in 1987, today they own 10 million! Finally, though women still earn less than men on average, the differential is narrowing, as Exhibit 12.4 shows. Women earned 79.9 percent of what men did in 2008, up from 63 percent in 1979.[64]

EXHIBIT 12.4 Women's Earnings as a Percentage of Men's

Although progress is being made, sex discrimination continues to operate via the glass ceiling at higher levels in organizations, as shown in Exhibit 12.5. For instance, while the trends are upward, women are the top earners in just 6.2 percent of companies in 2008. Likewise, while there has been progress, only 15.7 percent of corporate officers (i.e., top management) were women, and the numbers are even lower for women of color. Indra K. Nooyi, PepsiCo's CEO, Andrea Jung, Avon's CEO, and Ursula Burns, Xerox's CEO, are the only women of color heading *Fortune* 500 companies.[65] Indeed, only 15 of the 500 largest companies in the United States have women CEOs. Angela Braly, CEO of WellPoint, is the only woman to run a *Fortune* 50 company.[66] Similarly, only 15.2 percent of the members of corporate boards of directors are women.

Is sex discrimination the sole reason for the slow rate at which women have been promoted to middle and upper levels of management and corporate boards? Some studies indicate that it's not.[67] In some instances, the slow progress appears to be due to career and job choices. Whereas men's career and job choices are often driven by the search for higher pay and advancement, women are more likely to choose jobs or careers that also give them a greater sense of accomplishment, more control over their work schedules, and easier movement in and out of the workplace.[68] Furthermore, women are historically much more likely than men to prioritize family over work at some time in their careers. For example, 96 percent of 600 female Harvard MBAs held jobs while they were in their 20s. That dropped to 71 percent in their late 30s when they had children, but then increased to 82.5 percent in their late 40s as their children became older.[69]

In 1979, Lilly Ledbetter (pictured) was hired as a shift supervisor in a Goodyear tire factory in Gadsen, Alabama. She had worked the night shift for nearly twenty years when someone slipped an anonymous note into her locker and the tire factory worker learned that she was being paid less than her male counterparts who were doing the same work. Ledbetter took her case all the way to the U.S. Supreme Court, but never received compensation. She continued to lead the charge to change the laws that allow men to be paid more than women who do the same work. In 2009, President Obama signed into law the Lilly Ledbetter Fair Pay Act granting equal pay to all women.

Beyond these reasons, however, it's likely that sex discrimination does play a role in women's slow progress into the higher levels of management. And even if you don't think so, many of the women you work with probably do. Indeed, one study found that more than 90 percent of executive women believed that the glass ceiling had hurt their careers.[70] In another study, 80 percent of women said they left their last organization because the glass ceiling had limited their chances for advancement.[71] A third study indicated that the glass ceiling is prompting more and more women to leave companies to start their own businesses.[72] In fact, discrimination is believed to be the most significant factor to explain the infrequency of women at top levels of management.[73] Anita Borg, a senior researcher at a *Fortune* 500 company, sums up the frustrations of many professional women when she says, "You run into subtle sexism every day. It's like water torture. It wears you down."[74] Very few professional women achieve the same status as their male counterparts even in advanced economies, such as the United States, Canada, the United Kingdom, and Japan.[75]

In a Catalyst study of *Fortune* 1000 organizations, about two-thirds of the executives and half of the CEOs surveyed noted the failure of senior leadership to assume accountability for women's advancement to be the key barrier preventing professional women from progressing to senior executive positions.[76] So, what can companies do to make sure that women have the same opportunities for development and advancement as men? One strategy is mentoring, or pairing promising female executives with senior executives from whom they can seek advice and support. A vice president at a utility company says, "I think it's the single most critical piece to women advancing career-wise. In my experience you need somebody to help guide you and . . . go to bat for you."[77] In fact, 91 percent of female executives had a mentor at some point and feel their mentor was critical to their advancement.

Another strategy is to make sure that male-dominated social activities don't unintentionally exclude women. Nearly half (47 percent) of women in the work force believe that "exclusion from informal networks" makes it more difficult to advance their careers. By contrast, just 18 percent of CEOs thought this was a problem.[78] One final strategy is to designate a go-to person other than their supervisors that women can talk to if they believe that they are being held back or discriminated against because of their sex. Make sure this person has the knowledge and authority to conduct a fair, confidential internal investigation.[79]

2.3 Race/Ethnicity

Racial and ethnic discrimination occurs when people are treated differently because of their race or ethnicity. To what extent is racial and ethnic discrimination a factor in the workplace? Every year, the EEOC receives between 26,000 and 35,000 charges of race discrimination, which is more than any other type of charge of discrimination.[80] However, it is true that since the passage of the 1964 Civil Rights Act and Title VII, there is much less racial and ethnic discrimination than there used to be. For example, 18 *Fortune* 500 firms had an African American or Hispanic CEO in 2007, whereas none did in 1988.[81] Nonetheless, strong racial and ethnic disparities still exist. For instance, whereas 11 percent of Americans are black, only 6.4 percent of managers and 3.9 percent of CEOs are black. Similarly, 14 percent of Americans are Hispanic, but only 7.3 percent are managers and 4.8 percent are CEOs. By contrast, Asians, who constitute 4.7 percent of the population, are better represented, holding 4.6 percent of management jobs and 4 percent of CEO jobs.[82]

[Racial and ethnic discrimination] treating people differently because of their race or ethnicity

What accounts for the disparities between the percentages of minority groups in the general population and their smaller representation in management positions? Some studies have found that the disparities are due to preexisting differences in training, education, and skills. When African Americans, Hispanics, Asian Americans, and whites have similar skills, training, and education, they are much more likely to have similar jobs and salaries.[83]

Other studies, however, provide increasingly strong direct evidence of racial or ethnic discrimination in the workplace. For example, one study directly tested hiring discrimination by sending pairs of black and white males and pairs of Hispanic and non-Hispanic males to apply for the same jobs. Each pair had résumés with identical qualifications, and all were trained to present themselves in similar ways to minimize differences during interviews. The researchers found that the white males got three times as many job offers as the black males, and that the non-Hispanic males got three times as many offers as the Hispanic males.[84]

Another study, which used similar methods to test hiring procedures at 149 different companies, found that whites received 10 percent more interviews than blacks. Half of the whites interviewed received job offers, but only 11 percent of the blacks. And when job offers were made, blacks were much more likely to be offered lower-level positions, while whites were more likely to be offered jobs at higher levels than the jobs they had applied for.[85]

Critics of these studies point out that it's nearly impossible to train different applicants to give identical responses in job interviews and that differences in interviewing skills may have somehow accounted for the results. However, British researchers found similar kinds of discrimination just by sending letters of inquiry to prospective employers. As in the other studies, the letters were identical except for the applicant's race. Employers frequently responded to letters from Afro-Caribbean, Indian, or Pakistani applicants by indicating that the positions had been filled. By contrast, they often responded to white, Anglo-Saxon applicants by inviting them to face-to-face interviews. Similar results were found with Vietnamese and Greek applicants in Australia.[86] In short, the evidence strongly indicates that there is strong and persistent racial and ethnic discrimination in the hiring processes of many organizations.

What can companies do to make sure that people of all racial and ethnic backgrounds have the same opportunities?[87] Start by looking at the numbers. Compare the hiring rates of whites with the hiring rates for racial and ethnic applicants. Do the same thing for promotions within the company. See if nonwhite workers quit the company at higher rates than white workers. Also, survey employees to compare white and nonwhite employees' satisfaction with jobs, bosses, and the company as well as their perceptions concerning equal treatment. Next, if the numbers indicate racial or ethnic disparities, consider employing a private firm to test your hiring system by having applicants of different races with identical qualifications apply for jobs in your company.[88] Although disparities aren't proof of discrimination, it's much better to investigate hiring

and promotion disparities yourself than to have the EEOC or a plaintiff's lawyer do it for you.

Another step companies can take is to eliminate unclear selection and promotion criteria. Vague criteria allow decision makers to focus on non-job-related characteristics that may unintentionally lead to employment discrimination. Instead, selection and promotion criteria should spell out the specific knowledge, skills, abilities, education, and experience needed to perform a job well. Finally, as explained in Chapter 11, "Managing Human Resources," it is also important to train managers and others who make hiring and promotion decisions.

2.4 Mental or Physical Disabilities

Habitat International, a leading supplier of artificial-grass and indoor-outdoor carpet products for Home Depot, Lowe's, and other retailers, is also a socially responsible business because it employs hard-to-place workers. In fact, 75 percent of Habitat's workers have a physical or mental disability, or both. Over the years the company has also employed recovering alcoholics, homeless people, non-English-speaking refugees, and others who, when given a chance, work hard to overcome the stereotypes about them. Launched by David Morris and his father, Saul, in 1981, the Chattanooga, Tennessee, company has become a role model for other businesses, disability advocates, and the general public. Pepsi's Diversity Culture

It's not surprising that when it came time for PepsiCo to choose a new CEO, the board picked the Indian-born female executive Indra Nooyi. PepsiCo has a long history of diversity, stretching back to the end of World War II, when president Walter Mack hired Edward Boyd away from the National Urban League to head a team charged with launching a marketing program for African American consumers. In every area of the country where Boyd's team ran a marketing blitz, Pepsi sales increased, and soon Pepsi-Cola was able to overtake market leader Coca-Cola in cities like Cleveland and Chicago. One of the most successful campaigns was a series of print advertisements titled "Leaders in Their Fields," which profiled the accomplishments of professional and successful African Americans. Pepsi's print campaign was the first to shun the stereotypical images of African Americans used in advertising.

matter most, and its philosophy of love, kindness, and compassion honors the special diversity of the people who work there (**http://www.habitatinc.com**).[89]

According to the Americans with Disabilities Act (**http://www.ada.gov**), a **disability** is a mental or physical impairment that substantially limits one or more major life activities.[90] One in every five Americans, or more than 54 million people, has a disability.[91] **Disability discrimination** occurs when people are treated differently because of their disabilities. To what extent is disability discrimination a factor in the workplace? Although 79.7 percent of the overall U.S. population was employed in 2006, just 36.9 percent of people with disabilities had jobs. Individuals with sensory disabilities (46.4 percent), such as blindness or deafness, had the highest employment rates; those with self-care disabilities (16.7 percent), which inhibit their motor skills and their ability to care for their grooming needs, were the least represented in the work force.[92] Furthermore, people with disabilities are disproportionately employed in low-status or part-time jobs, have little chance for advancement, and, on average, are twice as likely to live in poverty as people without disabilities.[93] Numerous studies also indicate that managers and the general public believe that discrimination against people with disabilities is common and widespread.[94]

What accounts for the disparities between the employment and income levels of people with and without disabilities? Contrary to popular opinion, it has nothing to do with how well people with disabilities can do their jobs. Studies show that as long as companies make reasonable accommodations for disabilities (e.g., changing procedures or equipment), people with disabilities perform their jobs just as well as people without disabilities. Furthermore, they have better safety records and are not any more likely to be absent or quit their jobs.[95]

What can companies do to make sure that people with disabilities have the same opportunities as everyone else? Beyond educational efforts to address incorrect stereotypes and expectations, a good place to start is to commit to reasonable workplace accommodations such as changing work schedules, reassigning jobs, acquiring or modifying equipment, or providing assistance when needed. Accommodations for disabilities needn't be expensive. According to the Job Accommodation Network, 56 percent of accommodations don't cost anything at all, while those with a costs are typically just $600.[96] For example, rather than rebuild its offices, the U.S. Postal Service used inexpensive ramps to raise wheelchair-bound clerks to counter level so they could wait on customers. Other examples of low-cost accommodations include a telephone sound amplifier ($48) for a hearing-impaired factory worker; a card system with streets filed alphabetically with ZIP codes ($150) for a learning-impaired mailroom worker who couldn't remember which streets had which ZIP codes; lateral filing cabinets ($450 each) for a clerk who couldn't reach the vertical filing cabinets from her wheelchair; and a personal paging device ($350) that vibrated to notify a grocery store worker with Down syndrome who couldn't hear the public address system when he was to go to the store office.[97] For further information about reasonable accommodations, visit the Job Accommodation Network (**http://janweb.icdi.wvu.edu**), which provides free help and has a database of 26,000 successful accommodations. Exhibit 12.6 provides a list of common, inexpensive accommodations that companies can make for workers with disabilities.

Some of the accommodations just described involve *assistive technology* that gives workers with disabilities the tools they need to overcome their disabilities. Providing workers with assistive technology is also an effective strategy to recruit, retain, and enhance the productivity of people with disabilities. According to the National Council on Disability, 92 percent of workers with disabilities who use

assistive technology report that it helps them work faster and better, 81 percent indicate that it helps them work longer hours, and 67 percent say that it is critical to getting a job.[98] To learn about assistive technologies that can help workers with disabilities, see Abledata (**http://www.abledata.com**), which lists 25,000 products from 3,000 organizations, or the National Rehabilitation Information Center (**http://www.naric.com**), which provides information for specific disabilities.

Finally, companies should actively recruit qualified workers with disabilities. Numerous organizations, such as Mainstream, Kidder Resources, the American Council of the Blind (**http://www.acb.org**), the National Federation of the Blind (**http://www.nfb.org**), the National Association of the Deaf (**http://www.nad.org**), the Epilepsy Foundation (**http://www.epilepsyfoundation.org**), and the National Amputation Foundation (**http://www.nationalamputation.org**), actively work with employers to find jobs for qualified people with disabilities. Companies can also place advertisements in publications, such as *Careers and the Disabled*, that specifically target workers with disabilities.[99]

REVIEW 2

Surface-Level Diversity Age, sex, race/ethnicity, and physical and mental disabilities are dimensions of surface-level diversity. Because those dimensions are (usually) easily observed, managers and workers tend to rely on them to form initial impressions and stereotypes. Sometimes this can lead to age, sex, racial/ethnic, or disability discrimination (i.e., treating people differently) in the workplace. In general, older workers, women, people of color or different national origins, and people with disabilities are less likely to be hired or promoted than white males. This disparity is often due to incorrect beliefs or stereotypes, such as "job performance declines with age," or "women aren't willing to travel on business," or "workers with disabilities aren't as competent as workers without disabilities." To reduce discrimination, companies can determine the hiring and promotion rates for different groups, train managers to make hiring and promotion decisions on the basis of specific criteria, and make sure that everyone has equal access to training, mentors, reasonable work accommodations, and assistive technology. Finally, companies need to designate a go-to person whom employees can talk to if they believe they have suffered discrimination.

3 DEEP-LEVEL DIVERSITY

Have you ever taken an instant dislike to someone—perhaps because of the way the person talked, acted, or treated you—only to decide, after spending some time working or interacting with this person, that your initial impressions were wrong and that he or she wasn't so bad after all? If you've had this experience, then you understand the difference between surface and deep-level diversity.

As you learned in Section 2, people often use the dimensions of surface-level diversity to form initial impressions about others. Over time, however, as people have a chance to get to know each other, initial impressions based on age, sex, race/ethnicity, and mental or physical disabilities give way to deeper impressions based on behavior and psychological characteristics. When we think of others this way, we are focusing on deep-level diversity. *Deep-level diversity* represents differences that can be learned only through extended interaction with others. Examples of deep-level diversity include differences in personality, attitudes, beliefs, and values. In short, recognizing deep-level diversity requires getting to know and understand one another better. And that matters, because it can result in less prejudice, discrimination, and conflict in the workplace. These changes can then lead to better *social integration*, the degree to which organizational or group members are psychologically attracted to working with each other to accomplish a common objective.

Let's examine deep-level diversity by exploring **3.1 the "Big Five" dimensions of personality** and **3.2 other significant work-related aspects of personality**.

3.1 Big Five Dimensions of Personality

Stop for a second and think about your boss (or the boss you had in your last job). What words would you use to describe him or her? Is your boss introverted or extraverted? Emotionally stable or unstable? Agreeable or disagreeable? Organized or disorganized? Open or closed to new experiences? When you describe your boss or others in this way, what you're really doing is describing dispositions and personality.

A **disposition** is the tendency to respond to situations and events in a predetermined manner. **Personality** is the relatively stable set of behaviors, attitudes, and emotions displayed over time that makes people different from each other.[100] For example, which of your aunts or uncles is a little offbeat, a little out of the ordinary? What was that aunt or uncle like when you were small? What is she or he like now? Chances are she or he is pretty much the same wacky person. In other words, the person's core personality hasn't changed. For years, personality researchers studied hundreds of different ways to describe people's personalities. In the last decade, however, personality research conducted in different cultures, different settings, and different languages has shown that five basic dimensions of personality account for most of the differences in peoples' behaviors, attitudes, and emotions (or for why your boss is the way he or she is!). The *Big Five Personality Dimensions* are extraversion, emotional stability, agreeableness, conscientiousness, and openness to experience.[101]

Extraversion is the degree to which someone is active, assertive, gregarious, sociable, talkative, and energized by others. In contrast to extraverts, introverts are less active, prefer to be alone, and are shy, quiet, and reserved. For the best results in the workplace, introverts and extraverts should be correctly matched to their jobs. Tim Burke, CEO of Quest, a technology consulting and management company based in Sacramento, California, has had trouble finding the right people for jobs. He says the biggest challenge is "when we've hired a person who has all the necessary skills but still is not right for the job." Now Quest uses personality assessment to match people to jobs, matching for instance, extraverts to outside sales jobs and introverts to technical jobs.[102]

[Disposition] the tendency to respond to situations and events in a predetermined manner

[Personality] the relatively stable set of behaviors, attitudes, and emotions displayed over time that makes people different from each other

[Extraversion] the degree to which someone is active, assertive, gregarious, sociable, talkative, and energized by others

Emotional stability is the degree to which someone is not angry, depressed, anxious, emotional, insecure, or excitable. People who are emotionally stable respond well to stress. In other words, they can maintain a calm, problem-solving attitude in even the toughest situations (e.g., conflict, hostility, dangerous conditions, or extreme time pressures). By contrast, emotionally unstable people find it difficult to handle the most basic demands of their jobs under only moderately stressful situations and become distraught, tearful, self-doubting, and anxious. Emotional stability is particularly important for high-stress jobs such as police work, fire fighting, emergency medical treatment, piloting planes, or commanding rockets. NASA'a firing of astronaut Lisa Nowak illustrates the importance of emotional stability and the failure of employers to adequately screen potential employees for important characteristics. Nowak was charged with trying to kidnap a woman she regarded as her romantic rival for the affection of a space shuttle pilot. She allegedly pepper-sprayed the woman, and police found a BB gun, a steel mallet, a knife, and rubber tubing in her possession. The inability to handle stressful situations is a clear sign of emotional instability.[103] As you learned in Chapter 1, emotional stability is also important for managers. Indeed, the number-one mistake managers make is intimidating, bullying, and being abrasive to the people who work for them.

Agreeableness is the degree to which someone is cooperative, polite, flexible, forgiving, good-natured, tolerant, and trusting. Basically, agreeable people are easy to work with and be around, whereas disagreeable people are distrusting and difficult to work with and be around. A number of companies have made general attitude or agreeableness the most important factor in their hiring decisions. Small-business owner Roger Cook says, "Hire nice people. I'm looking for personal—not professional—traits. I want a good or nice person. I can teach the skills. I call their references and ask, 'Is he or she a nice person?' I take a close look at how applicants answer questions and carry themselves. Why nice people? Because they're trustworthy; they get along with other crew members: they are good with customers and they are usually hard workers."[104]

Conscientiousness is the degree to which someone is organized, hardworking, responsible, persevering, thorough, and achievement oriented. One management consultant wrote about his experiences with a conscientious employee: "He arrived at our first meeting with a typed copy of his daily schedule, a sheet bearing his home and office phone numbers, addresses, and his e-mail address. At his request, we established a timetable for meetings for the next four months. He showed up on time every time, day planner in hand, and carefully listed tasks and due dates. He questioned me exhaustively if he didn't understand an assignment and returned on

[Emotional stability] the degree to which someone is not angry, depressed, anxious, emotional, insecure, and excitable

[Agreeableness] the degree to which someone is cooperative, polite, flexible, forgiving, good-natured, tolerant, and trusting

schedule with the completed work or with a clear explanation as to why it wasn't done."[105] Conscientious employees are also more likely to engage in positive behaviors, such as helping new employees, coworkers, and supervisors and are less likely to engage in negative behaviors, such as verbally or physically abusing coworkers or stealing.[106]

Openness to experience is the degree to which someone is curious, broadminded, and open to new ideas, things, and experiences; is spontaneous; and has a high tolerance for ambiguity. Most companies need people who are strong in terms of openness to experience to fill certain positions, but for other positions, this dimension is less important. People in marketing, advertising, research, or other creative jobs need to be curious, open to new ideas, and spontaneous. By contrast, openness to experience is not particularly important to accountants, who need to consistently apply stringent rules and formulas to make sense out of complex financial information.

Which of the Big Five Personality Dimensions has the largest impact on behavior in organizations? The cumulative results indicate that conscientiousness is related to job performance across five different occupational groups (professionals, police, managers, sales, and skilled or semiskilled jobs).[107] In short, people "who are dependable, persistent, goal directed, and organized tend to be higher performers on virtually any job; viewed negatively, those who are careless, irresponsible, low achievement striving, and impulsive tend to be lower performers on virtually any job."[109] (See the "What Really Works" feature in this chapter for further explanation.) The results also indicate that extraversion is related to performance in jobs, such as sales and management, that involve significant interaction with others. In people-intensive jobs like these, it helps to be sociable, assertive, and talkative and to have energy and be able to energize others. Finally, people who are extraverted and open to experience seem to do much better in training. Being curious and open to new experiences as well as sociable, assertive, talkative, and full of energy helps people perform better in learning situations.[110]

3.2 Work-Related Personality Dimensions

Does the way you keep your desk reveal something about your personality? Lots of people think so. For example, people with ultra-neat desks tend to believe that a desk buried under mounds of paper, food wrappers, and old magazines is a sign that its owner is lazy, disorganized, undependable, and a dreamer. On the other hand, people with messy desks believe that a spotless desk with everything in its place is a sign that its owner is impatient, critical, controlling, analytical, and a perfectionist. Who knows, maybe if your desk is somewhere between operating-room clean and the aftermath of a tornado, it is a sign that you have a good-natured, flexible, and fun-loving personality.[111] Although studies indicate that extraversion, emotional stability, agreeableness, conscientiousness, and openness to experience are the five basic dimensions of personality in any culture, setting, or language, research has also identified additional personality dimensions that directly affect workplace attitudes and behaviors. These additional personality dimensions are authoritarianism, Machiavellian tendencies, Type A/B personality, locus of control, and positive/negative affectivity.

Authoritarianism is the extent to which an individual believes there should be power and status differences within the organization.[112] Authoritarian employees are likely to prefer a direct leadership style, in which the boss tells them exactly what to do. While this sounds desirable, one disadvantage is that authoritarian employees may simply carry out their boss's orders without question even when they know a better solution or are aware of problems. Also, authoritarian employees may not

Conscientiousness: The Organized, Hardworking, Responsible Personality

Conscientious people are organized, hardworking, responsible, persevering, thorough, and achievement oriented. Who wouldn't want to hire people with these personality traits? Indeed, 92 studies across five occupational groups (professionals, police, managers, sales, and skilled/semiskilled jobs) with a combined total of 12,893 study participants indicated that, on average, conscientious people are inherently more motivated and are better at their jobs.

perform well on ambiguous tasks or for managers who encourage employees to use their own initiative and judgment.

Authoritarian leaders are highly demanding and expect employees to unquestioningly obey their orders. One such boss, a body builder who liked to show off his strength to managers by doing 25 push-ups at the start of meetings, used to call the vice president of marketing at all hours to scream about things that had gone wrong. A second bully boss, the CEO of a semiconductor network start-up, ridiculed employees publicly. "He'd pick up something I'd written and say, 'Who wrote this? A second grader? It's the stupidest thing I've ever read,'" says the firm's marketing vice president. Business executives who are too demanding or who ridicule and scream at employees undermine productivity, discourage innovation, and may cause a talent drain at their companies, says James Clifton, CEO of the Gallup Organization.[113]

[Machiavellian] the extent to which individuals believe that virtually any type of behavior is acceptable in trying to satisfy their needs or meet their goals

People with **Machiavellian** personalities believe that virtually any type of behavior is acceptable if it helps satisfy needs or accomplish goals.[114] In other words, people with Machiavellian personalities believe that the ends justify the means. For example, "high Machs" are generally more willing to use lies and deceit to get their way than

are "low Machs," even in situations where the chances of being caught in a lie are high.[115] High Machs believe that most people are gullible and can be manipulated. High Machs are also more effective at persuading others than low Machs are and tend to be resistant to others' efforts to persuade them.[116] One reason high Machs are more effective at persuading others is that low Machs (i.e., most people) may be distracted by emotions or issues unrelated to winning. By contrast, high Machs are difficult to persuade because they ignore emotions and secondary issues and focus only on the things that move them closer to their goals. Also, because they are out for themselves and no one else, high Machs don't do well in work teams. High Machs often cause conflicts within teams and sometimes cause teams to break up. The *Wall Street Journal* offers this vivid description of High Machs: "They tend to be narcissistic, arrogant, manipulative, and goal-oriented. They trust no one and refuse to collaborate. They lack a capacity for empathy but are skilled at politics. Though they purposely disregard how they're coming off to colleagues or subordinates, they're often very good at sweet-talking bosses, who remain oblivious to their dastardly ways."[117] One study found that employees stuck with such manipulative bosses experienced more exhaustion, job tension, nervousness, depressed mood, and mistrust.[118]

The **Type A/B personality dimension** is the extent to which people tend toward impatience, hurriedness, competitiveness, and hostility.[119] **Type A personalities** try to complete as many tasks as possible in the shortest possible time and are hard-driving, competitive, impatient, perfectionistic, angry, and unable to relax.[120] Type As have a high need for achievement and are also likely to be aggressive, self-confident, dominant, and extraverted. By contrast, **Type B personalities** are easygoing, patient, and able to relax and engage in leisure activities. Unlike Type A personalities, they are neither highly competitive nor excessively driven to accomplishment.

What do we know about the Type A/B personality dimension and the workplace? Contrary to what you'd expect, Type As don't always outperform Type Bs on the job. Type As tend to perform better on tasks that demand quick decisions made at a rapid work pace under time pressure, whereas Type Bs tend to perform better at tasks requiring well-thought-out decisions when there is little time pressure. And despite the characteristic Type A ambition to succeed, top managers are much more likely to have Type B personalities.[121] Ironically, the task complexity and psychological challenge inherent in management jobs actually work against many Type A managers by dramatically increasing their stress levels.[122] Type Bs, on the other hand, do a much better job of handling and responding to the stress of managerial jobs.

A study involving 6,148 people aged 14 to 102 conducted by a group of researchers and the U.S. National Institute of Aging found absolutely no connection between a hard-driving personality and heart disease, contrary to previous studies and conventional wisdom. This study clearly establishes that Type A personality in itself is not related to heart disease.[123] However, individuals who are Type A and also "hostile and angry," may be at risk of heart attack. For example, businessperson Matt Sicinski gets extremely hostile and angry when his coworkers miss deadlines or don't follow directions. Says Sicinski, "My feet get cold, and I get a throbbing in my head. I can feel every muscle in my body tense up." If he gets angry with someone on the phone, sometimes he presses the mute button so he can't be heard and begins "cursing somebody up one side and down the other."[124] How dangerous is angry, hostile behavior to your health? A long-term study at Duke University followed a group of lawyers for 25 years and found that those with higher hostility scores were 4.2 times as likely to have died over that period as those with low scores.[125] This does not bode well for Sicinski, who at age 30 already has dangerously high blood pressure, which he admits is not responding well to his blood pressure medications.

[Type A/B personality dimension] the extent to which people tend toward impatience, hurriedness, competitiveness, and hostility

[Type A personality] a person who tries to complete as many tasks as possible in the shortest possible time and is hard driving, competitive, impatient, perfectionistic, angry, and unable to relax

[Type B personality] a person who is relaxed, easygoing, and able to engage in leisure activities without worrying about work

You do poorly on an exam. Quick: Whom do you blame, yourself or the professor? The answer to that question may, to some extent, indicate whether you have an internal or external locus of control. **Locus of control** is the degree to which people believe that their actions influence what happens to them. **Internal locus of control** is the belief that what happens to you is largely under your control. Students with an internal locus of control are more likely to hold themselves accountable for their exam performance ("I studied the wrong material" or "I didn't study enough"). Besides believing that what happens to them is largely under their control, internals are also easier to motivate (especially when rewards are linked to performance), more difficult to lead, more independent, and better able to handle complex information and solve complex problems.[126]

By contrast, an **external locus of control** is the belief that what happens to you is primarily due to factors beyond your control, factors such as luck, chance, or powerful people.[127] Students with an external locus of control are more likely to attribute their poor exam performance to luck ("If only it had been an essay exam instead of multiple choice"), chance ("I didn't get enough sleep"), or the professor (a powerful person). In general, externals are more compliant and conforming and therefore easier to lead than internals. For example, internals may question directives from their managers, while externals are likely to quietly accept them. Finally, internals are likely to perform better on complex tasks that require initiative and independent decision making, whereas externals tend to perform better on simple, repetitive tasks that are well structured.

Affectivity is the stable tendency to experience positive or negative moods and to react to things in a generally positive or negative way.[128] People with **positive affectivity** consistently notice and focus on the positive aspects of themselves and their environments. In other words, they seem to be in a good mood most of the time and are predisposed to being optimistic, cheerful, and cordial. By contrast, people with **negative affectivity** consistently notice and focus on the negative in themselves and their environments. They are frequently in bad moods, consistently expect the worst to happen, and are often irritated or pessimistic.

How stable are the moods associated with positive and negative affectivity? A 10-year study by the National Institute of Aging found that even when people changed jobs or companies, the people who were the happiest at the beginning of the study were still the happiest at the end of the study 10 years later.[129] Likewise, a much longer study found that high school counselors' ratings of student cheerfulness predicted how satisfied these people were with their jobs 30 years later.[130] Since dispositions toward positive or negative affectivity are long-lasting and very stable, some companies have begun measuring affectivity during the hiring process. Indeed, a recent survey of 1,000 customers conducted by Accenture indicates that poor customer service drives nearly half of consumers to take their business elsewhere. Many experts agree that hiring people who are enthusiastic and have a positive outlook is important for providing world-class customer service.[131] Studies also show that employees with positive affectivity are absent less often, report feeling less stress, are less likely to be injured in workplace accidents, and are less likely to retaliate against management and the company when they believe that they have been treated unfairly.[132] In fact, research shows that people with a high level of negative affectivity are more likely to engage in counterproductive work behaviors, such as stealing, abusing other employees, and retaliating against management and the company.[133]

Affectivity is also important because of **mood linkage**, a phenomenon in which one worker's negative affectivity and bad moods can spread to others. Studies of nurses and accountants show a strong relationship between individual workers' moods and the moods of their coworkers.[134] Finally, people with positive affectivity are better decision makers, are rated as having much higher managerial potential,

[Locus of control] the degree to which individuals believe that their actions can influence what happens to them

[Internal locus of control] the belief that what happens to you is largely the result of your own actions

[External locus of control] the belief that what happens to you is largely the result of factors beyond your control

[Affectivity] the stable tendency to experience positive or negative moods and to react to things in a generally positive or negative way

[Positive affectivity] a personality trait in which individuals tend to notice and focus on the positive aspects of themselves and their environments

[Negative affectivity] a personality trait in which individuals tend to notice and focus on the negative aspects of themselves and their environments

[Mood linkage] a phenomenon in which one worker's negative affectivity and bad moods can spread to others

and are more successful in sales jobs.[135] Indeed, numerous studies show that happy individuals are successful across multiple domains, including marriage, friendship, income, work performance, and health.[136]

Deep-Level Diversity Deep-level diversity matters because it can reduce prejudice, discrimination, and conflict while increasing social integration. It consists of dispositional and personality differences that can be learned only through extended interaction with others. Research conducted in different cultures, settings, and languages indicates that there are five basic dimensions of personality: extraversion, emotional stability, agreeableness, conscientiousness, and openness to experience. Of these, conscientiousness is perhaps the most important to companies because conscientious workers tend to be better performers on virtually any job. Extraversion is also related to performance in jobs that require significant interaction with others. Studies also show that the personality dimensions of authoritarianism, Machiavellian tendencies, Type A/B personality, locus of control, and positive/negative affectivity are important in the workplace. These personality dimensions are related to honesty, trust, teamwork, persuasive abilities, job performance, decision making, stress, heart disease, adaptability, promotions, interpersonal skills, motivation, initiative, job satisfaction, absenteeism, accidents, retaliatory behavior, mood linkage, and management potential.

HOW CAN DIVERSITY BE MANAGED?

How much should companies change their standard business practices to accommodate the diversity of their workers? In Canada, McGregory Jackman, a bus driver for the **York Region's VIVA** public transportation system, was sent home for violating dress code by refusing to take off his kufi, a brimless religious cap often worn by Muslims. Said Jackman, "I just want to go back to work and take care of my family. I just want to be a Muslim and do my job."[137] Should Jackman be allowed to wear his kufi consistent with his religious beliefs or is his employer correct for insisting that all bus drivers follow the dress code? What do you do when a talented top executive has a drinking problem that seems to affect his behavior only at company business parties (for entertaining clients), where he has made inappropriate advances toward female employees? What do you do when, despite aggressive company policies against racial discrimination, employees continue to tell racial jokes and publicly post cartoons displaying racial humor? And, since many people confuse diversity with affirmative action, what do you do to make sure that your company's diversity practices and policies are viewed as benefiting all workers and not just some workers?

After reading the next section, you should be able to

4. explain the basic principles and practices that can be used to manage diversity.

No doubt about it, questions like these make managing diversity one of the toughest challenges that managers face.[138] Nonetheless, there are steps companies can take to begin to address these issues.

4 MANAGING DIVERSITY

As discussed earlier, diversity programs try to create a positive work environment where no one is advantaged or disadvantaged, where "we" is everyone, where everyone can do his or her best work, where differences are respected and not ignored, and where everyone feels comfortable. Let's begin to address those goals by learning about **4.1 different diversity paradigms, 4.2 diversity principles,** and **4.3 diversity training and practices.**

4.1 Diversity Paradigms

As shown in Exhibit 12.7, there are several different methods or paradigms for managing diversity: the discrimination and fairness paradigm, the access and legitimacy paradigm, and the learning and effectiveness paradigm.[139]

The *discrimination and fairness paradigm*, which is the most common method of approaching diversity, focuses on equal opportunity, fair treatment, recruitment

EXHIBIT 12.7 Paradigms for Managing Diversity

Diversity paradigm	Focus	Success measured by	Benefits	Limitations
Discrimination & Fairness	Equal opportunity Fair treatment Recruitment of minorities Strict compliance with laws	Recruitment, promotion, and retention goals for underrepresented groups	Fairer treatment Increased demographic diversity	Focus on surface-level diversity
Access & Legitimacy	Acceptance and celebration of differences	Diversity in company matches diversity of primary stakeholders	Establishes a clear business reason for diversity	Focus on surface-level diversity
Learning & Effectiveness	Integrating deep-level differences into organization	Valuing people on the basis of individual knowledge, skills, and abilities	Values common ground Distinction between individual and group differences Less conflict, backlash, and divisiveness Bringing different talents and perspectives together	Focus on deep-level diversity is more difficult to measure and quantify

of minorities, and strict compliance with the equal employment opportunity laws. Under this approach, success is usually measured by how well companies achieve recruitment, promotion, and retention goals for women, people of different racial/ethnic backgrounds, or other underrepresented groups. According to a recent workplace diversity practices survey conducted by the Society of Human Resource Management, 66 percent to 91 percent of companies use specialized strategies to recruit, retain, and promote talented women and minorities. The percentages increase with company size, and companies of more than 500 employees are the most likely to use these strategies. Seventy-seven percent of companies with more than 500 employees systematically collect measurements on diversity-related practices.[140] One manager says, "If you don't measure something, it doesn't count. You measure your market share. You measure your profitability. The same should be true for diversity. There has to be some way of measuring whether you did, in fact, cast your net widely, and whether the company is better off today in terms of the experience of people of color than it was a few years ago. I measure my market share and my profitability. Why not this?"[141] The primary benefit of the discrimination and fairness paradigm is that it generally brings about fairer treatment of employees and increases demographic diversity. The primary limitation is that the focus of diversity remains on the surface-level diversity dimensions of sex, race, and ethnicity.[142]

"If you don't measure something, it doesn't count. You measure your market share. You measure your profitability. The same should be true for diversity."

The *access and legitimacy paradigm* focuses on the acceptance and celebration of differences to ensure that the diversity within the company matches the diversity found among primary stakeholders, such as customers, suppliers, and local communities. This is similar to the *business growth* advantage of diversity discussed earlier in the chapter. The basic idea behind this approach is to create a demographically diverse work force to then attract a broader customer base. Consistent with this goal, Ed Adams, vice president of human resources for Enterprise Rent-a-Car, says, "We want people who speak the same language, literally and figuratively, as our customers. We don't set quotas. We say [to our managers], 'Reflect your local market.'"[143] The primary benefit of this approach is that it establishes a clear business reason for diversity. Like the discrimination and fairness paradigm, however, it focuses only on the surface-level diversity dimensions of sex, race, and ethnicity. Furthermore, employees who are assigned responsibility for customers and stakeholders on the basis of their sex, race, or ethnicity may eventually feel frustrated and exploited.

Whereas the discrimination and fairness paradigm focuses on assimilation (having a demographically representative work force) and the access and legitimacy paradigm focuses on differentiation (having demographic differences inside the company match those of key customers and stakeholders), the *learning and effectiveness paradigm* focuses on integrating deep-level diversity differences, such as personality, attitudes, beliefs, and values, into the actual work of the organization. Aetna's 28,000 employees are diverse not only in terms of sex, ethnicity, and race, but also by age group, sexual orientation, work styles and levels, perspective, education, skills, and other characteristics. Raymond Arroyo, head of diversity at Aetna, says, "Diversity at Aetna means treating individuals individually, leveraging everyone's best, and maximizing the powerful potential of our workforce." He adds, "Part of a top diversity executive's role in any organization is to integrate diversity into every aspect of a business, including the workforce, customers, suppliers, products, services and even into the community a business serves."[144] Exhibit 12.8 shows the necessary preconditions for creating a learning and effectiveness diversity paradigm within an organization.

EXHIBIT 12.8 Creating a Learning and Effectiveness Diversity Paradigm in an Organization

1. The leadership must understand that a diverse workforce will embody different perspectives and approaches to work, and must truly value variety of opinion and insight.
2. The leadership must recognize both the learning opportunities and the challenges that the expression of different perspectives presents for an organization.
3. The organizational culture must create an expectation of high standards of performance for everyone.
4. The organizational culture must stimulate personal development.
5. The organizational culture must encourage openness and a high tolerance for debate and support constructive conflict on work-related matters.
6. The culture must make workers feel valued.
7. The organization must have a well-articulated and widely understood mission. This keeps discussions about work differences from degenerating into debates about the validity of people's perspectives.
8. The organization must have a relatively egalitarian, nonbureaucratic structure.

The learning and effectiveness paradigm is consistent with achieving organizational plurality. **Organizational plurality** is a work environment where (1) all members are empowered to contribute in a way that maximizes the benefits to the organization, customers, and themselves and (2) the individuality of each member is respected by not segmenting or polarizing people on the basis of their membership in a particular group.[145]

The learning and effectiveness diversity paradigm offers four benefits.[146] First, it values common ground. Dave Thomas of the Harvard Business School explains, "Like the fairness paradigm, it promotes equal opportunity for all individuals. And like the access paradigm, it acknowledges cultural differences among people and recognizes the value in those differences. Yet this new model for managing diversity lets the organization internalize differences among employees so that it learns and grows because of them. Indeed, with the model fully in place, members of the organization can say, 'We are all on the same team, with our differences—not despite them.'"[147]

Second, this paradigm makes a distinction between individual and group differences. When diversity focuses only on differences between groups, such as females versus males, large differences within groups are ignored.[148] For example, think of the women you know at work. Now, think for a second about what they have in common. After that, think about how they're different. If your situation is typical, the list of differences should be just as long as the list of commonalties, if not longer. In short, managers can achieve a greater understanding of diversity and their employees by treating them as individuals and by realizing that not all African Americans, Hispanics, women, or white males want the same things at work.[149]

[Organizational plurality] a work environment where (1) all members are empowered to contribute in a way that maximizes the benefits to the organization, customers, and themselves, and (2) the individuality of each member is respected by not segmenting or polarizing people on the basis of their membership in a particular group

Third, because the focus is on individual differences, the learning and effectiveness paradigm is less likely to encounter the conflict, backlash, and divisiveness sometimes associated with diversity programs that focus only on group differences. Taylor Cox, one of the leading management writers on diversity, says, "We are concerned here with these more destructive forms of conflict which may be present with diverse work forces due to language barriers, cultural clash, or resentment by majority-group members of what they may perceive as preferential and unwarranted treatment of minority-group members."[150] And Ray Haines, a consultant who has helped companies deal with the aftermath of diversity programs that became divisive, says, "There's a large amount of backlash related to diversity training. It stirs up a lot of hostility, anguish, and resentment but doesn't give people tools to deal with [the backlash]. You have people come in and talk about their specific ax to grind."[151] Not all diversity programs are divisive or lead to conflict. But by focusing on individual rather than group differences, the learning and effectiveness paradigm helps to minimize these potential problems.

Finally, unlike the other diversity paradigms that simply focus on surface-level diversity, the learning and effectiven ess paradigm focuses on bringing different talents and perspectives *together* (i.e., deep-level diversity) to make the best organizational decisions and to produce innovative, competitive products and services.

4.2 Diversity Principles

Diversity paradigms are general approaches or strategies for managing diversity. Whatever diversity paradigm a manager chooses, the diversity principles shown in Exhibit 12.9 will help managers do a better job of *managing company diversity programs*.[152]

Begin by *carefully and faithfully following and enforcing federal and state laws regarding equal opportunity employment*. Diversity programs can't and won't succeed if the company is being sued for discriminatory actions and behavior. Faithfully following the law will also reduce the time and expense associated with EEOC investigations or lawsuits. Start by learning more at the EEOC website (**http://www.eeoc.gov**). Following the law also means strictly and fairly enforcing company policies.

Treat group differences as important, but not special. Surface-level diversity dimensions such as age, sex, and race/ethnicity should be respected but should not be treated as more important than other kinds of differences (i.e., deep-level diversity). Remember, the shift from surface- to deep-level diversity helps people know and understand each other better, reduces prejudice and conflict, and leads to stronger social integration with people wanting to work together and get the job done. Also, *find the common ground*. Although respecting differences is important, it's just as important, especially with diverse work forces, to actively find ways for employees to see and share commonalties.

Tailor opportunities to individuals, not groups. Special programs for training, development, mentoring, or promotions should be based on individual strengths and weaknesses, not on group status. Instead of making mentoring available for just one group of workers, create mentoring opportunities for everyone who wants to be mentored. All

1. Carefully and faithfully follow and enforce federal and state laws regarding equal employment opportunity.
2. Treat group differences as important, but not special.
3. Find the common ground.
4. Tailor opportunities to individuals, not groups.
5. Reexamine, but maintain, high standards.
6. Solicit negative as well as positive feedback.
7. Set high but realistic goals.

programs at Pacific Enterprises, including Career Conversations forums, in which upper-level managers are publicly interviewed about themselves and how they got their jobs, are open to all employees.[153]

Maintain high standards. Companies have a legal and moral obligation to make sure that their hiring and promotion procedures and standards are fair to all. At the same time, in today's competitive markets, companies should not lower standards to promote diversity. This not only hurts the organizations but also feeds the stereotype that applicants who are hired or promoted in the name of affirmative action or diversity are less qualified. Executive director of diversity Monica Emerson says, "As a diversity executive, I not only have to have solid business capabilities, I need to be very knowledgeable of the different businesses in my organization to align diversity initiatives to support the needs of the businesses. Maintaining high standards when making employment decisions and involving the top management and the board in diversity initiatives is critical to the success of workplace diversity parctices."[154]

Solicit negative as well as positive feedback. Diversity is one of the most difficult management issues. No company or manager gets it right from the start. Consequently, companies should aggressively seek positive and negative feedback about their diversity programs. One way to do that is to use a series of measurements to see if progress is being made. L'Oréal, the cosmetics firm, has goals and measurements to track its progress in diversity with respect to recruitment, retention, and advancement as well as the extent to which the company buys goods and services from minority- and women-owned suppliers.[155]

Set high but realistic goals. Just because diversity is difficult doesn't mean that organizations shouldn't try to accomplish as much as possible. The general purpose of diversity programs is to try to create a positive work environment where no one is advantaged or disadvantaged, where "we" is everyone, where everyone can do his or her best work, where differences are respected and not ignored, and where everyone feels comfortable. Even if progress is slow, companies should not shrink from these goals.

doing the right thing

Don't Break the Law in the Name of Diversity

As you learned in Chapter 11 on human resource management, the general effect of employment law, which is still evolving through court decisions, is that employers may not discriminate in employment decisions on the basis of sex, age, religion, color, national origin, race, or disability. Employment decisions should be based on factors that are "job related," "reasonably necessary," or a "business necessity" for successful job performance. With one exception (see Chapter 11 for further explanation), employers who use sex, age, race, or religion to make employment-related decisions when those factors are unrelated to an applicant's or employee's ability to perform a job may face charges of discrimination from employee lawsuits or the Equal Employment Opportunity Commission. So, do the right thing. Stay within the law as you build a diverse work force.

4.3 Diversity Training and Practices

Organizations use diversity training and several common diversity practices to manage diversity. There are two basic types of diversity training programs. **Awareness training** is designed to raise employees' awareness of diversity issues, such as those discussed in this chapter, and to get employees to challenge underlying assumptions or stereotypes they may have about others. As a starting point in awareness training, some companies have begun using the Implicit Association Test (IAT), which measures the extent to which people associate positive or negative thoughts (i.e., underlying assumptions or stereotypes) with blacks or whites, men or women, homosexuals or heterosexuals, young or old, or other groups. For example, test takers are shown black or white faces that they must instantly pair with various words. Response times (shorter responses generally indicate stronger associations) and the pattern of associations indicate the extent to which people are biased. Most people are, and strongly so. For example, 88 percent of whites have a more positive mental association toward whites than toward blacks, but, surprisingly, so do blacks, 48 percent of whom show the same bias. Taking the IAT is a good way to increase awareness of diversity issues. To take the IAT and to learn more about the decade of research behind it, go to **https://implicit.harvard.edu**.[156] By contrast, **skills-based diversity training** teaches employees the practical skills they need for managing a diverse work force, skills such as flexibility and adaptability, negotiation, problem solving, and conflict resolution.[157]

Companies also use diversity audits, diversity pairing, and minority experiences for top executives to better manage diversity. **Diversity audits** are formal assessments that measure employee and management attitudes, investigate the extent to which people are advantaged or disadvantaged with respect to hiring and promotions, and review companies' diversity-related policies and procedures. For example, the results of a formal diversity audit prompted BRW, an architecture and engineering firm, to increase job advertising in minority publications, set up a diversity committee to make recommendations to upper management, provide diversity training for all employees, and rewrite the company handbook to make a stronger statement about the company's commitment to a diverse work force.[158]

Earlier in the chapter you learned that *mentoring*, pairing a junior employee with a senior employee, is a common strategy for creating learning and promotional opportunities for women. Diversity pairing is a special kind of mentoring. In **diversity pairing**, people of different cultural backgrounds, sexes, or races/ethnicities are paired for mentoring. The hope is that stereotypical beliefs and attitudes will change as people get to know each other as individuals.[159] Consultant Tom

[Awareness training] training that is designed to raise employees' awareness of diversity issues and to challenge the underlying assumptions or stereotypes they may have about others

[Skills-based diversity training] training that teaches employees the practical skills they need for managing a diverse work force, such as flexibility and adaptability, negotiation, problem solving, and conflict resolution

[Diversity audits] formal assessments that measure employee and management attitudes, investigate the extent to which people are advantaged or disadvantaged with respect to hiring and promotions, and review companies' diversity-related policies and procedures

[Diversity pairing] a mentoring program in which people of different cultural backgrounds, sexes, or races/ethnicities are paired together to get to know each other and change stereotypical beliefs and attitudes

More and more companies are embracing diversity because it makes good business sense. As this ad for Cargill puts it, "No one has a monopoly on good ideas."

McGee, who has set up mentoring programs for numerous companies, supports diversity pairing, saying, "the assumption that people participating in diversity mentoring programs are looking for someone of the same race or gender has been proved wrong in many cases."[160] Pat Carmichael, an African American female vice president at JPMorgan Chase, who was mentored early in her career by a white male, mentors men and women of all backgrounds. Regarding a current mentee, John Imperiale, a white assistant branch manager, she says, "My hope is that the exposure John has to me will give him insights when he's managing a diverse group of employees."[161]

Finally, because top managers are still overwhelmingly white and male, a number of companies believe that it is worthwhile to *have top executives experience what it is like to be in the minority*. This can be done by having top managers go to places or events where nearly everyone else is of a different sex or racial/ethnic background. At Hoechst Celanese (which has now split into two companies), top managers would join two organizations in which they were a minority. For instance, the CEO, a white male, joined the board of Hampton University, a historically African American college, and Jobs for Progress, a Hispanic organization that helps people prepare for jobs. Commenting on his experiences, he said, "The only way to break out of comfort zones is to be exposed to other people. When we are, it becomes clear that all people are similar." A Hoechst vice president who joined three organizations in which he was in the minority said, "Joining these organizations has been more helpful to me than two weeks of diversity training."[162]

REVIEW 4

Managing Diversity The three paradigms for managing diversity are the discrimination and fairness paradigm (equal opportunity, fair treatment, strict compliance with the law), the access and legitimacy paradigm (matching internal diversity to external diversity), and the learning and effectiveness paradigm (achieving organizational plurality by integrating deep-level diversity into the work of the organization). Unlike the other paradigms, which focus on surface-level differences, the learning and effectiveness program values common ground, distinguishes between individual and group differences, minimizes conflict and divisiveness, and focuses on bringing different talents and perspectives together. What principles can companies use when managing diversity? Follow and enforce federal and state laws regarding equal employment opportunity. Treat group differences as important, but not special. Find the common ground. Tailor opportunities to individuals, not groups. Reexamine, but maintain, high standards. Solicit negative as well as positive feedback. Set high but realistic goals. The two types of diversity training are awareness training and skills-based diversity training. Companies also manage diversity through diversity audits and diversity pairing and by having top executives experience what it is like to be in the minority.

SELF ASSESSMENT

Do You Know Your Mind?

Do you always speak your mind? Chances are that you probably don't—at least not always. In some cases, you may not even know your mind. Our conscious mind is not always aligned with our subconscious, and we may be motivated by deeply held beliefs that diverge from our image of who we are or want to be. Researchers at Harvard have developed a series of assessments to help you identify your implicit associations about a variety of topics, many related to the diversity issues you learned about in this chapter. Unlike the other assessments in this book, this one requires you to go online. Each Project Implicit test, which is also called an Implicit Association Test (IAT), takes about 10 minutes to complete. However, you'll find it worthwhile to complete all of the different IATs. The researchers ask that you complete the initial surveys so that they can further enrich their data, but you needn't worry about privacy issues. They are only interested in the raw data and not in who actually contributed it.

1. To begin, go to **https://implicit.harvard.edu** and click on "**Demonstration.**"
2. You will then be given a brief description of the project and prompted to "**Go to the demonstration tests.**" Click on that hot link.
3. The front page of the demonstration tests is a more detailed synopsis of the project and a disclaimer. Read the information, and then click on "**I wish to proceed.**"
4. You will then reach the list of all the tests: age, gender-science, race, presidents, sexuality, gender-career, Arab-Muslim, weight, religion, disability, Native, Asian, weapons, and skin tone. The tests most closely related to Chapter 12's content on diversity are age, race, sexuality, gender-career, weight, disability, Native, Asian, and skin tone. Each time you complete an IAT, return to the list to select the next relevant test for this course. We'll use the age IAT as the basis for these instructions. Once you get the hang of it, you will be able to move through the preliminaries on any of the IATs. To begin, click on "**Age IAT.**"
5. You will be directed to a page of technical information related to your computer settings. If you can see the green check mark, then click to begin. At the next page, click on "**Continue.**"
6. A survey of general information will pop up. The survey for each IAT is slightly different, except for the main demographic information at the bottom (age, race, etc.). Once you complete the survey, click on "**Proceed.**"
7. Read the instructions carefully. In essence, each time a certain word or image appears, you will need to either respond by typing an "e" or an "i." The words used are purposely set to be obviously good or bad. For example, few people would dispute that *evil* goes in the category labeled "bad," and *love* goes in the category labeled "good." Don't get caught up in semantics; just classify the terms as they are understood in the common language.
8. The test will ask you to classify the words and images several times, switching the words and images from the left hand to the right hand. That way, your right hand isn't always typing an "i" for good and your left an "e" for bad. Pay attention to the changes.

MANAGEMENT DECISION

Company of INTJs Seeks ESFP Employee

Every business magazine you've picked up recently has had some kind of article on personality testing in the workplace.[163] You've read about the Caliper, used by FedEx, the Chicago Cubs, and the WNBA's Phoenix Mercury. Anne Mariucci, part-owner of the Mercury, uses the test to evaluate potential draft picks and make coaching assignments. With the help of a consultant, venerable retailer Neiman Marcus designed a test to identify the characteristics needed to be a successful sales associate; as a result, it has increased sales per associate by 42 percent and reduced staff turnover by 18 percent. Today, you're reading about a personality test originally designed for Olympic teams and military units (small groups in high-pressure situations with a single, focused goal).

As you close your magazine, you can't help thinking about diversity. As the manager in a medium-sized candy company, you have always made sure that your work force was diverse with respect to minorities and women, but until now you've never considered managing based on personalities. Even though personality tests sound like a good idea (lots of reputable companies are using them), you wonder about the drawbacks. There must be some, in addition to the several hundred dollars it would cost to test each of your 75 employees, or you would have started testing a long time ago.

The stack of articles you've read, however, is prompting you to think that personality testing might be a good idea. It looks like the only way to ensure deep-level diversity. The new wave of tests, like the NEO Personality Inventory (Neuroticism, Extroversion, and Openness) and the Occupational Personality Questionnaire, make less sweeping generalizations than their predecessors. By using narrower indicators, the NEO and OPQ can identify how people will behave in certain situations and, ultimately, how well an employee's personality is suited to the tasks his or her job requires.

Testing is already a $400 million industry in the United States, and it's growing at 8 percent a year. The amount spent on personality testing alone has increased 10 to 15 percent each of the last 3 years. Most *Fortune* 500 companies use the venerable Myers-Briggs test. A recent study found that poorly performing employees cost U.S. employers $100 billion a year, so perhaps it's time to jump on the bandwagon.

Questions

1. If you knew the personality profiles of your workers, how would you actually use the information to benefit the company? Can personality testing help you achieve the company's goal of becoming one of the largest candy makers in North America?
2. Does personality testing help cultivate deep-level diversity, or does it do the opposite, ensuring a company staffed with people who are the same? Is there another way to cultivate deep-level diversity besides personality testing?
3. Do you see any drawbacks to personality testing? In addition to a diverse work force, what benefits could a manager derive from personality testing?
4. Do you begin personality testing? Explain your answer.

MANAGEMENT TEAM DECISION

Mentoring Millennials

Mentoring isn't what it used to be. Traditional mentoring programs usually match an up-and-coming newbie with a seasoned, gray-templed, and usually male executive for a career-long relationship that helps the junior person move up through the ranks of the company. But the work climate has changed, and people don't tend to stick with the same company for an entire

career. Plus, the old-school model has its serious drawbacks. Senior executives often say they don't have time for such an intensive, long-term commitment. Scheduled lunch meetings with no specific purpose leave both the mentor and the mentee wondering "What's the point?" and wishing they were back at the office actually getting work done. Such traditional matches can feel like arranged marriages. And, like a marriage gone bad, they can end in a messy divorce when a mentor takes credit for a mentee's work; a mentee vies for the mentor's job; or the two are just incompatible in their personalities, values, or work styles. And such sour relationships can be tough to pull out of when the matches are imposed from above.[164]

You've read a lot lately about new approaches to mentoring. Instead of formal matches, many involve a mentee seeking out a mentor, sometimes for help with a specific question or problem. Such relationships tend to be very focused and short-term, eliminating a number of the problems that plague traditional mentoring programs. There are also a variety of new takes on setting up relationships. Programs like Mentoring Worldwide or Circle of Friends transcend corporate boundaries, connecting mentors and mentees across businesses and industries—even across the globe. The Internet is a key tool in such efforts, connecting people through online databases, wikis, e-mail, and Skype. Some companies, like IBM and Intel, have even adopted such tools for in-house mentoring programs. These approaches have really changed the face of mentoring, which is becoming more about learning than feedback and perks. What's more, mentoring is becoming reciprocal. No longer top-down, senior executives are learning as much from the up-and-comings as they are offering their own knowledge and experience. In the new knowledge economy, everyone benefits.[165]

You're pleased to read about these new developments because you've been thinking about setting up a mentoring program to help the increasing number of millennials, or Generation Yers, who work for your company. Their turnover rate is very high, about every 18 months or so. You would like to keep them with the company longer so that you can benefit from their creativity and skills. The problem, perhaps more than anything else, is boredom. These folks need to be constantly learning, or they bolt. Ironically, they appreciate stability, but stability for them means support and constant feedback about how to improve and what challenges to take on next. It also means an environment in which they feel others genuinely care about their success in life.[166] You think a mentoring program could really help develop this part of your staff—and even benefit your more senior people—but you know that the traditional approach won't work.

For this exercise, assemble a team of three to four students to represent the senior management team responsible for this decision. Try using the dialectical inquiry technique discussed in Chapter 5 ("Planning and Decision Making") on page 158.

Questions

1. Why are traditional mentoring relationships unlikely to work for you in this situation? Use what you know specifically about millennials from this case and the text to help you answer.
2. What type of mentoring program would you set up? Explain your answer.
3. How could the mentoring program you design benefit your senior staff? What challenges might you encounter in bridging the generation gap to make such a program work? What features can you build into your program that will address these issues?

PRACTICE BEING A MANAGER

Culture, Subcultures, and You

Diversity may contribute a richness of perspective and understanding to a work group or organization. But to unlock these riches, it is essential that we develop tools for understanding individuals and cultures different from our own. Not all college students have experienced crossing a cultural boundary to live in another country. But most have encountered subcultures in the context of their middle or high school years. Teen subcultures are often quite pronounced and diverse. This exercise will offer practice in recognizing and understanding diversity.

Step 1: Get into groups. Your professor will organize you in small groups of three or four students.

Step 2: Identify teen subcultures. Think back to your middle school or high school experiences and identify some of the major subcultures you observed (Athletes, Toughs, and so on). Share descriptions of these subcultures with the members of your group.

Step 3: Conduct diversity training. Take turns training each other on what it would be like to be a member of one of the subcultures that you knew well. It is not necessary to have belonged to this subculture, but only to be able to recall it vividly. Teach your fellow group members what a young person would need to know to fit in with this subculture, including such dimensions as

- Clothing
- Manner of speech, common slang, or "code language"
- Music
- Value of the subculture to members; what it means to be "in" this group

Step 4: Discuss how teen subcultures are diverse. Discuss as a group the impact of teen subcultures on valuing diversity. In what ways do teen subcultures bond diverse people together (athletes of different races, for example), and help them to understand one another better? In what ways do teen subcultures separate people into "cliques" or foster stereotyping ("us" vs. "them")?

Step 5: Debrief as a class. Based on your group discussions, what are the challenges for organizations that are seriously attempting to value diversity? What are the benefits to these organizations? How do organizations train people about cultural (and subcultural) differences without falling into stereotyping?

DEVELOP YOUR CAREER POTENTIAL

From Majority to Minority and Back Again

Do you know what it feels like to walk into a room where, because of your sex, race/ethnicity, religion, language, or some other dimension, you are intensely aware of being different from everyone else?[167] Some of you do. Most of you probably don't. And, since most managers are white and male, it's a good bet that they don't know either. The experience can be unsettling, especially the first time it happens.

Some companies have begun broadening perspectives and understanding by having their managers join groups or attend events where they are different from everyone else. As you read in Section 4.3, at Hoechst Celanese, the CEO, a white male, joined the board of Hampton University, a historically African American college, and Jobs for Progress, a Hispanic organization that helps people prepare for jobs.

For more than 30 years, UPS has required its top managers to participate in community service programs in inner cities or poor rural areas. James Casey, UPS's founder, started the program in 1968 to expose his white male managers to diverse experiences, people, and communities. Casey also hoped that the experience would increase empathy, break down stereotypes, and encourage volunteer and community service. Today, managers with 10 to 30 years of experience are assigned to community service tasks in inner cities or rural areas. Don Wofford, who directs the program, says, "We choose managers on the fast track, people who'll be positioned to influence their work force and the community for years to come." The managers spend 2 weeks doing community service, followed by a weekend at home and then 2 more weeks of community service. Wofford says, "This format gives them a chance to digest the experience—they tend to come back renewed after the break, with a new focus, sometimes even more bewildered, but still ready to go for it."

Your assignment is to attend an event, meeting, or activity where you are different from almost everyone else in terms of your sex, race/ethnicity, religion, language, or some other dimension. You can choose a church service, local community group, volunteer organization, or student group on campus. Ask your professor for ideas. You should probably contact the group beforehand to arrange your visit. Answer the following questions after your visit.

Questions

1. Describe the event, meeting, activity, or organization you visited.
2. How were you different from others in attendance? Describe what it was like to be different from everyone else.
3. In what ways was this experience actually similar to previous experiences that you've had? In other words, while question 2 focuses on differences, this question focuses on similarities and commonalties.
4. What did you learn from this experience?

In the 2007 romantic comedy ***Because I Said So***, Daphne Wilder (Diane Keaton) is a meddling, overprotective, and divorced mother of three grown girls. Maggie and Mae (Lauren Graham and Piper Perabo) have already married and settled down. That leaves Milly (Mandy Moore) as the focus of Daphne's undivided attention. On the eve of her 60th birthday, Daphne decides to do everything she can to prevent Milly from making the same mistakes she did in life by finding her a nice, stable man to marry. She secretly places an ad in the online personals for her daughter, screens the applicants, and submits those she approves of to Milly. In this scene, Daphne tries to convince Milly to go out with Jason (Tom Everett Scott), who she believes would be good for her.

What to Watch for and Ask Yourself

1. Have you ever had someone meddle in your life the way Daphne does? How did it make you feel? Do you think this kind of behavior is justified if the person's intentions are good?
2. Which Big Five personality traits best describe Daphne? Give examples of behavior from the film scene to support your observations.
3. Which Big Five personality traits best describe Milly? Give examples of behavior from the film scene to support your observations.

Mitchell Gold + Bob Williams

© CENGAGE

For six consecutive years, the high-end furniture manufacturer and retailer Mitchell Gold + Bob Williams has scored 100 percent on the Human Rights Campaign's (HRC) Corporate Equality Index (CEI), which rates businesses' efforts to establish and maintain inclusive workplaces for lesbian, gay, bisexual, and transgender (LGBT) employees. Although many corporations have made it easier for LGBT employees to be open about their sexual orientation, few can claim two openly gay founders. Gold and Williams started their business together as a couple in 1989. Twenty years later, their corporate partnership is as strong as ever. In this video, Mitchell Gold and Bob Williams discuss how they want everyone to feel welcome and valued within the company, and that it all boils down to the Golden Rule: "Treat others the way you want to be treated."

What to Watch for and Ask Yourself

1. Have you ever felt that you were treated differently because of who you are?
2. How did the founders' past personal experiences influence their beliefs about how all employees should be treated?
3. Gold and Williams don't just want gay people to feel free to be themselves at work. What other kinds of employees are mentioned in this video?

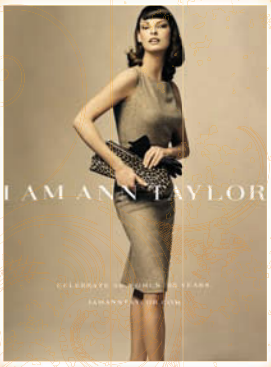
Chapter 13
Motivation

This chapter covers the basics of motivation—effort, needs, and intrinsic and extrinsic rewards. As we progress through the chapter, we build on that basic model of motivation by adding concepts of equity, expectancy, reinforcement, and goal-setting theories. There's also a summary of practical, theorybased actions that managers can take to motivate their workers.



Chapter 14
Leadership

This chapter discusses what leadership is, what characteristics are common of leaders, and what leaders do that makes them diff erent from people who aren't leaders. We examine major contingency theories of leadership and review strategic leadership issues, such as charismatic and transformational leadership.

Chapter 15
Communication

This chapter examines perception in communication, the communication process, and the kinds of organizational communication. You'll also learn about eff ective one-onone communication as well as techniques for organizationwide communication.

Develop Your Career Potential

Reel to Real

What would You Do?

Ann Taylor Headquarters, New York, New York.[1]

It's been a tough 18 months. When the recession blew in like a hurricane, the subsequent 19 percent drop in sales resulted in thousands of job cuts and 117 store closings. Six months and an additional 56 store closings later, you closed the year with a $334 million loss, telling investors, "While this economic crisis was felt across all demographics, the aspirational luxury consumer was particularly hard hit, including the professional working woman, our Ann Taylor division core client." Six months later, you made what you hoped were your last cuts, eliminating more jobs, mostly at headquarters, and closing 30 more stores. Sales are now 43 percent below a year ago, which were off considerably because of the recession, but this time, using the term "self-inflicted," you don't blame the economy to account for these latest results: you blame yourself and your management team.

With this last set of closings and cuts, you believe that costs are finally in line. The key to recovery, therefore, is increasing Ann Taylor's top line revenues by growing same store sales, the most common measure of retail performance in which each store's sales are compared to its sales from a year ago, with the results averaged across stores to produce an overall measure of increasing or decreasing same store sales. So, you turn to your stores to figure out why sales have dropped so drastically. One potential problem is simply the line of clothes offered in your stores. Sales data indicated that customers were snapping up higher priced and higher quality items whenever you stocked them, so the company debuted its Ann Taylor Collection, a line of 50 items that were upscale and about 40 percent more expensive than the typical clothing sold in your stores. The timing, just six months before the recession, however, was terrible. Now you've hired a new designer and asked her to trim prices but deliver greater value.

You also suspect that there might be issues with the effort being put forth in your stores. For example, it wasn't uncommon for employees to come in two hours before opening and then spend one hour drinking coffee and discussing the latest TV shows or movies. There are also problems with staffing not matching up with sales. For decades, your managers have done their store schedules by hand, balancing associates' work preferences against trends in daily sales from the previous year. Scheduling this way left you with way too many associates on the floor during the slow part of the day and too few when things got busy. Other retailers, like Gap and The Limited, have addressed this issue through customer counting and work force management. Rather than daily sales figures, customer counting tracks

Study Tips

One way to make sure you understand the concepts in the chapter is to re-create the chapter outline from scratch.

After you read Chapter 13, write down as many concepts and terms as you can remember from your reading. You'll see right away where you have gaps in your understanding!

the number of customers in terms of walk-ins and purchases in 15-minute increments throughout the day, thus helping determine when stores are busiest, how long customers spend in the store, whether staffing is optimum (too few, too many, or just right), and the conversion rates, the percentage of visitors who actually purchase something. Work force management, in turn, uses those data to schedule the highest performing employees during stores' busiest times. If you're not a top performer, you're scheduled during slower sales periods.

What steps might you take to increase efficiency in your stores, that is, to have staff associates be more productive so you can increase sales without increasing costs? How would you measure efficiency gains and what would you ask associates to do differently to increase their efforts? Second, should Ann Taylor adopt customer counting and work force management? What advantages and disadvantages do you see for the company, its managers, and its sales associates? Finally, what effect might work force management have on employee turnover and on your ability to attract top-notch sales associates? Likewise, what effects will it have on customer satisfaction? Overall would it work?

If you were the CEO of Ann Taylor, what would you do?

What makes people happiest and most productive at work? Is it money, benefits, opportunities for growth, interesting work, or something else altogether? And if people desire different things, how can a company keep everyone motivated? It takes insight and hard work to motivate workers to join the company, perform well, and then stay with the company. Indeed, when asked to name their biggest management challenge, nearly one-third of executives polled by Creative Group, a specialized staffing service in Menlo Park, California, cited "motivating employees."[2]

This chapter begins by reviewing the basics of motivation—effort, needs, and intrinsic and extrinsic rewards. We will start with a basic model of motivation and add to it as we progress through each section in the chapter. Next, we will explore how employees' equity perceptions and reward expectations affect their motivation. If you're familiar with the phrase "perception is reality," you're off to a good start in understanding the importance of perceptions and expectations in motivation. The third part of the chapter reviews the role that rewards and goals play in motivating employees. You'll see that finding the right combination of goals and rewards is much harder in practice than it looks. The chapter finishes with a summary of practical, theory-based actions that managers can take to motivate their workers.

WHAT IS MOTIVATION?

After reading the next section, you should be able to

1. explain the basics of motivation.

Motivation is the set of forces that initiates, directs, and makes people persist in their efforts to accomplish a goal.[3] *Initiation of effort* is concerned with the choices that people make about how much effort to put forth in their jobs. ("Do I really knock myself out for these performance appraisals or just do a decent job?") *Direction of effort* is concerned with the choices that people make in deciding where to put forth effort in their jobs. ("I should be spending time with my high-dollar accounts instead of learning this new computer system!") *Persistence of effort* is concerned with the choices that people make about how long they will put forth effort in their jobs before reducing or eliminating those efforts. ("I'm only halfway through the project, and I'm exhausted. Do I plow through to the end, or just call it quits?") As Exhibit 13.1 shows, initiation, direction, and persistence are at the heart of motivation.

1 BASICS OF MOTIVATION

Nobody picks their salary and their bonus, right? But what if your boss let you do just that? At San Francisco-based **Skyline Construction**, Vice President Mark Trento and Senior Project Manager Adam Chelini were allowed, along with 13 others, to choose their salaries, which had to be between $125,000 and $150,000. But, choosing a higher salary meant Trento and Chelini would get a smaller bonus and less overall compensation. By contrast, choosing a smaller salary would give them the opportunity—but no guarantee—to earn a larger bonus and higher overall compensation.[4] If you were in their shoes, which would you choose? A lower bonus but the security of a higher salary, or the smaller salary but potential of a larger bonus and higher overall compensation? Which would motivate you more? Why? What motivates people to take one option versus the other? Answering questions like these is at the heart of figuring out how best to motivate people at work.

Let's learn more about motivation by building a basic model of motivation out of **1.1 effort and performance, 1.2 need satisfaction, and 1.3 extrinsic and intrinsic rewards** and **then discussing 1.4 how to motivate people with this basic model of motivation.**

1.1 Effort and Performance

When most people think of work motivation, they think that working hard (effort) should lead to a good job (performance). Exhibit 13.2 shows a basic model of work motivation and performance, displaying this process. The first thing to notice about Exhibit 13.2 is that this is a basic model of work motivation *and* performance. In practice, it's almost impossible to talk about one without mentioning the other. Not surprisingly, managers often assume motivation to be the only determinant of performance, saying things such as "Your performance was really terrible last quarter. What's the matter? Aren't you as motivated as you used to be?" In fact, motivation is just one of three primary determinants of job performance. In industrial psychology, job performance is frequently represented by this equation:

$$\text{Job Performance} = \text{Motivation} \times \text{Ability} \times \text{Situational Constraints}$$

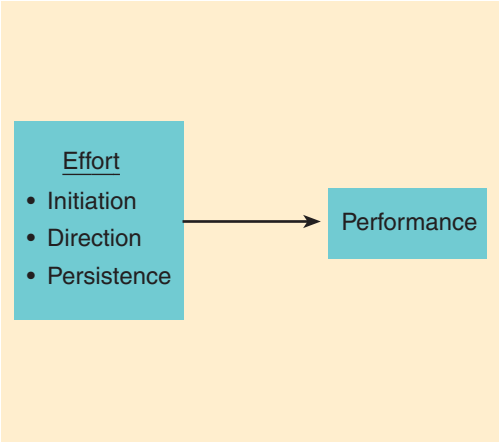
In this formula, *job performance* is how well someone performs the requirements of the job. *Motivation*, as defined above, is effort, the degree to which someone works hard to do the job well. *Ability* is the degree to which workers possess the knowledge, skills, and talent needed to do a job well. And *situational constraints* are factors beyond the control of individual employees, such as tools, policies, and resources that have an effect on job performance.

[Motivation] the set of forces that initiates, directs, and makes people persist in their efforts to accomplish a goal

EXHIBIT 13.1
The Components of Motivation

EXHIBIT 13.2

A Basic Model of Work Motivation and Performance



Since job performance is a multiplicative function of motivation times ability times situational constraints, job performance will suffer if any one of these components is weak. For example, in 1988, the East German bobsled team was fully funded by the East German government and had state-of-the-art coaching and equipment (no situational constraints). The team members were recruited and selected from a large pool of talented athletes (ability) who had trained year-round for most of their lives (motivation) for a chance to make the highly prestigious team. By contrast, consider the Jamaican bobsled team that Disney made famous in the movie *Cool Runnings*. In 1988 at its first Winter Olympics, the team had limited funding, a coach with bobsledding experience (a five-time U.S. champion) but no coaching experience, and an old bobsled that couldn't compete with the world-class equipment used by the best teams (high situational constraints). Furthermore, its members had been raised in tropical Jamaica and had almost no bobsledding or winter sports experience (very little ability). Nonetheless, they dreamed of competing in the Olympics and did what they could to train for several months, considering their limited circumstances (strong motivation).

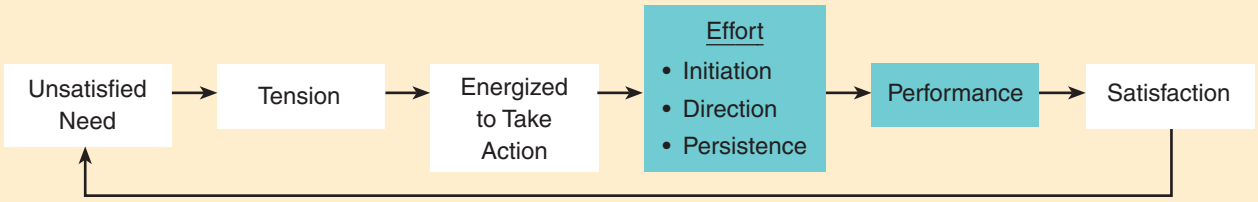
It's not hard to guess which team did better, is it? With ample motivation, ability, and almost no situational constraints, you'd expect the East Germans to be competitive, and they were—finishing second and third in the two-man competition and second in the four-man competition.[5] Despite their strong motivation, the Jamaican teams had little ability and extremely high situational constraints; the two-man team finished in 35th place, while the four-man team crashed spectacularly and had to push the bobsled across the line to complete the final run on the course.

Does this mean that motivation doesn't matter? No, not at all. It just means that all the motivation in the world won't translate into high performance when you have little ability and high situational constraints. In fact, prior to the 1996 Winter Olympics, the Jamaican team spent 6 weeks working with Sam Bock, who also worked with the elite Canadian team. Bock put the Jamaicans through their paces at a special bobsled training center in Oberhof, Germany. After training for 4 to 8 hours a day in world-class conditions under world-class tutelage, the Jamaican four-man team finished in 14th place, ahead of the Americans, French, Russians, and one of the two Swiss and Italian teams. The two-man team did even better, finishing 10th.[6]

1.2 Need Satisfaction

In Exhibit 13.2, we started with a very basic model of motivation in which effort leads to job performance. But managers want to know, "What leads to effort?" And they will try almost anything they can to find the answer. For example, at **SAS**, the leading maker of statistical software, employees can earn "SAS bucks" for free on-site haircuts, drop their cars off to be washed and detailed and their clothes to be altered or dry-cleaned, use the free fitness center, or drop their children off at the on-campus daycare center (employees pay only $360 a month, while SAS pays the rest, which is $720 per child).[7] At Seattle-based Zillow, the online real-estate valuation service, teams have had to work overtime to add new features to the company's website. So the company added foosball, Ping-Pong, and air-hockey tables and free all-you-can-drink soft drinks, juice, and milk to its downtown offices.[8] Envision Technology, a Seattle software company, offers a variety of health-oriented perks, including on-site massages and "Business Boxes" of fresh fruit and healthy snacks.[9]

EXHIBIT 13.3 Adding Need Satisfaction to the Model



As shown on the left side of this exhibit, a person's unsatisfied need creates an uncomfortable, internal state of tension that must be resolved. So, according to needs theories, people are motivated by unmet needs. But once a need is met, it no longer motivates. When this occurs, people become satisfied, as shown on the right side of the exhibit.

At Parker LePla, a Seattle marketing and branding company, the employees regularly spend an afternoon playing WhirlyBall, lawn bowling, or kayaking on Lake Union.[10] As you can see, employers will do almost anything to motivate employees to put extra effort into their jobs.

Needs are the physical or psychological requirements that must be met to ensure survival and well-being.[11] As shown on the left side of Exhibit 13.3, a person's unmet need creates an uncomfortable, internal state of tension that must be resolved. For example, if you normally skip breakfast, but then have to work through lunch, chances are you'll be so hungry by late afternoon that the only thing you'll be motivated to do is find something to eat. So, according to needs theories, people are motivated by unmet needs. But a need no longer motivates once it is met. When this occurs, people become satisfied, as shown on the right side of Exhibit 13.3.

Note: Throughout the chapter, as we build on this basic model, the parts of the model that we've already discussed will appear shaded in color. For example, since we've already discussed the effort → performance part of the model, those components are shown with a colored background. When we add new parts to the model, they will have a white background. Since we're adding need satisfaction to the model at this step, the need-satisfaction components of unsatisfied need, tension, energized to take action, and satisfaction are shown with a white background. This shading convention should make it easier to understand the work motivation model as we add to it in each section of the chapter.

Since people are motivated by unmet needs, managers must learn what those unmet needs are and address them. This is not always a straightforward task, however, because different needs theories suggest different needs categories. Exhibit 13.4 shows needs from three well-known needs theories. Maslow's Hierarchy of Needs suggests that people are motivated by *physiological* (food and water), *safety* (physical and economic), *belongingness* (friendship, love, social interaction), *esteem* (achievement and recognition), and *self-actualization* (realizing your full potential) needs.[12] Alderfer's ERG Theory collapses Maslow's five needs into three: *existence* (safety and physiological needs), *relatedness* (belongingness), and *growth* (esteem and self-actualization).[13] McClelland's Learned Needs Theory suggests that people are motivated by the need for *affiliation* (to be liked and accepted), the need for *achievement* (to accomplish challenging goals), or the need for *power* (to influence others).[14]

[Needs] the physical or psychological requirements that must be met to ensure survival and well-being.

EXHIBIT 13.4

Needs Classification of Different Theories

	Maslow's Hierarchy	Alderfer's Erg	Mcclelland's Learned Needs
Higher-Order Needs	Self-Actualization Esteem Belongingness	Growth Relatedness	Power Achievement Affiliation
Lower-Order Needs	Safety Physiological	Existence	

Things become even more complicated when we consider the different predictions made by these theories. According to Maslow, needs are arranged in a hierarchy from low (physiological) to high (self-actualization). Within this hierarchy, people are motivated by their lowest unsatisfied need. As each need is met, they work their way up the hierarchy from physiological to self-actualization needs. By contrast, Alderfer says that people can be motivated by more than one need at a time. Furthermore, he suggests that people are just as likely to move down the needs hierarchy as up, particularly when they are unable to achieve satisfaction at the next higher need level. McClelland argues that the degree to which particular needs motivate varies tremendously from person to person, with some people being motivated primarily by achievement and others by power or affiliation. Moreover, McClelland says that needs are learned, not innate. For instance, studies show that children whose parents own a small business or hold a managerial position are much more likely to have a high need for achievement.[16]

So, with three different sets of needs and three very different ideas about how needs motivate, how do we provide a practical answer to managers who just want to know "What leads to effort?" Fortunately, the research evidence simplifies things a bit. To start, studies indicate that there are two basic kinds of needs categories.[17] As shown in Exhibit 13.4, *lower-order needs* are concerned with safety and with physiological and existence requirements, whereas *higher-order needs* are concerned with relationships (belongingness, relatedness, and affiliation); challenges and accomplishments (esteem, self-actualization, growth, and achievement); and influence (power). Studies generally show that higher-order needs will not motivate people as long as lower-order needs remain unsatisfied.[18]

For example, imagine that you graduated from college 6 months ago and are still looking for your first job. With money running short (you're probably living on your credit cards) and the possibility of having to move back in with your

doing the right thing

Faking It, Not Making It

With technological assistance, you may be tempted to engage in "impression management" to try to convince your boss and coworkers that you're working hard when you're really not. For instance, a tech support worker who enjoyed 3-hour lunches used a program on his Palm personal computer to remotely control his office computer. He would open, close, and move files so it would look as if he had just stepped away from his desk. Other employees write e-mails before they go home and then "send" them after midnight (we won't tell you how this is done) to make it look as though they are still at work. Some people leave early and, on their way home, send e-mails via their Blackberry device so it will appear they are still at the office. You may be thinking that these ruses are harmless, but 59 percent of human resource managers and 53 percent of supervisors have caught employees lying about the hours they work. Furthermore, if you're using technology to fake it, you're usually leaving high-tech tracks and footprints along the way. That tech worker who controlled his office computer with his Palm PC at lunch was fired for habitual lateness. Motivation is all about effort. So, do the right thing. Work hard for your company, your customers, and yourself.[15]

parents looming (if this doesn't motivate you, what will?), your basic needs for food, shelter, and security drive your thoughts, behavior, and choices at this point. But once you land that job, find a great place (of your own!) to live, and put some money in the bank, these basic needs should decrease in importance as you begin to think about making new friends and taking on challenging work assignments. In fact, once lower-order needs are satisfied, it's difficult for managers to predict which higher-order needs will motivate behavior.[19] Some people will be motivated by affiliation, while others will be motivated by growth or esteem. Also, the relative importance of the various needs may change over time but not necessarily in any predictable pattern. So, what leads to effort? In part, needs do. After we discuss rewards in Subsection 1.3, in Subsection 1.4 we discuss how managers can use what we know from need-satisfaction theories to motivate workers.

1.3 Extrinsic and Intrinsic Rewards

No discussion of motivation would be complete without considering rewards. Let's add two kinds of rewards, extrinsic and intrinsic, to the model in Exhibit 13.5.[20]

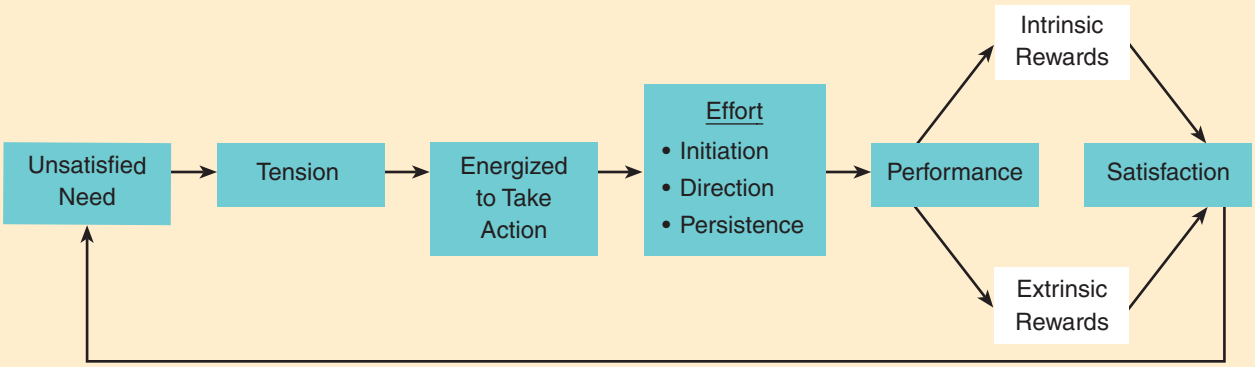
Extrinsic rewards are tangible and visible to others and are given to employees contingent on the performance of specific tasks or behaviors.[21] External agents (managers, for example) determine and control the distribution, frequency, and amount of extrinsic rewards, such as pay, company stock, benefits, and promotions. For example, 80 percent of 1,000 large and medium-sized U.S. companies surveyed by Hewitt Associates, a consulting company based in Lincolnshire, Illinois, offer incentives or bonuses to reward employees.[22] The payout from Boeing's employee incentive plan is determined by how well Boeing meets financial targets. One year, the incentive plan paid $439 million to about 109,000 workers companywide.[23] Likewise, Wal-Mart paid $529.8 million in bonuses to 813,759 hourly U.S. employees at Wal-Mart and Sam's Club stores. Lois Honeycutt, a 46-year-old customer service manager at Wal-Mart in Altamonte Springs, Florida, says the bonus program will help increase employee performance and boost employee spirits and morale.[24] Manufacturing employees at **Nucor Corporation** can earn bonuses of up to 170 percent of their base pay.[25]

Why do companies need extrinsic rewards? To get people to do things they wouldn't otherwise do. Companies use extrinsic rewards to motivate people to perform four basic behaviors: join the organization, regularly attend their jobs, perform their jobs well, and stay with the organization.[26] Think about it. Would you show up at work every day to do the best possible job that you could just out of the goodness of your heart? Very few people would. This is why **Cognex**, maker of industrial vision systems (robots that "see"), rewards its employees for perseverance, or staying with the company. The longer an employee stays, the greater the rewards. Says founder and CEO Dr. Robert Shillman, "After three years of service, you get a very nice-looking watch engraved on the back with the date you started. At five years, you get a gold pin and extra weekend vacation someplace. The 15-year perseverance award is a trip for you and your spouse to one of the wonders of the world, like the Great Wall of China. All you do is show up. You get $1,000 in spending money and an extra week vacation. After 20 years, it's the same thing with eight of your best friends plus your spouse and $1,500 in spending money."[27]

Intrinsic rewards are the natural rewards associated with performing a task or activity for its own sake. For example, aside from the external rewards management offers for doing something well, employees often find the activities or tasks they perform interesting and enjoyable. Examples of intrinsic rewards include a sense of accomplishment or achievement, a feeling of responsibility, the chance to learn something new or interact with others, or simply the fun that comes from

[Extrinsic reward] a reward that is tangible, visible to others, and given to employees contingent on the performance of specific tasks or behaviors

[Intrinsic reward] a natural reward associated with performing a task or activity for its own sake



Performing a job well can be rewarding intrinsically (the job itself is fun, challenging, or interesting) or extrinsically (as you receive better pay or promotions, etc.). Intrinsic and extrinsic rewards lead to satisfaction of various needs.

EXHIBIT 13.5

Adding Rewards to the Model

performing an interesting, challenging, and engaging task. For instance, researcher Mark Rise works for Medtronic, a leading medical technology company. Rise, one of Medtronic's most creative inventors, could have a more prestigious job at a university or make more money starting his own company, but he doesn't want to test theory or develop marketing plans or raise venture capital. What matters most to him is developing products that make a difference in people's lives. Says Rise, "That's what keeps me tied to what I'm doing now." Indeed, Rise thrives on the intrinsic aspects of his work such as being able to work with physicians, medical researchers, software developers, and engineers to identify new treatments and design and manufacture new products.[28]

Which types of rewards are most important to workers in general? A number of surveys suggest that both extrinsic and intrinsic rewards are important. One survey found that the most important rewards were good benefits and health insurance, job security, a week or more of vacation (all extrinsic rewards), interesting work, the opportunity to learn new skills, and independent work situations (all intrinsic rewards). And employee preferences for intrinsic and extrinsic rewards appear to be relatively stable. Studies conducted over the last three decades have consistently found that employees are twice as likely to indicate that important and meaningful work matters more to them than what they are paid.[29] Indeed, when asked, "If you were to get enough money to live as comfortably as you would like for the rest of your life, would you continue to work or would you stop working?" 69 percent of American workers said they would keep working. Clearly, intrinsic rewards matter.[30]

1.4 Motivating with the Basics

So, given the basic model of work motivation in Exhibit 13.5, what practical steps can managers take to motivate employees to increase their effort?

As shown in Exhibit 13.6, *start by asking people what their needs are*. Tommy Lee Hayes-Brown, who is in charge of recognition programs at **MetLife**, one of the larger insurance companies, puts it this way: "Let's say you decide to reward an employee's great performance with a ham. If he doesn't eat ham, it's not going to be all that meaningful."[31] In other words, if managers don't know what workers' needs are, they won't be able to provide them the opportunities and rewards that can satisfy those needs. Susan Richards, a human resource consultant with Atlanta-based Buck

Consultants, agrees, saying, "I don't think there's a one-size-fits-all reward program out there that's going to work."[32] So, if you want to meet employees' needs, just ask.

Next, *satisfy lower-order needs first*. Since higher-order needs will not motivate people as long as lower-order needs remain unsatisfied, companies should satisfy lower-order needs first. In practice, this means providing the equipment, training, and knowledge to create a safe workplace free of physical risks, paying employees well enough to provide financial security, and offering a benefits package that will protect employees and their families through good medical coverage and health and disability insurance. Indeed, a survey based on a representative sample of Americans found that when people choose jobs or organizations, three of the four most important factors—starting pay/salary (62 percent), employee benefits (57 percent), and job security (47 percent)—are lower-order needs.[33] Consistent with the idea of satisfying lower-order needs first, a survey of 12,000 employees found that inadequate compensation is the number-one reason employees leave organizations.[34]

Third, managers should *expect people's needs to change*. As some needs are satisfied or situations change, what motivated people before may not motivate them now. Likewise, what motivates people to accept a job may not necessarily motivate them once they have the job. For instance, David Stum, president of the Loyalty Institute, says, "The [attractive] power of pay and benefits is only [strong] during the recruitment stage. After employees take the job, pay and benefits become entitlements to them. They think: 'Now that I work here, you owe me that.'"[35]

Managers should also expect needs to change as people mature.[36] For older employees, benefits are as important as pay, which is always ranked as more important by younger employees. Older employees also rank job security as more important than personal and family time, which is more important to younger employees.[37]

Finally, *as needs change and lower-order needs are satisfied, create opportunities for employees to satisfy higher-order needs*. Recall that intrinsic rewards such as accomplishment, achievement, learning something new, and interacting with others are the natural rewards associated with performing a task or activity for its own sake. And, with the exception of influence (power), intrinsic rewards correspond very closely to higher-order needs that are concerned with relationships (belongingness, relatedness, and affiliation) and challenges and accomplishments (esteem, self-actualization, growth, and achievement). Therefore, one way for managers to meet employees' higher-order needs is to create opportunities for employees to experience intrinsic rewards by providing challenging work, encouraging employees to take greater responsibility for their work, and giving employees the freedom to pursue tasks and projects they find naturally interesting.

We began this section by asking what you would do if your company allowed you to choose your salary, the same way that San Francisco-based Skyline Construction asked its managers to do. Would you choose the higher salary that came with a small bonus, or would you choose the smaller salary that came with the opportunity—but no guarantee—of a larger bonus. Vice President Mark Trento chose the added certainty of a higher salary because "I can bank on that, and I don't have to take the risk." By contrast, even though it was a bit scary at first, Senior Project Manager Adam Chelini chose the smaller salary and larger bonus because he wanted the chance to increase his total compensation. In the end, both were happy. And allowing top managers to choose how they want to be compensated appears to be working, as Skyline's revenues increased $42 to $76 million in just 3 years.[38]

- Start by asking people what their needs are.
- Satisfy lower-order needs first.
- Expect people's needs to change.
- As needs change and lower-order needs are satisfied, create opportunities for employees to satisfy higher-order needs.

REVIEW 1

Basics of Motivation *Motivation* is the set of forces that initiates, directs, and makes people persist in their efforts over time to accomplish a goal. Managers often assume motivation to be the only determinant of performance, but job performance is a multiplicative function of motivation times ability times situational constraints. If any one of these components is weak, job performance will suffer. Needs are the physical or psychological requirements that must be met to ensure survival and well-being. When needs are not met, people experience an internal state of tension. But once a particular need is met, it no longer motivates. When this occurs, people become satisfied and are then motivated by other unmet needs.

Different motivational theories, such as Maslow's Hierarchy of Needs (physiological, safety, belongingness, esteem, and self-actualization), Alderfer's ERG Theory (existence, relatedness, and growth), and McClelland's Learned Needs Theory (affiliation, achievement, and power), specify a number of different needs. However, studies show that there are only two general kinds of needs, lower-order needs and higher-order needs, and that higher-order needs will not motivate people as long as lower-order needs remain unsatisfied.

Both extrinsic and intrinsic rewards motivate people. Extrinsic rewards, which include pay, company stock, benefits, and promotions, are used to motivate people to join organizations and attend and perform their jobs. The basic model of motivation suggests that managers can motivate employees by asking them what their needs are, satisfying lower-order needs first, expecting people's needs to change, and satisfying higher-order needs through intrinsic rewards.

HOW PERCEPTIONS AND EXPECTATIONS AFFECT MOTIVATION

After reading the next two sections, you should be able to

2. use equity theory to explain how employees' perceptions of fairness affect motivation.
3. use expectancy theory to describe how workers' expectations about rewards, effort, and the link between rewards and performance influence motivation.

When employees perceive that they will be unable to perform at a level necessary to obtain rewards, whether extrinsic or intrinsic, they are likely to be *demotivated*. Reward systems at many organizations are geared toward top performers and ignore the mid-level performers. Most banks, for instance, reward the top 10 percent of the salesforce; other sales representatives, who don't believe they can generate enough sales to end up in the top category, simply give up. Stephen O'Malley, an independent consultant, says that one way to avoid this scenario is to create an open-ended incentive program that keeps the top-performer programs intact while offering awards for mid-level performers who surpass their annual sales goals by10 percent. This system, implemented at a large U.S.-based financial services institution, was successful in influencing perceptions and expectations of mid-level performers, resulted in better performance from all employees,

and increased revenue for the company. Specifically, two-thirds of the company's mid-level performers qualified for rewards by collectively contributing almost 80 percent of the total sales growth and creating $14 million in incremental profit. The contributions of these mid-level performers as a group outpaced the growth of top performers by 16 percent. By influencing perceptions and expectations of the entire salesforce, the company was able to achieve a 47 percent overall increase in sales growth, three times the industry average.[39]

2 EQUITY THEORY

Finnish businessman Jaako Rytsola was out driving in his car one evening. "The road was wide and I was feeling good. It was nice to be driving when there was no one in sight." Unfortunately for Rytsola, he wasn't really alone. A police officer pulled him over and issued him a speeding ticket for driving 43 mph in a 25 mph zone. The cost of the ticket: $71,400! Janne Rajala, a college student, was also pulled over for driving 18 mph over the speed limit. However, Rajala's ticket cost him only $106. The $71,294 difference occurred because Finland bases traffic fines on the severity of the offense, which was identical in this case, *and* the income of the driver, which clearly wasn't.

Is Finland's method of determining speeding fines fair or unfair? Most Americans would argue that Finland's approach is unfair, that fairness requires that fines be proportional to the offense and that everyone who breaks the law to the same degree should pay the same fine. By contrast, most Finns believe that fines proportional to income are fair. Erkki Wuouma of Finland's Ministry of the Interior says, "This is a Nordic tradition. We have progressive taxation and progressive punishments. So the more you earn, the more you pay." Rytsola pays more because he is a high-earning Internet entrepreneur. Rajala pays less because he's a low-earning college student.[40]

Fairness, or what people perceive to be fair, is also a critical issue in organizations. **Equity theory** says that people will be motivated at work when they *perceive* that they are being treated fairly. In particular, equity theory stresses the importance of perceptions. So, regardless of the actual level of rewards people receive, they must also perceive that, relative to others, they are being treated fairly. For example, you learned in Chapter 11 that the average CEO now makes 344 times more than the average worker.[41] On average, CEOs of the 200 largest U.S. companies make $7.56 million.[42] CEOs of the Standard & Poor's 500 make an average of $10.4 million. And the top ten CEOs in terms of pay make over $100 million.[43] Many people believe that CEO pay is obscenely high and unfair. In order to keep CEO salaries in check, companies like Aflac, a Georgia insurance company, have adopted "say-on-pay" policies that allow investors a vote on executive compensation packages.[44] Others believe that CEO pay is fair because the supply and demand for executive talent largely determine what CEOs are paid. They argue that if it were easier to find good CEOs, then CEOs would be paid much less. As explained below, equity theory doesn't focus on objective equity (that is, that CEOs make 344 times more than blue-collar workers). Instead, equity theory says that equity, like beauty, is in the eye of the beholder.

Let's learn more about equity theory by examining **2.1 the components of equity theory, 2.2 how people react to perceived inequities,** and **2.3 how to motivate people using equity theory.**

[Equity theory] a theory that states that people will be motivated when they perceive that they are being treated fairly

Equity theory is not an absolute. It is dependent on many factors, including culture. Jaako Rytsola, pictured here with his Lamborghini, was fined $71,400 for speeding because in Finland traffic fines are based on a person's income. People of other cultures may not have the same view of equity as the Finns!

EXHIBIT 13.7

Outcome/Input Ratios

2.1 Components of Equity Theory

The basic components of equity theory are inputs, outcomes, and referents. **Inputs** are the contributions employees make to the organization. Inputs include education and training, intelligence, experience, effort, number of hours worked, and ability. **Outcomes** are what employees receive in exchange for their contributions to the organization. Outcomes include pay, fringe benefits, status symbols, and job titles and assignments. And, since perceptions of equity depend on comparisons, **referents** are others with whom people ompare themselves to determine if they have been treated fairly. The referent can be a single person (comparing yourself with a coworker), a generalized other (comparing yourself with "students in general," for example), or even yourself over time ("I was better off last year than I am this year"). Usually, people choose to compare themselves with referents who hold the same or similar jobs or who are otherwise similar in gender, race, age, tenure, or other characteristics.[45] For instance, by any objective measure, it's hard to argue that the best professional athletes, who make as much as $40 million a year (and no doubt more by the time you read this), are treated unfairly, given that the typical American earns $46,040 a year.[46] Nonetheless, most top athletes' contracts include escalator clauses specifying that if another top player at the same position (i.e., their referent) receives a larger contract, then their contract will automatically be increased to that amount.

According to the equity theory process shown in Exhibit 13.7, employees compare their outcomes (the rewards they receive from the organization) with their inputs (their contributions to the organization). This comparison of outcomes with inputs is called the **outcome/input (O/I) ratio**. After an internal comparison in which they compare their outcomes with their inputs, employees then make an external comparison in which they compare their O/I ratio with the O/I ratio of a referent.[47] When people perceive that their O/I ratio is equal to the referent's O/I ratio, they conclude that they are being treated fairly. But when people perceive that their O/I ratio is different from their referent's O/I ratio, they conclude that they have been treated inequitably or unfairly.

Inequity can take two forms, underreward and overreward. **Underreward** occurs when a referent's O/I ratio is better than your O/I ratio. In other words, you are getting fewer outcomes relative to your inputs than the referent you compare yourself with is getting. When people perceive that they have been underrewarded, they tend to experience anger or frustration. For example, when a manufacturing company received notice that some important contracts had been canceled, management cut employees' pay by 15 percent in one plant but not in another. Just as equity theory predicts, theft doubled in the plant that received the pay cut. Likewise, employee turnover increased from 5 percent to 23 percent.[48]

By contrast, **overreward** occurs when a referent's O/I ratio is worse than your O/I ratio. In this case, you are getting more outcomes relative to your inputs than your referent is. In theory, when people perceive that they have been overrewarded, they experience guilt. But, not surprisingly, people have a very high tolerance for overreward. It takes a tremendous amount of overpayment before people decide that their pay or benefits are more than they deserve.

[Inputs] in equity theory, the contributions employees make to the organization

[Outcomes] in equity theory, the rewards employees receive for their contributions to the organization

[Referents] in equity theory, others with whom people compare themselves to determine if they have been treated fairly

[Outcome/Input (O/I)] ratio in equity theory, an employee's perception of how the rewards received from an organization compare with the employee's contributions to that organization

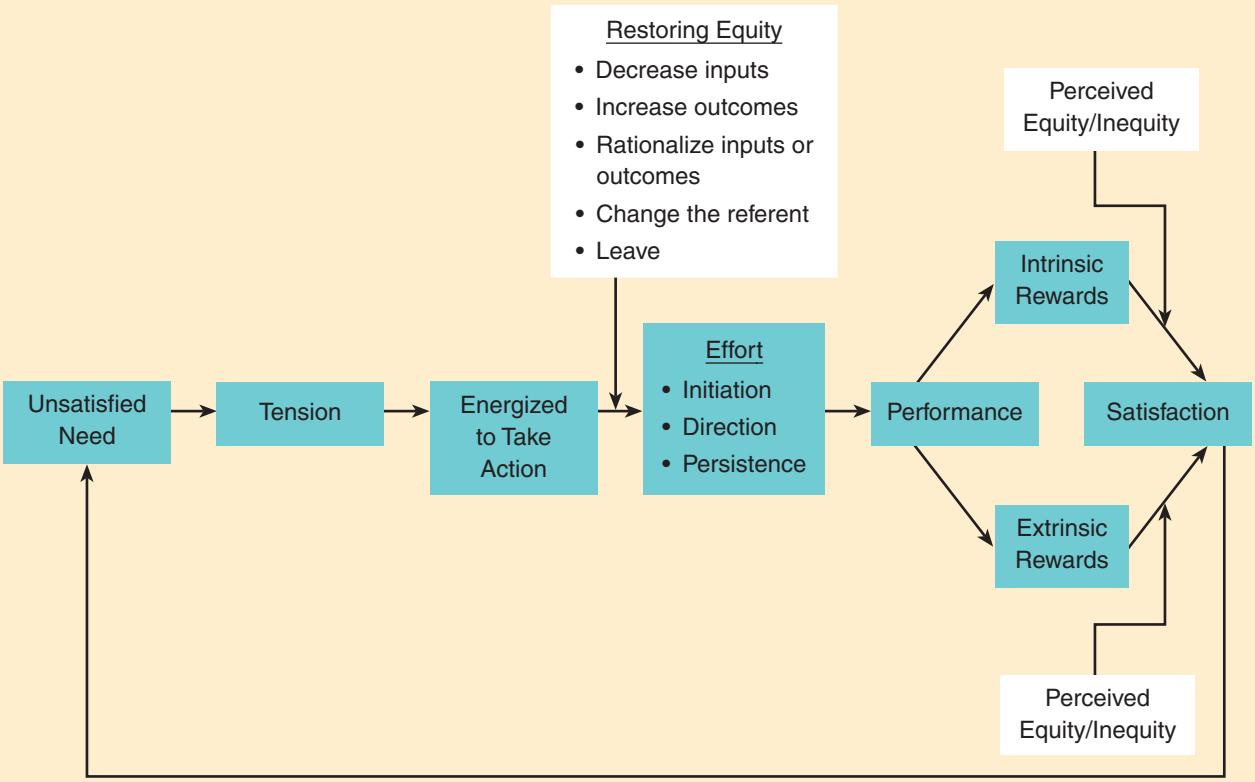
[Underreward] a form of inequity in which you are getting fewer outcomes relative to inputs than your referent is getting

[Overreward] a form of inequity in which you are getting more outcomes relative to inputs than your referent

2.2 How People React to Perceived Inequity

As a child do you ever remember calling for a do-over? Even as children, we have a strong desire for fairness, for being treated equitably. When this need isn't met, we are strongly motivated to find a way to restore equity and be fair, hence the

EXHIBIT 13.8 Adding Equity Theory to the Model



When people perceive that they have been treated inequitably at work because of the intrinsic or extrinsic rewards they receive relative to their efforts, they are dissatisfied (or frustrated or angry), because their needs aren't met. Those reactions lead to tension and a strong need to take action to restore equity in some way (as explained in the "Restoring Equity" box).

do-over. Not surprisingly, equity is just as important at the office as it is on the playground.

So what happens when people perceive that they have been treated inequitably at work? Exhibit 13.8 shows that perceived inequity affects satisfaction. In the case of underreward, this usually translates into frustration or anger; with overreward, the reaction is guilt. These reactions lead to tension and a strong need to take action to restore equity in some way. At first, a slight inequity may not be strong enough to motivate an employee to take immediate action. If the inequity continues or there are multiple inequities, however, tension may build over time until a point of intolerance is reached, and the person is energized to take action.[49] For example, when The Accident Group, an insurance company, laid off 2,500 employees in Manchester, Birmingham, and Liverpool, England, it made the announcement in an impersonal, insensitive way. Employees received text messages on their cell phones telling them to not go into work, that their final paychecks could not be issued, and that a more thorough explanation would be provided by e-mail. In addition, this message was left on everyone's office voice mail: "All staff who are being retained will be contacted today. If you have not been spoken to, you are therefore being made redundant [laid off] with immediate effect." Angry employees *and* managers ransacked offices, taking computers, phones, and anything else they could carry off. Claims assessor Andy

Potton says, "I could hardly believe what I saw. There were people walking out of the office with computers. One chap quite high up in the company had loaded up his car with laptops and driven off."[50]

When people perceive that they have been treated unfairly, they may try to restore equity by reducing inputs, increasing outcomes, rationalizing inputs or outcomes, changing the referent, or simply leaving. We will discuss these possible responses in terms of the inequity associated with underreward, which is much more common than the inequity associated with overreward.

People who perceive that they have been underrewarded may try to restore equity by *decreasing or withholding their inputs (that is, effort)*. Pilots at **American Airlines** took a 23 percent pay cut after 9/11 to help keep the airline out of bankruptcy. When American began doing well again, top managers collectively received a quarter-billion dollars in stock, whereas pilots and other employees received only small pay raises. When the pilots requested their old salaries back, with adjustments for inflation, American indicated that would amount to a 50 percent pay raise and cost the company $1.4 billion in higher salaries and benefits.[51] When airline pilots perceive that their pay and benefits are unfair (i.e., underrewarded), they frequently protest by calling in sick or going on strike. While American's pilots did not do so this time, about 5 years before this incident 2,400 American pilots reported in "sick" during a labor dispute, resulting in the cancellation of 1,100 flights.[52]

Increasing outcomes is another way people try to restore equity. This might include asking for a raise or pointing out the inequity to the boss and hoping that he or she takes care of it. Sometimes, however, employees may go to external organizations such as labor unions, federal agencies, or the courts for help in increasing outcomes to restore equity. For instance, the U.S. Department of Labor estimates that 10 percent of workers are not getting the extra overtime pay they deserve when they work more than 40 hours a week.[53] These are known as Fair Labor Standards Act violations. In fact, more than 30,000 such cases are brought each year, and employees win two-thirds of them.[54] Edward Harold, a partner with the law firm of Fisher & Phillips in New Orleans, says, "There has been an explosion of Fair Labor Standards Act litigation since 2002."[55] For example, the managers of Waffle House restaurants sued the company because they were working an average of 89 hours a week without any overtime pay.[56] The company contended that as managers they were exempt from the Fair Labor Standards Act (FLSA), which mandates that workers, that is, nonexempt employees, be paid time and a half for any work beyond 40 hours a week. But because Waffle House managers were required to perform and be proficient in the duties of hourly workers in addition to their managerial responsibilities, the courts ruled that Waffle House managers were really employees who deserved overtime pay. As a result, they were awarded $2,868,841.50 in back overtime pay.[57] Likewise, Wal-Mart Stores, Inc. settled 63 wage and hour lawsuits in 43 states, at an estimated cost $352 million to $640 million, in which it was consistently accused of underpaying its workers.[58]

Another method of restoring equity is to *rationalize or distort inputs or outcomes*. Instead of decreasing inputs or increasing outcomes, employees restore equity by making mental or emotional adjustments in their O/I ratios or the O/I ratios of their referents. For example, suppose that a company downsizes 10 percent of its work force. It's likely that the survivors (the people who still have jobs) will be angry or frustrated with company management because of the layoffs. If alternative jobs are difficult to find, however, these survivors may rationalize or distort their O/I ratios and conclude, "Well, things could be worse. At least I still have my job." Rationalizing or distorting outcomes may be used when other ways to restore equity aren't available.

Changing the referent is another way of restoring equity. In this case, people compare themselves with someone other than the referent they had been using for previous O/I ratio comparisons. Since people usually choose to compare themselves with others

who hold the same or similar jobs or who are otherwise similar (i.e., friends, family members, neighbors who work at other companies), they may change referents to restore equity when their personal situations change, such as a decrease in job status or pay.[59]

Finally, when none of these methods—reducing inputs, increasing outcomes, rationalizing inputs or outcomes, or changing referents—is possible or restores equity, *employees may leave* by quitting their jobs, transferring, or increasing absenteeism.[60] For example, attorneys and accountants at the Securities and Exchange Commission (SEC) quit their jobs at twice the rate of employees in other federal agencies. Why? One reason is that the SEC's attorneys and accountants are paid 40 percent less than their counterparts at other government agencies. Furthermore, they can get jobs in the private sector that pay $180,000 to $250,000 per year.[61]

2.3 Motivating with Equity Theory

What practical steps can managers take to use equity theory to motivate employees? As Exhibit 13.9 shows, they can *start by looking for and correcting major inequities*. Among other things, equity theory makes us aware that an employee's sense of fairness is based on subjective perceptions. What one employee considers grossly unfair may not affect another employee's perceptions of equity at all. Although these different perceptions make it difficult for managers to create conditions that satisfy all employees, it's critical that they do their best to take care of major inequities that can energize employees to take disruptive, costly, or harmful actions such as decreasing inputs or leaving. So, whenever possible, managers should look for and correct major inequities. At **Burgerville**, a 39-restaurant fast-food chain in Vancouver, Washington, annual employee turnover was 128 percent per year. The key inequity? Employees making $9 an hour couldn't afford health insurance for themselves and their families. Indeed, while Burgerville's health plan was cheap at $42 a month for employees and $105 a month for families, it provided limited benefits and came with a $1,000 deductible. As a result, only 3 percent of employees were enrolled in it. Under Burgerville's revised health plan, employees who work at least 20 hours a week get full health insurance at a cost of just $15 a month for themselves and $90 a month for their families—in both instances, there's no deductible. Although the new plan was expensive, nearly doubling health-care costs from $2.1 million to $4.1 million, the cost was easily offset by lower employee turnover, which dropped from 128 percent per year to 54 percent per year, and higher sales, which were up 11 percent. Furthermore, 98 percent of Burgerville's hourly employees and 97 percent of its salaried employees enrolled in the new health plan, compared to just 3 percent before.[62]

Second, managers can *reduce employees' inputs*. Increasing outcomes is often the first and only strategy that companies use to restore equity, yet reducing employee inputs is just as viable a strategy. In fact, with dual-career couples working 50-hour weeks, more and more employees are looking for ways to reduce stress and restore a balance between work and family. Consequently, it may make sense to ask employees to do less, not more; to have them identify and eliminate the 20 percent of their jobs that doesn't increase productivity or add value for customers; and to eliminate company-imposed requirements that really aren't critical to the performance of managers, employees, or the company (for example, unnecessary meetings and reports). In addition to higher pay, more vacation time, concierge services, and town hall sessions, the Big Four accounting firms are trying to make the jobs of junior accountants more equitable by reducing

EXHIBIT 13.9

- Look for and correct major inequities.
- Reduce employees' inputs.
- Make sure decision-making processes are fair.

the hours (that is, inputs) they must work. To shrink the workload, the firms are hiring more accountants, adding staff from other departments to help, and even turning away business that they lack the staff to handle. Bob Moritz, a senior partner at PriceWaterhouseCoopers, says, "The profession has recognized that we have a lot of stress in the system, and we're doing a lot of things [to fix it]."[63]

Finally, managers should *make sure decision-making processes are fair*. Equity theory focuses on **distributive justice**, the degree to which outcomes and rewards are fairly distributed or allocated. However, **procedural justice**, the fairness of the procedures used to make reward allocation decisions, is just as important.[64] Procedural justice matters because even when employees are unhappy with their outcomes (that is, low pay), they're much less likely to be unhappy with company management if they believe that the procedures used to allocate outcomes were fair. For example, employees who are laid off tend to be hostile toward their employer when they perceive that the procedures leading to the layoffs were unfair. By contrast, employees who perceive layoff procedures to be fair tend to continue to support and trust their employers.[65] Also, if employees perceive that their outcomes are unfair (that is, distributive injustice), but that the decisions and procedures leading to those outcomes were fair (that is, procedural justice), they are much more likely to seek constructive ways of restoring equity, such as discussing these matters with their manager. By contrast, if employees perceive both distributive and procedural injustice, they may resort to more destructive tactics, such as withholding effort, absenteeism, tardiness, or even sabotage and theft.[66]

Interactional justice refers to the fairness of interpersonal treatment that individuals receive during the enactment of organizational procedures. Two elements central to perceptions of interactional justice are (1) whether the reasons underlying the resource allocation decisions are clearly, truthfully, and adequately explained to affected parties; and (2) whether those responsible for implementing the decision treat the affected individuals with dignity and respect.[67] Recent studies indicate that interactional justice perceptions are at least as important as perceptions of procedural justice and distributive justice.[68] In addition, most managers are likely to have more control over interactional justice perceptions than, for example, fairness of organizational procedures or reward allocations in organizations.

[Distributive justice] the perceived degree to which outcomes and rewards are fairly distributed or allocated

[Procedural justice] the perceived fairness of the process used to make reward allocation decisions

REVIEW 2

Equity Theory The basic components of equity theory are inputs, outcomes, and referents. After an internal comparison in which employees compare their outcomes with their inputs, they then make an external comparison in which they compare their O/I ratio with the O/I ratio of a referent, a person who works in a similar job or is otherwise similar. When their O/I ratio is equal to the referent's O/I ratio, employees perceive that they are being treated fairly. But when their O/I ratio is different from their referent's O/I ratio, they perceive that they have been treated inequitably or unfairly.

There are two kinds of inequity, underreward and overreward. Underreward occurs when a referent's O/I ratio is better than the employee's O/I ratio and leads to anger or frustration. Overreward occurs when a referent's O/I ratio is worse than the employee's O/I ratio and can lead to guilt, but only when the level of overreward is extreme. When employees perceive that they have been treated inequitably (underrewarded), they may try to restore equity by reducing inputs, increasing outcomes, rationalizing inputs or outcomes, changing the referent, or simply leaving.

Managers can use equity theory to motivate workers by looking for and correcting major inequities, reducing employees' inputs, and emphasizing procedural as well as distributive justice. Most importantly, they should treat workers in an interpersonally sensitive manner and work to make sure that organizational procedures are fair and are applied in a consistent manner.

3 EXPECTANCY THEORY

How attractive do you find each of the following rewards? A company concierge service that will pick up your car from the mechanic and send someone to be at your house when the cable guy or repair person shows up. A "7 to 7" travel policy stipulating that no one has to leave home for business travel before 7 am on Mondays and that everyone should be home from business travel by 7 pm on Fridays. The opportunity to telecommute so that you can feed your kids breakfast, pick them up after school, and tuck them into bed at night.[69]

If you have kids, you might love the chance to telecommute; but if you don't, you may not be interested. If you don't travel much on business, you won't be interested in the "7 to 7" travel policy; but if you do, you'll probably love it. One of the hardest things about motivating people is that not everyone is attracted to the same rewards. **Expectancy theory** says that people will be motivated to the extent to which they believe that their efforts will lead to good performance, that good performance will be rewarded, and that they will be offered attractive rewards.[70]

Let's learn more about expectancy theory by examining **3.1 the components of expectancy theory** and **3.2 how to use expectancy theory as a motivational tool.**

3.1 Components of Expectancy Theory

Expectancy theory holds that people make conscious choices about their motivation. The three factors that affect those choices are valence, expectancy, and instrumentality.

Valence is simply the attractiveness or desirability of various rewards or outcomes. Expectancy theory recognizes that the same reward or outcome—say, a promotion—will be highly attractive to some people, will be highly disliked by others, and will not make much difference one way or the other to still others. Accordingly, when people are deciding how much effort to put forth, expectancy theory says that they will consider the valence of all possible rewards and outcomes that they can receive from their jobs. The greater the sum of those valences, each of which can be positive, negative, or neutral, the more effort people will choose to put forth on the job.

Expectancy is the perceived relationship between effort and performance. When expectancies are strong, employees believe that their hard work and efforts will result in good performance, so they work harder. By contrast, when expectancies are weak, employees figure that no matter what they do or how hard they work, they won't be able to perform their jobs successfully, so they don't work as hard.

Instrumentality is the perceived relationship between performance and rewards. When instrumentality is strong, employees believe that improved performance will lead to better and more rewards, so they choose to work harder. When instrumentality is weak, employees don't believe that better performance will result in more or better rewards, so they choose not to work as hard.

Expectancy theory holds that for people to be highly motivated, all three variables—valence, expectancy, and instrumentality—must be high. Thus, expectancy theory can be represented by the following simple equation:

$$\text{Motivation} = \text{Valence} \times \text{Expectancy} \times \text{Instrumentality}$$

If any one of these variables (valence, expectancy, or instrumentality) declines, overall motivation will decline, too.

[Expectancy theory] the theory that people will be motivated to the extent to which they believe that their efforts will lead to good performance, that good performance will be rewarded, and that they will be offered attractive rewards

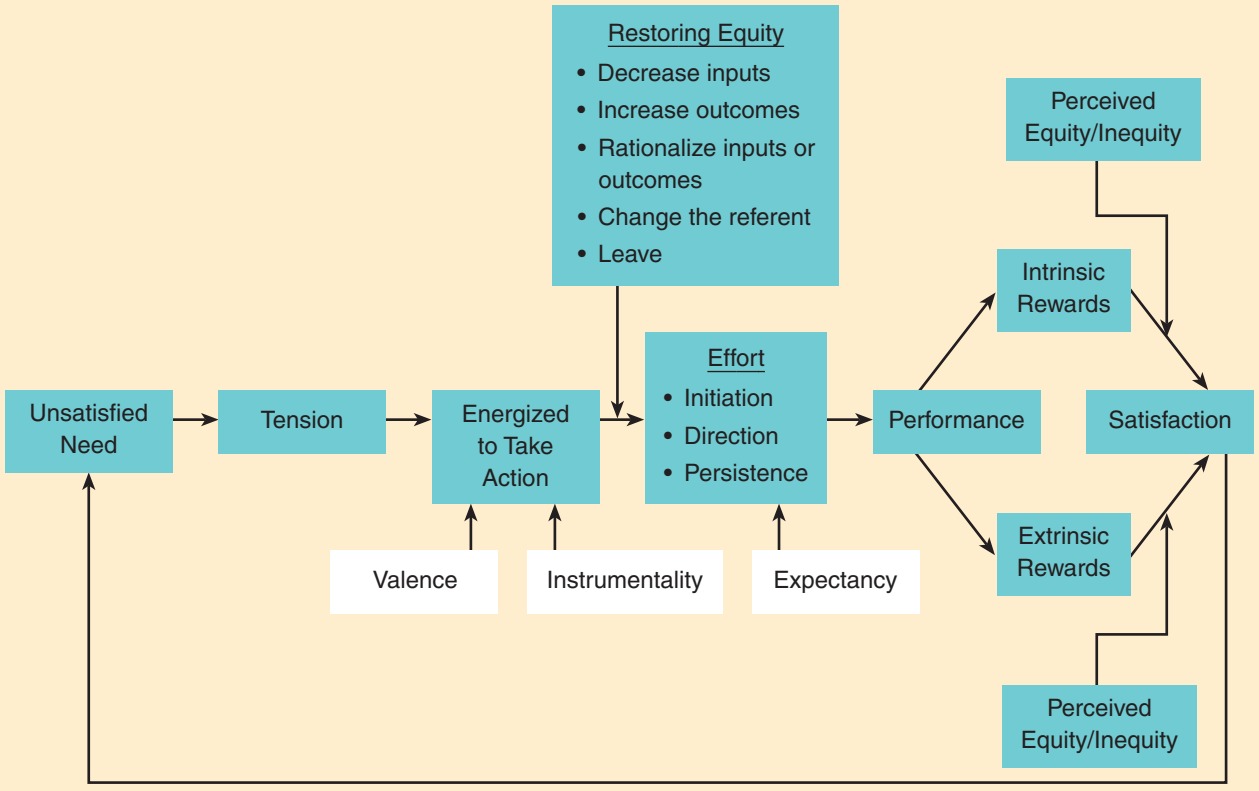
[Valence] the attractiveness or desirability of a reward or outcome

[Expectancy] the perceived relationship between effort and performance

[Instrumentality] the perceived relationship between performance and rewards

Exhibit 13.10 incorporates the expectancy theory variables into our motivation model. Valence and instrumentality combine to affect employees' willingness to put forth effort (i.e., the degree to which they are energized to take action), while expectancy transforms intended effort ("I'm really going to work hard in this job") into actual effort. If you're offered rewards that you desire and you believe that you will in fact receive these rewards for good performance, you're highly likely to be energized to take action. However, you're not likely to actually exert effort unless you also believe that you can do the job (i.e., that your efforts will lead to successful performance). Nucor Corporation, a steel products company, is the safest, highest-quality, lowest-cost, most productive and profitable steel company in the world. The Nucor performance management system integrates valence, expectancy, and instrumentality. First, Nucor offers a wide variety of rewards, including employee recognition programs, incentives and bonuses, and a no-layoff policy, so that all of its employees can receive highly valent rewards that they desire. Second, it manages expectancies through rigorous selection, orientation, and placement for new employees and through training and development opportunities for continuing employees. Finally, Nucor manages instrumentality by linking rewards to the specific results, behaviors, and values it wants to reward. For instance, manufacturing employees are paid weekly bonuses based on quality and quantity of steel produced by their work groups. This bonus averages 80 to 170 percent of base wages and

EXHIBIT 13.10 Adding Expectancy Theory to the Model



If rewards are attractive (valence) and linked to performance (instrumentality), then people are energized to take action. In other words, good performance gets them rewards that they want. Intended effort (i.e., energized to take action) turns into actual effort when people believe that their hard work and efforts will result in good performance. After all, why work hard if that hard work is wasted?

has no cap. As long as quality and quantity increase, so does the bonus. Department managers earn annual incentive bonuses, as much as 100 percent of base salary, based on the return on investment of their manufacturing facility. Likewise, professional and staff employees, such as accountants, engineers, clerks, receptionists, and others, can earn bonuses up to 28 percent of salary. Every employee at Nucor knows exactly how rewards are determined and perceives a strong link between performance and pay.[71]

3.2 Motivating with Expectancy Theory

What practical steps can managers take to use expectancy theory to motivate employees? First, as Exhibit 13.11 shows, they can *systematically gather information to find out what employees want from their jobs*. In addition to individual managers directly asking employees what they want from their jobs (see Subsection 1.4, "Motivating with the Basics"), companies need to survey their employees regularly to determine their wants, needs, and dissatisfactions. Since people consider the valence of all the possible rewards and outcomes that they can receive from their jobs, regular identification of wants, needs, and dissatisfactions gives companies the chance to turn negatively valent rewards and outcomes into positively valent rewards and outcomes, thus raising overall motivation and effort. Mark Peterman, vice president of client solutions at Maritz Incentives, says that individual employees are motivated in vastly different ways: "For some, being honored in front of one's peers is a great award, but for others, the thought of being put on display in front of peers embarrasses them." And companies have a long way to go to ensure that their employees feel valued, Peterman says. A Maritz survey found that only 27 percent of employees who want to be recognized by nonmonetary incentives are recognized that way.[72] Such findings suggest that employers should routinely survey employees to identify not only the range of rewards that are valued by most employees but also understand the preferences of specific employees.

Second, managers can *take specific steps to link rewards to individual performance in a way that is clear and understandable to employees*. Unfortunately, most employees are extremely dissatisfied with the link between pay and performance in their organizations. In one study, based on a representative sample, 80 percent of the employees surveyed wanted to be paid according to a different kind of pay system! Moreover, only 32 percent of employees were satisfied with how their annual pay raises were determined, and only 22 percent were happy with the way the starting salaries for their jobs were determined.[73]

One way to make sure that employees see the connection between pay and performance (see Chapter 11 for a discussion of compensation strategies) is for managers to publicize the way in which pay decisions are made. This is especially important given that only 41 percent of employees know how their pay increases are determined.[74] Kerry Solomon, an HR executive, faced this challenge when she joined SecureWorks, an Atlanta-based Internet security services provider. She gathered accurate, comparable salary information and launched an aggressive educational enlightenment program to show employees how pay rates and increases are determined and how their pay compares with pay at other comparable firms. She believes that such information sharing is important because it allows employees to gain an accurate sense of where they stand—and to appreciate their employer's generosity.[75]

EXHIBIT 13.11

Motivating with Expectancy Theory

- Systematically gather information to find out what employees want from their jobs.
- Take specific steps to link rewards to individual performance in a way that is clear and understandable to employees.
- Empower employees to make decisions if management really wants them to believe that their hard work and effort will lead to good performance.

Finally, managers should *empower employees to make decisions if management really wants them to believe that their hard work and effort will lead to good performance*. If valent rewards are linked to good performance, people should be energized to take action. However, this works only if they also believe that their efforts will lead to good performance. One of the ways that managers destroy the expectancy that hard work and effort will lead to good performance is by restricting what employees can do or by ignoring employees' ideas. In Chapter 9, you learned that *empowerment* is a feeling of intrinsic motivation, in which workers perceive their work to have meaning and perceive themselves to be competent, to have an impact, and to be capable of self-determination.[76] So, if managers want workers to have strong expectancies, they should empower them to make decisions. Doing so will motivate employees to take active rather than passive roles in their work.

Expectancy Theory Expectancy theory holds that three factors affect the conscious choices people make about their motivation: valence, expectancy, and instrumentality. Valence is simply the attractiveness or desirability of various rewards or outcomes. Expectancy is the perceived relationship between effort and performance. Instrumentality is the perceived relationship between performance and rewards. Expectancy theory holds that all three factors must be high in order for people to be highly motivated. If any one of these factors declines, overall motivation will decline, too. Managers can use expectancy theory to motivate workers by systematically gathering information to find out what employees want from their jobs, by linking rewards to individual performance in a way that is clear and understandable to employees, and by empowering employees to make decisions, which will increase their expectancies that hard work and effort will lead to good performance.

HOW REWARDS AND GOALS AFFECT MOTIVATION

After reading the next three sections, you should be able to

4. explain how reinforcement theory works and how it can be used to motivate.
5. describe the components of goal-setting theory and how managers can use them to motivate workers.
6. discuss how the entire motivation model can be used to motivate workers.

When used properly, rewards motivate and energize employees. But when used incorrectly, they can demotivate, baffle, and even anger them. For example, consider the dot-com company that gave *every* employee a plaque for outstanding performance. Then it compounded that mistake (How can every employee be outstanding?) by firing one of those "outstanding" employees, James Finkel, two weeks after awarding him his plaque. Says Finkel, "My reward for outstanding performance was getting canned. I left the plaque sitting on my desk."[77]

Goals are supposed to motivate employees. But leaders who focus blindly on meeting goals at all costs often find that they

destroy motivation. For instance, a president of a technology company calls his vice president of sales *daily* and asks, "Did you make your numbers *today*?" Consultant Richard Hapburg, who works with the vice president who receives these daily calls, says that the VP should be focusing on long-term solutions that increase sales, but "he's under enormous pressure to meet certain sales and profit targets on a *daily basis* now." The clear danger to using goals in this way, says Hapburg, is "that it's hard to capture employees' hearts, and best efforts, with numbers alone."[78]

4 REINFORCEMENT THEORY

Reinforcement theory says that behavior is a function of its consequences, that behaviors followed by positive consequences (i.e., reinforced) will occur more frequently, and that behaviors either followed by negative consequences or not followed by positive consequences will occur less frequently.[79] For example, more and more hotels with "100% smoke-free policies" have increased fines (i.e., negative consequences) for customers who smoke in their rooms. **Sheraton Hotels** charges a $200 fine, Walt Disney World charges $500, and Swissotel Chicago raised its fine from $175 to $250. Swissotel's marketing director, Nicole Jachimiak, says, "$175 wasn't quite enough to get people to stop."[80] More specifically, **reinforcement** is the process of changing behavior by changing the consequences that follow behavior.[81]

Reinforcement has two parts: reinforcement contingencies and schedules of reinforcement. **Reinforcement contingencies** are the cause-and-effect relationships between the performance of specific behaviors and specific consequences. For example, if you get docked an hour's pay for being late to work, then a reinforcement contingency exists between a behavior (being late to work) and a consequence (losing an hour's pay). A **schedule of reinforcement** is the set of rules regarding reinforcement contingencies such as which behaviors will be reinforced, which consequences will follow those behaviors, and the schedule by which those consequences will be delivered.[82]

Exhibit 13.12 incorporates reinforcement contingencies and reinforcement schedules into our motivation model. First, notice that extrinsic rewards and the schedules of reinforcement used to deliver them are the primary method for creating reinforcement contingencies in organizations. In turn, those reinforcement contingencies directly affect valences (the attractiveness of rewards), instrumentality (the perceived link between rewards and performance), and effort (how hard employees will work).

Let's learn more about reinforcement theory by examining **4.1 the components of reinforcement theory, 4.2 the different schedules for delivering reinforcement,** and **4.3 how to motivate with reinforcement theory.**

[Reinforcement theory] the theory that behavior is a function of its consequences, that behaviors followed by positive consequences will occur more frequently, and that behaviors followed by negative consequences, or not followed by positive consequences, will occur less frequently

[Reinforcement] the process of changing behavior by changing the consequences that follow behavior

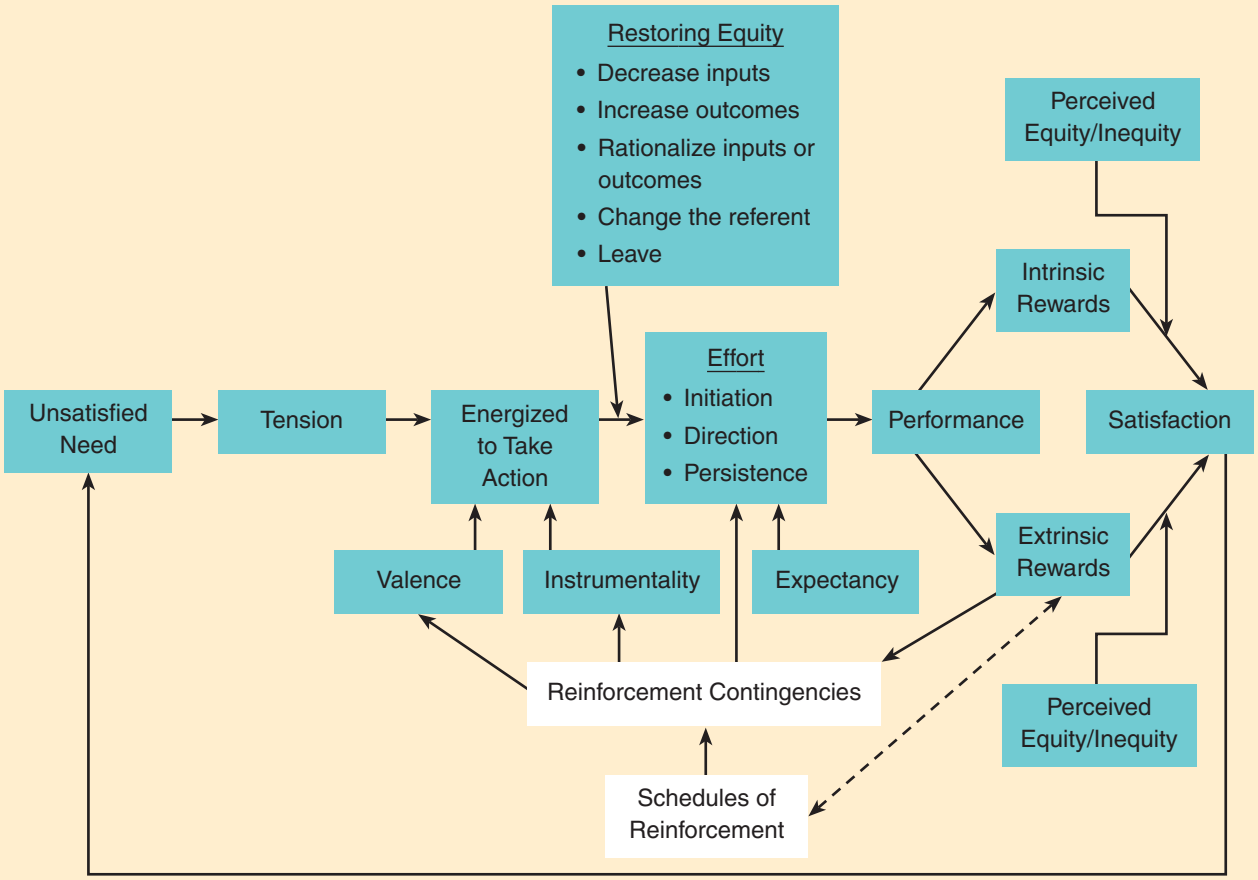
[Reinforcement contingencies] cause-and-effect relationships between the performance of specific behaviors and specific consequences

[Schedule of reinforcement] rules that specify which behaviors will be reinforced, which consequences will follow those behaviors, and the schedule by which those consequences will be delivered

4.1 Components of Reinforcement Theory

As just described, *reinforcement contingencies* are the cause-and-effect relationships between the performance of specific behaviors and specific consequences. There are four kinds of reinforcement contingencies: positive reinforcement, negative reinforcement, punishment, and extinction.

EXHIBIT 13.12 Adding Reinforcement Theory to the Model



Extrinsic rewards and the schedules of reinforcement used to deliver them are the primary method for creating reinforcement contingencies in organizations. In turn, those reinforcement contingencies directly affect valences (the attractiveness of rewards), instrumentality (the perceived link between rewards and performance), and effort (how hard employees will work).

Positive reinforcement strengthens behavior (i.e., increases its frequency) by following behaviors with desirable consequences. Harry Kraemer, the former CEO of Baxter International, a pharmaceutical firm, included this story about his four-year-old son in Baxter's company newsletter to illustrate the power of incentives and positive reinforcement:

> *He had got a hold of his sister's bead set and he somehow got one of them stuck up his nose. He tried to get it out, and the thing kept getting higher up his nose. I got him in the car to take him to the emergency room, and right as I was getting ready to park I said to him, "Andrew, Daddy loves you a lot. We've got to get this thing out. If we go to the emergency room, this is going to cost Dad about $150. But here's the deal: If you can figure out a way to blow that out of your nose [the goal], first, we'll go to Blockbuster and you can buy any tape you want. And second, we'll go to Bakers Square, and you and I will split a French silk pie [the positive rewards]." Well, he blew the thing out, and it almost cracked my windshield.*[83]

[Positive reinforcement] reinforcement that strengthens behavior by following behaviors with desirable consequences

Negative reinforcement strengthens behavior by withholding an unpleasant consequence when employees perform a specific behavior. Negative reinforcement is also called *avoidance learning* because workers perform a behavior to *avoid* a negative consequence. For example, at the Florist Network, a small business in Buffalo, New York, company management instituted a policy of requiring good attendance for employees to receive their annual bonuses. Employee attendance has improved significantly now that excessive absenteeism can result in the loss of $1,500 or more.[84]

By contrast, **punishment** weakens behavior (i.e., decreases its frequency) by following behaviors with undesirable consequences. For example, the standard disciplinary or punishment process in most companies is an oral warning ("Don't ever do that again"), followed by a written warning ("This letter is to discuss the serious problem you're having with . . ."), followed by three days off without pay ("While you're at home not being paid, we want you to think hard about . . ."), followed by being fired ("That was your last chance"). Though punishment can weaken behavior, managers have to be careful to avoid the backlash that sometimes occurs when employees are punished at work. For example, Frito-Lay began getting complaints from customers that they were finding potato chips with obscene messages written on them. Frito-Lay eventually traced the problem to a potato chip plant where supervisors had fired 58 out of the 210 workers for disciplinary reasons over a 9-month period. The remaining employees were so angry over what they saw as unfair treatment from management that they began writing the phrases on potato chips with felt-tip pens.[85]

Extinction is a reinforcement strategy in which a positive consequence is no longer allowed to follow a previously reinforced behavior. By removing the positive consequence, extinction weakens the behavior, making it less likely to occur. Based on the idea of positive reinforcement, most companies give company leaders and managers substantial financial rewards when the company performs well. Based on the idea of extinction, you would then expect that leaders and managers would not be rewarded (i.e., the positive consequence would be removed) when companies perform poorly. If companies really want pay to reinforce the right kinds of behaviors, then rewards have to be removed when company management doesn't produce successful performance. For example, with a $1 billion loss, sales down 28 percent, and the stock price down 35 percent, Agilent's board of directors cut CEO Ned Barnholt's base pay by 10 percent and didn't award him a cash or stock bonus. Says Barnholt, "I don't expect anything different. If the company doesn't perform, I shouldn't be getting any rewards."[86] By contrast, NYSE Euronext CEO Duncan Niederauer received a $4 million bonus, even as the company lost $738 million and its stock price dropped 69 percent.[87]

[Negative reinforcement] reinforcement that strengthens behavior by withholding an unpleasant consequence when employees perform a specifi c behavior

[Punishment] reinforcement that weakens behavior by following behaviors with undesirable consequences

[Extinction] reinforcement in which a positive consequence is no longer allowed to follow a previously reinforced behavior, thus weakening the behavior

4.2 Schedules for Delivering Reinforcement

As mentioned earlier, a *schedule of reinforcement* is the set of rules regarding reinforcement contingencies such as which behaviors will be reinforced, which consequences will follow those behaviors, and the schedule by which those consequences will be delivered. There are two categories of reinforcement schedules: continuous and intermittent.

With **continuous reinforcement schedules**, a consequence follows every instance of a behavior. For example, employees working on a piece-rate pay system earn money (consequence) for every part they manufacture (behavior). The more they produce, the more they earn. By contrast, with **intermittent reinforcement schedules**,

[Continuous reinforcement schedule] a schedule that requires a consequence to be administered following every instance of a behavior

[Intermittent reinforcement schedule] a schedule in which consequences are delivered after a specified or average time has elapsed or after a specified or average number of behaviors has occurred

consequences are delivered after a specified or average time has elapsed or after a specified or average number of behaviors has occurred. As Exhibit 13.13 shows, there are four types of intermittent reinforcement schedules. Two of these are based on time and are called *interval reinforcement schedules*; the other two, known as *ratio schedules*, are based on behaviors.

With **fixed interval reinforcement schedules**, consequences follow a behavior only after a fixed time has elapsed. For example, most people receive their paychecks on a fixed interval schedule (e.g., once or twice per month). As long as they work (behavior) during a specified pay period (interval), they get a paycheck (consequence). With **variable interval reinforcement schedules**, consequences follow a behavior after different times, some shorter and some longer, that vary around a specified average time. On a 90-day variable interval reinforcement schedule, you might receive a bonus after 80 days or perhaps after 100 days, but the average interval between performing your job well (behavior) and receiving your bonus (consequence) would be 90 days.

With **fixed ratio reinforcement schedules**, consequences are delivered following a specific number of behaviors. For example, a car salesperson might receive a $1,000 bonus after every 10 sales. Therefore, a salesperson with only 9 sales would not receive the bonus until he or she finally sold a 10th car.

With **variable ratio reinforcement schedules**, consequences are delivered following a different number of behaviors, sometimes more and sometimes less, that vary around a specified average number of behaviors. With a 10-car variable ratio reinforcement schedule, a salesperson might receive the bonus after 7 car sales, or after 12, 11, or 9 sales, but the average number of cars sold before receiving the bonus would be 10 cars.

[Fixed Interval reinforcement schedule] an intermittent schedule in which consequences follow a behavior only after a fixed time has elapsed

[Variable interval reinforcement schedules] an intermittent schedule in which the time between a behavior and the following consequences varies around a specifi ed average

[Fixed ratio reinforcement schedule] an intermittent schedule in which consequences are delivered following a specific number of behaviors

[Variable ratio reinforcement schedule] an intermittent schedule in which consequences are delivered following a different number of behaviors, sometimes more and sometimes less, that vary around a specified average number of behaviors

Students often have trouble envisioning how these schedules can actually be used in work settings, so a couple of examples will help. In a study designed to increase employee attendance, employees who came to work participated in an innovative variable ratio schedule in which they drew a card from a deck of playing cards every day they came to work. At the end of each week, the employee with the best poker hand from those cards received a $20 bonus.[88] In another variable reinforcement system, Electric Boat, which builds nuclear submarines, uses a lottery that gives workers with good attendance a chance to win sizable rewards. Eligibility for the various rewards depends on the level of attendance. For example, 933 workers with 2 years of perfect attendance were placed in a lottery in which 20 of them would win $2,500. Likewise, 1,400 workers with a year of perfect attendance were placed in a lottery where 75 would win $1,000, 50 would win $500, 25 would win prime parking spaces, and all would win a $25 gift certificate for the company

store. Greg Angelini, who won a $1,000 prize, says, "I'm not a gambler, but it sure was nice to get that check right before Christmas. And it was just as nice that the powers that be noticed that I've had perfect attendance."[89] Electric Boat's lottery system is so rewarding that on average an amazing 41 percent of its workers have perfect attendance.

Which reinforcement schedules work best? In the past, the standard advice was to use continuous reinforcement when employees were learning new behaviors because reinforcement after each success leads to faster learning. Likewise, the standard advice was to use intermittent reinforcement schedules to maintain behavior after it is learned because intermittent rewards are supposed to make behavior much less subject to extinction.[90] Research shows, however, that except for interval-based systems, which usually produce weak results, the effectiveness of continuous reinforcement, fixed ratio, and variable ratio schedules differs very little.[91] In organizational settings, all three produce consistently large increases over noncontingent reward schedules. So managers should choose whichever of these three is easiest to use in their companies.

4.3 Motivating with Reinforcement Theory

What practical steps can managers take to use reinforcement theory to motivate employees? University of Nebraska business professor Fred Luthans, who has been studying the effects of reinforcement theory in organizations for more than a quarter of a century, says that there are five steps to motivating workers with reinforcement theory: *identify*, *measure*, *analyze*, *intervene*, and *evaluate* critical performance-related behaviors.[92]

Identify means singling out critical, observable, performance-related behaviors. These are the behaviors that are most important to successful job performance. In addition, they must also be easily observed so that they can be accurately measured. *Measure* means determining the baseline frequencies of these behaviors. In other words, find out how often workers perform them. *Analyze* means studying the causes and consequences of these behaviors. Analyzing the causes helps managers create the conditions that produce these critical behaviors, and analyzing the consequences helps them determine if these behaviors produce the results that they want. *Intervene* means changing the organization by using positive and negative reinforcement to increase the frequency of these critical behaviors. *Evaluate* means assessing the extent to which the intervention actually changed workers' behavior. This is done by comparing behavior after the intervention to the original baseline of behavior before the intervention. For more on the effectiveness of reinforcement theory, see the "What Really Works?" feature in this chapter.

In addition to these five steps, managers should remember three other key things when motivating with reinforcement theory; these are listed in Exhibit 13.14. First, *Don't reinforce the wrong behaviors*. Although reinforcement theory sounds simple, it's actually very difficult to put into practice. One of the most common mistakes is accidentally reinforcing the wrong behaviors. Sometimes managers reinforce behaviors that they don't want! If you want to become a merit-based company, stop rewarding behavior that is not exceptional, says Dave Anderson, a management consultant. According to him, "the average car salesperson in the United States sells 10 cars per month, but many pay plans begin to pay bonuses at 7, 8, 9, or 10 cars. Under a typical plan, an employee

who sells 8 cars gets a $200 bonus, another $250 for selling 2 additional cars, and $300 for selling 2 more cars. The total bonus for selling 12 cars in a month is $750." Anderson notes, "Based on national averages, such a pay plan financially rewards average and below-average results." Many of his clients have revised their system and only pay an $800 bonus to an employee *after* he or she has sold 12 cars, thus ending bonus payments for employees who sell fewer than the target amount of cars.[93] In this system, you pay more for better performance but don't fall into the trap of rewarding and endorsing the wrong things, rewarding below average performance.

Managers should also *correctly administer punishment at the appropriate time*. Many managers believe that punishment can change workers' behavior and help them improve their job performance. Furthermore, managers believe that fairly punishing workers also lets other workers know what is or isn't acceptable.[94] A danger of using punishment is that it can produce a backlash against managers and companies. But, if administered properly, punishment can weaken the frequency of undesirable behaviors without creating a backlash.[95] To be effective, the punishment must be strong enough to stop the undesired behavior and must be administered objectively (same rules applied to everyone), impersonally (without emotion or anger), consistently and contingently (each time improper behavior occurs), and quickly (as soon as possible following the undesirable behavior). In addition, managers should clearly explain what the appropriate behavior is and why the employee is being punished. Employees typically respond well when punishment is administered this way.[96]

Finally, managers should *choose the simplest and most effective schedule of reinforcement*. When choosing a schedule of reinforcement, managers need to balance effectiveness against simplicity. In fact, the more complex the schedule of reinforcement, the more likely it is to be misunderstood and resisted by managers and employees. For example, a forestry and logging company experimented with a unique variable ratio schedule. When tree-planters finished planting a bag of seedlings (about 1,000 seedlings per bag), they got to flip a coin. If they called the coin flip correctly (heads or tails), they were paid $4, double the regular rate of $2 per bag. If they called the coin flip incorrectly, they got nothing. The company began having problems when several workers and a manager, who was a part-time minister, claimed that the coin flip was a form of gambling. Then another worker found that the company was taking out too much money for taxes from workers' paychecks. Since the workers didn't really understand the reinforcement schedule, they blamed the payment plan associated with it and accused the company of trying to cheat them out of their money. After all of these problems, the researchers who implemented the variable ratio schedule concluded that "the results of this study may not be so much an indication of the relative effectiveness of different schedules of reinforcement as they are an indication of the types of problems that one encounters when applying these concepts in an industrial setting."[98] In short, choose the simplest, most effective schedule of reinforcement. Since continuous reinforcement, fixed ratio, and variable ratio schedules are about equally effective, continuous reinforcement schedules may be the best choice in many instances by virtue of their simplicity.

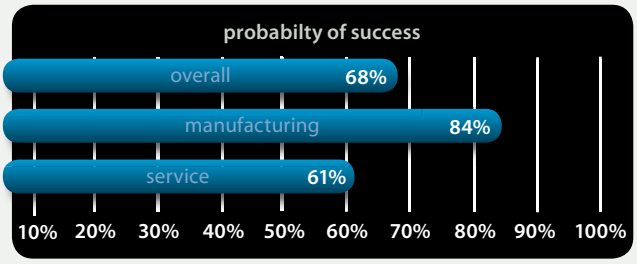
Financial, Nonfinancial, and Social Rewards

Throughout this chapter, we have been making the point that there is more to motivating people than money. But we haven't yet examined how well financial (money or prizes), nonfinancial (performance feedback), and social (recognition and attention) rewards motivate workers by themselves or in combination. However, the results of two meta-analyses, one with 19 studies based on more than 2,800 people (study 1) and another based on 72 studies and 13,301 people (study 2), clearly indicate that rewarding and reinforcing employees greatly improve motivation and performance, especially when combined.

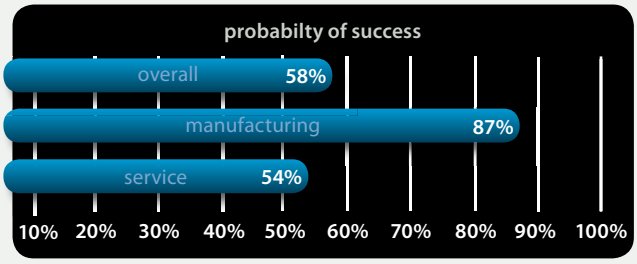
Financial Rewards

On average, there is a 68 percent chance that employees whose behavior is reinforced with financial rewards will outperform employees whose behavior is not reinforced. This increases to 84 percent in manufacturing organizations but drops to 61 percent in service organizations.



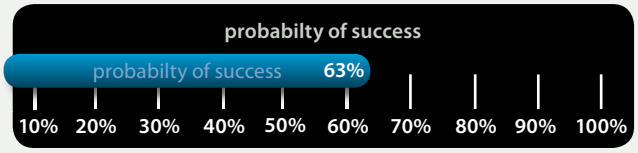
Nonfinancial Rewards

On average, there is a 58 percent chance that employees whose behavior is reinforced with nonfinancial rewards will outperform employees whose behavior is not reinforced. This increases to 87 percent in manufacturing organizations but drops to 54 percent in service organizations.



Social Rewards

On average, there is a 63 percent chance that employees whose behavior is reinforced with social rewards will outperform employees whose behavior is not reinforced.



Financial and Nonfinancial Rewards

On average, there is a 62 percent chance that employees whose behavior is reinforced with a combination of financial and nonfinancial rewards will outperform employees whose behavior is not reinforced.

Reinforcement Theory Reinforcement theory says that behavior is a function of its consequences. Reinforcement has two parts: reinforcement contingencies and schedules of reinforcement. The four kinds of reinforcement contingencies are positive reinforcement and negative reinforcement (which strengthen behavior), and punishment and extinction (which weaken behavior). There are two kinds of reinforcement schedules, continuous and intermittent; intermittent schedules, in turn, can be divided into fixed and variable interval schedules and fixed and variable ratio schedules. Managers can use reinforcement theory to motivate workers by following five steps (identify, measure, analyze, intervene, and evaluate critical performance-related behaviors); not reinforcing the wrong behaviors; correctly administering punishment at the appropriate time; and choosing a reinforcement schedule, such as continuous reinforcement, that balances simplicity and effectiveness.

5 GOAL-SETTING THEORY

The basic model of motivation with which we began this chapter showed that individuals feel tension after becoming aware of an unfulfilled need. Once they experience tension, they search for and select courses of action that they believe will eliminate this tension. In other words, they direct their behavior toward something. This something is a goal. A **goal** is a target, objective, or result that someone tries to accomplish. **US Airways** had one of the worst on-time records in the airline industry. Senior Vice President Suzanne Boda said, "Our numbers were abysmal." Bags went missing and delayed connecting flights and many employees actually thought that as long as a flight pushed back from the gate no more than 30 minutes after its scheduled departure it was still scored as "on time."[99] That's when Robert Isom, the company's chief operating officer, established a new company-wide goal, "D-zero," which meant that every flight had to depart before or at its scheduled time, and then promised to pay every employee a $50 monthly bonus each month the company met its goals. Said Isom, "Airlines, or really any organization, need a rallying cry, especially one that has been the worst of the worst for so long."[100] In addition to the goal and bonuses, US Airlines added 100 more mechanics to quickly fix problems, took bags directly to connecting flights instead of to a central sorting area in which every bag was handled again (an unneeded extra step), and authorized managers to make hiring, spending, and operational decisions without approval from headquarters. The result? In less than a year, US Airways went from worst in on-time performance to first.

"Airlines, or really any organization, need a rallying cry, especially one that has been the worst of the worst for so long."

ROBERT ISOM, CHIEF OPERATING OFFICER, US AIRWAYS

Goal-setting theory says that people will be motivated to the extent to which they accept specific, challenging goals and receive feedback that indicates their progress toward goal achievement. Let's learn more about goal setting by examining **5.1 the components of goal-setting theory and 5.2 how to motivate with goal-setting theory.**

5.1 Components of Goal-Setting Theory

The basic components of goal-setting theory are goal specificity, goal difficulty, goal acceptance, and performance feedback.[101] **Goal specificity** is the extent to which goals are detailed, exact, and unambiguous. Specific goals, such as "I'm going to have a 3.0 average this semester," are more motivating than general goals, such as "I'm going to get better grades this semester."

Goal difficulty is the extent to which a goal is hard or challenging to accomplish. Difficult goals, such as "I'm going to have a 3.5 average and make the Dean's List this semester," are more motivating than easy goals, such as "I'm going to have a 2.0 average this semester."

Goal acceptance, which is similar to the idea of goal commitment discussed in Chapter 5, is the extent to which people consciously understand and agree to goals. Accepted goals, such as "I really want to get a 3.5 average this semester to show my parents how much I've improved," are more motivating than unaccepted goals, such as "My parents really want me to get a 3.5 average this semester, but there's so much more I'd rather do on campus than study!"

Performance feedback is information about the quality or quantity of past performance and indicates whether progress is being made toward the accomplishment of a goal. Performance feedback, such as "My prof said I need a 92 on the final to get an 'A' in that class," is more motivating than no feedback, "I have no idea what my grade is in that class." In short, goal-setting theory says that people will be motivated to the extent to which they accept specific, challenging goals and receive feedback that indicates their progress toward goal achievement.

[Goal] a target, objective, or result that someone tries to accomplish

[Goal-setting theory] the theory that people will be motivated to the extent to which they accept specific, challenging goals and receive feedback that indicates their progress toward goal achievement

[Goal specificity] the extent to which goals are detailed, exact, and unambiguous

[Goal difficulty] the extent to which a goal is hard or challenging to accomplish

[Goal acceptance] the extent to which people consciously understand and agree to goals

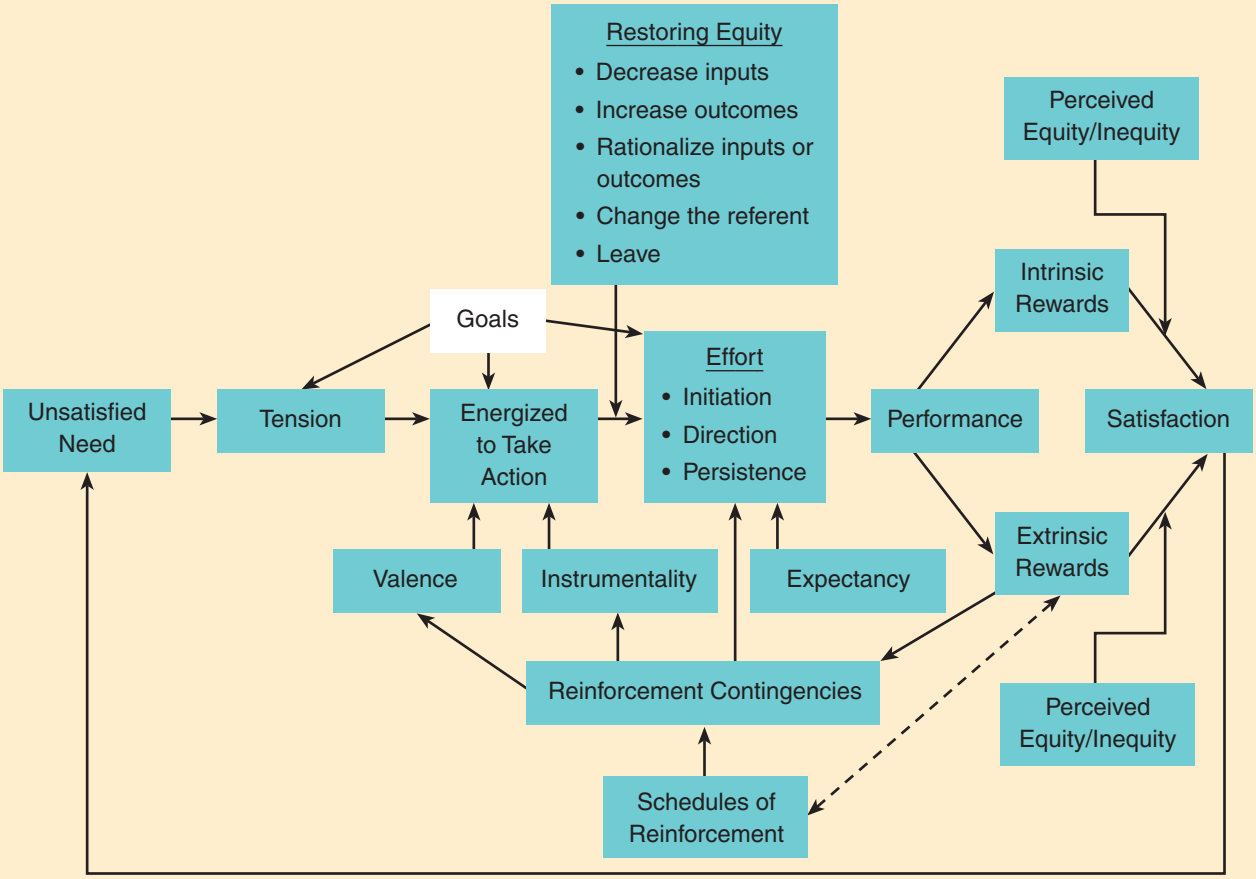
[Performance feedback] information about the quality or quantity of past performance that indicates whether progress is being made toward the accomplishment of a goal

How does goal setting work? To start, challenging goals focus employees' attention (i.e., direction of effort) on the critical aspects of their jobs and away from unimportant areas. Goals also energize behavior. When faced with unaccomplished goals, employees typically develop plans and strategies to reach those goals. Goals also create tension between the goal, which is the desired future state of affairs, and where the employee or company is now, meaning the current state of affairs. This tension can be satisfied only by achieving or abandoning the goal. Finally, goals influence persistence. Since goals only go away when they are accomplished, employees are more likely to persist in their efforts in the presence of goals. Exhibit 13.15 incorporates goals into the motivation model by showing how goals directly affect tension, effort, and the extent to which employees are energized to take action.

5.2 Motivating with Goal-Setting Theory

What practical steps can managers take to use goal-setting theory to motivate employees? Exhibit 13.16 lists three suggestions, beginning with *assign specific, challenging goals*. One of the simplest, most effective ways to motivate workers is to give them specific, challenging goals. For example, **Valpak Direct Marketing Systems** is a direct-mailing company that awards regional franchises to people with

EXHIBIT 13.15 Adding Goal-Setting Theory to the Model



Goals create tension between the goal, which is the desired future state of affairs, and where the employee or company is now, meaning the current state of affairs. This tension can be satisfied only by achieving or abandoning the goal. Goals also energize behavior. enough business experience and cash ($43,000 is usually enough for a small region). However, if you work for Valpak and meet the goal of $1.1 million in sales over 3 years, putting you among the top third of its best salespeople, the company lets you choose your reward: $50,000 toward the purchase of a small regional territory, or $10,000 toward getting your MBA. Joe Bourdow, Valpak's president, said, "Sharp people coming out of school have choices, and so we're trying to give them a reason to at least consider us."[102] For more information on assigning specific, challenging goals, see the discussion in Chapter 5 on S.M.A.R.T. goals.

> "Sharp people coming out of school have choices, and so we're trying to give them a reason to at least consider us."
>
> JOE BOURDOW, PRESIDENT, VALPAK

Second, managers should *make sure workers truly accept organizational goals*. Specific, challenging goals won't motivate workers unless they really accept, understand, and agree to the organization's goals. For this to occur, people must see the goals as fair and reasonable. Plus, they must trust management and believe that managers are using goals to clarify what is expected from them rather than to exploit or threaten them ("If you don't achieve these goals . . ."). Participative goal setting, in which managers and employees generate goals together, can help increase trust and understanding and thus acceptance of goals. Furthermore, providing workers with training can help increase goal acceptance, particularly when workers don't believe they are capable of reaching the organization's goals.[103]

Finally, managers should *provide frequent*, *specific*, *performance-related feedback*. Once employees have accepted specific, challenging goals, they should receive frequent performance-related feedback so that they can track their progress toward goal completion. Feedback leads to stronger motivation and effort in three ways.[104] Receiving specific feedback about the quality of their performance can encourage employees who don't have specific, challenging goals to set goals to improve their performance. Once people meet goals, performance feedback often encourages them to set higher, more difficult goals. And feedback lets people know whether they need to increase their efforts or change strategies in order to accomplish their goals.

For example, in an effort to improve worker safety on offshore oil-drilling platforms, an oil company generated a list of dangerous work behaviors by analyzing previous accident reports, reviewing industry safety manuals, and interviewing and observing workers. Following detailed safety training, each work crew set goals to engage in safe behaviors 100 percent of the time on each shift. To help workers track their improvement, management posted a weekly safety record in the galley of each rig, where workers would see it when they gathered for meals and coffee breaks. Previously, employees were engaging in safe work behaviors just 76 percent of the time. After a year of goal setting (100 percent safe behavior on each shift) and weekly performance feedback at two oil rigs, however, workers behaved safely over 90 percent of the time. As a result, accident rates dropped from 21.1 percent to 6.1 percent at the first rig and from 14.2 percent to 12.1 percent at the second rig. By contrast, at a third oil rig, where training, goal setting, and feedback were not used, the total accident rate *increased* from 11.6 percent to 20.3 percent over the same time.[105] So, to motivate employees with goal-setting theory, make sure they receive frequent performance-related feedback so that they can track their progress toward goal completion.

6 MOTIVATING WITH THE INTEGRATED MODEL

We began this chapter by defining motivation as the set of forces that initiates, directs, and makes people persist in their efforts to accomplish a goal. We also asked the basic question that managers ask when they try to figure out how to motivate their workers: "What leads to effort?" Though the answer to that question is likely to be somewhat different for each employee, Exhibit 13.17 helps you begin to answer it by consolidating the practical advice from the theories reviewed in this chapter in one convenient location. So, if you're having difficulty figuring out why people aren't motivated where you work, Exhibit 13.17 provides a useful, theory-based starting point.

Motivating the Multigenerational Work Force

Now that Generation Y (also known as millennials) is entering the work force, managers must juggle four generations of workers with distinctly different work styles, ambitions, and values. Gen Yers have grown up immersed in technology and have largely been insulated from negative feedback by overinvolved Boomer parents. These workers tend to be fearless and blunt, believe that old-school ways don't necessarily generate the best results, and are more committed to work–life balance than previous generations. Today's managers need to adapt if they want to attract, retain, and motivate Gen Yers, who will conceivably dominate the work force for the next 70 years. What motivated older generations is probably not going to work as well with Gen Y.

SELF ASSESSMENT

What Do You Need?

What people want out of their jobs is as varied as the jobs themselves.[106] And as you would expect, need theories show why not everyone wants to be CEO. Take the example of the woman who is extremely organized and efficient in her job as an assistant. She is so effective that she is offered a promotion to management, but she turns it down flatly, saying that she has no interest in moving up the ladder, that she is happy doing what she does. What she needs from work clearly differs from the needs of the person who jumps at every opportunity to move up the corporate hierarchy. Not everyone needs or wants the same things from their jobs.[107] Indicate the extent to which you agree with each of the following statements. Try not to spend too much time on any one item, and be sure to answer all the questions. Use this scale for your responses:

1. Strongly disagree
2. Disagree
3. Slightly disagree
4. Neutral
5. Slightly agree
6. Agree

MANAGEMENT DECISION

Crowdsourcing a More Stable Economy

Magazine and newspaper articles, op-ed columns, and even entire books are being written in an effort to explain the causes of the recent global economic downturn. Many ask, "How did we not see it coming?" Being in the credit rating business, you know that the signs were there. They were just missed by the big-name agencies like Moody's, which gave Lehman Brothers an A2 rating despite signs of a likely default. What's the problem in your industry? One problem might be groupthink: There is not a lot of diversity or creativity in how algorithms are created among the big agencies (so there is not a diversity of opinion), and their models are not available for public scrutiny. Another problem: Large firms can be slow to react to new information. What's more, credit rating organizations often take payment from the companies they evaluate—it's legal, but it still looks an awful lot like a conflict of interest.

You think you may have a solution: crowdsourcing. Set up a website where users can create their own algorithms to assess credit risk. Your main goal is to get a clean, open store of financial data and make it available for download. Then you might offer some examples and templates to get contributors off to a start, but you want to encourage people to come up with their own strategies. This will certainly provide a diversity of algorithms that will be transparent and can be assessed on how well they actually perform.[108]

Your problem: How can you motivate potential users to contribute to this "ecosystem" without offering financial rewards? Crowdsourcing has been growing in recent years, enabled by the fact that people are motivated by other things besides cold, hard cash: recognition, respect, satisfaction at having accomplished something and contributed to a greater goal, the opportunity for personal expression and building a personal brand. You know you will have to invest in creating a base—getting contributors access to the financial data they need will be a good start—and a message that will bring potential contributors on board. But beyond that, what can you do? Some organizations, like those who post challenges in need of solutions on InnoCentive.com, can offer cash prizes for the person who comes up with the best solution. Others create online games or contests to offer incentive, create competition, and make it fun.[109] You know you've got a powerful message that can tap into this set of powerful internal motivations: We can work together to create a more stable economy. Now you just have to create a strategy for doing it.

Questions

1. Think about the four theories of motivation you read about in the text. Which one (or combination of more than one) might work best in this situation?

2. What specific incentives would you design and implement to motivate potential contributors if you were in charge of this website? Discuss them with reference to one or more of the motivational theories presented in the text.

MANAGEMENT TEAM DECISION

Mining Human Capital

Labor is probably the single largest expense of any business.[110] According to some estimates, labor costs average about 60 percent of sales. In addition to salaries, labor costs include health insurance, paid time off, child-care benefits, tuition reimbursements, and any number of other programs designed to extrinsically motivate the work force. Many companies offer the same types of benefits across their organizations without knowing whether the benefits really motivate employees at all. In other words, companies often don't know what return they are getting on their labor investment. The same is true where you work.

As you head back to your desk from a meeting on cafeteria-style benefit plans, your boss intercepts you and says she wants to talk with you about cutting labor costs. As she plops into your side chair, she is already describing a new type of software that applies data-mining technology to employee information to determine what is the best motivator. "We can get rid of one-size-fits-all benefit programs and tailor the benefits to each employee. This software lets you slice and dice employee data, like age, seniority, education, commute time, residential ZIP code, even the age and condition of the person's office," she says. "We could find out if we could pay someone, say, 20 percent less if we gave a 3-month sabbatical every couple of years. Or we could predict the reaction of certain employees if we cut our 401(k) match. Maybe that's not as important to everyone as we think. We could find out who would quit if we did that and who couldn't care less. Basically, we could find out what incentives would spike productivity the most with each employee, and that way we could cut costs without sabotaging morale. It would reduce the guesswork of rewarding our employees. Here is some literature on the various programs. I'd like your team to draft a recommendation to top management by next Monday. I'm really excited about this." She leaves a small stack of brochures on your desk corner and leaves your office.

All you can do is wonder, "What will the employees think of this idea?"

Assemble a team of three to four students to review the issue of mining human resource data for information to help you customize incentives.

Questions

1. Which motivational theory provides the biggest justification for employee data mining? Explain.
2. Does employee data mining violate any of the motivational theories? If so, which ones and how?
3. Will your team recommend mining employee data or, despite your boss's enthusiasm, will you present reasons not to begin mining employee data? Explain your choice, using the motivational theories in the chapter as support for your recommendation.

PRACTICE BEING A MANAGER

The Makings of Motivation

Motivation is an invisible and powerful force. Strong motivation can drive individuals and organizations to remarkable heights of achievement. A loss of motivation can leave us dispirited and ineffective. One of the fundamental responsibilities of managers is to support healthy worker motivation. This exercise will allow you to practice designing support for worker motivation.

Step 1: Divide intro groups. Your professor will organize you in pairs or groups of three.

Step 2: Prepare interviews. Between this class session and the target date set by your professor, you and your partner(s) will each interview two individuals about motivation at work. You should brainstorm about possible types of work, interesting individuals, and so on, and then agree on each partner's list of interviewees/jobholders.

Some considerations for brainstorming include jobs or types of work that you consider particularly interesting, appealing, or mysterious; jobs or types of work that you consider particularly uninteresting, dull, or monotonous (how does a person do that work day after day?); and self-employed or creative work (how do such workers manage their own motivation without a boss or supervisor?)

Step 3: Conduct interviews. Outside of class each student should complete their assigned interviews. Inform the potential interview that you are interested in talking about workplace motivation. Set a time that is convenient and ensure that you arrive on time and prepared. Make the interview brief, with 15–20 minutes a good target. Go beyond 20 minutes only if the interview gives permission and the discussion is lively. Be sure to thank the interview for taking the time to visit with you.

Your instructor may give additional instructions for these interviews, and you should carefully follow these guidelines in conducting the interview.

Interview questions might include the following:

1. How would you describe your work? What are some of the things that you particularly like about your work?
2. We are currently studying the topic of motivation in one of my classes. What boosts your motivation at work? If you have ever experienced a period of low motivation, can you identify things that might have contributed to your losing steam in your work?
3. What kinds of rewards or incentives work best to motivate individuals and/or teams who do your type of work? What kinds of rewards or incentives don't work so well?

Step 4: Summarize your findings. Write a one-page paper summarizing your interview findings. Be prepared to compare notes with your partners and to contribute to class discussion.

Step 5: Debrief as a class. Pairs/small groups report their findings and discuss as a class. What did you learn from your interviews? Did you notice common themes or issues across the interviews you conducted? Did you notice any striking differences across individuals or types of work? What are some possible implications of these interview findings for managers who are responsible for cultivating healthy motivation in a particular work setting?

DEVELOP YOUR CAREER POTENTIAL

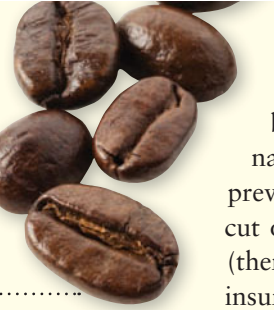
Cut Your Costs, Not Your Morale

Management textbooks abound with discussions of the importance of honest and open communication when disseminating negative information to employees.[111] One study suggests that the best way to ruin morale and motivation is to spring bad news on employees without explaining the reasoning or rationale. Yet, despite the need to maintain a high level of motivation and morale during a receding economy, many companies cut perks without communicating the need to their employees. During the high-tech boom at the end of the 20th century, many companies implemented programs to increase productivity, motivation, and job satisfaction. Some of the perks provided were minor, such as free soft drinks, catered lunches, snacks, and tickets to events such as a baseball game or the opera. Other free perks were more extravagant, such as concierge services to run errands for employees, service their vehicles, and pick up their laundry. Some firms even provided their employees with in-house massages and annual Caribbean cruises. Obviously, cutting these non-value-added expenses can save tremendous money for a struggling firm. In fact, many firms cut out both the extravagant perks and the basics as a way to conserve much-needed cash. Cutting perks, however, doesn't have to be forever. Perks can be powerful motivational tools that companies can reintegrate into their performance reward systems.

For this assignment, consider your own budget and expenses in terms of revenue and perks. Imagine that like so many companies, you experience a cash crunch. Your revenue (income) shrinks 25 percent, so you must trim some fat from your budget.

Exercises

1. First, you will need to review your expenditures. What "perks" have you built into your budget as a student? (Think pizza and beer.) Make a list of all your non-value-added expenses. This includes anything not directly related to your studies (like books, tuition, enrollment fees, pens, paper) or your fixed expenses (like rent, car payments, insurance).
2. If you experienced a 25 percent reduction in your income—as numerous firms did after the tech



bubble burst—which perks would you eliminate? In addition, are there items that you previously considered necessities that you could cut out? An example would be selling your car (thereby eliminating car payments and related insurance) and taking public transportation or catching a ride with a friend. What about getting a roommate, moving into the dorms, or living with your parents?

3. Often employees develop a sense of entitlement about perks, and when the perks are trimmed, great dissatisfaction can result. Companies even lose employees when perks are cut. In this exercise, let's consider that cutting out your non-value-added (that is, fun) expenditures may put a crimp in your social life. In fact, you may have trouble staying in the loop. What can you do to "retain" your social friends as you cut down on your personal perks? Do you think that "retention" will even be an issue for you? Why or why not?
4. Once you have taken the ax to your perks, how can you reincorporate them into your budget, this time as motivational tools? Which perks would motivate you to have perfect attendance in class? To make an A? Straight As? Be creative. The purpose is to see if you can modify your own behavior by using your perks.

Friday Night Lights

In the small town of Odessa, Texas, everyone lives for Friday nights when the high school football team, the Permian Panthers, takes the field. The town is proud of their Panthers, led by quarterback Mike Winchell (Lucas Black) and superstar tailback Boobie Miles (Derek Luke), and they're used to winning. They expect a state championship, and nothing less. When Boobie suffers a career-ending injury in the first game of the season, the team isn't sure they can win without him. But Coach Gary Gaines (Billy Bob Thornton) isn't ready to give up yet. In this scene, Coach visits the home of his QB Mike Winchell and tries to motivate him, even though it seems like all hope for the Panthers is lost.

What to Watch for and Ask Yourself

1. This chapter defines motivation as "the set of forces that initiates, directs, and makes people persist in their efforts to accomplish a goal." Does Mike Winchell show the characteristics of this definition early in the sequence? Do you expect him to show any of the characteristics after the sequence ends and he returns to the team?
2. How does Coach Gaines try to motivate his QB? Do you think his approach is effective?
3. Apply the various parts of goal-setting theory to this sequence. Which parts of that theory appear in the sequence?

In this video we meet Amanda Shank, who works at Flight 001, a store for seasoned travelers. She says that the respect and encouragement she receives from the store owners motivates her to do her best work. She wants her ideas to be taken seriously, and at Flight 001, they are. At her last job, her boss told her, "You're just a number. You can be replaced at any time." Shank says, "When you're told something like that, why would you want to put any effort in?" Store leader Claire Rainwater echoes Shank's sentiments, adding that while pay is important, she also wants to feel supported and valued for the work she does. Shank says she is happy to have found a place where she can make a contribution and be challenged. "At this company they make an effort to show you you're appreciated; you have a say in what goes on. You're given compliments and feedback about what you could be better at."

What to Watch for and Ask Yourself

1. According to Maslow's hierarchy, which basic needs did Shank's old boss fail to meet?
2. What do you think would motivate you most if you were working in a retail position?
3. What types of intrinsic and extrinsic rewards does Flight 001 offer its employees?

Reel to Real

What would You Do?

PepsiCo Headquarters, Purchase, New York.[1]

Growing up in India, the city water supply was only on between 3 am and 5 am, so that's when you got up to fill every bucket in the house. Two buckets were for cooking, and there were two each for you, your sister, and your brother. Because water was scarce, "you learned to live your life off those two buckets." Well, it's a long way from those buckets to being CEO of PepsiCo, one of the leading beverage and snack companies in the world. Fourteen years ago in your first job as Pepsi's chief of strategy and head of mergers and acquisitions, the CEO asked you to create a strategy that would make Pepsi the "defining Corp. for the 21st century." You responded with a bold plan to sell PepsiCo's restaurants, Kentucky Fried Chicken, Pizza Hut, and Taco Bell (which then became Yum! Brands). With the billions of dollars from that sale, you then recommended acquiring Tropicana (the juice company) for $3 billion and Quaker (Quaker Oats and Gatorade) for $14 billion.

These were huge, but very successful, changes for PepsiCo, and helped it address significant competitive issues. Now, as Pepsi's CEO, the challenges that you face are no less daunting. Commodity prices have soared worldwide, so PepsiCo is paying more for everything from corn, to oats, to cooking oil—the main ingredients in many of its products. The Coca-Cola Company, your primary worldwide competitor in beverages, is thriving again under new leadership and is taking away market share. Coke moved aggressively into healthy, noncarbonated beverages, recently acquiring Energy Brands and its fast-growing products Vitaminwater and Smartwater. In carbonated beverages, PepsiCo sales are down 3 to 4 percent. As a significant source of profits and cash flows, that must not continue. Even Frito-Lay, Pepsi's bulletproof cash cow, which controls 60 percent of the U. S. snack food market and provides 50 percent of company profits, faces significant challenges. With public-health experts and the medical profession drawing attention to widespread obesity, activists, the media, and government are turning their focus to fast-food restaurants and snack food companies that sell cheap, calorie-dense foods. Schools are eliminating soft drinks and "unhealthy" snacks from vending machines. Soccer moms, who bring treats for their children's teams, are under pressure to buy healthy snacks—but because of allergies and other medical restrictions, they can't bring nuts or products with wheat. The challenge for Frito-Lay is to adapt its best-selling brands, such as Lay's, Doritos, Tostitos, Cheetos, and Fritos—none of which are thought of as healthy products—to this changing consumer market.

these things yourself. Your job is to lead, inspire, and influence PepsiCo's people to address these challenges. Your first leadership issue is to find a way to motivate and challenge PepsiCo's hard-working managers and employees to again make significant changes to keep the company competitive. What will you do to get them to be creative and innovative, to question assumptions, and to look at problems and situations in new ways? Your second leadership issue is to choose a strategic direction for Pepsi's future that will address the challenges to its business. How should PepsiCo position itself to compete with Coca-Cola, address rising commodity prices, and produce healthier products without sacrificing profits and market share? Finally, you need to build a management team to help lead the company. With these challenges, should your top executives have stronger leadership or management skills? Which are more important? And, you have to find a way to keep the top manager who lost out to you when PepsiCo made you CEO. How are you going to do that?

If you were the CEO of PepsiCo, what would you do?

If you've ever been in charge, or even just thought about it, chances are you've considered questions like: Do I have what it takes to lead? What are the most important things leaders do? How can I transform a poorly performing department, division, or company? Do I need to adjust my leadership depending on the situation and the employee? Why doesn't my leadership inspire people? If you feel overwhelmed at the prospect of being a leader, you're not alone—millions of leaders in organizations across the world struggle with these fundamental leadership issues on a daily basis.

We begin this chapter by discussing what leadership is, who leaders are (meaning their traits and characteristics), and what leaders do that makes them different from people who aren't leaders. Next we examine four major contingency theories of leadership that specify which leaders are best suited for which situations or how leaders should change their behavior to lead different people in different circumstances. The chapter ends with a review of strategic leadership issues, such as charismatic and transformational leadership, which address how to work with others to meet long-term goals and how to create a viable future for an organization.

WHAT IS LEADERSHIP?

After reading the next two sections, you should be able to

1. explain what leadership is.
2. describe who leaders are and what effective leaders do.

How does an ensemble of 100 or more musicians, all playing different parts at different times on different instruments, manage to produce something as beautiful as Beethoven's Fifth Symphony? (Or, if Gustav Mahler's "Symphony of a Thousand" is on the program, a lot more people might be involved!) The conductor, like a CEO, is responsible for managing all of this complexity and ensuring a great performance. But conductors do much more than just keep the beat with a baton. According to Ramona Wis, author of *The Conductor as Leader: Principles of Leadership Applied to Life on the Podium*, conductors must also build connections between people, inspire them with vision, command their trust, and persuade them to participate in the ensemble at their very best.

Whether the end result is a stirring musical performance, innovation of new products, or increased profits, **leadership** is the process of influencing others to achieve group or organizational goals. The knowledge and skills you'll learn in this chapter won't make the task of leadership less daunting, but they will help you navigate it.

1 LEADERSHIP

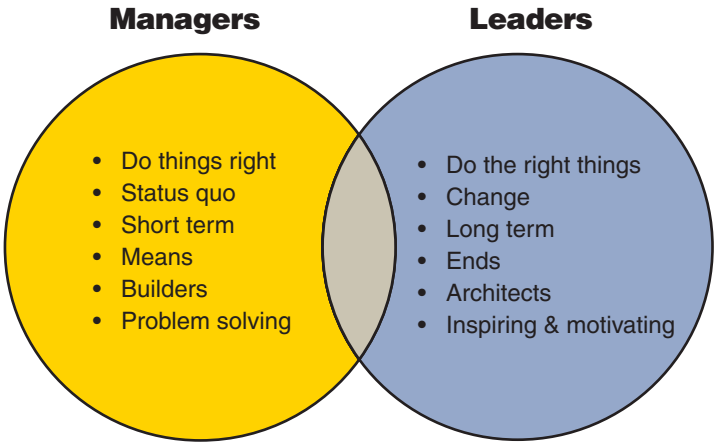
In Chapter 1, we defined *management* as getting work done through others. In other words, managers don't do the work themselves. Managers help others do their jobs better. By contrast, *leadership* is the process of influencing others to achieve group or organizational goals. What then are the key differences between leaders and managers? Another question that gets at the nature of leadership is this: Is leadership required in every situation? Does leadership always matter? Or are there situations when leadership isn't needed or may even make things worse?

Let's learn more about leadership by exploring **1.1 the differences between leaders and managers** and **1.2 substitutes for leadership**.

1.1 Leaders versus Managers

According to University of Southern California business professor Warren Bennis, the primary difference between leaders and managers, as shown in Exhibit 14.1, is that leaders are concerned with doing the right thing, while managers are concerned with doing things right.[2] In other words, leaders begin with the question, "What should we be doing?" while managers start with "How can we do what we're already doing better?" Leaders focus on vision, mission, goals, and objectives, while managers focus on productivity and efficiency. Managers see themselves as preservers of the status quo, while leaders see themselves as promoters of change and challengers of the status quo. in that they encourage creativity and risk taking. Six years ago, McDonald's was losing money and closing down stores. Today, with faster, friendlier service, healthier, better-tasting food, and a focus on quality rather than growth, McDonald's stock is up and the company is again highly profitable. Furthermore, 50 million customers walk into its restaurants each day, 3.5 million more per day than six years ago. Despite these successes, CEO Jim Skinner is not happy with the status quo. Says Skinner, "I worry about complacency. We're not satisfied. We have a lot [more] work to do."[3]

EXHIBIT 14.1
Managers versus Leaders



Another difference is that managers have a relatively short-term perspective, while leaders take a long-term view. Managers are concerned with control and limiting the choices of others, while leaders are more concerned with expanding people's choices and options.[4] Managers also solve problems so that others can do their work, while leaders inspire and motivate others to find their own solutions.

[Leadership] the process of influencing others to achieve group or organizational goals

"American organizations (and probably those in much of the rest of the industrialized world) are underled and overmanaged. They do not pay enough attention to doing the right thing, while they pay too much attention to doing things right."

WARREN BENNIS, PROFESSOR UNIVERSITY OF SOUTHERN CALIFORNIA

Finally, managers are also more concerned with *means*, how to get things done, while leaders are more concerned with *ends*, what gets done. When **Hewlett-Packard's** board replaced CEO Carly Fiorina, insiders complained that Fiorina was too much of a big-picture thinker and that she didn't provide enough direction. Said one, "We had grown used to hearing vision and abstractions, but nothing you can sink your teeth into. It [meaning Fiorina's rhetoric] doesn't mean anything."[5] In the end, said one insider, "The board replaced Carly because it wanted to focus on execution," not more leadership.[6] By contrast, Fiorina's replacement, Mark Hurd, was much more concerned about getting things done. Said Hurd, "We need to temper the idea that this company has to have some earthshaking event every 15 minutes. I'm not sure how it got that way—and to be very frank, I really don't care. Our job is to execute."[7]

Although leaders are different from managers, organizations need them both. Managers are critical to getting out the day-to-day work, and leaders are critical to inspiring employees and setting the organization's long-term direction. The key issue for any organization is the extent to which it is properly led and properly managed. As Warren Bennis said in summing up the difference between leaders and managers, "American organizations (and probably those in much of the rest of the industrialized world) are underled and overmanaged. They do not pay enough attention to doing the right thing, while they pay too much attention to doing things right."[8]

doing the right thing

The Three M's: Mission, Mentor, and Mirror

Doctors take the Hippocratic oath. Lawyers swear to protect and enforce the law. Leaders . . . well, there's no equivalent for business leaders. That's why Harvard professor Howard Gardner says that business leaders can develop personal ethics by focusing on their mission, a mentor, and the mirror.

First, leaders need to develop a personal mission statement by asking themselves these questions: Why am I doing what I'm doing? What do I want from work? What are my personal goals? Let your personal mission statement, and not the company's, guide your ethical behavior. Second, take care in choosing a mentor. An interesting study compared 20 business leaders selected at random with 20 "good" business leaders nominated by businesspeople, business school professors, and deans. The randomly selected business leaders focused on short-term goals exclusively, worrying only about next quarter's results. By contrast, 18 of the 20 "good" executives focused on the long term, on doing what was right for the company in the long run. So, if you want to be a good leader, choose a "good" mentor. Third, periodically stand in front of the mirror to assess your ethical performance as a business leader. Are you proud or ashamed of what you accomplished and how you accomplished it? Are you proud or ashamed of your company? What needs to change to make you proud? So, do the right thing. Develop a personal mission statement. Choose the right mentor. And look hard at yourself in the mirror.[9]

1.2 Substitutes for Leadership: Do Leaders Always Matter?

One of the basic assumptions about leadership is that leaders always matter. According to this thinking, organizations are sure to fail without sound leadership. In fact, when companies struggle, their leaders are almost always blamed for their poor performance. When Home Depot fired CEO Robert Nardelli, *BusinessWeek* wrote:

> *Nardelli's "numbers were quite good," says Matthew J. Fassler, an analyst at Goldman Sachs Group Inc. But "the fact is that this retail organization never really embraced his leadership style." The CEO's reputation also suffered because of Wall Street's affection for Home Depot's smaller archrival, Lowe's Companies, whose stock price has soared more than 200 percent since 2000, while Home Depot's shares declined 6 percent. . . . "He's not a very humble guy. He seems to have enormous energy but needs to be front and center, and that can wear on the board and the employees after a while," says Edward E. Lawler, director of the Center for Effective Organizations at the University of Southern California's Marshall School of Business. . . .*
>
> *. . . [T]he Nardelli departure was already brightening the mood at some company stores. "It's amazing the reaction of people on my floor. People are openly ecstatic. High-fiving," said an Atlanta store operations manager only hours after the Jan. 3 announcement.*[10]

In some situations and circumstances, however, leadership isn't necessary, is unlikely to make much of a difference, or isn't to blame for poor performance. These are known as leadership substitutes and leadership neutralizers.[11] Exhibit 14.2 lists

a number of subordinate, task, or organizational characteristics that can act as leadership substitutes or neutralizers (some can act as both) for either people-related or task-related leader behaviors. Leaders' people-related behaviors—such as being approachable, supportive, or showing concern for employees—affect how satisfied people are with their jobs. Leaders' task-related behaviors—such as setting goals, giving directions, and providing resources—affect the extent to which people are able to perform their jobs well.

Leadership substitutes are subordinate, task, or organizational characteristics that make leaders redundant or unnecessary. For instance, when subordinates have ability, experience, training, and knowledge about their jobs (see subordinate characteristics in Exhibit 14.2), a subordinate's work performance is unlikely to improve under task-related leader behavior that specifies goals, task assignments, and how to do the job. Think about it. Workers already have the capability to do their jobs. And the job itself provides enough information to let them know how well they're doing or what they might do to correct performance problems. In situations like this, where leadership substitutes are strong, leaders don't need to tell workers what to do or how to do their jobs.

Leadership neutralizers are subordinate, task, or organizational characteristics that can interfere with a leader's actions or make it impossible for a leader to influence followers' performance. Unlike substitutes, which simply take the place of leaders, leadership neutralizers create an "influence vacuum." In other words, leadership neutralizers actually create a need for leadership by preventing leadership from working. For example, when subordinates are indifferent toward organizational rewards (see subordinate characteristics in Exhibit 14.2), there may be nothing that a leader can do to reward them for good performance. Likewise, inflexible rules and procedures (see organizational characteristics in Exhibit 14.2) effectively neutralize the ability of leaders to reward workers. Such procedures include things like union contracts specifying that all employees be paid the same, organizational policies that reward employees by seniority, and salary and raise processes that don't give leaders enough money to substantially reward good performers.

Spatial distance (see organizational characteristics in Exhibit 14.2) can also neutralize leadership. Spatial distance arises when supervisors and subordinates don't work in the same place. This happens when people telecommute or work thousands of miles away in overseas offices. Spatial distance typically results in infrequent feedback, little or no face-to-face contact, and being "out of sight and out of mind," all of which make it very difficult for leaders to lead. Tony Bono, who manages his company's employee training programs, began working out of his home office several years ago. He said, "I had no idea" how difficult it would be to manage people he didn't see every day.[12] Karin Levitt, who is director of organizational development at **Computer Sciences Corporation**, trains her telecommuting managers to "tune into different ways of reading" their workers. She encourages them to stay in touch frequently through phone calls or instant messages. She says that instead of paying attention to body language, her managers should pay attention to cues such as a long pause or silence in phone calls or teleconferences. Because of these challenges, some companies find telecommuting to be so disruptive to leadership processes that they require their telecommuters to come into the office at least once or twice a week.

So do leaders *always* matter? Leadership substitutes and neutralizers indicate that sometimes they don't. This doesn't mean that leaders never matter, though. Quite the opposite. Leaders do matter, but they're not superhuman. They can't do it all by themselves. And they can't fix every situation. In short, leadership is very important. But poor leadership isn't the cause of every organizational crisis, and changing leaders isn't the solution to every company problem.

[Leadership substitutes] subordinate, task, or organizational characteristics that make leaders redundant or unnecessary

[Leadership neutralizers] subordinate, task, or organizational characteristics that can interfere with a leader's actions or make it impossible for a leader to influence followers' performance

Leadership Leadership is the process of influencing others to achieve group or organizational goals. Leaders are different from managers. The primary difference is that leaders are concerned with doing the right thing, while managers are concerned with doing things right. Furthermore, managers have a short-term focus and are concerned with the status quo, with means rather than ends, and with solving others' problems. By contrast, leaders have a long-term focus and are concerned with change, with ends rather than means, and with inspiring and motivating others to solve their own problems. Organizations need both managers and leaders. But in general, companies are overmanaged and underled. While leadership is important, leadership substitutes and neutralizers create situations in which leadership isn't necessary or is unlikely to make much of a difference. Leadership substitutes are subordinate, task, or organizational characteristics that make leaders redundant or unnecessary. By contrast, leadership neutralizers are subordinate, task, or organizational characteristics that interfere with a leader's actions or make it impossible for a leader to influence followers' performance.

REVIEW 1

2 WHO LEADERS ARE AND WHAT LEADERS DO

Indra Nooyi, PepsiCo's CEO, talks straight, has a sharp sense of humor, and sings in the hallways wherever she is. Nooyi is an extrovert. By contrast, JC Penney's CEO, Mike Ullman, who is soft-spoken and easy to approach, is an introvert.[13] Which one is likely to be successful as a CEO? According to a survey of 1,542 senior managers, it's the extrovert. Forty-seven percent of those 1,542 senior managers felt that extroverts make better CEOs, while 65 percent said that being an introvert hurts a CEO's chances of success.[14] So clearly, senior managers believe that extroverted CEOs are better leaders. But are they? Not necessarily. In fact, a relatively high percentage of CEOs, 40 percent, are introverts. Sara Lee CEO Brenda Barnes says, "I've always been shy. . . . People wouldn't call me that [an introvert], but I am."[15] Indeed, Barnes turns down all speaking requests and rarely gives interviews.

So, what makes a good leader? Does leadership success depend on who leaders are, such as introverts or extroverts, or on what leaders do and how they behave? Let's learn more about who leaders are by investigating **2.1 leadership traits and 2.2 leadership behaviors**.

2.1 Leadership Traits

Trait theory is one way to describe who leaders are. **Trait theory** says that effective leaders possess a similar set of traits or characteristics. **Traits** are relatively stable characteristics such as abilities, psychological motives, or consistent patterns of behavior. For example, trait theory holds that leaders are taller and more confident and have greater physical stamina (i.e., higher energy levels) than nonleaders. Indeed, while just 14.5 percent of men are 6 feet tall, 58 percent of *Fortune* 500 CEOs are 6 feet or taller.[16] Author Malcolm Gladwell says, "We have this sense of what a leader is supposed to look like. And that stereotype is so powerful that when someone fits it, we simply become blind to other considerations."[17] Trait theory is also known as the "great person" theory because early versions of the theory stated that leaders are

[Trait theory] a leadership theory that holds that effective leaders possess a similar set of traits or characteristics

EXHIBIT 14.3 Leadership Traits

born, not made. In other words, you either have the right stuff to be a leader, or you don't. And if you don't, there is no way to get it.

For some time, it was thought that trait theory was wrong and that there are no consistent trait differences between leaders and nonleaders, or between effective and ineffective leaders. However, more recent evidence shows that "successful leaders are not like other people," that successful leaders are indeed different from the rest of us.[18] More specifically, as shown in Exhibit 14.3, leaders are different from nonleaders in the following traits: drive, the desire to lead, honesty/integrity, self-confidence, emotional stability, cognitive ability, and knowledge of the business.[19]

Drive refers to high levels of effort and is characterized by achievement, motivation, initiative, energy, and tenacity. In terms of achievement and ambition, leaders always try to make improvements or achieve success in what they're doing. Because of their initiative, they have strong desires to promote change or solve problems. Leaders typically have more energy—they have to, given the long hours they put in and followers' expectations that they be positive and upbeat. Thus, leaders must have physical, mental, and emotional vitality. Leaders are also more tenacious than nonleaders and are better at overcoming obstacles and problems that would deter most of us.

Successful leaders also have a stronger *desire to lead*. They want to be in charge and think about ways to influence or convince others about what should or shouldn't be done. *Honesty/integrity* is also important to leaders. *Honesty*, being truthful with others, is a cornerstone of leadership. Without it, leaders won't be trusted. When leaders are honest, subordinates are willing to overlook other flaws. For example, one follower said this about the leadership qualities of his manager: "I don't like a lot of the things he does, but he's basically honest. He's a genuine article, and you'll forgive a lot of things because of that. That goes a long way in how much I trust him."[20] *Integrity* is the extent to which leaders do what they say they will do. Leaders may be honest and have good intentions, but if they don't consistently deliver on what they promise, they won't be trusted.

Self-confidence, or believing in one's abilities, also distinguishes leaders from nonleaders. Self-confident leaders are more decisive and assertive and are more likely to gain others' confidence. Moreover, self-confident leaders will admit mistakes because they view them as learning opportunities rather than a refutation of their leadership capabilities. This also means that leaders have *emotional stability*. Even when things go wrong, they remain even-tempered and consistent in their outlook and in the way they treat others. Leaders who can't control their emotions, who anger quickly or attack and blame others for mistakes, are unlikely to be trusted.

Leaders are also smart. Leaders typically have strong *cognitive abilities*. This doesn't mean that leaders are necessarily geniuses—far from it. But it does mean that leaders have the capacity to analyze large amounts of seemingly unrelated, complex information and see patterns, opportunities, or threats where others might not see them. Finally, leaders also know their stuff, which means they have superior technical knowledge about the businesses they run. Leaders who have a good *knowledge of the business* understand the key technological decisions and concerns facing their companies. More often than not, studies indicate that effective leaders have long, extensive experience in their industries.

How did Anne Mulcahy, the CEO who turned around Xerox, measure up on these traits? In general, quite well. *Fortune* magazine said this about her: "She is straightforward, hard-working, disciplined. She is fiercely loyal to Xerox—the company, the brand, the people. She has the integrity of the Catholic schoolgirl she was

for 16 years. Her coworkers describe her as both compassionate and tough. She is not afraid of bad news. . . . Her willingness to work shoulder to shoulder with subordinates gives her unusual credibility and the ability to galvanize her team."[21]

Initially, however, Mulcahy had a clear weakness: Because her experience was limited to sales, she lacked knowledge of the entire business. Since Xerox was $14.1 billion in debt and had only $154 million in cash on hand, she had to learn fast. So she asked Joe Mancini, Jr., the director of corporate financial analysis, to give her a course in "Balance Sheet 101." Mulcahy says, "It was an unusual situation for me—tutoring the CEO. But there wasn't a lot of time for false pride."[22] Every night she took home binders full of information to study, and eventually she transformed her knowledge of the financial side of the business from a weakness into a strength.

"It was an unusual situation for me—tutoring the CEO. But there wasn't a lot of time for false pride."

2.2 Leadership Behaviors

Thus far, you've read about who leaders *are*. But traits alone are not enough to make a successful leader. They are, however, a precondition for success. After all, it's hard to imagine a truly successful leader who lacks most of these qualities. Leaders who have these traits (or many of them) must then take actions that encourage people to achieve group or organizational goals.[24] Accordingly, we now examine what leaders *do*, meaning the behaviors they perform or the actions they take to influence others to achieve group or organizational goals.

Researchers at the University of Michigan, Ohio State University, and the University of Texas examined the specific behaviors that leaders use to improve subordinate satisfaction and performance. Hundreds of studies were conducted and hundreds of leader behaviors were examined. At all three universities, two basic leader behaviors emerged as central to successful leadership: initiating structure (called *job-centered leadership* at the University of Michigan and *concern for production* at the University of Texas) and considerate leader behavior (called *employee-centered leadership* at the University of Michigan and *concern for people* at the University of Texas).[25] These two leader behaviors form the basis for many of the leadership theories discussed in this chapter.

Initiating structure is the degree to which a leader structures the roles of followers by setting goals, giving directions, setting deadlines, and assigning tasks. A leader's ability to initiate structure primarily affects subordinates' job performance. When Jamie Dimon became CEO of JPMorgan Chase, the financial services company had four different computer systems from previously acquired companies. Branch bankers couldn't access checking histories or determine whether customers qualified for credit cards or mortgages. Dimon initiated structure by telling his executives to put one system in place, and, "If you don't do it in six weeks, I'll make all the choices myself."[26] The deadline was met. Now, with just one software system, the annual cost of processing credit card statements has dropped from $80 to $52 a customer. Furthermore, with a new system that calculates which credit card deals are best for particular customers, Morgan has increased its open credit card accounts by 55 percent.

Consideration is the extent to which a leader is friendly, approachable, and supportive and shows concern for employees. Consideration primarily affects subordinates' job satisfaction. Specific leader consideration behaviors include listening to employees' problems and concerns, consulting with employees before making decisions, and treating employees as equals. Earlier in the chapter you learned that H-P CEO Mark Hurd is very focused on "execution," that is, initiating structure. Hurd, however, is also a considerate leader. The managers and employers who work for him appreciate that he listens and is willing to help them

[Initiating structure] the degree to which a leader structures the roles of followers by setting goals, giving directions, setting deadlines, and assigning tasks

[Consideration] the extent to which a leader is friendly, approachable, and supportive and shows concern for employees

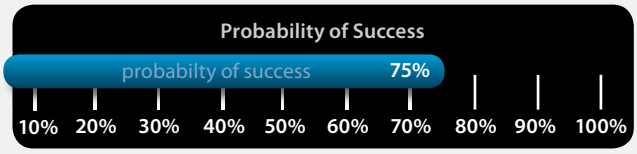
Leadership Traits That Do Make a Difference

For decades, researchers assumed that leadership traits such as drive, emotional stability, cognitive ability, and charisma were *not* related to effective leadership. More recent evidence, however, shows that there are reliable trait differences between leaders and nonleaders. In fact, 54 studies based on more than 6,000 people clearly indicate that in terms of leadership traits, "successful leaders are not like other people."

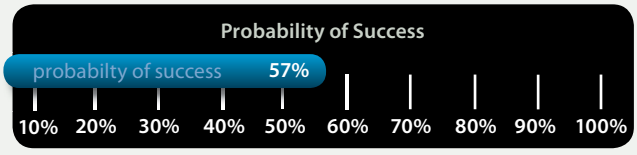
Traits and Perceptions of Leadership Effectiveness

Several leadership models argue that in order to be successful, leaders must be viewed as good leaders by their followers. (This is completely different from determining whether leaders actually improve organizational performance.) Consequently, one test of trait theory is whether leaders with particular traits are viewed as more or less effective leaders by their followers.

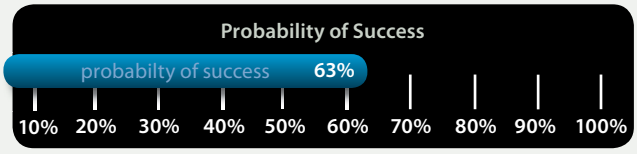
Intelligence. On average, there is a 75 percent chance that intelligent leaders will be seen as better leaders than less intelligent leaders.



Dominance. On average, there is only a 57 percent chance that leaders with highly dominant personalities will be seen as better leaders than those with less dominant personalities.



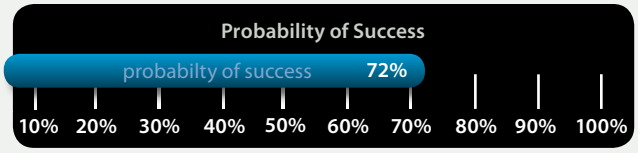
Extroversion. On average, there is a 63 percent chance that extroverts will be seen as better leaders than introverts.



Charisma and Leadership Effectiveness

As discussed at the end of the chapter, *charismatic leadership* is the set of behavioral tendencies and personal characteristics of leaders that creates an exceptionally strong relationship between leaders and their followers. More specifically, charismatic leaders articulate a clear vision for the future that is based on strongly held values or morals; model those values by acting in a way consistent with the company's vision; communicate high performance expectations to followers; and display confidence in followers' abilities to achieve the vision.

Charisma and Performance. On average, there is a 72 percent chance that charismatic leaders will have better-performing followers and organizations than less charismatic leaders.



Charisma and Perceived Leader Effectiveness. On average, there is an 89 percent chance that charismatic leaders will be perceived as more effective leaders than less charismatic leaders.

Charisma and Leader Satisfaction. On average, there is a 90 percent chance that the followers of charismatic leaders will be more satisfied with their leaders than the followers of less charismatic leaders.[23]

with their problems and concerns. Dave Booth, senior vice president for sales, says, "If I pick up the phone and tell Mark's office I have an urgent customer request, if he isn't already with a customer, he'll stop what he's doing and call me to find out what he can do. The fact that I pick up the phone and call his office directly and not go through channels is new."[27]

Mark Hurd, CEO of Hewlett Packard

Although researchers at all three universities generally agreed that initiating structure and consideration were basic leader behaviors, their interpretation differed on how these two behaviors are related to one another and which are necessary for effective leadership. The University of Michigan studies indicated that initiating structure and consideration were mutually exclusive behaviors on opposite ends of the same continuum. In other words, leaders who wanted to be more considerate would have to do less initiating of structure (and vice versa). The University of Michigan studies also indicated that only considerate leader behaviors (i.e., employee-centered behaviors) were associated with successful leadership. By contrast, researchers at Ohio State University and the University of Texas found that initiating structure and consideration were independent behaviors, meaning that leaders can be considerate and initiate structure at the same time. Additional evidence confirms this finding.[28] The same researchers also concluded that the most effective leaders were strong on both initiating structure and considerate leader behaviors.

This "high-high" approach can be seen in the upper right corner of the Blake/Mouton leadership grid, shown in Exhibit 14.4. Blake and Mouton used two leadership behaviors, concern for people (i.e., consideration) and concern for production (i.e., initiating structure), to categorize five different leadership styles. Both behaviors are rated on a 9-point scale, with 1 representing "low" and 9 representing "high." Blake and Mouton suggest that a "high-high," or 9,9, leadership style is the best. They call this style *team management* because leaders who use it display a high concern for people (9) and a high concern for production (9).

By contrast, leaders use a 9,1 *authority-compliance* leadership style when they have a high concern for production and a low concern for people. A 1,9 *country club* style occurs when leaders care about having a friendly, enjoyable work environment but don't really pay much attention to production or performance. The worst leadership style, according to the grid, is the 1,1 *impoverished* leader, who shows little concern for people or production and does the bare minimum needed to keep his or her job. Finally, the 5,5 *middle-of-the-road* style occurs when leaders show a moderate amount of concern for both people and production.

Is the team management style, with a high concern for production and a high concern for people, the best leadership style? Logically, it would seem so. Why wouldn't you want to show high concern for both people and production? Nonetheless, nearly 50 years of research indicates that there isn't one best leadership style. The best leadership style depends on the situation. In other words, no one leadership behavior by itself and no one combination of leadership behaviors works well across all situations and employees.

REVIEW 2

Who Leaders Are and What Leaders Do Trait theory says that effective leaders possess traits or characteristics that differentiate them from nonleaders. Those traits are drive, the desire to lead, honesty/integrity, self-confidence, emotional stability, cognitive ability, and knowledge of the business. Traits alone aren't enough for successful leadership, however; leaders who have these traits (or many of them) must also behave in ways that encourage people to achieve group or organizational goals. Two key leader behaviors are initiating structure, which improves subordinate performance, and consideration, which improves subordinate satisfaction. There is no single best combination of these behaviors. The best leadership style depends on the situation.

SITUATIONAL APPROACHES TO LEADERSHIP

After leader traits and behaviors, the situational approach to leadership is the third major method used in the study of leadership. We'll review four major situational approaches to leadership—Fiedler's contingency theory, path-goal theory, Hersey and Blanchard's Situational Leadership theory, and Vroom and Yetton's normative decision model. All assume that the effectiveness of any **leadership style**, the way a leader generally behaves toward followers, depends on the situation.[29] Stanford Business School professor Jeffrey Pfeffer agrees: "Situations differ, often wildly, in the extent to which one individual can make a difference and in the set of attributes required to be successful. . . . But utopia is impossible, which is why management consultants and authors should stop talking so much about how to find an ideal leader and instead focus on placing people into jobs that play to their strengths—and where their flaws won't be fatal."[30]

After reading the next four sections, you should be able to

3. explain Fiedler's contingency theory.
4. describe how path-goal theory works.
5. discuss Hersey and Blanchard's Situational Leadership theory.
6. explain the normative decision theory.

According to situational leadership theories, there is no one best leadership style. But one of these situational theories differs from the other three in one significant way. Fiedler's contingency theory assumes that leadership styles are consistent and difficult to change. Therefore, leaders must be placed in or matched to a situation that fits their leadership style. By contrast, the other three situational theories all assume that leaders are capable of adapting and adjusting their leadership styles to fit the demands of different situations.

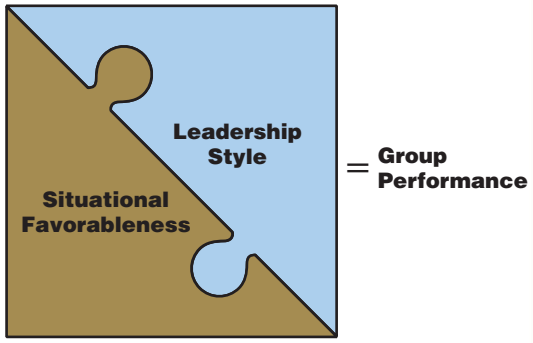
[Leadership style] the way a leader generally behaves toward followers

[Contingency theory] a leadership theory that states that in order to maximize work group performance, leaders must be matched to the situation that best fits their leadership style

3 PUTTING LEADERS IN THE RIGHT SITUATION: FIEDLER'S CONTINGENCY THEORY

Fiedler's **contingency theory** states that, in order to maximize work group performance, leaders must be matched to the right leadership situation.[31] More specifically, as shown in Exhibit 14.5, the first basic assumption of Fiedler's theory is that leaders are effective when the work groups they lead perform well. So, instead of judging leaders' effectiveness by what they do (i.e., initiating structure and consideration) or who they are (i.e., trait theory), Fiedler assesses leaders by the conduct and performance of the people they supervise. Second, Fiedler assumes that leaders are generally unable to change their leadership styles and that they will be more effective when their styles are matched to the proper situation. Third, Fiedler assumes that the favorableness of a situation for a leader depends on the degree to which the situation permits the leader to influence the behavior of group members. Fiedler's third assumption is consistent with our definition of leadership

EXHIBIT 14.5
Fiedler's Contingency Theory



Good fit makes for higher performance levels.

as the process of influencing others to achieve group or organizational goals. In other words, in addition to traits, behaviors, and a favorable situation to match, leaders have to be allowed to lead.

Let's learn more about Fiedler's contingency theory by examining **3.1 the least preferred coworker and leadership styles, 3.2 situational favorableness, and 3.3 how to match leadership styles to situations**.

3.1 Leadership Style: Least Preferred Coworker

When Fiedler refers to *leadership style*, he means the way that leaders generally behave toward their followers. Do the leaders yell and scream and blame others when things go wrong? Or do they correct mistakes by listening and then quietly but directly make their point? Do they take credit for others' work when things go right? Or do they make sure that those who did the work receive the credit they rightfully deserve? Do they let others make their own decisions and hold them accountable for the results? Or do they micromanage, insisting that all decisions be approved first by them? Fiedler also assumes that leadership styles are tied to leaders' underlying needs and personalities. Since personality and needs are relatively stable, he assumes that leaders are generally incapable of changing their leadership styles. In other words, the way that leaders treat people now is probably the way they've always treated others. So, according to Fiedler, if your boss's first instinct is to yell and scream and blame others, chances are he or she has always done that.

Fiedler uses a questionnaire called the Least Preferred Coworker (LPC) scale to measure leadership style; a sample of the scale is shown in Exhibit 14.6 (see the Self-Assessment at the end of this chapter for the full LPC scale). When completing the LPC scale, people are instructed to consider all of the people with whom they have ever worked and then to choose the one person with whom they have worked *least* well. Fiedler explains, "This does not have to be the person you liked least well, but should be the one person with whom you have the most trouble getting the job done."[32]

Would you describe your LPC as pleasant, friendly, supportive, interesting, cheerful, and sincere? Or would you describe the person as unpleasant, unfriendly, hostile, boring, gloomy, and insincere? People who describe their LPC in a positive

way (scoring 64 and above) have *relationship-oriented* leadership styles. After all, if they can still be positive about their least preferred coworker, they must be people-oriented. By contrast, people who describe their LPC in a negative way (scoring 57 or below) have *task-oriented* leadership styles. Given a choice, they'll focus first on getting the job done and second on making sure everyone gets along. Finally, those with moderate scores (from 58 to 63) have a more flexible leadership style and can be somewhat relationship-oriented or somewhat task-oriented.

3.2 Situational Favorableness

Fiedler assumes that leaders will be more effective when their leadership styles are matched to the proper situation. More specifically, Fiedler defines **situational favorableness** as the degree to which a particular situation either permits or denies a leader the chance to influence the behavior of group members.[33] In highly favorable situations, leaders find that their actions influence followers. But in highly unfavorable situations, leaders have little or no success influencing the people they are trying to lead.

Three situational factors determine the favorability of a situation: leader-member relations, task structure, and position power. The most important situational factor is **leader-member relations**, which refers to how well followers respect, trust, and like their leaders. When leader-member relations are good, followers trust the leader and there is a friendly work atmosphere. Such was the case under Gordon Bethune, CEO of Continental Airlines for 10 years. Joe Caudle, a Continental employee, says, "I've worked under a lot of presidents and CEOs. When the others came around, the employees would be ducking out. But with him, it's 'Hey, Bethune's upstairs!' They start smiling and want to shake his hand."[34] **Task structure** is the degree to which the requirements of a subordinate's tasks are clearly specified. With highly structured tasks, employees have clear job responsibilities, goals, and procedures. **Position power** is the degree to which leaders are able to hire, fire, reward, and punish workers. The more influence leaders have over hiring, firing, rewards, and punishments, the greater their power.

Exhibit 14.7 shows how leader-member relations, task structure, and position power can be combined into eight situations that differ in their favorability to leaders. In general, Situation I, on the left side of Exhibit 14.7, is the most favorable leader situation. Followers like and trust their leaders and know what to do because their tasks are highly structured. Also, the leaders have the formal power to influence workers through hiring, firing, rewarding, and punishing them. Therefore, it's relatively easy for a leader to influence followers in Situation I. By contrast, Situation VIII, on the right side of Exhibit 14.7, is the least favorable situation for leaders. Followers don't like or trust their leaders. Plus, followers are not sure what they're supposed to be doing, given that their tasks or jobs are highly unstructured. Finally,

"I've worked under a lot of presidents and CEOs. When the others came around, the employees would be ducking out. But with him, it's 'Hey, Bethune's upstairs!' They start smiling and want to shake his hand."

leaders find it difficult to influence followers because they don't have the ability to hire, fire, reward, or punish the people who work for them. In short, it's very difficult to influence followers given the conditions found in Situation VIII.

3.3 Matching Leadership Styles to Situations

After studying thousands of leaders and followers in hundreds of different situations, Fiedler found that the performance of relationship- and task-oriented leaders followed the pattern displayed in Exhibit 14.8.

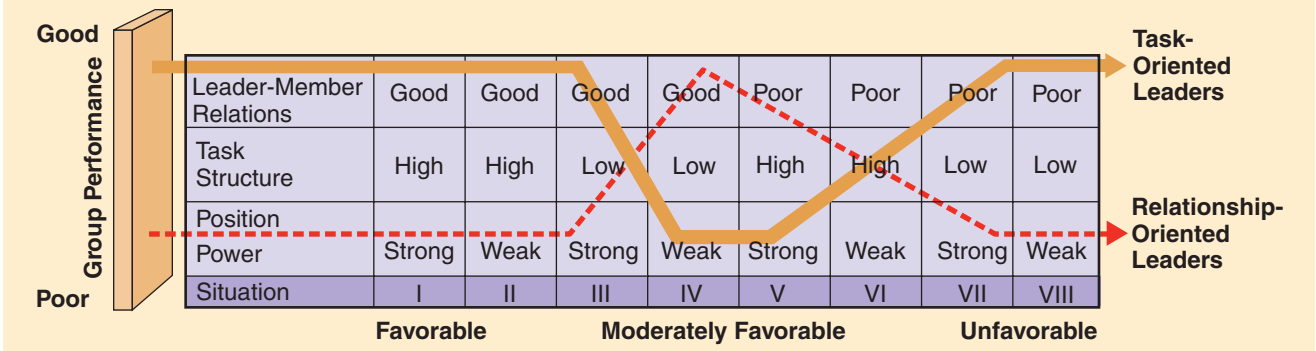
Relationship-oriented leaders with high LPC scores were better leaders (i.e., their groups performed more effectively) under moderately favorable situations. In moderately favorable situations, the leader may be liked somewhat, tasks may be somewhat structured, and the leader may have some position power. In this situation, a relationship-oriented leader improves leader-member relations, which is the most important of the three situational factors. In turn, morale and performance improve. How did Gordon Bethune turn around Continental Airlines and its previously poisonous labor-management relations? He explains it this way: "When I was a mechanic, I knew how much faster I could fix an airplane when I wanted to fix it than when I didn't. I've tried to make it so our guys want to do it."[35]

By contrast, as Exhibit 14.8 shows, task-oriented leaders with low LPC scores are better leaders in highly favorable and unfavorable situations. Task-oriented leaders do well in favorable situations where leaders are liked, tasks are structured, and the leader has the power to hire, fire, reward, and punish. In these favorable situations, task-oriented leaders effectively step on the gas of a well-tuned car. Their focus on performance sets the goal for the group, which then charges forward to meet it. But task-oriented leaders also do well in unfavorable situations where leaders are disliked, tasks are unstructured, and the leader doesn't have the power to hire, fire, reward, and punish. In these unfavorable situations, the task-oriented leader sets goals, which focus attention on performance and clarify what needs to be done, thus overcoming low task structure. This is enough to jump-start performance even if workers don't like or trust the leader.

Finally, though not shown in Exhibit 14.8, people with moderate LPC scores, who can be somewhat relationship-oriented or somewhat task-oriented, tend to do fairly well in all situations because they can adapt their behavior. Typically, though, they don't perform quite as well as relationship-oriented or task-oriented leaders whose leadership styles are well matched to the situation.

Recall, however, that Fiedler assumes leaders to be incapable of changing their leadership styles. Accordingly, the key to applying Fiedler's contingency theory in

EXHIBIT 14.8 Matching Leadership Styles to Situations



the workplace is to accurately measure and match leaders to situations or to teach leaders how to change situational favorableness by changing leader-member relations, task structure, or position power. Though matching or placing leaders in appropriate situations works particularly well, practicing managers have had little luck reengineering situations to fit their leadership styles. The primary problem, as you've no doubt realized, is the complexity of the theory.

© RUBBERBALL/GETTY IMAGES

In a study designed to teach leaders how to reengineer their situations to fit their leadership styles, Fiedler found that most of the leaders simply did not understand what they were supposed to do to change their situations. Furthermore, if they didn't like their LPC profile (perhaps they felt they were more relationship-oriented than their scores indicated), they arbitrarily changed it to better suit their view of themselves. Of course, the theory won't work as well if leaders are attempting to change situational factors to fit their perceived leadership style rather than their real leadership style.[36]

Putting Leaders in the Right Situation: Fiedler's Contingency Theory Fiedler's theory assumes that leaders are effective when their work groups perform well, that leaders are unable to change their leadership styles, that leadership styles must be matched to the proper situation, and that favorable situations permit leaders to influence group members. According to the Least Preferred Coworker (LPC) scale, there are two basic leadership styles. People who describe their LPC in a positive way have relationship-oriented leadership styles. People who describe their LPC in a negative way have task-oriented leadership styles. Situational favorableness occurs when leaders can influence followers and is determined by leader-member relations, task structure, and position power. In general, relationship-oriented leaders with high LPC scores are better leaders under moderately favorable situations, whereas task-oriented leaders with low LPC scores are better leaders in highly favorable and unfavorable situations. Since Fiedler assumes that leaders are incapable of changing their leadership styles, the key is to accurately measure and match leaders to situations or to teach leaders how to change situational factors. Although matching or placing leaders in appropriate situations works well, reengineering situations to fit leadership styles doesn't because the model is complex and difficult for people to understand.

4 ADAPTING LEADER BEHAVIOR: PATH-GOAL THEORY

Just as its name suggests, **path-goal theory** states that leaders can increase subordinate satisfaction and performance by clarifying and clearing the paths to goals and by increasing the number and kinds of rewards available for goal attainment. Said another way, leaders need to clarify how followers can achieve organizational goals, take care of problems that prevent followers from achieving goals, and then find more and varied rewards to motivate followers to achieve those goals.[37]

[Path-goal theory] a leadership theory that states that leaders can increase subordinate satisfaction and performance by clarifying and clearing the paths to goals and by increasing the number and kinds of rewards available for goal attainment

Leaders must meet two conditions for path clarification, path clearing, and rewards to increase followers' motivation and effort. First, leader behavior must be a source of immediate or future satisfaction for followers. The things you do as a leader must either please your followers today or lead to activities or rewards

EXHIBIT 14.9 Basic Assumptions of Path-Goal Theory

- Clarify paths to goals.
- Clear paths to goals by solving problems and removing roadblocks.
- Increase the number and kinds of rewards available for goal attainment.
- Do things that satisfy followers today or will lead to future rewards or satisfaction.
- Offer followers something unique and valuable beyond what they're experiencing or can already do for themselves.

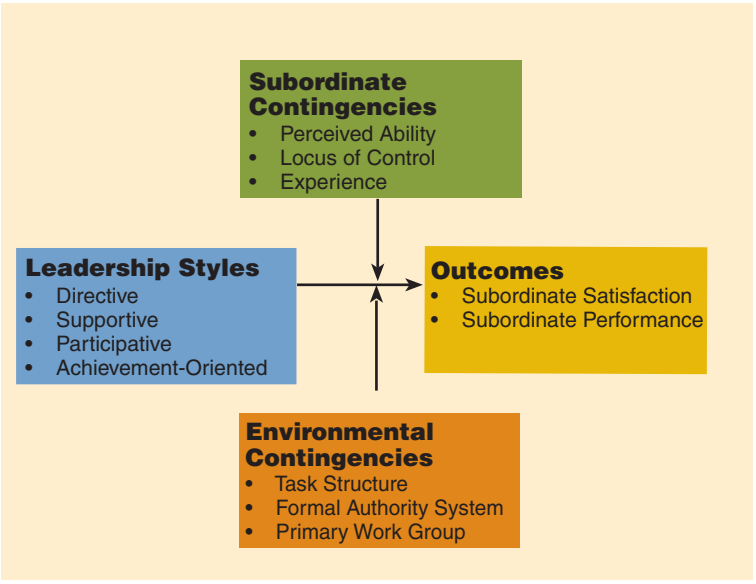
EXHIBIT 14.10 Path-Goal Theory



that will satisfy them in the future. For example, Kerri Brotherson started at **Paducah Bank & Trust Company** as a bank teller. But after three promotions, she is now a commercial loan officer. Paducah Bank & Trust does such a good job of developing its workers that 80 percent of its management jobs are filled from within. Each year, 6 to 8 of the bank's 140 employees are selected for an 18-month leadership development program. Says Brotherson, "they've always listened to me and helped me move into areas I wanted to move into."[38] She plans to spend her entire career with the bank.

Second, while providing the coaching, guidance, support, and rewards necessary for effective work performance, leader behaviors must complement and not duplicate the characteristics of followers' work environments. Thus, leader behaviors must offer something unique and valuable to followers beyond what they're already experiencing as they do their jobs or what they can already do for themselves. Exhibit 14.9 summarizes these basic assumptions of path-goal theory.

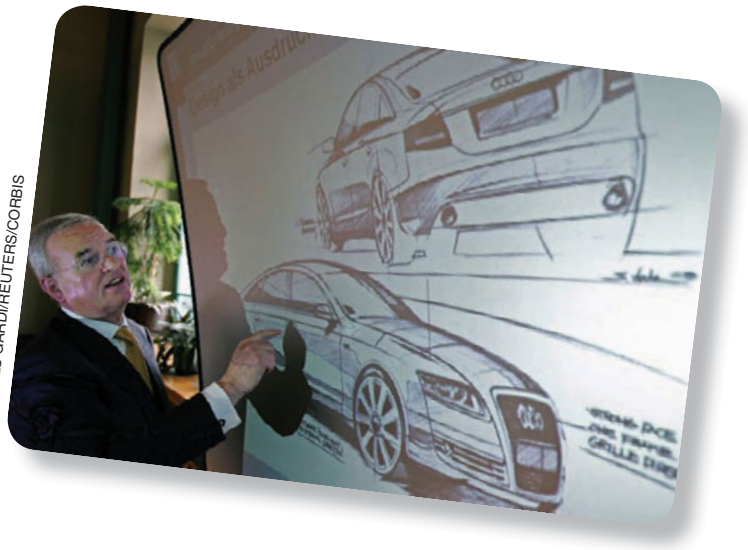
In contrast to Fiedler's contingency theory, path-goal theory assumes that leaders *can* change and adapt their leadership styles. Exhibit 14.10 illustrates this process, showing that leaders change and adapt their leadership styles contingent on their subordinates or the environment in which those subordinates work.

Let's learn more about path-goal theory by examining **4.1 the four kinds of leadership styles that leaders use, 4.2 the subordinate and environmental contingency factors that determine when different leader styles are effective, and 4.3 the outcomes of path-goal theory in improving employee satisfaction and performance.**

4.1 Leadership Styles

As illustrated in Exhibit 14.10, the four leadership styles in path-goal theory are directive, supportive, participative, and achievement oriented.[39] **Directive leadership** involves letting employees know precisely what is expected of them, giving them specific guidelines for performing tasks, scheduling work, setting standards of performance, and making sure that people follow standard rules and regulations. For example, "each month, Audi's compulsive chief executive, Martin Winterkorn, rolls up his sleeves and leads a trouble-shooting session with managers and engineers at the company's electronics center, zeroing in on faulty systems and problem parts. Winterkorn's rules: no shifting the blame to anyone else, such as suppliers. No phone calls to subordinates—the brains to remedy the defects better be in the room. And no one leaves until a fix is found."[40] Why is Winterkorn so demanding (i.e., directive)?

[Directive leadership] a leadership style in which the leader lets employees know precisely what is expected of them, gives them specific guidelines for performing tasks, schedules work, sets standards of performance, and makes sure that people follow standard rules and regulations



In addition to being a directive leader, Audi CEO Martin Winterkorn has deep technical knowledge in his field, which gives him credibility when he assigns work and sets goals and procedures. Winterkorn is shown here giving a lecture on car design concepts at the Budapest Technical University.

As he explains, "We want [Audi] to be the No. 1 premium [car] brand," and you don't achieve that goal easily when you're competing with Lexus, Mercedes, BMW, and Acura."

Supportive leadership involves being approachable and friendly to employees, showing concern for them and their welfare, treating them as equals, and creating a friendly climate. Supportive leadership is very similar to considerate leader behavior. Supportive leadership often results in employee satisfaction with the job and with leaders. This leadership style may also result in improved performance when it increases employee confidence, lowers employee job stress, or improves relations and trust between employees and leaders.[41]

When gas prices surged to over $4 a gallon, commuting costs took a toll on employee budgets and bank accounts. A survey at the time found that one-third of employees would quit to take a comparable job closer to home. Atlanta-based **Lathem Time Corp.** responded by changing from a 5-day workweek to a compressed 4-day workweek with 10-hour days. The change saved employees a tank of gas a month ($60 to $100 at the time) and greatly reduced commutes (by leaving work at 6:30 pm, 90-minute commutes were reduced to 30 minutes). Lathem Time Corp. employee Jason Dupree said, "It's definitely improved my work. My stress level is down. Getting that break in the middle of the week is like a mini-weekend for me."[42]

Participative leadership involves consulting employees for their suggestions and input before making decisions. Participation in decision making should help followers understand which goals are most important and clarify the paths to accomplishing them. Furthermore, when people participate in decisions, they become more committed to making them work. Greg Cushard, who founded **Rubicon Oil**, a truck refueling company, was an admitted micromanager. Cushard led nine meetings a week and his interfering style led him to frequently interrupt his managers, publicly identify mistakes, and make decisions that his managers and employees should be making. Says Cushard, "I acted like a quarterback . . . more than a coach."[43] And his employees "stopped making suggestions because they were afraid they'd get shot down." He fixed the problem by turning to participative leadership. Cushard would start meetings to set the context and the agenda and then leave, literally. He says, "They did not want me there. My presence hindered thinking." Tim Johnson, who heads sales for Rubicon, said, "When the CEO became a member of the meeting and not the center of the meeting, so much more got accomplished." Today, his managers take turns running the meetings. Cushard now goes to just three meetings a week and gets updates on the rest. He said, as owners of business, "we think we know best, but we don't, not all of the time. I realized that it's not all about me."[44]

"They did not want me there. My presence hindered thinking."

[Supportive leadership] a leadership style in which the leader is friendly and approachable to employees, shows concern for employees and their welfare, treats them as equals, and creates a friendly climate

[Participative leadership] a leadership style in which the leader consults employees for their suggestions and input before making decisions

Achievement-oriented leadership means setting challenging goals, having high expectations of employees, and displaying confidence that employees will assume responsibility and put forth extraordinary effort. Simon Cooper, president and COO of the Ritz-Carlton luxury hotel chain, uses the phrase "He who says it, does" to describe achievement-oriented leadership. Cooper explains, "I use this phrase whenever someone convinces me that they can achieve something I consider to be unachievable. In the past I've been known to add focus to a goal by making a bet to see if they can make it—sometimes with amusing consequences. I remember being at a mountain resort in Canada and proposing an incredible goal for the season. The team convinced me that they could achieve it, and I offered to jump into the lake if they did. It's a long story, but they made it. There's a great scene of a hole being cut in the ice and an ambulance on standby while I gave a whole new meaning to the term 'dunking.' The cognac [afterward] was very welcome."[45]

4.2 Subordinate and Environmental Contingencies

As shown in Exhibit 14.10, path-goal theory specifies that leader behaviors should be adapted to subordinate characteristics. The theory identifies three kinds of subordinate contingencies: perceived ability, experience, and locus of control. *Perceived ability* is simply how much ability subordinates believe they have for doing their jobs well. Subordinates who perceive that they have a great deal of ability will be dissatisfied with directive leader behaviors. Experienced employees are likely to react in a similar way. Since they already know how to do their jobs (or perceive that they do), they don't need or want close supervision. By contrast, subordinates with little experience or little perceived ability will welcome directive leadership.

Locus of control is a personality measure that indicates the extent to which people believe that they have control over what happens to them in life. *Internals* believe that what happens to them, good or bad, is largely a result of their choices and actions. *Externals*, on the other hand, believe that what happens to them is caused by external forces beyond their control. Accordingly, externals are much more comfortable with a directive leadership style, whereas internals greatly prefer a participative leadership style because they like to have a say in what goes on at work.

Path-goal theory specifies that leader behaviors should complement rather than duplicate the characteristics of followers' work environments. There are three kinds of environmental contingencies: task structure, the formal authority system, and the primary work group. As in Fiedler's contingency theory, *task structure* is the degree to which the requirements of a subordinate's tasks are clearly specified. When task structure is low and tasks are unclear, directive leadership should be used because it complements the work environment. When task structure is high and tasks are clear, however, directive leadership is not needed because it duplicates what task structure provides. Alternatively, when tasks are stressful, frustrating, or dissatisfying, leaders should respond with supportive leadership.

The *formal authority system* is an organization's set of procedures, rules, and policies. When the formal authority system is unclear, directive leadership complements the situation by reducing uncertainty and increasing clarity. But when the formal authority system is clear, directive leadership is redundant and should not be used.

Primary work group refers to the amount of work-oriented participation or emotional support that is provided by an employee's immediate work group. Participative leadership should be used when tasks are complex and there is little existing work-oriented participation in the primary work group. When tasks are stressful, frustrating, or repetitive, supportive leadership is called for.

EXHIBIT 14.11 Path-Goal Theory: When to Use Directive, Supportive, Participative, or Achievement-Oriented Leadership

Directive Leadership	Supportive Leadership	Participative Leadership	Achievement-Oriented Leadership
Unstructured tasks	Structured, simple, repetitive tasks	Experienced workers	Unchallenging tasks
Inexperienced workers	Stressful, frustrating tasks	Workers with high perceived ability	
Workers with low perceived ability	When workers lack confidence	Workers with internal locus of control	
Workers with external locus of control	Clear formal authority system	Workers not satisfied with rewards	
Unclear formal authority system		Complex tasks	

Finally, since keeping track of all of these subordinate and environmental contingencies can get a bit confusing, Exhibit 14.11 provides a summary of when directive, supportive, participative, and achievement-oriented leadership styles should be used.

4.3 Outcomes

Does following path-goal theory improve subordinate satisfaction and performance? Preliminary evidence suggests that it does.[46] In particular, people who work for supportive leaders are much more satisfied with their jobs and their bosses. Likewise, people who work for directive leaders are more satisfied with their jobs and bosses (but not quite as much as when their bosses are supportive) and perform their jobs better, too. Does adapting one's leadership style to subordinate and environmental characteristics improve subordinate satisfaction and performance? At this point, because it is difficult to completely test this complex theory, it's too early to tell.[47] However, since the data clearly show that it makes sense for leaders to be both supportive *and* directive, it also makes sense that leaders could improve subordinate satisfaction and performance by adding participative and achievement-oriented leadership styles to their capabilities as leaders.

Adapting Leader Behavior: Path-Goal Theory Path-goal theory states that leaders can increase subordinate satisfaction and performance by clarifying and clearing the paths to goals and by increasing the number and kinds of rewards available for goal attainment. For this to work, however, leader behavior must be a source of immediate or future satisfaction for followers and must complement rather than duplicate the characteristics of followers' work environments. In contrast to Fiedler's contingency theory, path-goal theory assumes that leaders can and do change and adapt their leadership styles (directive, supportive, participative, and achievement-oriented), depending on their subordinates (experience, perceived ability, internal or external) or the environment in which those subordinates work (task structure, formal authority system, or primary work group).

5 ADAPTING LEADER BEHAVIOR: HERSEY AND BLANCHARD'S SITUATIONAL LEADERSHIP® THEORY

Have you ever had a new job that you didn't know how to do and your boss was not around to help you learn it? Conversely, have you ever known exactly how to do your job but your boss kept treating you as though you didn't? Hersey and Blanchard's Situational Leadership theory is based on the idea of follower readiness. Hersey and Blanchard argue that employees have different levels of readiness for handling different jobs, responsibilities, and work assignments. Accordingly, Hersey and Blanchard's **situational theory** states that leaders need to adjust their leadership styles to match followers' readiness.[48]

Let's learn more about Hersey and Blanchard's situational theory by examining **5.1 worker readiness** and **5.2 different leadership styles**.

5.1 Worker Readiness

Worker readiness is the ability and willingness to take responsibility for directing one's behavior at work. Readiness is composed of two components. *Job readiness* consists of the amount of knowledge, skill, ability, and experience people have to perform their jobs. As you would expect, people with greater skill, ability, and experience do a better job of supervising their own work. *Psychological readiness*, on the other hand, is a feeling of self-confidence or self-respect. Confident people are better at guiding their own work than insecure people are. Hersey and Blanchard combine job readiness and psychological readiness to produce four different levels of readiness in their situational leadership theory. The lowest level, R1, represents insecure people who are neither willing nor able to take responsibility for guiding their own work. R2 represents people who are confident and willing but not able to take responsibility for guiding their own work. R3 represents people who are insecure and able but not willing to take responsibility for guiding their own work. And R4 represents people who are confident, willing, and able to take responsibility for guiding their own work. It's important to note that a follower's readiness is usually task-specific. For example, you may be highly confident and capable when it comes to personal computers but know nothing about setting up budgets for planning purposes. You would possess readiness (R4) with respect to computers but not with respect to budgets.

5.2 Leadership Styles

Similar to Blake and Mouton's managerial grid, situational theory defines leadership styles in terms of task behavior (i.e., concern for production) and relationship behavior (i.e., concern for people). These two behaviors can be combined to form four different leadership styles: telling, selling, participating, and delegating. Leaders choose one of these styles depending on the readiness a follower has for a specific task.

A *telling* leadership style (high task behavior and low relationship behavior) is based on one-way communication in which followers are told what, how, when, and where to do particular tasks. Telling is used when people are at the R1 stage. For instance, someone using a telling leadership style would identify all the steps in a project and give explicit instructions on exactly how to execute each one.

A *selling* leadership style (high task behavior and high relationship behavior) involves two-way communication and psychological support to encourage followers

[Situational theory] a leadership theory that states that leaders need to adjust their leadership styles to match their followers' readiness

[Worker readiness] the ability and willingness to take responsibility for directing one's behavior at work

to own, or buy into, particular ways of doing things. Selling is used most appropriately at the R2 stage. For instance, someone using a selling leadership style might say, "We're going to start a company newsletter. I really think that's a great idea, don't you? We're going to need some cost estimates from printers and some comments from each manager. But that's pretty straightforward. Oh, don't forget that we need the CEO's comments, too. She's expecting you to call. I know that you'll do a great job on this. We'll meet next Tuesday to see if you have any questions once you've dug into this. By the way, we need to have this done by next Friday."

A *participating* style (low task behavior and high relationship behavior) is based on two-way communication and shared decision making. Participating is used with employees at R3. Since the problem is with motivation rather than ability, someone using a participating leadership style might solicit ideas from a subordinate about a project and let the subordinate get started but ask to review progress along the way.

A *delegating* style (low task behavior and low relationship behavior) is used when leaders basically let workers run their own show and make their own decisions. Delegating is used for people at R4. For instance, someone using a delegating leadership style might say, "We're going to start a company newsletter. You've got 10 days to do it. Run with it. Let me know when you've got it done. I'll e-mail you a couple of ideas, but other than that, do what you think is best. Thanks."

In general, as people become more ready and thus more willing and able to guide their own behavior, leaders should become less task-oriented and more relationship-oriented. As people become even more ready, leaders should become less task-oriented *and* less relationship-oriented until people eventually manage their own work with little input from their leaders.

How well does Hersey and Blanchard's situational theory work? Despite its intuitive appeal (managers and consultants tend to prefer it over Fiedler's contingency theory because of its underlying logic and simplicity), most studies don't support situational theory.[49] While managers generally do a good job of judging followers' readiness levels, the theory doesn't seem to work well except at lower levels, where a telling style is recommended for people who are insecure and neither willing nor able to take responsibility for guiding their own work.[50]

Adapting Leader Behavior: Hersey and Blanchard's Situational Leadership® Theory According to situational theory, leaders need to adjust their leadership styles to match their followers' readiness, which is the ability (job readiness) and willingness (psychological readiness) to take responsibility for directing one's work. Job readiness and psychological readiness combine to produce four different levels of readiness (R1–R4). The levels vary based on people's confidence, ability, and willingness to guide their own work. Situational theory combines task and relationship behavior to create four leadership styles—telling (R1), selling (R2), participating (R3), and delegating (R4)—that are used with employees at different readiness levels.

6 ADAPTING LEADER BEHAVIOR: NORMATIVE DECISION THEORY

For years, your company has insisted on formal business attire for men and women. Now, however, you want to make a change to casual wear. Do you make the decision yourself and announce it, or do you consult your employees before making the decision?

To keep up with the exponential growth in one of your sales regions, you're going to cut the region in half, add staff, and effectively reduce the earnings of its sales representatives and managers. Do you make the decision yourself, announce it, and then live with the backlash? Do you consult all of your regional managers before making this decision? Or do you go straight to the salespeople in the region to let them know about your concerns?

Many people believe that making tough decisions is at the heart of leadership. Yet experienced leaders will tell you that deciding *how* to make decisions is just as important. The **normative decision theory** (also known as the *Vroom-Yetton-Jago model*) helps leaders decide how much employee participation (from none to letting employees make the entire decision) should be used when making decisions.[51]

Let's learn more about normative decision theory by investigating **6.1 decision styles and 6.2 decision quality and acceptance**.

6.1 Decision Styles

[Normative decision theory] a theory that suggests how leaders can determine an appropriate amount of employee participation when making decisions

Unlike nearly all of the other leadership theories discussed in this chapter, which have specified *leadership* styles, that is, the way a leader generally behaves toward followers, the normative decision theory specifies five different *decision* styles, or ways of making decisions. (See Chapter 5 for a more complete review of decision making in organizations.) As shown in Exhibit 14.12, those styles vary from *autocratic decisions* (AI or AII) on the left, in which leaders make the decisions by themselves, to *consultative decisions* (CI or CII), in which leaders share problems with subordinates but still make the decisions themselves, to *group decisions* (GII) on the right, in which leaders share the problems with subordinates and then have the group make the decisions.

GE Aircraft Engines in Durham, North Carolina, uses a similar approach when making decisions. According to *Fast Company* magazine, "At GE/Durham, every decision is either an 'A' decision, a 'B' decision, or a 'C' decision. An 'A' decision is one that the plant manager makes herself, without consulting anyone."[52] Plant manager Paula Sims says, "I don't make very many of those, and when I do make one, everyone at the plant knows it. I make maybe 10 or 12 a year."[53] "B" decisions are also made by the plant manager but with input from the people affected. "C" decisions, the most common type, are made by consensus, by the people directly involved, with plenty of discussion. With "C" decisions, the view of the plant manager doesn't necessarily carry more weight than the views of those affected."[54]

6.2 Decision Quality and Acceptance

According to the normative decision theory, using the right degree of employee participation improves the quality of decisions and the extent to which employees accept and are committed to decisions. Exhibit 14.13 lists the decision rules that normative decision theory uses to increase the quality of a decision and the degree to which employees accept and commit to it. The quality, leader information, subordinate information, goal congruence, and problem structure rules are used to increase decision quality. For example, the leader information rule states that if a leader doesn't have enough information to make a decision on his or her own, then the leader should not use an autocratic decision style.

EXHIBIT 14.13 Normative Theory Decision Rules

Decision Rules to Increase Decision Quality
Quality Rule. If the quality of the decision is important, then don't use an autocratic decision style.
Leader Information Rule. If the quality of the decision is important, and if the leader doesn't have enough information to make the decision on his or her own, then don't use an autocratic decision style.
Subordinate Information Rule. If the quality of the decision is important, and if the subordinates don't have enough information to make the decision themselves, then don't use a group decision style.
Goal Congruence Rule. If the quality of the decision is important, and subordinates' goals are different from the organization's goals, then don't use a group decision style.
Problem Structure Rule. If the quality of the decision is important, the leader doesn't have enough information to make the decision on his or her own, and the problem is unstructured, then don't use an autocratic decision style.
Decision Rules to Increase Decision Acceptance
Commitment Probability Rule. If having subordinates accept and commit to the decision is important, then don't use an autocratic decision style.
Subordinate Conflict Rule. If having subordinates accept the decision is important and critical to successful implementation and subordinates are likely to disagree or end up in conflict over the decision, then don't use an autocratic or consultative decision style.
Commitment Requirement Rule. If having subordinates accept the decision is absolutely required for successful implementation and subordinates share the organization's goals, then don't use an autocratic or consultative style.

Sources: Adapted from V. H. Vroom, "Leadership," in *Handbook of Industrial and Organizational Psychology*, ed. M. D. Dunnette (Chicago: Rand McNally, 1976); V. H. Vroom & A. G. Jago, *The New Leadership: Managing Participation in Organizations* (Englewood Cliffs, NJ: Prentice Hall, 1988).

The commitment probability, subordinate conflict, and commitment requirement rules shown in Exhibit 14.13 are used to increase employee acceptance and commitment to decisions. For example, the commitment requirement rule says that if decision acceptance and commitment are important, and the subordinates share the organization's goals, then you shouldn't use an autocratic or consultative style. In other words, if followers want to do what's best for the company and you need their acceptance and commitment to make a decision work, then use a group decision style and let them make the decision.

As you can see, these decision rules help leaders improve decision quality and follower acceptance and commitment by eliminating decision styles that don't fit the particular decision or situation they're facing. Normative decision theory then operationalizes these decision rules in the form of yes/no questions, which are shown in the decision tree displayed in Exhibit 14.14. You start at the left side of the model and answer the first question, "How important is the technical quality of this decision?" by choosing "high" or "low." Then you continue by answering each question as you proceed along the decision tree until you get to a recommended decision style.

Let's use the model to make the decision of whether to change from a formal business attire policy to a casual wear policy. The problem sounds simple, but it is actually more complex than you might think. Follow the yellow line in Exhibit 14.14 as we work through the decision in the following discussion.

Problem: Change to Casual Wear?

1. ***Quality requirement: How important is the technical quality of this decision?*** High. This question has to do with whether there are quality differences in the alternatives and whether those quality differences matter. In other words: Is there a lot at stake in this decision? Although most people would assume that quality isn't an issue here, it really is, given the overall positive changes that generally accompany changes to casual wear.
2. ***Commitment requirement: How important is subordinate commitment to the decision?*** High. Changes in culture, like dress codes, require subordinate commitment or they fail.
3. ***Leader's information: Do you have sufficient information to make a high-quality decision?*** Yes. Let's assume that you've done your homework. Much has been written about casual wear, from how to make the change to the effects it has in companies (almost all positive).
4. ***Commitment probability: If you were to make the decision by yourself, is it reasonably certain that your subordinate(s) would be committed to the decision?*** No. Studies of casual wear find that employees' reactions are almost uniformly positive. Nonetheless, employees are likely to be angry if you change something as personal as clothing policies without consulting them.
5. ***Goal congruence: Do subordinates share the organizational goals to be attained in solving this problem?*** Yes. The goals that usually accompany a change to casual dress policies are a more informal culture, better communication, and less money spent on business attire.
6. ***Subordinate information: Do subordinates have sufficient information to make a high-quality decision?*** No. Most employees know little about casual wear policies or even what constitutes casual wear in most companies. Consequently, most companies have to educate employees about casual wear practices and policies before making a decision.

7. ***CII is the answer:*** With a CII, or consultative decision process, the leader shares the problem with employees as a group, obtains their ideas and suggestions, and then makes the decision, which may or may not reflect their input. So, given the answers to these questions (remember, different managers won't necessarily answer these questions the same way), the normative decision theory recommends that leaders consult with their subordinates before deciding whether to change to a casual wear policy.

How well does the normative decision theory work? A prominent leadership scholar has described it as the best supported of all leadership theories.[55] In general, the more managers violate the decision rules in Exhibit 14.13, the less effective their decisions are, especially with respect to subordinate acceptance and commitment.[56]

Adapting Leader Behavior: Normative Decision Theory The normative decision theory helps leaders decide how much employee participation should be used when making decisions. Using the right degree of employee participation improves the quality of decisions and the extent to which employees accept and are committed to decisions. The theory specifies five different decision styles or ways of making decisions: autocratic decisions (AI or AII), consultative decisions (CI or CII), and group decisions (GII). The theory improves decision quality via the quality, leader information, subordinate information, goal congruence, and unstructured problem decision rules. The theory improves employee commitment and acceptance via the commitment probability, subordinate conflict, and commitment requirement decision rules. These decision rules help leaders improve decision quality and follower acceptance and commitment by eliminating decision styles that don't fit the decision or situation they're facing. Normative decision theory then makes these decision rules more concrete by framing them as yes/no questions, as shown in the decision tree displayed in Exhibit 14.14.

STRATEGIC LEADERSHIP

Thus far, you have read about three major leadership ideas: traits, behaviors, and situational theories. Leader *traits* are relatively stable characteristics such as abilities or psychological motives. Traits capture who effective leaders are. Leader *behaviors* are the actions leaders take to influence others to achieve group or organizational goals. Behaviors capture what effective leaders do (i.e., initiate structure and consideration). And *situational theories* indicate that the effectiveness of a leadership style, the way a leader generally behaves toward followers, depends on the situation. Situational theories capture what leaders need to do or not do in particular situations or circumstances. This final part of the chapter introduces a fourth major leadership idea—strategic leadership—and its components: visionary, charismatic, and transformational leadership.

Strategic leadership is the ability to anticipate, envision, maintain flexibility, think strategically, and work with others to initiate changes that will create a positive future for an organization.[57] General Electric was one of the best run and most profitable companies in the world. Yet, since taking charge seven years ago, CEO Jeffrey Immelt has led GE through a series of strategic changes that have made the company more global, more customer-oriented, and more focused on developing new technology for new markets.[58] Immelt explains his strategic leadership this way: "In my case, I was

[Strategic leadership] the ability to anticipate, envision, maintain flexibility, think strategically, and work with others to initiate changes that will create a positive future for an organization

taking over a well-known company that had been led by a famous and excellent CEO [Jack Welch]. But I never wanted to run *that* company, and I never wanted to be *that* CEO. [But] I knew the company had to change. I would say most of us were trained to have a pretty healthy disrespect for history. We respect performance, respect integrity, but everybody was trained to have a look-forward attitude instead of look-backward. I inherited a company that had great strengths for a long time—good risk management, good cost control, good productivity—and I viewed the mission for my generation as not to lose those things but to build capability around growth, which we didn't have."[59] Thus, strategic leadership captures how leaders inspire their companies to change and their followers to give extraordinary effort to accomplish organizational goals.

After reading the next section, you should be able to

7. explain how visionary leadership (i.e., charismatic and transformational leadership) helps leaders achieve strategic leadership.

7 VISIONARY LEADERSHIP

In Chapter 5, we defined a purpose statement, which is often referred to as an organizational mission or vision, as a statement of a company's purpose or reason for existing. Similarly, **visionary leadership** creates a positive image of the future that motivates organizational members and provides direction for future planning and goal setting.[60]

Two kinds of visionary leadership are **7.1 charismatic leadership and 7.2 transformational leadership.**

7.1 Charismatic Leadership

Charisma is a Greek word meaning "divine gift." The ancient Greeks saw people with charisma as inspired by the gods and capable of incredible accomplishments. German sociologist Max Weber viewed charisma as a special bond between leaders and followers.[61] Weber wrote that the special qualities of charismatic leaders enable them to strongly influence followers. For example, Richard Scrushy, a founder and the former CEO of HealthSouth, a worldwide provider of health care (outpatient surgery, diagnostic imaging, and rehabilitation), was undoubtedly a charismatic leader. Scrushy, who had a magnetic personality, personally recruited many of HealthSouth's employees and top managers. Says one employee, "When he was talking, you could be hypnotized by him."[62] Dean Thomas Ratcliffe of Troy State University's business school says, "Heck, I [got] goose bumps listening to him."[63] Weber also noted that charismatic leaders tend to emerge in times of crisis and that the radical solutions they propose enhance the admiration that followers feel for them. Indeed, charismatic leaders tend to have incredible influence over followers who may be inspired by their leaders and become fanatically devoted to them. From this perspective, charismatic leaders are often seen as larger-than-life or more special than other employees of the company.

Charismatic leaders have strong, confident, dynamic personalities that attract followers and enable the leaders to create strong bonds with their followers. Followers trust charismatic leaders, are loyal to them, and are inspired to work toward the accomplishment of the leader's vision. Followers who become devoted to charismatic leaders may go to extraordinary lengths to please them. Therefore, we can define **charismatic leadership** as the behavioral tendencies and personal characteristics of

[Visionary leadership] leadership that creates a positive image of the future that motivates organizational members and provides direction for future planning and goal setting

[Charismatic leadership] the behavioral tendencies and personal characteristics of leaders that create an exceptionally strong relationship between them and their followers

leaders that create an exceptionally strong relationship between them and their followers. Charismatic leaders also

- Articulate a clear vision for the future that is based on strongly held values or morals;
- Model those values by acting in a way consistent with the vision;
- Communicate high performance expectations to followers; and
- Display confidence in followers' abilities to achieve the vision.[64]

"I start with people's growth because I believe that if the people who are running and participating in a company grow, then the company's growth will in many respects take care of itself."

JIM McNERNEY, CEO BOEING

Does charismatic leadership work? Studies indicate that it often does. In general, the followers of charismatic leaders are more committed and satisfied, are better performers, are more likely to trust their leaders, and simply work harder.[65] Nonetheless, charismatic leadership also has risks that are at least as large as its benefits. The problems are likely to occur with ego-driven charismatic leaders who take advantage of fanatical followers.

In general, there are two kinds of charismatic leaders, ethical charismatics and unethical charismatics.[66] **Ethical charismatics** provide developmental opportunities for followers, are open to positive and negative feedback, recognize others' contributions, share information, and have moral standards that emphasize the larger interests of the group, organization, or society. Jim McNerney, Boeing's CEO, believes that providing development opportunities for followers should be a leader's highest priority. Says McNerney, "I don't start with the company's strategy or products. I start with people's growth because I believe that if the people who are running and participating in a company grow, then the company's growth will in many respects take care of itself. I have this idea in my mind—all of us get 15 percent better every year. . . . Usually that means your ability to lead, and that's all about your ability to chart the course for [your employees], to inspire them to reach for performance—the values you bring to the job, with a focus on the courage to do the right thing. I tend to think about this in terms of helping others get better."[67] As you would expect, ethical charismatics produce stronger commitment, higher satisfaction, more effort, better performance, and greater trust.

By contrast, **unethical charismatics** control and manipulate followers, do what is best for themselves instead of their organizations, want to hear only positive feedback, share information that is only beneficial to themselves, and have moral standards that put their interests before everyone else's. Because followers can become just as committed to unethical charismatics as to ethical characteristics, unethical characteristics pose a tremendous risk for companies. According to *Fast Company*, "We're worshipful of top executives who seem charismatic, visionary, and tough. So long as they're lifting profits and stock prices, we're willing to overlook that they can also be callous, cunning, manipulative, deceitful, verbally and psychologically abusive, remorseless, exploitative, self-delusional, irresponsible, and megalomaniacal."[68]

John Thompson, a management consultant, warns, "Often what begins as a mission becomes an obsession. Leaders can cut corners on values and become driven by self-interest. Then they may abuse anyone who makes a mistake."[69] In terms of cutting corners and self-interest, it's hard to top the unethical charismatic behavior of former Enron chief financial officer Andrew Fastow, whom *Fast Company* described as follows: "He pressured his bosses for a promotion to CFO even though he had a shaky grasp of the position's basic responsibilities, such as accounting and treasury operations. Suffering delusions of grandeur after just a little time on the job, Fastow ordered Enron's PR people to lobby *CFO* magazine to make him its CFO of the Year. But Fastow's master manipulation was a scheme to loot Enron. He set up separate

[Unethical charismatics] charismatic leaders who control and manipulate followers, do what is best for themselves instead of their organizations, want to hear only positive feedback, share only information that is beneficial to themselves, and have moral standards that put their interests before everyone else's

EXHIBIT 14.15 Ethical and Unethical Charismatics

CHARISMATIC LEADER BEHAVIORS	ETHICAL CHARISMATICS	UNETHICAL CHARISMATICS
Exercising power	Power is used to serve others.	Power is used to dominate or manipulate others for personal gain.
Creating the vision	Followers help develop the vision.	Vision comes solely from leader and serves his or her personal agenda.
Communicating with followers	Two-way communication: Seek out viewpoints on critical issues.	One-way communication: Not open to input and suggestions from others.
Accepting feedback	Open to feedback. Willing to learn from criticism.	Inflated ego thrives on attention and admiration of sycophants. Avoid or punish candid feedback.
Stimulating followers	Want followers to think and question status quo as well as leader's views.	Don't want followers to think. Want uncritical, intellectually unquestioning acceptance of leader's ideas.
Developing followers	Focus on developing people with whom they interact. Express confidence in them and share recognition with others.	Insensitive and unresponsive to followers' needs and aspirations.
Living by moral standards	Follow self-guided principles that may go against popular opinion. Have three virtues: courage, a sense of fairness or justice, and integrity.	Follow standards only if they satisfy immediate self-interests. Manipulate impressions so that others think they are "doing the right thing." Use communication skills to manipulate others to support their personal agenda.

partnerships, which he secretly ran, to engage in deals with Enron. The deals quickly made tens of millions of dollars for Fastow—and prettified Enron's financials in the short run by taking unwanted assets off its books. But they left Enron with time bombs that would ultimately cause the company's total implosion—and lose shareholders billions. When Enron's scandals were exposed, Fastow pleaded guilty to securities fraud and agreed to pay back nearly $24 million and serve 10 years in prison."[70] Likewise, HealthSouth's former CEO, Richard Scrushy, was convicted of artificially inflating HealthSouth's earnings numbers for 6 years and was hit with a $2.88 billion civil judgment, the largest financial penalty on record against a single executive.[71]

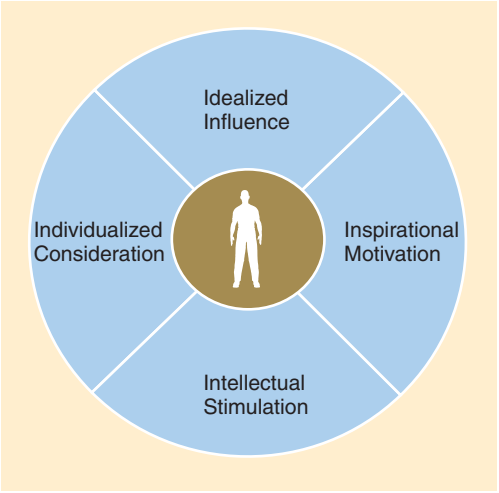
Exhibit 14.15 shows the stark differences between ethical and unethical charismatics on several leader behaviors: exercising power, creating the vision, communicating with followers, accepting feedback, stimulating followers intellectually, developing followers, and living by moral standards. For example, ethical charismatics account for the concerns and wishes of their followers when creating a vision by having followers participate in the development of the company vision. By contrast, unethical charismatics develop a vision by themselves solely to meet their personal agendas. One unethical charismatic said, "The key thing is that it is my idea; and I am going to win with it at all costs."[72]

What can companies do to reduce the risks associated with unethical charismatics? To start, they need a clearly written code of conduct that is fairly and consistently enforced for all managers. Next, companies should recruit, select, and promote managers with high ethical standards. Also, companies need to train leaders to value, seek, and use diverse points of view. Both leaders and subordinates need training regarding ethical leader behaviors so that abuses can be recognized and corrected. Finally, companies should celebrate and reward people who exhibit ethical behaviors, especially ethical leader behaviors.[73]

7.2 Transformational Leadership

While charismatic leadership involves articulating a clear vision, modeling values consistent with that vision, communicating high performance expectations, and establishing very strong relationships with followers, **transformational leadership** goes further by generating awareness and acceptance of a group's purpose and mission and by getting employees to see beyond their own needs and self-interest for the good of the group.[74] Like charismatic leaders, transformational leaders are visionary, but they transform their organizations by getting their followers to accomplish more than they intended and even more than they thought possible.

EXHIBIT 14.16 Components of Transformational Leadership



Transformational leaders are able to make their followers feel that they are a vital part of the organization and help them see how their jobs fit with the organization's vision. By linking individual and organizational interests, transformational leaders encourage followers to make sacrifices for the organization because they know that they will prosper when the organization prospers. As Exhibit 14.16 shows, transformational leadership has four components: charismatic leadership or idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration.[75]

Charismatic leadership or idealized influence means that transformational leaders act as role models for their followers. Because transformational leaders put others' needs ahead of their own and share risks with their followers, they are admired, respected, and trusted, and followers want to emulate them. Thus, in contrast to purely charismatic leaders (especially unethical charismatics), transformational leaders can be counted on to do the right thing and maintain high standards for ethical and personal conduct. After Jim McNerney became Boeing's third CEO in 3 years, he pushed company lawyers to settle ethics violations that occurred under his predecessors. Under the settlement with the U.S. Justice Department, Boeing agreed to pay a $615 million penalty. But that wasn't enough for McNerney. He apologized before a Senate committee and refused to take a $200 million tax deduction to which Boeing was entitled for its costs in obtaining the settlement. Critics charge that McNerney's decision to not take the tax deduction wrongly cost Boeing shareholders $200 million. McNerney, who was responsible for restoring the company's commitment to ethical behavior, said, "I thought it was the right thing to do."[76] McNerney also instituted a new organization-wide ethics program and has linked bonuses and promotion to ethical behavior.

Inspirational motivation means that transformational leaders motivate and inspire followers by providing meaning and challenge to their work. By clearly communicating expectations and demonstrating commitment to goals, transformational leaders help followers envision future states, such as the organizational vision or mission. In turn, this leads to greater enthusiasm and optimism about the future. Medtronic's mission is "To contribute to human welfare by application of biomedical

[Transformational leadership] leadership that generates awareness and acceptance of a group's purpose and mission and gets employees to see beyond their own needs and self-interests for the good of the group

engineering in the research, design, manufacture, and sale of instruments or appliances that *alleviate pain*, *restore health*, *and extend life*."[77] Because Medtronic designs and makes life-altering products, it has an opportunity to inspire the managers and workers who work there. Every December for the holiday party, Medtronic flies in six patients to demonstrate that the company is accomplishing its mission to "alleviate pain, restore health, and extend life." The patients give testimonials describing the difference that Medtronic's products have made to them and their loved ones. Production supervisor Karen McFadzen says, "We have patients who come in who would be dead if it wasn't for us. I mean, they sit right up there and they tell us what their lives are like. You don't walk away from them not feeling anything." Medtronic quality systems manager Kirk Knock says, "we hear first-hand from the patients, including children, who we have helped. This is a very emotional and rewarding day for all of us."[78]

Intellectual stimulation means that transformational leaders encourage followers to be creative and innovative, to question assumptions, and to look at problems and situations in new ways even if their ideas are different from the leaders. Carol Bartz, former CEO of **AutoDesk**, the industry leader in computer-aided design software, and now CEO of **Yahoo!**, pushes the people who work for her to think beyond their original assumptions by asking questions. Says Bartz, "all you have to do is ask questions. You just have to keep asking questions. You ask questions and guess what, they go, 'Oh, I never thought of that.' Because it unleashes so much power in people by just asking. Why do I [as the CEO] have to be the know-it-all? My God, I'm not that smart. But I'm smart enough to just keep asking questions and say, 'Is that the best you can do? Does that excite you? Will that excite the customer? Does this really have to work this way?'"[79]

Individualized consideration means that transformational leaders pay special attention to followers' individual needs by creating learning opportunities, accepting and tolerating individual differences, encouraging two-way communication, and being good listeners. At **Corporate Ink Public Relations**, a small public relations firm in Newton, Massachusetts, company president and founder Amy Bermar says, "Junior people have a lot of opportunities to influence some really significant activities at our firm."[80] For example, any PR representative who snags a high-profile interview for a client (i.e., setting up a high-visibility TV, magazine, or newspaper interview) gets to handle it from beginning to end, even less experienced PR representatives. Adam Parken is a 29-year-old account manager with Corporate Ink. At a previous PR firm, senior executives developed the PR strategies while junior representatives executed them. But, says Parkin, "Here at Corporate Ink, no matter what position you're in, you're expected to help strategize."[81] Corporate Ink maximizes those learning opportunities by assigning each new employee a senior mentor, and by generally promoting them within 18 months.

Finally, a distinction needs to be drawn between transformational leadership and transactional leadership. While transformational leaders use visionary and inspirational appeals to influence followers, **transactional leadership** is based on an exchange process in which followers are rewarded for good performance and punished for poor performance. When leaders administer rewards fairly and offer followers the rewards that they want, followers will often reciprocate with effort. A problem, however, is that transactional leaders often rely too heavily on discipline

[Transactional leadership] leadership based on an exchange process, in which followers are rewarded for good performance and punished for poor performance

or threats to bring performance up to standards. This may work in the short run, but it's much less effective in the long run. Also, as discussed in Chapters 11 and 13, many leaders and organizations have difficulty successfully linking pay practices to individual performance. As a result, studies consistently show that transformational leadership is much more effective on average than transactional leadership. In the United States, Canada, Japan, and India and at all organizational levels, from first-level supervisors to upper-level executives, followers view transformational leaders as much better leaders and are much more satisfied when working for them. Furthermore, companies with transformational leaders have significantly better financial performance.[82]

REVIEW 7

Visionary Leadership Strategic leadership requires visionary, charismatic, and transformational leadership. Visionary leadership creates a positive image of the future that motivates organizational members and provides direction for future planning and goal setting. Charismatic leaders have strong, confident, dynamic personalities that attract followers, enable the leader to create strong bonds, and inspire followers to accomplish the leader's vision. Followers of ethical charismatic leaders work harder, are more committed and satisfied, are better performers, and are more likely to trust their leaders. Followers can be just as supportive and committed to unethical charismatics, but these leaders can pose a tremendous risk for companies. Unethical charismatics control and manipulate followers and do what is best for themselves instead of their organizations. To reduce the risks associated with unethical charismatics, companies need to enforce a clearly written code of conduct; recruit, select, and promote managers with high ethical standards; train leaders to value, seek, and use diverse points of view; teach everyone in the company to recognize unethical leader behaviors; and celebrate and reward people who exhibit ethical behaviors. Transformational leadership goes beyond charismatic leadership by generating awareness and acceptance of a group's purpose and mission and by getting employees to see beyond their own needs and self-interest for the good of the group. The four components of transformational leadership are charisma or idealized influence, inspirational motivation, intellectual stimulation, and individualized consideration.

Executive Turnover

In 2008, U.S. companies saw 1,484 CEO changes, for an average of six exits per business day. Terminated executives are taking it either one of two ways. Some are in denial and can't believe that they've actually been let go. Others face it head on. Going forward, successful CEOs will recognize that they're not invincible. The role of executive is not a solo performance, after all.

SELF ASSESSMENT

Leadership Orientation

Think of everyone you have ever worked with in jobs, clubs, volunteer positions, student projects—everything. Now that you have all those situations in mind, try to identify the one person with whom you least liked to work. Who was the most difficult person to work with to get a job done? For whatever reason, you had trouble working with this person. The person can be a peer, boss, or subordinate. Once you have that person in mind, think of how you would describe him or her to another person. The Least Preferred Coworker scale uses 18 oppositional adjective pairs to help you build your description.[83] For each pair, choose the number closest to the word that best describes your LPC.

MANAGEMENT DECISION

Are New Offices Necessary?

Everyone says that when business is good, you're supposed to be able to relax a little. Whoever said that never set foot in the office of your magazine.[84]

When you launched the magazine, the staff consisted of you (editor and publisher), an advertising salesperson (who also handled distribution), an art director, a page designer, and a production director. All writing was by freelancers. As circulation has grown, so has the number of pages in the magazine and the frequency with which you publish issues. That core of 6 people has quadrupled, causing the space all of you occupy to become cramped. At 6,000 square feet, the office is comfortably full with 25 people. Your problem is that you have more work than your 25 employees can comfortably handle, and you need to hire about 5 more people. Where will you put them?

The way you see it, you have a couple of options. First, you could move. Pack everyone's desk up, all the equipment, and find a space that will accommodate a larger and growing work force. Moving, though, would be costly. Companies typically charge upwards of $50 per hour per mover, plus you'd have to get insurance to cover the move. The Better Business Bureau has received complaints about companies in over 1,000 industries, with the moving industry the target of over 5,000 complaints, putting it 11th on that list. Finding a reputable, high-quality moving company could take time away from magazine work. And managing the logistics could be a nightmare. You can't just shut down, turn off the phones, and move in peace. You'd still have to conduct business, sell ads, edit copy, handle subscriptions, lay out pages, shoot photos, and do dozens of other day-to-day activities. Plus, the sheer volume of paper archives related to 5 years of magazine publishing, not to mention all the technology hardware, would make packing and unpacking a big endeavor for each of your workers.

The second option: Stay put and let workers telecommute. Although you'd avoid the headache of a move, you'd trade the management of a one-time event (moving offices) for regular management of everyone's on-site and off-site schedules. Telecommuting is on the verge of being a widely accepted form of scheduling despite the very real danger of work and home life blending into one big pot of time. Already 40 percent of Americans work evenings, weekends, or on rotating shifts, and the numbers of full-time workers who work from home at least one day a month rose 30 percent in a single year, proving the trend is toward working from home. People tend to romanticize working from home, however, and forget that there are real challenges (like not having access to convenient photocopying or shipping, lack of quiet space, not enough space, and, yes, no social interaction).

You're primarily concerned about a drop in creativity as fewer people are on-site to collaborate and give feedback on article ideas, layouts, and other decisions that come up nearly every hour. Statistically, 14 percent of U.S. workers who could telecommute if they wanted still prefer to work in an office. That means you could be left with only four people in the office! But offering telecommuting would let you tap into a larger talent pool and help you retain workers who are looking for flexibility in their schedules and work locations. If your employees could work from home, you wouldn't lose as much time during inclement weather either—no more snow days.

Even though your choice is between two options—move or offer telecommuting—you also need to consider how involved your employees should be in the decision. Telecommuting affects their work and home lives, but the expense and the responsibility for managing the project will be yours.

Questions

1. How involved should your employees be in making the decision? (*Hint:* Consider using the decision tree in Exhibit 14.14 to determine the appropriate level of employee participation in this decision.)
2. Because everyone has worked closely in the same open office, you've been able to use an achievement-oriented leadership style. Would a shift to telecommuting require a change in style? Explain.
3. How do you manage space issues as your business grows?

MANAGEMENT TEAM DECISION

Transition at Habitat for Humanity

With 500 full-time employees, roughly 500,000 unpaid volunteers, 2,303 affiliates worldwide, and upwards of $160 million in annual donations, Habitat for Humanity International (HFHI) is the 19th largest nonprofit organization in the United States.[85] Since it was founded in 1976 by Millard and Linda Fuller, HFHI has built some 175,000 houses around the world, more than 20,000 of them in a single year. Clearly, what started as a straightforward, ecumenical Christian ministry has grown into a global force for housing the poor and one of the world's most renowned nonprofit organizations. And that success is due in large part to the efforts of Millard Fuller, an avid fund-raiser, prolific author (he has written nine books), sought-after public speaker, and an all-around passionate spokesperson for the cause.

When Fuller's tenure as president was set to end after 28 years at the helm of HFHI, he and the board of directors had serious disagreements about the transition of leadership. Fuller feared that the board was moving toward a culture of "bean-counting" and away from a strong Christian commitment. He charged that many board members were not spiritually grounded. The board defended its Christian focus but recognized that the organization's mission had become much larger than the influence of a single individual.

After 11 months of wrangling, Fuller, who was approaching 70 years of age, agreed to step down as CEO and hire an interim CEO. Fuller took a new position with the title Founder/President and became the chief spokesperson for Habitat. Taking the CEO position was Paul Leonard, who couldn't have been more different from his predecessor. Leonard, a retired real estate and construction industry executive, had expertise in organizational development and a deep knowledge of the construction industry. He accepted the position and with it responsibility for the overall management of HFHI for a period of 2 years.

Only 3 months after naming Leonard as CEO, however, the HFHI board of directors fired Fuller altogether for a pattern of "divisive and disruptive" public comments and went so far as to lock him out of the HFHI building. In the face of soaring land costs and growing housing regulations, Leonard will have to contend with a changing external environment that requires more careful planning. At the same time, HFHI's 5-year plan calls for the organization to seek exponential annual growth, rather than the 5 to 10 percent annual growth it has been experiencing in recent years.

As a member of the board, you face significant challenges as well. Even though Leonard was a solid choice for interim CEO, the board is conducting an executive search to fill the permanent position. Should the permanent CEO be more like Fuller, a passionate and charismatic evangelist not afraid of setting tremendous stretch goals (like eradicating substandard housing in 20 years), or like Leonard, a methodical executive who can manage and grow Habitat's sprawling, decentralized organization? Or should the permanent CEO fit an altogether different profile?

Assemble a team of four to five students to act as the board of directors of Habitat for Humanity International. As a group, discuss each of the following questions to identify the chief characteristics the new CEO of HFHI will need to possess.

Questions

1. Does Habitat for Humanity need a leader or a seasoned manager? In other words, do you look to fill the CEO position with a visionary leader (like Fuller) or a seasoned manager (like Leonard) whose strengths lie more in organizational development than charismatic passion?
2. The new CEO will need to work with both the employees of HFHI and its hundreds of thousands of volunteers and donors. What leadership style will you look for in prospective candidates to meet the needs of those two constituencies?

PRACTICE BEING A MANAGER

Changing Directions

Leadership is a highly prized process and capability. Organizations invest billions of dollars each year in recruiting and developing leadership talent. As more companies compete primarily on the basis of how well they employ their human capabilities, the importance of leadership continues to grow. This exercise will provide you with an opportunity to play coach to a leader entering a challenging situation.

Step 1: Get into groups. Your professor will assign you to pairs or small groups.

Scenario: The opening "What would you do?" segment in this chapter focused on the challenges facing the new CEO of Pepsico. Pepsico is a company with a remarkable tradition of product and management innovations, but as the opening segment makes clear, over the past several years PepsiCo is facing increased competition from its archrival Coca-Cola and struggling to navigate the challenges of an ever-changing marketplace. As the new CEO scans the situation, it is difficult to know how to prioritize. Where to begin?

Assume that the members of your small team are a group of consultants working with Pepsi's new CEO. Your job is behind the scenes—you are simply helping the CEO brainstorm and think carefully about how to lead this company, improve performance, and restore the once-vibrant culture of creativity that made Pepsico a leader in its industry.

Step 2: Outline leadership criteria. Work as a team to develop a set of leadership recommendations that are well matched to the Pepsico situation. What do you think employees need most from their new leader? Should the CEO help employees look back and learn from the company's past, or should the CEO encourage employees to move on and focus on the future? What are the trade-offs in each approach? The opening segment highlights some key areas of concern: (a) increased competition; (b) rising cost structures; (c) declining financial and marketing performance; (d) declining brand image (e.g., as a contributor to unhealthy eating habits and childhood obesity). So how would you recommend that the CEO prioritize these issues? Are there creative possibilities for tackling some of these concerns simultaneously?

Step 3: Determine a coaching plan. Prepare to coach the CEO during the process of transforming Pepsico. How might path-goal thinking help the CEO guide Pepsico employees through the transition? What should the CEO keep in mind regarding such situational factors as worker readiness, situation favorableness, and environmental contingencies? Assuming the CEO possesses charismatic capabilities, would you recommend relying upon a charismatic leadership style in this situation? Why or why not?

Step 4: Debrief as a class. Share some of the highlights of your recommendations, and discuss what leadership consultants/coaches need to know to effectively advise their clients.

DEVELOP YOUR CAREER POTENTIAL

The Role of Humility in Leadership

Everybody makes mistakes; today's media-saturated culture makes everyone's mistakes everyone else's news.[86] This is particularly true of leaders, who are less able (perhaps simply unable) to hide from the media microscope than in times past. We want our leaders to have an unshakable integrity, so when their mistakes turn into front-page news, it provides a unique look at the mettle of those who lead our governments, institutions, and businesses. One of the functions of leadership is to assume responsibility for company actions, even when those actions are dubious at best or downright shameful at worst. But how can leaders—who are supposed to always take the high road—work through mistakes that they or their organizations have made?

The answer is simple: a sincere apology. Okay, so the answer is not so simple. Everyone knows that apologizing is not so easy, as proved by the associated lump in the throat and the awful feeling that comes from knowing that something you did caused someone else pain, embarrassment, loss, or hardship. But as you read in the chapter, a critical element of

what leaders do and how leaders succeed is consideration, which is akin to empathy, the engine of a sincere apology.

How do *you* apologize for mistakes? Do you use "sorry" so often that it is devoid of meaning? Or do you apologize profusely, which comes to the same effect? Do you wait until you have time to think things over, or do you apologize immediately if briefly? The biggest mistake that leaders make when apologizing is passing the buck and using the word *regret* instead of *apologize*. Leaders take responsibility for actions and should assume blame even if it is not their own. Making an unqualified assumption of responsibility helps demonstrate that your apology is sincere, as does going beyond a basic "I'm sorry." According to Karen Friedman, a communication coach, "'I'm sorry' doesn't cut it. . . . It's empty, hollow, and quite frankly, pathetic: 'I'm sorry I cooked the books.' 'I'm sorry I beat my wife. I won't do it again.' You have to say, 'I made a terrible mistake. I offended people. I lied. I was stupid.'"[87] So, one of the marks of a true leader is not hubris, but humility. In other words, the best way to *appear* sincere is to *be* sincere.

Questions

1. Describe a time when something you did or said had a profound negative impact on a person, group, or situation.
2. Did you take responsibility for your actions, or did you try to blame circumstances or other people?
3. Did you apologize? How do you think the person who was receiving the apology took it?
4. What was the most difficult thing about apologizing?
5. Think about some high-profile blunders in recent news stories, whether in the world of sports, business, or entertainment. How do you think the company or individual involved did at delivering a public apology? Explain why you thought it was—or was not—sincere.

In the futuristic action thriller *Doomsday*, the "Reaper Virus" strikes the British Isles in 2007 and devastates the population in Scotland. Authorities go to desperate lengths to quarantine it, sealing off the borders and not allowing anyone to enter or leave the country. Social decay spreads, and cannibalistic behavior develops among the few remaining survivors. When the Reaper Virus reemerges in 2032, this time in London, England, classified satellite images show signs of life in Glasgow and Edinburgh. In this scene, Major Eden Sinclair (Rhona Mitra) is given the task of going into the city to find the scientist who they hope may have the cure for the virus. If she can't find him in time, she is told, "then you needn't bother coming back."

What to Watch for and Ask Yourself

1. Assess the behavior of both Major Sinclair and Michael Canaris. Which leadership traits does their behavior show?
2. Does this film sequence show any aspects of charismatic and transformational leadership? Draw some examples from the sequence.

MANAGEMENT WORKPLACE

City of Greensburg, Kansas

© CENGAGE

After working in Oklahoma City as a parks director, Steve Hewitt wanted to run an entire town. A smaller community seemed the perfect place to get hands-on leadership experience before tackling a bigger city, so Hewitt took the city administrator position in his hometown of Greensburg, Kansas (population: 1,500). Standing in the remains of his kitchen, looking up at the dark sky on May 4, 2007, after a tornado destroyed his town, he realized that he got more than he'd bargained for. When Mayor Lonnie McCollum resigned, he said, "They didn't need me; they had good leadership," referring to the younger, tougher-skinned Hewitt. This video focuses on City Administrator Steve Hewitt and his efforts to transform Greensburg in the wake of the storm.

What to Watch for and Ask Yourself

1. Based on this video, which leadership traits would you say Hewitt displays?
2. How does having two distinct leadership roles, mayor and city administrator, create a challenging environment for effective leadership?
3. How would you characterize Hewitt's leadership style?

What would You Do?

Zappos Headquarters and Call Center, Las Vegas, Nevada.[1]

"Shoes? You sell shoes online? Who buys shoes online?" That was your reaction when the founder of Shoesite.com suggested you invest in his company. With $265 million from the sale of your first Internet business, you could invest in or start any company you wanted. And you did, starting 27 different businesses. But, something was missing. You weren't having any fun. You were depressed. As you told your friends, "the easiest way to explain it was that going into the office started to feel like work." The problem was that the people working in your first company weren't committed to long-term success. "The Silicon Valley culture is,'I'm going to work hard for years and make millions of dollars and then retire.'" So you vowed that if you ever ran another Internet business, you would create a company where employees were happy, satisfied, and committed to providing great service to customers.

You never realized that opportunity would come through Shoesite.com. Sure, selling shoes online sounded silly at first. But that was before you knew the U.S. shoe market was $40 billion a year and that $2 billion in sales came through mail order catalogs. If people bought shoes through mail order catalogs, they would buy via the Internet. So you not only bought a share of the company, which changed its name to Zappos.com (""Zappos" is derived from a ***zapatos***, which is the Spanish word for shoes), you helped run it. Six years after joining, the founder left, and you were Zappos's CEO.

Your first major challenge was how to get people to buy from you instead of your competitors. JCPenney took its mail order catalog shoe business and flipped it online. Then came new competitors, such as Piperlime.com, a division of Gap Inc., which carries 100 brands; Shoemall.com, which was started by a company with 100 years in the shoe business; Shoebuy.com, which, with 800 brands, bills itself as "The World's Largest Site for Shoes"; and Endless.com, which was started by Amazon.com, to sell shoes and handbags. Figuring that there was no other way to get consumers to choose Zappos over your competition, you instituted free shipping and free returns. The allure of this policy was simple. Choose the wrong size or wrong style and you can send the shoes back at no cost. However, "free" shipping and "free" returns cost you $100 million a year. While that has helped you build market share, Shoebuy.com now offers the same thing, so free shipping and free returns may not be enough to sustain your competitive advantage.

Your long-term goal is to combine free shipping and free returns with the best customer service in the business so that most of your profits come from repeat customers. What would that customer service look like? What would customers expect? Then, how can you make sure that every new person hired in the company "gap it" as you build your corporate culture around great

service? While you don't intend to compete on price, competition will make you keep costs down. Given Zappos's emphasis on culture and customer service, it doesn't make sense, like many companies have done, to outsource the call center to India. So, to keep costs down, you need to find a way to improve the communication between headquarters, the call center, and the distribution warehouse, all of which are in different locations. Finally, market research indicates that new shoppers don't see many differences between you and your competition. The websites are similar and your message of great customer service hasn't sunk in yet. This isn't a marketing issue. It's a communication issue. What steps can you personally take as the CEO to effectively and frequently talk about Zappos so that employees and customers have a deeper, more meaningful connection to the company?

If you were in charge at Zappos, what would you do?

It's estimated that managers spend over 80 percent of their day communicating with others.[2] Indeed, much of the basic management process—planning, organizing, leading, and controlling—cannot be performed without effective communication. If this weren't reason enough to study communication, consider that effective oral communication—achieved by listening, following instructions, conversing, and giving feedback—is the most important skill for college graduates who are entering the work force.[3] Furthermore, across all industries, poor communication skills rank as the single most important reason that people do not advance in their careers.[4] Communication is especially important for top managers like Zappos's CEO. As Mark DeMichele, former CEO of Arizona Public Service Company, puts it, "Communication is the key to success. CEOs can have good ideas, a vision, and a plan. But they also have to be able to communicate those plans to people who work for them."[5]

This chapter begins by examining the role of perception in communication and how perception can make it difficult for managers to communicate effectively. Next, you'll read about the communication process and the various kinds of communication found in most organizations. In the last half of the chapter, the focus is on improving communication in organizations. You'll learn about one-on-one communication and then about how to effectively communicate and listen to others organization-wide.

WHAT IS COMMUNICATION?

Whenever Kristy Keith's boss said, "Today is a good day for change," she knew that bad news, be it layoffs or a lost client, was sure to follow. Keith says, "It was comforting to some people who didn't know better," but the experienced employees went "back to their offices and huddled" to discuss what her boss's announcement really meant (and it usually wasn't good).[6] Many bosses try to make bad news sound good with phrases like "rightsizing" for layoffs, "merger of equals" for acquisition by another company, "pursuing other interests" for employees who were fired, and "cost efficiencies" for outsourced jobs. Why do managers sugarcoat bad news? Because, says Dartmouth management professor Paul Argenti, they think "they'll get less flak."

After reading the next two sections, you should be able to

1. explain the role that perception plays in communication and communication problems.
2. describe the communication process and the various kinds of communication in organizations.

Communication is the process of transmitting information from one person or place to another. While some bosses sugarcoat bad news, smart managers understand that effective, straightforward communication between managers and employees is essential for success.

1 PERCEPTION AND COMMUNICATION PROBLEMS

One study found that when *employees* were asked whether their supervisor gave recognition for good work, only 13 percent said their supervisor gave a pat on the back, and a mere 14 percent said their supervisor gave sincere and thorough praise. But when the *supervisors* of these employees were asked if they gave recognition for good work, 82 percent said they gave pats on the back, while 80 percent said that they gave sincere and thorough praise.[7] Given that these managers and employees worked closely together, how could they have had such different perceptions of something as simple as praise?

Let's learn more about perception and communication problems by examining **1.1 the basic perception process, 1.2 perception problems, 1.3 how we perceive others, and 1.4 how we perceive ourselves.** We'll also consider how all of these factors make it difficult for managers to communicate effectively.

1.1 Basic Perception Process

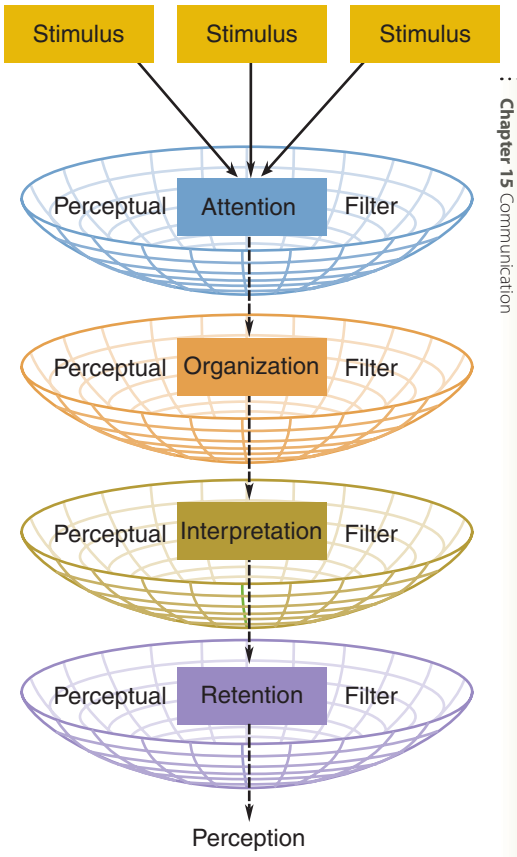
As shown in Exhibit 15.1, **perception** is the process by which individuals attend to, organize, interpret, and retain information from their environments. And since communication is the process of transmitting information from one person or place to another, perception is obviously a key part of communication. Yet perception can also be a key obstacle to communication.

As people perform their jobs, they are exposed to a wide variety of informational stimuli such as e-mails, direct conversations with the boss or coworkers, rumors heard over lunch, stories about the company in the press, or a video broadcast of a speech from the CEO to all employees. Just being exposed to an informational stimulus, however, is no guarantee that an individual will pay attention or attend to that stimulus. People experience stimuli through their own **perceptual filters**—the personality-, psychology-, or experience-based differences that influence them to ignore or pay attention to particular stimuli. Because of filtering, people exposed to the same information will often disagree about what they saw or heard.

For example, every major stadium in the National Football League has a huge TV monitor on which fans can watch replays. As the slow-motion video is replayed on the monitor, you can often hear cheers *and* boos, as fans of competing teams perceive the same replay in completely different ways. This happens because the fans'perceptual filters predispose them to attend to stimuli that support their team and not their opponents.[8] The same perceptual filters that affect whether we believe our favorite team was "robbed" by the referees also affect communication, that is, the transmitting of information from one person or place to another. As shown in Exhibit 15.1, perceptual filters affect each part of the *perception process*: attention, organization, interpretation, and retention.

EXHIBIT 15.1

Basic Perception Process



[Communication] the process of transmitting information from one person or place to another

[Perception] the process by which individuals attend to, organize, interpret, and retain information from their environments

[Perceptual filters] the personality-, psychology-, or experience-based differences that influence people to ignore or pay attention to particular stimuli

Attention is the process of noticing, or becoming aware of, particular stimuli. Because of perceptual filters, we attend to some stimuli and not others. For instance, a study at the University of Illinois asked viewers to watch people in black shirts and white shirts toss a basketball back and forth and to count the number of times someone in a black shirt tossed the basketball. Because their perceptual filters had narrowed to track the activities of people in black shirts, half of the viewers did not notice when the experimenters had someone in a gorilla suit walk through the midst of the people tossing the basketball back and forth.[9] *Organization* is the process of incorporating new information (from the stimuli that you notice) into your existing knowledge. Because of perceptual filters, we are more likely to incorporate new knowledge that is consistent with what we already know or believe. *Interpretation* is the process of attaching meaning to new knowledge. Because of perceptual filters, our preferences and beliefs strongly influence the meaning we attach to new information (e.g., "This decision must mean that top management supports our project."). Finally, *retention* is the process of remembering interpreted information. Retention affects what we recall and commit to memory after we have perceived something. Of course, perceptual filters affect retention as much as they do organization and interpretation.

For instance, imagine that you miss the first 10 minutes of a TV show and turn on your TV to see two people talking to each other in a living room. As they talk, they walk around the room, picking up and putting down various items. Some items, such as a ring, watch, and credit card, appear to be valuable, while others appear to be drug-related, such as a water pipe for smoking marijuana. In fact, this situation was depicted on videotape in a well-known study that manipulated people's perceptual filters.[10] Before watching the video, one-third of the study participants were told that the people were there to rob the apartment. Another third of the participants were told that police were on their way to conduct a drug raid and that the people in the apartment were getting rid of incriminating evidence. The remaining third of the participants were told that the people were simply waiting for a friend.

After watching the video, participants were asked to list all of the objects from the video that they could remember. Not surprisingly, the different perceptual filters (theft, drug raid, and waiting for a friend) affected what the participants attended to, how they organized the information, how they interpreted it, and ultimately which objects they remembered. Participants who thought a theft was in progress were more likely to remember the valuable objects in the video. Those who thought a drug raid was imminent were more likely to remember the drug-related objects. There was no discernible pattern to the items remembered by those who thought that the people in the video were simply waiting for a friend.

In short, because of perception and perceptual filters, people are likely to pay attention to different things, organize and interpret what they pay attention to differently, and, finally, remember things differently. Consequently, even when people are exposed to the same communications (e.g., organizational memos, discussions with managers or customers), they can end up with very different perceptions and understandings. This is why communication can be so difficult and frustrating for managers. Let's review some of the communication problems created by perception and perceptual filters.

Consequently, even when people are exposed to the same communications, they can end up with very different perceptions and understandings.

1.2 Perception Problems

Perception creates communication problems for organizations because people exposed to the same communication and information can end up with completely different ideas and understandings. Two of the most common perception problems in organizations are selective perception and closure.

At work, we are constantly bombarded with sensory stimuli: phones ringing, people talking in the background, computers dinging as new e-mail arrives, people calling our names, and so forth. As limited processors of information, we cannot possibly notice, receive, and interpret all of this information. As a result, we attend to and accept some stimuli but screen out and reject others. This isn't a random process.

Selective perception is the tendency to notice and accept objects and information consistent with our values, beliefs, and expectations while ignoring or screening out inconsistent information. For example, when Jack Smith, the former CEO of General Motors, was a junior-level executive, he traveled to Japan to learn why Toyota's cars were so reliable and why Toyota was so productive. When he learned that Toyota could build a car with half as many people as GM, he wrote a report and shared his findings with GM's all-powerful executive committee. But no one on the committee believed what he told them. The executives just couldn't accept that a Japanese company was so much more effective than GM. Says Smith, "Never in my life have I been so quickly and unceremoniously blown out of the water."[11]

Once we have initial information about a person, event, or process, **closure** is the tendency to fill in the gaps where information is missing, that is, to assume that what we don't know is consistent with what we already do know. If employees are told that budgets must be cut by 10 percent, they may automatically assume that 10 percent of employees will lose their jobs, too, even if that isn't the case. Not surprisingly, when closure occurs, people sometimes fill in the gaps with inaccurate information, which can create problems for organizations.

For example, one of the first decisions faced by a new CEO was whether to approve a marketing campaign to launch a new product. Promotional materials, advertising, and a sales and distribution plan had all been completed. The only thing missing was the CEO's approval. Although he liked the campaign, he wanted to send a strong message that the company needed to change, so he killed the campaign. The marketing manager and team that had spent a year developing it were demoralized. Because they didn't know why the CEO canceled the marketing campaign, his top managers closed the gap by assuming that the CEO didn't have confidence in any of them, either. Fearing that their decisions would be overturned, too, they began seeking the CEO's approval on everything from capital expenditures to personnel decisions to lower-level issues such as where, when, and whether to hold a conference for customers. After the marketing manager quit to take a job at another company, the CEO called his top managers together, assured them they had his confidence, told them he probably should have approved the marketing campaign, and said that he wouldn't repeat his mistake by doing anything to undermine their confidence or their authority.[12]

1.3 Perceptions of Others

Attribution theory says that we all have a basic need to understand and explain the causes of other people's behavior.[13] In other words, we need to know why people do what they do. According to attribution theory, we use two general reasons or attributions to explain people's behavior: an *internal attribution*, in which behavior is thought to be voluntary or under the control of the individual; and an *external attribution*, in which behavior is thought to be involuntary and outside of the control of the individual.

Have you ever seen someone changing a flat tire on the side of the road and thought to yourself, "What rotten luck—somebody's having a bad day"? If you did,

[Selective perception] the tendency to notice and accept objects and information consistent with our values, beliefs, and expectations, while ignoring or screening out or not accepting inconsistent information

[Closure] the tendency to fill in gaps of missing information by assuming that what we don't know is consistent with what we already know

[Attribution theory] the theory that we all have a basic need to understand and explain the causes of other people's behavior

you perceived the person through an external attribution known as the defensive bias. The **defensive bias** is the tendency for people to perceive themselves as personally and situationally similar to someone who is having difficulty or trouble.[14] When we identify with the person in a situation, we tend to use external attributions (i.e., features related to the situation) to explain the person's behavior. For instance, since flat tires are common, it's easy to perceive ourselves in that same situation and put the blame on external causes such as running over a nail.

Now, let's assume a different situation, this time in the workplace:

> *A utility company worker puts a ladder on a utility pole and then climbs up to do his work. As he's doing his work, he falls from the ladder and seriously injures himself.*[15]

Answer this question: Who or what caused the accident? If you thought, "It's not the worker's fault. Anybody could fall from a tall ladder," then you interpreted the incident with a defensive bias in which you saw yourself as personally and situationally similar to someone who is having difficulty or trouble. In other words, you made an external attribution by attributing the accident to an external cause, or some feature of the situation.

Most accident investigations, however, initially blame the worker (i.e., an internal attribution) and not the situation (i.e., an external attribution). Typically, 60 to 80 percent of workplace accidents each year are blamed on "operator error," that is, the employees themselves. In reality, more complete investigations usually show that workers are responsible for only 30 to 40 percent of all workplace accidents.[16] Why are accident investigators so quick to blame workers? The reason is that they are committing the **fundamental attribution error**, which is the tendency to ignore external causes of behavior and to attribute other people's actions to internal causes.[17] In other words, when investigators examine the possible causes of an accident, they're much more likely to assume that the accident is a function of the person and not the situation.

Which attribution—the defensive bias or the fundamental attribution error—are workers likely to make when something goes wrong? In general, as shown in Exhibit 15.2, employees and coworkers are more likely to perceive events and explain behavior from a defensive bias. Because they do the work themselves and see themselves as similar to others who make mistakes, have accidents, or are otherwise held responsible for things that go wrong at work, employees and coworkers are likely to attribute problems to external causes such as failed machinery, poor support, or inadequate training. By contrast, because they are typically observers (who don't do the work themselves) and see themselves as situationally and personally different from workers, managers (i.e., the boss) tend to commit the fundamental attribution error and blame mistakes, accidents, and other things that go wrong on workers (i.e., an internal attribution).

Consequently, workers and managers in most workplaces can be expected to take opposite views when things go wrong. Therefore, the defensive bias, which is typically used by workers, and the fundamental attribution error, which is typically made by managers, together present a significant challenge to effective communication and understanding in organizations.

[Defensive bias] the tendency for people to perceive themselves as personally and situationally similar to someone who is having difficulty or trouble

[Fundamental attribution error] the tendency to ignore external causes of behavior and to attribute other people's actions to internal causes

1.4 Self-Perception

Cindy Pruitt is a professional development and recruiting manager at the law firm of Womble Carlyle Sandridge & Rice. Pruitt works frequently with the firm's summer associates, law school students who are interning with the company during

summer break. Pruitt was surprised when one of the summer associates broke down in tears after being told that the writing structure on a memo he had written was "a little too loose." Says Pruitt, "They're simply stunned when they get any kind of negative feedback. I practically had to walk him off the ledge."[18]

The **self-serving bias** is the tendency to overestimate our value by attributing successes to ourselves (internal causes) and attributing failures to others or the environment (external causes).[19] As the example with the upset summer law associate illustrates, the self-serving bias can make it especially difficult for managers to talk to employees about performance problems. In general, people have a need to maintain a positive self-image. This need is so strong that when people seek feedback at work, they typically want verification of their worth (rather than information about performance deficiencies) or assurance that mistakes or problems weren't their fault.[20] People can become defensive and emotional when managerial communication threatens their positive self-image. They quit listening, and communication becomes ineffective. In the second half of the chapter, which focuses on improving communication, we'll explain ways in which managers can minimize this self-serving bias and improve effective one-on-one communication with employees.

REVIEW 1

Perception and Communication Problems Perception is the process by which people attend to, organize, interpret, and retain information from their environments. Perception is not a straightforward process. Because of perceptual filters such as selective perception and closure, people exposed to the same information stimuli often end up with very different perceptions and understandings. Perception-based differences can also lead to differences in the attributions (internal or external) that managers and workers make when explaining workplace behavior. In general, workers are more likely to explain behavior from a defensive bias, in which they attribute problems to external causes (the situation). Managers, on the other hand, tend to commit the fundamental attribution error, attributing problems to internal causes (the worker associated with a mistake or error). Consequently, when things go wrong, it's common for managers to blame workers and for workers to blame the situation or context in which they do their jobs. Finally, this problem is compounded by a self-serving bias that leads people to attribute successes to internal causes and failures to external causes. So workers may become defensive and emotional and not hear what managers have to say when they receive negative feedback from managers. In short, perceptions and attributions represent a significant challenge to effective communication and understanding in organizations.

2 KINDS OF COMMUNICATION

Each year, on the anniversary of your hiring date, you receive a written assessment of your performance from your boss. This year, after receiving your performance appraisal, you gripe about it to your best friend, a coworker in a cubicle down the hall. Despite your griping, however, you appreciate that your boss cut you some slack, allowing you extra days off when you went through a divorce earlier this year. How did your boss know you were having personal problems? He knew something was wrong from your nonverbal communication—your rounded shoulders, the bags under your eyes, and your overall lack of energy. There are many kinds of communication—formal, informal, coaching/counseling, and nonverbal—but they all follow the same fundamental process.

Let's learn more about the different kinds of communication by examining **2.1 the communication process, 2.2 formal communication channels, 2.3 informal communication channels, 2.4 coaching and counseling, or one-on-one communication, and 2.5 nonverbal communication.**

2.1 The Communication Process

Earlier in the chapter, we defined *communication* as the process of transmitting information from one person or place to another. Exhibit 15.3 displays a model of the communication process and its major components: the sender (message to be conveyed, encoding the message, transmitting the message); the receiver (receiving message, decoding the message, and the message that was understood); and noise, which interferes with the communication process.

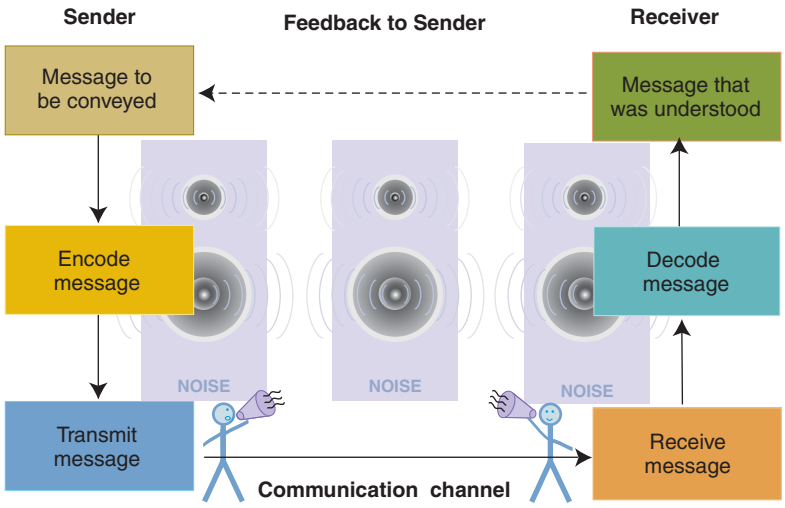
The communication process begins when a *sender* thinks of a message he or she wants to convey to another person. For example, a few years ago, the CEO of a phone company turned a corner near his house, saw a pay phone booth sitting there, and thought, "That's an odd location for a phone booth. I wonder how much money it earns us."[21] The next step is to encode the message. **Encoding** means putting a message into a verbal (written or spoken) or symbolic form that can be

[Encoding] putting a message into a written, verbal, or symbolic form that can be recognized and understood by the receiver

recognized and understood by the receiver. The sender then *transmits the message* via *communication channels*. In the case of the CEO and the phone booth, the CEO ran into a midlevel employee the next day and said, "I'm curious. How much do we make on that phone booth near my house? It's not a big deal. Don't spend a lot of time on it. Just send me a note."[22] With some communication channels such as the telephone and face-to-face communication, the sender receives immediate feedback, whereas with others such as e-mail (or text messages and file attachments), fax, beepers, voice mail, memos, and letters, the sender must wait for the receiver to respond.

EXHIBIT 15.3

The Interpersonal Communication Process



Unfortunately, because of technical difficulties (e.g., fax down, dead battery on the mobile phone, inability to read e-mail attachments) or people-based transmission problems (e.g., forgetting to pass on the message), messages aren't always transmitted. If the message is transmitted and received, however, the next step is for the receiver to decode it. **Decoding** is the process by which the receiver translates the written, verbal, or symbolic form of the message into an understood message. However, the message as understood by the receiver isn't always the same message that was intended by the sender. Because of different experiences or perceptual filters, receivers may attach a completely different meaning to a message than was intended. With respect to the phone booth, the midlevel employee was writing that quick note that the CEO wanted when his manager walked up and asked, "What are you doing?" The employee explained, "Oh, this is for the CEO. He stopped by and wanted to know how much we make on that phone booth near his house." At this point the manager said—and this is where the message is improperly decoded—"You can't send him a little note. There's no comparison between that phone booth and other booths in the area."

The last step of the communication process occurs when the receiver gives the sender feedback. **Feedback to sender** is a return message to the sender that indicates the receiver's understanding of the message (of what the receiver was supposed to know, to do, or not to do). Feedback makes senders aware of possible miscommunications and enables them to continue communicating until the receiver understands the intended message. Unfortunately, feedback doesn't always occur in the communication process. In the case of the CEO and the phone booth, two months after his inquiry about the phone booth near his house, the midlevel employee to whom he posed the question and that employee's executive vice president walked into his office. When they presented the CEO with a three-ring binder containing a report and detailed analysis and charts regarding the phone booth near his house, he looked at them and said, "I have no idea what you're talking about."[23]

Complacency and overconfidence about the ease and simplicity of communication can lead senders and receivers to simply assume that they share a common understanding of the message and, consequently, to not use feedback to improve the effectiveness of their communication. This is a serious mistake, especially since messages and feedback are always transmitted with and against a background of noise. **Noise** is anything that interferes with the transmission of the intended message. Noise can occur in any of the following situations:

[Decoding] the process by which the receiver translates the written, verbal, or symbolic form of a message into an understood message

[Feedback to sender] in the communication process, a return message to the sender that indicates the receiver's understanding of the message

[Noise] anything that interferes with the transmission of the intended message

- The sender isn't sure what message to communicate.
- The message is not clearly encoded.
- The wrong communication channel is chosen.
- The message is not received or decoded properly.
- The receiver doesn't have the experience or time to understand the message.

Jargon, which is vocabulary particular to a profession or group, is another form of noise that interferes with communication in the workplace. Any idea what "rightsizing," "delayering," "unsiloing," and "knowledge acquisition" mean? Rightsizing means laying off workers. Delayering means firing managers, or getting rid of layers of management. Unsiloing means getting workers in different parts of the company (i.e., different vertical silos) to work with others outside their own areas. Knowledge acquisition means teaching workers new knowledge or skills. Unfortunately, the business world is rife with jargon. Carol Hymowitz of the *Wall Street Journal* points out, "A new crop of buzzwords usually sprouts every three to five years, or about the same length of time many top executives have to prove themselves. Some can be useful in swiftly communicating, and spreading, new business concepts. Others are less useful, even devious."[24]

When managers wrongly assume that communication is easy, they reduce communication to something called the conduit metaphor.[25] Strictly speaking, a conduit is a pipe or tube that protects electrical wire. The **conduit metaphor** refers to the mistaken assumption that senders can pipe their intended messages directly into the heads of receivers with perfect clarity and without noise or perceptual filters interfering with the receivers'understanding of the message. However, this just isn't possible. Even if managers could telepathically direct their thoughts straight into receivers'heads, misunderstandings and communication problems would still occur because words and symbols typically have multiple meanings, depending on how they're used. Exhibit 15.4 shows several meanings of an extremely common word, *fine*. Depending on how you use it, *fine* can mean a penalty; a good job; that something is delicate, small, pure, or flimsy; or that something is okay.

In summary, the conduit metaphor causes problems in communication by making managers too complacent and confident in their ability to easily and accurately

transfer messages to receivers. Managers who want to be effective communicators need to carefully choose words and symbols that will help receivers derive the intended meaning of a message. Furthermore, they need to be aware of all steps in the communication process, beginning with the sender (message to be conveyed, encoding the message, transmitting the message) and ending with the receiver (receiving the message, decoding the message, understanding the message, and using feedback to communicate what was understood).

2.2 Formal Communication Channels

An organization's **formal communication channel** is the system of official channels that carry organizationally approved messages and information. Organizational objectives, rules, policies, procedures, instructions, commands, and requests for information are all transmitted via the formal communication system or channel. There are three formal communication channels: downward communication, upward communication, and horizontal communication.[26]

Downward communication flows from higher to lower levels in an organization. Downward communication is used to issue orders down the organizational hierarchy, to give organizational members job-related information, to give managers and workers performance reviews from upper managers, and to clarify organizational objectives and goals.[27] Compared to Baby Boomers, born from 1946 to 1964, Generation Y employees, born after 1980, are much more likely to ask their bosses for downward communication in the form of frequent feedback and performance reviews. For example, at Big 4 accounting firm **Ernst & Young**, half of Baby Boomers indicated they wanted "frequent and candid performance feedback" compared to 85 percent of Gen Y employees. Brittany Rotondo, a 26-year-old who manages work/life programs for Accenture, an international consulting firm, agrees, "I'm definitely a feedback kind of person. It's always incredibly important for me to know how my work is perceived and the impact it's having."[28] As a result of Generation Ys'preferences, Ernst & Young has established the "Feedback Zone," which allows employees to ask for formal feedback any time they want, rather than the typical once-a-year review found at most companies.

Hey Coach!

Management coaching has grown into an estimated $1 billion business and is no longer just for the likes of General Electric's Jeffrey Immelt and eBay's Meg Whitman, both of whom have sought tips on being better leaders. Many companies use coaching as a means to help overachievers (i.e., task-oriented managers) develop their people skills. Yahoo, Inc., and Genentech enlist coaching services to groom internal candidates for future executive positions within the company.

Upward communication flows from lower levels to higher levels in an organization. Upward communication is used to give higher-level managers feedback about operations, issues, and problems; to help higher-level managers assess organizational performance and effectiveness; to encourage lower-level managers and employees to participate in organizational decision making; and to give those at lower levels the chance to share their concerns with higher-level authorities.

Sony executive Ken Kutaragi was known for not communicating with his bosses or other Sony units. That wasn't a problem when he was in charge of Sony's successful rollouts of the PlayStation 1 and PlayStation 2. But it became a problem during the development of the PlayStation 3 when he went over his budget by several hundred million dollars without telling Sony's previous CEO. Sony's new CEO Howard Stringer tried to improve Kutaragi's upward communication through frequent informal dinners. Quipped Stringer, "I've had dinner with [Mr. Kutaragi] more times than I've had dinner with my wife, and that's not really healthy."[29] Despite Stringer's efforts, Kutaragi changed little, prompting Stringer to move him into another position. To make sure that he knew what was happening in the games division, Stringer took the unusual move of requiring that his managers send him daily e-mail updates about manufacturing problems, "more e-mails," said Stringer, "than I care to read."[30] But at least he was informed and upward communication was restored.

Horizontal communication flows among managers and workers who are at the same organizational level, such as when a day shift nurse comes in at 7:30 am for a half-hour discussion with the midnight nurse supervisor who leaves at 8:00 am. Horizontal communication helps facilitate coordination and cooperation between different parts of a company and allows coworkers to share relevant information. It also helps people at the same level resolve conflicts and solve problems without involving high levels of management. Studies show that communication breakdowns, which occur most often during horizontal communication, such as when patients are handed over from one nurse or doctor to another, are the largest source of medical errors in hospitals. Different communication styles, time pressures, and a general lack of standardized procedures for sharing information during patient handoffs are the likely causes. Medical organizations like Kaiser Permanente, which has 30 patient care facilities, are changing that by requiring all of its doctors and

nurses to communicate SBAR information (situation, background, assessment, and recommendation) about each patient in 60 seconds. Since its adoption at Kaiser's St. Joseph Medical Center in Bloomington, Illinois, the number of unexpected medical problems fell from 89.9 per 1,000 patient days to 39.6 per 1,000 patient days. Using the SBAR protocol significantly reduces the horizontal communication problems associated with patient handoffs.[31]

In general, what can managers do to improve formal communication? First, decrease reliance on downward communication. Second, increase chances for upward communication by increasing personal contact with lower-level managers and workers. Third, as at Kaiser Permanente, encourage much better use of horizontal communication. Finally, be aware of the problems associated with downward, upward, and horizontal communication, some of which are listed in Exhibit 15.5.

2.3 Informal Communication Channels

An organization's **informal communication channel**, sometimes called the **grapevine**, is the transmission of messages from employee to employee outside of formal communication channels. The grapevine arises out of curiosity, that is, the need to know what is going on in an organization and how it might affect you or others. To satisfy this curiosity, employees need a consistent supply of relevant, accurate, in-depth information about "who is doing what and what changes are occurring within the organization."[32] Supervisor Paul McCann of **Appleton Papers Inc.** a specialty paper and packaging products company, agrees that when management doesn't explain what's happening in the company, "people will work together to develop their own reason."[33]

[Informal communication channel ("grapevine")] the transmission of messages from employee to employee outside of formal communication channels

For example, at the University of Texas Medical Branch (part of the UT system), any of the 13,000 employees wanting to know the truth about rumors working their way through the campus grapevine can log on to the school's website and click on

= Maybe, but...

Response: No, the cards will not contain anything but the most basic information, much as ID cards do today. No personal data, no employment history, no critical financial info or medical records. The cards will primarily verify identity (your photo and name help do that) and access, the same way magnetic strips and keys do now. In the future, they will also enable a user, at his/her discretion, to use them as a debit card for campus purchases, like a pre-paid phone card, and will help manage access to computer resources.

The cards can't track your location. The proximity readers are designed with a narrow sensitivity field (you wouldn't want doors unexpectedly unlocking because someone with access is walking in a nearby hallway). However, the system does register when you are in or out of a restricted area. This is no different than is currently the case with the magnetic key cards, and is an important aspect of maintaining security in sensitive research, clinical, and business areas.

"Rumors or Trumors." Campus administrators comment on each posted rumor and rate it using the "kernel of truth" system. As shown in Exhibit 15.6, one kernel of corn indicates a little bit of truth. Two kernels indicate that more of the rumor is accurate, but it's still not entirely true. Three kernels indicate that the rumor is accurate. Wildly inaccurate rumors such as the one in Exhibit 15.6 about new ID tags being able to track the location of an employee are rated with a spaceship, indicating that they're too far out to be believed. Reaction thus far has been positive. Lecturer Sheryl Prather says, "It looks sincere. I've found that everything thus far has been pretty factual. It at least shows that somebody's listening to some of the talk that goes on around here and [is] putting it down on the computer where we can all see it."[34]

Grapevines arise out of informal communication networks such as the gossip or cluster chains shown in Exhibit 15.7. In a *gossip chain*, one highly connected individual shares information with many other managers and workers. By contrast, in a *cluster chain*, numerous people simply tell a few of their friends. The result in both cases is that information flows freely and quickly through the organization. Some believe that grapevines are a waste of employees'time, that they promote gossip and rumors that fuel political speculation, and that they are sources of highly unreliable, inaccurate information. Yet studies clearly show that grapevines are highly accurate sources of information for a number of reasons.[35] First, because grapevines typically carry "juicy" information that is interesting and timely, information spreads rapidly. At Meghan De Goyler Hauser's former company, the word on the grapevine was that her boss drank on the job, the company accountant was stealing the company blind, and that one of her coworkers was a nude model. She says, "The rumors all turned out to be true."[36] Second, since information is typically spread by face-to-face conversation, receivers can send feedback to make sure they understand the message that is being communicated. This reduces misunderstandings and increases accuracy. Third, since most of the information in a company moves along the grapevine rather than formal communication channels, people can usually verify the accuracy of information by checking it out with others.

What can managers do to manage organizational grapevines? The very worst thing they can do is withhold information or try to punish those who share information with others. The grapevine abhors a vacuum, so rumors and anxiety will flourish in the absence of information from company management. Why does this occur? According to workplace psychologist Nicholas DiFonzo, "The main

focus of rumor is to figure out the truth. It's the group trying to make sense of something that's important to them."[37] A better strategy is to embrace the grapevine and keep employees informed about possible changes and strategies. Failure to do so will just make things worse. An employee who works in a company where management maintains a culture of silence says, "They [management] think that not communicating the tough stuff will keep employees unaware of it. Of course, it doesn't work. It just fuels the grapevine."[38]

Finally, in addition to using the grapevine to communicate with others, managers should not overlook the grapevine as a tremendous source of valuable information and feedback. In fact, information flowing through organizational grapevines is estimated to be 75 to 95 percent accurate.[39] For this reason, managers should gather their courage and be willing to read the anonymous comments that angry, frustrated employees post on Internet gripe sites like untied.com (about United Airlines) or stainedapron.com (for griping restaurant workers), where employees post gripes about hundreds of different companies. Bob Rosner, who runs a gripe site called workingwounded.com, suggests managers look for themes rather than responding to any particular message. And Jeff Jarvis, author of *The Blog BuzzMachine*, says, "There should be someone at every company whose job is to put into Google and blog search engines the name of the company or the brand, followed by the word'sucks,'just to see what customers [and employees] are saying."[40] Indeed, there are over 20,000 Internet domain names that end in "sucks.com" and 2,000 that end in "stinks.com." As a preemptive strategy, 30 percent of *Fortune* 500 companies have purchased the "sucks.com" domain names affiliated with their company (i.e., Goldmansachssucks.com) or product names (i.e., michelobsucks.com).[41] Exhibit 15.8 lists that and other strategies that today's managers can use in dealing with gripe sites and blogs, the latest forms of the traditional organizational grapevine. See Section 4.2 for more on how managers can use blogs to do a better job of hearing what employees and customers think and feel about their companies.

EXHIBIT 15.8 Organizational Grapevines: Dealing with Internet Gripe Sites

1.	Correct misinformation. Put an end to false rumors and set the record straight. Don't be defensive.
2.	Don't take angry comments personally.
3.	Give your name and contact number to show employees that you're concerned and that they can contact you directly.
4.	Hold a town meeting to discuss the issues raised on the gripe site.
5.	Set up anonymous internal discussion forums on the company server. Then encourage employees to gripe anonymously on the company intranet, rather than on the web.
6.	If a mistake has been made, apologize; explain what happened and how the company will attempt to make it right.
7.	Stop the gripes before they start by having clear communication channels, web, phone, e-mail, or mail, through which employees and others can communicate concerns to management.
8.	Purchase "IHateYourCompany.com" website domain names and then use them to invite and collect feedback from disgruntled employees and customers.

2.4 Coaching and Counseling: One-on-One Communication

When the Wyatt Company surveyed 531 U.S. companies undergoing major changes and restructuring, it asked the CEOs, "If you could go back and change one thing, what would it be?" The answer: "The way we communicated with our employees." The CEOs said that instead of flashy videos, printed materials, or formal meetings, they would make greater use of one-on-one communication, especially with employees'immediate supervisors instead of with higher-level executives whom employees didn't know.[42]

Coaching and counseling are two kinds of one-on-one communication. **Coaching** is communicating with someone for the direct purpose of improving the person's on-the-job performance or behavior.[43] Managers tend to make several mistakes when coaching employees. First, they wait for a problem before coaching. Jim Concelman, manager for leadership development at Development Dimensions International, says, "Of course, a boss has to coach an employee if a mistake has been made, but they shouldn't be waiting for the error. While it is a lot easier to see a mistake and correct it, people learn more through success than through failure, so bosses should ensure that employees are experiencing as many successes as possible. Successful employees lead to a more successful organization."[44] Second, when mistakes *are* made, managers wait much too long before talking to the employee about the problem. Management professor Ray Hilgert says, "A manager must respond as soon as possible after an incident of poor performance. Don't bury your head. . . . When employees are told nothing, they assume everything is okay."[45] When Jay Whitehead, now president of Outsourcing Today, was a manager at a previous company, one of his employees accidentally copied an e-mail to a customer that insulted the customer. Whitehead immediately talked to the employee, who offered to quit. Whitehead told him, "No, instead you're going to do something much harder. You're going to apologize." He did, and, according to White, "all was forgiven."[46] The key to this successful result was that Whitehead acted immediately to coach the employee on his mistake. In Section 3, you'll learn a number of specific steps for effective one-on-one communication and coaching.

[Coaching] communicating with someone for the direct purpose of improving the person's on-the-job performance or behavior

[Counseling] communicating with someone about non-job-related issues that may be affecting or interfering with the person's performance

By contrast to coaching, **counseling** is communicating with someone about non-job-related issues such as stress, child care, health issues, retirement planning, or legal issues that may be affecting or interfering with the person's performance. But counseling does not mean that managers should try to be clinicians, even though an estimated 20 percent of employees are dealing with personal problems at any one time. Dana Kiel, who works for Cigna Behavioral Health, says, "We call it the quicksand. If you're a good supervisor, you do care about your employees, but it's not your job to be

a therapist."[47] Instead, managers should discuss specific performance problems, listen if the employee chooses to share personal issues, and then recommend that the employee call the company's *Employee Assistance Program (EAP)*. EAPs are typically free when provided as part of a company's benefit package. In emergencies or times of crisis, EAPs can offer immediate counseling and support; they can also provide referrals to organizations and professionals that can help employees and their family members address personal issues. Exhibit 15.9 lists the standard services provided by EAPs.

2.5 Nonverbal Communication

When people talk, they send both verbal and nonverbal messages. Verbal messages are sent and received through the words we speak, as when we congratulate a speaker by saying "That was a great presentation." By contrast, nonverbal messages are sent through body language, facial expressions, or tone of voice. Hearing "*That* was a *great* presentation!" is very different from hearing "ahem [clearing throat], that was, ahem, ahem, a great presentation."

More generally, **nonverbal communication** is any communication that doesn't involve words. Nonverbal communication almost always accompanies verbal communication and may either support and reinforce the verbal message or contradict it. The importance of nonverbal communication is well established. Researchers have estimated that as much as 93 percent of any message is transmitted nonverbally, with 55 percent coming from body language and facial expressions and 38 percent coming from the tone and pitch of the voice.[48] Since many nonverbal cues are unintentional, receivers often consider nonverbal communication to be a more accurate representation of what senders are thinking and feeling than the words they use. If you have ever asked someone out on a date and been told "yes," but realized that the real answer was "no," then you understand the importance of paying attention to nonverbal communication.

Kinesics and paralanguage are two kinds of nonverbal communication.[49] **Kinesics** (from the Greek word *kinesis*, meaning "movement") are movements of the body and face.[50] These movements include arm and hand gestures, facial expressions, eye contact, folding arms, crossing legs, and leaning toward or away from another person. For example, people tend to avoid eye contact when they are embarrassed or unsure of the message they are sending. Crossed arms or legs usually indicate defensiveness or that the person is not receptive to the message or the sender. Also, people tend to smile frequently when they are seeking someone's approval.

It turns out that kinesics play an incredibly important role in communication. Studies of married couples'kinesic interactions can predict whether they will stay married with 93 percent accuracy.[51] The key is the ratio of positive to negative kinesic interactions of husbands and wives as they communicate. Negative kinesic expressions such as eye rolling suggest contempt, whereas positive kinetic expressions such as maintaining eye contact and nodding suggest listening and caring. When the ratio of positive to negative interactions drops below 5 to 1, the chances for divorce quickly increase. Kinesics operate similarly in the workplace, providing clues about people's true feelings, over and above what they say (or don't say). For instance, Louis Giuliano, former CEO of ITT (which makes heavy use of teams), says, "When you get a team together and say to them we're going to change a process, you always have people who say, 'No, we're not.'" They usually don't say it out loud, but 'the body language is there,' making it clear that their real answer is "no."[52]

[Nonverbal communication] any communication that doesn't involve words

[Kinesics] movements of the body and face

Paralanguage includes the pitch, rate, tone, volume, and speaking pattern (use of silences, pauses, or hesitations) of one's voice. For example, when people are unsure what to say, they tend to decrease their communication effectiveness by speaking softly. When people are nervous, they tend to talk faster and louder. These characteristics have a tremendous influence on whether listeners are receptive to what speakers are saying. For example, Vinya Lynch believes that her "timid and sing-songy" voice is why others don't take her seriously and cut her off when she makes presentations. Lynch says, "When I listen to myself, it doesn't sound intelligent." She began working with a speech coach ($2,250 for 10 sessions) because, as she says, "I want my voice to be charismatic and confident all at the same time."[53]

[Paralanguage] the pitch, rate, tone, volume, and speaking pattern (i.e., use of silences, pauses, or hesitations) of one's voice

In short, because nonverbal communication is so informative, especially when it contradicts verbal communication, managers need to learn how to monitor and control their nonverbal behavior.

REVIEW 2

Kinds of Communication Communication within an organization depends on the communication process, formal and informal communication channels, one-on-one communication, and nonverbal communication. The major components of the communication process are the sender, the receiver, noise, and feedback. The conduit metaphor refers to the mistaken assumption that senders can pipe their intended messages directly into receivers'heads with perfect clarity. With noise, perceptual filters, and little feedback, however, this just isn't possible. Formal communication channels such as downward, upward, and horizontal communication carry organizationally approved messages and information. By contrast, the informal communication channel, called the grapevine, arises out of curiosity and is carried out through gossip or cluster chains. Managers should use the grapevine to keep employees informed and to obtain better, clearer information for themselves. There are two kinds of one-on-one communication. Coaching is used to improve on-the-job performance while counseling is used to communicate about non-job-related issues affecting job performance. Nonverbal communication such as kinesics and paralanguage accounts for as much as 93 percent of a message's content and interpretation. Since nonverbal communication is so informative, managers need to learn how to monitor and control their nonverbal behavior.

HOW TO IMPROVE COMMUNICATION

An employee comes in late every day, takes long lunches, and leaves early. His coworkers resent his tardiness and having to do his share of the work. Another employee makes as many as ten personal phone calls a day on company time. Still another employee's job performance has dropped significantly in the last 3 months. How do you communicate with these employees to begin solving these problems? Or suppose that you supervise a division of 50, 100, or even 1,000 people. How can you communicate effectively with everyone in that division? Moreover, how can top managers communicate effectively with everyone in the company when employees work in different offices, states, countries, and time zones? Turning that around, how can managers make themselves accessible so that they can hear what employees feel and think throughout the organization?

When it comes to improving communication, managers face two primary tasks, managing one-on-one communication and managing organization-wide communication.

After reading the next two sections, you should be able to

3. explain how managers can manage effective one-on-one communication.
4. describe how managers can manage effective organization-wide communication.

3 MANAGING ONE-ON-ONE COMMUNICATION

You learned in Chapter 1 that, on average, first-line managers spend 57 percent of their time with people, middle managers spend 63 percent of their time directly with people, and top managers spend as much as 78 percent of their time dealing with people.[55] These numbers make it clear that managers spend a great deal of time in one-on-one communication with others.

Learn more about managing one-on-one communication by reading how to **3.1 choose the right communication medium, 3.2 be a good listener, 3.3 give effective feedback, and 3.4 improve cross-cultural communication.**

3.1 Choosing the Right Communication Medium

Sometimes messages are poorly communicated simply because they are delivered using the wrong **communication medium**, which is the method used to deliver a

[Communication medium] the method used to deliver an oral or written message

Protect Personal, Confidential Information

By virtue of their jobs, managers are privy to information that others aren't. Although much of that information will be about the company, some of it will be personal and confidential information about employees. As a manager, you have a moral and legal obligation to protect employees'privacy. Moreover, sharing others'personal, confidential information may dissuade employees from confiding in managers or seeking help from a company's employee assistance program. Does this mean that if employees confide in you that you can't tell anyone else? No, if you're a manager, sometimes you may have to inform your boss or human resources about a situation. But inform only those who have a need to know and who are also obligated to protect employee privacy. Furthermore, not all information that employees disclose to you should be protected. Information about discrimination, sexual harassment, potential workplace violence, or conflicts of interest between employees and the company may need to be shared with upper management to protect the rights and well-being of others. So, when employees disclose personal, confidential information, do the right thing. Don't discuss it with others unless it falls under one of the exceptions discussed here.[54]

message. For example, the wrong communication medium is being used when an employee returns from lunch, picks up the note left on her office chair, and learns she has been fired. The wrong communication medium is also being used when an employee pops into your office every 10 minutes with a simple request. (An e-mail would be better.)

There are two general kinds of communication media: oral and written communication. *Oral communication* includes face-to-face and group meetings through telephone calls, videoconferencing, or any other means of sending and receiving spoken messages. Studies show that managers generally prefer oral communication over written because it provides the opportunity to ask questions about parts of the message that they don't understand. Oral communication is also a rich communication medium because it allows managers to receive and assess the nonverbal communication that accompanies spoken messages (i.e., body language, facial expressions, and the voice characteristics associated with paralanguage).

Furthermore, you don't need a personal computer and an Internet connection to conduct oral communication. Simply schedule an appointment, track someone down in the hall, or catch someone on the phone. In fact, *Wall Street Journal* columnist Jason Fry worries that voice mail and e-mail have made managers less willing to engage in meaningful, face-to-face oral communication than before. In fact, 67 percent of managers admit to using e-mail as a substitute for face-to-face conversations.[56] While there are advantages to e-mail (e.g., it creates a record of what's been said), it's often better to talk to people instead of just e-mailing them. Jason Fry writes, "If you're close enough that the person you're e-mailing uses the plonk of your return key as a cue to look for the little Outlook envelope, [it's] best [to] think carefully about whether you should be typing instead of talking."[57] But the oral medium should not be used for *all* communication. In general, when the message is simple, such as a quick request or a presentation of straightforward information, a memo or e-mail is often the better communication medium.

Written communication includes letters, e-mail, and memos. Although most managers still like and use oral communication, e-mail in particular is changing how they communicate with workers, customers, and each other. E-mail is the fastest-growing form of communication in organizations primarily because of its convenience and speed. For instance, because people read six times faster than they can listen, they usually can read thirty e-mail messages in 10 to 15 minutes.[58] By contrast, dealing with voice messages can take a considerable amount of time. Fred DeLuca, founder of the Subway sandwich shop franchise, says, "I get about 60 messages a day from employees and franchisees, and I listen to all of them. For my sanity, I set a time limit of 75 seconds, because people can be long-winded when they're excited. When I hear,'You have 30 messages,'I know right away that I'll spend 60 minutes on voice mail. I take two minutes per message, listening and returning or forwarding."[59]

Written communication such as e-mail is well suited for delivering straightforward messages and information. Furthermore, with e-mail accessible at the office, at home, and on the road (by laptop computer, cell phone, or web-based e-mail), managers can use e-mail to stay in touch from anywhere at almost any time. And, since e-mail and other written communications don't have to be sent and received simultaneously, messages can be sent and stored for reading at any time. Consequently, managers can send and receive many more messages using e-mail than

by using oral communication, which requires people to get together in person or by phone or video conference.

E-mail has its own drawbacks, however. One is that it lacks the formality of paper memos and letters. It is easy to fire off a rushed e-mail that is not well written or fully thought through. Another drawback to e-mail is that it lacks nonverbal cues, making e-mails very easy to misinterpret. Kristin Byron, assistant professor of management at **Syracuse University**, says, "People perceive e-mails as more negative than they are intended to be, and even e-mails that are intended to be positive can be misinterpreted as more neutral. You get an e-mail that's really short, with no greeting, no closing; it's probably because they were very rushed, or maybe they're not very good typists. But because of those things, people have a tendency to perceive the message as negative."[60]

E-mail is also not well suited to complex, ambiguous, or emotionally laden messages. Neal Patterson, CEO of Cerner Corporation, which develops health-care software, learned this lesson when he sent the following e-mail to 400 company managers:

> *We are getting less than 40 hours of work from a large number of our KC-based EMPLOYEES. . . . The parking lot is sparsely used at 8 AM, likewise at 5 PM. As managers—you either do not know what your EMPLOYEES are doing or YOU do not CARE. You have created expectations on the work effort which allowed this to happen inside Cerner, creating a very unhealthy environment. In either case, you have a problem and you will fix it or I will replace you. NEVER in my career have I allowed a team which worked for me to think they had a 40-hour job. I have allowed YOU to create a culture which is permitting this. NO LONGER.*[61]

Patterson continued: "We passed a Stock Purchase Program, allowing for the EMPLOYEE to purchase Cerner stock at a 15 percent discount, at Friday's BOD [board of directors] meeting. Hell will freeze over before this CEO implements ANOTHER EMPLOYEE benefit in this Culture."[62] He concluded by saying, "I will hold you accountable. You have allowed this to get to this state. You have two weeks. Tick, tock."[63]

Reaction to the message was so strong that, in just over a week, the e-mail had been leaked to the entire company. And then someone, nobody knows who, posted the e-mail on a Yahoo.com discussion board about Cerner. As word spread about the negative e-mail, Cerner's stock price dropped from $44 to $31 per share in just 3 days. By the end of the week, Patterson issued another e-mail, offering an apology. Not surprisingly, that e-mail began, "Please treat this memo with the utmost confidentiality. It is for internal dissemination only. Do not copy or e-mail to anyone else."[64] Emotionally laden and complex messages are better delivered through oral communication.

3.2 Listening

Are you a good listener? You probably think so. In fact, most people, including managers, are terrible listeners, retaining only about 25 percent of what they hear.[65] You qualify as a poor listener if you frequently interrupt others, jump to conclusions about what people will say before they've said it, hurry the speaker to finish his or her point, are a passive listener (not actively working at your listening), or simply don't pay attention to what people are saying.[66] On this last point—attentiveness—college students were periodically asked to record their thoughts during a psychology course. On average, 20 percent of the students were paying

attention (only 12 percent were actively working at being good listeners), 20 percent were thinking about sex, 20 percent were thinking about things they had done before, and the remaining 40 percent were thinking about other things unrelated to the class (e.g., worries, religion, lunch, daydreaming).[67]

How important is it to be a good listener? In general, about 45 percent of the total time you spend communicating with others is spent listening. Furthermore, listening is important for managerial and business success, even for those at the top of an organization. As Feargal Quinn, CEO of Irish grocery chain **Superquinn's**, points out, "If you expect to learn from your customers and employees, don't rely on market research or a suggestion box. Host customer panels, solicit complaints, step into your customer's shoes, plant your people at the front lines, and learn a dozen customer names a week. Listening is not an activity you can delegate—no matter who you are."[68] Quinn continues, "Genuine listening ability is one of the true forms of competitive advantage."[69] Which is why company meetings with suppliers, managers, and employees take place in the stores as customers are shopping. Superquinn's managers are also expected to "jump the counter," or, spend time "in the customer's shoes" by shopping, waiting in line, asking questions, and so on.

Listening is a more important skill for managers than ever, since Generation X employees tend to expect a high level of interaction with their supervisors. They want feedback on their performance, but they also want to offer feedback and know that it is heard.[70] In fact, managers with better listening skills are rated as better managers by their employees and are much more likely to be promoted.[71]

So, what can you do to improve your listening ability? First, understand the difference between hearing and listening. According to *Webster's New World Dictionary*, **hearing** is the "act or process of perceiving sounds," whereas **listening** is "making a conscious effort to hear." In other words, we react to sounds, such as bottles breaking or music being played too loud, because hearing is an involuntary physiological process. By contrast, listening is a voluntary behavior. So, if you want to be a good listener, you have to choose to be a good listener. Typically, that means choosing to be an active, empathetic listener.[72]

Active listening means assuming half the responsibility for successful communication by actively giving the speaker nonjudgmental feedback that shows you've accurately heard what he or she said. Active listeners make it clear from their behavior that they are listening carefully to what the speaker has to say. Active listeners put the speaker at ease, maintain eye contact, and show the speaker that they are attentively listening by nodding and making short statements.

Several specific strategies can help you be a better active listener. First, *clarify responses* by asking the speaker to explain confusing or ambiguous statements. Second, when there are natural breaks in the speaker's delivery, use this time to paraphrase or summarize what has been said. *Paraphrasing* is restating what has been said in your own words. *Summarizing* is reviewing the speaker's main points or emotions. Paraphrasing and summarizing give the speaker the chance to correct the message if the active listener has attached the wrong meaning to it. Paraphrasing and summarizing also show the speaker that the active listener is interested in the speaker's message. Exhibit 15.10 lists specific statements that listeners can use to clarify responses, paraphrase, or summarize what has been said.

Active listeners also avoid evaluating the message or being critical until the message is complete. They recognize that their only responsibility during the transmission of a message is to receive it accurately and derive the intended meaning from it. Evaluation and criticism can take place after the message is accurately received. Finally, active listeners also recognize that a large portion of any message is transmitted nonverbally and thus pay very careful attention to the nonverbal cues transmitted by the speaker.

Empathetic listening means understanding the speaker's perspective and personal frame of reference and giving feedback that conveys that understanding to the speaker. Empathetic listening goes beyond active listening because it depends on our ability to set aside our own attitudes or relationships to be able to see and understand things through someone else's eyes. Empathetic listening is just as important as active listening, especially for managers, because it helps build rapport and trust with others.

The key to being a more empathetic listener is to show your desire to understand and to reflect people's feelings. You can *show your desire to understand* by listening, that is, asking people to talk about what's most important to them and then by giving them sufficient time to talk before responding or interrupting. Altera Corp., which makes computer chips, uses empathetic listening as the key sales tool for its salesforce. When salesperson Mike Dionne first met with an information technology manager from a medical company, he told him he was there to find out how Altera could expand its business in the medical field. During the 90-minute meeting, Dionne rarely spoke and never said that Altera wanted to sell him computer chips. Instead, Dionne listened quietly and didn't interrupt as the manager described the kinds of technology (using computer chips) that his company wanted to buy. Dionne says, "You could tell [he] was jazzed. He was comfortable, leaning back in his chair and talking freely."[73]

Reflecting feelings is also an important part of empathetic listening because it demonstrates that you understand the speaker's emotions. Unlike active listening, in which you restate or summarize the informational content of what has been said, the focus is on the affective part of the message. As an empathetic listener, you can use the following statements to *reflect the speaker's emotions*:

- So, right now it sounds like you're feeling. . . .
- You seem as if you're. . . .
- Do you feel a bit . . .?
- I could be wrong, but I'm sensing that you're feeling. . . .

[Empathetic listening] understanding the speaker's perspective and personal frame of reference and giving feedback that conveys that understanding to the speaker

In the end, says management consultant Terry Pearce, empathetic listening can be boiled down to these three steps. First, wait 10 seconds before you respond. It will seem an eternity, but waiting prevents you from interrupting others and rushing your response. Second, to be sure you understand what the speaker wants, ask questions to clarify the speaker's intent. Third, only then should you respond first with feelings and then facts (notice that facts *follow* feelings).[74]

A word of caution, however, not everyone appreciates having what they said repeated back to them. Manager Candy Friesen says that whenever she did that, "I seemed to engender animosity or hostility. . . . the person to whom you're speaking may not appreciate having his thoughts paraphrased one little bit."[75] So, when applying these listening techniques, pay attention to the body language and tone of voice of the person you're communicating with to make sure they appreciate your attempts to be a better listener.

3.3 Giving Feedback

In Chapter 11, you learned that performance appraisal feedback (i.e., judging) should be separated from developmental feedback (i.e., coaching).[76] We can now focus on the steps needed to communicate feedback one-on-one to employees.

To start, managers need to recognize that feedback can be constructive or destructive. **Destructive feedback** is disapproving without any intention of being helpful and almost always causes a negative or defensive reaction in the recipient. When business reporter Margaret Heffernan worked in television, her boss Tim frequently gave destructive feedback. Says Heffernan, "Standard procedure required that all films be seen in an early rough cut by the program editor. These viewings filled me with dread. Not only was I revealing my carefully nurtured work to the outside world for the first time; I also happened to work for a screamer. Tim almost never liked the first cut of anything, and his displeasure took the form of tantrums: yelling, screaming, throwing phones against the wall, occasionally dragging in other producers to see what a miserable piece of dumb garbage I'd wasted his budget on. The only (very slight) compensation was knowing that he treated everyone this way."[77] Heffernan eventually quit her job because of her boss's behavior. Some employees, however, will push back when their bosses behave this way. Avoiding destructive feedback is important. In fact, one study found that 98 percent of employees responded to destructive feedback from their bosses with either verbal aggression (two-thirds) or physical aggression (one-third).[78]

By contrast, **constructive feedback** is intended to be helpful, corrective, and/or encouraging. It is aimed at correcting performance deficiencies and motivating employees. When providing constructive feedback, Jenet Noriega Schwind, vice president and chief people officer of Zantaz, an e-business archiving company, tells employees, "What I'm going to tell you may be upsetting to you—but it's important to your success." She says, "When you are telling people things they don't necessarily want to hear, you have to deliver your message in a way that gets their attention and acceptance."[79]

[Destructive feedback] feedback that disapproves without any intention of being helpful and almost always causes a negative or defensive reaction in the recipient

[Constructive feedback] feedback intended to be helpful, corrective, and/or encouraging

For feedback to be constructive rather than destructive, it must be immediate, focused on specific behaviors, and problem-oriented. *Immediate feedback* is much more effective than delayed feedback because manager and worker can recall the mistake or incident more accurately and discuss it in detail. For example, if a worker is rude to a customer and the customer immediately reports the incident to management, and if the manager, in turn, immediately discusses the incident with

the employee, there should be little disagreement over what was said or done. By contrast, it's unlikely that either the manager or the worker will be able to accurately remember the specifics of what occurred if the manager waits several weeks to discuss the incident. When that happens, it's usually too late to have a meaningful conversation.

Specific feedback focuses on particular acts or incidents that are clearly under the control of the employee. For instance, instead of telling an employee that he or she is "always late for work," it's much more constructive to say, "In the last 3 weeks, you have been 30 minutes late on four occasions and more than an hour late on two others." Furthermore, specific feedback isn't very helpful unless employees have control over the problems that the feedback addresses. Giving negative feedback about behaviors beyond someone's control is likely to be seen as unfair. Similarly, giving positive feedback about behaviors beyond someone's control may be viewed as insincere.

Last, *problem-oriented feedback* focuses on the problems or incidents associated with the poor performance rather than on the worker or the worker's personality. Giving feedback does not give managers the right to personally attack workers. Although managers may be frustrated by a worker's poor performance, the point of problem-oriented feedback is to draw attention to the problem in a nonjudgmental way so that the employee has enough information to correct it. For example, if an employee has body odor, a surprisingly common workplace problem, don't leave deodorant, soap, or shampoo on the person's desk (for all to see) or say, "You stink." *HR Magazine* advises handling the problem this way: "Because this is a sensitive issue and the employee will likely be uncomfortable and embarrassed in discussing it, keep the meeting private and confidential. Be compassionate but direct. Treat it as you would handle any other job-related performance issue. Explain the problem and the need to correct it. Be specific about expectations. . . . If the employer has a dress and grooming policy, refer to the policy and provide the employee with a copy."[80]

3.4 Improving Cross-Cultural Communication

As you know by now, effective communication is very difficult to accomplish. **Cross-cultural communication**, which involves transmitting information from a person in one country or culture to a person from another country or culture, is even more difficult. For example, when a French company bought a U.S. company, it found that the American managers would not implement the new strategy that it recommended. As tensions grew worse, the American managers challenged their new French boss's strategy and explained why they hadn't followed it. Meanwhile, the French, who now owned the company, couldn't understand why the American managers, who, after all, worked for them, didn't just do as they were told.[81] Exhibit 15.11, which shows the rather different views that French and American workers have about work, gives us some insight into the difficulty of cross-cultural communication in this situation. Overall, the French are much more likely to believe that managers need to have precise answers to subordinates'questions (53 percent versus 18 percent), that organizations would be better off without conflict (24 percent versus 5 percent), and that managers are more motivated by power than by achieving objectives (56 percent versus 36 percent).[82] With such different views on these basic topics, no wonder there were communication difficulties.

You can do a number of things to increase your chances for successful cross-cultural communication:

- Familiarize yourself with a culture's general work norms.
- Determine whether a culture is emotionally affective or neutral.
- Develop respect for other cultures.
- And understand how address terms and attitudes toward time differ from culture to culture.

In Chapter 8, you learned that expatriates who receive predeparture language and cross-cultural training make faster adjustments to foreign cultures and perform better on their international assignments.[83] Therefore, the first step for successful cross-cultural communication is *familiarizing yourself with a culture's general work norms*, that is, the shared values, beliefs, and perceptions toward work and how it should be done. (See Chapter 8 for a more complete discussion of international cultures.) And don't assume that it will be easy.

For example, when he became Sony's new CEO, British-born Howard Stringer, whose family lives in Britain, managed across two different languages, Japanese and English, and three different cultures, Britain, the United States, and Japan. Regarding the language challenge, Stringer said, "English is the common language, and I would say if I give a speech . . . 50 percent will understand my English. They may not understand what the hell I'm saying, but 50 percent speak English and another 25 percent speak it fairly well. Then we have astonishing simultaneous translations. I have the

emperor's translator, who speaks better Japanese than I speak English and she tidies my syntax up."[84] When it comes to the cultural challenges, Stringer said, "You have to find a way to marry the values that Japanese business has, which are admirable, with the competitive pressures [facing Sony] that force them to behave differently. How you manage and orchestrate that compromise is critical. It's something I feel every day. I can't come in and throw out the baby with the bath water in the interests of the all-American way. Nor do I want to."[85]

So, no matter how difficult, you should work hard to learn different cultures and languages. Fortunately, books such as *Kiss, Bow, or Shake Hands: How to Do Business in 60 Countries* (by Terri Morrison, Wayne Conaway, George Borden, and Hans Koehler), *Do's and Taboos Around the World* (by Roger E. Axtell), and *Dun & Bradstreet's Guide to Doing Business Around the World (*by Terri Morrison, Wayne Conaway, and Joseph Douress) and websites such as BusinessCulture.com and ExecutivePlanet.com provide a wealth of information about countries, their cultures, and their work and communication norms.

Determining whether a culture is emotionally affective or neutral is also important to cross-cultural communication. People in **affective cultures** tend to display their emotions and feelings openly when communicating, whereas people in **neutral cultures** do not.[86] While Italians are prone to strong bursts of emotion (positive and negative), Chinese don't show strong emotions because doing so is thought to disrupt harmony and lead to conflict. Likewise, a smiling American is displaying happiness, but a smiling Japanese may be trying to hide another emotion or avoid answering a question.[87] The mistake most managers make is misunderstanding the differences between affective and neutral cultures. People from neutral cultures aren't by definition cold and unfeeling. They just don't show their emotions in the same way or with the same intensity as people from affective cultures. The key is to recognize the differences and then make sure your judgments are not based on the lack or presence of emotional reactions. Exhibit 15.12 provides a more detailed explanation of the differences between affective and neutral cultures.

Respecting other cultures is also an important part of improving cross-cultural communication. Because we use our own culture as the standard of comparison, it's very easy to make the common mistake of assuming that "different" means "inferior."[88] Take this example:

> *A Swiss executive waits more than an hour past the appointed time for his Spanish colleague to arrive and to sign a major supply contract. In his impatience he concludes that the Spaniard must be lazy and totally unconcerned about business.*[89]

1. Reveal thoughts and feelings through verbal and nonverbal communication	1. Don't reveal what they are thinking or feeling
2. Express and show feelings of tension	2. Hide tension and only show it accidentally in face or posture
3. Let their emotions show easily, intensely, and without inhibition	3. Suppress emotions, leading to occasional "explosions"
4. Admire heated, animated, and intense expression of emotion	4. Admire remaining cool, calm, and relaxed
5. Are used to touching, gesturing, and showing strong emotions through facial expressions (all are common)	5. Resist touching, gesturing, and showing strong emotions through facial expressions
6. Make statements with emotion	6. Often make statements in an unexpressive manner

According to Professor Nancy J. Adler,

> *The Swiss executive has misevaluated his colleague by negatively comparing the colleague's behavior to his own culture's standard for business punctuality. Implicitly, he has labeled his own culture's behavior as good ("The Swiss arrive on time, especially for important meetings, and that is good.") and the other culture's behavior as bad ("The Spanish do not arrive on time and that is bad.").*[90]

According to Adler, "Evaluating others'behavior rarely helps in trying to understand, communicate with, or conduct business with people from another culture."[91] The key, she says, is taking a step back and realizing that you don't know or understand everything that is going on and that your assumptions and interpretations of others'behavior and motives may be wrong.

So, instead of judging or evaluating your international business colleagues, observe what they do. Also, delay your judgments until you have more experience with your colleagues and their culture. Last, treat any judgments or conclusions you do make as guesses and then double-check those judgments or conclusions with others.[92] The more patient you are in forming opinions and drawing conclusions, the better you'll be at cross-cultural communication.

You can also improve cross-cultural communication by *knowing the address terms* that different cultures use to address each other in the workplace.[93] **Address terms** are the cultural norms that establish whether you address businesspeople by their first names, family names, or titles. When meeting for the first time, Americans and Australians tend to be informal and address each other by first names, even nicknames. Such immediate informality is not accepted in many cultures. For instance, an American manager working in one of his company's British subsidiaries introduced himself as "Chuck" to his British employees and coworkers. Nonetheless, even after 6 months on the job, his British counterparts still referred to him as "Charles." And the more he insisted they call him "Chuck," the more they seemed to dig in their heels and call him "Charles."[94] So, to decrease defensiveness, know your address terms before addressing your international business counterparts.

Understanding different cultural attitudes toward time is another major consideration for effective cross-cultural communication. Cultures tend to be either monochronic or polychronic in their orientation toward time.[95] In **monochromic cultures**,

[Address terms] cultural norms that establish whether you should address businesspeople by their first names, family names, or titles

[Monochronic cultures] cultures in which people tend to do one thing at a time and view time as linear

people tend to do one thing at a time and view time as linear, meaning that time is the passage of sequential events. You may have heard the saying, "There are three stages in people's lives: when they believe in Santa Claus, when they don't believe in Santa Claus, and when they are Santa Claus." The progression from childhood, to young adulthood, to parenthood (when they are Santa Claus) reflects a linear view of time. Schedules are important in monochronic cultures because you schedule time to get a particular thing done. Professor Frons Trompenaars, a noted researcher on international cultures and business, gives these examples of monochronic cultures:

> *In London I once saw a long queue of people waiting for a bus when it started pouring rain. They all stood stolidly, getting soaked even though cover was close by, lest they lose their sequential order. They preferred to do things right rather than do the right thing. In the Netherlands, you could be the queen, but if you are in a butcher's shop with number 46 and you step up for service when number 12 is called, you are still in deep trouble. Nor does it matter if you have an emergency; order is order.*[96]

By contrast, in **polychronic cultures**, people tend to do more than one thing at a time and view time as circular, meaning that time is a combination of the past, present, and future. Consider the following example from a polychronic culture:

> *In the Bahamas, bus service is managed similarly to many taxi systems. Drivers own their own buses and collect passenger fares for their income. There is no set schedule nor set time when buses will run or arrive at a particular location. Everything depends on the driver.*
>
> *Bus drivers in the Bahamas are present-oriented; what they feel like doing on a particular day at a particular hour dictates what they will actually do. If the bus driver feels hungry, for example, the driver will go home to eat lunch without waiting for a preset lunch hour. Drivers see no need to repeat yesterday's actions today, nor to set tomorrow's schedule according to the needs and patterns of yesterday.*[97]

As you can easily imagine, businesspeople from monochronic cultures are driven to distraction by what they perceive as the laxness of polychronic cultures, while people from polychronic cultures chafe under what they perceive as the strict regimentation of monochronic cultures. Conflicts between these two views of time occur rather easily. Let's go back to Trompenaars's butcher shop for an example:

> *At my local butcher shop in Amsterdam, the butcher calls a number, unwraps, cuts, rewraps each item the customer wants, and then calls the next number. Once I ventured a suggestion, "While you have the salami out, cut a pound for me, too." Customers and staff went into shock. The system may be inefficient, but they were not about to let some wise guy change it.*

Researchers Edward and Mildred Hall summed up the conflicts between these different views of time by saying, "It is impossible to know how many millions of dollars have been lost in international business because monochronic and polychronic people do not understand each other or even realize that two such different time systems exist."[98] Exhibit 15.13 provides a more detailed explanation of the differences between monochronic and polychronic cultures.

Differences in monochronic and polychronic time show up in four important temporal concepts that affect cross-cultural communication: appointment time, schedule time, discussion time, and acquaintance time.[99] **Appointment time** refers to how punctual you must be when showing up for scheduled appointments or meetings. In the United States, you are considered late if you arrive more than 5 minutes after the appointed time. Swedes don't even allow 5 minutes, expecting others

[Polychronic cultures] cultures in which people tend to do more than one thing at a time and view times as circular

to arrive on the dot. By contrast, in Latin countries people can arrive 20 to 30 minutes after a scheduled appointment and still not be considered late.

Schedule time is the time by which scheduled projects or jobs should actually be completed. In the United States and other Anglo cultures, a premium is placed on completing things on time. By contrast, more relaxed attitudes toward schedule time can be found throughout Asia and Latin America.

Discussion time concerns how much time should be spent in discussion with others. In the United States, we carefully manage discussion time to avoid wasting time on nonbusiness topics. In Brazil, though, because of the emphasis on building relationships, as much as 2 hours of general discussion on nonbusiness topics can take place before moving on to business issues.

Finally, **acquaintance time** is how much time you must spend getting to know someone before the person is prepared to do business with you. Again, in the United States, people quickly get down to business and are willing to strike a deal on the same day if the terms are good and initial impressions are positive. In the Middle East, however, it may take 2 or 3 weeks of meetings before reaching this comfort level. The French also have a different attitude toward acquaintance time. Polly Platt,

[Schedule time] a cultural norm for the time by which scheduled projects or jobs should actually be completed

[Discussion time] a cultural norm for how much time should be spent in discussion with others

[Acquaintance time] a cultural norm for how much time you must spend getting to know someone before the person is prepared to do business with you

author of *French or Foe*, a book that explains French culture and people for travelers and businesspeople, says, "Know that things are going to take longer and don't resent it. Realize that the time system is different. Time is not a quantity for them. We save time, we spend time, we waste time; all this comes from money. The French don't. They pass time. It's a totally different concept."[100]

Managing One-on-One Communication One-on-one communication can be managed by choosing the right communication medium, being a good listener, giving effective feedback, and understanding cross-cultural communication. Managers generally prefer oral communication because it provides the opportunity to ask questions and assess nonverbal communication. Oral communication is best suited to complex, ambiguous, or emotionally laden topics. Written communication is best suited for delivering straightforward messages and information. Listening is important for managerial success, but most people are terrible listeners. To improve your listening skills, choose to be an active listener (clarify responses, paraphrase, and summarize) and an empathetic listener (show your desire to understand, reflect feelings). Feedback can be constructive or destructive. To be constructive, feedback must be immediate, focused on specific behaviors, and problem-oriented. Finally, to increase the chances for successful cross-cultural communication, familiarize yourself with a culture's general work norms, determine whether a culture is emotionally affective or neutral, develop respect for other cultures, and understand how address terms and attitudes toward time (polychronic versus monochronic time; appointment, schedule, discussion, and acquaintance time) differ from culture to culture.

4 MANAGING ORGANIZATION-WIDE COMMUNICATION

Although managing one-on-one communication is important, managers must also know how to communicate effectively with a larger number of people throughout an organization. When Bill Zollars became CEO of Yellow Corporation, a trucking company, he decided that he needed to communicate directly with all 25,000 of the company's employees, most of whom did not work at company headquarters in Overland Park, Kansas. For a year and a half, he traveled across the country conducting small, town hall meetings. Zollars says, "When I first got to Yellow, we were in a bad state. So I spent 85 percent of my time on the road talking to people one-on-one or in small groups. I would start off in the morning with the sales force, then talk to drivers, and then the people on the docks. At the end of the day I would have a customer dinner. I would say the same thing to every group and repeat it ad nauseam. The people traveling with me were ready to shoot me. But you have to be relentless in terms of your message."[101] Effective leaders, however, don't just communicate to others. They also make themselves accessible so they can hear what employees throughout their organizations are thinking and feeling.

Learn more about organization-wide communication by reading the following sections about **4.1 improving transmission by getting the message out and 4.2 improving reception by finding ways to hear what others feel and think.**

4.1 Improving Transmission: Getting the Message Out

Several methods of electronic communication—e-mail, collaborative discussion sites, televised/videotaped speeches and conferences, and broadcast voice mail—now make it easier for managers to communicate with people throughout the organization and get the message out.

Although we normally think of *e-mail*, the transmission of messages via computers, as a means of one-on-one communication, it also plays an important role in organization-wide communication. With the click of a button, managers can send e-mail to everyone in the company via distribution lists. Many CEOs now use this capability regularly to keep employees up-to-date on changes and developments. On his first day as CEO of Diebold, which makes ATM machines, Thomas Swidarski e-mailed Diebold's 14,500 employees a message about improving customer loyalty, increasing the speed with which products were manufactured and delivered, and "providing quality products and outstanding service." Swidarski concluded his e-mail by writing that leading Diebold, "does not rest with one person—it rests with each and every one of us."[102]

Many CEOs and top executives make their e-mail addresses public and encourage employees to contact them directly. On his first day as the new CEO of Quest Communications, Richard Notebaert sent this simple e-mail to his 50,000 employees: "I'm here. Talk to me." Since then he has received 200,000 e-mails, many of which he has reacted to by taking some action.[103]

Collaborative websites are another means of electronically promoting organization-wide communication. **Online discussion forums** use web- or software-based discussion tools to allow employees across the company to easily ask questions and share knowledge with each other. The point is to share expertise and not duplicate solutions already discovered by others in the company. Furthermore, because collaborative discussion sites remain online, they provide a historical database for people who are dealing with particular problems for the first time.

Collaborative discussion sites are typically organized by topic, project, or person and can take the shape of blogs that allow readers to post comments, wikis to allow collaborative discussions, document sharing and editing, or traditional discussion forums (see Chapter 17 on managing information for further explanation). At **IBM**, 26,000 employees have blogs (blogs are discussed later in the chapter) where they write about their work and invite others to contribute through standard blog comments. "Wiki Central" at IBM hosts 20,000 wikis for IBM teams and projects that have 100,000 users. Brian Goodman, who manages an IBM software development team, says that with his wiki, "I have a single view of the projects and their status without pinging each of them once a day."[104] Goodman's team wiki also uses a "polling widget" to let team members vote on specific issues as they design the software and a "rating widget" that is used by team members to rate proposals and ideas. And connecting all of this and IBM's employees is BluePages, IBM's employee-edited corporate directory. When you want to find out more about who authored a wiki or blog entry, click on the name (no anonymous entries or pseudonyms allowed within IBM) and you're taken to that employee's BluePages site (which looks a lot like a FaceBook page), which lists contact information, projects they're working on, jobs they've had, and other blog and wiki entries they've written.

Exhibit 15.14 lists the steps companies need to take to establish successful collaborative discussion sites. First, pinpoint your company's top intellectual assets through a knowledge audit and spread that knowledge throughout the organization. Second, create an online directory detailing the expertise of individual workers and make it available to all employees. Third, set up collaborative discussion sites on the intranet so that managers and workers can collaborate on problem solving. Finally, reward

[Online discussion forums] the in-house equivalent of Internet newsgroups. By using Web- or software-based discussion tools that are available across the company, employees can easily ask questions and share knowledge with each other

information sharing by making the online sharing of knowledge a key part of performance ratings.

Televised/videotaped speeches and meetings are a third electronic method of organization-wide communication. **Televised/videotaped speeches and meetings** are simply speeches and meetings originally made to a small audience that are either simultaneously broadcast to other locations in the company or videotaped for subsequent distribution and viewing by a broader audience. Cisco's John Chambers describes how, over his 15 years as CEO, he's added televised messages to his communication strategies:

> *I started off with classic communication methods when I got here 15 years ago. I'd walk around and talk to small groups and larger groups. I'd see who was here in the evening. To this day I can tell you whose car is out in the parking lot. Then e-mail became very effective, because it gave me the ability to send a message to the whole group. But I'm a voice person. I communicate with emotion that way. I like to listen to emotion too. It's a lot easier to listen to a key customer if I hear how they're describing a problem to me. I'll leave 40 or 50 voice mails a day. I do them on the way to work and coming back from work. The newest thing for me is video on demand, which is my primary communication vehicle today. We have a small studio downstairs. We probably tape 10 to 15 videos a quarter. That way employees, and customers, can watch them when they want.*[105]

Voice messaging, or voice mail, is a telephone answering system that records audio messages. In one survey, 89 percent of respondents said that voice messaging is critical to business communication, 78 percent said that it improves productivity, and 58 percent said they would rather leave a message on a voice messaging system than with a receptionist.[106] Nonetheless, most people are unfamiliar with the ability to *broadcast voice mail* by sending a recorded message to everyone in the company. Broadcast voice mail gives top managers a quick, convenient way to address their work forces via oral communication. Harry Kraemer, former CEO of pharmaceutical giant Baxter International, described Baxter's broadcast voice mail system: "We have more than 30,000 Baxter team members hooked onto the same voice-mail system. That includes everybody but the folks on the factory line. This is hooked up in over 50 countries."[107] At Ernst & Young, the company-wide broadcast voice mails of former chairman Phil Laskawy were so well known and well liked that E & Y employees called them "Travels with Phil." No matter where he was traveling on business for the company—and he traveled all over the world—Phil would begin his voice mails, most of which lasted 5 to 10 minutes, with a weather report, a couple of bad jokes, and an update on his beloved New York Yankees baseball team. Then came the core part of his message.[108]

4.2 Improving Reception: Hearing What Others Feel and Think

When people think of "organization-wide" communication, they think of the CEO and top managers getting their message out to people in the company. But organization-wide communication also means finding ways to hear what people throughout the organization are thinking and feeling. This is important because most employees and managers are reluctant to share their thoughts and feelings with top managers. Surveys indicate that only 29 percent of first-level managers feel that their companies encourage employees to express their opinions openly. Another study of 22 companies found that 70 percent of the people surveyed were afraid to speak up about problems they knew existed at work.

[Televised/videotaped speeches and meetings] speeches and meetings originally made to a smaller audience that are either simultaneously broadcast to other locations in the company or videotaped for subsequent distribution and viewing

Withholding information about organizational problems or issues is called **organizational silence**. Organizational silence occurs when employees believe that telling management about problems won't make a difference or that they'll be punished or hurt in some way for sharing such information.[109] For example, the norm in most operating rooms is that the surgeon is clearly in charge. At first look, there doesn't seem to be anything wrong with that. After all, if the surgeon wasn't in charge, who would be? However, at 20 hospitals, 60 percent of the operating room staffers—nurses, technicians, and other doctors—agreed with this statement, "In the ORs [Operating Rooms] here, it is difficult to speak up if I perceive a problem with patient care."[110] This is a problem because serious mistakes can occur when nurses and other operating room staffers don't speak up (organizational silence). VHA Inc., which helps 2,400 hospitals coordinate best practices, has a new program called "Transformation of the Operating Room," in which operating teams use safety pauses and time-outs. The surgical team pauses for a moment, asks if anyone has concerns or comments, and then addresses them if need be. Studies show that programs such as this are not only changing the norms in operating rooms but also reducing mistakes such as operating on the wrong leg or noticing that key surgical instruments are missing prior to beginning surgery.

Company hotlines, survey feedback, frequent informal meetings, surprise visits, and blogs are additional ways of overcoming organizational silence. **Company hotlines** are phone numbers that anyone in the company can call anonymously to leave information for upper management. For example, **Force Protection**, which builds vehicles that protect armed forces personnel from explosions and ballistics, has a toll-free hotline for employees to call to report any kind of problem or issue within the company. Force Protection's policy states, "The Company Hotline is available 24 hours a day, 7 days a week and is serviced by an independent contractor. The Hotline will not be answered by an employee of Force Protection. You have the option to remain anonymous. No retaliation or reprisals will be taken against anyone utilizing this confidential service in good faith."[111] Hotlines are particularly important because 44 percent of employees will not report misconduct. Why not? The reason is twofold: They don't believe anything will be done, *and* they "fear that the report will not be kept confidential."[112] David Childers, CEO of EthicsPoint, which runs hotlines for corporations, says that companies can expect 1 to 1.5 percent of their employees to call their hotlines.[113] Company hotlines are incredibly useful, as 47 percent of the calls placed to them result in an investigation and some form of corrective action within the organization. Anonymity is critical, too, because as those investigations proceed, 54 percent of the callers did not want their identities revealed.[114]

Survey feedback is information that is collected by survey from organization members and then compiled, disseminated, and used to develop action plans for improvement. Many organizations make use of survey feedback by surveying their managers and employees several times a year. FedEx, for example, runs its own Survey Feedback Action program. The survey, which is administered online and is completely anonymous, includes sections for employees to evaluate their managers and the overall environment at FedEx, including benefits, incentives, and working conditions. After the surveys are completed, the results are compiled and then fed back to each FedEx work group to decide where changes and improvements need to be made and to develop specific action plans that address those problems. The final step is to look for improvements in subsequent employee surveys to see if those plans worked. John Allison, vice president of HR for FedEx Asia Pacific, says, "It's a means of engaging all of our employees so that they can participate in expressing concerns about issues and at the same time participate in solving any problems that might arise."[115]

Frequent *informal meetings* between top managers and lower-level employees are one of the best ways for top managers to hear what others think and feel. Many people assume that top managers are at the center of everything that goes on in organizations, but top managers commonly feel isolated from most of their lower-level managers and employees.[116] Consequently, more and more top managers are scheduling frequent informal meetings with people throughout their companies. Yogesh Gupta, CEO of **Fatwire**, which makes software to manage business websites, says that managers must not get defensive during informal meetings. Says Gupta, "I've heard so many executives tell employees to be candid and then jump down their throats if they bring up a problem or ask a critical question."[117] Gupta has spent hundreds of hours in informal meetings with his 200 managers and 9 executives. He meets with each privately because he believes that it encourages people to be candid. And, he asks each these questions:

- What am I doing wrong?
- What would you do differently if you were running the company?
- What's the biggest thing getting in the way of you doing your job well?

"What am I doing wrong? What would you do differently if you were running the company? What's the biggest thing getting in the way of you doing your job well?"

As a result of these meetings, Gupta learned that Fatwire was understaffed in marketing and product development.

Have you ever been around when a supervisor learns that upper management is going to be paying a visit? First, there's shock. Next, there's anxiety. And then there's panic, as everyone is told to drop what he or she is doing to polish, shine, and spruce up the workplace so that it looks perfect for the visit. Of course, when visits are conducted under these conditions, top managers don't get a realistic look at what's going on in the company. Consequently, one of the ways to get an accurate picture is to pay *surprise visits* to various parts of the organization. These visits should not just be surprise inspections, but should also be used as an opportunity to encourage meaningful upward communication from those who normally don't get a chance to communicate with upper management. Such surprise visits are now part of the culture at the Royal Mail, the United Kingdom's postal service. Chairman Allan Leighton frequently shows up unannounced at Royal Mail delivery offices. Leighton says the initial reaction is always the same, "Oh s***, it's the chairman." However, Leighton isn't there to catch his employees doing something wrong. He's there to find out, right or wrong, what's really going on. Says Leighton, "Those visits at half past five in the morning [with employees] are the most important part" of turning around the Royal Mail, which was once losing 1.5 million pounds a day.[118] Today, thanks in part to his communication with employees, the Royal Mail delivers 95 percent of first-class mail in one day, better than any other postal service in the world, and now *earns a profit* of 1.5 million pounds per day.

Blogs are another way to hear what people are thinking and saying, both inside and outside the organization. A **blog** is a personal website that provides personal opinions or recommendations, news summaries, and reader comments. At Google, which owns the blog-hosting service Blogger, hundreds of employees are writing *internal blogs*. One employee even wrote a blog for posting all the notes from the brainstorming sessions used to redesign the search page used by millions each day. Marissa Mayer, now Vice President, Search Products & User Experience, said, "Our legal department loves the blogs, because it basically is a written-down, backed-up, permanent time-stamped version of the scientist's notebook. When you want to file a patent, you can now show in blogs where this idea happened."[119]

External blogs and twitter sites (*micro blogs where entries are limited to 140 characters*), written by people outside the company, can be a good way to find out what others are saying or thinking about your organization or its products or actions. But it means that someone in the firm has to actively monitor what is being said on web, blog, and twitter sites. For example, when C. C. Chapman noticed a blur on the screen of his high-definition TV (only on the channel carrying the NBA playoffs), he didn't gripe to **Comcast**, his cable TV provider. Instead, he aired his complaint using his twitter account. Just a few minutes later, a twitter account called "ComcastCares" had contacted him about the problem. A Comcast repairperson fixed the problem at his home the next day. Said Chapman, "I was so floored."[120] Likewise, when Travis Johnson, who goes by "pastortray" on twitter, complained about Southwest Airlines check-in process, he received a quick, public response from a Southwest employee, who said, "So sorry to hear it! What don't you like about the check-in process? Did your flight get off okay?" Southwest spokesperson Christy Day says, "We monitor those channels because we know these conversations are taking place there, and we can either watch the conversations or take part in them."[121] Some companies have created the new position of chief blogging officer to manage internal company blogs and to monitor what is said about the company and its products on external blogs.[122]

REVIEW 8

Managing Organization-Wide Communication Managers need methods for managing organization-wide communication and for making themselves accessible so they can hear what employees throughout their organizations are thinking and feeling. E-mail, collaborative discussion sites, televised/videotaped speeches and conferences, and broadcast voice mail make it much easier for managers to improve message transmission and get the message out. By contrast, anonymous company hotlines, survey feedback, frequent informal meetings, and surprise visits help managers avoid organizational silence and improve reception by hearing what others in the organization feel and think. Monitoring internal blogs and external blogs and twitter sites is another way to find out what people are saying and thinking about your organization.

SELF ASSESSMENT

How Do You Listen?

Have you ever been eager to tell someone a funny story, only to have that person interrupt you repeatedly to ask for details or clarification? MANAGEMENT DECISION

To Blog or Not to Blog

Just this month, your company, AeroPrecision, a manufacturer of aircraft engine components, completed the upgrade of its computer system—the first upgrade in nearly 15 years.[124] Everyone cheered when the DOS-based operating software was replaced with the newest Windows-based version. Now, for the first time data are being electronically collected directly from the factory floor, and the engineering, tooling, and maintenance departments are connected. You and the other top managers expect to reap terrific gains in productivity—and profitability—as a result of the upgrade. As the operations manager, you were ultimately responsible for revamping the entire system, and the process has left you motivated to adopt even more technological advances.

Over the course of the upgrade, you came across several short articles and references to *blogs*, which you learned was short for "web logs." Not too savvy about these things at the time, you asked your IT consultant, and she told you that blogs are web pages that serve as publicly accessible journals. That didn't help you much, so she directed you to a variety of blogs to find out what they were all about. After only a few visits you started thinking about creating a blog for AeroPrecision.

Some managers use blogs to communicate with employees, and others use them as marketing tools to "get the message out" about their companies. The question for you is how AeroPrecision would use blogs. Only 30 of AeroPrecision's 100 employees have computers at their desks (only 30 have desks). The rest of the employees are shop-floor workers who use the 20 terminals located on stands throughout the factory to record their personal production information. Shop-floor terminals don't have Internet access. Could you justify connecting the 20 factory terminals to the Internet? And do you really want employees standing around the shop-floor terminals reading a company blog? But then you wonder, "Would that be any different from them hovering around the bulletin board by the time clock reading the company's biweekly newsletter? And with a blog, the information would be more timely."

Or would it? You pause to think about the time required to maintain a blog. And what would you link out to? A public blog would need to be an authoritative voice on—well, what? You could hook up to links about aerodynamics, metal prices, and travel statistics. If you could leverage AeroPrecision's technical expertise, you would be able to position the company as a premier provider of component parts for aircraft engines. You may even be able to convert the research you do for the blog into new customers or products for new industries. If you put your mind to it, you are confident that you can brainstorm enough valuable resources for a blog, but you come back to the issue of time. Would the time spent be worth it?

Questions

1. Does it make sense for AeroPrecision to create a company blog for employees only? In other words, is a blog the best medium to get the company's message out to employees and to hear what they feel and think? Explain.
2. Brainstorm possible items for inclusion on an AeroPrecision blog destined for public viewing. Can you think of any topics that you would want to avoid linking to?
3. How could a blog play a role in designing a company's strategy? (Recall the issues discussed in Chapter 6, "Organizational Strategy.")
4. Do you create a public blog for AeroPrecision? Why or why not?

MANAGEMENT TEAM DECISION

Communication Dilemmas and Decisions

As you watch the falling snow, you can't help thinking about the way the fax machine coughs out legal missives into a collection bin. You are a partner at Shaw Walker Theobald, a law firm with offices across the United States, and your office sits right next to the constantly humming fax machine. You're at your wit's end from the incessant buzzing. Documents of all lengths and levels of importance come through the fax; sometimes, a lawyer on one floor will write a question

on a cover letter, send it by fax to a lawyer on another floor at your firm, and then request the answer by fax! While you pack your briefcase before heading home, you think, "What a drain on productivity! And the client ends up footing the bill. There has to be a more efficient way to communicate."

After you finish dinner, you open your work and are again distracted—not by a fax, but by the pinging of your teenager's instant messaging on the computer in the den. Immediately, you think you've hit on a solution for the office. If the firm used instant messaging, you could save the energy used by the fax, eliminate all the paper, and have answers in an instant. Communication would reach terminal speed! Unfortunately, you can't just implement your idea when you walk in tomorrow morning. You're only one of many partners, and they all have to approve anything that affects the management of the firm. How are you going to persuade a team of people trained to object? Instead of pulling a brief out of your bag, you flip to a clean sheet on your legal pad and begin drafting a convincing memo.

Getting Started

This exercise will give you practice in writing memos and giving verbal feedback. You will begin by writing a memo on your own based on the scenario you just read. Then assemble a team of five to six students. Make enough copies of your memo so that each team member can have one. The job of the team is to review and critique all the memos. You will want to review Section 3.3 on giving feedback before convening the team to evaluate the memos. Choose one team member to be the moderator. The moderator will be in charge of keeping the discussion on track and ensuring that it doesn't disintegrate into subjective attacks.

Activities

1. Write a memo to your colleagues proposing the use of instant messaging to speed communication.
2. Convene the team and critique the members' memos. Try to use descriptive terms to give feedback about the memos. Avoid words like "good" and "bad"—they don't give the writer any real information about the effectiveness of the memo. Here are some adjectives that you might find useful as a starting point:
   - Convincing
   - Persuasive
   - Condescending
   - Concise
   - Wordy
   - Informative
   - Detailed
   - Sparse
   - Neat
   - Hard to follow
   - Clear
   - Sloppy
   - Off-putting
   - Effective
   - Inappropriate
   - Unprofessional

   Don't limit your comment to a negative adjective, either. If you say a memo is hard to follow, explain *why*. What makes it hard to follow? If you say a memo is wordy, explain how it is wordy. And be specific: Point out which phrases are redundant, unnecessary, or repetitive.
3. Assume that your individual proposal was accepted, and the partners (your team) have asked you to announce the new capabilities and outline the rules for their use. Determine the best way to communicate the instant messaging plan to the junior partners, associates, paralegals, and office staff. Using whatever medium you think is best, write out your communication. For example, if you think e-mail is best, draft a relevant e-mail. If you think a memo would be appropriate, then draft one. If you think oral communication would be a better choice, draft the speech you will give. Regardless of your medium, you will need to remember your audience.
4. If you have time, repeat the group critique session with the second communication. You may also wish to discuss as a team which medium would be the best for telling everyone at the firm about the new instant messaging initiative.

PRACTICE BEING A MANAGER

Avoiding Communication Breakdown

When problems occur in organizations, they are frequently attributed to a breakdown in communication. The communication process may get more than its share of the blame for some breakdowns that result from organizational or leadership problems. But there is some truth to the common perception that communication is problematic. In this exercise, you will have the opportunity to consider how you might improve your own communication from two sides of the table—coaching/disciplining an employee and receiving coaching/disciplining from a manager.

Step 1: Get into groups and read the scenario. Your professor will organize you in small groups of three or four students.

Scenario: Chalet is a fine-dining restaurant in a ski resort setting. The restaurant is well known for its gourmet cuisine, fine wine selection, and outstanding service. Dinner for two at Chalet would typically cost $100 or more. A key management responsibility at Chalet is the training and development of waitstaff. Service quality is carefully monitored and standards rigorously maintained. In exchange for meeting these demanding standards, Chalet waitstaff are well compensated and enjoy good benefits. As time permits, you should complete conversations in which you play each of the following roles: Dennis/Denise (new waitstaff member with 3 months of experience at Chalet); Christy/Chris (service manager); and D.J./R.J. (communication consultant to Chalet).

Here are some basic facts of the situation:

- The service manager has not directly observed any problems with Dennis/Denise interacting with customers of the restaurant.
- Over this past busy weekend three tables of customers reported problems with the service they received from Dennis/Denise. Only one other table received any negative feedback at all during the weekend, and that concerned the quality of a particular dessert item.
- The reports about Dennis/Denise were rather vague—"server seemed distant, unresponsive" and "acted aloof, like we were a bother."
- Christy/Chris, the service manager, did catch the tail end of what seemed like an argument between Dennis/Denise and one of the cooks on Friday night. When the cook was asked about the incident, she said, "It was nothing . . . usual cook versus server stuff."
- Dennis/Denise needs this job to pay for college and is taking a full load of classes.

The role play should involve a brief conversation (5 to 7 minutes) initiated by Christy/Chris on Monday afternoon prior to opening. The focus of this conversation should be to coach and/or discipline regarding the concerns of the previous weekend. Those playing the role of communication consultant should take notes and provide feedback on the communication in this conversation (strengths and areas for improvement). As time allows, rotate roles after completing a conversation and hearing consultant feedback.

Step 2: Do the role play. Complete a role-play conversation with one person playing the role of the service manager (Christy/Chris) and another person playing the role of the waitstaffer (Dennis/Denise). Communication consultant(s) should listen and take notes in order to provide feedback to the two individuals who are role-playing the coaching/discipline conversation.

Step 3: Give feedback. Communication consultant(s) should give feedback to the role-players at the conclusion of the conversation, considering key aspects of communication discussed in this chapter.

Step 4: Switch roles. Switch roles and repeat the role-play conversation and postconversation feedback as time allows.

Step 5: Debrief as a class. What challenges face the communicators in this scenario? Which role was most difficult for you, and why? Why is it important for managers to coach and discipline effectively? Why might managers avoid (or underutilize) this form of communication?

DEVELOP YOUR CAREER POTENTIAL

I Don't Agree, but I'm Listening

Being a good listener is a critical part of effective communication. Without it, you're unlikely to be a good manager. Therefore, the purpose of this assignment is to help you develop your listening skills. And there's no better way to do that than to talk to someone whose views are quite different from yours. In the best of situations, being a good listener is difficult. Because of perceptual filters, distractions, or daydreams, we retain only about 25 percent of what we hear. When we're talking with people who have very different views and opinions, it can be almost impossible to be good listeners. We tend to interrupt, jump to conclusions about what they'll say, and hurry them to finish their points (which we don't want to listen to anyway) so that we can "correct" their thinking with our own opinions.

To complete this assignment, you'll have to find someone who has different views or opinions on some topic (handgun control, abortion, capital punishment, and euthanasia are just some of the topics on which you can always find someone with a different viewpoint). Once you've found someone, conduct a 10-minute listening session, following this simple rule: Before stating your opinion, you must first accurately reflect or paraphrase the statement that your listening partner just made (be sure to reread Subsection 3.2 on listening). For example, suppose that your listening partner says, "Women shouldn't have to ask anyone for permission for what they do to their bodies. If they decide they want an abortion, they should go ahead and have it." Before making your point or disagreeing with your partner's, you will have to accurately paraphrase that statement in your own words. If you don't paraphrase it correctly, your listening partner will tell you. If you or your partner has difficulty accurately paraphrasing a statement, ask the other person to repeat the statement and try again. Also, don't parrot the statement by repeating it word for word. Good listening isn't mimicry. It's capturing the essence of what others have said in your own words. And before your listening partner responds, he or she, too, has to accurately paraphrase what you say. Continue this listening-based discussion for 10 minutes.

Questions

1. Was this discussion different from the way you normally discuss contentious topics with other people? Why or why not?
2. Was it difficult to reflect or paraphrase your listening partner's perspectives? Explain and give an example.
3. Did active listening techniques or empathetic listening techniques lead to more effective listening for you? Explain.

Friday Night Lights

© GREENLIGHT

In the small town of Odessa, Texas, everyone lives for Friday nights when the high school football team, the Permian Panthers, takes the field. The town is proud of their Panthers, led by quarterback Mike Winchell (Lucas Black) and superstar tailback Boobie Miles (Derek Luke), and they're used to winning. They expect a state championship, and nothing less. When Boobie suffers a career-ending injury in the first game of the season, the team isn't sure they can win without him. But Coach Gary Gaines (Billy Bob Thornton) isn't ready to give up yet. In this clip from the film, Coach Gaines gathers the team around during the half-time break to talk about what success really means and how he wants them to achieve it.

What to Watch for and Ask Yourself

1. Both the speaker and the listener(s) are necessary components in the communication process. Coach Gaines is the speaker and each team member and the assistant coaches are listeners. Only Gaines spoke. Did he still meet the basic requirements of effective communication? Draw examples from his speech to support your conclusions.
2. How well do the members of the team and the assistant coaches seem to be listening to the message the coach is communicating to them? How can you tell?
3. Assess the effectiveness of the coach's communication to the team. How do you expect the team to play in the second half of the game as a result?

Greensburg Public Schools

Greensburg superintendent Darrin Headrick was driving home the night the tornado hit town. He stopped at a friend's house to take cover. After the storm passed, he discovered that the entire school system was wiped out. Every building was gone. Textbooks were scattered all over town, and the computers had been destroyed. Only the bleachers behind the football field remained. Headrick had some tough decisions to make. If families were going to feel like it was worth coming back to Greensburg, then he had to reassure them school would be back in session by fall. In this video, he states that the biggest challenge in the days after the tornado was probably communication and he explains why. He also talks about why communication in the town is actually better now than it was before the disaster.

What to Watch for and Ask Yourself

1. Why was communication so difficult in the days following the tornado?
2. Describe the advantages and disadvantages of text messaging as the preferred communication channel in Greensburg after the tornado.
3. In what ways has communication in Greensburg improved since then?

Subaru of Indiana Automotive, Lafayette, Indiana.[1]

With gas prices rising and more drivers desiring ecologically friendly vehicles, auto manufacturers turned to hybrid gas/electric cars, like the Toyota Prius and the Ford Fusion, to significantly improve gas mileage and reduce auto emissions. In the next few years, thanks to advances in battery technology, environmentally minded consumers will be able to shop for plug-in cars, like the Nissan Leaf, which have a range of about 40 miles per charge. So, instead of filling up with gas on your way home, you'll plug in your Leaf in your garage at the end of the day. Business/environment consultant Gary List is not surprised at these trends. Says List, "Green has become a hot commodity. It's something customers are asking about. Employees want to work for companies that are green and politicians are struggling to be greener than the next politician." While auto manufacturers are making progress on emissions and gas mileage, most pay little attention to the environmental impact of their manufacturing facilities which send hundreds of millions of tons of waste to landfills each year. That waste, in turn contributes to increases in the methane gas emitted from landfills, which some estimate to be more than 20 times as damaging to the environment as carbon dioxide emissions.

Your Subaru manufacturing facility has an outstanding record on environmental issues. It was the first smoke-free auto assembly plant in the U.S., the first to be ISO 14001 certified (indicating that you have taken steps to identify and control the environmental impact of your plant's activities, product, and services), and the first to have an on-site solvent recovery system (typically, solvents are some of the worst pollutants in manufacturing). Yet, despite this progress, your Subaru plant sends nearly 500 pounds of waste per car to landfills each year. And with annual production nearing 200,000 cars, that means 100 million pounds of waste were going to landfills each year (including 26 million pounds of steel and 3 million pounds of cardboard and paper). With Subaru's long commitment to being a green manufacturer, no one is happy with the current situation. While it sounds impossible, you've heard about leading-edge companies that are taking steps to become zero-landfill manufacturers. That's right, zero, zip, nada. Despite producing hundreds of thousands of products, they send no waste to landfills—nothing. You wonder could your production facility do this, too?

Before you even start, you and your management team must answer some key questions. First, should you become a zero waste plant even if it costs you money to do so? What if it's only breakeven? Or should you do it only if it saves you money? Sure, the company's got a long-standing commitment to the environment, but you're running a

business, not the Sierra Club. What tradeoffs, if any, is the company willing to make in terms of costs and profits to become a zero-landfill manufacturing facility? Second, when environmental consultants work with companies, they help them address four levels of waste minimization, but you'll only focus on three, since the fourth deals with safely preparing materials for landfills. The first level is to prevent waste and pollution before they occur, or to reduce them when they do occur. At the second level, called recycle and reuse, wastes are reduced by reusing materials as long as possible or by collecting materials for on- or off-site recycling. From steel, to cardboard and paper, to plastics and foam, what steps could you take to minimize waste on these two levels? Finally, at the third level of waste minimization, consultants work with companies to treat waste via biological, chemical, or other processes to turn potentially harmful waste into harmless compounds or useful by-products. What steps might you take at this level to again avoid sending any materials to landfills?

If you were in charge of this Subaru manufacturing plant, what would you do?

As Subaru's situation shows, past success is no guarantee of future success. Even successful companies fall short, face challenges, and have to make changes. Control is a regulatory process of establishing standards to achieve organizational goals, comparing actual performance against the standards, and taking corrective action when necessary, as at Gap, to restore performance to those standards. Control is achieved when behavior and work procedures conform to standards and when company goals are accomplished.[2] Control is not just an after-the-fact process, however. Preventive measures are also a form of control.

We begin this chapter by examining the basic control process used in organizations. In the second part of the chapter, we go beyond the basics to an in-depth examination of the different methods that companies use to achieve control. We conclude the chapter by looking at the things that companies choose to control (finances, customer retention, and product quality, among others).

BASICS OF CONTROL

After reading the next section, you should be able to

1. describe the basic control process.

If you're at home and it's too warm, you turn down your thermostat to kick on the air-conditioning. But if it's too warm in a Wal-Mart store, then the Wal-Mart manager has to contact a team of energy control specialists at the company's Bentonville, Arkansas, headquarters. **Wal-Mart's** Charles Zimmerman says, "It's not like a store manager can turn down a thermostat two degrees. He has to call us to make that happen."[3] In addition to monitoring a store's heating and cooling, Wal-Mart's energy control processes are so sophisticated that if a freezer door is accidentally left open for 45 minutes, a sensor alerts someone at headquarters to contact the store manager. Wal-Mart spokesperson Dave Tovar says, the "monitoring team saves the company millions of dollars by detecting and responding to situations that could cause Wal-Mart to lose money on wasted energy or spoiled food."[4]

[Control] a regulatory process of establishing standards to achieve organizational goals, comparing actual performance against the standards, and taking corrective action, when necessary

1 THE CONTROL PROCESS

The basic control process **1.1 begins with the establishment of clear standards of performance; 1.2 involves a comparison of performance to those standards; 1.3 takes corrective action, if needed, to repair performance deficiencies; 1.4 is a dynamic, cybernetic process; and 1.5 consists of three basic methods: feedback control, concurrent control, and feedforward control.** However, as much as managers would like, **1.6 control isn't always worthwhile or possible.**

1.1 Standards

The control process begins when managers set goals such as satisfying 90 percent of customers or increasing sales by 5 percent. Companies then specify the performance standards that must be met to accomplish those goals. **Standards** are a basis of comparison for measuring the extent to which organizational performance is satisfactory or unsatisfactory. For example, many pizzerias use 30–40 minutes as the standard for delivery times. Since anything longer is viewed as unsatisfactory, they'll typically reduce the price if they can't deliver a hot pizza to you within that time period.

So how do managers set standards? How do they decide which levels of performance are satisfactory and which are unsatisfactory? The first criterion for a good standard is that it must enable goal achievement. If you're meeting the standard but still not achieving company goals, then the standard may have to be changed. In the salmon industry, to maximize productivity, it was standard procedure to grow as many fish as possible in fish farms and then deal with diseases (that spread from the fish being in such close proximity) through liberal use of antibiotics in fish food. This was effective until a few years ago, when the new Isa (infectious salmon anemia) virus, which is resistant to antibiotics, developed. Norwegian salmon farms, the largest in the world, sharply reduced the incidence of Isa by developing new production standards that involved the use anti-viral vaccines and no longer allowing overcrowded fish pens.[5]

Companies also determine standards by listening to customers' comments, complaints, and suggestions or by observing competitors. **TNT NV** is a global delivery company based in the Netherlands. After frequent complaints about how late deliveries were being handled by the company, it conducted a number of customer discussion forums to better understand how this was affecting its customers and what it might do to address the issue. One of the problems that came to light was the company policy of requiring drivers who were running late to call TNT NV's call control center, which would then notify customer services, which would then contact the customer to tell them the driver was running late. This overly complicated process was slow and frequently resulted in late notifications, frustrated customers, and embarrassed drivers. The company's new policy is that drivers who are running late should contact the customer directly. Customers appreciate the personal contact and drivers, who often see their customers on a daily basis, appreciate being given control of the situation.[6]

Standards can also be determined by benchmarking other companies. **Benchmarking** is the process of determining how well other companies (though not just competitors) perform business functions or tasks. In other words, benchmarking is the process of determining other companies' standards. When setting standards by benchmarking, the first step is to determine what to benchmark. Companies can benchmark anything from cycle time (how fast) to quality (how well) to price

[Standards] a basis of comparison for measuring the extent to which various kinds of organizational performance are satisfactory or unsatisfactory

[Benchmarking] the process of identifying outstanding practices, processes, and standards in other companies and adapting them to your company

(how much). For example, through national benchmarking studies of thousands of fire departments, firehouses are expected to respond to an alarm within 15 seconds 95 percent of the time. Additionally, 90 percent of the time it should take no more than 60 seconds to leave the firehouse, and then no more than 4 minutes to arrive at the scene.[7]

The next step is to identify the companies against which to benchmark your standards. The last step is to collect data to determine other companies' performance standards. **Intel**, the leading manufacturer of microprocessors, used benchmarking to assess every aspect of its multi-billion-dollar fabrication plants. CEO Paul Otellini said, ". . . we used external benchmarks—best-of-class benchmarks—for every element of the operation and then weighed that against what we were doing."[8] As a result of benchmarking, Otellini says that Intel has cuts its factory throughput from 90 to 45 days, significantly increasing speed and reducing costs and inventory.

1.2 Comparison to Standards

The next step in the control process is to compare actual performance to performance standards. Although this sounds straightforward, the quality of the comparison depends largely on the measurement and information systems a company uses to keep track of performance. The better the system, the easier it is for companies to track their progress and identify problems that need to be fixed.

One way for retailers to verify that performance standards are being met is to use secret shoppers. Retail stores spend $600 million a year to hire these consultants, who visit the stores pretending to be customers but are really there to determine whether employees provide helpful customer service. The "secret shoppers" make detailed observations of the service provided. Secret shopper Cliff Fill recalls the fast-food restaurant where the workers discussed their dating plans as he stood in front of them ready to order. After ignoring him for 90 seconds (secret shoppers often carry timers with them), they turned to him and said, "We'll be done with our conversation in a minute and be with you."[9] Secret shoppers also note great service. Mike Bare, cofounder of the Mystery Shopping Providers Association, says, "It used to be about catching people doing something wrong. But, more and more, it's validating people who do things right."[10] Indeed, Intrawest, a ski resort, gives $100 bills to employees praised in its secret shopper reports.

1.3 Corrective Action

The next step in the control process is to identify performance deviations, analyze those deviations, and then develop and implement programs to correct them. This is similar to the planning process discussed in Chapter 5. Regular, frequent performance feedback allows workers and managers to track their performance and make adjustments in effort, direction, and strategies.

Beta versions of software programs are a classic tool that developers use to monitor deviations from the standard and take corrective action *before* the product is released on the market. Google used a beta version of its Google Groups software for close to a decade as managers mined users' comments to improve the product.[11] Likewise, Microsoft has an internal program called Software Quality Metrics (SQM) that company software developers use when creating new software releases. SQM helps the developers determine how each change in the software code will affect the functionality of the program and uses a system of comparison charts to show how the changes will affect users of new software.[12]

1.4 Dynamic, Cybernetic Process

As shown in Exhibit 16.1, control is a continuous, dynamic, cybernetic process. Control begins by setting standards, measuring performance, and then comparing performance to the standards. If the performance deviates from the standards, then managers and employees analyze the deviations and develop and implement corrective programs that (they hope) achieve the desired performance by meeting the standards. Managers must repeat the entire process again and again in an endless feedback loop (a continuous process). Thus, control is not a onetime achievement or result. It continues over time (i.e., it is dynamic) and requires daily, weekly, and monthly attention from managers to maintain performance levels at the standard (i.e., it is cybernetic). **Cybernetic** derives from the Greek word *kubernetes*, meaning "steersman," that is, one who steers or keeps on course.[13] The control process shown in Exhibit 16.1 is cybernetic because constant attention to the feedback loop is necessary to keep the company's activity on course.

Keeping control of business expenses is an example of a continuous, dynamic, cybernetic process. A company that doesn't closely monitor expenses usually finds that they quickly get out of control, even for the smallest things. When Eddie Lampert became chairman of Kmart, he saw expenses that could be cut everywhere he looked. He demanded that everyone stop looking at sales and instead focus on profitability. He told all of his store managers that he was willing to spend money but only when they could assure the company of a big return. He didn't allow a proposal to improve lighting in stores that would have cost more than $2 million. Declaring, "It doesn't matter what Target and Wal-Mart do," Lampert wanted to know the positive value of every investment. He quickly eliminated what he referred to as "crazy promotions" that were designed to clear out inventory. Kmart stopped pricing DVDs at Wal-Mart levels (i.e., heavily discounted) and began selling them only at full price. Lampert knew the stores would sell less in terms of volume but make more profit on each sale; he said, "For the first year or so, we had declining same-store sales, but more stores made a profit. To some people, it looked like a plane that was going from 40,000 feet to 20,000 feet, and in five minutes from now, it's going to hit the ground. We said, 'We're going to land this plane' and we did."[14] Sure, it's a cliché, but it's just as true in business as in sports: If you take your eye off the ball, you're going to strike out. Control is an ongoing, dynamic, cybernetic process.

1.5 Feedback, Concurrent, and Feedforward Control

The three basic control methods are feedback control, concurrent control, and feedforward control. **Feedback control** is a mechanism for gathering information about performance deficiencies *after* they occur. This information is then used to correct or prevent performance deficiencies. Study after study has clearly shown that feedback improves both individual and organizational performance. In most instances, any feedback is better than no feedback.

If feedback has a downside, it's that feedback always comes after the fact. Wal-Mart instituted a new feedback system when it began building more stores closer to urban areas. The company engaged the services of business analysts whose job it is to roam Wal-Mart stores and competitors' stores looking for opportunities to increase sales. This new feedback system is designed to help Wal-Mart managers and

[Cybernetic] the process of steering or keeping on course

[Feedback control] a mechanism for gathering information about performance deficiencies after they occur

merchandisers tailor store floor plans to produce maximum sales per square foot, a standard metric in retailing. One business analyst noticed that a Wal-Mart in a mostly Hispanic neighborhood was out of women's shoes in size 5½ and concluded that the buyers at headquarters were not "aware of the store's large base of Hispanic women, who tend to have small feet—an insight that could aid buying decisions." Wal-Mart's feedback system helps it identify problems on the floor with merchandise locations and displays as well as opportunities to sell products the analysts discover in other stores. Still, the feedback always lags behind the actual opportunity.[15]

Concurrent control addresses the problems inherent in feedback control by gathering information about performance deficiencies *as* they occur. Thus, it is an improvement over feedback because it attempts to eliminate or shorten the delay between performance and feedback about the performance. Apple and NIKE teamed up to create a real-time exercise feedback system called Nike + iPod. After a runner installs the system in her shoes, it transmits concurrent information to her iPod. The system measures time, distance, calories burned, and pace. Runners can actually track their efforts every moment of their run and make changes on the fly. Greg Joswiak, Apple's vice president of worldwide iPod marketing, says, "We've enabled people to have a much better running experience than ever before."[16]

Feedforward control is a mechanism for gathering information about performance deficiencies *before* they occur. In contrast to feedback and concurrent control, which provide feedback on the basis of outcomes and results, feedforward control provides information about performance deficiencies by monitoring inputs rather than outputs. Thus, feedforward control seeks to prevent or minimize performance deficiencies before they happen. **Microsoft** uses feedforward controls to try to prevent software problems before they occur. For example, when developing the latest version of its Windows Server software (for network and Internet computer servers), Microsoft taught 8,500 experienced programmers new methods for writing more reliable software code *before* asking them to develop new features for Windows Server software. Microsoft has also developed new software testing tools that let the programmers thoroughly test the code they've written (i.e., input) before passing the code on to others to be used in beta testing of Windows 7. Using feedforward control has shortened development time and, by the end of its development cycle, Windows 7 was expected to ship ahead of schedule.[17] Exhibit 16.2 lists guidelines that companies can follow to get the most out of feedforward control.

[Concurrent control] a mechanism for gathering information about performance deficiencies as they occur, thereby eliminating or shortening the delay between performance and feedback

[Feedforward control] a mechanism for monitoring performance inputs rather than outputs to prevent or minimize performance deficiencies before they occur

EXHIBIT 16.2 Guidelines for Using Feedforward Control

1.	Thorough planning and analysis are required.
2.	Careful discrimination must be applied in selecting input variables.
3.	The feedforward system must be kept dynamic.
4.	A model of the control system should be developed.
5.	Data on input variables must be regularly collected.
6.	Data on input variables must be regularly assessed.
7.	Feedforward control requires action.

1.6 Control Isn't Always Worthwhile or Possible

© FRONTPAGE/SHUTTERSTOCK.COM

Because American Airlines missed the deadlines for completing routine inspections, the U.S. Federal Aviation Administration grounded the airlines' fleet.

Control is achieved when behavior and work procedures conform to standards and goals are accomplished. By contrast, **control loss** occurs when behavior and work procedures do not conform to standards.[18] After **American Airlines** missed a deadline to conduct wiring inspections of its planes, the U.S. Federal Aviation Administration grounded each American plane that had not yet been inspected and certified. With nearly 1,500 American flights canceled and thousands of customers stranded, unable to make their connections, American's CEO Gerard Arpey promised that the company would spend "tens of millions of dollars" to cover the overtime pay and costs of the inspections and, if needed, repairs. American also promised to refund and rebook customers' flights. With reinspections taking just 15 to 20 minutes per plane and repairs, when needed, taking 2 to 6 hours, American was able to inspect and certify its entire fleet within three to four days.[19] Clearly, however, control loss occurred, because American should never have missed the deadline for completing these routine inspections.

Maintaining control is important because control loss prevents organizations from achieving their goals. When control loss occurs, managers need to find out what, if anything, they could have done to prevent it. Usually, that means identifying deviations from standard performance, analyzing the causes of those deviations, and taking corrective action. Even so, implementing controls isn't always worthwhile or possible. Let's look at regulation costs and cybernetic feasibility to see why this is so.

To determine whether control is worthwhile, managers need to carefully assess **regulation costs**, that is, whether the costs and unintended consequences of control exceed its benefits. If a control process costs more than it benefits, it may not be worthwhile. For example, the European Union uses the metric system—kilograms and centimeters—to ensure standard pricing throughout its 27 member states. But, since the United Kingdom uses the British imperial system (pounds, ounces, inches, miles, etc.), the EU regulation allows businesses to use both metric *and* imperial measures. So when Janet Devers, who runs a vegetable stall at the Ridley Road market in East London, only sold vegetables by the pound and the ounce, she faced 13 criminal charges and fines totaling $130,000 for not also posting prices using the metric system. Devers could not believe she was being prosecuted: "We have knifings. We have killings. And they're taking me to court because I'm selling in pounds and ounces."[20]

> "We have knifings. We have killings. And they're talking me to court because I'm selling [vegetables] in pounds and ounces."
>
> JANET DEVERS, VEGETABLE MERCHANT

Since everyone in Britain buys fruits and vegetables by the pound or ounce, the British public was outraged by the charges because the regulatory costs clearly outweighed their benefits. Innovations Secretary for the UK, John Denham, soon indicated that such prosecutions were not in the public interest. And the local government council that had spent $50,000 pursuing the case in court eventually dropped all the charges.[21]

An often overlooked factor in determining the cost of control is that *unintended consequences* sometimes accompany increased control. Control systems help companies, managers, and workers accomplish their goals. But, while they help solve some problems, they can create others. For example, Six Sigma is a quality control system, originally developed by Motorola, that manufacturers use to achieve the goal of producing only 3.4 defective or nonstandard parts per million parts made. Clearly, manufacturers who reach Six Sigma consistently produce extremely high-quality products. But aligning the very constrictive process needed to attain Six Sigma with the need for out-of-the box thinking and innovation can be a feat.

[Control loss] the situation in which behavior and work procedures do not conform to standards

[Regulation costs] the costs associated with implementing or maintaining control

For example, Motorola's focus on achieving near-perfect production (99.9997 percent error-free) was stifling the company's creativity and innovation, both of which are critical for organizations to grow. In the late 1990s, Motorola lost its lead in mobile phones to Nokia, in part because tight manufacturing control systems were crushing efforts to develop new products. To mitigate the unintended consequences of Six Sigma, Motorola designers are now given a free hand to design, but the process engineers are always on hand to help ensure that Motorola's phones—like the RAZR—can actually be manufactured to perfection. In fact, the RAZR helped Motorola climb from a 15.4 percent market share to 22.4 percent in a two-year period.[22]

Another factor to consider is **cybernetic feasibility**, the extent to which it is possible to implement each step in the control process: clear standards of performance, comparison of performance against standards, and corrective action. If one or more steps cannot be implemented, then maintaining effective control may be difficult or impossible.

For example, retail stores are struggling to find successful ways to provide discounts via the web or social media. When Indianapolis-based **Marsh Groceries** used its Facebook site to give 3,100 customers, who had signed up as its Facebook "friends" a $10 coupon and then encouraged them to share that coupon with their friends, the number of people who tried to redeem the downloadable coupons exploded and spiraled out of control, so Marsh had to halt the offer after 4 days. The company apologized on its website, saying, "We at Marsh recently stuck our toe in the water to try this whole social media thing. Unfortunately, we ended up stubbing it. Our recent $10 coupon offer on Facebook has instead left us red in the face and many of our loyal customers angry. Rightfully so. For that we are truly sorry. Needless to say, we're learning."[23] Likewise, when Oprah Winfrey mentioned that KFC was offering an online free grilled chicken meal coupon, 10 million coupons were downloaded and 4.5 million meals were given away in 4 days. Like Marsh, KFC had to stop honoring the coupon because it couldn't limit the number that could be redeemed. In both instances, there was no cybernetic feasibility.

[Cybernetic feasibility] the extent to which it is possible to implement each step in the control process

The Control Process The control process begins by setting standards, measuring performance, and then comparing performance against the standards. The better a company's information and measurement systems, the easier it is to make these comparisons. The control process continues by identifying and analyzing performance deviations and then developing and implementing programs for corrective action. Control is a continuous, dynamic, cybernetic process, not a onetime achievement or result. Control requires frequent managerial attention. The three basic control methods are feedback control (after-the-fact performance information), concurrent control (simultaneous performance information), and feedforward control (preventive performance information). Control has regulation costs and unanticipated consequences and therefore isn't always worthwhile or possible.

HOW AND WHAT TO CONTROL

Skiers and snowboarders who love the thrill of racing down steep mountain slopes may have to start tying a radar detector onto their ski passes. In response to the more than 70,000 accidents each year on Swiss ski slopes, the

state-controlled **Swiss Accident Insurance (Suva)**, the country's biggest provider of compulsory skiing insurance, will now be using radar guns on the slopes to track and "pull over" skiers and snowboarders who go faster than 19 mph. Studies using crash test dummies on skis show that going faster than 19 mph is not safe, and that going faster than 30 mph can be potentially fatal. Although speeders will only be warned at first, they could eventually be fined and have their ski passes taken away.[24]

If you managed a ski resort, would you use radar guns to "pull over" skiers and snowboarders who were going too fast? Would skiers and snowboarders see this as something your resort was doing for their safety or something the company was doing to lower its costs and legal risks? Is this a reasonable policy that you should pursue, or is this something that you shouldn't even consider? Should you also require all skiers and snowboarders to where helmets on your slopes? If you were running a ski slope, what would you do?

After reading the next two sections, you should be able to

2. discuss the various methods that managers can use to maintain control.
3. describe the behaviors, processes, and outcomes that today's managers are choosing to control in their organizations.

2 CONTROL METHODS

Managers can use five different methods to achieve control in their organizations: **2.1 bureaucratic, 2.2 objective, 2.3 normative, 2.4 concertive,** and **2.5 self-control.**

2.1 Bureaucratic Control

When most people think of managerial control, what they have in mind is bureaucratic control. **Bureaucratic control** is top-down control, in which managers try to influence employee behavior by rewarding or punishing employees for compliance or noncompliance with organizational policies, rules, and procedures. Most employees, however, would argue that bureaucratic managers emphasize punishment for noncompliance much more than rewards for compliance.

For instance, one manager gave an employee a written reprimand for "leaving work without permission"—after she passed out in the bathroom and was whisked by ambulance to a nearby hospital. Another manager, a school principal, forced a teacher to work through the day even after the teacher said her arm was throbbing after slipping on ice outside the school. "He decided there was no way I could have broken my arm, probably just bruised it." The teacher said, "During first period, my arm hurt horribly, but I continued teaching. But when I reached for chalk, and my fingers would not move, I did go [to the hospital] where my broken arm was set."[25]

As you learned in Chapter 2, bureaucratic management and control were created to prevent just this type of managerial behavior. By encouraging managers to apply well-thought-out rules, policies, and procedures in an impartial, consistent manner to everyone in the organization, bureaucratic control is supposed to make companies more efficient, effective, and fair. Ironically, it frequently has just the opposite effect. Managers who use bureaucratic control often emphasize following the rules above all else.

For instance, when visiting the company's regional offices and managers, the president of a training company, who was known for his temper, for micromanaging

[Bureaucratic control] the use of hierarchical authority to influence employee behavior by rewarding or punishing employees for compliance or noncompliance with organizational policies, rules, and procedures

"Poor Ike. It won't be a bit like the army. He'll sit here and he'll say, 'Do this, do that,' and nothing will happen."

HARRY TRUMAN

others, and an extraordinary commitment to pressuring others to reduce or eliminate costs, would get some toilet paper from the restrooms and aggressively ask, "What's this?" When the managers answered, "toilet paper," the president would scream that it was two-ply toilet paper that the company couldn't afford. When told of a cracked toilet seat in one of the women's restrooms, he said, "If you don't like sitting on that seat, you can stand up like I do!"[26]

Another characteristic of bureaucratically controlled companies is that, due to their rule- and policy-driven decision making, they are highly resistant to change and slow to respond to customers and competitors. Recall from Chapter 2 that even Max Weber, the German philosopher who is largely credited with popularizing bureaucratic ideals in the late 19th century, referred to bureaucracy as the "iron cage." He said, "Once fully established, bureaucracy is among those social structures which are the hardest to destroy."[27] Of course, the national government, with hundreds of bureaus, agencies, and departments, is typically the largest bureaucracy in most countries. In the United States, because of the thousands of career bureaucrats who staff the offices of the federal government, even presidents and Congress have difficulty making changes. When General Dwight Eisenhower became president, his predecessor, Harry Truman, quipped: "Poor Ike. It won't be a bit like the army. He'll sit here and he'll say, 'Do this, do that,' and nothing will happen."[28]

2.2 Objective Control

In many companies, bureaucratic control has evolved into **objective control**, which is the use of observable measures of employee behavior or output to assess performance and influence behavior. Whereas bureaucratic control focuses on whether policies and rules are followed, objective control focuses on observing and measuring worker behavior or output. Three employees at Kwik Trip Convenience stores were fired for postings they made about the company on the social networking website Facebook. Because the employees' postings were complaints about rude customers and their jobs in general, the company determined that their behavior was not appropriate, especially given that an employee can be let go for treating customers badly in the store.[28]

There are two kinds of objective control: behavior control and output control. **Behavior control** is regulating behaviors and actions that workers perform on the job. The basic assumption of behavior control is that if you do the right things (i.e., the right behaviors) every day, then those things should lead to goal achievement. Behavior control is still management-based, however, which means that managers are responsible for monitoring and rewarding or punishing workers for exhibiting desired or undesired behaviors.

For example, companies that use global positioning satellite (GPS) technology to track where workers are and what they're doing are using behavior control. After getting complaints that his Clinton Township, New Jersey, police officers weren't always on the job, Sergeant John Kuczynski quietly put GPS tracking devices in his officers' cars. Contrary to the officers' reports indicating that they were patrolling streets or using radar to catch speeding drivers, the GPS tracking software soon showed that five officers were sitting for long periods in parking lots or taking long breaks for meals. All five are now barred from law enforcement jobs.[30] Likewise, **Diligent Environmental Services**, a pest-control company in Boca Raton, Florida, uses GPS-enabled cell phones with software that allows employees to indicate when they arrive and then leave a job site (i.e., when they actually start and complete their work). Company president Hu Montague says that the GPS-enabled phones "protect us on hours and wages. Our payroll would be 10 percent higher if we went by how the employees report their hours."[31]

[Objective control] the use of observable measures of worker behavior or outputs to assess performance and influence behavior

[Behavior control] the regulation of the behaviors and actions that workers perform on the job

doing the right thing

Don't Cheat on Travel Expense Reports

Workers are often tempted to pad their travel expense reports. As one puts it, "After a while you feel that they owe it to ya, so the hell with 'em. I'm going to expense it." Frank Navran of the Ethics Resource Center says that people justify this by telling themselves, "I'm not really stealing from the company—I'm just getting back what I feel I'm entitled to." However, Joel Richards, executive vice president and chief administrative officer of El Paso Corporation, says, "You learn a lot about people from their expense reports. If you can't trust an employee to be truthful on an expense report, if you can't trust them with small dollars, how can you trust them with making decisions involving millions of dollars?" So, do the right thing: Don't cheat on your travel expense reports.[32]

Instead of measuring what managers and workers do, **output control** measures the results of their efforts. Whereas behavior control regulates, guides, and measures how workers behave on the job, output control gives managers and workers the freedom to behave as they see fit as long as they accomplish prespecified, measurable results. Output control is often coupled with rewards and incentives. Three things must occur for output control and rewards to lead to improved business results. First, output control measures must be reliable, fair, and accurate. Second, employees and managers must believe that they can produce the desired results. If they don't, then the output controls won't affect their behavior. Third, the rewards or incentives tied to output control measures must truly be dependent on achieving established standards of performance.

For example, Smithfield Foods CEO Joseph Luter doesn't earn a bonus unless pretax profits exceed $100 million. Ray Goldberg, chairman of the company's compensation committee, says that the performance requirements shouldn't "be so low that you get a bonus no matter what you do."[33] Goldberg explains, "We were trying to make sure [Luter's] rewards are based on the ups and downs of the company."[34] So, with pretax profits of $227.1 million, Luter's bonus, based on 2 percent of earnings between $100 million and $300 million, and 3 percent of profits over $300 million, would total just over $2.5 million. For output control to work with rewards, the rewards must truly be at risk if performance doesn't measure up.

2.3 Normative Control

Rather than monitoring rules, behavior, or output, another way to control what goes on in organizations is to use normative control to shape the beliefs and values of the people who work there. With **normative controls**, a company's widely shared values and beliefs guide workers' behavior and decisions. For example, at Nordstrom, a Seattle-based department store chain, one value permeates the entire work force from top to bottom: extraordinary customer service. On the first day of work at Nordstrom, trainees begin their transformation to the "Nordstrom way" by reading

[Output control] the regulation of workers' results or outputs through rewards and incentives

[Normative control] the regulation of workers' behavior and decisions through widely shared organizational values and beliefs

the employee handbook. Sounds boring, doesn't it? But Nordstrom's handbook is printed on one side of a 3-by-5-inch note card. In its entirety, it reads:

> *Welcome to Nordstrom's. We're glad to have you with our company. Our Number One goal is to provide outstanding customer service. Set both your personal and professional goals high. We have great confidence in your ability to achieve them. Nordstrom Rules: Rule #1: Use your good judgment in all situations. There will be no additional rules. Please feel free to ask your department manager, store manager, or division general manager any question at any time.*[35]

Nordstrom sets the retailing industry's benchmark for customer service by using normative control. Here an employee is helping customers in Nordstrom's Costa Mesa, California, store.

According to its website (**http://about.nordstrom.com**), the company's philosophy has remained unchanged for more than 100 years: Offer the best possible service, selection, quality and value. That's it. No lengthy rules. No specifics about what behavior is or is not appropriate. Use your judgment.[36]

Normative controls are created in two ways. First, companies that use normative controls are very careful about who they hire. While many companies screen potential applicants on the basis of their abilities, normatively controlled companies are just as likely to screen potential applicants based on their attitudes and values. For example, before building stores in a new city, Nordstrom sends its human resource team into town to interview prospective applicants. In a few cities, the company canceled its expansion plans when it could not find enough qualified applicants who embodied the service attitudes and values for which Nordstrom is known. Nordstrom would rather give up potential sales in lucrative markets than do business using people who cannot provide Nordstrom's level of service.[37]

Second, with normative controls, managers and employees learn what they should and should not do by observing experienced employees and by listening to the stories they tell about the company. At Nordstrom, many of these stories, which employees call "heroics," have been inspired by the company motto, "Respond to Unreasonable Customer Requests!"[38] "Nordies," as Nordstrom employees call themselves, like to tell the story about a customer who just had to have a pair of burgundy Donna Karan slacks that had gone on sale but could not find her size. The sales associate who was helping her contacted five nearby Nordstrom stores, but none had the customer's size. So rather than leave the customer dissatisfied with her shopping experience, the sales associate went to her manager for petty cash and then went across the street and paid full price for the slacks at a competitor's store. She then resold them to the customer at Nordstrom's lower sale price.[39] Obviously, Nordstrom would quickly go out of business if this were the norm. Nevertheless, this story makes clear the attitude that drives employee performance at Nordstrom in ways that rules, behavioral guidelines, or output controls could not.

2.4 Concertive Control

Whereas normative controls are based on beliefs that are strongly held and widely shared throughout a company, **concertive controls** are based on beliefs that are shaped and negotiated by work groups.[40] Whereas normative controls are driven by strong organizational cultures, concertive controls usually arise when companies give work groups complete autonomy and responsibility for task completion (see Chapter 10, "Managing Teams," for a complete discussion of the role of autonomy

[Concertive control] the regulation of workers' behavior and decisions through work group values and beliefs

in teams and groups). The most autonomous groups operate without managers and are completely responsible for controlling work group processes, outputs, and behavior. Such groups do their own hiring, firing, worker discipline, work schedules, materials ordering, budget making and meeting, and decision making.

Concertive control is not established overnight. Highly autonomous work groups evolve through two phases as they develop concertive control. In phase one, group members learn to work with each other, supervise each other's work, and develop the values and beliefs that will guide and control their behavior. And because they develop these values and beliefs themselves, work group members feel strongly about following them.

In the steel industry, Nucor was long considered an upstart compared with the "biggies" U.S. Steel and Bethlehem Steel. Today, however, not only has Nucor managed to outlast many other mills, the company has bought out thirteen other mills in the past 5 years. Nucor has a unique culture that gives real power to employees on the line and fosters teamwork throughout the organization. This type of teamwork can be a difficult thing for a newly acquired group of employees to get used to. For example, at Nucor's first big acquisition in Auburn, New York, David Hutchins is a frontline supervisor or "lead man" in the rolling mill, where steel from the furnace is spread thin enough to be cut into sheets. When the plant was under the previous ownership, if the guys doing the cutting got backed up, the guys doing the rolling—including Hutchins—would just take a break. He says, "We'd sit back, have a cup of coffee, and complain: 'Those guys stink.'" It took 6 months to convince the employees at the Auburn plant that the Nucor teamwork way was better than the old way. Now, Hutchins says: "At Nucor, we're not 'you guys' and 'us guys.' It's all of us guys. Wherever the bottleneck is, we go there, and everyone works on it."[41]

The second phase in the development of concertive control is the emergence and formalization of objective rules to guide and control behavior. The beliefs and values developed in phase one usually develop into more objective rules as new members join teams. The clearer those rules, the easier it becomes for new members to figure out how and how not to behave. Before Nucor finalizes an acquisition, it sends a team of long-time employees to the new plant. People at all levels, from managers to steelworkers, visit with their counterparts at the mill being acquired and tell them about the "Nucor way." Getting new employees on board quickly helps preserve everyone's bonus and performance-based pay. By following the program of working together and increasing output, Dave Hutchins saw his annual pay of $53,000 rise to $67,000 the year after Nucor acquired his plant, then to $92,000 only 4 years after that.[42] Again, the key difference in concertive control is that the teams—and not management—enforce these rules. A system based upon team equality is not just a feature of Nucor, but permeates the best companies.

Ironically, concertive control may lead to even more stress for workers to conform to expectations than bureaucratic control. Under bureaucratic control, most workers only have to worry about pleasing the boss. But with concertive control, their behavior has to satisfy the rest of their team members. For example, one team member says, "I don't have to sit there and look for the boss to be around; and if the boss is not around, I can sit there and talk to my neighbor or do what I want. Now the whole team is around me and the whole team is observing what I'm doing."[43] Plus, with concertive control, team members have a second, much more stressful role to perform: that of making sure that their team members adhere to team values and rules.

"At Nucor, we're not 'you guys' and 'us guys.' It's all of us guys. Wherever the bottleneck is, we go there, and everyone works on it."

2.5 Self-Control

Self-control, also known as **self-management**, is a control system in which managers and workers control their own behavior.[44] Self-control does not result in anarchy, in which everyone gets to do whatever he or she wants. In self-control or self-management,

[Self-control (self-management)] a control system in which managers and workers control their own behavior by setting their own goals, monitoring their own progress, and rewarding themselves for goal achievement

leaders and managers provide workers with clear boundaries within which they may guide and control their own goals and behaviors.[45] Leaders and managers also contribute to self-control by teaching others the skills they need to maximize and monitor their own work effectiveness. In turn, individuals who manage and lead themselves establish self-control by setting their own goals, monitoring their own progress, rewarding or punishing themselves for achieving or for not achieving their self-set goals, and constructing positive thought patterns that remind them of the importance of their goals and their ability to accomplish them.[46]

For example, let's assume you need to do a better job of praising and recognizing the good work that your staff does for you. You can use goal setting, self-observation, and self-reward to manage this behavior on your own. For self-observation, write "praise/recognition" on a 3-by-5-inch card. Put the card in your pocket. Put a check on the card each time you praise or recognize someone. (Wait until the person has left before you do this.) Keep track for a week. This serves as your baseline or starting point. Simply keeping track will probably increase how often you do this. After a week, assess your baseline or starting point and then set a specific goal. For instance, if your baseline was twice a day, you might set a specific goal to praise or recognize others' work five times a day. Continue monitoring your performance with your cards. Once you've achieved your goal every day for a week, give yourself a reward (perhaps a CD, a movie, lunch with a friend at a new restaurant) for achieving your goal.[47]

As you can see, the components of self-management, self-set goals, self-observation, and self-reward have their roots in the motivation theories you read about in Chapter 13. The key difference, though, is that the goals, feedback, and rewards originate from employees themselves and not from their managers or organizations.

REVIEW 2

Control Methods The five methods of control are bureaucratic, objective, normative, concertive, and self-control (self-management). Bureaucratic and objective controls are top-down, management-based, and measurement-based. Normative and concertive controls represent shared forms of control because they evolve from company-wide or team-based beliefs and values. Self-control, or self-management, is a control system in which managers turn over much, but not all, control to the individuals themselves.

Bureaucratic control is based on organizational policies, rules, and procedures. Objective controls are based on reliable measures of behavior or outputs. Normative control is based on strong corporate beliefs and careful hiring practices. Concertive control is based on the development of values, beliefs, and rules in autonomous work groups. Self-control is based on individuals' setting their own goals, monitoring themselves, and rewarding or punishing themselves with respect to goal achievement.

Each of these control methods may be more or less appropriate depending on the circumstances. Examine Exhibit 16.3 to find out when each of these five control methods should be used.

3 WHAT TO CONTROL?

In the first section of this chapter, we discussed the basics of the control process and the fact that control isn't always worthwhile or possible. In the second section, we looked at the various ways in which control can be obtained. In this third and final section, we address an equally important issue: What should managers control? Costs? Quality? Customer satisfaction? The way managers answer this question has critical implications for most businesses.

EXHIBIT 16.3 When to Use Different Methods of Control

BUREAUCRATIC CONTROL	• When it is necessary to standardize operating procedures • When it is necessary to establish limits
BEHAVIOR CONTROL	• When it is easier to measure what workers do on the job than what they accomplish on the job • When "cause-effect" relationships are clear, that is, when companies know which behaviors will lead to success and which won't • When good measures of worker behavior can be created
OUTPUT CONTROL	• When it is easier to measure what workers accomplish on the job than what they do on the job • When good measures of worker output can be created • When it is possible to set clear goals and standards for worker output • When "cause-effect" relationships are unclear
NORMATIVE CONTROL	• When organizational culture, values, and beliefs are strong • When it is difficult to create good measures of worker behavior • When it is difficult to create good measures of worker output
CONCERTIVE CONTROL	• When responsibility for task accomplishment is given to autonomous work groups • When management wants workers to take "ownership" of their behavior and outputs • When management desires a strong form of worker-based control
SELF-CONTROL	• When workers are intrinsically motivated to do their jobs well • When it is difficult to create good measures of worker behavior • When it is difficult to create good measures of worker output • When workers have or are taught self-control and self-leadership skills

In grocery stores where profit margins are thin, competitors are aggressive, and customers are price sensitive, chains have long focused on controlling costs. By having beef carcasses presliced into larger segments and by switching to suppliers who delivered prepackaged frozen poultry and pork, ready to put in display cases, they were able to shrink their meat-cutting staff and lower costs. But by controlling costs alone, grocery stores severed the traditional service relationship between meat cutters and customers. Realizing that they overcorrected on costs at the expense of service, many grocers are now putting their meat cutters back out front to help customers. **Winn-Dixie's** meat cutters watch cooking videos. Supervalu's meat cutters now have thick "speak the language of beef" binders to teach them how to answer customers' questions. Paul Henry, a meat cutter at **Fresh Seasons Markets**, says that people ask him how to season roasts, how long to cook them, and what vegetables to serve with them. Says Henry, "I don't think people look at us as a chef, but they expect us to have the knowledge of a chef."[48]

If you control for just one thing, such as costs, as many grocers have done in their meat departments, then other dimensions like marketing, customer service, and quality are likely to suffer. But if you try to control for too many things, then managers and employees become confused about what's really important. In the end, successful companies find a balance that comes from doing three or four things right, like managing costs, providing value, and keeping customers and employees satisfied.

After reading this section, you should be able to explain **3.1 the balanced scorecard approach to control and how companies can achieve balanced control of company performance by choosing to control 3.2 budgets, cash flows, and economic value added; 3.3 customer defections; 3.4 quality;** and **3.5 waste and pollution.**

3.1 The Balanced Scorecard

Most companies measure performance using standard financial and accounting measures such as return on capital, return on assets, return on investments, cash flow, net income, and net margins. The **balanced scorecard** encourages managers to look beyond such traditional financial measures to four different perspectives on company performance. How do customers see us (the customer perspective)? At what must we excel (the internal perspective)? Can we continue to improve and create value (the innovation and learning perspective)? How do we look to shareholders (the financial perspective)?[49]

The balanced scorecard has several advantages over traditional control processes that rely solely on financial measures. First, it forces managers at each level of the company to set specific goals and measure performance in each of the four areas. For example, Exhibit 16.4 shows that Southwest Airlines uses nine different measures in its balanced scorecard in order to determine whether it is meeting the standards it has set for itself in the control process. Of those, only three—market value, seat revenue, and plane lease costs (at various compounded annual growth rates, or CAGR)—are standard financial measures of performance. In addition, Southwest measures its Federal Aviation Administration (FAA) on-time arrival rating and the cost of its airfares compared with those of competitors (customer perspective); how much time each plane spends on the ground after landing and the percentage of planes that depart on time (internal business perspective); and the percentage of its ground crew workers, such as mechanics and luggage handlers, who own company stock and have received job training (learning perspective).

[Balanced scorecard] measurement of organizational performance in four equally important areas: finances, customers, internal operations, and innovation and learning

[Suboptimization] performance improvement in one part of an organization but only at the expense of decreased performance in another part

The second major advantage of the balanced scorecard approach to control is that it minimizes the chances of **suboptimization**, which occurs when performance improves in one area at the expense of decreased performance in others. Jon Meliones, chief medical director at Duke Children's Hospital, says, "We explained

the [balanced scorecard] theory to clinicians and administrators like this . . . if you sacrifice too much in one quadrant to satisfy another, your organization as a whole is thrown out of balance. We could, for example, cut costs to improve the financial quadrant by firing half the staff, but that would hurt quality of service, and the customer quadrant would fall out of balance. Or we could increase productivity in the internal business quadrant by assigning more patients to a nurse, but doing so would raise the likelihood of errors—an unacceptable trade-off."[50] Likewise, **Toyota's** president, Akio Toyoda, admits that the company's all-out-push to become the world's largest car maker might have come at the expense of product quality, bloated inventories, and huge financial losses. As a result, he has vowed to rebalance Toyota's priorities.[51]

Let's examine some of the ways in which companies are controlling the four basic parts of the balanced scorecard: the financial perspective (budgets, cash flows, and economic value added), the customer perspective (customer defections), the internal perspective (total quality management), and the innovation and learning perspective (waste and pollution).

3.2 The Financial Perspective: Controlling Budgets, Cash Flows, and Economic Value Added

The traditional approach to controlling financial performance focuses on accounting tools such as cash flow analysis, balance sheets, income statements, financial ratios, and budgets. **Cash flow analysis** predicts how changes in a business will affect its ability to take in more cash than it pays out. **Balance sheets** provide a snapshot of a company's financial position at a particular time (but not the future). **Income statements**, also called profit and loss statements, show what has happened to an organization's income, expenses, and net profit (income less expenses) over a period of time. Exhibit 16.5 shows the basic steps or parts for cash flow analyses, balance sheets, and income statements. **Financial ratios** are typically used to track a business's liquidity (cash), efficiency, and profitability over time compared with other businesses in its industry. Exhibit 16.6 lists a few of the most common financial ratios and explains how they are calculated, what they mean, and when to use them. Finally, **budgets** are used to project costs and revenues, prioritize and control spending, and ensure that expenses don't exceed available funds and revenues. Exhibit 16.7 reviews the different kinds of budgets managers can use to track and control company finances.

By themselves, none of these tools—cash flow analyses, balance sheets, income statements, financial ratios, or budgets—tell the whole financial story of a business.

By themselves, none of these tools—cash flow analyses, balance sheets, income statements, financial ratios, or budgets—tell the whole financial story of a business. They must be used together when assessing a company's financial performance. Since these tools are reviewed in detail in your accounting and finance classes, only a brief overview is provided here. Still, these are necessary tools for controlling organizational finances and expenses, and they should be part of your business toolbox. Unfortunately, most managers don't have a good understanding of these accounting tools even though they should.[52] When Boeing's new chief financial officer attended her first company retreat with other Boeing executives, she assumed that her discussion of financial ratios, like those shown in Exhibit 16.6, would be a

[Cash flow analysis] a type of analysis that predicts how changes in a business will affect its ability to take in more cash than it pays out

[Balance sheets] accounting statements that provide a snapshot of a company's financial position at a particular time

[Income statements] accounting statements, also called "profit and loss statements," that show what has happened to an organization's income, expenses, and net profit over a period of time

[Financial ratios] calculations typically used to track a business's liquidity (cash), efficiency, and profitability over time compared to other businesses in its industry

[Budgets] quantitative plans through which managers decide how to allocate available money to best accomplish company goals

EXHIBIT 16.5 Basic Accounting Tools for Controlling Financial Performance

STEPS FOR A BASIC CASH FLOW ANALYSIS
1. Forecast sales (steady, up, or down).
2. Project changes in anticipated cash inflows (as a result of changes).
3. Project anticipated cash outflows (as a result of changes).
4. Project net cash flows by combining anticipated cash inflows and outflows.
PARTS OF A BASIC BALANCE SHEET (ASSETS = LIABILITIES + OWNER'S EQUITY)
1. Assets a. Current Assets (cash, short-term investment, marketable securities, accounts receivable, etc.) b. Fixed Assets (land, buildings, machinery, equipment, etc.)
2. Liabilities a. Current Liabilities (accounts payable, notes payable, taxes payable, etc.) b. Long-Term Liabilities (long-term debt, deferred income taxes, etc.)
3. Owner's Equity a. Preferred stock and common stock b. Additional paid-in capital c. Retained earnings
BASIC INCOME STATEMENT
SALES REVENUE − sales returns and allowances + other income = NET REVENUE − cost of goods sold (beginning inventory, costs of goods purchased, ending inventory) = GROSS PROFIT − total operating expenses (selling, general, and administrative expenses) = INCOME FROM OPERATIONS − interest expense = PRETAX INCOME − income taxes = NET INCOME

boring review for everyone present. Afterward, she was shocked when dozens of the 280 executives attending the retreat told her that for the very first time they finally understood what the formulas meant.[53]

If you, like those experienced executives, struggle to understand how financial ratios can be used where you work, you might find help in the following books: *Accounting the Easy Way*, by Peter J. Eisen; *Accounting for Dummies* and *How to Read a Financial Report: Wringing Vital Signs Out of the Numbers*, both by John A. Tracy; *Schaum's Quick Guide to Business Formulas: 201 Decision-Making Tools for Business, Finance, and Accounting Students*, by Joel G. Siegel, Jae K. Shim, and Stephen W. Hartman; *The Vest-Pocket Guide to Business Ratios*, by Michael R. Tyran; *Essential Managers: Managing Budgets*, by Stephen Brookson; or *Forecasting Budgets: 25 Keys to Successful Planning (The New York Times Pocket MBA Series)*, by Norman Moore and Grover Gardner.

Though no one would dispute the importance of cash flow analyses, balance sheets, income statements, financial ratios, or budgets for determining the financial health of a business, accounting research also indicates that the complexity and sheer amount of information contained in these accounting tools can shut down the brain and glaze over the eyes of even the most experienced manager.[54] Sometimes there's

EXHIBIT 16.6 Common Financial Ratios

RATIONS	FORMULA	WHAT IT MEANS	WHEN TO USE
LIQUIDITY RATIONS			
Current Ratio	Current Assets / Current Liabilities	• Whether you have enough assets on hand to pay for short-term bills and obligations. • Higher is better. • Recommended level is two times as many current assets as current liabilities.	• Track monthly and quarterly. • Basic measure of your company's health.
Quick (Acid Test) Ratio	(Current Assets − Inventories) / Current Liabilities	• Stricter than current ratio • Whether you have enough (i.e., cash) to pay short-term bills and obligations. • Higher is better. • Recommended level is one or higher.	• Track monthly. • Also calculate quick ratio with potential customers to evaluate whether they're likely to pay you in a timely manner.
LEVERAGE RATIOS			
Debt to Equity	Total Liabilities / Total Equity	• Indicates how much the company is leveraged (in debt) by comparing what is owed (liabilities) with what is owned (equity). • Lower is better. A high debt-to-equity ratio could indicate that the company has too much debt. • Recommended level depends on industry.	• Track monthly. • Lenders often use this to determine the creditworthiness of a business (i.e., whether to approve additional loans).
Debt Coverage	(Net Profit + Noncash Expense) / Debt	• Indicates how well cash flow covers debt payments. • Higher is better.	• Track monthly. • Lenders look at this ratio to determine if there is adequate cash to make loan payments.
EFFICIENCY RATIOS			
Inventory Turnover	Cost of Goods Sold / Inventory Average Value of Inventory	• Whether you're making efficient use of inventory. • Higher is better, indicating that inventory (dollars) isn't purchased (spent) until needed. • Recommended level depends on industry.	• Track monthly by using a 12-month rolling average.
Average Collections Period	Accounts Receivable / (Annual Net Credit Sales Divided by 365)	• Shows on average how quickly your customers are paying their bills. • Lower is better. • Recommended level is no more than 15 days longer than credit terms. If credit is net 30 days, then average should not be longer than 45 days.	• Track monthly. • Use to determine how long company's money is being tied up in customer credit.
PROFITABILITY RATIOS			
Gross Profit Margin	Gross Profit / Total Sales	• Shows how efficiently a business is using its materials and labor in the production process. • Higher is better, indicating that a profit can be made if fixed costs are controlled.	• Track monthly. • Analyze when unsure about product or service pricing. • Low margin compared with competitors means you're underpricing.
Return on Equity	Net Income/Owner's Equity	• Shows what was earned on your investment in the business during a particular period. Often called "return on investment." • Higher is better.	• Track quarterly and annually. • Use to compare what you might have earned on the stock market, bonds, or government Treasury bills during the same period.

EXHIBIT 16.7 Common Kinds of Budgets

Revenue Budgets—used to project or forecast future sales.	• Accuracy of projection depends on economy, competitors, sales force estimates, etc. • Determined by estimating future sales volume and sales prices for all products and services
Expense Budgets—used within departments and divisions to determine how much will be spent on various supplies, projects, or activities.	• One of the first places that companies look for cuts when trying to lower expenses
Profit Budgets—used by profit centers, which have "profit and loss" responsibility.	• Profit budgets combine revenue and expense budgets into one budget • Typically used in large businesses with multiple plants and divisions
Cash Budgets—used to forecast how much cash a company will have on hand to meet expenses.	• Similar to cash flow analyses • Used to identify cash shortfalls, which must be covered to pay bills, or cash excesses, which should be invested for a higher return
Capital Expenditure Budgets—used to forecast large, long-lasting investments in equipment, buildings, and property.	• Help managers identify funding that will be needed to pay for future expansion or strategic moves designed to increase competitive advantage
Variable Budgets—used to project costs across varying levels of sales and revenues.	• Important because it is difficult to accurately predict sales revenue and volume • Lead to more accurate budgeting with respect to labor, materials, and administrative expenses, which vary with sales volume and revenues • Build flexibility into the budgeting process

simply too much information to make sense of. The balanced scorecard simplifies things by focusing on one simple question when it comes to finances: How do we look to shareholders? One way to answer that question is through something called economic value added.

Conceptually, **economic value added (EVA)** is not the same thing as profits. It is the amount by which profits exceed the cost of capital in a given year. It is based on the simple idea that capital is necessary to run a business and that capital comes at a cost. Although most people think of capital as cash, once it is invested (i.e., spent), capital is more likely to be found in a business in the form of computers, manufacturing plants, employees, raw materials, and so forth. And just like the interest that a homeowner pays on a mortgage or that a college student pays on a student loan, there is a cost to that capital.

The most common costs of capital are the interest paid on long-term bank loans used to buy all those resources, the interest paid to bondholders (who lend organizations their money), and the dividends (cash payments) and growth in stock value that accrue to shareholders. EVA is positive when company profits (revenues minus expenses minus taxes) exceed the cost of capital in a given year. In other words, if a business is to truly grow, its revenues must be large enough to cover both short-term costs (annual expenses and taxes) and long-term costs (the cost of borrowing capital from bondholders and shareholders). If you're a bit confused, the late Roberto Goizueta, the former CEO of Coca-Cola, explained it this way: "You borrow money at a certain rate and invest it at a higher rate and pocket the difference. It is simple. It is the essence of banking."[55]

Exhibit 16.8 shows how to calculate EVA. First, starting with a company's income statement, you calculate the net operating profit after taxes (NOPAT) by subtracting taxes owed from income from operations (see Exhibit 16.5 to review an income statement). The NOPAT shown in Exhibit 16.8 is

[Economic value added (EVA)] the amount by which company profits (revenues, minus expenses, minus taxes) exceed the cost of capital in a given year

EXHIBIT 16.8 Calculating Economic Value Added (EVA)

1. Calculate net operating profit after tax (NOPAT).	$3,500,000
2. Identify how much capital the company has invested (i.e., spent).	$16,800,000
3. Determine the cost (i.e., rate) paid for capital (usually between 5 and 13 percent).	10 percent
4. Multiply capital used (Step 2) times cost of capital (Step 3).	(10% × $16,800,000) = $1,680,000
5. Subtract the total dollar cost of capital from net profit after taxes.	$3,500,000 NOPAT −$1,680,000 Total cost of capital $1,820,000 Economic value added

$3,500,000. Second, identify how much capital the company has invested (i.e., spent). Total liabilities (what the company owes) less accounts payable and less accrued expenses, neither of which you pay interest on, provides a rough approximation of this amount. In Exhibit 16.8, total capital invested is $16,800,000. Third, calculate the cost (i.e., rate) paid for capital by determining the interest paid to bondholders (who lend organizations their money), which is usually somewhere between 5 and 8 percent, and the return that stockholders want in terms of dividends and stock price appreciation, which is historically about 13 percent. Take a weighted average of the two to determine the overall cost of capital. In Exhibit 16.8, the cost of capital is 10 percent. Fourth, multiply the total capital ($16,800,000) from Step 2 by the cost of capital (10 percent) from Step 3. In Exhibit 16.8, this amount is $1,680,000. Fifth, subtract the total dollar cost of capital in Step 4 from the NOPAT in Step 1. In Exhibit 16.8, this value is $1,820,000, which means that our example company has created economic value or wealth this year. If our EVA number had been negative, meaning that the company didn't make enough profit to cover the cost of capital from bondholders and shareholders, then the company would have destroyed economic value or wealth by taking in more money than it returned.[56]

Why is EVA so important? First and most importantly, because it includes the cost of capital, it shows whether a business, division, department, profit center, or product is really paying for itself. The key is to make sure that managers and employees can see how their choices and behavior affect the company's EVA. For example, because of EVA training and information systems, factory workers at Herman Miller, a leading office furniture manufacturer, understand that using more efficient materials, such as less expensive wood-dust board instead of real wood sheeting, contributes an extra dollar of EVA from each desk the company makes.[57]

Second, because EVA can easily be determined for subsets of a company such as divisions, regional offices, manufacturing plants, and sometimes even departments, it makes managers and workers at all levels pay much closer attention to their segment of the business. When company offices were being refurbished at Genesco, a shoe company, a worker who had EVA training handed CEO Ben Harris $4,000 in cash. The worker explained that he now understood the effect his job had on the company's ability to survive and prosper. Since the company was struggling, he sold the old doors that had been removed during remodeling so that the company could have the cash.[58] In other words, EVA motivates managers and workers to think like small-business owners who must scramble to contain costs and generate enough business to meet their bills each month. And, unlike many kinds of financial controls, EVA doesn't specify what should or should not be done to improve performance. Thus, it encourages managers and workers to be creative in looking for ways to improve EVA performance.

Exhibit 16.9 shows the top ten U.S. companies in terms of EVA and market value added (MVA), as measured by the EVA Dimenions EVA/MVA Annual Rankings. Remember that EVA is the amount by which profits exceed the cost of capital in a given year. So the more that EVA exceeds the total dollar cost of capital, the better a company has used investors' money that year. MVA is simply the cumulative EVA created by a company over time. Thus, MVA indicates how much value or wealth a company has created or destroyed in total during its existence. As indicated by the MVA figures in Exhibit 16.9, over time the top ten companies have created considerable wealth, ranging from almost $101 billion at Cisco to $207 billion at Microsoft; thus, they have returned substantially more than they took in. All of the top ten in MVA had positive EVAs in the most recent year. However, this doesn't always happen. Good businesses sometimes have years with negative EVAs.

3.3 The Customer Perspective: Controlling Customer Defections

The second aspect of organizational performance that the balanced scorecard helps managers monitor is customers. It does so by forcing managers to address the question, "How do customers see us?" Unfortunately, most companies try to answer this question through customer satisfaction surveys, but these are often misleadingly positive. Most customers are reluctant to talk about their problems because they don't know who to complain to or think that complaining will not do any good. Indeed, a study by the federal Office of Consumer Affairs found that 96 percent of unhappy customers never complain to anyone in the company.[59]

One reason that customer satisfaction surveys can be misleading is that sometimes even very satisfied customers will leave to do business with competitors. Another challenge is getting effective feedback when there is a problem. Jon Piot, cofounder of Impact Innovations Group, an IT solutions provider, sent a team of twenty employees to work with a client at the client's facility. He thought everything was going well: All of the feedback from the client's CIO (chief information officer) was positive. So Piot was shocked when the client did not renew Impact's contract. As it turned out, the rest of the client's organization was very dissatisfied with the

performance of Impact's employees. Piot says, "This was pretty painful for us; we had a pretty big team there, and it was a prestigious client."[60]

Rather than poring over customer satisfaction surveys from current customers, studies indicate that companies may do a better job of answering the question "How do customers see us?" by closely monitoring **customer defections**, that is, by identifying which customers are leaving the company and measuring the rate at which they are leaving. Unlike the results of customer satisfaction surveys, customer defections and retention do have a great effect on profits.

For example, very few managers realize that obtaining a new customer costs ten times as much as keeping a current one. In fact, the cost of replacing old customers with new ones is so great that most companies could double their profits by increasing the rate of customer retention by just 5 to 10 percent per year.[61] Retaining customers obviously means having more customers, but how much more?

Consider two companies starting with a customer base of 100,000 customers and an acquisition rate of 20 percent (i.e., yearly each company's customer base grows by 20 percent). Assuming company B has a higher retention rate of just 5 percent (90 percent retention rate for company B versus an 85 percent retention rate for company A), company B will double its customer base around the 9th year, while it will take company A slightly more than 15 years to double its customer base. On average, this means company B also profited by a higher percentage. [62] And if a company can keep a customer for life, the benefits are even larger. According to Stew Leonard, owner of the Connecticut-based Stew Leonard's grocery store chain: "The lifetime value of a customer in a supermarket is about $246,000. Every time a customer comes through our front door I see, stamped on their forehead in big red numbers, '$246,000.' I'm never going to make that person unhappy with me. Or lose her to the competition."[63]

STEW LEONARD, FOUNDER, STEW LEONARD'S

Beyond the clear benefits to the bottom line, the second reason to study customer defections is that customers who have left are much more likely than current customers to tell you what you are doing wrong. Perhaps the best way to tap into this source of good feedback is to have top-level managers from various departments talk directly to customers who have left. It's also worthwhile to have top managers talk to dissatisfied customers who are still with the company. Every day, John Chambers, CEO of Cisco Systems, has fifteen to twenty voice mails from dissatisfied Cisco customers forwarded to his phone. Chambers says, "E-mail would be more efficient, but I want to hear the emotion, I want to hear the frustration, I want to hear the caller's level of comfort with the strategy we're employing. I can't get that through e-mail." Likewise, at Vanguard, a leading investment fund company, CEO Jack Brennan visits the customer call center and, working alongside call representatives, answers customer questions and addresses customer complaints.[64] Some might argue that it's a waste of valuable executive time to have upper-level managers make or listen to these calls, but there's no faster way for the people in charge to learn what needs to be done than to hear it directly from customers who are unhappy with the company's performance.

An Old Standby Is a Hot Trend

Vertical integration is making a comeback. In an effort to better control resources—namely, raw materials—some companies are buying suppliers who furnish critical components for important product lines. In 2006, Armor Holdings bought the North Carolina textile manufacturer that supplied the super-strong fibers used in its armored cars. Toyota took control of a key battery supplier for hybrid gasoline-electric engines, and Bridgestone Tire bought a rubber plantation in Indonesia. Watch the business press for articles on companies expanding vertically rather than horizontally.

Finally, companies that understand why customers leave can not only take steps to fix ongoing problems but can also identify which customers are likely to leave and can make changes to prevent them from leaving.

3.4 The Internal Perspective: Controlling Quality

The third part of the balanced scorecard, the internal perspective, consists of the processes, decisions, and actions that managers and workers make within the organization. In contrast to the financial perspective of EVA and the outward-looking customer perspective, the internal perspective focuses on internal processes and systems that add-value to the organization. For McDonald's, it could be processes and systems that enable the company to provide consistent, quick, low-cost food. For Toyota, it could be reliability—when you turn on your car it starts, no matter whether the car has 20,000 or 200,000 miles on it. Yet no matter what area a company chooses, the key is to excel in that area. Consequently, the internal perspective of the balanced scorecard usually leads managers to a focus on quality.

Quality is typically defined and measured in three ways: excellence, value, and conformance to expectations.[65] When the company defines its quality goal as *excellence*, managers must try to produce a product or service of unsurpassed performance and features. For example, Singapore Airlines is the best airline in the world by almost any standard. It has been named "best" 18 years in a row by readers of *Conde Nast Traveler* magazine.[66] It has also received various "best airline" awards from the *Pacific Asia Travel Association, Travel and Leisure, Business Traveler, Conde Nast Traveler,* and *Fortune*.[67] Whereas many airlines try to cram passengers into every available inch on a plane, Singapore Airlines delivers creature comforts to encourage repeat business and customers willing to pay premium prices. On its newer planes, the first-class cabin is divided into eight private mini-rooms, each with an unusually wide leather seat that folds down flat for sleeping, a 23-inch LCD TV that doubles as a computer monitor, and an adjustable

table. These amenities and services are common for private jets but truly unique in the commercial airline industry.[68] Singapore Airlines was the first airline, in the 1970s, to introduce a choice of meals, complimentary drinks, and earphones in coach class. It was the first to introduce worldwide video, news, telephone, and fax services and the first to feature personal video monitors for movies, news, documentaries, and games. Singapore Airlines has had AC power for laptop computers for some time, and recently it became the first airline to introduce on-board, high-speed Internet access.

Value is the customer perception that the product quality is excellent for the price offered. At a higher price, for example, customers may perceive the product to be less of a value. When a company emphasizes value as its quality goal, managers must simultaneously control excellence, price, durability, or other features of a product or service that customers strongly associate with value. Aldi, a grocery store company with 7,500 stores worldwide, operates on the single principle of bringing maximum value to customers. Aldi stocks only 3 percent of the products that a typical grocery store carries, and most of its products are store brands. Customers bring their own bags and pick products off pallets rather than store shelves. Yet Aldi's store brands have consistently beaten the name-brand rivals in taste and quality, and Aldi was voted the most trusted name in the grocery business in Germany.[69]

When a company defines its quality goal as conformance to specifications, employees must base decisions and actions on whether services and products measure up to the standard. In contrast to excellence and value-based definitions of quality that can be somewhat ambiguous, measuring whether products and services are "in spec" is relatively easy. Furthermore, while conformance to specifications (e.g., precise tolerances for a part's weight or thickness) is usually associated with manufacturing, it can be used equally well to control quality in nonmanufacturing jobs. Exhibit 16.10 shows a checklist that a cook or restaurant owner would use to ensure quality when buying fresh fish.

The way in which a company defines quality affects the methods and measures that workers use to control quality. Accordingly, Exhibit 16.11 shows the advantages and disadvantages associated with the excellence, value, and conformance to specification definitions of quality.

EXHIBIT 16.11 Advantages and Disadvantages of Different Measures of Quality

QUALITY MEASURE	ADVANTAGES	DISADVANTAGES
Excellence	Promotes clear organizational vision.	Provides little practical guidance for managers.
	Being/providing the "best" motivates and inspires managers and employees.	Excellence is ambiguous. What is it? Who defines it?
Value	Appeals to customers, who "know excellence when they see it."	Difficult to measure and control.
	Customers recognize differences in value.	Can be difficult to determine what factors influence whether a product/service is seen as having value.
	Easier to measure and compare whether products/services differ in value.	Controlling the balance between excellence and cost (i.e., affordable excellence) can be difficult.
Conformance to Specifications	If specifications can be written, conformance to specifications is usually measurable.	Many products/services cannot be easily evaluated in terms of conformance to specifications.
	Should lead to increased efficiency.	Promotes standardization, so may hurt performance when adapting to changes is more important.
	Promotes consistency in quality.	May be less appropriate for services, which are dependent on a high degree of human contact.

3.5 The Innovation and Learning Perspective: Controlling Waste and Pollution

The last part of the balanced scorecard, the innovation and learning perspective, addresses the question "Can we continue to improve and create value?" Thus, the innovation and learning perspective involves continuous improvement in ongoing products and services (discussed in Chapter 18), as well as relearning and redesigning the processes by which products and services are created (discussed in Chapter 7). Since these are discussed in more detail elsewhere in the text, this section reviews an increasingly important topic, waste and pollution minimization. Exhibit 16.12 shows the four levels of waste minimization, ranging from waste disposal, which produces the smallest minimization of waste, to waste prevention and reduction, which produces the greatest minimization.[70]

©STEPHEN CHERNIN/GETTY IMAGES

The goals of the top level, *waste prevention and reduction*, are to prevent waste and pollution before they occur or to reduce them when they do occur. For example, one small way to reduce waste is to make more right turns than left turns. Right turns, which are faster than left turns, speed up trips and reduce needless idling time waiting to turn. United Parcel Service (UPS) uses a software program that helps drivers plan routes with only right turns to save driving time. The strategy also reduces environmental waste since UPS saves 3 million gallons of

fuel each year and reduces CO2 emissions by 31,000 metric tons.[71] There are three strategies for waste prevention and reduction:

1. *Good housekeeping*—performing regularly scheduled preventive maintenance for offices, plants, and equipment. Examples of good housekeeping include fixing leaky valves quickly to prevent wasted water and making sure machines are running properly so that they don't use more fuel than necessary. Doug Goulding, a maintenance supervisor at Canada Cordage, a producer of synthetic and natural fiber ropes, reduced the water bills at the company's factory in Kitchener, Canada, from $1,200 to $200 per month by systematically plugging leaks in machines and pipes and installing water-saving devices.[72]
2. *Material/product substitution*—replacing toxic or hazardous materials with less harmful materials. As part of its Pollution Prevention Pays program over the last 30 years, 3M eliminated 2.2 billion pounds of pollutants and saved $1 billion by using benign substitutes for toxic solvents in its manufacturing processes.[73]
3. *Process modification*—changing steps or procedures to eliminate or reduce waste. Terracycle is a manufacturer of plant food made from the castings (i.e., the droppings) of red worms that have feasted on various types of organic waste. But rather than package the plant food in new bottles, Terracycle packages its product in used beverage containers and ships the bottles in recycled boxes to the retailers. The company's entire process operation is 100 percent geared toward reducing or eliminating waste.[74]

At the second level of waste minimization, *recycle and reuse*, wastes are reduced by reusing materials as long as possible or by collecting materials for on- or off-site recycling. Recycline recycles more than 50,000 pounds of plastic each year and provides recycled material to business customers and recyclable products to consumers. The company recycles all manner of plastic waste, including its own products, into new toothbrushes, plastic dinnerware, razors, and toothpicks. In addition to the waste plastic the company receives from other manufacturers and garbage collectors, Recycline receives about 15 percent of its own products back each year for recycling, which it heats to over 400 degrees to thoroughly sterilize. Partners like Stonyfield Farm, a maker of yogurt, donate their plastic cups to Recycline and give Recycline advertising space on their lids.[75]

A growing trend in recycling is *design for disassembly*, where products are designed from the start for easy disassembly, recycling, and reuse once they are no longer usable. For example, the European Union (EU) is moving toward prohibiting companies from selling products unless most of the product and its packaging can be recycled.[76] Since companies, not consumers, will be held responsible for recycling the products they manufacture, they must design their products from the start with recycling in mind.[77] At reclamation centers throughout Europe, companies will have to be able to recover and recycle 80 percent of the parts that go into their original products.[78] Under the EU's end-of-life vehicle program, all cars built in Europe since June 2002 are subject to the 80 percent requirement, which rose to 85 percent in 2006 and will be 95 percent by 2015 for autos. Moreover, the EU requires auto manufacturers to pay to recycle all the cars they made between 1989 and 2002.[79] Roughly 160 million cars in Europe are covered by these strict end-of-life regulations. Although rising prices for recycled steel have made the regulations less burdensome than they might have been otherwise, the high level of composite plastics that make up today's lighter, more environmentally friendly cars are more difficult to recycle. One critic calls the 95 percent threshold "utopian," but others are more optimistic. Chrysler, for example, has begun to replace fiberglass in some of its car exterior panels with a type of banana-plant fiber.[80]

© ISTOCKPHOTO/JASON LUGO

At the third level of waste minimization, *waste treatment*, companies use biological, chemical, or other processes to turn potentially harmful waste into harmless compounds or useful by-products. In Africa, animal slaughterhouses often dump untreated animal waste into rivers and lakes. This spreads disease and generates methane and carbon dioxide—greenhouse gases that contribute to global warming. Unlike traditional treatment processes, **Cows to Kilowatts Partnership Limited** uses an advanced anaerobic reactor to turn animal blood and waste into biogas, which is then processed and compressed into cooking gas or fuel to run household generators. Even the leftover sludge can be reused as environmentally friendly fertilizer.[81]

The fourth and lowest level of waste minimization is *waste disposal*. Wastes that cannot be prevented, reduced, recycled, reused, or treated should be safely disposed of in processing plants or in environmentally secure landfills that prevent leakage and contamination of soil and underground water supplies. Contrary to common belief, all businesses,

not just manufacturing firms, have waste disposal problems. For example, with the average computer lasting just 3 years, approximately 60 million computers come out of service each year, creating disposal problems for offices all over the world. But organizations cant't just throw old computers away, since they have lead-containing cathode ray tubes in the monitors, toxic metals in the circuit boards, paint-coated plastic, and metal coatings that can contaminate groundwater.[82] Many companies give old computers and computer equipment to local computer recycling centers that distribute usable computers to nonprofit organizations or safely dispose of lead and other toxic materials. For a fee, companies and consumers can us HP's Planter Partners website to arrange to have their old computer equipment picked up. HP has already recycled 1 billion pounds of electronic products and supplies, diverting them from landfills, and will recover another billion pounds by the end of 2010. [83]

What to Control? Deciding what to control is just as important as deciding whether or how to control. In most companies, performance is measured using financial measures alone. However, the balanced scorecard encourages managers to measure and control company performance from four perspectives: financial, customers, internal operations, and innovation and learning. Traditionally, financial control has been achieved through cash flow analysis, balance sheets, income statements, financial ratios, and budgets. Another way to measure and control financial performance is through economic value added (EVA). Unlike traditional financial measures, EVA helps managers assess whether they are performing well enough to pay the cost of the capital needed to run the business. Instead of using customer satisfaction surveys to measure performance, companies should pay attention to customer defectors, who are more likely to speak up about what the company is doing wrong. Performance of internal operations is often measured in terms of quality, which is defined in three ways: excellence, value, and conformance to expectations. Minimization of waste has become an important part of innovation and learning in companies. The four levels of waste minimization are waste prevention and reduction, recycling and reuse, waste treatment, and waste disposal.

Scoring

Determine your average score for each category by entering your response to each survey item below, as follows. In blanks that say *regular score*, simply enter your response for that item. If your response was a 4, place a 4 in the *regular score* blank. In blanks that say *reverse score*, subtract your response from 7 and enter the result. So if your response was a 4, place a 3 (7 − 4 = 3) in the *reverse score* blank. Total your scores, then compute each average score.

MANAGEMENT DECISION

Controlling Employee Theft

You thought that that shrinkage—loss due to things like general wear and tear, clerical error, or employee theft—was something that only retail managers had to be concerned about. But, as the manager at a small IT firm, you're concerned about the fact that more employees in industries like IT and health care admit to stealing than retail employees do.[85] Of course, you know that doesn't mean it happens more in your industry (it might mean people in your industry are just more honest overall). Still, it's a serious problem on your radar.

That's especially true in a down economy, when some people figure they might be laid off and therefore have little to lose. The stealing is not limited to pens, white out, and toilet paper. You've heard of an employee who resigned, turned in his company documents and equipment, and reported his laptop missing. Only his former employer discovered he was still using it from home to share company processes with the competition. Another employee pilfered laptops from his company and sold them on eBay. You've also heard of abuses of company privileges such as charging a new iPhone for personal use to the company card. Theft can also take the form of an employee messing with the books to make it look like she deserves a bonus when she doesn't or clocking in early for a pal who has not arrived at work yet. Insider fraud, by some estimates, makes up 7 percent of revenues.[86]

You'd like to take steps to control the potential for employee theft at your company. You haven't had any major incidents yet, but you'd like to keep it that way. What's the best way to control this potential problem? Fortunately, there are a lot of options available to you. Monitoring software, which can track file sharing, e-mail, and data transfers, is commonplace. Video systems, fingerprinting software, and expense report software all can help you hold your employees accountable for their actions. But you're not sure this bureaucratic approach is necessarily the best way to go. After all, employees might resent being watched by a corporate "big brother," and you'd like to keep the positive work environment you've built. A Gallup Organization study you read made you think that good leadership alone might be the ticket at your organization. According to this study, profits increase (14 percent over goal, on average), turnover is low, and shrinkage is less at companies where employees are valued, have good relationships with their coworkers, are nurtured, and given what they need to succeed, and receive praise when they do.[87]

Questions

1. To what extent can you control employee theft? Is it reasonable to eliminate it altogether? What is a satisfactory level of shrinkage?
2. The case gives an example of a bureaucratic control method and a method that is probably best classed as concertive. Think of objective and normative solutions to this control problem.
3. From the range of solutions available to you after answering question 2, decide which control method you will adopt at your company. What factors will you consider as you decide?

MANAGEMENT TEAM DECISION

Is H&R Block Taxed to Its Limits?

When you first came to H&R Block 4 years ago, you had a vision: increase the scope of the company and transform it from a simple tax preparation service to a full-service financial services provider.[88] And why not? Block has roughly 17 million customers, and converting only a fraction of them to financial services clients would mean substantial growth for the 60-year-old company. Couple that with the company's recent expansion into mortgage financing, and Block could become a financial services powerhouse.

Eagerly you set about mapping the company's growth. You bought Olde Financial, a discount-brokerage business, and quickly found yourself with around $50 billion in assets under management. You hired financial advisers, and then to get them more clients, you instructed tax preparers to refer new financial prospects to them. Another way you planned

to fuel growth was by aggressively opening new tax preparation outlets. Today, Block has more U.S. storefronts (over 11,000) than Barnes & Noble (2,356), Gap (3,051), and even growth-happy Starbucks (6,409)! Over 1,000 outlets were added just this year to expand coverage during tax-filing season.

Despite all the good ideas, H&R Block is not producing the results you expected. In fact, it is struggling. Assets under management in the financial services division have declined by more than 30 percent since the division was acquired, and its advisers are leaving faster than they can be replaced. Outwardly, you say that the economic upswing is creating more demand for junior advisers, the largest percentage of your financial managers, but you also know that even new advisers are going to follow the money. And the money seems to be flowing out of Block. Mortgage refinancing, which at its peak contributed an incredible 70 percent of pretax income, now contributes only 28 percent per year, or $112 million. Mortgage activity has dropped since the Federal Reserve began increasing interest rates, and competitive pricing among lenders has not subsided as you expected it would.

On the tax front, the company faces serious competition from smaller upstarts like Jackson Hewitt and Liberty Tax Service, which are both experiencing increases in the number of returns prepared at Block's expense. This tax season Jackson Hewitt handled nearly 6 percent more returns than last year. Compare that with Block, which has lost over 1 million customers in the past 3 years. Aggressive cost cutting is minimizing damage to the bottom line, but it is also having some adverse effects, including waits as long as 2 to 3 hours for some customers. Digitally, Block is being surpassed by Intuit's TurboTax software. Even though Intuit's TurboTax costs 50 percent more than Block's competing TaxCut software, Intuit has three times the market share of TaxCut and is growing by double digits each tax season. All this trouble has caused Block's revenues to slide over 5 percent from last year.

As you hang up the phone from yet another apologetic conference call with Wall Street analysts, during which you revised your expectations for earnings per share sharply downward, you sigh and sink back into your chair. You are getting tired of announcing quarterly losses. Plans should be flexible enough to change if expected results don't materialize, but you really believe in the growth strategy. One analyst even said, "It seems like a smart strategy, and they seem to have the right infrastructure, but for some reason it's just not happening." You think to yourself, "There's got to be a way to get things back on track!"

Form a team of four students to answer the following questions.

Questions

1. As a team, identify where more control is needed at H&R Block. Is control in these areas possible? Explain.
2. Build a balanced scorecard for H&R Block that proposes objectives and measures for each the four quadrants of the card (financial, customer, internal, and learning).

PRACTICE BEING A MANAGER

In Control or Control Freak?

Control is one of the most controversial aspects of management. Exercising too much control can foster employee resentment and bureaucratic delays. Exercising too little control can raise employee stress and breed organizational chaos. And not only must managers work to achieve a healthy *level* of control but they must also strive to set controls around the *right targets*. The control process is about more than charts and feedback loops—it is about focusing personal and organizational efforts toward desired outcomes. This exercise will allow you an opportunity to try your hand at developing a control system that is tailored to a particular company and type of work.

Step 1: Get into groups. Your professor will organize your class into teams of three or four students per team. One team will be designated as Company Leadership.

Scenario: Razor's Edge (RE) is a young and growing company that serves the needs of those who engage in extreme sports, adventure/exploration, and guiding services. Some examples of RE's core market include expert/professional mountain climbers, white-water rafting guides, and polar explorers. The founders of RE are the husband and wife team of Dan and Alice Connors, world-famous mountain climbers and explorers. Dan and Alice have both reached the summit of Mount Everest and each is well respected in the rather small

and close-knit community of adventurers and explorers. RE is an eclectic company of employees who, like Dan and Alice, share a passion for adventure and extreme sports. The company not only designs and sells its own lines of specialized products such as mountain-climbing shoes and ropes but also develops software designed to support expedition planning, communication and navigation, and simulation and scenario response (i.e., training tools for guides and newer expedition members).

For the first 5 years of its development, RE did not worry too much about organizational policies or controls. Employees were encouraged to climb, trek, and guide, and attendance issues were addressed on a case-by-case basis. Although officially all employees were given 2 weeks of paid vacation, many employees were allowed to take up to 2 months off at half-pay so that they could complete an expedition. Sick days were jokingly referred to as "mountain flu" days, and it was not unusual for the small company to be thinly staffed on Mondays and Fridays. But in the past 3 years, RE has grown from 25 employees to 85. The company is too big, and the jobs too diverse, for Dan and Alice to deal with each employee request for "expedition time" away from work. And the "mountain flu" has occasionally weakened the company's response to customers. Dan and Alice have also become victims of their own success as they attracted other climbers to join their company—most climbers want time off in the peak climbing seasons. But this also happens to be a peak time for RE orders and service requests.

The company has organized all employees into teams and announced a contest. Each team should come up with an approach for controlling staffing levels to meet or exceed customer expectations for responsiveness, while at the same time preserving RE's tradition as a company of active adventurers and explorers. The company has announced that each member of the employee team that develops the winning solution will receive $2,500 worth of RE gear of their choice.

Step 2: Determine staffing levels. You are a team of workers at RE. Design an approach to controlling daily staffing levels so that RE is able to meet or exceed customer expectations for responsiveness without sacrificing its own identity as a company of adventurers and explorers. Keep in mind that RE is somewhat unusual in that even its accounting staff members (five full-time employees) are experienced adventurers and explorers and are expected to answer customer questions and handle their service needs. You should consider the following elements:

- Paid vacation
- Expedition time
- Sick days and "mountain flu" (Monday/Friday absences)
- Dealing with peak times, and/or most desirable times for vacation or expedition
- Knowing whether customers are pleased with RE's responsiveness to their needs

Step 3: Outline a proposal. Submit a one-page handwritten outline of your proposal to the Company Leadership team.

Step 4: Present the proposal. Each team will briefly present its proposal to the Company Leadership team, and members of the Company Leadership team may ask questions.

Step 5: Vote. The Company Leadership will confer, vote, and announce the winning proposal.

Step 6: Debrief as a class. What tensions confronted you as you worked to design an approach to staffing control for Razor's Edge? What trade-offs and challenges might you anticipate for the company when it implements the winning proposal? In what ways is control related to employee motivation? In what ways is control related to organizational culture? Do you think that the winning RE proposal would be well suited for use by a major outdoor and casual clothing company such as Lands' End? Why or why not?

DEVELOP YOUR CAREER POTENTIAL

Learning from Failure

There is the greatest practical benefit of making a few failures early in life.

—T. H. Huxley

No one wants to fail.[89] Everyone wants to succeed. Nevertheless, some businesspeople believe that failure can have enormous value. At Microsoft, founder Bill Gates encouraged his managers to hire people who have made mistakes in their jobs or careers.

A Microsoft vice president says, "We look for somebody who learns, adapts, and is active in the process of learning from mistakes. We always ask, what was a major failure you had? What did you learn from it?" Another reason that failure is viewed positively is that it is often a sign of risk taking and experimentation, both of which are in short supply in many companies. Harvard Business School professor John Kotter says, "I can imagine a group of executives 20 years ago discussing a candidate for a top job and saying, 'This guy had a big failure when he was 32.' Everyone else would say, 'Yep, yep, that's a bad sign.' I can imagine that same group considering a candidate today and saying, 'What worries me about this guy is that he's never failed.'" Jack Matson, who teaches a class at the University of Michigan called Failure 101, says, "If you are doing something innovative, you are going to trip and fumble. So the more failing you do faster, the quicker you can get to success."

One of the most common mistakes that occurs after failure is the *attribution error*. To *attribute* is to assign blame or credit. When we succeed, we take credit for the success by claiming it was due to our strategies, how we behaved, and how hard we worked. When we fail, however, we ignore our strategies, how we behaved, and how hard we worked (or didn't). Instead, when we fail, we assign the blame to other people, or to the circumstances, or to bad luck. In other words, the basic attribution error is that success is our fault but failure isn't. The disappointment we feel when we fail often prevents us from learning from our failures.

This means that attribution errors disrupt the control process. The three basic steps of control are to set goals and performance standards, to compare actual performance against the performance standards, and to identify and correct performance deviations. When we put all of the blame on external forces rather than our own actions, we stop ourselves from identifying and correcting performance deviations.

Furthermore, by not learning from our mistakes, we make it even more likely that we will fail again. Your task in this exercise is to begin the process of learning from failure. This is not an easy thing to do. When *Fortune* magazine writer Patricia Sellers wrote an article called "So You Fail," she found that most of the people she contacted were reluctant to talk about their failures. She wrote:

> *Compiling this story required months of pleading and letter writing to dozens of people who failed and came back. "If it weren't for the 'F' word, I'd talk," lamented one senior executive who got fired twice, reformed his know-it-all management style, and considered bragging about his current hot streak. Others cringed at hearing the word "failure" in the same breath as "your career."*

Questions

1. Identify and describe a point in your life when you failed. Don't write about simple or silly mistakes. The difference between a failure and a mistake is how bad you felt afterwards. A real failure still makes you cringe when you think about it years later. What was the situation? What were your goals? And how did it turn out?
2. Describe your initial reaction to the failure. Were you shocked, surprised, angry, or depressed? Initially, who or what did you blame for the failure? Explain.
3. One purpose of control is to identify and correct performance deviations. With that in mind, describe three mistakes that you made that contributed to your failure. Now that you've had time to think about it, what could you have done differently to prevent these mistakes? Finally, summarize what you learned from your mistakes that will increase your chances of success the next time around.

Friday Night Lights

In the small town of Odessa, Texas, everyone lives for Friday nights when the high school football team, the Permian Panthers, takes the field. The town is proud of their Panthers, led by quarterback Mike Winchell (Lucas Black) and superstar tailback Boobie Miles (Derek Luke), and they're used to winning. They expect a state championship, and nothing less. When Boobie suffers a career-ending injury in the first game of the season, the team isn't sure they can win without him. But Coach Gary Gaines (Billy Bob Thornton) isn't ready to give up yet. In this clip from the film, Coach Gaines gathers the team around during the half-time break to talk about what success really means and how he wants them to achieve it.

What to Watch for and Ask Yourself

1. The control process begins when managers set goals and create standards. In this scene, what does Coach Gaines state that he expects from the members of his team?
2. Based on the topics discussed in this chapter, what similarities could you draw between what a coach and the manager of a company must do to ensure success for their team?
3. Which method of control do you think most football coaches exert over their teams: bureaucratic, objective, normative, or concertive? Why?

Numi Organic Tea

© CENGAGE

When Brian Durkee shows up at Numi Organic Tea every day to work as the director of operations, he's on a mission to make his company a worldwide leader in sustainable supply chain management. Setting up and maintaining an efficient enterprise resource planning (ERP) system turned out to be much easier than converting Chinese suppliers to profoundly different farming methods and ways of doing business. Numi had just begun to implement an ERP system with integrated inventory management and accounting when Durkee joined the company. In this video, he explains how Numi is dedicated to sustainable supply chain management, eliminating waste, and using recycled materials.

What to Watch for and Ask Yourself

1. The control process begins when managers decide what is most important to the company. What are the main three things that Durkee says that Numi focuses on?
2. What are some of Numi's practices that aim to minimize waste?
3. What are some of the challenges that Numi faces when trying to maintain product standards?

What would You Do?

Starbucks Headquarters, Seattle, Washington.[1]

In its first 20 years, Starbucks grew from 4 to 17,000 stores. But, in its last 2 years, Starbucks closed 800 stores and laid off 25,000 workers. In the middle of an economic downturn, consumers bought less because they perceived Starbucks as more expensive than McDonald's or Dunkin' Donuts. After founder Howard Schultz returned as CEO, Starbucks introduced its $3.95 breakfast pairings (a drink and a breakfast sandwich), offered the Starbucks "gold card" (which costs $25 per year, but comes with a 10 percent discount on all food and drinks), and began selling a $2 cup of coffee to fend off McDonald's, which had introduced new, cheaper lattes and cappuccinos. Schultz also ousted the chief information officer (CIO) and hired you as the replacement. Your assignment as Starbucks' new CIO is to "craft a digital strategy" that creates a digital aspect to the Starbucks experience and increases how much people spend every time they visit a Starbucks.

In addition to crafting a digital strategy, several key issues have come up in your discussions with Schultz. First, should Starbucks offer free Wi-Fi? The fact that you're even considering this question tells you how much things have changed. Starbucks has always charged for wireless Internet access because it didn't want people camping out all day and taking up tables and chairs that new customers might use. It's the same philosophy that restaurants use: keep "turning over" the tables. In other words, the more customers who sit at a table every day, the more money you make. Historically, to make sure that Internet wireless access didn't encourage people to "camp out," Starbucks charged $6 an hour for the first hour and then $.10 for every additional minute of wireless access. At roughly 15,000 of its 30,000 restaurants, however, McDonald's charges just $2.95 for 2 hours of wireless Internet access. Panera Bread bakery-cafés, by contrast, charge nothing for wireless Internet access. Paula Rosenblum, of Retail Systems Research, says, "It's a part of Panera's value proposition because I think that they like to increase average transaction value and get loyalty at the same time." Panera's CIO, Tom Kish, said, "We were the first major concept to offer it free and have established one of the largest free Wi-Fi networks in the U.S. with approximately 1,200 cafés providing the service." He goes on to say, "We see it as another amenity for our customers. Free Internet access is one of a series of Panera's innovations designed to engage, connect and support our customers."

How can Starbucks use technology to do a better job of connecting with its customers? As you told Shultz, "When you look at our customers and what's happening in our stores, you see wireless devices, iPhones, converged networks, laptops. You see a generation of customers who are entering our stores and engaging [with us] in new ways. We have to understand our customers in ways that we've never had to in the past."

Study Tips

Imagine you are the professor, and make up your own test for Chapter 17.

What are the main topics and key concepts that students should know? If you work with a study group, exchange practice tests. Work them individually, then "grade" them collectively. This way you can discuss trouble spots and answer each other's questions.

Finally, now that Starbucks is a global chain, the security of its food chain is at risk. Someone wanting to harm Starbucks' reputation could do so by tampering with the food that gets delivered and sold at Starbucks stores around the world. Starbucks has 40,000 suppliers who drop off sandwiches, pastries, milk, coffee beans, and other supplies every night. A further complication is that not only do all of Starbucks food products have to be fresh every day, many of them have to be refrigerated while being transported. Furthermore, since many of the deliveries have to be made after store hours, and you need to keep costs down by not keeping staff on hand to receive them, how can you give those 40,000 suppliers access to Starbucks stores so they can make those deliveries and not walk out with as much stuff as they dropped off?

If you were the new CIO at Starbucks, what would you do?

A generation ago, computer hardware and software had little to do with managing business information. Rather than storing information on hard drives, managers stored it in filing cabinets. Instead of uploading daily sales and inventory levels by satellite to corporate headquarters, they mailed hard-copy summaries to headquarters at the end of each month. Instead of word processing, reports were typed on an electric typewriter. Instead of spreadsheets, calculations were made on adding machines. Managers communicated by sticky notes, not e-mail. Phone messages were written down by assistants and coworkers, not left on voice mail. Workers did not use desktop or laptop computers as a daily tool to get work done. Instead, they scheduled limited access time to run batch jobs on the mainframe computer (and prayed that the batch job computer code they wrote would work).

Today, a generation later, computer hardware and software are an integral part of managing business information. This is due mainly to something called Moore's law. Gordon Moore is one of the founders of Intel Corporation, which makes 75 percent of the integrated processors used in personal computers. In 1965, Moore predicted that computer-processing power would double and that its cost would drop by 50 percent every 2 years.[2] As Exhibit 17.1 shows, Moore was right. Computer power, as measured by the number of transistors per computer chip, *has* more than doubled every few years. Consequently, the computer sitting in your lap or on your desk is not only smaller but also much cheaper and more powerful than the large mainframe computers used by *Fortune* 500 companies 15 years ago. In fact, if car manufacturers had achieved the same power increases and cost decreases attained by computer manufacturers, a fully outfitted Lexus or Mercedes sedan would cost less than $1,000!

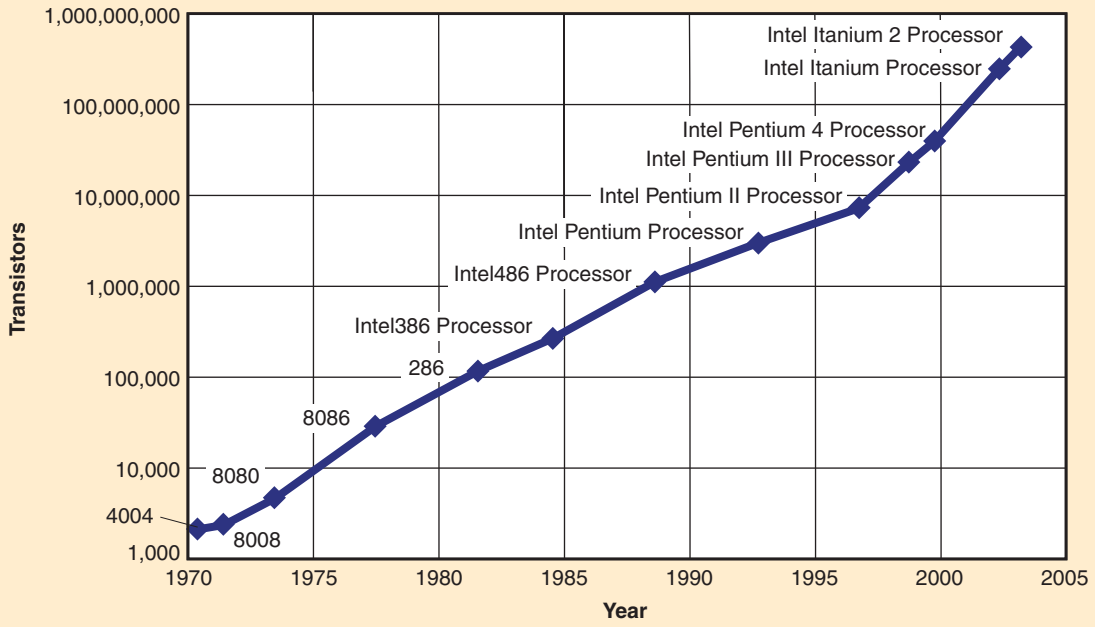
We begin this chapter by explaining why information matters. In particular, you will learn the value of strategic information to companies as well as the cost and characteristics of good information. Next, you will investigate how companies capture, process, and protect information. Finally, you'll learn how information is accessed and shared with those both inside and outside the company and how knowledge and expertise (not just information or data) are shared, too.

WHY INFORMATION MATTERS

[Moore's law] the prediction that about every two years, computer processing power would double and its cost would drop by 50 percent

Raw data are facts and figures. For example, 11, $452, 16, and 26,100 are some data that I used the day I wrote this section of the chapter. However, facts and figures aren't particularly useful unless they have meaning. For example, you probably can't guess what these four pieces of raw data represent, can you? If you can't, these data are useless. That's why researchers make the distinction

EXHIBIT 17.1 Moore's Law



Source: "Moore's Law: Overviews," © Intel Corporation, available at http://www.intel.com/technology/mooreslaw, 27 June 2005.

between raw data and information. Whereas raw data consist of facts and figures, **information** is useful data that can influence someone's choices and behavior. One way to think about the difference between data and information is that information has context.

So what did those four pieces of data mean to me? Well, 11 stands for Channel 11, the local CBS affiliate on which I watched part of the men's PGA golf tournament; $452 is how much it would cost me to rent a minivan for a week if I go skiing over spring break; 16 is for the 16-gigabyte storage card that I want to add to my digital camera (prices are low, so I'll probably buy it); and 26,100 means that it's time to get the oil changed in my car.

After reading the next two sections, you should be able to

1. explain the strategic importance of information.
2. describe the characteristics of useful information (i.e., its value and costs).

1 STRATEGIC IMPORTANCE OF INFORMATION

Each year, 15,000 customers file formal complaints over late, bungled deliveries of their furniture. If it was promised to be delivered in a month, it actually shows up in 8 weeks but with only three of the four pieces you ordered. Then, on the day the furniture is finally scheduled for delivery, the furniture truck shows up late or doesn't show at all, leaving furious customers who were required to be home from 9 am to 5 pm to receive delivery. Strategic use of technology, however, is beginning to address these problems. Crate and Barrel and Pier 1

[Raw data] facts and figures

[Information] useful data that can influence people's choices and behavior

now use their websites to give customers instant access to estimated completion dates using inventory tracking programs that follow the construction of furniture through the factory. This way, customers don't have to guess when their furniture will be ready. Sophisticated route-tracking software determines the fastest and most efficient combination of directions and deliveries for each furniture truck. Combine that with global positioning systems that track each truck's progress and location, and you get reduced costs and scheduled delivery windows. As a result, Crate and Barrel charges only $69 for delivery within 50 miles, no matter how much furniture you order. Likewise, Pottery Barn requires furniture customers to be home for just a 2-hour delivery window instead of all day.[3]

In today's hypercompetitive business environments, information is as important as capital (i.e., money) for business success, whether it's about furniture delivery, product inventory, pricing, or costs. It takes money to get businesses started, but businesses can't survive and grow without the right information. Information has strategic importance for organizations because it can be used to **1.1. obtain first-mover advantage and 1.2. sustain competitive advantage once it has been created.**

1.1 First-Mover Advantage

First-mover advantage is the strategic advantage that companies earn by being the first in an industry to use new information technology to substantially lower costs or to differentiate a product or service from that of competitors. By investing $90 billion over the last decade to replace copper coaxial lines with digital lines that fed high-speed cable modems and digital TV cable channels, cable companies convinced two out of every three high-speed Internet subscribers to choose cable over the DSL service provided by phone companies.[4] The phone companies are beginning to catch up. They now sign up more new high-speed Internet subscribers than do cable providers. But does that mean that cable companies' first-mover advantage is slipping away? Well, not yet, as 57 percent of high-speed Internet subscribers still choose cable.[5] And with a growing subscriber base for residential phone service, the cable companies are now going after the phone companies' business customers, offering them high-speed Internet and business phone service. [6]

First-mover advantages like those established by high-speed Internet cable companies can be sizable. On average, first movers earn a 30 percent market share compared to 19 percent for the companies that follow.[7] Likewise, over 70 percent of market leaders started as first movers.[8]

1.2 Sustaining Competitive Advantage

As described, companies that use information technology to establish first-mover advantage usually have higher market shares and profits. According to the resource-based view of information technology shown in Exhibit 17.2, companies need to address three critical questions in order to sustain a competitive advantage through information technology. First, does the information technology create value for the firm by lowering costs or providing a better product or service? If an information technology doesn't add value, then investing in it would put the firm at a competitive disadvantage to companies that choose information technologies that do add value.

Second, is the information technology the same or different across competing firms? If all the firms have access to the same information technology and use it in the same way, then no firm has an advantage over another (i.e., there is competitive parity).

[First-mover advantage] the strategic advantage that companies earn by being the first to use new information technology to substantially lower costs or to make a product or service different from that of competitors

Third, is it difficult for another company to create or buy the information technology used by the firm? If so, then the firm has established a sustainable competitive advantage over competitors through information technology. If not, then the competitive advantage is just temporary, and competitors should eventually be able to duplicate the advantages the leading firm has gained from information technology. For more about sustainable competitive advantage and its sources, see Chapter 6 on organizational strategy.

In short, the key to sustaining a competitive advantage is not faster computers, more memory, and larger hard drives. The key is using information technology to continuously improve and support the core functions of a business. Ron Ireland, a former Wal-Mart manager, says, "Wal-Mart has always considered information technology as a competitive advantage, never as a business expense."[9] Thanks to innovative use of information technology and the largest private satellite network and database system in the world, Wal-Mart's costs are 10 percent lower than its competitors'.[10] Wal-Mart was one of the first retailers to use computers and bar codes to track sales and inventory data and then share those data with suppliers. Today, Wal-Mart's supplier network, Retail Link, allows vendors like Ted Haedicke of Coca-Cola to "look at how much [and what kind of] Coke [has] sold . . . and at what prices at any store in the Wal-Mart system." He went on to say, "You can't do that with any other retailer today."[11]

Companies like Wal-Mart that achieve first-mover advantage with information technology and then sustain it with continued investment create a moving target that competitors have difficulty hitting.

Strategic Importance of Information The first company to use new information technology to substantially lower costs or differentiate products or services often gains first-mover advantage, which can lead to higher profits and larger market share. Creating a first-mover advantage can be difficult, expensive, and risky. According to the resource-based view of information technology, sustainable competitive advantage occurs when information technology adds value, is different across firms, and is difficult to create or acquire.

2 CHARACTERISTICS AND COSTS OF USEFUL INFORMATION

Portsmouth, a scenic city of 190,000 on the southern coast of England, attracts 6.5 million visitors a year, primarily because of its historic role as the home of the British Royal Navy. To handle the crush of visitors, Portsmouth relies on 320 buses, all equipped with computers and QDMA (quad-division multiple access) radio communication, which works reliably at speeds up to 250 miles per hour. Because the buses are networked, passengers waiting at bus stops can access a weatherproof computer terminal to find out when the next bus will arrive and what route that bus is taking. They can also check their e-mail, use trip planning software to determine which bus routes to take, or swipe a credit card to purchase tickets. John Domblides, who works for Portmouth's Traffic Systems Group, says, "The response from the public using the new facilities has been very positive, largely due to the quality of both the information displayed and the infrastructure used—stainless-steel and glass bus shelters with bright displays."[12] The initial cost was £3.2 million (about $6.4 million), and the annual cost is £200,000 ($400,000).

As Portsmouth's bus system demonstrates, information is useful when it is **2.1 accurate, 2.2 complete, 2.3 relevant, and 2.4 timely. However, there can be significant 2.5 acquisition, 2.6 processing, 2.7 storage, 2.8 retrieval, and 2.9 communication costs associated with useful information.**

2.1 Accurate Information

Information is useful when it is accurate. For example, Portsmouth's QDMA computer system allows people to know exactly when their bus will arrive. Before relying on information to make decisions, you must know that the information is correct. But what if it isn't? For example, the restaurant business is notoriously difficult for two reasons. First, it's extremely competitive. Customers in any location typically have hundreds of restaurants from which to choose when dining out. Second, 60 percent of restaurants go out of business within 3 years. Why? Restaurant owners and managers typically have little accurate information about their businesses. Sure, they know whether they're losing money or not, but they don't know why. Restaurants often don't have accurate information regarding how much alcohol they sell (e.g., wine versus beer versus hard liquor), nor do they have information regarding which food dishes (e.g., lobster versus swordfish) sell more or are more expensive to prepare. With Avero's Slingshot software, however, restaurants can track this information and more. John Stinson, the head chef at Antonio's in Las Vegas, says, "My bosses keep asking, 'How many did you sell? How many did you sell?' I constantly need to provide the numbers." So Stinson uses Slingshot to examine the data and plan his menus accordingly. For instance, he found out that sea bass sold 196 times in one month, whereas ahi tuna sold 89 times. Since they both cost the same and sell for $29, Stinson reduced costs and eliminated unsold food by cutting his ahi tuna orders from suppliers in half.[13]

"My bosses keep asking, 'How many did you sell? How many did you sell?' I constantly need to provide the numbers."

2.2 Complete Information

Information is useful when it is complete. Incomplete or missing information makes it difficult to recognize problems and identify potential solutions. For example, doctors hate learning new technology, but they hate inaccurate and incomplete information even more. So, the **University of Pittsburgh Medical Center** (UPMC) set up a computerized medical system, eRecords, to replace paper medical charts and test results

that were easily lost or misplaced and therefore not available when doctors and nurses needed them. eRecords automatically tracks vital signs, such as pulse, blood pressure, and respirations, and gives doctors and nurses immediate computerized bedside access to X-rays, medical test results, and patients' prescriptions. Dr. Ibrahim Ghobrial, UPMC's director of ambulatory services, says, "The applications within eRecord also enable the physician to complete clinical documentation, transcription, family histories, procedure histories, and a variety of other tasks online . . . online documentation is organized in clear, concise formats, which eliminates the task of interpreting handwritten notes sometimes placed in the margins of paper records or scattered throughout other parts of the paper forms."[14]

2.3 Relevant Information

You can have accurate, complete information, but it's not very useful if it doesn't pertain to the problems you're facing. Imagine that an earthquake destroys a large city in Japan or that a hurricane destroys cities and towns in a five-state area in the southeastern part of the United States. Usually when disaster strikes, the power goes out, and the authorities, first responders, and people affected lose access to what they need most, relevant information. Microsoft's Claire Bonilla is a senior director of field operations who coordinates **Microsoft's** resources to help people affected by disasters around the world (this is part of Microsoft's corporate social responsibility efforts). Bonilla says, "The core to the effectiveness of any disaster response is the ability to share information and coordinate the effort between the many organizations involved. Software can play a huge role in doing that. Whenever we hear about a disaster, the first step is to establish a connection with the lead response organization locally. Then we help with real-time communication and use mapping software to provide partners with situational awareness so that, for example, relief agencies can see the location of a shelter in need of medical supplies. We also give data-sharing capability to first responders and government agencies so they can share relevant information with outside organizations without compromising security."[15] For example, when an earthquake destroyed much of Wenchuan, China, and killed nearly 70,000 people, with another 18,000 listed as missing but presumed dead, a team of Microsoft employees developed and launched a missing people website that was up and running within 24 hours.[16] That website helped families and friends locate 500 missing people.

2.4 Timely Information

Finally, information is useful when it is timely. To be timely, the information must be available when needed to define a problem or to begin to identify possible solutions. If you've ever thought, "I wish I had known that earlier," then you understand the importance of timely information and the opportunity cost of not having it. If it seems as if airlines are misplacing your bags more often than they used to, they are. The number of mishandled bags is 28 percent higher now than it was 10 years ago. The primary reason for this is a lack of timeliness because of delayed flights. David Castelveter of the **Air Transport Association** says, "Delays cause missed

connections. Missed connections caused mishandled bags." Airlines that do a better job of handling baggage, however, have been using bar code tags and scanners to keep track of luggage and make sure it gets where it's supposed to at the right time. For example, after having one of the worst baggage handling records, American Airlines purchased mobile scanning units for its gates at Dallas–Fort Worth Airport, which is American's main hub. These scanners are attached to the small tractors that are used to move bags between connecting flights. Importantly, they give baggage handlers timely information on gate changes and allow the company to know precisely where your bag is at any time.[17] That, in turn, helps American figure out where the bottlenecks are in its baggage handling system.

2.5 Acquisition Costs

Acquisition cost is the cost of obtaining data that you don't have. Axciom, a billion-dollar company, gathers and processes data for direct-mail marketing companies. If you've received an unsolicited, "preapproved" credit card application recently (and who hasn't?), chances are Acxiom helped the credit card company gather information about you. Where does Acxiom get that information? The first place it turns is to companies that sell consumer credit reports at a wholesale cost of $1 each. Acxiom also obtains information from retailers. Each time you use your credit card, websites and retailers' checkout scanners gather information about your spending habits and product preferences. So why pay for this information? Acquiring it can help credit card companies better identify who will mail back a signed credit card application and who will rip the credit card application in half and toss it in the trash. Likewise, Acxiom uses its databases to help websites determine the ads that should appear on their web pages when different people surf their websites. For example, suppose that you gave the **New York Times** some personal information about yourself (your e-mail, your address, and your phone number) in exchange for free access to its website. The *Times* pays Acxiom to identify you and, when you surf **http://www.nytimes.com**, use the information it has on your age, gender, buying habits, geographic location, and so on to determine which ads to display on its website for you.[18]

2.6 Processing Costs

"[Virtualization is] like quadrupling the gas mileage in your car." Paul Sikora, vice president of IT transformation, UPMC

Companies often have massive amounts of data, but not in the form or combination they need. **Processing cost** is the cost of turning raw data into usable information. Without getting too technical, virtualization is the process of dividing one computer into several independent computer systems, each with a separate operating system, software, and data processing. While virtualization has been around for decades, recent software and hardware advances are now allowing companies to add more capacity without buying more computers. In other words, instead of buying additional servers, virtualization allows companies to get more performance and capacity out of the servers they already own and thus lower processing costs. For example, image servers are a key part of UPMC's eRecords system because they let doctors and nurses easily and quickly access medical images, such as X-rays and MRI scans. By using virtualization, UPMC upgraded its image management systems for just $250,000, combining twenty-three servers into one larger, and more powerful system. By contrast, without virtualization, the same upgrade would have required forty-three servers at a cost of $523,000. Paul Sikora, UPMC's vice president of IT transformation, said, "It's like quadrupling the gas mileage in your car."[19]

[Acquisition cost] the cost of obtaining data that you don't have

[Processing cost] the cost of turning raw data into usable information

doing the right thing

Recycling and Disposing of Computer Equipment

With most companies replacing computers every 4 years, an estimated 250 million computers will be discarded over the next 5 years. Computers and computer monitors contain hazardous materials, however, so you can't just toss them in the trash. Doing that is not just wrong—it's against the law. Instead, contact your state's department of environmental protection for help in finding a recycling company. Or donate your old computers to deserving individuals or charitable organizations. Or sell the computers at a steep discount to your employees. And when you buy your new corporate computers, bargain with the vendor to make it responsible for recycling those computers the next time around.[20]

2.7 Storage Costs

Storage cost is the cost of physically or electronically archiving information for later use and retrieval. Google, Yahoo, and Microsoft Live have incurred large storage costs to make it easy and fast for you to retrieve archived information. How costly can the storage for a simple web search be? Well, consider that each time you conduct a web search at Yahoo, 7,000 computers are activated to return the results of your search to you in less than 18/100 of a second.[21] And with the need for data storage doubling every 14 months, Yahoo, Google, Microsoft, and other *Fortune* 500 companies are building server farms, large collections of networked computer servers in 750,000-square-foot buildings (seven times the size of a Costco), to keep up with demand. Google's new server farm, located on 30 acres in Oregon where hydroelectric plants produce some of the cheapest electricity in the United States, will handle up to 2.7 billion online searches a month.

2.8 Retrieval Costs

Retrieval cost is the cost of accessing already-stored and processed information. One of the most common misunderstandings about information is that it is easy and cheap to retrieve once the company has it. Not so. First, you have to find the information. Then, you've got to convince whoever has it to share it with you. Then the information has to be processed into a form that is useful for you. By the time you get the information you need, it may not be timely anymore.

For example, as companies move toward paperless office systems, how will employees quickly and easily retrieve archived e-mails, file records, website information, word processing documents, or images? One solution is Enterprise Content Management (ECM), which is a way of storing and providing access to unstructured information wherever it exists. Ulrich Kampffmeyer, former member of the board of directors of the **Association for Information and Image Management**, summed up the challenge of retrieval costs well when he said, "The most important job is to keep in-house information under control. The questions add up: where to put

[Storage cost] the cost of physically or electronically archiving information for later use and retrieval

[Retrieval cost] the cost of accessing already-stored and processed information

the thousands and thousands of emails, what to do with the electronically signed business correspondence, where to put taxation-relevant data, how to transfer information from the disorganized file system, how to consolidate information in a repository that everybody can use, how to get a single login for all the systems, how to create a uniform in-basket for all incoming information, how to make sure that no information is lost or ignored, etc. etc."[22]

2.9 Communication Costs

Communication cost is the cost of transmitting information from one place to another. For example, the most important information that an electric utility company collects each month is the information from the electric meter attached to the side of your house. Traditionally, utility companies employed meter readers to walk from house to house to gather usage information that was entered into company computers. Then meter readers lost their jobs to water, gas, and electric meters with radio frequency (RF) transmitters (see Section 3.1 for more on this technology) that turn on when a utility company van that has a laptop computer specially equipped to receive the RF signals drives by. Specially equipped vans can read 12,000 to 13,000 meters in an 8-hour day compared to 500 meters per day for a meter reader on foot.[23] Utility companies are now replacing RF meters with "smart meters," which, besides sending information to the utility companies, also provide consumers with online information about their energy usage patterns and recommendations on how to reduce it.[24]

REVIEW 2

Characteristics and Costs of Useful Information Raw data are facts and figures. Raw data do not become information until they are in a form that can affect decisions and behavior. For information to be useful, it has to be reliable and valid (accurate), of sufficient quantity (complete), pertinent to the problems you're facing (relevant), and available when you need it (timely). Useful information does not come cheaply. The five costs of obtaining good information are the costs of acquiring, processing, storing, retrieving, and communicating information.

GETTING AND SHARING INFORMATION

In 1907, Metropolitan Life Insurance built a huge office building in New York City for its brand-new, state-of-the-art information technology system. What was this great breakthrough in information management? Card files. That's right, the same card file system that every library in America used before computers. Metropolitan Life's information technology consisted of 20,000 separate file drawers that sat in hundreds of file cabinets more than 15 feet tall. This filing system held 20 million insurance applications, 700,000 accounting books, and 500,000 death certificates. Metropolitan Life employed 61 workers who did nothing but sort, file, and climb ladders to pull files as needed.[25]

[Communication cost] the cost of transmitting information from one place to another

How we get and share information has clearly changed. The cost, inefficiency, and ineffectiveness of using this formerly state-of-the-art system would put an insurance company out of business within months. Today, if storms, fire, or accidents damage policyholders' property, insurance companies write checks on the spot to cover the losses. When policyholders buy a car, they call their insurance agent from the dealership to activate their insurance before driving off in their new car. And now, insurance companies are marketing their products and services to customers directly from the Internet.

From card files to Internet files in just under a century, the rate of change in information technology is spectacular.

After reading the next two sections, you should be able to

3. explain the basics of capturing, processing, and protecting information
4. describe how companies can access and share information and knowledge.

3 CAPTURING, PROCESSING, AND PROTECTING INFORMATION

When you go to your local Rite Aid pharmacy to pick up a prescription, the pharmacist reviews an electronic file that shows all of the medications you're taking. That same system automatically checks to make sure that your new prescription won't create adverse side effects by interacting with your other medications. When you pay for your prescription, Rite Aid's point-of-sale information system determines whether you've written any bad checks lately (to Rite Aid or other stores), records your payment, and then checks with the computer of the pharmaceutical company that makes your prescription drugs to see if it's time to reorder. Throughout the process, Rite Aid protects your information to make sure that your data are readily available only to you, your physician, and your pharmacist.

In this section, you will learn about the information technologies that companies like Rite Aid use to **3.1 capture, 3.2 process, and 3.3 protect information.**

3.1 Capturing Information

There are two basic methods of capturing information: manual and electronic. Manual capture of information is a slow, costly, labor-intensive, and often inaccurate process, which entails recording and entering data by hand into a data storage device. For example, when you applied for a driver's license, you probably recorded personal information about yourself by filling out a form. Then, after you passed your driver's test, someone typed your handwritten information into the department of motor vehicles' computer database so that local and state police could access it from their patrol cars in the event they pulled you over for speeding. (Isn't information great?) Consequently, companies are relying more on electronic capture. They use electronic storage devices such as bar codes, radio frequency identification tags, and document scanners to capture and record data electronically.

Bar codes represent numerical data by varying the thickness and pattern of vertical bars. The primary advantage of bar codes is that the data they represent can be read and recorded in an instant with a handheld or pen-type scanner. One pass of the scanner (okay, sometimes several) and "beep!" the information has been captured. Bar codes cut checkout times in half, reduce data entry errors by 75 percent, and save stores money because stockers don't have to go through the labor-intensive process

[Bar code] a visual pattern that represents numerical data by varying the thickness and pattern of vertical bars

of putting a price tag on each item in the store.[26] Consumer product companies, like Unilever, are now partnering with grocery stores and technology companies to test bar code–based coupons that can be scanned directly from consumers' cell phones.[27]

Radio frequency identification (RFID) tags contain minuscule microchips and antennas that transmit information via radio waves.[28] Unlike bar codes, which require direct line-of-sight scanning, RFID tags are read by turning on an RFID reader that, like a radio, tunes into a specific frequency to determine the number *and* location of products, parts, or anything else to which the RFID tags are attached. Turn on an RFID reader, and every RFID tag within the reader's range (from several hundred to several thousand feet) is accounted for.

Because they are now so inexpensive, RFID tags and readers are being put to thousands of uses in all kinds of businesses. For example, **Blue C Sushi** has five restaurants in Seattle where, as is the tradition, plates of food circle the restaurant on a conveyor belt so that diners can pick the food they want. At the end of the meal, your bill is determined by the number of plates you've taken. Blue C uses RFID to make sure that the food it serves is fresh. With RFID tags on all of its plates, plates are scanned as they leave each chef's workstation and then are periodically scanned on the conveyor belt to determine if they are still fresh. If a plate of food is still on the belt after 90 minutes, the system issues an alert to remove it. The system also keeps track of which plates are selling the fastest and when sales begin to slow. This has helped each of the company's five restaurants, which would typically throw out 80 to 100 plates of food each night, cut waste by about 45 percent.[29]

Electronic scanners, which convert printed text and pictures into digital images, have become an increasingly popular method of capturing data electronically because they are inexpensive and easy to use. The first requirement for a good scanner is a *document feeder* that automatically feeds document pages into the scanner or turns the pages (often with a puff of air) when scanning books or bound documents.[30] Text that has been digitized cannot be searched or edited like the regular text in your word processing software, however, so the second requirement for a good scanner is **optical character recognition** software to scan and convert original or digitized documents into ASCII text (American Standard Code for Information Interchange) or Adobe PDF documents. ASCII text can be searched, read, and edited with standard word processing, e-mail, desktop publishing, database management, and spreadsheet software, and PDF documents can be searched and edited with Adobe's Acrobat software. Sloans Lake Managed Care, a Colorado health-care organization, uses scanners and optical character recognition software to read the medical claims forms submitted by the 450,000 people covered by its health plan. Sloans Lake can scan 450 to 500 characters per form with 98 percent accuracy. As a result, the company now automatically scans and processes over 5,000 claims forms per day and has lowered the time for processing claims by an average of 65 percent.[31]

[Processing information] transforming raw data into meaningful information

3.2 Processing Information

Processing information means transforming raw data into meaningful information that can be applied to business decision making. Evaluating sales data to determine the best- and worst-selling products, examining repair records to determine product reliability, and monitoring the cost of long-distance phone calls are all examples of processing raw data into meaningful information. And with automated, electronic capture of data, increased processing power, and cheaper and more plentiful ways to store data, managers no longer worry about getting data. Instead, they scratch their heads about how to use the overwhelming amount of data that pours into their businesses every day. Furthermore, most managers know little about statistics and have

neither the time nor the inclination to learn how to use them to analyze data.

One promising tool to help managers dig out from under the avalanche of data is data mining. **Data mining** is the process of discovering patterns and relationships in large amounts of data.[32] Data mining works by using complex algorithms such as neural networks, rule induction, and decision trees. If you don't know what those are, that's okay. With data mining, you don't have to. Most managers only need to know that data mining looks for patterns that are already in the data but are too complex for them to spot on their own. For example, when Yahoo decided to redesign its Yahoo.com front page, it was faced with analyzing 10 terabytes (a terabyte is the same as 500 million pages of single-spaced text) of data per day generated by users' clicks! Since there was no way to make sense of that much data, Yahoo bought DMX Group, a company that provides simple data mining tools to employees who pose simple questions, such as "Are users more likely to click on an ad placed in the middle of the page or at the top of the page?" Bassel Ojjeh, vice president of DMX (which Yahoo has renamed the department of Strategic Data Solutions), says that Yahoo is now using data and not wild guesses to make changes to its websites. Says Ojjeh, "We say: Use data to make decisions. Don't make decisions based on a fad or what your competitors are doing."[33]

Data mining typically splits a data set in half, finds patterns in one half, and then tests the validity of those patterns by trying to find them again in the second half of the data set. The data typically come from a **data warehouse** that stores huge amounts of data that have been prepared for data mining analysis by being cleaned of errors and redundancy. The data in a data warehouse can then be analyzed using two kinds of data mining. **Supervised data mining** usually begins with the user telling the data mining software to look and test for specific patterns and relationships in a data set. Typically, this is done through a series of "what-if?" questions or statements. For instance, a grocery store manager might instruct the data mining software to determine if coupons placed in the Sunday paper increase or decrease sales. By contrast, with **unsupervised data mining**, the user simply tells the data mining software to uncover whatever patterns and relationships it can find in a data set. For example, State Farm Insurance used to have three pricing categories for car insurance depending on your driving record: preferred for the best drivers, standard for typical drivers, and nonstandard for the worst drivers. Now, however, it has moved to tiered pricing based on the 300 different kinds of driving records that its data mining software was able to discover. This allows State Farm to be much more precise in matching 300 different price levels to 300 different kinds of driving records.[34]

Unsupervised data mining is particularly good at identifying association or affinity patterns, sequence patterns, and predictive patterns. It can also identify what data mining technicians call data clusters.[35] **Association or affinity patterns** occur when two or more database elements tend to occur together in a significant way.

Surprisingly, Osco Drugs, based in Chicago, found that beer and diapers tended to be bought together between 5 and 7 pm. The question, of course, was: Why? The answer, on further review, was fairly straightforward. Fathers, who were told by their wives to buy some diapers on their way home, decided to pick up a six-pack for themselves, too.[36] Likewise, because Wal-Mart's data mining indicated that people tend to buy bananas and cereal at the same time, Wal-Mart now places bananas near the cereal aisle as well as in the fruits and vegetables aisle.[37]

Sequence patterns occur when two or more database elements occur together in a significant pattern in which one of the elements precedes the other. StratBridge provides data mining capability to professional sports teams like basketball's Boston Celtics so they can analyze their ticket sales in real time. One of its products is a live color-coded graphic of the Celtics stadium seating chart. Prior to a game, colors will change every few seconds to show whether a seat has been sold, at what price, and whether the seat was bought as part of a group purchase or an individual purchase. One season, after the Celtics had been eliminated from playoff eligibility, StratBridge's data mining software connected demographic data, sales data, seat location, and the timing of the seat sales to reveal that families typically bought tickets behind the basket just a few hours before tipoff. When the Celtics noticed that sales were lagging for those seats, they bundled them together in a family four-pack, dropped the prices, added food coupons, and then e-mailed a list of local families who had previously purchased tickets to the game. As a result, all of those unsold seats sold. Says Shawn Sullivan, a vice president for the team, "If we'd done our usual newspaper ad [for those seats], there'd have been no return at all."[38]

Predictive patterns are just the opposite of association or affinity patterns. Whereas association or affinity patterns look for database elements that seem to go together, **predictive patterns** help identify database elements that are different. Banks and credit card companies use predictive data mining to determine customers who are good credit risks from those who are poor credit risks and less likely to pay their loans and monthly bills. Insurance companies use it to determine which insurance claims are likely to be legitimate or fraudulent. At **Highmark Blue Cross Blue Shield** of Pennsylvania, which ensures the 4.6 million people who obtain medical treatment from 48,000 health-care providers, it used to take weeks to sift through potential fraud cases one variable at a time. But according to Tom Brennan, director of special investigations, with predictive data mining software, "Now we can do our analysis in minutes, rather than days."[39] Since 2002, data mining has helped Highmark recover $23 million in fraudulent payouts.

Data clusters are the last kind of pattern found by data mining. **Data clusters** occur when three or more database elements occur together (i.e., cluster) in a significant way. For example, after analyzing several years' worth of repair and warranty claims, Ford Motor Company might find that, compared with cars built in its Chicago plant, the cars it builds in Kansas City (first element) are more likely to have problems with overtightened fan belts (second element) that break (third element) and result in overheated engines (fourth element), ruined radiators (fifth element), and payments for tow trucks (sixth element), which are paid for by Ford's 5-year, 60,000-mile power train warranty.

Traditionally, data mining has been very expensive and very complex. Today, however, data mining services and analysis are much more affordable and within

reach of most companies' budgets. And, if it follows the path of most technologies, it will become even easier and cheaper to use in the future.

3.3 Protecting Information

Protecting information is the process of ensuring that data are reliably and consistently retrievable in a usable format for authorized users but no one else. For instance, when customers purchase prescription medicine at Drugstore.com, an online drugstore and health-aid retailer, they want to be confident that their medical and credit card information is available only to them, the pharmacists at Drugstore.com, and their doctors. So Drugstore.com has an extensive privacy policy (click "Privacy Policy" at **http://www.drugstore.com** to make sure this is the case).[40]

Companies like Drugstore.com find it necessary to protect information because of the numerous security threats to data and data security listed in Exhibit 17.3. People inside and outside companies can steal or destroy company data in various ways, including denial-of-service web server attacks that can bring down some of the busiest and best-run sites on the Internet; viruses and spyware/adware that spread quickly and can result in data loss and business disruption; keystroke monitoring in which every mouse click and keystroke you make is monitored, stored, and sent to unauthorized users; password-cracking software that steals supposedly secure passwords; and phishing, where fake but real-looking e-mails and websites trick users into sharing personal information (user names, passwords, account numbers) leading to unauthorized account access. On average, 19 percent of computers are infected with viruses, 80 percent have spyware, and only one-third are running behind a protected firewall (discussed shortly). Studies show that the threats listed in Exhibit 17.3 are so widespread that automatic attacks will begin on an unprotected computer just 15 seconds after it connects to the Internet.[41]

As shown in the right-hand column of Exhibit 17.3, numerous steps can be taken to secure data and data networks. Some of the most important are authentication and authorization, firewalls, antivirus software for PCs and e-mail servers, data

encryption, and virtual private networks.[42] We will review those steps and then finish this section with a brief review of the dangers of wireless networks, which are exploding in popularity.

Two critical steps are required to make sure that data can be accessed by authorized users and no one else. One is **authentication**, that is, making sure users are who they claim to be.[43] The other is **authorization**, that is, granting authenticated users approved access to data, software, and systems.[44] When an ATM prompts you to enter your personal identification number (PIN), the bank is authenticating that you are you. Once you've been authenticated, you are authorized to access your

[Authentication] making sure potential users are who they claim to be

[Authorization] granting authenticated users approved access to data, software, and systems

funds and no one else's. Of course, as anyone who has lost a PIN or password or had one stolen knows, user authentication systems are not foolproof. In particular, users create security risks by not changing their default account passwords (such as birth dates) or by using weak passwords such as names ("Larry") or complete words ("football") that are quickly guessed by password-cracker software.[45] (See "Doing the Right Thing" on password do's and don'ts to learn how to prevent this.)

This is why many companies are now turning to **two-factor authentication**, which is based on what users know, such as a password, and what they have, such as a secure ID card.[47] In order to log on to their computer accounts, employees at Bloomberg, a global provider of business news, data, and analysis, must enter a password, such as a four-digit personal identification number, plus a secure number that changes every 60 seconds and is displayed on the tiny screen of the secure electronic ID (about the size of a pack of gum) they carry. For these same reasons, some companies are turning to biometrics for two-factor authentication. With **biometrics** such as fingerprint recognition or iris scanning, users are identified by unique, measurable body features.[48] Troy Appling, vice president of The Bankers Bank, says, "With fingerprint biometrics, we can reduce the risk of unauthorized people making millions of dollars off fraudulent transfers. And we don't have to spend up to 60 percent of our IT [information technology] time resolving lost or forgotten passwords."[49] Of course, since some fingerprint scanners can be fooled by fingerprint molds, some companies take security measures even further by requiring users to simultaneously scan their fingerprint *and* insert a secure, smart card containing a digital file of their fingerprint. This is another form of two-factor authentication.

Unfortunately, stolen or cracked passwords are not the only way for hackers and electronic thieves to gain access to an organization's computer resources. Unless special safeguards are put in place, every time corporate users are online there's literally nothing between their personal computers and the Internet (home users with high-speed DSL or cable Internet access face the same risks). Hackers can access files, run programs, and control key parts of computers if precautions aren't taken. To reduce these risks, companies use **firewalls**, hardware or software devices that sit between the computers in an internal organizational network and outside networks such as the Internet. Firewalls filter and check incoming and outgoing data. They prevent company insiders from accessing unauthorized sites or from sending confidential company information to people outside the company. Firewalls also prevent outsiders from identifying and gaining access to company computers and data. Indeed, if a firewall is working properly, the computers behind the company firewall literally cannot be seen or accessed by outsiders.

A **virus** is a program or piece of code that, without your knowledge, attaches itself to other programs on your computer and can trigger anything from a harmless flashing message to the reformatting of your hard drive to a system-wide network shutdown. You used to have to do or run something to get a virus, such as double-clicking an infected e-mail attachment. Today's viruses are much more threatening. In fact, with some viruses, just being connected to a network can infect your computer. *Antivirus software for personal computers* scans e-mail, downloaded files, and computer hard drives, disk drives, and memory to detect and stop computer viruses from doing damage. However, this software is effective only to the extent that users of individual computers have and use up-to-date versions. With new viruses appearing all the time, users should update their antivirus software weekly or, even better, configure their virus software to automatically check for, download, and install updates. By contrast, *corporate antivirus software* automatically scans e-mail attachments such as Microsoft Word documents, graphics, or text files as they come across the company e-mail server. It also monitors and scans all file downloads across company databases and network servers. So, while antivirus software for personal computers

Password Do's and Don'ts

Anyone with access to sensitive personal (personnel or medical files), customer (credit cards), or corporate data (costs) has a clear responsibility to protect those data from unauthorized access. Use the following do's and don'ts to maintain a "strong" password system and protect your data.

- Don't use any public information such as part of your name, address, or birthdate to create a password.
- Don't use complete words, English or foreign, that are easily guessed by password software using "dictionary attacks."
- Use eight or more characters and include some unique characters such as !@#$ to create passwords like "cow@#boy."
- The longer the password and the more unique characters, the more difficult it is to guess.
- Consider using "passphrases," such as "My European vacation starts July 8th," instead of shorter passwords. The longer password, including upper- and lowercase letters, spaces, and numbers, is easy to remember and much, much more difficult to guess using password-cracking software.
- Remember your password and don't write it down on a sticky note attached to your computer.
- Change your password every 6 weeks. Better yet, specify that your computer system force all users to change their passwords this often.
- Don't reuse old passwords.

Together, these basic steps can make it much more difficult to gain unauthorized access to sensitive data.[46]

prevents individual computers from being infected, corporate antivirus software for e-mail servers, databases, and network servers adds another layer of protection by preventing infected files from multiplying and being sent to others.

Another way of protecting information is to encrypt sensitive data. **Data encryption** transforms data into complex, scrambled digital codes that can be unencrypted only by authorized users who possess unique decryption keys. One method of data encryption is to use products by PGP (Pretty Good Privacy) (**http://www.pgp.com**) to encrypt the files stored on personal computers or network servers and databases. This is especially important with laptop computers, which are easily stolen. After a Boeing employee's laptop PC was stolen from his hotel room, the company implemented a training program that requires managers and employees to have data encryption software installed on their laptops and become certified in using it. Those not following the encryption procedures can be reprimanded and even fired.[50]

[Data encryption] the transformation of data into complex, scrambled digital codes that can be unencrypted only by authorized users who possess unique decryption keys

With people increasingly gaining unauthorized access to e-mail messages—e-mail snooping—it's also important to encrypt sensitive e-mail messages and file attachments. You can use a system called "public key encryption" to do so. First, give copies of your "public key" to anyone who sends you files or e-mail. Have the sender use the public key, which is actually a piece of software, to encrypt files before sending them to you. The only way to decrypt the files is with a companion "private key" that you keep to yourself. If you want to learn more or want to begin encrypting your own files, download a free copy of Pretty Good Privacy from **http://web.mit.edu/pgp**.

Although firewalls can protect personal computers and network servers connected to the corporate network, people away from their offices (e.g., salespeople, business travelers, telecommuters) who interact with their company networks via the Internet face a security risk. Because Internet data are not encrypted, packet sniffer software easily allows hackers to read everything sent or received except files that have been encrypted before sending. Previously, the only practical solution was to have employees dial in to secure company phone lines for direct access to the company network. Of course, with international and long-distance phone calls, the costs quickly added up. Now, **virtual private networks (VPNs)** have solved this problem by using software to encrypt all Internet data at both ends of the transmission process. Instead of making long-distance calls, employees connect to the Internet. But, unlike typical Internet connections in which data packets are unencrypted, the VPN encrypts the data sent by employees outside the company computer network, decrypts the data when they arrive within the company network, and does the same when data are sent back to the computer outside the network.

Alternatively, many companies are now adopting web-based **secure sockets layer (SSL) encryption** to provide secure off-site access to data and programs. If you've ever entered your credit card in a web browser to make an online purchase, you've used SSL technology to encrypt and protect that information. SSL encryption is being used if a gold lock (Internet Explorer) or a gold key (Netscape) appears along the bottom of your web browser. SSL encryption works the same way in the workplace. Managers and employees who aren't at the office simply connect to the Internet, open a web browser, and then enter a user name and password to gain access to SSL-encrypted data and programs. For example, the Catholic Health System of Buffalo, New York, uses an SSL system to allow radiologists to access and review medical images like X-rays from their homes. Likewise, lawyers at Sonnenschein, Nath & Rosenthal, a Chicago law firm, use the Internet and their SSL-encrypted system to securely access case records from anywhere in the world.[51] SSL encryption is cheaper than VPN, but it typically provides only limited access to data and files. By contrast, VPN connections provide complete, secure access to everything on a company's network.

Finally, many companies now have wireless networks, which make it possible for anybody with a laptop and a wireless card to access the company network from anywhere in the office. Though wireless networks come equipped with security and encryption capabilities that, in theory, permit only authorized users to access the wireless network, those capabilities are easily bypassed with the right tools. Compounding the problem, many wireless networks are shipped with their security and encryption capabilities turned off for ease of installation.[52] Caution is important even when encryption is turned on because the WEP (Wired Equivalent Privacy) security protocol is easily compromised. If you work at home or are working on the go, extra care is critical because Wi-Fi networks in homes and public places like hotel lobbies are among the most targeted by hackers.[53] See the Wi-Fi Alliance site at **http://www.wi-fi.org** for the latest information on wireless security and encryption protocols that provide much stronger protection for your company's wireless network.

Capturing, Processing, and Protecting Information Electronic data capture (bar codes, radio frequency identification [RFID] tags, scanners, and optical character recognition) is much faster, easier, and cheaper than manual data capture. Processing information means transforming raw data into meaningful information that can be applied to business decision making. Data mining helps managers with this transformation by discovering unknown patterns and relationships in data. Supervised data mining looks for patterns specified by managers; unsupervised data mining looks for four general kinds of data patterns: association/affinity patterns, sequence patterns, predictive patterns, and data clusters. Protecting information ensures that data are reliably and consistently retrievable in a usable format by authorized users but no one else. Authentication and authorization, firewalls, antivirus software for PCs and corporate e-mail and network servers, data encryption, virtual private networks, and web-based secure sockets layer (SSL) encryption are some of the best ways to protect information. Be careful with wireless networks, which are easily compromised even when security and encryption protocols are in place.

4 ACCESSING AND SHARING INFORMATION AND KNOWLEDGE

"Vendor Pulse," is a data sharing program started by grocery store chain Food Lion. **Food Lion** provides vendors, such as consumer goods company Unilever, with fourteen kinds of sales metrics, ranging from point-of-sale statistics (even down to each cash register), store inventory (how much of each item is left in each store), distribution center inventory (how much of each item is in the warehouse), shrinkage (how much of each item has been stolen or misplaced), out-of-stocks (extent to which a product is out of stock in various locations), and reclamations (how much of each item has been returned). Troy Prothero, Food Lion's supply chain manager, says that the data are so rich in information that "there are no more data requests from suppliers [and the program]. Anything they would have requested comes to them daily."[54] How good is Food Lion's "Vendor Pulse" program? According to Andy Patel, manager of business capabilities for Unilever, "... few have the rich and robust data of Food Lion. It's got 14 metrics around each individual UPC [Universal Product Code, which is unique to each product], while some other retailers have only got two." Today, information technologies are letting companies communicate data, share data, and provide data access to workers, managers, suppliers, and customers in ways that were unthinkable just a few years ago.

After reading this section, you should be able to explain how companies use information technology to improve **4.1 internal access and sharing of information, 4.2 external access and sharing of information,** and **4.3 the sharing of knowledge and expertise.**

4.1 Internal Access and Sharing

Executives, managers, and workers inside the company use three kinds of information technology to access and share information: executive information systems, intranets, and

EXHIBIT 17.4 Characteristics of Best-Selling Executive Information Systems

EASE OF USE	Few commands to learn.	Simply drag-and-drop or point-and-click to create charts and tables or get the information you need.
	Important views saved.	Need to see weekly sales by store every Monday? Save that "view" of the data, and it will automatically be updated with new data every week.
	3-D charts to display data.	Column, square, pie, ring, line, area, scatter, bar, cube, etc.
	Geographic dimensions.	Different geographic areas are automatically color-coded for easy understanding.
ANALYSIS OF INFORMATION	Sales tracking.	Track sales performance by product, region, account, and channel.
	Easy-to-understand displays.	Information is displayed in tabular and graphical charts.
	Time periods.	Data can be analyzed by current year, prior year, year to date, quarter to date, and month to date.
IDENTIFICATION OF PROBLEMS AND EXCEPTIONS	Compare with standards.	Compares actual company performance (actual expenses versus planned expenses, or actual sales by sales quotas).
	Trigger exceptions.	Allows users to set triggers (5 percent over budget, 3 percent under sales quota), which then highlight negative exceptions in red and positive exceptions in green.
	Drill down.	Once exceptions have been identified, users can drill down for more information to determine why the exception is occurring.
	Detect & alert newspaper.	When things go wrong, the EIS delivers a "newspaper" via e-mail to alert managers to problems. The newspaper offers an intuitive interface for easily navigating and further analyzing the alert content.
	Detect & alert robots.	Detect & alert robots keep an extra "eye" out for events and problems. Want to keep an eye out for news about one of your competitors? Use a news robot to track stories on Dow Jones News Retrieval. Robots can also be used to track stock quotes, internal databases, and e-mail messages.

portals. An **executive information system (EIS)** uses internal and external sources of data to provide managers and executives the information they need to monitor and analyze organizational performance.[55] The goal of an EIS is to provide accurate, complete, relevant, and timely information to managers.

Managers at Lands' End, the web/mail-order company, use their EIS, which they call their "dashboard," to see how well the company is running. With just a few mouse clicks and basic commands such as *find*, *compare*, and *show*, the EIS displays costs, sales revenues, and other kinds of data in color-coded charts and graphs. Managers can drill down to view and compare data by region, state, time period, and product. Lands' End CIO Frank Giannantonio says, "Our dashboards include an early alert system that utilizes key performance metrics to target items selling faster than expected and gives our managers the ability to adjust product levels far earlier than they were able to do in the past."[56] Exhibit 17.4 describes the capabilities of two of the best-selling products that companies use for EIS programs.

Intranets are private company networks that allow employees to easily access, share, and publish information using Internet software. Intranet websites are just like external websites, but the firewall separating the internal company network from the Internet permits only authorized internal access.[57] Companies typically use intranets to share information (e.g., about benefits) and to replace paper forms with online forms. Many

EXHIBIT 17.5 Why Companies Use Intranets

- Intranets are inexpensive.
- Intranets increase efficiencies and reduce costs.
- Intranets are intuitive and easy to use and web-based.
- Intranets work across all computer systems and platforms (web-based).
- Intranets can be built on top of an existing computer network.
- Intranets work with software programs that easily convert electronic documents to HTML files for intranet use.
- Much of the software required to set up an intranet is either freeware (no cost) or shareware (try before you buy, usually less expensive than commercial software).

company intranets are built on the web model as it existed a decade ago. Companies like Motorola, however, are building new systems based on the web 2.0 model. The new intranet is collaborative like social media sites, allowing employees to network with one another beyond departmental boundaries and share their own information rather than just access company-published documents. Ninety-two percent of the company's employees use **Motorola's** Intranet 2.0 and collectively contribute about 100,000 documents per day.[58] Exhibit 17.5 further explains why companies use intranets.

Finally, **corporate portals** are a hybrid of executive information systems and intranets. While an EIS provides managers and executives with the information they need to monitor and analyze organizational performance, and intranets help companies distribute and publish information and forms within the company, corporate portals allow company managers and employees to access customized information *and* complete specialized transactions using a web browser. Hilman Group is the company that sells the nuts, bolts, fasteners, keys, and key cutting machines that you find in Home Depot, Lowes, Ace, and nearly every other hardware store. Hillman's 1,800 employees produce products for 25,000 customers. Two years ago, Hillman hired a new CIO, Jim Honerkamp, to improve the quality of information that Hillman's managers and employees used to make decisions. Says Honerkamp, "Our executives were trying to piecemeal information together to make business decisions on spreadsheets." The first thing he did was to create a corporate portal that contained a real-time revenue report for every product that updated sales and production numbers on a continuous basis. The portal and the report were so useful that CEO Mick Hillman began using them on a daily basis. Says Honerkamp, "The first thing he [Hillman] does when he arrives at 6:30 am is to get on the portal and start looking at reports. He picks up the phone and starts calling my peers, the SVP of operations or the VP of distribution or the CFO and starts asking questions based on what he's seeing."[59] Today, Hillman's portal contains 75 specialized reports that are accessed by 800 managers and employees.

[Corporate portal] a hybrid of executive information systems and intranets that allows managers and employees to use a web browser to gain access to customized company information and to complete specialized transactions

4.2 External Access and Sharing

Historically, companies have been unable or reluctant to let outside groups have access to corporate information. Now, however, a number of information

technologies—electronic data interchange, extranets, web services, and the Internet—are making it easier to share company data with external groups like suppliers and customers. They're also reducing costs, increasing productivity by eliminating manual information processing (70 percent of the data output from one company, like a purchase order, ends up as data input at another company, such as a sales invoice or shipping order), reducing data entry errors, improving customer service, and speeding communications. As a result, managers are scrambling to adopt these technologies.

With **electronic data interchange, or EDI**, two companies convert purchase and ordering information to a standardized format to enable direct electronic transmission of that information from one company's computer system to the other company's system. For example, when a Wal-Mart checkout clerk drags an Apple iPod across the checkout scanner, Wal-Mart's computerized inventory system automatically reorders another iPod through the direct EDI connection that its computer has with Apple's manufacturing and shipping computer. No one at Wal-Mart or Apple fills out paperwork. No one makes phone calls. There are no delays to wait to find out whether Apple has the iPod in stock. The transaction takes place instantly and automatically because the data from both companies were translated into a standardized, shareable, compatible format.

Web services, as mentioned in the Food Lion example, are another way for companies to directly and automatically transmit purchase and ordering information from one company's computer system to another company's computer system. **Web services** use standardized protocols to describe and transfer data from one company in such a way that those data can automatically be read, understood, transcribed, and processed by different computer systems in another company.[60] Route One, which helps automobile dealers process loans for car buyers, was started by the financing companies of DaimlerChrysler, Ford, General Motors, and Toyota. Not surprisingly, each auto company had a different computer system with different operating systems, different programs, and different data structures. Route One relies on web services to connect these different computer systems to the wide variety of different databases and software used by various auto dealers, credit bureaus, banks, and other auto financing companies. Without web services, there's no way these different companies and systems could share information.[61]

Now, what's the difference between web services and EDI? For EDI to work, the data in different companies' computer, database, and network systems must adhere to a particular set of standards for data structure and processing. For example, company X, which has a 7-digit parts numbering system, and company Y, which has an 8-digit parts numbering system, would agree to convert their internal parts numbering systems to identical 10-digit parts numbers when their computer systems talk to each other. By contrast, the tools underlying web services such as extensible markup language (or XML) automatically do the describing and transcribing so that data with different structures can be shared across very different computer systems in different companies. (Don't worry if you don't understand how this works, just appreciate what it does.) As a result, by automatically handling those differences web services allow organizations to communicate data without special knowledge of each other's computer information systems.

In EDI and web services, the different purchasing and ordering applications in each company interact automatically without any human input. No one has to lift a finger to click a mouse, enter data, or hit the return key. An **extranet**, by contrast, allows companies to exchange information and conduct transactions by purposely providing outsiders with direct, web browser-based access to authorized parts of a company's intranet or information system. Typically, user names and passwords are required to access an extranet.[62] General Mills uses an extranet to provide web-based

access to its trucking database to twenty other companies that ship their products over similar distribution routes to make sure that its distribution trucks don't waste money by running half empty (or make late deliveries to customers because it waited to ship until the trucks were full). When other companies are ready to ship products, they log on to General Mills' trucking database, check the availability, and then enter the shipping load, place, and pickup time. By sharing shipping capacity on its trucks, General Mills can run them fully loaded all the time. In several test areas, General Mills saved 7 percent on shipping costs (nearly $2 million) in the first year. Expanding the program company-wide is producing even larger cost savings.[63]

Finally, companies are reducing paperwork and manual information processing by using the Internet to electronically automate transactions with customers; this is similar to the way in which extranets are used to handle transactions with suppliers and distributors. For example, most airlines have automated the ticketing process by eliminating paper tickets altogether. Simply buy an e-ticket via the Internet, and then check yourself in online by printing your boarding pass from your personal computer or from a kiosk at the airport. Internet purchases, ticketless travel, and automated check-ins have together fully automated the purchase of airline tickets. Use of self-service kiosks is expanding, too. For example, Alamo Rent-a-Car has introduced kiosks that print rental agreements, permit upgrades to nicer cars, and allow customers to add additional drivers or buy rental insurance. Jerry Dow, Alamo's chief marketing officer, says, "Customers are already comfortable using the check-in kiosk for flights. Using a self-service kiosk for car rental is a natural progression."[64] Alamo has found that kiosks reduce check-in times by 50 percent.

In the long run, the goal is to link customer Internet sites with company intranets (or EDI) and extranets so that everyone—all the employees and managers within a company as well as the suppliers and distributors outside the company—involved in providing a service or making a product for a customer is automatically notified when a purchase is made. Companies that use EDI, web services, extranets, and the Internet to share data with customers and suppliers achieve increases in productivity 2.7 times larger than those that don't.[65]

4.3 Sharing Knowledge and Expertise

At the beginning of the chapter, we distinguished between raw data, which consist of facts and figures, and information, which consists of useful data that influence someone's choices and behavior. One more important distinction needs to be made, namely, that data and information are not the same as knowledge. **Knowledge** is the understanding that one gains from information. Importantly, knowledge does not reside in information. Knowledge resides in people. That's why companies hire consultants and why family doctors refer patients to specialists. Unfortunately, it can be quite expensive to employ consultants, specialists, and experts. So companies have begun using two information technologies to capture and share the knowledge of consultants, specialists, and experts with other managers and workers: decision support systems and expert systems.

[Knowledge] the understanding that one gains from information

Whereas an executive information system speeds up and simplifies the acquisition of information, a **decision support system (DSS)** helps managers understand problems and potential solutions by acquiring and analyzing information with sophisticated models and tools.[66] Furthermore, whereas EIS programs are broad in scope and permit managers to retrieve all kinds of information about a company, DSS programs are usually narrow in scope and targeted toward helping managers solve specific kinds of problems. DSS programs have been developed to help managers pick the shortest and most efficient routes for delivery trucks, select the best combination of stocks for investors, and schedule the flow of inventory through complex manufacturing facilities.

It's important to understand that DSS programs don't replace managerial decision making; they *improve* it by furthering managers' and workers' understanding of the problems they face and the solutions that might work. Though used by just 2 percent of physicians, medical DSS programs hold the promise of helping doctors make more accurate patient diagnoses. A British study of 88 cases misdiagnosed or initially misdiagnosed (to be correctly diagnosed much later) found that a medical DSS made the right diagnosis 69 percent of the time.[67] With a medical DSS, doctors enter patient data such as age, gender, weight, and medical symptoms. The medical DSS then produces a list of diseases and conditions, ranked by probability, low or high, or by medical specialty, such as cardiology or oncology. For instance, when emergency room physician Dr. Harold Cross treated a 10-year-old boy who had been ill with nausea and dizziness for 2 weeks, he wasn't sure what was wrong because the boy had a healthy appetite, no abdominal pain, and just one brief headache. However, when the medical DSS that Dr. Cross used suggested a possible problem in the back of the boy's brain, he ordered an MRI scan that revealed a tumor, which was successfully removed 2 days later. Says Dr. Cross, "My personal knowledge of the literature and physical findings would not have prompted me to suspect a brain tumor."[68]

It's important to understand that DSS programs don't replace managerial decision making.

Expert systems are created by capturing the specialized knowledge and decision rules used by experts and experienced decision makers. They permit nonexpert employees to draw on this expert knowledge base to make decisions. Most expert systems work by using a collection of "if–then" rules to sort through information and recommend a course of action. For example, let's say that you're using your American Express card to help your spouse celebrate a promotion. After dinner and a movie, the two of you stroll by a travel office with a Las Vegas poster in its window. Thirty minutes later, caught up in the moment, you find yourselves at the airport ticket counter trying to purchase last-minute tickets to Vegas. But there's just one problem. American Express didn't approve your purchase. In fact, the ticket counter agent is now on the phone with an American Express customer service agent.

So what put a temporary halt to your weekend escape to Vegas? An expert system that American Express calls "Authorizer's Assistant."[69] The first "if–then" rule that prevented your purchase was the rule "*if* a purchase is much larger than the cardholder's regular spending habits, *then* deny approval of the purchase." This if–then rule, just one of 3,000, is built into American Express's transaction-processing system that handles thousands of purchase requests per second. Now that the American Express customer service agent is on the line, he or she is prompted by the Authorizer's Assistant to ask the ticket counter agent to examine your

identification. You hand over your driver's license and another credit card to prove you're you. Then the ticket agent asks for your address, phone number, Social Security number, and your mother's maiden name and relays the information to American Express. Finally, your ticket purchase is approved. Why? Because you met the last series of "if–then" rules. *If* the purchaser can provide proof of identity and *if* the purchaser can provide personal information that isn't common knowledge, *then* approve the purchase.

Accessing and Sharing Information and Knowledge Executive information systems, intranets, and corporate portals facilitate internal sharing and access to company information and transactions. Electronic data interchange, web services, and the Internet allow external groups like suppliers and customers to easily access company information. All three decrease costs by reducing or eliminating data entry, data errors, and paperwork and by speeding up communication. Organizations use decision support systems and expert systems to capture and share specialized knowledge with non-expert employees.

MANAGEMENT DECISION

Jumping on the Health-Tech Bandwagon—or Not[71]

Not long ago, patient records were stored in manila charts lined up on vast walls of shelving. Any coordination between different clinics involved sending paper records. Doctors scrawled notoriously illegible prescriptions, often faulted when pharmacists misfilled an order. But the way medical information is managed is rapidly changing, and your company is one of many vying to be at the center of the change. What steps should you take to digitize your information management system?

Digitization is widely thought to hold a lot of potential benefit. Digitally stored medical records can be accessed anywhere via a networked system or even the Internet. Computerized orders and automated prescription filling systems claim to reduce errors and potential harm to patients. Treatment software guides doctors to the best and least costly treatment alternatives and allows them to track a patient's treatment. Digital medicine promises less paper, instant and universal access, and fewer errors.

In addition to the promise are the incentives. On top is the $19.6 billion federal stimulus to computerize health care. And your company is not the only one tempted to clamor for that money to develop and implement technology; General Electric, Intel, and IBM are all climbing on the health-tech bandwagon. You can't afford to be behind. What's more, the government plans to cut Medicare reimbursement for health-care companies that aren't completely digital by 2015.

With all the promise and the hefty incentives (both positive and negative), why is your decision so difficult? Why isn't health care already digital? Only one in fifty hospitals has a digital system, and only 17 percent of doctors use any form of digital record. Well, the answer is mainly that digital management systems for health information are not (yet) all they're cracked up to be. The systems are very expensive to begin with. Plus, most are mass-produced, which means further hefty expense in money and time to customize them. What's more, it is questionable whether the currently available systems actually reduce error and increase patient safety. One hospital began to see several errors a week after implementing its system, and staff had to resort to verifying prescriptions with the pharmacy over the telephone to ensure accuracy. A study in the *Journal of the American Medical Association* found twenty-two new types of prescription errors, and staff at Children's National Medical Center found an eightfold increase in errors with high-risk medications.

Questions

1. In light of the heavy incentives and the significant problems, what advantages are there to being a first mover in digitized medicine?
2. If you were to build your own system rather than purchasing and customizing a system that is already on the market, what features would it have? Think about the characteristics and costs of useful information discussed in the text and apply them to this situation.
3. How would you protect the security of medical records in your system?

MANAGEMENT TEAM DECISION

Brain Drain[72]

The whistle blows, signaling the end of the work day, and you automatically cringe. These days, that whistle seems like a warning bell for the mass exodus of employees you'll soon experience. You're a top manager at a nuclear power generator that employs thousands of engineers—for now, anyway. Very soon, though,

you'll start loosing Baby Boomer workers to retirement. And you're not the only one. Within one decade, 43 percent of the work force will be eligible to retire. United States businesses expect a worker shortage of 10 million by 2010.

As you await the arrival of your management team, you start to review the topic of your after-hours meeting. Your company will be hit hard by a double loss. Not only will you lose people (hard to replace), you'll lose their know-how (nearly impossible to replace). Skilled engineers have spent years acquiring the "tricks-of-the trade" and developing strategies for dealing with specific problems, so when they retire, a huge knowledge base will walk with them out the door.

A recent survey found that 63 percent of companies worry that the retirement of talented workers will create a "brain drain." Like many companies, yours has put off dealing with its aging work force. Even though there's a plan for retaining some of your older workers on a part-time basis, it's only a temporary measure. What you really need is a way to transmit knowledge from one group of employees to another—and to identify who has the knowledge you need to transmit.

Many companies in similar situations have developed knowledge management projects. Bruce Power—another nuclear power generator—uses a knowledge management system called Kana IQ that helps engineers document their solutions to certain problems so that future workers can search previous employees' notes using decision trees and other algorithms. Technology isn't the only way to stem the knowledge hemorrhage, however. Some companies are implementing mentoring programs to educate their next generation of skilled employees. At Tennessee Valley Authority power plants, younger engineers are assigned to shadow older engineers to facilitate the transfer of impossible-to-document skills.

So what will you do? Operating a nuclear power plant with less experienced workers is a dangerous proposition. Profitability and efficiency aren't the only concerns: Safety is also paramount. You can't delay much longer or you'll be in a crisis when the retirements start in large numbers. When you open your door to see what on earth is keeping your management team, you see them standing on your threshold mid-knock. It's time to get down to the hard business of creating a process for transmitting the wisdom of your older employees to your next generation of workers.

Questions

1. How can you find out which employees are about to retire? And how do you determine whose knowledge is most critical? Develop a strategy for identifying soon-to-retire workers and ranking the importance of their knowledge.
2. What are the pros and cons of developing a knowledge management database? What could you do to keep your engineers from becoming overly dependent upon a database? What steps might you take to ensure that your knowledge management project stays inclusive and accessible?
3. What if you developed a mentoring program? What would be the pros and cons of that?
4. Will you invest in a knowledge management project or a mentoring program? Explain your decision.

PRACTICE BEING A MANAGER

Information Pipeline

Information is the lifeblood of organizations and one of the keys to sustaining a competitive advantage. The tools for processing and sharing information have improved and proliferated rapidly over the past few decades. But growing sophistication has also meant growing challenges in maintaining quality and security across far-flung corporate information systems. And managers increasingly feel deluged by the rising flow of e-mail, text messages, and near-instantaneous reports. To thrive in the information-rich environment of modern business, managers must effectively utilize the various tools available. This exercise will give you an opportunity to consider which tools might work best for a given need.

Step 1: Get into groups and read the scenario. Your professor will organize you into pairs or groups of three.

Scenario: Suppose that you and your partner(s) are going into business together. Brainstorm about some new ventures that might interest you. Select one of the ideas that seems appealing, and then talk about how you might build a sustainable competitive advantage for your new business. (*Hint:* You may want to review the first few sections of the chapter.) With this initial sketch of your business plan in mind, discuss how you might use information systems and tools to accomplish the following tasks:

- Researching the likely competition that you will face
- Finding out what steps will be required to get the necessary permits, licenses, and/or regulatory approvals to open and maintain your business
- Determining what price you should charge for your product(s) or service(s)
- Deciding what computer and communication equipment you will need to buy to support your new venture
- Recruiting and hiring the best people for available jobs in your new company

Step 2: Discuss the issues. Discuss how you might develop the information system that your company needs to successfully launch and grow. Be sure to include security issues/concerns in your discussion.

Step 3: Debrief as a class. What are the major challenges in creating and maintaining a sustainable competitive advantage? What role does information and information technology play in successfully competing with other companies in a given market? Is it possible to secure sensitive information and at the same share information with employees and/or other key stakeholders (suppliers, customers)?

DEVELOP YOUR CAREER POTENTIAL

Learn to Talk Tech

Most people are intimidated by technology. But like many things, technology becomes easier if you familiarize yourself with the basics. One way to learn to "speak geek" is to subscribe to *PC Magazine*, the premier magazine about personal computing. Depending on your budget, it may be more feasible (and possibly more productive) if you spend a set amount of time each week perusing technology web sites like http://www.cnet.com and flipping through a selection of magazines dedicated to technology. The important thing is to be patient, however. After several issues, you should begin to understand what they're talking about. After that, it's easy to stay current. Subscribe at **http://pcmag.com**. You can also sign up for the "Term of the Day" e-mail newsletter at **http://webopedia.com**. Each day, Webopedia will e-mail you a new technology term and its definition. Either way, you'll soon be able to talk tech.

Why is talking tech so important? Information technology (IT) is an integral part of nearly every business, whether it's simple e-mail applications or more complex networking, e-commerce, and operations software. Very few companies are able to get by without using IT regularly. This being the case, managers need to understand this critical component of their companies' operations. That's not to say that managers (other than IT managers, of course) need to know every last technical detail, but as a manager, you will need—and want—to know what your tech staff is talking about when they bring problems, concerns, or suggestions for improvement to your office.

Computers are becoming an integral part of all kinds of work, so you need to do more than just understand the terminology. You also need to be able to use technology effectively. The reason is that people with basic computer skills earn 15 to 30 percent higher lifetime incomes than those without them. What should you do to learn about computers? Subscribe to *PC Magazine, PC World*, or *Macworld*. Buy a book about Microsoft Office and then take tests to be Microsoft Office User certified (see the Microsoft website for more information) in Word, Excel, PowerPoint, or Access. Take more than the required computer classes for your degree. Unless you want less job security and earning power, start learning more about computers today.

Activities

1. If you are completely new to IT, you might be more comfortable reading about it in the context of your favorite business publication. Walter Mossberg has a regular technology column in the *Wall Street Journal*, as does David Pogue, see Pogue's Posts, in *The New York Times*. Articles in both publications are on the shorter side, so take an hour and read through a few weeks' worth of each.
2. The U.S. government operates a career website at **http://www.careervoyages.gov/infotech-main.cfm** Go there to learn more about the IT field, see which jobs are in demand, and to get an industry overview. There are also industry videos and links. This will give you a wealth of ideas about where and what kind of IT training you may want to pursue in conjunction with your business degree.

In the 2006 film ***The Good Shepherd***, Edward Wilson (Matt Damon) is an idealistic young man who values honor, morality, and discretion. As the head of the CIA counterintelligence, Wilson is in charge of covert operations during the Bay of Pigs. The agency suspects that Castro was tipped off about the invasion, and Wilson is looking for the mole. As he investigates, his idealism gives way to something else: distrust of everyone in his office, fueled by Cold War paranoia. When Brian Durkee shows up at Numi Organic Tea every day to work as the director of operations, he's on a mission to make Numi a worldwide leader in sustainable supply chain management. Setting up and maintaining an efficient enterprise resource planning (ERP) system turned out to be much easier than converting Chinese suppliers to profoundly different farming methods and ways of doing business. Numi had just begun to implement an ERP system with integrated inventory management and accounting when Durkee joined the company. In this video, Durkee explains how Numi is dedicated to sustainable supply chain management, eliminating waste, and using recycled materials.

What to Watch for and Ask Yourself

2. Why was it no longer sufficient for Numi to use programs like Excel and QuickBooks to manage its information?
3. What are some of the advantages Durkee mentions that have come with using the ERP system?

What would You Do?

JCPenney, Plano, TX.[1]

The retail sector has been hard hit by the downturn in the economy. Seventy-three thousand retail store sites have closed the first six months of this year, roughly the same as the 148,000 store sites that closed last year. Not surprisingly, sales at JCPenney, as measured by same-store sales (comparing each store to it sales one year before) have dropped seven quarters in a row. So instead of spending $1 billion to open 50 new stores and renovate 65 existing stores this year, JCPenney will spend $650 million and open 20 new stores and renovate 10 to 15 existing stores.

One of those new stores, however, will be in the Manhattan Mall in midtown New York City, which sits directly over the 33rd Street PATH train station (from New Jersey) and the 34th Street Herald Square subway station, through which 250,000 commuters pass each day. The store site was "dark and menacing" when you first examined it, but after an investment of $84 million it should look great. You were delighted to have been handpicked by the CEO to open and run what should be Penney's highest grossing store, but you're increasingly concerned about the challenges you face. It doesn't help that New York City real estate experts believe that the Manhattan Mall is a "loser." Indeed, despite the prime location, its retailers have struggled. JCPenney will be the mall's new store anchor (or largest store). The first two anchor stores, however, closed. It's your job to make sure that JCPenney is not the third.

Founded in Wyoming in 1902, but now headquartered in Plano, Texas, JCPenney has always emphasized value and conservative fashions. The company expanded aggressively in the 1980s and 1990s and now reports $18.5 billion in revenues, 1,106 stores, and 150,000 employees. Over time, the company's traditional image has proven difficult to change. Recent market research found that while consumers still went to JCPenney for quality and value, they viewed it as a place where their mothers and grandmothers shop. Since most of Manhattan's boutiques and department stores cater to upscale, brand-conscious consumers, it will be difficult to attract and keep customers without high-end brands. As a store manager, you can't fix that on your own. But, you do have upper management's ear. How, you wonder, is management going to persuade popular, upscale brands to begin selling their high-quality products at a traditional store like JCPenney? You need the right inventory in order to succeed.

JCPenney already has stores in New York City's Bronx, Queens, and Staten Island boroughs, but Manhattan presents special challenges that have kept out retailers like Wal-Mart and Target. Storage space is expensive and complicated, as is transporting merchandise from distribution centers to stores. With New York City traffic, you can't just park 18-wheeler semi-trucks on 33rd Street and unload them like you do at other locations. Yet, you need to make sure you have the right merchandise in the right quantities in the store at all times while also keeping

Study Tips

Studying for comprehensive exams doesn't have to be a chore.

Form a study group. Photocopy the glossary at the end of this text, and cut the copies into strips, one term per strip. Put all strips into a large bowl. Divide into two teams and have one team at a time draw out a strip. Quiz the opposing team, and then read the correct answer. You can do the same with the chapter outlines at the beginning of each chapter.

inventory costs to a minimum. So what can you do to make that work?

Finally, your store sits on some of the most expensive retail space in the United States, which means that you're going to have to generate more sales per square foot than in any other JCPenney store. Also, New Yorkers are not known for their patience, and with a potentially heavy flow of customers, you're going to have to make sure that checkout flows smoothly and lines are short—anything over 90 seconds will have customers heading out the door forever. That means more cashiers and cash registers, but that also means higher labor costs, which, per employee, are already much higher in New York City than at your regular stores. All of these add to the cost of doing business and will lower store profits unless you can offset the additional expenses with higher productivity. You wonder how to do just that.

If you were the manager of JCPenney's new Manhattan store in New York, what would you do?

As you read in the opening vignette, JCPenney is opening a new store in Midtown Manhattan and faces the challenges of adapting its operations, managing inventory, and improving productivity. In this chapter, you will learn about operations management—managing the daily production of goods and services. You will begin by learning about the basics of operations management: productivity and quality. Next, you will read about managing operations, beginning with service operations, turning next to manufacturing operations, and finishing with an examination of the types, measures, costs, and methods for managing inventory.

MANAGING FOR PRODUCTIVITY AND QUALITY

You're "crossing the pond" in September to visit your company's European offices and suppliers. Because business is down, your boss has given you a limited budget of $1,600 for airfare. Your round-trip ticket from Chicago to London costs $880 on American Airlines, but that leaves only $720 for airfare in Europe. The total cost of flying from London to Dublin (via BMI), Dublin to Brussels (via Aer Lingus), Brussels to Venice (via Lufthansa), and Venice to London (via Alitalia) is $2,576—$1,856 more than your remaining budget and $1,696 more than your flight from the United States. At lunch, you're griping about the cost of European air travel when the company intern tells you to check out Ryanair, which she flew when she backpacked in Europe last summer. So, after lunch, you surf to **http://www.ryanair.com** and find that the total cost to travel to the same cities on the same dates and times is an amazing $253, or just 9.8 percent of the cost of flying the other major European airlines!

Modeled after U.S.-based Southwest Airlines, Ryanair achieves dramatically lower prices through aggressive price cutting and much higher productivity. Want a frequent-flier plan? You won't find one at Ryanair. It's too expensive. Want a meal on your flight? Pack a lunch. Ryanair doesn't even serve peanuts because it takes too much time (i.e., expense) to get them out of the seat cushions. Passengers enter and exit the planes using old-fashioned rolling stairs because they're quicker and cheaper than extendable boarding gates. As a result of such cost-cutting moves, Ryanair does more with less and thus has higher productivity. Most airlines break even on their flights when they're 75 percent full, but Ryanair's productivity allows it to break even when its planes are only half full, even with its incredibly low prices. With this low

[Operations management] managing the daily production of goods and services

break-even point, Ryanair attracts plenty of customers who enable it to fill most of its seats (84 percent) and earn 20 percent net profit margins. Finally, because of its extremely low prices (and its competitors' extremely high prices), Ryanair has increased passenger traffic and profits for 19 straight years. Ryanair is the third-largest airline in Europe in terms of passenger numbers and the world's largest in terms of international passenger numbers.[2]

After reading the next two sections, you should be able to

1. discuss the kinds of productivity and their importance in managing operations.
2. explain the role that quality plays in managing operations.

1 PRODUCTIVITY

At their core, organizations are production systems. Companies combine inputs such as labor, raw materials, capital, and knowledge to produce outputs in the form of finished products or services. **Productivity** is a measure of performance that indicates how many inputs it takes to produce or create an output.

$$\text{Productivity} = \frac{\text{Outputs}}{\text{Inputs}}$$

The fewer inputs it takes to create an output (or the greater the output from one input), the higher the productivity. For example, a car's gas mileage is a common measure of productivity. A car that gets 35 miles (output) per gallon (input) is more productive and fuel efficient than a car that gets 18 miles per gallon.

Let's examine **1.1 why productivity matters and 1.2 the different kinds of productivity.**

1.1 Why Productivity Matters

Why does productivity matter? For companies, higher productivity—that is, doing more with less—results in lower costs for the company, lower prices, faster service, higher market share, and higher profits. For example, every second saved in the drive-through lane at a fast-food restaurant increases sales by 1 percent. Furthermore, increasing the efficiency of drive-through service by 10 percent adds nearly 10 percent to a fast-food restaurant's sales. And with up to 75 percent of all fast-food restaurant sales coming from the drive-through window, it's no wonder that Wendy's (average drive-through time of 131 seconds per vehicle), Burger King (average time of 153 seconds per vehicle), and McDonald's (average time of 167.1 seconds per vehicle) continue to look for ways to shorten the time it takes to process a drive-through order.[3]

Productivity matters so much at the drive-through that McDonald's is experimenting with outsourcing. At roughly fifty McDonald's franchises around the country, drive-through orders are taken by someone at a California call center. An operator can take orders from customers at restaurants in Honolulu one minute and in Gulfport, Mississippi, the next. Although it seems counterintuitive, initial results show the system has improved order-taking accuracy and improved productivity. During the 10 seconds it takes for a car to pull away from the

[Productivity] a measure of performance that indicates how many inputs it takes to produce or create an output

microphone at the drive-through, a call center operator can take the order of a different customer who has pulled up to the microphone at another restaurant, even if it's thousands of miles away. According to Jon Anton, cofounder of Bronco Communications, which operates the call center for McDonald's, the goal is "saving seconds to make millions," because more efficient service can lead to more sales and lower labor costs.[4]

The productivity of businesses within a country matters to that country because it results in a higher standard of living. One way productivity leads to a higher standard of living is through increased wages. When companies can do more with less, they can raise employee wages without increasing prices or sacrificing normal profits. For instance, when I wrote this chapter, recent government economic data indicated that companies were paying workers 3.1 percent more than in the previous year. But since workers were producing 4.3 percent more than they had the year before, real labor costs had actually decreased by 1.2 percent.[5] The average American family earned approximately $61,355 in 2007. If productivity grows 1 percent a year, that family's income will increase to $78,684 in 2032. But if productivity grows 2 percent a year, their annual income in 2030 will be $100,659, nearly $22,000 higher, and that's without working longer hours.[6] Thanks to long-term increases in business productivity, the average American family today earns 37 percent more than the average family in 1980 and 65 percent more than the average family in 1967—and that's after accounting for inflation.[7]

Rising income stemming from increased productivity creates other benefits as well. Productivity increased an average of 2.7 percent between 1995 and 2002, and then slowed to an average of 1.4 percent from 2005 to 2007.[8] And, from 1996 to 2006, the U.S. economy created nearly 17.5 million new jobs.[9]And when more people have jobs that pay more, they give more to charity. For example, in 2007 Americans donated over $306 billion to charities, 3.9 percent more than they gave in 2006. Did Americans become more thoughtful, caring, conscientious, and giving? Probably not. Yet, because of strong increases in productivity during this time, the average American income increased by 30 percent, from $35,190 in 2000 to $45,840 in 2007.[10] Because more people earned more money, they were able to share their good fortune with others by giving more to charity.[11]

Another benefit of productivity is that it makes products more affordable or better. For example, while inflation has pushed the average cost of a car to about $28,929 (after incentives and discounts), increases in productivity have actually made cars cheaper.[12] In 1960, the average family needed 26 weeks of income to pay for the average car. Today, the average family needs only 24.1 weeks of income—and today's car is loaded with accessories that weren't even available in 1960, including air bags, power steering and brakes, power windows, cruise control, stereo/CD/DVD players, seat warmers, air-conditioning, and satellite navigation.[13] So, in terms of real purchasing power, productivity gains have actually made today's $29,400 car cheaper than that $2,000 car in 1960.[14]

One of the largest drivers of manufacturing productivity has been the increased use of robotic technology. Using robotics, manufacturing facilities can keep producing through breaks, lunch, and the night to create a 24/7 manufacturing schedule.

1.2 Kinds of Productivity

Two common measures of productivity are partial productivity and multifactor productivity. **Partial productivity** indicates how much of a particular kind of input it takes to produce an output.

[Partial productivity] a measure of performance that indicates how much of a particular kind of input it takes to produce an output

$$\text{Partial Productivity} = \frac{\text{Outputs}}{\text{Single Kind of Input}}$$

Labor is one kind of input that is frequently used when determining partial productivity. *Labor productivity* typically indicates the cost or number of hours of labor it takes to produce an output. In other words, the lower the cost of the labor to produce a unit of output, or the less time it takes to produce a unit of output, the higher the labor productivity. For example, the automobile industry often measures labor productivity by determining the average number of hours of labor needed to completely assemble a car. According to the most recent Harbour Report, the three Detroit-based automakers have reached near parity with their Japanese rivals in manufacturing efficiency. Toyota and Chrysler assemble a car in 30.37 hours, Honda in 31.33 hours, GM in 32.29 hours, Nissan in 32.96 hours, and Ford in 33.88 hours. The gap between the most and least productive automakers has narrowed form 10.51 labor hours in 2003 to just 3.5 labor hours in 2008.[15] Partial productivity assesses how efficiently companies use only one input, such as labor, when creating outputs. Multifactor productivity is an overall measure of productivity that assesses how efficiently companies use all the inputs it takes to make outputs. More specifically, **multifactor productivity** indicates how much labor, capital, materials, and energy it takes to produce an output.[16]

[Multifactor productivity] an overall measure of performance that indicates how much labor, capital, materials, and energy it takes to produce an output

$$\text{Multifactor Productivity} = \frac{\text{Outputs}}{(\text{Labor} + \text{Capital} + \text{Materials} + \text{Energy})}$$

Exhibit 18.1 shows the trends in multifactor productivity across a number of U.S. industries since 1987. With a 182 percent increase between 1997 (scaled at 100) and

EXHIBIT 18.1 Multifactor Productivity Growth across Industries

2006 (when it reached a level of 282) and a tenfold increase since 1987, the growth in multifactor productivity in the computer and electronic products industry far exceeded the productivity growth in retail stores, auto manufacturing, mining, utilities, and air transportation as well as most other industries tracked by the U.S. government.

Of course, the surge in productivity in the computer and electronics industry isn't a surprise. Each round of technology advances brings significantly smaller and cheaper yet much more powerful electronic devices. Significantly less labor, capital, materials, and energy are needed today than in the past to produce computers and electronic products (including cell phones, MP3 players, and computer game devices such as the PlayStation 3). As shown in Exhibit 18.1, gains in multifactor productivity aren't limited to technology businesses. Railroad companies, for example, have increased multifactor productivity by 163 percent since 1980. That overall increase in multifactor productivity stems from a 428 percent increase in employee productivity (labor), a 225 percent increase in locomotive productivity (capital—locomotives cost $1.5 million or more), and an 85 percent increase in fuel efficiency (energy).[17] According to the **Association of American Railroads**, "Railroads generated 93 percent more ton-miles of freight in 2007 than they did in 1980, but they did so with 41 percent fewer miles of track, 64 percent fewer employees, 14 percent fewer locomotives, and just 4 percent more gallons of diesel fuel—and at rates that, on average, were 54 percent lower when adjusted for inflation."[18]

Should managers use multiple or partial productivity measures? In general, they should use both. Multifactor productivity indicates a company's overall level of productivity relative to its competitors. In the end, that's what counts most. However, multifactor productivity measures don't indicate the specific contributions that labor, capital, materials, or energy make to overall productivity. To analyze the contributions of these individual components, managers need to use partial productivity measures. Doing so can help them determine what factors need to be adjusted or in what areas adjustment can make the most difference in overall productivity.

REVIEW 1

Productivity At their core, companies are production systems that combine inputs (such as labor), raw materials, capital, and knowledge to produce outputs (such as finished products or services). Productivity is a measure of how many inputs it takes to produce or create an output. The greater the output from one input, or the fewer inputs it takes to create an output, the higher the productivity. Partial productivity measures how much of a single kind of input (such as labor) is needed to produce an output. Multifactor productivity is an overall measure of productivity that indicates how much labor, capital, materials, and energy are needed to produce an output. Increased productivity helps companies lower costs, which can lead to lower prices, higher market share, and higher profits. Increased productivity helps countries by leading to higher wages, lower product prices, and a higher standard of living.

2 QUALITY

With the average car costing $28,400, car buyers want to make sure that they're getting good quality for their money.[19] Fortunately, as indicated by the number of problems per 100 cars (PP100), today's cars are of much higher quality than earlier models. In 1981, Japanese cars averaged 240 PP100. General Motors' cars averaged 670, Ford's averaged 740, and Chrysler's averaged 870 PP100! In other words, as measured by PP100, the quality of American cars was two to three times worse than that of Japanese cars. By 1992, however, U.S. carmakers

had made great strides, significantly reducing the number of problems to an average of 155 PP100. Japanese vehicles had improved, too, averaging just 125 PP100.

Exhibit 18.2 shows the results of the 2009 J.D. Power and Associates survey of initial car quality.[20] Overall quality improved to 108 problems per 100 vehicles (PP100) in 2009, down from 125 PP100 in 2007 and 118 PP100 in 2008. Lexus, with just 84 PP100, had the best quality, followed by Porsche at 90 PP100 and Hyundai at 95 PP100; at the bottom of the list were Land Rover, with 150 PPM, and MINI, 165 PP100. In 2009, however, even the worst cars on the J.D. Power and Associates Survey of Initial Car quality beat the scores of the Japanese cars of decades ago. And high-quality cars like the Mercedes S-Class and Audi A8 even came in with scores under 100 (72 to be exact). That means there's less than one problem per car![21] The American Society for Quality gives two meanings for **quality**. It can mean a product or service free of deficiencies, such as the number of problems per 100 cars, or it can mean the characteristics of a product or service that satisfy customer needs.[22] Today's cars are of higher quality than those produced twenty years ago in both senses. Not only do they have fewer problems per 100 cars, they also have a number of additional standard features (power brakes and steering, stereo/CD/MP3 player, power windows and locks, air bags, cruise control).

In this part of the chapter, you will learn about **2.1 quality-related characteristics for products and services, 2.2 ISO 9000 and 14000, 2.3 the Baldrige National Quality Award, and 2.4 total quality management.**

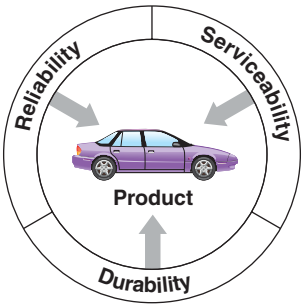
EXHIBIT 18.3
Characteristics of Product Quality



2.1 Quality-Related Characteristics for Products and Services

As shown in Exhibit 18.3, quality products usually possess three characteristics: reliability, serviceability, and durability.[23] A breakdown occurs when a product quits working or doesn't do what it was designed to do. The longer it takes for a product to break down, or the longer the time between breakdowns, the more reliable the product. Consequently, many companies define *product reliability* in terms of the average time between breakdowns. For example, **Western Digital** sells the WD RE4 2 TB hard drive, an extremely fast 2 terabyte (a terabyte is 1,000 gigabytes) hard drive that customers can use for gaming, multimedia, and video applications. The WD RE4 2 TB is so reliable that the estimated mean time between breakdowns is 1.2 million hours, or more than 28.5 years![24] Of course, this is just an average. Some WD RE4 hard drives will break down much sooner, but others will last even longer than 137 years.

Serviceability refers to how easy or difficult it is to fix a product. The easier it is to maintain a working product or fix a broken product, the more serviceable that product is. The REVA is an electric two-seater car built in India for city use. It goes 50 miles on a single battery charge (a recharge takes just 5 hours), and its operating costs per mile are one-third that of a typical gasoline-powered car. The REVA has high serviceability by virtue of a computerized diagnostic system that plugs into a portable electronic tool (PET) about the size of a personal digital assistant that assesses how well the car is running. Because the PET can be linked to a phone, customers can easily transmit their REVA's operational history to instantly find out if their car needs work and, if so, what kind. In many instances, a simple computer change downloaded to the PET and then to the REVA will fix the problem.[25]

A product breakdown assumes that a product can be repaired. However, some products don't break down; they fail. *Product failure* means products can't be repaired. They can only be replaced. *Durability* is defined as the mean time to failure. Typically, for example, when an LCD screen quits working, it "dies" and can't be repaired. Consequently, durability, or the average time before failure, is a key part of LCD quality. Why buy a great-looking LCD if it's only going to last a few years? Indeed, Toshiba is now producing thin-film transistor LCDs with a mean time between failures of 100,000 hours, or 11.4 years.[26]

An electric Reva automobile drives along a city street during Bangalore's celebration of World Environment Day. Reva uses a computer diagnostic system that can sync to the owner's cell phone and indicate the type of service the vehicle needs.

While high-quality products are characterized by reliability, serviceability, and durability, services are different. There's no point in assessing the durability of a service because services don't last but are consumed the minute they're performed. For example, once a lawn service has mowed your lawn, the job is done until the mowers come back next week to do it again. Services also don't have serviceability. You can't maintain or fix a service. If a service wasn't performed correctly, all you can do is perform it again. Rather than serviceability and durability, the quality of service interactions often depends on how the service provider interacts with the customer. Was the service provider friendly, rude, or helpful? As shown in Exhibit 18.4, five characteristics typically distinguish a quality service: reliability, tangibles, responsiveness, assurance, and empathy.[27]

Service reliability is the ability to consistently perform a service well. Studies clearly show that reliability matters more to customers than anything else when buying services. When you take your clothes to the dry cleaner, you don't want them returned with cracked buttons or wrinkles down the front. If your dry cleaner gives you back perfectly clean and pressed clothes every time, it's providing a reliable service.

Also, although services themselves are not tangible (you can't see or touch them), services are provided in tangible places. Thus, *tangibles* refer to the appearance of the offices, equipment, and personnel involved with the delivery of a service. One of the best examples of the effect of tangibles on the perception of quality is the restroom. When you eat at a fancy restaurant, you expect clean, if not upscale, restrooms. How different is your perception of a business, say a gas station, if it has clean restrooms rather than filthy ones?

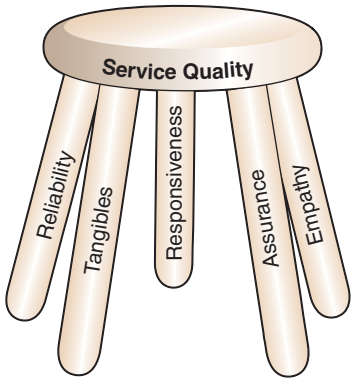
Responsiveness is the promptness and willingness with which service providers give good service (your dry cleaner returning your laundry perfectly clean and pressed in a day or an hour). *Assurance* is the confidence that service providers are knowledgeable, courteous, and trustworthy. *Empathy* is the extent to which service providers give individual attention and care to customers' concerns and problems.

EMC Corporation makes highly reliable computers that are used by some of the largest companies in the world, including banks, phone companies, and auto manufacturers. If EMC's equipment goes down for even a few minutes, its customers can lose millions from vanished sales. Although its equipment is incredibly reliable, what distinguishes EMC from its competition is the level of service it provides when problems do occur. In other words, EMC is a standout performer in *service reliability*, the ability to consistently perform a service well. Because of its excellent service, EMC retains an amazing 99 percent of its customers from year to year. When Carl Howe of Forrester Research, a marketing research firm, asked 50 *Fortune* 500 companies about the technology companies they worked with, "EMC came out looking like God." Howe says EMC "had the best customer-service reviews we have ever seen, in any industry."[28]

EMC also excels in *responsiveness*, the promptness and willingness with which service providers give good service. When a Wisconsin bank lost access to all its data (no account numbers, no deposits, no withdrawals—nada!), which were stored on an EMC machine, EMC service engineers were on the problem within minutes. (EMC's computers "call home" automatically whenever a problem arises.) In 4 hours, EMC created a setup identical to the bank's in a $1 billion facility designed for such purposes. There EMC engineers identified the problem and put together a software patch that had the bank up and running by the end of the day.[29]

EMC provides quality service also by virtue of clear *assurance* that it can be trusted. Every customer knows that the company follows a disciplined procedure for addressing customer problems. First, every EMC system does a self-check every 2 hours to make sure it is running the way it's supposed to. If even the slightest thing is wrong, the system "calls home" to tell EMC's engineers what's happening. EMC gets 3,500 such communications from its machines and systems every day. Second, if a problem isn't fixed within 4 hours, Leo Colborne, the vice president of global technical support, is notified. After 6 hours, Colborne's boss, the senior vice president of global customer services, is contacted. After 8 hours, the company's CEO and chairman are notified. In most cases, the CEO will leave immediately to visit the customer, apologize for the problem, reassure the customer that everything is being done to solve the problem, and begin working with the customer to implement procedures or solutions to prevent the problem from recurring in the future.[30]

EXHIBIT 18.4
Characteristics of Service Quality



Finally, EMC provides quality service because of the *empathy* it has for its customers' problems. Early in the company's history, its customers' businesses were suffering because EMC could not figure out why one of its best-selling systems had unexpectedly become unreliable. With key information systems frozen up, business ground to a halt for major customers. Rather than make excuses or empty promises, EMC gave its customers the choice between a brand-new EMC computer system or a similar system, made by EMC's competitor, IBM. At the height of its problems, EMC installed more of IBM's machines than its own. But the company benefited in the long run as customers realized that EMC would do almost anything to solve their problems. And once EMC solved the problems with that machine, customers trusted the company enough to begin ordering again. EMC's then-CEO said, "What that proved to me, to all of us, was that when a customer believes in you, and you go to great lengths to preserve that relationship, they'll stick with you almost no matter what. It opened our eyes to the power of customer service."[31]

Consistent with its dedication so service reliability, *Fortune* magazine ranks EMC as the only technology company among the World's 10 Most Admired Companies for Product and Service Quality and was named "Industry Champion" as the most admired company in the technology industry for the second consecutive year.[32]

2.2 ISO 9000 and 14000

ISO, pronounced *eye-so*, comes from the Greek word *isos*, meaning "equal, similar, alike, or identical" and is also an acronym for the **International Organization for Standardization**, which helps set standards for 162 countries. The purpose of this agency is to develop and publish standards that facilitate the international exchange of goods and services.[33] **ISO 9000** is a series of five international standards, from ISO 9000 to ISO 9004, for achieving consistency in quality management and quality assurance in companies throughout the world. **ISO 14000** is a series of international standards for managing, monitoring, and minimizing an organization's harmful effects on the environment.[34] (For more on environmental quality and issues, see Section 3.5 of Chapter 16 on controlling waste and pollution.)

The ISO 9000 standards publications, which are available from the American National Standards Institute (see the end of this section), are general and can be used for manufacturing any kind of product or delivering any kind of service. Importantly, the ISO 9000 standards don't describe how to make a better-quality car, computer, or widget. Instead, they describe how companies can extensively document (and thus standardize) the steps they take to create and improve the quality of their products. Why should companies go to the trouble to achieve ISO 9000 certification? Because their customers increasingly want them to. In fact, studies show that customers clearly prefer to buy from companies that are ISO 9000 certified. Companies, in turn, believe that being ISO 9000 certified helps them keep customers who might otherwise switch to an ISO 9000 certified competitor.[35]

To become ISO certified, a process that can take months, a company must show that it is following its own procedures for improving production, updating design plans and specifications, keeping machinery in top condition, educating and training workers, and satisfactorily dealing with customer complaints.[36] An accredited third party oversees the ISO certification process, just as a certified public accountant verifies that a company's financial accounts are up-to-date and accurate. Once a company has been certified as ISO 9000 compliant, the accredited third party will issue an ISO 9000 certificate that the company can use in its advertising and publications. This is the quality equivalent of the *Good Housekeeping* Seal of Approval. But continued ISO 9000 certification is not guaranteed. Accredited third parties typically

conduct periodic audits to make sure the company is still following quality procedures. If it is not, its certification is suspended or canceled.

It's estimated that more than half of mid-sized U.S. manufacturers have achieved ISO 9000 certification. Two-thirds of the certified companies say they wanted certification because it increases customer satisfaction. Accordingly, most advertise their ISO certification in their promotional materials and mention or even post it on their website. For example, **ACME Specialty Manufacturing**, a maker of rugged tempered glass exterior mirrors and interior mirrors for manufacturers of a wide variety of types of vehicles, has posted its certificate at **http://www.acmespecialty.com** and states, "At ACME Specialty Manufacturing, our products are created using state-of-the-art equipment in our 70,000 square-feet, ISO-9001-2000 registered facility in Toledo, Ohio."[37] To get additional information on ISO 9000 guidelines and procedures, see the American National Standards Institute (**http://www.webstoreansi.org**; the ISO 9000 and ISO 14000 standards publications are available here for about $400 and $300, respectively), the American Society for Quality (**http://www.asq.org**), and the International Organization for Standardization (**http://www.iso.org**).

2.3 Baldrige National Quality Award

The Baldrige National Quality Award, which is administered by the U.S. government's National Institute for Standards and Technology, is given "to recognize U.S. companies for their achievements in quality and business performance and to raise awareness about the importance of quality and performance excellence as a competitive edge."[38] Each year, up to three awards may be given in these categories: manufacturing, service, small business, education, and health care (the latter two categories were added in 1999). Exhibit 18.5 lists the latest Baldrige Award winners.

The cost of applying for the Baldrige Award includes a $150 eligibility fee, an application fee of $7,000 for manufacturing firms and $3,500 for small businesses, and a site visitation fee of $20,000 to $35,000 for manufacturing firms and $10,000 to $17,000 for small businesses.[39] Why does it cost so much? Because you get a great deal of useful information about your business even if you don't win. At a minimum, each company that applies receives an extensive report based on 300 hours of assessment from at least eight business and quality experts. At $10 an hour for small businesses and about $20 an hour for manufacturing and service businesses, the *Journal for Quality and Participation* called the Baldrige feedback report "the best bargain in

The criteria for the Baldrige Award are different for business, education, and health-care organizations. Businesses that apply for the Baldrige Award are judged on a 1,000-point scale based on the seven criteria shown in Exhibit 18.6: leadership; strategic planning; customer and market focus; measurement, analysis, and knowledge management; work force focus; process management; and results.[42] Results is clearly the most important category, as it takes up 450 out of 1,000 points. In other words, in addition to the six other criteria, companies must show that they have achieved superior quality when it comes to products and services, customers, financial performance and market share, treatment of employees, work systems and processes, and leadership and social responsibility. This emphasis on results is what differentiates the Baldrige Award from the ISO 9000 standards. The Baldrige Award indicates the extent to which companies have actually achieved world-class quality. The ISO 9000 standards simply indicate whether a company is following the management

system it put into place to improve quality. In fact, ISO 9000 certification covers less than 10 percent of the requirements for the Baldridge Award.[43]

Why should companies go to the trouble of applying for the Baldrige Award? Earnest Deavenport, CEO of Eastman Chemical, explains, "Eastman, like other Baldrige Award winners, didn't apply the concepts of total quality management to win an award. We did it to win customers. We did it to grow. We did it to prosper and to remain competitive in a world marketplace."[44] Furthermore, the companies that have won the Baldrige Award have achieved superior financial returns. Since 1988, an investment in Baldrige Award winners would have outperformed the Standard & Poor's 500 stock index 80 percent of the time.[45] For additional information about the Baldrige Award, see the National Institute of Standards and Technology website at **http://www.quality.nist.gov**.

2.4 Total Quality Management

Total quality management (TQM) is an integrated, organization-wide strategy for improving product and service quality.[46] TQM is not a specific tool or technique. Rather, TQM is a philosophy or overall approach to management that is characterized by three principles: customer focus and satisfaction, continuous improvement, and teamwork.[47]

Although most economists, accountants, and financiers argue that companies exist to earn profits for shareholders, TQM suggests that customer focus and customer satisfaction should be a company's primary goals. **Customer focus** means that the entire organization, from top to bottom, should be focused on meeting customers' needs. The result of that customer focus should be **customer satisfaction**, which occurs when the company's products or services meet or exceed customers' expectations.

At companies where TQM is taken seriously, such as Enterprise Rent-A-Car, paychecks and promotions depend on keeping customers satisfied.[48] Enterprise measures customer satisfaction with a detailed survey called the Enterprise Service Quality index. Enterprise not only ranks each branch office by operating profits and customer satisfaction but also makes promotions to higher-paying jobs contingent on above-average customer satisfaction scores. According to Andy Taylor, Enterprise's CEO, "Once we showed we were serious—a couple of star performers who had achieved good growth and profit numbers but had generated below-average satisfaction scores were passed over for promotions—all doubt about the importance of the scores vanished."[49] Not surprisingly, this emphasis on quality increased the number of completely satisfied Enterprise Rent-a-Car customers from the high 60 percent range to the high 70 percent range in just 5 years. As a result, Enterprise customers are three times more likely to rent an Enterprise car again than are customers of other car rental companies, and Enterprise has topped J.D. Power & Associates' Rental Car Satisfaction ratings for 5 straight years.[50]

Continuous improvement is an ongoing commitment to increase product and service quality by constantly assessing and improving the processes and procedures used to create those products and services. How do companies know whether they're achieving continuous improvement? Besides higher customer satisfaction, continuous improvement is usually associated with a reduction in variation. **Variation** is a deviation in the form, condition, or appearance of a product from the quality standard for that product. The less a product varies from the quality standard, or the more consistently a company's products meet a quality standard, the higher the quality.

[Total quality management (TQM)] an integrated, principle-based, organization-wide strategy for improving product and service quality

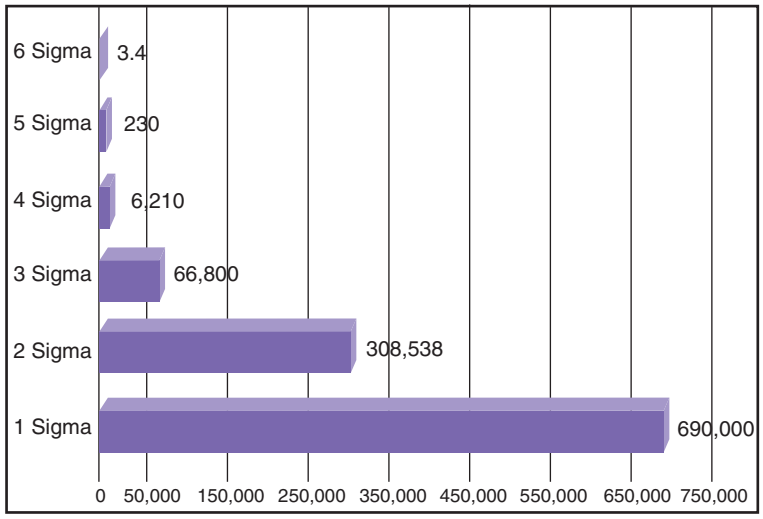
[Customer focus] an organizational goal to concentrate on meeting customers' needs at all levels of the organization

[Customer satisfaction] an organizational goal to provide products or services that meet or exceed customers' expectations

[Continuous improvement] an organization's ongoing commitment to constantly assess and improve the processes and procedures used to create products and services

[Variation] a deviation in the form, condition, or appearance of a product from the quality standard for that product

EXHIBIT 18.7 Number of Defects per Million with Six Sigma Quality

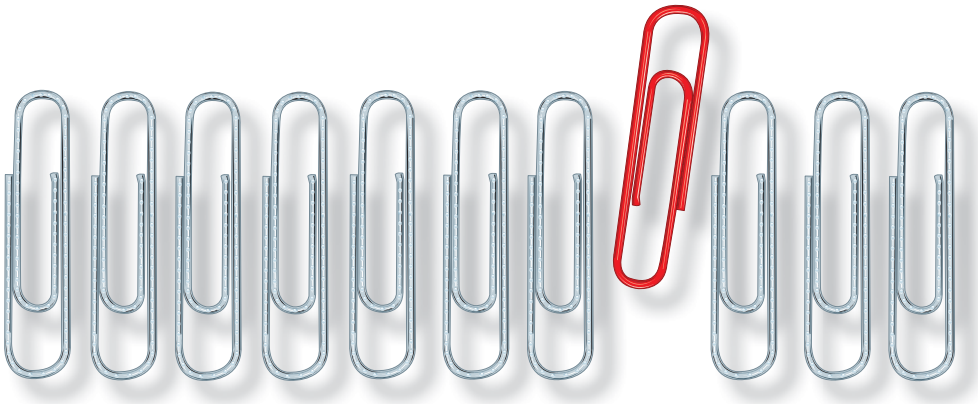


At Freudenberg-NOK, a manufacturer of seals and gaskets for the automotive industry, continuous improvement means shooting for a goal of Six Sigma quality, meaning just 3.4 defective or nonstandard parts per million (PPM). Achieving this goal would eliminate almost all product variation. In a recent year, Freudenberg-NOK made over 200 million seals and gaskets with a defect rate of 9 PPM.[51] As Exhibit 18.7 shows, this almost puts Freudenberg-NOK at Six Sigma, or 3.4 defective PPM. Furthermore, it represents a significant improvement from seven years previous when Freudenberg-NOK was averaging 650 defective PPM. General manager Gary VanWambeke says, "The whole goal is variation reduction," so Freudenberg-NOK expects the quality of its products to continue to improve.[52]

The third principle of TQM is teamwork. **Teamwork** means collaboration between managers and nonmanagers, across business functions, and between the company and its customers and suppliers. In short, quality improves when everyone in the company is given the incentive to work together and the responsibility and authority to make improvements and solve problems. At Valassis, a printing company long famous for its use of teams, management turned to employees for additional suggestions when business fell during a recession. Teams offered so many ideas to cut costs and raise quality that the company was able to avoid layoffs.[53]

[Teamwork] collaboration between managers and nonmanagers, across business functions, and between companies, customers, and suppliers

Customer focus and satisfaction, continuous improvement, and teamwork mutually reinforce each other to improve quality throughout a company. Customer-focused continuous improvement is necessary to increase customer satisfaction. At the same time, continuous improvement depends on teamwork from different functional and hierarchical parts of the company.



Reduction in variation is typically associated with even (and higher) quality. The pinnacle is achieving only 3.4 nonconforming parts per million which indicates attainment of Six Sigma.

Quality Quality can refer to a product or service free of deficiencies or the characteristics of a product or service that satisfy customer needs. Quality products usually possess three characteristics: reliability, serviceability, and durability. Quality service involves reliability, tangibles, responsiveness, assurance, and empathy. ISO 9000 is a series of five international standards for achieving consistency in quality management and quality assurance; ISO 14000 is a set of standards for minimizing an organization's harmful effects on the environment. The ISO 9000 standards can be used for any product or service because they ensure that companies carefully document the steps they take to create and improve quality. ISO 9000 certification is awarded following a quality audit from an accredited third party. The Baldrige National Quality Award recognizes U.S. companies for their achievements in quality and business performance. Each year, up to three Baldrige Awards may be given for manufacturing, service, small business, education, and health care. Companies that apply for the Baldrige Award are judged on a 1,000-point scale based on leadership; strategic planning; customer focus; measurement, analysis, and knowledge management; work force focus; process management; and results. Total quality management (TQM) is an integrated, organization-wide strategy for improving product and service quality. TQM is based on three mutually reinforcing principles: customer focus and satisfaction, continuous improvement, and teamwork.

MANAGING OPERATIONS

At the start of this chapter, you learned that operations management means managing the daily production of goods and services. Then you learned that, to manage production, you must oversee the factors that affect productivity and quality. In this half of the chapter, you will learn about managing operations in service and manufacturing businesses. The chapter ends with a discussion of inventory management, a key factor in a company's profitability.

After reading the next three sections, you should be able to

3. explain the essentials of managing a service business.
4. describe the different kinds of manufacturing operations.
5. explain why and how companies should manage inventory levels.

3 SERVICE OPERATIONS

Imagine that your trusty TIVO digital video recorder (DVR) breaks down as you try to record your favorite TV show. You've got two choices. You can run to Wal-Mart and spend $250 to purchase a new DVR, or you can spend less (you hope) to have it fixed at a repair shop. Either way, you end up with the same thing, a working DVR. However, the first choice, getting a new DVR, involves buying a physical product (a good), while the second, dealing with a repair shop, involves buying a service.

Services differ from goods in several ways. First, goods are produced or made, but services are performed. In other words, services are almost always

labor-intensive: Someone typically has to perform the service for you. A repair shop could give you the parts needed to repair your old DVR, but you're still going to have a broken DVR without the technician to perform the repairs. Second, goods are tangible, but services are intangible. You can touch and see that new DVR, but you can't touch or see the service provided by the technician who fixed your old DVR. All you can "see" is that the DVR works. Third, services are perishable and unstorable. If you don't use them when they're available, they're wasted. For example, if your DVR repair shop is backlogged on repair jobs, then you'll just have to wait until next week to get your DVR repaired. You can't store an unused service and use it when you like. By contrast, you can purchase a good, such as motor oil, and store it until you're ready to use it. Finally, services account for 59 percent of gross national product, whereas manufacturing accounts for only 30.8 percent.[54] So any review of operations management would be incomplete without an examination of how to manage service operations.

Because services are different from goods, managing a service operation is different from managing a manufacturing or production operation. Let's look at **3.1 the service-profit chain and 3.2 service recovery and empowerment.**

3.1 The Service-Profit Chain

One of the key assumptions in the service business is that success depends on how well employees—that is, service providers—deliver their services to customers. But success actually begins with how well management treats service employees, as the the service-profit chain, depicted in Exhibit 18.8, demonstrates.[55]

The key concept behind the service-profit chain is *internal service quality*, meaning the quality of treatment that employees receive from a company's internal service providers, such as management, payroll and benefits, human resources, and so forth. For example, **HCL Technologies**, an India-based technology services company, created an "EmployeeFirst" strategy to increase employee satisfaction with internal service quality, meaning the way they are treated by others in the company. The philosophy is simple, says CEO Vineet Nayar, "In our day and age, it's the employee who sucks up to the boss. We are trying, as much as possible, to get the manager to suck up to the employee."[56] One way in which HCL encourages better quality treatment of its employees is its online "smart service desk," where employees file "tickets" or complaints about any issue in the company, from overly cold air-conditioning to mistakes made in their paychecks to complaints about the food sold in the cafeteria. And, to make sure the "smart service desk" matters, only employees who have filed the "tickets" can close them. So, tickets remain open until employees feel that their problems and issues have been fairly addressed.

Exhibit 18.9 defines the elements that constitute good internal service quality. For employees to do a good job serving customers, management must implement policies and procedures that support good customer service; provide workers the tools and training they need to do their jobs; reward, recognize, and support good customer service; facilitate communication; and encourage people and departments to work together as teams to accomplish

company goals with respect to internal service quality and customer service. For example, companies that reward employees for low rates of customer complaints unwittingly encourage those employees to ignore dissatisfied customers so that their problems aren't acknowledged and counted (which would endanger employee bonuses).[57] Instead of ignoring customer complaints, the **Ritz-Carlton Hotel** (a luxury chain) gives their front-desk employees the tools to address them by authorizing each employee to credit up to $2,000 on a dissatisfied customer's account. This not only empowers its employees to fix customer problems, the high costs (up to $2,000) also encourages Ritz-Carlton workers to fix service failures before they happen.[58]

As depicted in Exhibit 18.8, good internal service leads to employee satisfaction and service capability. *Employee satisfaction* occurs when companies treat employees in a way that meets or exceeds their expectations. In other words, the better employees are treated, the more satisfied they are, and the more likely they are to give high-value service that satisfies customers. How employers treat employees is important because it affects service capability. *Service capability* is an employee's perception of his or her ability to serve customers well. When an organization serves its employees in ways that help them to do their jobs well, employees, in turn, are more likely to believe that they can and ought to provide high-value service to customers.

Finally, according to the service-profit chain shown in Exhibit 18.8, *high-value service* leads to *customer satisfaction* and *customer loyalty*, which, in turn, lead to *long-term profits and growth*.[59] What's the link between customer satisfaction and loyalty and profits? To start, the average business keeps only 70 to 90 percent of its existing customers each year. No big deal, you say? Just replace leaving customers with new customers. Well, there's one significant problem with that solution. It costs ten times as much to find a new customer as it does to keep an existing customer. Also, new customers typically buy only 20 percent as much as established customers. In fact, keeping existing customers is so cost-effective that most businesses could double their profits by simply keeping 5 percent more customers per year![60] How does this work? Imagine that keeping more of yours customers turns some of those customers into customers for life? How much of a difference would that make to company profits? Consider that just one lifetime customer spends $8,000 on pizza and over $330,000 on luxury cars![61]

One service company that understands the relationship between high-value service, customer loyalty, and profits is USAA, a Texas-based finance/insurance company. USAA sends booklets on how to save for a college education to its customers who have young children. When its customers near the age of 50, the company contacts them about retirement and estate planning. And when USAA issues credit cards to college students, it takes the time to teach them how to manage their credit and avoid excessive credit card debt. Says USAA vice president Phyllis Stahle, "We build loyalty by convincing [customers] we're loyal to them."[62] Indeed, USAA has a 97 percent customer retention rate!

3.2 Service Recovery and Empowerment

When mistakes are made, when problems occur, and when customers become dissatisfied with the service they've received, service businesses must switch from the process of service delivery to the process of **service recovery**, or restoring customer satisfaction to strongly dissatisfied customers.[63] Service recovery sometimes requires service employees to not only fix whatever mistake was made but also perform heroic service acts that delight highly dissatisfied customers by far surpassing their expectations of fair treatment. When accountant Tom Taylor checked into his room at a Hampton Inn in Greenville, South Carolina, he wasn't happy. The company website had given him incorrect directions. The lights in his room weren't plugged in. The shower controls were backward—"hot" was cold and "cold" was hot. And the air-conditioning was malfunctioning, so his room was freezing cold. When he complained, the employee at the front desk immediately offered him two free nights of lodging. Taylor was delighted by the offer, but since he thought it was excessive, he took just one free night.[64]

Unfortunately, when mistakes occur, service employees often don't have the discretion to resolve customer complaints. Customers who want service employees to correct or make up for poor service are frequently told, "I'm not allowed to do that," "I'm just following company rules," or "I'm sorry, only managers are allowed to make changes of any kind." In other words, company rules prevent them from engaging in acts of service recovery meant to turn dissatisfied customers back into satisfied customers. The result is frustration for customers and service employees and lost customers for the company.

[Service recovery] restoring customer satisfaction to strongly dissatisfied customers

Now, however, many companies are empowering their service employees.[66] In Chapter 9, you learned that *empowering workers* means permanently passing

Protect Your Frontline Staff: The Customer Isn't Always Right

In 1909, Harry Gordon Selfridge, an American who founded London's famous Selfridge's department store, coined the phrase "The customer is always right." Though managers and employees should do what they can to provide great service and make up for mistakes with great service recovery, the customer isn't always right. Companies should fire customers who use foul language, make threats against employees or other customers, lie, demand unethical or illegal service, try to bully frontline employees into granting special favors, or are just generally belligerent. Management consultant John Curtis says, "If you don't [fire these customers], you're telling your employees and your other customers that you care more about money than the safety of the people in the business." So, do the right thing. Protect your frontline staff by telling bad customers that you won't tolerate these kinds of behavior. Ask them to leave. Close their accounts. Inform them that they'll need to go elsewhere.[65]

decision-making authority and responsibility from managers to workers. With respect to service recovery, empowering workers means giving service employees the authority and responsibility to make decisions that immediately solve customer problems.[67] At Hampton Inn, all employees are empowered to solve customer problems. Senior vice president Phil Cordell says, "You don't have to call an 800 number. Just mention it at the front desk or to any employee—a housekeeper, maintenance person or breakfast hostess—and, on the spot, your stay is free."[68] Similarly, as you learned above, all of the front-desk employees at Ritz-Carlton Hotels are authorized to credit up to $2,000 to a dissatisfied customer's account.

In short, the purpose of empowering service employees is zero customer defections, that is, turning dissatisfied customers back into satisfied customers who continue to do business with the company. Empowering service workers does entail some costs, although they are usually less than the company's savings from retaining customers. For example, over a typical year, Hampton Inn will give back 0.5 percent of its room rental charges to dissatisfied customers. But according to Cordell, service recovery pays off because every dollar refunded to disgruntled customers results in a $7 payoff as those formerly dissatisfied customers return to Hampton Inn or recommend Hampton Inn to their friends.[69] Exhibit 18.10 describes some costs and benefits of empowering service workers to act in ways that they believe will accomplish service recovery.

EXHIBIT 18.10 Costs and Benefits of Empowering Service Workers for Service Recovery

COSTS
1. Finding service workers who are capable of solving problems and dealing with upset customers increases selection costs.
2. Training service workers to solve different kinds of problems entails increased costs.
3. Higher wages are needed to attract and keep talented service workers.
4. A focus on service recovery may lead to less emphasis on service reliability, doing it right the first time. Ultimately, this could lead to slower delivery of services.
5. In their quest to please customers, empowered service workers may cost the company money by being too eager to provide "giveaways" to make up for poor or slow service.
6. Empowered service workers may unintentionally treat customers unfairly by occasionally being overly generous to make up for poor or slow service.
BENEFITS
1. Responses to customer complaints and problems are quicker.
2. Employees feel better about their jobs and themselves.
3. Employee interaction with customers will be warm and enthusiastic.
4. Employees are more likely to offer ideas for improving service or preventing problems.
5. Empowered employees who provide service recovery lead to great word-of-mouth advertising and customer retention.
6. Satisfied employees who take good care of customers are more likely to stay with the company.

REVIEW 3

Service Operations Services are different from goods. Goods are produced, tangible, and storable. Services are performed, intangible, and perishable. Likewise, managing service operations is different from managing production operations. The service-profit chain indicates that success begins with internal service quality, or how well management treats service employees. Internal service quality leads to employee satisfaction and service capability, which, in turn, lead to high-value service to customers, customer satisfaction, customer loyalty, and long-term profits and growth. Keeping existing customers is far more cost-effective than finding new ones. Consequently, to prevent disgruntled customers from leaving, some companies are empowering service employees to perform service recovery—restoring customer satisfaction to strongly dissatisfied customers—by giving them the authority and responsibility to immediately solve customer problems. The hope is that empowered service recovery will prevent customer defections.

4 MANUFACTURING OPERATIONS

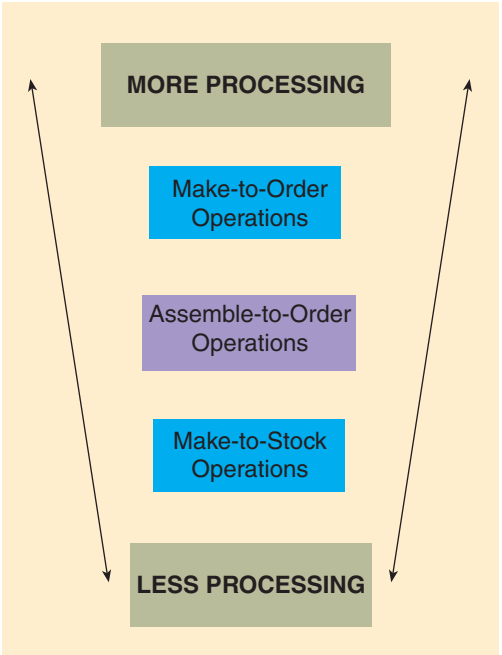
[Make-to-order operation] a manufacturing operation that does not start processing or assembling products until a customer order is received

[Assemble-to-order operation] a manufacturing operation that divides manufacturing processes into separate parts or modules that are combined to create semicustomized products

Ford makes cars and Dell does computers. British Petroleum produces gasoline, whereas Sherwin-Williams makes paint. Boeing makes jet planes, but Budweiser makes beer. Maxtor makes hard drives, and Maytag makes appliances. The *manufacturing operations* of these companies all produce physical goods. But not all manufacturing operations, especially these, are the same. Let's learn how various manufacturing operations differ in terms of **4.1 the amount of processing that is done to produce and assemble a product and 4.2 the flexibility to change the number, kind, and characteristics of products that are produced**.

4.1 Amount of Processing in Manufacturing Operations

EXHIBIT 18.11 Processing in Manufacturing Operations



As Exhibit 18.11 shows, manufacturing operations can be classified according to the amount of processing or assembly that occurs after a customer order is received. The highest degree of processing occurs in **make-to-order operations**. A make-to-order operation does not start processing or assembling products until it receives a customer order. In fact, some make-to-order operations may not even order parts until a customer order is received. Not surprisingly, make-to-order operations produce or assemble highly specialized or customized products for customers.

For example, **Dell** has one of the most advanced make-to-order operations in the computer business. Because Dell has no finished goods inventory and no component parts inventory, its computers always have the latest, most advanced components, and Dell can pass on price cuts to customers. Plus, Dell can customize all of its orders, big and small. So whether you're ordering 5,000 personal computers for your company or just 1 personal computer for your home, Dell doesn't make the computers until you order them.

A moderate degree of processing occurs in **assemble-to-order operations**. A company using an assemble-to-order operation divides its manufacturing or assembly process into separate parts or modules. The company orders parts and assembles modules ahead of customer

orders. Then, based on actual customer orders or on research forecasting what customers will want, those modules are combined to create semicustomized products. For example, when a customer orders a new car, General Motors may have already ordered the basic parts or modules it needs from suppliers. In other words, based on sales forecasts, GM may already have ordered enough tires, air-conditioning compressors, brake systems, and seats from suppliers to accommodate nearly all customer orders on a particular day. Special orders from customers and car dealers are then used to determine the final assembly checklist for particular cars as they move down the assembly line.

The lowest degree of processing occurs in **make-to-stock operations** (also called build-to-stock). Because the products are standardized, meaning each product is exactly the same as the next, a company using a make-to-stock operation starts ordering parts and assembling finished products before receiving customer orders. Customers then purchase these standardized products—such as Rubbermaid storage containers, microwave ovens, and vacuum cleaners—at retail stores or directly from the manufacturer. Because parts are ordered and products are assembled before customers order the products, make-to-stock operations are highly dependent on the accuracy of sales forecasts. If sales forecasts are incorrect, make-to-stock operations may end up building too many or too few products, or they may make products with the wrong features or without the features that customers want.

These disadvantages are leading many companies to move from make-to-stock to build-to-order systems. Randy Meis, director of manufacturing for **Dorner Manufacturing**, which makes conveyer systems used to move materials efficiently in factories throughout the world, says, "Even though we've got less inventory, we've been able to speed up our delivery rates for conveyers, in most cases, to just a few days from the time the order is received. Overall our BTO [build-to-order] process allows our employees to become more efficient in their jobs."[70]

[Make-to-stock operation] a manufacturing operation that orders parts and assembles standardized products before receiving customer orders

[Manufacturing flexibility] the degree to which manufacturing operations can easily and quickly change the number, kind, and characteristics of products they produce

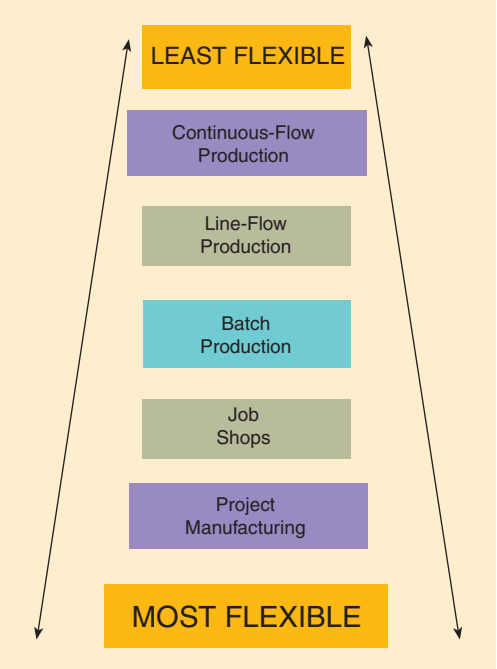
[Continuous-flow production] a manufacturing operation that produces goods at a continuous, rather than a discrete, rate

4.2 Flexibility of Manufacturing Operations

A second way to categorize manufacturing operations is by **manufacturing flexibility**, meaning the degree to which manufacturing operations can easily and quickly change the number, kind, and characteristics of products they produce. Flexibility allows companies to respond quickly to changes in the marketplace (i.e., respond to competitors and customers) and to reduce the lead time between ordering and final delivery of products. There is often a trade-off between flexibility and cost, however, with the most flexible manufacturing operations frequently having higher costs per unit and the least flexible operations having lower costs per unit.[71] Exhibit 18.12 shows different types of manufacturing operations arranged in order from the least flexible to the most flexible: continuous-flow production, line-flow production, batch production, job shops, and project manufacturing.

Most production processes generate finished products at a discrete rate. A product is completed, and then—perhaps a few seconds, minutes, or hours later—another is completed, and so on. For instance, if you stood at the end of an automobile assembly line, nothing much would seem to be happening for 55 seconds of every minute. In that last 5 seconds, however, a new car would be started and driven off the assembly line, ready for its new owner. By contrast, in **continuous-flow production**, products are produced continuously rather than at a discrete rate. Like a water hose that is never turned off and just keeps on

EXHIBIT 18.12 Flexibility of Manufacturing Operations



flowing, production of the final product never stops. Liquid chemicals and petroleum products are examples of continuous-flow production. If you're still struggling with this concept, think of Play-Doh. Continuous-flow production is similar to squeezing Play-Doh into a toy press and watching the various shapes ooze out of the Play-Doh machine. With continuous-flow production, the Play-Doh machine would never stop oozing or producing rectangle- or triangle-shaped Play-Doh. Because of their complexity, continuous-flow production processes are the most standardized and least flexible manufacturing operations.

Line-flow production processes are preestablished, occur in a serial or linear manner, and are dedicated to making one type of product. In this way, the ten different steps required to make product X can be completed in a separate manufacturing process (with separate machines, parts, treatments, locations, and workers) from the twelve different steps required to make product Y. Line-flow production processes are inflexible because they are typically dedicated to manufacturing one kind of product. For example, nearly every city has a local bottling plant for soft drinks or beer. The processes or steps in bottling plants are serial, meaning they must occur in a particular order. After empty bottles are sterilized, they are filled with soft drinks or beer using a special dispenser that distributes the liquid down the inside walls of the bottle. This fills the bottle from the bottom up and displaces the air that was in the bottle. The bottles are then crowned or capped, checked for underfilling and missing caps, labeled, inspected a final time for fill levels and missing labels, and then placed in cases that are shrink-wrapped on pallets and put on trucks for delivery.[72]

The next most flexible manufacturing operation is **batch production**, which involves the manufacture of large batches of different products in standard lot sizes. A worker in a batch production operation will perform the same manufacturing process on 100 copies of product X, followed by 200 copies of product Y, and then 50 copies of product Z. Furthermore, these batches move through each manufacturing department or process in identical order. So, if the paint department follows chemical treatment, and chemical treatment is now processing a batch of 50 copies of product Z, then the paint department's next task will be to paint 50 copies of product Z. Batch production is finding increasing use among restaurant chains. To ensure consistency in the taste and quality of their products, many restaurant chains have central kitchens, or commissaries, that produce batches of food such as mashed potatoes, stuffing, macaroni and cheese, rice, quiche filling, and chili, in volumes ranging from 10 to 200 gallons. These batches are then delivered to the individual restaurant locations, which in turn serve the food to customers.

Next in terms of flexibility is the job shop. **Job shops** are typically small manufacturing operations that handle special manufacturing processes or jobs. In contrast to batch production, which handles large batches of different products, job shops typically handle very small batches, some as small as one product or process per batch. Basically, each job in a job shop is different, and once a job is done, the job shop moves on to a completely different job or manufacturing process for, most likely, a different customer. For example, **Grauch Enterprises** in Philipsburg, Pennsylvania, is a job shop that mills, turns, drills, paints, and finishes everything from plastics, such as nylon, polycarbonates, and laminates, to metals, such as brass, aluminum, stainless and alloy steels, titanium, and cast iron. It makes 650 different parts for one customer alone and receives one order to make 5,000 units out of 20,000 individual parts. When it comes to making different parts for different customers, owner Fred Grauch says, "There's very little we won't try. . . ."[73] Likewise, Millennium Precision, a job shop in Londonderry, New Hampshire, makes brass, titanium, and regular and stainless-steel parts for the aerospace industry. Millennium also makes parts for the medical industry, such as bone taps, bone drills, and parts to help stop leaky heart valves.[74]

[Line-flow production] manufacturing processes that are preestablished, occur in a serial or linear manner, and are dedicated to making one type of product

[Batch production] a manufacturing operation that produces goods in large batches in standard lot sizes

[Job shops] manufacturing operations that handle custom orders or small batch jobs

The most flexible manufacturing operation is project manufacturing. **Project manufacturing** is an operation designed to produce large, expensive, specialized products like custom homes; military systems such as aircraft carriers and submarines; and aerospace products such as passenger planes and the space shuttle. Project manufacturing is highly flexible because each project is usually significantly different from the one before it, even if the projects involve the same general type of product, such as a submarine. Because of each project's size, expense, and high degree of customization, project manufacturing can take an extremely long time to complete.

© CHRIS OXLEY/MAI /LANDOV

For instance, General Dynamics uses project manufacturing when making new submarines. The U.S. Navy's Virginia class subs, which are its newest and most advanced attack submarines, are 377 feet long and able to attain speeds greater than 25 knots (28 miles per hour/46.3 kilometers per hour). Therefore, they will be significantly quieter and faster than the Los Angeles class submarines that they replace.[75] Project manufacturing is required for submarine construction because of the tremendous cost (budgeted cost of $1.6 billion each), the complexity of the subs, and the length of time it takes to complete a new submarine (6 years). Because of these enormous challenges, only one new Virginia class submarine is being completed each year.

Manufacturing Operations Manufacturing operations produce physical goods. Manufacturing operations can be classified according to the amount of processing or assembly that occurs after receiving an order from customers. Make-to-order operations, in which assembly doesn't begin until products are ordered, involve the most processing. The next-highest degree of processing occurs in assemble-to-order operations, in which preassembled modules are combined after orders are received to produce semicustomized products. The least processing occurs in make-to-stock operations, in which standard parts are ordered on the basis of sales forecasts and assembled before orders are received.

Manufacturing operations can also be classified in terms of flexibility, the degree to which the number, kind, and characteristics of products can easily and quickly be changed. Flexibility allows companies to respond quickly to competitors and customers and to reduce order lead times, but it can also lead to higher unit costs. Manufacturing operations can be arranged in order from the least to the most flexible as follows: continuous-flow production, line-flow production, batch production, job shops, and project manufacturing.

5 INVENTORY

With SUVs and pickup trucks accounting for nearly 80 percent of its sales, Chrysler was reluctant to stop making them even when consumer demand dried up. Despite a lack of orders, Chrysler kept building SUVs and pickups and ended up with nearly a 4-month supply of inventory. In addition to what was already on dealer lots, the automaker had 50,000 vehicles sitting on

random storage lots around the midwestern United States. Ultimately, Chrysler significantly reduced production for 6 months to sell off its unsold vehicles.[76]

Inventory is the amount and number of raw materials, parts, and finished products that a company has in its possession. Like Chrysler, General Motors made the mistake of having too much inventory on hand; GM had to reduce production by over 10 percent at its plants to let existing sales draw down inventory levels to an acceptable and affordable level. Industry experts estimate Chrysler has somewhere between 80 and 126 days of invenstory on hand, and it has more SUV inventory (82 days) than GM (77) and Ford (74) and almost three times as much as Toyota (28).[77]

In this section, you will learn about **5.1 the different types of inventory, 5.2 how to measure inventory levels, 5.3 the costs of maintaining an inventory, and 5.4 the different systems for managing inventory.**

5.1 Types of Inventory

Exhibit 18.13 shows the four kinds of inventory a manufacturer stores: raw materials, component parts, work-in-process, and finished goods. The flow of inventory through a manufacturing plant begins when the purchasing department buys raw materials from vendors. **Raw material inventories** are the basic inputs in the manufacturing process. For example, to begin making a car, automobile manufacturers purchase raw materials like steel, iron, aluminum, copper, rubber, and unprocessed plastic.

Next, raw materials are fabricated or processed into **component parts inventories**, meaning the basic parts used in manufacturing a product. For example, in an automobile plant, steel is fabricated or processed into a car's body panels, and steel and iron are melted and shaped into engine parts like pistons or engine blocks. Some component parts are purchased from vendors rather than fabricated in-house.

The component parts are then assembled to make unfinished **work-in-process inventories**, which are also known as partially finished goods. This process is also called *initial assembly*. For example, steel body panels are welded to each other and to the frame of the car to make a "unibody," which comprises the unpainted interior frame and exterior structure of the car. Likewise, pistons, camshafts, and other engine parts are inserted into the engine block to create a working engine.

Next, all the work-in-process inventories are assembled to create **finished goods inventories**, which are the final outputs of the manufacturing process. This process is also called *final assembly*. For a car, the engine, wheels, brake system, suspension, interior, and electrical system are assembled into a car's painted unibody to make

the working automobile, which is the factory's finished product. In the last step in the process, the finished goods are sent to field warehouses, distribution centers, or wholesalers, and then to retailers for final sale to customers.

5.2 Measuring Inventory

As you'll learn next, uncontrolled inventory can lead to huge costs for a manufacturing operation. Consequently, managers need good measures of inventory to prevent inventory costs from becoming too large. Three basic measures of inventory are average aggregate inventory, weeks of supply, and inventory turnover.

If you've ever worked in a retail store and had to take inventory, you probably weren't too excited about the process of counting every item in the store and storeroom. It's an extensive task that's a bit easier today because of bar codes that mark items and computers that can count and track them. Nonetheless, inventories still differ from day to day. An inventory count taken at the beginning of the month will likely be different from a count taken at the end of the month. Similarly, an inventory count taken on a Friday will differ from a count taken on a Monday. Because of such differences, companies often measure **average aggregate inventory**, which is the average overall inventory during a particular time period. Average aggregate inventory for a month can be determined by simply averaging the inventory counts at the end of each business day for that month. One way companies know whether they're carrying too much or too little inventory is to compare their average aggregate inventory with the industry average for aggregate inventory. For example, 72 days of inventory is the average for the automobile industry.

The automobile industry records inventory in terms of days of supply, but most other industries measure inventory in terms of *weeks of supply*, meaning the number of weeks it would take for a company to run out of its current supply of inventory. In general, there is an acceptable number of weeks of inventory for a particular kind of business. Too few weeks of inventory on hand, and a company risks a **stockout**—running out of inventory. For example, when Apple introduced the iPhone 3GS (which was significantly faster than the two previous versions of the iPhone), its retail and online stores (as well at AT&T's, which sells the iPhone 3GS to its cell phone customers) ran out of inventory in 44 states in the United States.[78] On the other hand, a business that has too many weeks of inventory on hand incurs high costs (discussed next). For example, companies that make the linerboard used for corrugated cardboard boxes typically have too much inventory when they have more than 6 weeks' supply on hand; the right amount is about 4 weeks' supply.[79] Anything more than that results in excess inventory, which can be reduced only by cutting prices or temporarily stopping production.

Another common inventory measure, **inventory turnover**, is the number of times per year that a company sells or "turns over" its average inventory. For example, if a company keeps an average of 100 finished widgets in inventory each month, and it sold 1,000 widgets this year, then it turned its inventory ten times this year.

In general, the higher the number of inventory turns, the better. In practice, a high turnover means that a company can continue its daily operations with just a small amount of inventory on hand. For example, let's take two companies, A and B, which have identical inventory levels (520,000 widget parts and raw materials) over the course of a year. If company A turns its inventories twenty-six times a year, it will completely replenish its inventory every 2 weeks and have an average inventory of 20,000 widget parts and raw materials. By contrast, if company B turns its inventories only two times a year, it will completely replenish its inventory every 26 weeks and have an average inventory of 260,000 widget parts and raw materials. So, by

turning its inventory more often, company A has 92 percent less inventory on hand at any one time than company B.

The average number of inventory turns across all kinds of manufacturing plants is approximately eight per year, as shown in Exhibit 18.14, although the average can be higher or lower for different industries.[80] The exhibit also shows the inventory turn rates for some of the best companies in each industry (i.e., companies in the 75th percentile). Whereas the average auto company turns its entire inventory 13 times per year, some of the best auto companies more than double that rate, turning their inventory 27.8 times per year, or once every 2 weeks.[81] Turning inventory more frequently than the industry average can cut an auto company's costs by several hundred million dollars per year. Finally, it should be pointed out that even make-to-order companies like Dell turn their inventory. In theory, make-to-order companies have no inventory. In fact, they've got inventory, but you have to measure it in hours. For example, Dell turns the inventory in its faculties 500 times a year, which means that on average it has 17 hours—that's *hours* and not days—of inventory on hand in its factories.[82]

5.3 Costs of Maintaining an Inventory

Maintaining an inventory incurs four kinds of costs: ordering, setup, holding, and stockout. **Ordering cost** is not the cost of the inventory itself but the costs associated with ordering the inventory. It includes the costs of completing paperwork, manually entering data into a computer, making phone calls, getting competing bids, correcting mistakes, and simply determining when and how much new inventory should be reordered. For example, ordering costs are relatively high in the restaurant business because 80 percent of foodservice orders (in which restaurants reorder food supplies) are processed manually. A report, *Enabling Profitable Growth in the Food-Prepared-Away-From-Home Industries*, estimated that the food industry could save $14.3 billion if all restaurants converted to electronic data interchange

[Ordering cost] the costs associated with ordering inventory, including the cost of data entry, phone calls, obtaining bids, correcting mistakes, and determining when and how much inventory to order

(see Chapter 17), in which purchase and ordering information from one company's computer system is automatically relayed to another company's computer system. Toward that end, an industry-wide effort, Efficient Foodservice Response (EFR), is underway to improve efficiencies in the foodservice supply chain.[83]

Setup cost is the cost of changing or adjusting a machine so that it can produce a different kind of inventory.[84] For example, 3M uses the same production machinery to make several kinds of industrial tape, but it must adjust the machines whenever it switches from one kind of tape to another. There are two kinds of setup costs, downtime and lost efficiency. *Downtime* occurs whenever a machine is not being used to process inventory. If it takes 5 hours to switch a machine from processing one kind of inventory to another, then 5 hours of downtime have occurred. Downtime is costly because companies earn an economic return only when machines are actively turning raw materials into parts or parts into finished products. The second setup cost is *lost efficiency*. Recalibrating a machine to its optimal settings after a switchover typically takes some time. It may take several days of fine-tuning before a machine finally produces the number of high-quality parts that it is supposed to. Exhibit 18.15 illustrates the trade-off between setup costs, meaning downtime and lost efficiency, and manufacturing flexibility, or the number of *different* products (or inventory) that can be processed or assembled on a particular machine. The data in Exhibit 18.15 assume that 4 hours of downtime and 3 percent lost efficiency occur each time a machine's setup has to be changed from one product to another. So, as shown in the exhibit, each time a machine has to be changed to handle a different kind of inventory, setup costs (downtime and lost efficiency) rise.

Holding cost, also known as *carrying* or *storage cost*, is the cost of keeping inventory until it is used or sold. Holding cost includes the cost of storage facilities, insurance to protect inventory from damage or theft, inventory taxes, the cost of obsolescence (holding inventory that is no longer useful to the company), and the

opportunity cost of spending money on inventory that could have been spent elsewhere in the company. For example, it's estimated that U.S. airlines have a total of $44 billion worth of airplane parts in stock at any one time for maintenance, repair, and overhauling their planes. The holding cost for managing, storing, and purchasing these parts is nearly $11 billion—or roughly one-fifth of the cost of the parts themselves.[85]

Stockout costs are the costs incurred when a company runs out of a product, as happened to Apple when it failed to have enough iPods during the holiday shopping season. There are two basic kinds of stockout costs. First, the company incurs the transaction costs of overtime work, shipping, and the like in trying to quickly replace out-of-stock inventories with new inventories. The second and perhaps more damaging cost is the loss of customers' goodwill when a company cannot deliver the products it promised. Stockouts occur more often than you might think. In the United States, the supermarket industry's average out-of-stock rate (the percentage of items that are unavailable at a given time) is 7.9 percent, according to research firm Market6. Highly promoted items have, as would be expected, a higher average out-of-stock rate of 13.1 percent. How costly is it for stores to run out of stock? Market6 estimates that running out of stock on the twenty-five best-selling product categories reduces a grocery store's revenue by an average of $200,000 per year, per store.[86] In general, retailers can increase sales 4 percent if they never run out of stock.

5.4 Managing Inventory

Inventory management has two basic goals. The first is to avoid running out of stock and thus angering and dissatisfying customers. This goal seeks to increase inventory to a safe level that won't risk stockouts. The second is to efficiently reduce inventory levels and costs as much as possible without impairing daily operations. This goal seeks a minimum level of inventory. The following inventory management techniques—economic order quantity (EOQ), just-in-time inventory (JIT), and materials requirement planning (MRP)—are different ways of balancing these competing goals.

Economic order quantity (EOQ) is a system of formulas that helps determine how much and how often inventory should be ordered. EOQ takes into account the overall demand (D) for a product while trying to minimize ordering costs (O) and holding costs (H). The formula for EOQ is

$$EOQ = \sqrt{\frac{2DO}{4}}$$

For example, if a factory uses 40,000 gallons of paint a year (D), ordering costs (O) are $75 per order, and holding costs (H) are $4 per gallon, then the optimal quantity to order is 1,225 gallons:

$$EOQ = \sqrt{\frac{2(40{,}000)(75)}{4}} = 1{,}225$$

With 40,000 gallons of paint being used per year, the factory uses approximately 110 gallons per day:

$$\frac{40{,}000 \text{ gallons}}{365 \text{ days}} = 110$$

[Stockout costs] the costs incurred when a company runs out of a product, including transaction costs to replace inventory and the loss of customers' goodwill

[Economic order quantity (EOQ)] a system of formulas that minimizes ordering and holding costs and helps determine how much and how often inventory should be ordered

Consequently, the factory would order 1,225 new gallons of paint approximately every 11 days:

$$\frac{1{,}225 \text{ gallons}}{110 \text{ gallons per day}} = 11.1 \text{ days}$$

In general, EOQ formulas do a good job of letting managers know what size or amount of inventory they should reorder to minimize ordering and holding costs. However, EOQ formulas and models can become much more complex as adjustments are made for price changes, quantity discounts, setup costs, and many other factors.[87]

While EOQ formulas try to minimize holding and ordering costs, the just-in-time (JIT) approach to inventory management attempts to eliminate holding costs by reducing inventory levels to near zero. With a **just-in-time (JIT) inventory** system, component parts arrive from suppliers just as they are needed at each stage of production. By having parts arrive just in time, the manufacturer has little inventory on hand and thus avoids the costs associated with holding inventory. By combining a JIT inventory system with its make-to-order production system, Dell turns its inventory more than 500 times a year, as mentioned above. John Egan heads Dell's inventory fulfillment center in Austin, Texas, and has this to say about Dell's JIT inventory system: "We used to measure our factory inventory in days; but now we manage it in hours. Our suppliers see demand changes every two hours. We try to achieve a perfect balance between the parts that are needed and what's already in the factory."[88]

To have just the right amount of inventory arrive at just the right time requires a tremendous amount of coordination between manufacturing operations and suppliers. One way to promote tight coordination under JIT is close proximity. Most parts suppliers for Toyota's JIT system at its Georgetown, Kentucky, plant are located within 200 miles of the plant. Furthermore, parts are picked up from suppliers and delivered to Toyota as often as sixteen times a day.[89] A second way to promote close coordination under JIT is to have a shared information system that allows a manufacturer and its suppliers to know the quantity and kinds of parts inventory the other has in stock. Generally, factories and suppliers facilitate information sharing by using the same part numbers and names. Ford's seat supplier accomplishes this by sticking a bar code on each seat, and Ford then uses the sticker to route the seat through its factory.

Manufacturing operations and their parts suppliers can also facilitate close coordination by using the system of kanban. **Kanban**, which is Japanese for "sign," is a simple ticket-based system that indicates when it is time to reorder inventory. Suppliers attach kanban cards to batches of parts. Then, when an assembly-line worker uses the first part out of a batch, the kanban card is removed. The cards are then collected, sorted, and quickly returned to the supplier, who begins resupplying the factory with parts that match the order information on the kanban cards. Glenn Uminger, manager of production control and logistics at Toyota's Georgetown, Kentucky, plant, says, "We are placing orders for new parts as the first part is used out of a box." Because prices and batch sizes are typically agreed to ahead of time, kanban tickets greatly reduce paperwork and ordering costs.[90]

A third method for managing inventory is **materials requirement planning (MRP)**. MRP is a production and inventory system that, from beginning to end, precisely determines the production schedule, production batch sizes, and inventories needed to complete final products. The three key parts of MRP systems are the master production schedule, the bill of materials, and inventory records. The *master production schedule* is a detailed schedule that indicates the quantity of each item to be produced, the planned delivery dates for those items, and the time by which each step of the production process must be completed in order to meet those delivery dates.

"We are placing orders for new parts as the first part is used out of a box."

[Kanban] a ticket-based JIT system that indicates when to reorder inventory

[Materials requirement planning (MRP)] a production and inventory system that determines the production schedule, production batch sizes, and inventory needed to complete final products

Based on the quantity and kind of products set forth in the master production schedule, the *bill of materials* identifies all the necessary parts and inventory, the quantity or volume of inventory to be ordered, and the order in which the parts and inventory should be assembled. *Inventory records* indicate the kind, quantity, and location of inventory that is on hand or that has been ordered. When inventory records are combined with the bill of materials, the resulting report indicates what to buy, when to buy it, and what it will cost to order. Today, nearly all MRP systems are available in the form of powerful, flexible computer software.[91]

Which inventory management system should you use? Economic order quantity (EOQ) formulas are intended for use with **independent demand systems**, in which the level of one kind of inventory does not depend on another. For example, because inventory levels for automobile tires are unrelated to the inventory levels of women's dresses, Sears could use EOQ formulas to calculate separate optimal order quantities for dresses and tires. By contrast, JIT and MRP are used with **dependent demand systems**, in which the level of inventory depends on the number of finished units to be produced. For example, if Yamaha makes 1,000 motorcycles a day, then it will need 1,000 seats, 1,000 gas tanks, and 2,000 wheels and tires each day. So, when optimal inventory levels depend on the number of products to be produced, use a JIT or MRP management system.

REVIEW 5

Inventory There are four kinds of inventory: raw materials, component parts, work-in-process, and finished goods. Because companies incur ordering, setup, holding, and sometimes stockout costs when handling inventory, inventory costs can be enormous. To control those costs, companies measure and track inventory in three ways: average aggregate inventory, weeks of supply, and turnover. Companies meet the basic goals of inventory management (avoiding stockouts and reducing inventory without hurting daily operations) through economic order quantity (EOQ) formulas, just-in-time (JIT) inventory systems, and materials requirement planning (MRP).

EOQ formulas minimize holding and ordering costs by determining how much and how often inventory should be ordered. By having parts arrive just when they are needed at each stage of production, JIT systems attempt to minimize inventory levels and holding costs. JIT systems often depend on proximity, shared information, and the system of kanban made popular by Japanese manufacturers. MRP precisely determines the production schedule, production batch sizes, and the ordering of inventories needed to complete final products. The three key parts of MRP systems are the master production schedule, the bill of materials, and inventory records. Use EOQ formulas when inventory levels are independent, and use JIT and MRP when inventory levels are dependent on the number of products to be produced.

SELF ASSESSMENT

How to Handle Disgruntled Customers

How a company manages its customers is an important indicator of its future success. But managing customers can be as difficult as it is critical. For example, one customer may like to be greeted by an employee and immediately helped upon entering the store. Another might find this approach a bit aggressive. What is your style? If you were responsible for interacting with customers, which approach would you use? The following assessment will evaluate your perspectives on the relationship a company has with its customers. Be candid as you respond to the questions using a scale from 1 to 9, in which 1 means you strongly disagree, 5 means you are neutral, and 9 means you strongly agree (other numbers indicate varying degrees of agreement or disagreement).[92]

1. I try to bring a customer with a problem together with a product/ service that helps solve that problem.
2. I keep alert for weaknesses in a customer's personality so I can use them to put pressure on them to agree with me.
3. I try to influence a customer by information rather than pressure.
4. It is necessary to stretch the truth in describing a product to a customer.
5. I decide what product/service to offer on the basis of what I can convince customers to accept, not on the basis of what will satisfy them in the long run.
6. I paint too rosy a picture of my product/service to make them sound as good as possible.
7. I try to find out what kind of products/services will be most helpful to a customer.
8. I try to sell a customer all I can convince them to buy, even if I think it is more than a wise customer would buy.
9. I begin talking about the product/service before exploring a customer's need with him or her.
10. I try to help customers achieve their goals.
11. I try to figure out what a customer's needs are.
12. A good employee has to have the customer's best interest in mind.
13. I try to sell as much as I can rather than to satisfy a customer.
14. I try to give customers an accurate expectation of what our product/service will do for them.
15. I imply to a customer that something is beyond my control when it is not.
16. I try to achieve my goals by satisfying customers.
17. If I am not sure if our product/service is right for a customer, I will still apply pressure to get him or her to buy.
18. I answer a customer's question about product/ services as correctly as I can.
19. I offer the product/service that is best suited to the customer's problem.
20. I treat a customer as a rival.
21. I spend more time trying to persuade a customer to buy than I do trying to discover his or her needs.

MANAGEMENT DECISION

Dealing with Oversupply

"My first boss in the steel industry told me, nobody thinks there's any inventory until they look out the window and say, 'Oh my God, what's all that stuff?'"[93] So said economist Michael Montgomery of IHS Global Insight. Although it's not as simple as looking out the window, you can definitely relate to the thought as you look over the inventory and sales statistics for your company, which makes LCD screen televisions. You've been keeping the typical 8-week inventory that is the industry standard. But sales are declining rapidly and you're faced with, well, a lot of stuff. And it's your job to figure out what to do with it.

You know you're not alone. Consumer spending on anything that isn't essential has been declining globally due to the economic recession. Overstock, especially of SUVs, in the U.S. auto industry is now widespread. But the problem of excess inventory has also hit companies that make chips, computers, and cell phones, along with flat-screen TVs, as you well know. And the problem isn't only a decrease in consumer spending. Companies have invested enormous amounts of money into production and now many are running at partial capacity or closing. The numbers are staggering: Semiconductor inventories have nearly tripled, from $3.8 billion to $10.2 billion.[94]

While you can't fix the global economy, you're still faced with the problem of how to manage your inventory. There are the immediate solutions like temporarily stopping production—SanDisk stopped production for a week at some of its plants and then re-opened at 70 percent capacity and reduced prices and wrote down inventory that couldn't be sold. But you're also concerned with the more long-term issue of how to manage your inventory and your operations in a way that brings supply and demand into balance in what will probably be a smaller market. As Montgomery said, "It's going to get worse." You're looking to shift from an 8-week supply of flat-screen TVs to a 4- or 5-week supply. What will your inventory system of the future look like?

Questions

1. What issues do you need to think about as you design a new inventory system?
2. Think about the systems discussed in the text. Which would you use? Explain your decision.

MANAGEMENT TEAM DECISION

Recovery Plan

As you read in Chapter 5, crisis management planning is an important component of business planning and corporate communication.[95] Typically, when you hear "crisis management," you think of a company responding to catastrophic publicity, but companies also need to think about managing smaller negative encounters because those encounters play a large role in customer retention. The retention rate for customers whose complaints or problems are resolved satisfactorily is 70 percent; when complaints are resolved quickly as well—typically on the spot—the retention rate soars to 95 percent. But when complaints are not resolved to the customer's satisfaction, customer retention falls to 46 percent. And research shows that for major purchases (defined as being over $100), customers whose complaints are unresolved stay with the company only 19 percent of the time. So, companies should have a plan for responding to customers' complaints and problems. Putting service recovery plans in place enables companies to respond quickly, the biggest factor in reversing the damage from negative customer experiences.

In the spa industry, customer service and satisfaction are paramount. Spa services are very personal and can be very expensive. It doesn't take long for a tab of services to surpass the $100 mark, which many consider the point at which an expenditure becomes a major purchase. And what would upset a customer more than a horrendous haircut, botched fingernails, or losing half an eyebrow during a wax!

For this exercise, assemble four to five students to act as the management team for a local salon and day spa that is getting ready to expand by adding four salons in new neighborhoods. Your salon has always had a high reputation for service, but as you expand, your experienced staff will be spread thin. In the next month, your team plans to hire and train twenty-five new cosmetologists and estheticians (skin-care providers). To ensure that the new stores are successful, your team has decided to map out very clear service recovery procedures. After all, during the training periods and the first few months the new stores are open, mistakes are bound to happen. How you respond to them will mean the difference between a successful expansion and possible bankruptcy.

Questions

1. As a team, brainstorm a list of service failures that could occur in a salon and day spa. (The examples of a bad haircut, damaged nails, and losing half an eyebrow during a wax job were mentioned above, but there are many more possibilities.) Then identify ways that you can resolve each problem on the list quickly and to the customer's satisfaction.
2. There are bound to be situations that you haven't planned for. How will you instruct your employees to handle unanticipated problems?
3. What kind of metric(s) can you create to measure the quality of your service delivery? Manufacturing companies typically measure things like on-time delivery, defects per million, production rate (how many pieces per hour), and so forth. What can a spa measure to keep its service operation in control?

PRACTICE BEING A MANAGER

Balancing Speed and Accuracy

Success in service and manufacturing operations requires managers to maintain high levels of both productivity and quality. High productivity ensures that the company is cost-competitive with rivals; and high quality helps the company to attract customers and grow revenues and profits. Because productivity and quality are basic drivers of company success, managers must be adept at measuring and improving both. This exercise will give you some practice in developing productivity and quality measures.

Step 1: Your professor will organize your class into small groups of three or four students.

Scenario: Your group is a management team working to improve productivity and quality in a pharmaceutical company. You have been assigned two units of this company as the focus of your improvement efforts. The first is a pill-packaging unit, and the second is a research and development (R&D) laboratory.

Workers in the packaging unit are responsible for checking to ensure that the pills in the box match the packaging and labeling, placing the appropriate labels and packaging information on each box, and then certifying with a stamp that the box of pills is ready for shipping to wholesale customers, for example, chains like Walgreens and Costco. Mistakes in packaging, if undetected by pharmacists, could have serious, even fatal, outcomes. These manufacturing workers are skilled and highly trained. If they detect a problem, they have the authority to halt production.

Workers in the R&D unit are responsible for developing new drugs and for testing their effectiveness and safety. The company relies for its success upon a steady pipeline of promising new products. At the same time, some basic research (e.g., study of progression of a particular type of cancer) is necessary in order to develop new drugs. These workers are mostly Ph.D.s and highly skilled laboratory technicians.

Step 2: Develop metrics. Working as a team, develop some productivity and quality measures for (a) packaging unit workers and (b) R&D unit workers. Be sure to consider whether productivity and quality should be measured on an individual or unit basis, and why.

Step 3: Analyze the metrics. Critically examine your team's measures for each unit. What unintended consequences might develop as workers in each unit strive to improve on the measures you have designed? Are you more confident of your measures in one unit versus the other? Why or why not?

Step 4: Debrief as a class. What are some of the challenges of measuring productivity and quality? Are these challenges greater for particular types of work? Which level of measurement and accountability—individual or unit—is most likely to generate positive results? Why? What impact do productivity and quality systems of measurement and improvement have on workers? How can firms ensure productivity and quality without overloading workers and/or fostering unhealthy levels of stress?

DEVELOP YOUR CAREER POTENTIAL

Take a Factory Tour

Imagine that you arrive back at your dorm room one afternoon to find your roommate watching a *Mister Rogers* rerun. When asked why, your roommate replies, "Management homework." That may not be as crazy as it sounds. The late Fred Rogers, host of PBS's *Mr. Rogers' Neighborhood*, may well hold the record for factory tours. During his long career, he broadcast footage to millions of children showing how Cheerios, plastic drinking straws, raincoats, pasta, blue jeans, spoons, and a host of other products are made. He was even at Crayola when the one-billionth crayon rolled off the production line. (He also broadcast footage of how Crayola crayons are made and packaged.)

For years, John Ratzenberger (known for his role as Cliff Clavin on *Cheers* and as a regular voice in Pixar animated feature movies (most recently Mustafa the waiter in *Ratatouille*), hosted a cable television program titled *Made in America* that features nothing but factory tours around the United States. The Food Network also broadcasts a program that describes

how all kinds of food products are manufactured. Beyond the world of television, however, each year thousands of people visit corporate facilities like these:

- The Boeing Everett Tour Center outside Seattle introduces visitors to how Boeing makes its 747, 767, and 777 passenger jets.
- Steinway & Sons in Queens, New York, offers a 2½-hour tour that is like a master class. Each Steinway piano takes about a year to build, so you will be able to see pianos at every stage of the production process.
- Ben & Jerry's in Waterbury, Vermont, offers tours accompanied with a scoop of whatever flavor ice cream was made that day.
- Tabasco Factory on Avery Island, Louisiana, is part factory tour, part nature preserve. You can see how the pepper sauce is aged in oak barrels and then step outside to see Bird City, a special structure devised by E. A. McIlhenny to provide a sanctuary for snowy egrets.
- Mack Truck has an assembly plant in Macungie, Pennsylvania. The production line is a mile and a half long, so wear comfortable shoes!
- Yuengling Brewery in Pottsville, Pennsylvania, also offers tours, which include a trip to the cave where the nation's oldest brewery used to age its beer.
- Louisville Slugger in Louisville, Kentucky (where else?), offers a factory tour at the end of which you receive a miniature Slugger bat to take home.
- Harley-Davidson plants in Milwaukee, Kansas City, and York, Pennsylvania, offer factory tours for teens and adults.
- Carousel Magic in Mansfield, Ohio, is one of the few remaining carousel horse manufacturers and restorers.

Many companies no longer open their factories for tours. Kellogg's in Battle Creek, Michigan, ceased giving factory tours in 1986, but now the company operates a museum/activity center called Cereal City. Other companies say they offer factory tours, but in reality the tour is just a marketing device. Budweiser in St. Louis has an enormous visitor center for its tours, but you won't be able to see any of the actual production—just videos and the various outbuildings on the Anheuser-Busch campus. Still other companies offer virtual tours of their operations. Just Born, maker of Marshmallow Peeps, Mike & Ikes, and Hot Tamales, offers a static tour of the Peep production line at **http://www.marshmallowpeeps.com**. Hershey Foods also has an online tour at **http://www.hersheys.com/kidztown/factorytour.shtml**.[96]

Your assignment is to take a factory tour. Use the Internet or other resources to locate a factory tour near you. The site Factory Tours USA (**http://www.factorytoursusa.com**) organizes tours by state, so locating something interesting is easy.

Questions

1. What steps or procedures does the company take to ensure the quality of its products?
2. How does the company measure productivity, and how does its productivity compare with others in the industry?
3. Using the vocabulary from the chapter, describe the basic steps used to make the finished products in this factory.
4. What did you find most impressive about this company or its manufacturing processes? Based on what you read in the chapter, describe one thing the company could do differently to improve quality, increase productivity, or reduce inventory.

In Bruges

The tagline for the award-winning 2008 film ***In Bruges*** was "Shoot first. Sightsee later." That's because it's the story of two hit men—Ray (Colin Farrell) and Ken (Brandan Gleeson)—who tragically botch the job of murdering a priest in a confessional by accidentally killing an innocent young bystander. Ray and Ken are ordered to hide out in the beautiful medieval Flemish city of Bruges, Belgium. They spend their days sightseeing, interacting with the locals, and bickering with each other while awaiting further orders from Harry, their boss (Ralph Fiennes). This video features two scenes that show Ken and Harry interacting with a ticket seller (Rudy Blomme), who makes it more difficult for them to visit a historic bell tower than they'd like.

© GREENLIGHT

What to Watch for and Ask Yourself

1. Ken is the customer and the ticket seller responds to him as a customer. Do you perceive the ticket seller as having a customer focus as emphasized in this chapter? Why or why not?
2. As you were watching the ticket seller interact with Ken and Harry in the second part of this video, did you predict that his customer approach could result in negative results for him? Why or why not?
3. These scenes offer a lesson in customer focus. What did the ticket seller fail to understand about his customers? Could he have handled the situations better?

MANAGEMENT WORKPLACE

Preserve

When John Lively, director of operations at Preserve, arrived for his first day on the job 10 years ago, there wasn't much to see. The company, which makes housewares and personal care products from recycled plastics, was just getting started. There were about three or four people in one room doing whatever it took to get the company off the ground. In 1999, the idea of an information technology (IT) department and all the organizational tools we now take for granted were still new. Lively says he had a lot to learn—and fast! In this video Lively describes the challenges that Preserve faced when Wal-Mart placed an order and the small company had to scramble to meet demand, manage its inventory, and ensure that products would be delivered on time.

Questions

1. What is one of the key ways that the company has improved its process control and quality control?
2. What are some of the inventory issues that arose when Wal-Mart decided to carry Preserve's products? What were some of the solutions?
3. As the company has grown, what types of controls did it have to establish in its operations?

Collins and Porras define an organization's mission: "A mission is a clear and compelling goal that serves to unify an organization's efforts. An effective mission must stretch and challenge the organization, yet be achievable." However, many others define mission as an organization's purpose. In this edition, to be more specific and avoid confusion, we used Collins and Porras's term "purpose statement," meaning a clear statement of an organization's purpose or reason for existence. Furthermore, we continued to use Collins and Porras's definition of a mission (i.e., "a clear and compelling goal . . . ,"), but instead call it "the strategic objective."
